Based upon the above information, indirect impacts from habitat modifications that could affect sensitive or endangered species as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared

to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to generate habitat modifications that may affect sensitive or endangered species, but indirect cumulative impacts to sensitive or endangered species would be less than the proposed project.

### ***Adversely Affect Riparian/Sensitive Habitats***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts affecting riparian or sensitive habitats from the proposed project identified no primary facility categories that would significantly adversely affect riparian or sensitive habitats. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to riparian or sensitive habitats, it was concluded that the proposed project would create significant adverse indirect impacts affecting riparian or sensitive habitats. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to riparian or sensitive habitats.

Based upon the above information, indirect impacts from future land use projects that could adversely affect riparian or sensitive habitats as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to adversely affect riparian or sensitive habitats, but indirect cumulative impacts to riparian or sensitive habitats would be less than the proposed project.

### ***Adversely Affect Federally Protected Wetlands***

The survey of CEQA documents to evaluate the potential for impacts that could adversely affect federally protected wetlands from the proposed project identified no primary facility categories that would significantly adversely affect federally protected wetlands. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant impacts that could adversely affect federally protected wetlands, it was concluded that the proposed project would create significant indirect impacts that could adversely affect federally protected wetlands. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to federally protected wetlands.

Based upon the above information, indirect impacts from future land use projects that could adversely affect federally protected wetlands as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to adversely affect federally protected wetlands, but indirect cumulative impacts to federally protected wetlands would be less than the proposed project.

### ***Interfere with the Movement of Resident or Migratory Species***

The survey of CEQA documents to evaluate the potential for impacts from the proposed project identified one primary facility category, institutional facility projects, that would significantly interfere with the movement of resident or migratory species. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of land use projects interfering with the movement of resident or migratory species, it was concluded that the proposed project would create significant adverse indirect impacts as a result of future land use projects interfering with the movement of resident or migratory species. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to the movement of resident or migratory species.

Based upon the above information, indirect impacts from future land use projects that could interfere with the movement of resident or migratory species as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to interfere with the movement of resident or migratory species, but indirect cumulative impacts to resident or migratory species would be less than the proposed project.

#### ***Conflict with Policies/Ordinances Protecting Biological Resources***

The survey of CEQA documents to evaluate the potential for conflicts with policies or ordinances protecting biological resources from the proposed project identified one primary facility category, entertainment/recreational facility projects, that would significantly conflict with policies or ordinances protecting biological resources. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with policies or ordinances protecting biological resources impacts, it was concluded that the proposed project would create significant adverse indirect conflicts with policies or ordinances protecting biological resources. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to the policies or ordinances protecting biological resources.

Based upon the above information, indirect impacts from future land use projects that could conflict with policies or ordinances protecting biological resources as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further,

only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to conflict with policy ordinances protecting biological resources, but indirect cumulative biological resources impacts would be less than the proposed project.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from conflicts with habitat conservation plans. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to habitat conservation plans.

Based upon the above information, indirect impacts from conflicts with habitat conservation plans as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to conflict with habitat conservation plans, but indirect cumulative conflict impacts would be less than the proposed project.

## **Alternative E – Limited Offset Availability**

### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The analysis of potential adverse indirect impacts from habitat modifications that could affect sensitive or endangered species as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for impacts as a result of land use projects that could create habitat modifications that could affect sensitive or endangered species from the proposed project identified one primary facility category, transportation facility projects, that would create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species, it was concluded that the proposed project would create significant adverse indirect impacts on habitats that contain sensitive or endangered species. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to sensitive or endangered species.

Indirect impacts from habitat modifications that could affect sensitive or endangered species as a result of implementing Alternative E would be less than indirect impacts from habitat modifications that could affect sensitive or endangered species as result of implementing the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, potential indirect impacts from future facilities that could result in habitat modifications that could affect sensitive or endangered species as a result of implementing Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from habitat modifications that could affect sensitive or endangered species as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Adversely Affect Riparian/Sensitive Habitats***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts affecting riparian or sensitive habitats from the proposed project identified no primary

facility categories that would significantly adversely affect riparian or sensitive habitats. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to riparian or sensitive habitats, it was concluded that the proposed project would create significant adverse indirect impacts affecting riparian or sensitive habitats. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to riparian or sensitive habitats.

Indirect impacts to riparian or sensitive habitats from implementing Alternative E would be less than indirect impacts to riparian or sensitive habitats from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect impacts to riparian or sensitive habitats from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts to riparian or sensitive habitats from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

#### ***Adversely Affect Federally Protected Wetlands***

The survey of CEQA documents to evaluate the potential for impacts that could adversely affect federally protected wetlands from the proposed project identified no primary facility categories that would significantly adversely affect federally protected wetlands. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant impacts that could adversely affect federally protected wetlands, it was concluded that the proposed project would create significant indirect impacts that could adversely affect federally protected wetlands. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to federally protected wetlands.

Indirect impacts to federally protected wetlands from implementing Alternative E would be less than indirect impacts to federally protected wetlands from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets

compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect impacts to federally protected wetlands from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts to federally protected wetlands from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Interfere with the Movement of Resident or Migratory Species***

The survey of CEQA documents to evaluate the potential for impacts from the proposed project identified one primary facility category, institutional facility projects, that would significantly interfere with the movement of resident or migratory species. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of land use projects interfering with the movement of resident or migratory species, it was concluded that the proposed project would create significant adverse indirect impacts as a result of future land use projects interfering with the movement of resident or migratory species. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to the movement of resident or migratory species.

