HEALTH RISK ASSESSMENT SUMMARY FORM

(Required in Executive Summary of HRA)

Facility Name : _____

Facility Address: _____

Type of Business: _____

SCAQMD ID No.: _____

A. Cancer Risk

(One in a million means one chance in a million of getting cancer from being constantly exposed to a certain level of a chemical over a period of time)

1. Inventory Reporting Year : _____

2. Maximum Cancer Risk to Receptors : *(Offsite and residence = 30-year exposure, worker = 25-year exposure)*

- | | | | |
|--------------|--------------------|-----------|-------|
| a. Offsite | _____ in a million | Location: | _____ |
| b. Residence | _____ in a million | Location: | _____ |
| c. Worker | _____ in a million | Location: | _____ |

3. Substances Accounting for 90% of Cancer Risk: _____

Processes Accounting for 90% of Cancer Risk: _____

4. Cancer Burden for a 70-yr exposure: *(Cancer Burden = [cancer risk] x [# of people exposed to specific cancer risk])*

- | | |
|--|-------|
| a. Cancer Burden | _____ |
| b. Number of people exposed to >1 per million cancer risk for a 70-yr exposure | _____ |
| c. Maximum distance to edge of 70-year, 1×10^{-6} cancer risk isopleth (meters) | _____ |

B. Hazard Indices

[Long Term Effects (chronic) and Short Term Effects (acute)]

(non-carcinogenic impacts are estimated by comparing calculated concentration to identified Reference Exposure Levels, and expressing this comparison in terms of a "Hazard Index")

1. Maximum Chronic Hazard Indices:

- | | | | | |
|------------------|-----------------|-------|-------------------------|-------|
| a. Residence HI: | _____ Location: | _____ | toxicological endpoint: | _____ |
| b. Worker HI : | _____ Location: | _____ | toxicological endpoint: | _____ |

2. Substances Accounting for 90% of Chronic Hazard Index: _____

3. Maximum 8-hour Chronic Hazard Index:

8-Hour Chronic HI: _____ Location: _____ toxicological endpoint: _____

4. Substances Accounting for 90% of 8-hour Chronic Hazard Index: _____

5. Maximum Acute Hazard Index:

PMI: _____ Location: _____ toxicological endpoint: _____

6. Substances Accounting for 90% of Acute Hazard Index: _____

C. Public Notification and Risk Reduction

1. Public Notification Required? _____ Yes _____ No

a. If 'Yes', estimated population exposed to risks > 10 in a million for a 30-year exposure, or an HI > 1

2. Risk Reduction Required? _____ Yes _____ No

Re: Approval of Air Toxic Inventory Report and Notice to Prepare a Health Risk Assessment for Whittier Fertilizer, Co. (South Coast AQMD Facility No.: 511)

Dear SCAQMD AB2588 Staff,

Please find enclosed the written report of Whittier Fertilizer, Co. Health Risk Assessment based on the district's supplemental guidelines along the electronic inputs and outputs files, which are attached separately and submitted through the district's OnBase system.

Upon reviewing and evaluation of this HRA, Whittier Fertilizer, Co. would like the district to consider the additional inputs in order to further accurately determine the final health risk impacts:

Variable Emissions: Whittier's operating hours are 8 hours per day (9AM - 4PM), 5 days per week, 52 weeks per year. The prepared HRA has the default emission variable assumption of 24 hours per day, 7 days per week, 52 weeks per year. This default assumption does not accurately represent the facility's actual operating hours of emissions.

OIMP Permit: Whittier is currently operating under the state's permitted Odor Impact Minimization Plan (OIMP) that limits the facility's operation based on the wind directions. When the wind is blowing southwest towards the direction of residential receptors, the facility seizes operation in order to prevent potential odors dispersion into the nearby residential. This determination based on a visual monitoring procedure and is enforced by the local health department. A copy of the facility's OIMP can be found in the HRA Appendix.

Diesel Usage: During the 2017 Annual Emission Reporting, Whittier's total diesel emission was calculated using the engine's CARB fuel rating, which was based on a 100% efficiency. In reality, the facility operates at a much lower efficiency, therefore the emissions reported was not accurate. The facility will be installing a fuel consumption meters in addition to the hour meters, in order to accurately capture the total emissions.

Future reassessment of the Whittier's HRA with these inputs would most definitely reduce the health risk impact that has been determined in this 2019 HRA report. If you have further questions, please feel free to contact me.

Sincerely,

Nhat Nguyen
Assistant Environmental Engineer

Whittier Fertilizer, Co.

Definitions:

The definitions below are reference from the 2015 Office of Environmental Health Hazard Assessment: Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, (OEHHA 2015).

