Air Quality Management Plan
Attn: Elaine Change

A review of the Draft 2007 AQMP has resulted in the following comments to and including Page 4-47. I will continue, but wanted to get these into the hand of those updating the document

The Summary and Introduction are excelent examples of organization and clarity on a very complex matter. Specific comments are:

Page 1-9 An inconsistency is on 2007 Baseline text of NO_x at 84 tons per day in 2010 compared to 74 tons per day in Figure 1-5. The color coding is diffrent than the caption under the Figure.

Page 2-14 In Figure 2-6 the shading does not discern between "not exceeded" and "over 50 $\mu g/m^3$"

Page 4-39 In Table 4-6, it appears that different analysists are using different ground rules. They are dealing with the initial emissions (in 2007), in the increased number of vehicles (eg ONRD-06 and ONRD-07) and the resulting emissions minus the effects of all reductions in effect at that time period (2014 and 2020). Please check why the totals would not be greater in 2020.

Thank you for the challenge and opportunity to participate in this worthy effort.

Yours truly,

Don Blos

P.S. (951) 686-9981 if any questions.