Indirect impacts from future projects that have the potential of interfering with the movement of resident or migratory species as a result of implementing Alternative E would be less than indirect movement or migration interference impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect movement or migration impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative from future projects that have the potential of interfering with the movement of resident or migratory species as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Policies/Ordinances Protecting Biological Resources***

The survey of CEQA documents to evaluate the potential for conflicts with policies or ordinances protecting biological resources from the proposed project identified one primary facility category, entertainment/recreational facility projects, which could significantly conflict with policies or ordinances protecting biological resources. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with policies or ordinances protecting biological resources impacts, it was concluded that the proposed project would create significant adverse indirect conflicts with policies or ordinances protecting biological resources. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to the policies or ordinances protecting biological resources.

Indirect impacts from future projects that have the potential to conflict with policies or ordinances protecting biological resources as a result of implementing Alternative E would be less than indirect policy or ordinance impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect policy or ordinance impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future projects that have the potential to conflict with policies or ordinances protecting biological resources as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from conflicts with habitat conservation plans. Because fewer facilities could be built

under Alternative E, Alternative E would generate similar but fewer impacts to habitat conservation plans.

Indirect impacts from future projects that have the potential to conflict with habitat conservation plans as a result of implementing Alternative E would be less than indirect habitat conservation plan impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect habitat conservation plan impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future projects that have the potential to conflict with habitat conservation plans as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Cultural Resources**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse cultural resources impacts. The rationale for this conclusion was as follows. There are existing laws in place that are designed to protect and mitigate potential impacts to cultural resources. Historical or archaeological resource databases are expected to be checked before a new facility is constructed. As discussed in the following subsections, SCAQMD staff has taken a more conservative approach and concluded that there may be situations where some types of projects could be located in areas that could adversely affect cultural resources. Cultural resources impacts could include the demolition of historical or paleontological structures or disturbing human remains.

The analysis in Subchapter 5.05 concludes that the proposed project has the potential to adversely affect cultural resources. Mitigation of cultural impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant cultural resource impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Adversely Affect Historical Resources***

The survey of the 52 CEQA documents shown in Table 5.5-1 revealed that retail/services facilities (documents #5, #6, and #8) and institutional facilities (documents #24 and #37) have the potential to create significant impacts that could adversely affect cultural resources. The CEQA documents for the remaining primary facility categories: agricultural facilities; large commercial facilities; entertainment facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts to historical resources. Based on the results of the CEQA document survey and the possibility that future individual projects in any of the primary facility categories could be sited in or near a location that could create significant adverse indirect impacts to historical resources, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental category.

### ***Adversely Affect Archaeological Resources***

The survey of the 52 CEQA documents shown in Table 5.5-1 revealed that no primary facility categories generated significant adverse indirect impacts that could adversely affect archaeological resources. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could significantly adversely affect archaeological resources as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Destroy Paleontological/Geologic Resources***

The survey of the 52 CEQA documents shown in Table 5.5-1 revealed that transportation facilities (document #39) have the potential to create significant adverse indirect impacts that could destroy paleontological/geological resources. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts that could destroy paleontological/geological resources. Based on the results of the CEQA document survey and the possibility that future individual projects in any of these facility categories could be sited in or near a location that could create significant adverse indirect impacts resulting in the destruction of paleontological/geological resources, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental category.

### ***Disturb Human Remains***

The survey of the 52 CEQA documents shown in Table 5.5-1 revealed that no primary facility categories generated significant adverse indirect impacts that could disturb human remains. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could significantly adversely disturb human remains as a result of being sited in or near locations where such remains could be found, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to cultural resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to cultural resources.

### **Alternative A - No Project Alternative**

#### ***Adversely Affect Historical Resources***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could adversely affect historical resources are considered to be significant. Starting May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could adversely affect historical resources when compared against the proposed project. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could adversely affect historical resources when compared against the proposed project. As a result, under the No Project Alternative potential indirect impacts

from future projects constructed and operated in the district that could adversely affect historical resources would not be expected to occur after May 1, 2012.

### ***Adversely Affect Archaeological Resources***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could adversely affect archaeological resources are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could adversely affect archaeological resources when compared against the proposed project. As a result, under the No Project Alternative potential indirect impacts from future projects constructed and operated in the district that could adversely affect archaeological resources would not be expected to occur after May 1, 2012.

### ***Destroy Paleontological/Geologic Resources***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to destroy paleontological or geologic resources are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. As a result, only new or

modified facilities that obtain credits on the open market for offset purposes would be able to obtain permits to construct and operate in the future. Projects that obtain credits on the open market are outside the scope of the analysis of the proposed project. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could destroy paleontological or geological resources when compared against the proposed project. As a result, under the No Project Alternative potential indirect impacts from future projects constructed and operated in the district that could destroy paleontological or geological resources would not be expected to occur after May 1, 2012.

### ***Disturb Human Remains***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could disturb human remains are considered to be significant. Starting May 1, 2012, future projects that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could disturb human remains when compared against the proposed project. As a result, under the No Project Alternative potential indirect impacts from future projects constructed and operated in the district that could disturb human remains would not be expected to occur after May 1, 2012.

## **Alternative B – Offset User Fees for Large Businesses**

### ***Adversely Affect Historical Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to historical resources from the proposed project identified the following primary facility categories that would significantly adversely affect historical resources: retail/services

facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to historical resources, it was concluded that the proposed project would create significant adverse indirect impacts on historical resources in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to historical resources compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects that could adversely affect historical resources. For example, a number of emission reduction projects could be located in or near areas that contain historical resources. Such projects include, but are not limited to, renewable energy projects such as wind turbines, solar collector panels, and biosolids energy production.