Acute Health Impact:

Non-cancer health impacts for short-term, one-hour peak exposures to facility emissions. By definition, an acute reference exposure level (REL) is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration for the specified exposure duration on an intermittent basis.

8-Hour Chronic Health Impact:

Non-cancer health impacts for exposures to the general public that occur on a recurrent basis, but only during a portion of each day. By definition, an 8-hour reference exposure level (REL) is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups exposed to that concentration for an 8-hour exposure duration on a regular (including daily) basis.

Chronic Health Impact:

A chronic reference exposure level (REL) is a concentration level for inhalation exposure and in a dose expressed in units of milligrams per kilogram-day (mg/kg-day) for oral exposures at or below which no adverse health effects are anticipated following long-term exposure. Long-term exposure for these purposes has been defined by U.S. EPA as at least 12% of a lifetime, or about eight years for humans.

Cancer Health Impact:

Cancer risk is often expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance over a 30-year residential period.

Brief Description of Operation: Fertilizer Manufacturing and Green Waste Composting

1.0 Site Description & Facility Operations

Whittier Fertilizer, Co. is a fertilizer manufacturing and green waste composting facility located on 9441 Kruse Road in the city of Pico Rivera, California. The facility manufactures a variety of products such as fertilizers, composts, soil amendments, mulch, and decorative rocks. The facility is located under the Universal Transverse Mercator (UTM) Zone 11 at coordinates 401,393.3 meters East (X) and 3,764,804 meters North (Y), with an estimated population of 9,818,605 according to South Coast AQMD Modeling Guidance for AERMOD. The facility is surrounded by commercial businesses and residential homes in the east, west, and south directions. The nearest school is Durfee Elementary School, which is approximately 3,600 feet away from the facility.

The facility receive raw materials such as green organic materials that is further process through grinders, screens, shredders, and bag system that ultimately produce a variety of products mention in the above paragraph. The facility structure layout consists of two main building structures that is use for office space, product packaging, and product storage. North of the facility within the property boundary consists of raw material storage, process material storage, finished material storage, and processing equipments. Throughout the rest of the facility consists of parking spaces, equipment storage areas, sheds, and final product storage areas.

The facility Ammonia and Diesel Exhaust Particulates emissions come from multiple sources. Ammonia is emitted from three green waste composting piles at are generated and staged on site.

Diesel Exhaust Particulates are emitted from three diesel engines running a grinder and two aggregate screening equipments. Table 1 below displays the facility's emitted substances, 1-hour (lbs/hr) and total annual emissions (lbs/yr).

Table 1. Facility Emission Summary by Sources

EIM Source ID	EIM Stack ID	Chemical Name	CAS #	Annual Emission (lbs/yr)	Max. Hourly Emissions (lbs/hr)
S0001	1	Ammonia	7664417	822.36	6.35E-01
S0002	584581	Diesel Exhaust Particulate	9901	514.66	7.31E-02
S0003	584583	Diesel Exhaust Particulate	9901	193.62	1.98E-02
S0004	584587	Diesel Exhaust Particulate	9901	134.84	1.64E-03

2.0 Multipathway Substances and Pathways

The facility's emitted pollutants, ammonia and diesel exhaust particulates, multipathway were evaluated and determined based on the pollutants characteristics, level, air dispersion modeling software using the provided meteorological data. Table 2 below identifies the facility's emitted substances along with their pathways.

Table 2. Facility Pollutants Multipathway Evaluation

Chemical Name	CAS #	Pathway(s)
Ammonia	7664417	Inhalation
Diesel Exhaust Particulate	9901	Inhalation

3.0 Overview of Dispersion Modeling and Exposure Assessment

The air dispersion modeling and exposure assessment was performed using Air Dispersion Modeling and Risk Tool (ADMRT), provided by the California Air Resources Board (CARB) under the HotSpots Analysis and Reporting Program Version 2 (HARP 2). HARP is a tool for preparing health risk assessment, which incorporates information from the 2015 Office of Environmental Health Hazard Assessment: Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, (OEHHA 2015). Incorporating the Emission Inventory Module (EIM), which is also under the HARP program, ADMRT performs air dispersion analysis by calculating the ground level concentrations (GLCs) of pollutants in order to evaluate the potential cancer and non-cancer health impacts. The evaluation of potential cancer and non-cancer health impacts were perform both within and outside the facility's boundary.

4.0 Overview of Dose-Response Assessment for Cancer and Non-Cancer Health Impact.

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with an estimated exposure. Cancer potency factors are expressed as the 95th percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. Typically, potency factors are expressed as units of inverse dose (e.g., (mg/kg BW/day)-1) or inverse concentration. It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis.