For the above reasons, it is concluded that the proposed project would create significant adverse indirect impacts to historical resources greater than the proposed project. The contribution to cumulative historical resources impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adversely Affect Archaeological Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to archaeological resources from the proposed project identified no primary facility categories that would significantly adversely affect archaeological resources. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to archaeological resources, it was concluded that the Alternative B would create significant adverse indirect impacts on archaeological resources in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to archaeological resources compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would result in the indirect effects of potential future emission reduction projects that could adversely affect archaeological resources. For example, a number of emission reduction projects could be located in or near areas that contain archaeological resources, resulting in adverse indirect impacts to such resources. Such projects include, but are not limited to wind turbines, solar collector panels, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on archaeological resources greater than the proposed project. The contribution to cumulative archaeological resources impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Destroy Paleontological/Geologic Resources***

The survey of CEQA documents to evaluate the potential for destruction of paleontological or geologic resources from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect or destroy paleontological or geologic resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of destroying paleontological or geologic resources, it was concluded that the proposed project would create significant adverse indirect impacts through destruction of paleontological or geologic resources in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to paleontological or geologic resources compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would also result in the indirect effects of potential future emission reduction projects in areas that contain paleontological or geological resources. For example, a number of emission reduction projects could be located in or near areas that contain paleontological or geological resources that could be destroyed during construction activities. Such projects include, but are not limited to: wind turbines, solar collector panels, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on paleontological or geological resources that are greater than the proposed project. The contribution to cumulative impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Disturb Human Remains***

The survey of CEQA documents to evaluate the potential for future projects to disturb human remains from the proposed project identified no primary facility categories that would significantly adversely affect human remains interred outside of formal

cemeteries. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to human remains, it was concluded that the proposed project would create significant adverse indirect impacts to human remains interred outside of formal cemeteries in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to disturb human remains compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would also result in the indirect effects of potential future emission reduction projects on habitats, resulting in adverse indirect impacts to sensitive or endangered species. For example, a number of emission reduction projects could be located in or near wildlife habitats, resulting in resulting adverse effects to sensitive or endangered species. Such projects include, but are not limited to: wind turbines, and solar collector panels.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on sensitive or endangered species through habitat modifications that are greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of future projects that have the potential to disturb human remains is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C- Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Adversely Affect Historical Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to historical resources from the proposed project identified the following primary facility categories that would significantly adversely affect historical resources: retail/services facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to historical resources, it was concluded that the proposed project would create significant adverse indirect impacts on historical resources in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer historical resources impacts compared to the proposed project.

Based upon the above information, indirect impacts that could result in destroying historical resources from implementing Alternative C are significant, but would be less compared to the proposed project because large businesses would no longer qualify for

the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to historical resources from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Adversely Affect Archaeological Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to archaeological resources from the proposed project identified no primary facility categories that would significantly adversely affect archaeological resources. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to archaeological resources, it was concluded that the proposed project would create significant adverse indirect impacts on archaeological resources in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer archaeological resources impacts compared to the proposed project.

Based upon the above information, indirect impacts that could result in destroying archaeological resources from implementing Alternative C are significant, but less significant compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to archaeological resources from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Destroy Paleontological/Geologic Resources***

The survey of CEQA documents to evaluate the potential for destruction of paleontological or geologic resources from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect or destroy paleontological or geologic resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of destroying paleontological or geologic resources, it was concluded that the proposed project would create significant adverse indirect impacts through destruction of paleontological or geologic resources in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar

or fewer impacts that could destroy paleontological or geologic resources compared to the proposed project.

Based upon the above information, indirect impacts that could result in destroying paleontological or geologic resources from implementing Alternative C are significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to paleontological or geologic resources from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Disturb Human Remains***

The survey of CEQA documents to evaluate the potential for future projects to disturb human remains from the proposed project identified no primary facility categories that would significantly adversely affect human remains interred outside of formal cemeteries. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to human remains, it was concluded that the proposed project would create significant adverse indirect impacts to human remains interred outside of formal cemeteries in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future facilities sited in locations that could disturb human remains compared to the proposed project.

Based upon the above information, indirect impacts would be significant as a result of siting future facilities in locations that could disturb human remains as a result of implementing Alternative C, but would be less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to from Alternative C from siting future facilities in locations that could disturb human remains would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

## **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

### ***Adversely Affect Historical Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to historical resources from the proposed project identified the following primary facility categories that would significantly adversely affect historical resources: retail/services facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to historical resources, it was concluded that the proposed project would create significant adverse indirect impacts on historical resources in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to historical resources.

Based upon the above information, indirect impacts to historical resources as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to adversely affect historical resources, but indirect cumulative historical resources impacts would be less than under the proposed project.

### ***Adversely Affect Archaeological Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to archaeological resources from the proposed project identified no primary facility categories that would significantly adversely affect archaeological resources. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to archaeological resources, it was concluded that the proposed project would create significant adverse indirect impacts on archaeological resources in the district. Because fewer facilities could be built under

Alternative D, Alternative D would generate similar but fewer impacts to adversely affect archaeological resources.

Based upon the above information, indirect impacts to archaeological resources as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to adversely affect archaeological resources, but indirect cumulative archaeological resources impacts would be less than under the proposed project.

### ***Destroy Paleontological/Geologic Resources***

The survey of CEQA documents to evaluate the potential for destruction of paleontological or geologic resources from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect or destroy paleontological or geologic resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of destroying paleontological or geologic resources, it was concluded that the proposed project would create significant adverse indirect impacts through destruction of paleontological or geologic resources in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to destroy paleontological/geologic resources.

Based upon the above information, indirect impacts from future land use projects that have the potential to destroy paleontological or geologic resources as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further,

only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to destroy paleontological or geologic resources, but indirect cumulative paleontological or geological resources impacts would be less than under the proposed project.

### ***Disturb Human Remains***

The survey of CEQA documents to evaluate the potential for future projects to disturb human remains from the proposed project identified no primary facility categories that would significantly adversely affect human remains interred outside of formal cemeteries. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to human remains, it was concluded that the proposed project would create significant adverse indirect impacts to human remains interred outside of formal cemeteries in the district.

Based upon the above information, indirect impacts from the potential for future land use projects to disturb human remains interred outside of formal cemeteries as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to disturb human remains, but indirect cumulative impacts to human remains would be less than under the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Adversely Affect Historical Resources***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts to historical resources from the proposed project identified the following primary facility

categories that would significantly adversely affect historical resources: retail/services facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to historical resources, it was concluded that the proposed project would create significant adverse indirect impacts on historical resources in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to adversely affect historical resources.

Indirect historical resources impacts from implementing Alternative E would be less than indirect historical resources impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect historical resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative historical resources impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Adversely Affect Archaeological Resources***

The analysis of potential adverse indirect impacts to archaeological resources as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for adverse indirect impacts to archaeological resources from the proposed project identified no primary facility categories that would significantly adversely affect archaeological resources. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to archaeological resources, it was concluded that the proposed project would create significant adverse indirect impacts on archaeological resources in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to adversely affect archaeological resources.

Indirect archaeological resources impacts from implementing Alternative E would be less than indirect archaeological resources impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by

the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect archaeological resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative archaeological resources impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Destroy Paleontological/Geologic Resources***

The survey of CEQA documents to evaluate the potential for destruction of paleontological or geologic resources from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect or destroy paleontological or geologic resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of destroying paleontological or geologic resources, it was concluded that the proposed project would create significant adverse indirect impacts through destruction of paleontological or geologic resources in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to destroy paleontological/geologic resources.

Indirect paleontological or geologic resources impacts from implementing Alternative E would be less than indirect paleontological or geologic resources impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect paleontological or geologic resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative paleontological or geologic resources impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Disturb Human Remains***

The survey of CEQA documents to evaluate the potential for future projects to disturb human remains from the proposed project identified no primary facility categories that would significantly adversely affect human remains interred outside of formal cemeteries. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to human remains, it was concluded that the proposed project would create significant adverse indirect impacts to human remains interred outside of formal cemeteries in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of disturbing human remains.

Indirect impacts to human remains interred outside of formal cemeteries in the district from implementing Alternative E would be less than indirect impacts to human remains interred outside of formal cemeteries in the district from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect impacts to human remains interred outside of formal cemeteries in the district from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts to human remains interred outside of formal cemeteries in the district from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Energy**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse energy impacts, primarily as a result of increased demand for energy resources from future facilities that obtain offsets from the SCAQMD's internal account. Energy impacts would generally consist of increased demand for energy resources as a result of constructing and operating future facilities that obtain offsets from the SCAQMD's internal accounts. The analysis in Subchapter 5.6 concludes that the proposed project has the potential to significantly adversely affect such resources. Mitigation of energy resources impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant energy resources impact, the potential exists

for future impacts to be significant and unavoidable (i.e., significant even after mitigation).

Because it is foreseeable at this time that at least one electric power generating facility (and possibly two others) will qualify as an eligible facility pursuant to AB 1318, impacts from this facility are considered to be reasonably foreseeable. Eligible facilities obtaining offsets pursuant to AB 1318 are not part of the proposed project, but could be considered a related project. Therefore, potential cumulative impacts from eligible facilities have been addressed in the cumulative impacts analysis in the subchapters in Chapter 5.

### ***Conflict with Adopted Conservation Plans***

The survey of the 52 CEQA documents shown in Table 5.6-1 revealed that no primary facility categories generated significant adverse indirect impacts that could conflict with adopted conservation plans. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could conflict with adopted conservation plans as a result of increased future energy demands from a variety of primary facility categories, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Create a Need for New Power or Utility Systems***

The survey of the 52 CEQA documents shown in Table 5.6-1 revealed that no primary facility categories generated significant adverse indirect impacts that could create a need for new power or utility systems. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could create a need for new power or utility systems as a result of increased future energy demands from a variety of facility categories, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Create a Significant Effect on Energy Supplies***

The survey of the 52 CEQA documents shown in Table 5.6-1 revealed that no primary facility categories generated significant adverse indirect impacts that could create a significant effect on energy supplies. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, the possibility that future individual projects in any of the nine facility

categories could generate other changes that could create a significant effect on energy supplies as a result of increased future energy demands from a variety of facility categories, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Comply with Existing Energy Standards***

The survey of the 52 CEQA documents shown in Table 5.6-1 revealed that no primary facility categories generated significant adverse indirect impacts that could violate energy standards in the future. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could cause a violation of energy standards in the future as a result of increased future energy demands from a variety of facility categories and, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to energy resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to energy resources.

### **Alternative A - No Project Alternative**

#### ***Conflict with Adopted Conservation Plans***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could conflict with adopted conservation plans are considered to be significant. Starting May 1, 2012, future facilities that would have had access to

the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1 would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could conflict with adopted energy conservation plans.

### ***Create a Need for New Power or Utility Systems***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would create a need for new power or utility systems. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could create a need for new power or utility systems are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1 would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could create a need for new power or utility systems.