The Office of Environmental Health Hazard Assessment (OEHHA) has compiled cancer potency factors, which should be used in risk assessments for the Hot Spots program. Cancer potency factors were derived either by the U.S. EPA or by OEHHA, underwent public and peer-review, and were adopted for use in the program. For a detailed description of cancer potency factors, refer to the Technical Support Document for Cancer Potency Factors (OEHHA, 2009).

For non-carcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, 8-hour, and chronic non-cancer Reference Exposure Levels (RELs). The acute, 8-hour and chronic RELs are defined as the concentration at which no adverse non-cancer health effects are anticipated even in sensitive members of the general population, with infrequent one hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively. The most sensitive health effect is chosen to develop the REL if the chemical affects multiple organ systems. Unlike cancer health effects, non-cancer health effects are generally assumed to have thresholds for adverse effects. In other words, injury from a pollutant will not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold) and/or dose. The acute, 8-hour, and chronic RELs are air concentrations intended to be below the threshold for health effects for the general population.

The actual threshold for health effects in the general population is generally not known with any precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies to help ensure that the chronic, 8-hour and acute REL values are below the threshold for human health for nearly all individuals. This guidance manual provides the acute, 8-hour, and chronic Reference Exposure Levels. Some substances that pose a chronic or repeated 8-hour inhalation hazard may also present a chronic hazard via non-inhalation routes of exposure (e.g., ingestion of contaminated water, foods, or soils, and dermal absorption). The methodology and derivations for acute, 8-hour, and chronic, RELs are described in the Technical Support Document for the Derivation of Non-cancer Reference Exposure Levels (OEHHA, 2008).

Below in Table 3 shows the target organ systems that are affected by the emitted substances for non-cancer chronic and acute health impacts.

Table 3. Facility Pollutants Chronic & Acute Risk Target Organ Systems

Chemical Name	CAS #	Chronic Risk Target Organ Systems	Acute Risk Target Organ Systems
Ammonia	7664417	Respiratory	Respiratory, Eyes
Diesel Exhaust Particulate	9901	Respiratory	Respiratory, Eyes

5.0 Summary of Results

The summary of results for potential cancer and non-cancer health impacts for residential and workers are presented in the Health Risk Assessment Summary Form attached in the Appendix. The PMI, MEIR, and MEIW health impact was calculated to be 169, 69, and 11 in one million, respectively.

5.1 Location and Description of PMI, MEIR, & MEIW

The table below presents the maximum risk exposure for off-site, residential, and worker with the location (UTM) coordinates. The Point of Maximum Impact (PMI) is located north along the facility property boundary line, in an undeveloped area. The Maximally Exposed Individual Resident (MEIR) is located south of the facility across Kruse Road, within a residential community. The Maximally Exposed Individual Worker (MEIW) is located just south of the facility within a commercial business property.

Location of Cancer Risk	
Maximum Risk Exposure	UTM Coordinates (m)
Point of Maximum Impact (PMI)	401,615 (X), 3,765,025 (Y)
Maximally Exposed Individual Resident (MEIR)	401,515 (X), 3,764,795 (Y)
Maximally Exposed Individual Worker (MEIW)	401,565 (X), 3,764,885 (Y)

5.2 Location and Description of Sensitive Receptors

There are a total of fifty-seven sensitive receptors located within the one in one million isopleths zone of impact. As mentioned in Section 1.0, the near school is Durfee Elementary School, which is also the nearest sensitive receptor, located approximately 3,600 ft with UTM coordinates 400746.23 (X), 3763990.71 (Y). The primary cancer risk exposure to these sensitive receptors would be from the inhalation of diesel exhaust particulate. There are currently no sensitive receptors that are above the cancer risk of ten in one million, or above the cancer health HI of one. Table 7 presents the list of all the sensitive receptors and its UTM coordinates location within the one in one million zone of impact.