### ***Create a Significant Effect on Energy Supplies***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed

and operated in the future in the district that would create significant effects on energy supplies. However, projects that could improve energy efficiency also could not occur. For example, as shown in Appendix H – Facilities Affected by Permit Moratorium, there were 1,178 permit applications for new or modified equipment on hold. Examples of permit applications for new or modified equipment that were on hold include: new boilers, burners, cogeneration units, engines, and air pollution control equipment (e.g., thermal oxidizers, spray booths) In particular, there were a number of pending permit applications that would replace existing flares with electricity or steam generating equipment that, reduce electricity demand from the electricity grid.

The No Project Alternative could also have an adverse effect on the production of renewable energy. In September 2009 Governor Schwarzenegger signed Executive Order S-21-09 which increases California’s Renewable Portfolio Standard to 33 percent by the year 2020. Generating electricity through the use of renewable fuels such as landfill gas is one means of displacing energy generation by fossil fuels, which helps reduce GHG emissions. For example, in addition to controlling landfill gas by combusting it in flares, it can also be controlled by combusting it in a gas turbine or internal combustion engine to generate renewable energy. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were pending permit applications for: five electrical generating engines at a landfill in Irvine; electrical generating engines at a landfill in Rolling Hills Estates; electrical generating engines at a landfill in West Covina; replacement of an old, inefficient boiler with a more efficient boiler to generate steam at a landfill in Fountain Valley; electrical generating engines at a landfill in Brea; and electrical generating engines at a landfill in Sylmar.

Therefore, under the No Project Alternative after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district and, as a result, significant indirect effects on energy supplies are not anticipated. However, beneficial electricity generating projects, such as renewable energy projects, would not be built. In the long term, it is expected that impacts to energy supplies from the No Project Alternative would be significant,

### ***Comply with Existing Energy Standards***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD’s internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's offset accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to violate energy standards are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could violate existing energy standards when compared to the proposed project.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could result in increasing violations of existing energy standards, especially equipment that has already been in operation for a number of years. Further, old, inefficient equipment could not be replaced by new and more efficient equipment, thus exacerbating potential violations of existing energy standards.

As time goes by it is expected that the probability of aging equipment violating existing energy standards could potentially increase. Consequently, under the No Project Alternative, potential impacts of aging combustion equipment violating existing energy standards are considered to be significant.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Conflict with Adopted Energy Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with adopted energy conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with adopted energy conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with adopted energy conservation plans, it was concluded that the proposed project would create significant adverse indirect conflicts with adopted energy conservation plans.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would also result in the indirect effects of potential future emission reduction projects on adopted conservation plans. For example, most emission reduction projects identified for

Alternative B promote renewable energy projects (e.g., wind turbines, and solar collector panels), increase energy efficiency (e.g., development of better energy storage capacity, and capturing energy losses during transmissions), or require replacing one type of fuel, e.g., diesel, with cleaner burning Alternative Fuels such as compressed natural gas, and electric motors. However, because future individual projects in the primary facility categories could have unique characteristics and/or include energy intensive equipment, the analysis in this PEA assumes Alternative B would create significant adverse indirect impacts as a result of potential conflicts with adopted conservation plans. The contribution to cumulative impacts is expected to be less than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects that may include renewable energy sources or energy efficiency measures.

### ***Create a Need for New Power or Utility Systems***

The survey of CEQA documents to evaluate projects that have the potential to create a need for new power or utility systems from the proposed project identified no primary facility categories that would create a need for new power or utility systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or create significant need in the future for new power or utility systems, it was concluded that the proposed project would create significant adverse indirect impacts in the district from new land use projects increasing the need for new power or utility systems.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create a need for new power or utility systems compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects relative to the need for new power or utility systems. For example, most emission reduction projects identified for Alternative B promote renewable energy projects (e.g., wind turbines, and solar collector panels), increase energy efficiency (e.g., development of better energy storage capacity, and capturing energy losses during transmissions), or require replacing one type of fuel, e.g., diesel, with cleaner burning Alternative Fuels such as compressed natural gas, and electric motors. However, because future individual projects in the primary facility categories could have unique characteristics and/or include energy intensive equipment, the analysis in this PEA assumes that Alternative B would create significant adverse indirect impacts as a result of creating a need for new power or utility systems. Cumulative impacts from future Alternative B projects that have the potential to increase the need for new power or utility systems is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future

effects of constructing and operating potential emission reduction projects that may include renewable energy sources or energy efficiency measures.

### ***Create a Significant Effect on Energy Supplies***

The survey of CEQA documents to evaluate the potential for significant effects on energy supplies from the proposed project identified no primary facility categories that would significantly adversely affect energy supplies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics that could create significant adverse effects on energy supplies, it was concluded that the proposed project would create significant adverse indirect effects on energy supplies.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create significant effects on energy supplies compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects, which have the potential to create beneficial effects on energy supplies. For example, most emission reduction projects identified for Alternative B promote renewable energy projects (e.g., wind turbines, and solar collector panels), increase energy efficiency (e.g., development of better energy storage capacity, capturing energy losses during transmissions), or require replacing one type of fuel, e.g., diesel, with cleaner burning Alternative Fuels such as compressed natural gas, and electric motors. Because future individual projects in the primary facility categories could have unique characteristics and/or include energy intensive equipment, the analysis in this PEA and assumes that Alternative B would create significant adverse indirect impacts in the future on energy supplies. The contribution to cumulative impacts from future Alternative B projects that have the potential to create significant effects on energy supplies is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects as well as the future effects of constructing and operating potential emission reduction projects that may include renewable energy sources or energy efficiency measures.

### ***Comply with Existing Energy Standards***

The survey of CEQA documents to evaluate the potential for impacts resulting from future land use projects violating existing energy standards as a result of implementing the proposed project identified no primary facility categories that would create significant adverse indirect impacts through violations of existing energy standards. However, because of the possibility that future individual projects in the primary facility

categories could have unique characteristics and/or be constructed in such a way that could exceed existing energy standards, it was concluded that the proposed project would create significant adverse indirect impacts on existing energy standards.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects on existing energy standards. For example, most emission reduction projects identified for Alternative B: promote renewable energy projects (e.g., wind turbines, solar collector panels), increase energy efficiency (e.g., development of better energy storage capacity, capturing energy losses during transmissions), or require replacing one type of fuel, e.g., diesel, with cleaner burning Alternative Fuels such as compressed natural gas, and electric motors. Because future individual projects in the primary facility categories could have unique characteristics and/or include energy intensive equipment, the analysis in this PEA assumes that Alternative B would create significant adverse indirect impacts as a result of potential conflicts with existing energy standards. The contribution to cumulative impacts from future Alternative B projects that have the potential to exceed existing energy standards are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects as well as the future effects of constructing and operating potential emission reduction projects that may include renewable energy sources or energy efficiency measures.

### **Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Conflict with Adopted Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with adopted energy conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with adopted energy conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with adopted energy conservation plans, it was concluded that the proposed project would create significant adverse indirect conflicts with adopted energy conservation plans in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future facilities that have the potential to conflict with adopted energy conservation plans compared to the proposed project.

Based upon the above information, potential indirect impacts from future facilities that have the potential to conflict with adopted energy conservation plans as a result of

implementing Alternative C would be significant, but less than the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to adopted energy conservation plans from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Create a Need for New Power or Utility Systems***

The survey of CEQA documents to evaluate projects that have the potential to create a need for new power or utility systems from the proposed project identified no primary facility categories that would create a need for new power or utility systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or create significant need in the future for new power or utility systems, it was concluded that the proposed project would create significant adverse indirect impacts in the district from new land use projects increasing the need for new power or utility systems. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or less demand for new power or utility systems compared to the proposed project.

Based upon the above information, potential impacts as a result of increased demand for new power or utility systems from implementing Alternative C would be significant, but less than the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to from Alternative C as a result of future projects that have the potential to increase the demand for new power or utility systems would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Create a Significant Effect on Energy Supplies***

The survey of CEQA documents to evaluate the potential for significant effects on energy supplies from the proposed project identified no primary facility categories that would significantly adversely affect energy supplies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics that could create significant adverse effects on energy supplies, it was concluded that the proposed project would create significant adverse indirect effects on energy supplies in the district. Because fewer facilities could be built under

Alternative C, Alternative C would generate similar or fewer energy supply impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to energy supplies. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential energy supply impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to energy supplies from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Comply with Existing Energy Standards***

The survey of CEQA documents to evaluate the potential for impacts resulting from future land use projects violating existing energy standards as a result of implementing the proposed project identified no primary facility categories that would create significant adverse indirect impacts through violations of existing energy standards. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be constructed in such a way that could exceed existing energy standards, it was concluded that the proposed project would create significant adverse indirect impacts on existing energy standards in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future facilities that have the potential to violate existing energy standards compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts in terms of compliance with existing energy standards. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential indirect impacts from future facilities that have the potential to violate existing energy standards as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future facilities that have the potential to violate existing energy standards as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying

for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

**Alternative D - Use of Credits Generated in 2009 and Beyond Only**

***Conflict with Adopted Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with adopted energy conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with adopted energy conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with adopted energy conservation plans, it was concluded that the proposed project would create significant adverse indirect conflicts with adopted energy conservation plans in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of conflicts with adopted conservation plans.

Based upon the above information, indirect impacts from conflicts with adopted energy conservation plans as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to conflict with adopted conservation plans, but indirect cumulative plan conflict impacts less than the proposed project.

***Create a Need for New Power or Utility Systems***

The analysis of potential indirect impacts from future land use projects that have the potential to create a need for new power or utility systems as a result of implementing Alternative D is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate projects that have the potential to create a need for new power or utility systems from the proposed project identified no primary facility categories that would create a need for new power or utility

systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or create significant need in the future for new power or utility systems, it was concluded that the proposed project would create significant adverse indirect impacts in the district from new land use projects increasing the need for new power or utility systems. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of creating a need for new power or utility systems.

Based upon the above information, indirect impacts from future land use projects that have the potential to create a need for new power or utility systems as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that have the potential to create the need for new power or utility systems, but indirect cumulative power or utility impacts would be less than the proposed project.

### ***Create a Significant Effect on Energy Supplies***

The survey of CEQA documents to evaluate the potential for significant effects on energy supplies from the proposed project identified no primary facility categories that would significantly adversely affect energy supplies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics that could create significant adverse effects on energy supplies, it was concluded that the proposed project would create significant adverse indirect effects on energy supplies in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of creating a significant effect on energy supplies

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to energy supplies. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect significant effects on energy supplies as a result of implementing Alternative D are considered to be significant, but less than the proposed project because

fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that have the potential to create significant effects on energy supplies, but indirect cumulative energy supply impacts would be less than the proposed project.

### ***Comply with Existing Energy Standards***

The survey of CEQA documents to evaluate the potential for impacts resulting from future land use projects violating existing energy standards as a result of implementing the proposed project identified no primary facility categories that would create significant adverse indirect impacts through violations of existing energy standards. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be constructed in such a way that could exceed existing energy standards, it was concluded that the proposed project would create significant adverse indirect impacts on existing energy standards in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of compliance with existing energy standards.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts in terms of compliance with existing energy standards. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future land use projects violating existing energy standards as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits

generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that do not comply with existing energy standards, but indirect cumulative energy standards impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Conflict with Adopted Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with adopted energy conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with adopted energy conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with adopted energy conservation plans, it was concluded that the proposed project would create significant adverse indirect conflicts with adopted energy conservation plans in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of conflicts with adopted conservation plans.