5.3 Cancer Risk Exposure Assessment

The total potential cancer risk for residential exposure was assessed based on the assumption of a 30-years exposure duration scenario. The potential cancer risk for worker exposure was assessed based on the assumption of a 25-years exposure duration scenario. Based on this cancer risk exposure assessment, the substance appears to contribute to the potential health impact for both residential and worker is diesel exhaust particulate emissions. The respiratory is the target organ system for both residential and worker cancer risk exposure. Table 4 below summarizes the total potential cancer risk health impacts by substances and the total potential multipathway (MP) at the PMI, MEIR, and MEIW

Table 4. Summary of Cancer Risk Exposure Assessment

Maximum Risk Exposure	UTM Coordinates (m)	Grid Receptor ID Number	Cancer Risk	Substances	Potential Multipathway
Point of Maximum Impact (PMI)	401,615 (X), 3,765,025 (Y)	8287	169 in one million	Diesel Exhaust Particulate	Inhalation
Maximally Exposed Individual Resident (MEIR)	401,515 (X), 3,764,795 (Y)	5977	69 in one million	Diesel Exhaust Particulate	Inhalation
Maximally Exposed Individual Worker (MEIW)	401,565 (X), 3,764,885 (Y)	6882	11 in one million	Diesel Exhaust Particulate	Inhalation

5.4 Non-Cancer Risk Exposure Assessment

The non-cancer chronic risk health hazard indices (HIs) at the PMI, MEIW, and MEIR are 0.06, 0.02, and 0.04 respectively. The non-cancer chronic PMI & MEIR was evaluated under the residential non-cancer chronic exposure scenario, whereas the MEIW was evaluated under the worker non-cancer chronic exposure scenario. The substances driving the potential health impact for both residential and worker non-cancer risk exposure are ammonia and diesel exhaust particulate emissions. The respiratory and eyes are the target organ systems for these non-cancer risk exposure. Table 5 below summarizes the non-cancer risk exposure assessment. Additionally, Figures 4 and 5 below displays the map and locations of the MEIW and MEIR of the non-cancer chronic risk.

The non-cancer acute risk exposure health impact hazard indices (HIs) at the PMI, MEIW, and MEIR are 0.07, 0.02, and 0.01 respectively. The 8-hour chronic risk hazard indices were determined to be zero at all exposure scenarios. Figure 6 below shows the map of the acute risk for the PMI, MEIW, and MEIR. Lastly, Table 5.1 further displays the health impact in details.

Table 5. Summary of Non-Cancer Risk Exposure Assessment

Maximum Risk Exposure	UTM Coordinates (m)	Grid Receptor ID Number	Non-Cancer Chronic Risk (HIs)	UTM Coordinates (m)	Grid Receptor ID Number	Non-Cancer Acute Risk (HIs)	8-Hr Chronic Risk (HIs)
PMI	401575 (X), 3765025 (Y)	8283	0.06	401,565 (X), 3,765,025 (Y)	8282	0.07	0
MEIW	401,505 (X), 3,764,795 (Y)	5976	0.02	401,565 (X), 3,764,885 (Y)	6882	0.02	0
MEIR	401,555 (X), 3,764,885 (y)	6881	0.04	401,535 (X), 3,764,795 (Y)	5979	0.01	0

5.5 Map of facility and surrounding MEIR, MEIW & PMI along with the zone of impact 1, 10, 25, 100 in one million isopleths

The facility is surrounded by commercial businesses, residential, and undeveloped lands. There are commercial businesses located south, southwest, and southeast of the facility. All residential homes are located south and all of the undeveloped area is located north of the facility. Figure 1. shows the facility location, property boundary, and sources contributing to the emissions. Figure 2. shows the calculated MEIR, MEIW, and PMI based on the health risk assessment. Figure 3. shows the 1, 10, 25, 100 in one million zone of impact isopleths. In further details, the one in one million zone of impact extends roughly about 6 km north and 5.5 km south of the facility origin. The cancer burden was determined less than 0.50 based on a residential 70-year lifetime exposure and is further discussed in the next section.

5.6 Population & Subpopulations Exposures

The total cancer burden greater than 1, 10, 100 in a million isopleths was 0.46, 0.1 and 0.0 respectively. The cancer burden results are less than the risk reduction level threshold of 0.5, therefore, risk reduction is unnecessary. Table 6 summarizes the population exposure 70-years residential cancer risk. There are currently no subpopulations of concern determined within this health risk assessment.

Table 6. Population Exposure 70-Years Residential Cancer Risk

Total Cancer Risk Greater Than...	Population	Cumulative Cancer Burden
1 in a million	176,342	0.46
10 in a million	5,233	0.1
100 in a million	0	0.0

6.0 Conclusions

In conclusion, Whittier Fertilizer, Co. cancer risk, non-cancer risk and the cancer burden health risk assessment were determined using Air Dispersion Modeling and Risk Tool (ADMRT), provided by the California Air Resources Board (CARB) under the HotSpots Analysis and Reporting Program Version 2 (HARP 2). HARP is a tool for preparing health risk assessment, which incorporates information from the 2015 Office of Environmental Health Hazard Assessment: Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, (OEHHA 2015) and SCAQMD AB2588 and Rule 1402 Supplemental Guideline for Preparing Risk Assessment for the Air Toxics “Hot Spots” Information and Assessment Act.

The cancer risk level was determined to be greater than 10 in one million south of the facility, where residential and off-site workers are located, public notification may be required based on the final evaluation of the district.

7.0 Hazard Identification

The sources of ammonia and diesel exhaust particulate (DEP) toxic air contaminants (TACs) generated from Whittier through the process of green waste composting and the manufacturing of fertilizers, using diesel engines to operate equipments such grinder and aggregate screening.

Chemical Name	CAS #	Physical Form
Ammonia	7664417	Gas
Diesel Exhaust Particulate	9901	Gas/Solid

These two substances were evaluated for cancer risk and non-cancer chronic/acute risk health impacts. The health impacts evaluation were determined by air dispersion modeling under the worker and residential scenarios presented in the district's guidelines. Both substances have a potential cancer risk and non-cancer risk via inhalation routes of exposure.

Following the 2017 Annual Emission Reporting (AER) year, the district determined the facility was subjected to an air toxic inventory report (ATIR), which resulted in a health risk assessment to be completed for toxic air contaminants. Table 8 below lists all the sources that generated TACs and the total amount of emissions generated during the 2017 reporting year. There were no records or occurrences of any unauthorized releases of TACs into the atmosphere during the reporting year.

Table 8. 2017 Total Emission by Sources

Source Name	Chemical Name	CAS #	Annual Emission (lbs/yr)	Max. Hourly Emissions (lbs/hr)
Compost Piles	Ammonia	7664417	822.36	6.35E-01
McCloskey	Diesel Exhaust Particulate	9901	514.66	7.31E-02
Rotochopper	Diesel Exhaust Particulate	9901	193.62	1.98E-02
Deutz Ag	Diesel Exhaust Particulate	9901	134.84	1.64E-03

8.0 Exposure Assessment

Facility Name: Whittier Fertilizer, Co.

Facility ID Number: 511

Facility Address: 9441 Kruse Road
Pico Rivera, CA 90660-1492

8.1. Facility Description

Whittier Fertilizer, Co. is a fertilizer manufacturing and green waste composting facility located under the Universal Transverse Mercator (UTM) Zone 11 at coordinates 401,393.3 meters East (X) and 3,764,804 meters North (Y) with an estimated 61 meters elevation above sea level. The facility operates 5 days a week, 8 hours per day, within a 17 acres property boundary. The facility plot plan (noted in Figure 1 in the Tables and Figures above) consists of three portable diesel-fueled internal combustion engines (ICEs) and three piles of green waste composting materials sources that contributes toxic air contaminants (TACs) and are evaluated within this health risk assessment. These sources are located center north within the facility boundary in an open area. There are two buildings located within the property that are used for office space, product packaging and product storage. The building dimensions can be found the Emission Inventory Module (EIM) file that is attached separately with this report.

There are currently no site/route dependent exposure pathways other than the default pathways assumed within ADMRT and are under the district's health risk assessment supplemental guideline.

8.2. Emission Inventory

The facility operates 8 hours per day, 5 days per week, and 52 weeks per year. The facility's sources emissions were determined and calculated based on operating records such as total annual hours usage and total annual tonnage of green waste material processed. Currently, there is a diesel particulate filter control installed on one of the source (Rotochopper) that has an 85% control efficiency. Table 9 below summarizes the facility's total emission by sources and their release substance. The emission calculations can be found in the Appendix.

Table 9. Emission Inventory Summary

EIM Stack ID	Source Name	UTM Coordinates (m)	Base Elevation (m)	Source Height (m)	Sources Dimensions (m)	Stack Exhaust Flow Rate (CFM)	Stack Gas Exit Temp. (K)	Chemical Releases	CAS #	Annual Emission (lbs/yr)	Max. Hourly Emission (lbs/hr)	Annual Emission (g/s)
1	Compost Pile	401,533.41 (X), 3,764,966.20 (Y)	61	4.57	27.43 (L) x 15.24 (W) x 4.57 (H)	N/A	N/A	Ammonia	7664417	822.36	6.35E-01	8.00E-02

8.3. Air Dispersion Modeling

The latest air dispersion modeling software used to perform the health risk assessment for the facility is HARP2 - ADMRT Version 19121 provided by CARB. Ground Level Concentrations (GLCs) were performed at the sources and beyond the facility's boundary using emissions inventory module (EIM) and AERMOD-ready meteorological data station from CARB. The meteorological data station or nearest station to the facility was Pico Rivera has a time period starting from 2010 through 2016 and a base elevation of 58 meters. The terrain assumed within the HARP2 – ADMRT software was UTM WGS84, Zone 11, and Datum 4. There was a total of nine AERMAP Digital Elevation Model (DEM) used in this air dispersion modeling evaluation.