Indirect conflict impacts with adopted energy conservation plans in the district from implementing Alternative E would be less than indirect conflict impacts with adopted energy conservation plans in the district from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect conflict impacts with adopted energy conservation plans in the district from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative conflict impacts with adopted energy conservation plans in the district from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Create a Need for New Power or Utility Systems***

The survey of CEQA documents to evaluate projects that have the potential to create a need for new power or utility systems from the proposed project identified no primary facility categories that would create a need for new power or utility systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or create significant need in the future for new power or utility systems, it was concluded that the proposed project would create significant adverse indirect impacts in the district from new land use projects increasing the need for new power or utility systems. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of creating a need for new power or utility systems.

Indirect impacts from future facilities that have the potential to create a need for new power or utility systems as a result of implementing Alternative E would be less than indirect power or utility system impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect power or utility system impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to create a need for new power or utility systems as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Create a Significant Effect on Energy Supplies***

The survey of CEQA documents to evaluate the potential for significant effects on energy supplies from the proposed project identified no primary facility categories that would significantly adversely affect energy supplies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics that could create significant adverse effects on energy supplies, it was concluded that the proposed project would create significant adverse indirect effects on energy supplies in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of creating significant effects on energy supplies.

Indirect impacts from future facilities that have the potential to create significant effects on energy supplies as a result of implementing Alternative E would be less than indirect

energy supply impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to energy supplies. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect energy supply impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to create significant effects on energy supplies as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Comply with Existing Energy Standards***

The survey of CEQA documents to evaluate the potential for impacts resulting from future land use projects violating existing energy standards as a result of implementing the proposed project identified no primary facility categories that would create significant adverse indirect impacts through violations of existing energy standards. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be constructed in such a way that could exceed existing energy standards, it was concluded that the proposed project would create significant adverse indirect impacts on existing energy standards in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of complying with existing energy standards.

Indirect impacts from future facilities that have the potential to violate energy standards as a result of implementing Alternative E would be less than indirect energy standard impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts in terms of compliance with existing energy standards. Therefore, environmental impacts may not

be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect energy standard impacts from Alternative E would be significant, but less than compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to violate energy standards as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Geology and Soils**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that the proposed project has the potential to generate significant adverse geology and soils impacts for the following reasons. Individual projects could occur along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual projects could be located in areas subject to liquefaction and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features.

The analysis in subchapter 5-7 concludes that the proposed project has the potential to significantly adversely affect such resources. Mitigation of geology and soils impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant environmental impact, the potential exists for future indirect geology and soils impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The survey of the 52 CEQA documents shown in Table 5.7-1 revealed that entertainment/recreational facilities (document #23) and transportation facilities (document #39) have the potential to create significant adverse indirect impacts that could expose people to risks from earthquakes, liquefaction, or landslides. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts that could expose people to risks from

earthquakes, liquefaction, or landslides. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could expose people to significant risks from earthquakes, liquefaction, or landslides, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

#### ***Result in Substantial Soil Erosion***

The survey of the 52 CEQA documents shown in Table 5.7-1 revealed that no primary facility categories generated significant adverse indirect impacts that could create substantial soil erosion. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Future individual projects in any of the nine facility categories could generate other changes that could create substantial soil erosion in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal accounts and, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Locate Project on Unstable Soil***

The survey of the 52 CEQA documents shown in Table 5.7-1 revealed that transportation facilities (document #39) have the potential to create significant adverse indirect impacts that could expose people to risks from earthquakes, liquefaction, or landslides. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from locating projects on unstable soils, resulting in landslides or liquefaction. Based on the results of the CEQA document survey and the possibility that future individual projects in any of these facility categories could be sited in or near a location that consists of unstable soils, resulting in landslides or liquefaction, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

#### ***Locate Project on Expansive Soil***

The survey of the 52 CEQA documents shown in Table 5.7-1 revealed that no primary facility categories generated significant adverse indirect impacts that could result in future facilities being located on expansive soil. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could result in facilities being located on

expansive soil in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

***Project Incapable of Supporting Use of Septic Tanks/Alternative Wastewater Systems***

The survey of the 52 CEQA documents shown in Table 5.7-1 revealed that no primary facility categories generated significant adverse indirect impacts from facilities that have the potential to use septic tanks in areas incapable of supporting their use or use alternative wastewater systems. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could result in the use of septic tanks in areas incapable of supporting their use or the use of alternative wastewater systems from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

***Cumulative Impacts***

Project impacts to geology and soils could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to geology and soils.

**Alternative A - No Project Alternative**

***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that have the potential to expose people to risks from earthquakes, liquefaction or landslides are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no future projects that have the potential to expose people to risks from earthquakes, liquefaction or landslides when compared against the proposed project, so under the No Project Alternative potential future impacts from projects that have the potential to expose people to risks from earthquakes, liquefaction or landslides would not be significant when compared to the proposed project.

### ***Result in Substantial Soil Erosion***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that have the potential to result in substantial soil erosion are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no future projects that have the potential to result in substantial soil erosion when compared against the proposed project, so under the No Project Alternative potential future impacts from future projects that have the potential to result in substantial soil erosion would not be significant when compared to the proposed project.

### ***Locate Project on Unstable Soil***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state

legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could be located on unstable soils are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would be located on unstable soil compared to the proposed project. Overall, under the No Project Alternative potential future indirect impacts from locating projects on unstable soils could occur, would be significant, but would be less than the significance determination for the proposed project.