The modeling options and parameters used to determine the health impacts for all receptors were assumed from SCAQMD health risk assessment supplemental guidelines. The facility total area is approximately 17 acres, with the maximum allowance receptor grid spacing of 50 meters. The property boundary receptor utilizes points determining the facility boundary with a 50 meters grid spacing resulting in 39 receptors. The Cartesian grid was set at two different spacing. At 300 meters grid spacing allow the visual determination of the 1 in one million zone of impact. At 10 meter spacing allow a more accurate determination of the cancer and non-cancer health risk. The Census receptors were obtained by importing from the HARP database based on year 2010. Lastly, the sensitive receptors were individually evaluated within the 1 in one million isopleths. Table 10 below summarizes the air dispersion model options. All HRA input and output files are included in this report.

Table 10. Air Dispersion Model Options

8.4 Concentrations for all Substances

The concentrations at the PMI, MEIR, and nearest sensitive receptor were evaluated and determined based on the residential 30-years cancer risk scenario, whereas the MEIW was evaluated based on the Worker 25-year cancer risk scenario. Table 11 below summarizes the annual concentration by substances.

Table 11. Annual Concentration by Substances

Substances Name	CAS #	PMI (ug/m ³)	MEIW (ug/m ³)	MEIR (ug/m ³)	Nearest Sensitive Receptor (ug/m ³)
Ammonia	7664417	2.35E+00	4.80E-01	2.24E-01	1.99E-02
Diesel Exhaust Particulate	9901	2.27E-01	1.74E-01	9.21E-02	1.17E-02

The Maximum 1-hour and period average concentrations by substances at the PMI, MEIW, and MEIR are listed below in Tables 12 and 13.

Table 12. Maximum 1-Hour Concentration by Substances

Substances Name	CAS #	PMI (ug/m ³)	MEIW (ug/m ³)	MEIR (ug/m ³)
Ammonia	7664417	1.13E+02	6.72E+01	3.07E+01
Diesel Exhaust Particulate	9901	1.20E+00	1.75E+00	6.89E-01

Table 13. Period Average Concentration by Substances

Substances Name	CAS #	PMI (ug/m ³)	MEIW (ug/m ³)	MEIR (ug/m ³)

Diesel Exhaust Particulate	9901	2.26E-01	1.72E-01	9.18E-02

9.0 Risk Characterization and Results

Table 14 below summarizes the risk, hazard index and cancer burden at the modeled PMI, MEIW, MEIR, and nearest sensitive receptor. The maximally exposure individual for residential, worker and sensitive receptors were evaluated within the 1, 10, 25, and 100 in one million zone of impact. Figure 3 in the above Tables and Figures section illustrates the zone of impact isopleths. All cancer and non-cancer risk scenarios exposure pathway is by inhalation and exposure of ammonia and/or diesel exhaust particulates TACs. There were no other site-specific or route exposure pathways determined for this health risk assessment. The cancer and non-cancer risk for the PMI, MEIW, and MEIR by sources are summarized in Table 15 below.

9.1. MEIR Cancer Risk Exposure Assessment

The maximally exposure individual resident (MEIR) 30-year exposure is located south of the facility's and is approximately 160 meters away from the sources across Kruse Road. The residential layout is a typical suburban neighborhood community. The district's default exposure pathways were used when evaluating the health risk impact. The exposure pathways were inhalation, soil ingestion, dermal ingestion, mother's milk, and homegrown produce with a deposition rate of 0.02 m/s. Within the dermal ingestion pathway option, the climate was default as "warm" as stated in the district's supplemental guideline. The intake rate percentile was set as "RMP using the Derived Method," which is default option stated in the district's supplemental guideline for this scenario. The targeted organ for residential exposure is the respiratory system through inhalation.

9.2 MEIW Cancer Risk Exposure Assessment

The maximally exposure individual worker (MEIW) 25-year exposure is located south of the facility just outside the property boundary approximately 65 meters away from the sources. The worker exposure is located within a commercial business. The exposure pathways used for this risk scenario were inhalation, soil ingestion, and dermal ingestion with a deposition rate of 0.02 m/s, intake rate percentile set as "OEHHA Derived Method," and the 8-hour breathing rate set as moderate intensity. The targeted organ for worker exposure is the respiratory system through inhalation.

9.3 Non-Cancer Risk Exposure Assessment

The residential non-cancer chronic hazard index (HIs) was determined using the same scenario as the residential cancer risk, but with the intake rate percentile set as "OEHHA Derived Method." The worker non-cancer chronic risk hazard index (HIs) was determined using the same scenario as the worker cancer risk mentioned in the above section 9.2. The non-cancer 8-hour chronic risk hazard index (HIs) was determined under the residential as the receptor type option. Additionally, the worker receptor type option was also evaluated and both scenarios resulted in no risks. The non-cancer acute risk hazard index (HIs) was determined under no specific receptor type with the pathway evaluated for inhalation. The targeted organ for all non-

cancer risk is the respiratory system through inhalation. The results are summarized in the following Table 14 below.

9.4. Population Exposure 70-year Cancer Burden

The air dispersion scenario for the 70-year population wide exposure scenario mimics the worker cancer risk scenario described in section 9.2, but with the exposure duration of 70-year. The census data was imported from HARP 2010 census database and the list of census receptors can be found in the Appendix. The population exposed to total cancer risk greater than 1 in one million was determined to be 176,342 with a cancer burden of 0.46. Majority of the population with the cancer risk greater than 1 in one million was located south of the facility. Figure 7 in the Tables and Figures section above illustrates the census data within the 1 in one million zone of impact.

9.5 Sensitive Receptors Risk Exposure Assessment.

Sensitive receptors were evaluated under the residential cancer risk scenario. A total of 57 sensitive receptors (hospitals, schools, and daycare centers) were within the 1 in one million zone of impact. The list of sensitive receptors can be found in Table 7 above. There were no sensitive receptors within the 10 in one million zone of impact. The nearest sensitive receptor is Durfee Elementary School, which is approximately 3,600 ft away from the sources. The exposure pathway for all sensitive receptors is inhalation, targeting the respiratory system. Table 14 below summarizes the cancer and non-cancer risk for the nearest sensitive receptor.

Table 14. Summary of Risk, Hazard Index, and Cancer Burden**Summary of Cancer Risk Exposure Assessment**

Maximum Risk Exposure	UTM Coordinates (m)	Grid Receptor ID Number	Cancer Risk	Source Name	Substances	Potential Multipathway	Target Organ(s)

10.0 Conclusions

The cancer risk for residential and workers were 69 and 11 in one million respectively. Since the result for each risk variable was greater than the 10 in one million threshold found in Table 3 of the district's supplemental guidelines, public notification is required for the residential and businesses located south of the facility. The non-cancer chronic, acute and 8-hour hazard indices were below the 1.0 HI. The cancer burden within the 1, 10 and 100 in one million zone of impact were 0.46, 0.1, and 0.00 respectively, which is below the 0.50 excess cancer case thresholds. However, risk reduction level is required for cancer risk greater than 25 in a million thresholds.

HEALTH RISK ASSESSMENT SUMMARY FORM

(Required in Executive Summary of HRA)

Facility Name : _____

Facility Address: _____

Type of Business: _____

SCAQMD ID No.: _____

A. Cancer Risk

(One in a million means one chance in a million of getting cancer from being constantly exposed to a certain level of a chemical over a period of time)

1. Inventory Reporting Year : _____

2. Maximum Cancer Risk to Receptors : *(Offsite and residence = 30-year exposure, worker = 25-year exposure)*

- a. Offsite _____ in a million Location: _____
- b. Residence _____ in a million Location: _____
- c. Worker _____ in a million Location: _____

3. Substances Accounting for 90% of Cancer Risk:

Processes Accounting for 90% of Cancer Risk: _____

4. Cancer Burden for a 70-yr exposure: *(Cancer Burden = [cancer risk] x [# of people exposed to specific cancer risk])*

- a. Cancer Burden _____
- b. Number of people exposed to >1 per million cancer risk for a 70-yr exposure _____
- c. Maximum distance to edge of 70-year, 1×10^{-6} cancer risk isopleth (meters) _____

B. Hazard Indices

[Long Term Effects (chronic) and Short Term Effects (acute)]

(non-carcinogenic impacts are estimated by comparing calculated concentration to identified Reference Exposure Levels, and expressing this comparison in terms of a "Hazard Index")

1. Maximum Chronic Hazard Indices:

- a. Residence HI: _____ Location: _____ toxicological endpoint: _____
- b. Worker HI : _____ Location: _____ toxicological endpoint: _____

2. Substances Accounting for 90% of Chronic Hazard Index: _____

3. Maximum 8-hour Chronic Hazard Index:

8-Hour Chronic HI: _____ Location: _____ toxicological endpoint: _____

4. Substances Accounting for 90% of 8-hour Chronic Hazard Index: _____

5. Maximum Acute Hazard Index:

PMI: _____ Location: _____ toxicological endpoint: _____

6. Substances Accounting for 90% of Acute Hazard Index: _____

C. Public Notification and Risk Reduction

1. Public Notification Required? _____ Yes _____ No

a. If 'Yes', estimated population exposed to risks > 10 in a million for a 30-year exposure, or an HI > 1

2. Risk Reduction Required? _____ Yes _____ No

Odor Impact Minimization Plan (OIMP)

WHITTIER FERTILIZER GREEN WASTE FACILITY

Odor Impact Minimization Plan

Draft California Integrated Waste Management Board (CIWMB) regulations Title 14, CCR proposed Section 17863.4 require that all compostable material handling operations and facilities prepare and maintain a site-specific Odor Impact Minimization Plan. The following plan has been adopted by Whittier Fertilizer Company for this purpose.

Project Name: Whittier Fertilizer Company Green Waste Facility

Phone Number: (562) 699-3461

Mailing Address: P.O. Box 596
Pico Rivera, Ca 90660

Landowner: Bob Osborn

Regulatory Contacts: County of Los Angeles
Department of Health Services
2525 Corporate Place – Suite 150
Monterey Park, Ca 91754

The following provides specific information on compliance with proposed regulation section 17863.4. Odor impact minimization plans shall provide guidance to on-site personnel by describing, at a minimum, the following items.

1. DESCRIPTION OF POSSIBLE ODOR RECEPTORS

The closest receptors will be facility staff and management who will be on-site daily monitoring the status of the facility. Each day the operator will evaluate on-site odors and evaluate planned operations for potential release of objectionable odors. These include good composting practices as described in the Report of Composting Site Information (appropriate C:N ratio, sufficient moisture content, regular turning, etc.) and other good housekeeping practices such as clearing spills between piles, eliminating areas where water could pond, and maintaining reasonable sized piles of finished compost.

The site is bordered on the south by industrial property adjacent and immediately beyond, across Kruse Road, about 500 feet from the site, there are homes.

To the east of the property is the city operated municipal golf course and the San Gabriel River.

To the north is the Whittier Narrows Dam and flood basin.

To the west is industrial property and a city park.

2. WIND CONDITIONS:

Prevailing wind is to the east/northeast and receptors are very minimal and well dispersed and odors of any nature are minimal as well. The challenge, however, is during early morning hours and/or days of Santa Ana wind conditions when winds move any odors toward our neighbors. The following policies and procedures have been adopted to minimize odors during these times when wind is moving toward the southwest.

1. Our misting system containing recommended chemicals to reduce odor will be active.
2. All movement of stockpiles or turning of compost windrows shall cease until wind direction becomes prevailing and favorable.
3. All blending and mixing of products using greenwaste compost shall also be delayed until appropriate.

3. UNUSUAL OR STRONG ODORS

Should any unusual or strong odors be detected by staff or management, or should staff be made aware from any source of an odor problem, they shall proceed immediately to find its source and mitigate the problem as soon as possible using the best procedures available.

4. PROCEDURES TO MITIGATE ODOR

1. All incoming material will be ground for the first time within 24 hours of arrival on site.
2. All material will be turned after reaching 122 degrees but before reaching 150 degrees.
3. All piles will be turned no less than weekly.
4. Amount of grass and other such wet material will be monitored and limited.
5. The misting system will be in operation during early morning hours and when the wind direction is from the northeast whenever possible.

WHITTIER FERTILIZER COMPANY

Dust Control Plan

POLICIES AND PROCEDURES IN PLACE

1. The yard and internal roadways are kept moist using a water truck.
2. Trucks accumulating material on tires are required to wash prior to exit.
3. All vehicles leaving the property must cross a steel grate to remove excess material from tires.
4. Screening, blending, grinding, loader mixing, and other such activities are terminated when wind conditions increase and could take dust from our property.
5. All stacking conveyors are fitted with sprinklers to moisten discharge materials and prevent flying dust.
6. All equipment is fitted with water misters at all points where material transfers from one conveyor to another.
7. Piles of product dry enough to create dust in windy conditions are kept moist with sprinklers or the water truck.
8. Delivery trucks leaving the property are tarped, or in the case of small loads below bed level, are watered down.
9. WFC drivers observe a self imposed 20 MPH speed limit on Kruse Road.
10. Piles of organic material shall be maintained at a height of less than 15 feet.

I have discussed Whittier Fertilizer's Odor Impact Minimization Plan with my supervisors on numerous occasions and understand it's intent and my roll in mitigating dust and odor at our business location.