### ***Locate Project on Expansive Soil***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to be located on expansive soils are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no future facilities that have the potential to be located on expansive soils when compared against the proposed project, so under the No Project Alternative potential future impacts from future facilities that have the potential to be located on expansive soils would not be significant when compared to the proposed project.

***Project Incapable of Supporting Use of Septic Tanks/Alternative Waste Water Systems***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities incapable of supporting the use of septic tanks or alternative waste water systems are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no future facilities incapable of supporting the use of septic tanks or alternative waste water systems when compared against the proposed project, so under the No Project Alternative potential future impacts from future facilities incapable of supporting the use of septic tanks or alternative waste water systems would not be significant when compared to the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that are incapable of supporting the use of septic tanks or alternative waste water systems are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. . Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would be located in areas unable to support the use of septic tanks or alternative wastewater systems compared to the proposed project. Overall, under the No Project Alternative potential future indirect impacts from locating projects in areas unable to support the use of septic tanks or alternative wastewater systems would be significant, but would be less than the significance determination for the proposed project.

## **Alternative B – Offset User Fees for Large Businesses**

### ***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The survey of CEQA documents to evaluate the potential for risk impacts from exposing people to earthquakes, liquefaction, or landslides the proposed project identified the following primary facility category that would create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides: entertainment/recreational facilities, and transportation facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides, it was concluded that the proposed project would create significant adverse indirect impacts in the district from future land use projects that could expose people to earthquakes, liquefaction, or landslides.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to expose people to risks from earthquakes, etc., compared to the proposed project. In addition, a number of emission reduction projects could be located in or near areas that could expose people to risks from earthquakes, liquefaction, or landslides. Such projects include, but are not limited to anaerobic digesters, liquefied natural gas fueling stations.

As a result, indirect future risks from Alternative B from exposing people to earthquakes, liquefaction, or landslides are considered to be equivalent to or greater than the proposed project. The contribution to cumulative impacts from future Alternative B projects that have the potential to expose people to risks from earthquakes, liquefaction, or landslides is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Result in Substantial Soil Erosion***

The survey of CEQA documents to evaluate the potential for impacts from future land use projects that could result in substantial soil erosion from the proposed project identified no primary facility categories that would significantly adversely affect soil erosion from future land use projects. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse soil erosion impacts, it was concluded that the proposed project would create significant adverse indirect soil erosion impacts.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect soil erosion impacts compared to the proposed project. In addition, a number of future emission reduction projects could require substantial site modifications that have the potential to generate indirect soil erosion impacts. In addition, emission reduction projects could have such impacts. Such projects include, but are not limited to anaerobic digesters, and liquefied natural gas fueling stations.

As a result, indirect future soil erosion impacts from implementing Alternative B are considered to be equivalent to or greater than the proposed project. The contribution to cumulative soil erosion impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Locate Project on Unstable Soil***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts from locating future land use projects on unstable soils from the proposed project identified one primary facility category, transportation facilities, that would create significant adverse indirect impacts from locating projects on unstable soils. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from locating future land use projects on unstable soils, it was concluded that the proposed project would create significant adverse indirect impacts as a result of building land use in the district on unstable soils.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to be located on unstable soils compared to the proposed project.

As a result, indirect future impacts from Alternative B from locating projects on unstable soils are considered to be equivalent to or greater than the proposed project. The contribution to cumulative unstable soil impacts from Alternative B are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Locate Project on Expansive Soil***

The survey of CEQA documents to evaluate the potential impacts from future projects located on expansive soil from the proposed project identified no primary facility categories that would be located on expansive soil. However, because of the possibility

that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects located on expansive soil, it was concluded that the proposed project would create significant adverse indirect impacts from future projects located on expansive soil in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to be located on expansive soils compared to the proposed project. Such projects include, but are not limited to: anaerobic digesters and liquefied natural gas fueling stations.

As a result, indirect future impacts from Alternative B from locating projects on expansive soils are considered to be equivalent to or greater than the proposed project. The contribution to cumulative expansive soil impacts from Alternative B are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Project Incapable of Supporting Use of Septic Tanks/Alternative Waste Water Systems***

The survey of CEQA documents to evaluate the potential impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems from the proposed project identified no primary facility categories that would be incapable of supporting the use of septic tanks or alternative waste water systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems, it was concluded that Alternative B would create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to be located in areas incapable of supporting alternative wastewater systems compared to the proposed project. For example, a number of emission reduction projects could be located in or near areas that could expose people to risks from earthquakes, liquefaction, or landslides. Such projects include, but are not limited to anaerobic digesters and liquefied natural gas fueling stations.

As a result, indirect future impacts from Alternative B from locating projects in areas incapable of supporting the use of septic tanks or alternative waste water disposal systems are considered to be equivalent to or greater than the proposed project. The

contribution to cumulative impacts from future Alternative B projects incapable of supporting the use of septic tanks or alternative wastewater disposal systems are expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

**Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The survey of CEQA documents to evaluate the potential for risk impacts from exposing people to earthquakes, liquefaction, or landslides the proposed project identified the following primary facility categories that would create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides: entertainment/recreational facilities, and transportation facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides, it was concluded that the proposed project would create significant adverse indirect impacts in the district from future land use projects that could expose people to earthquakes, liquefaction, or landslides. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of future affected facilities exposing people to risks from earthquakes, liquefaction, or landslides compared to the proposed project.

Based upon the above information, potentially significant impacts as a result of future affected facilities exposing people to risks from earthquakes, liquefaction, or landslides from implementing Alternative C would be significant, but less than the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of future affected facilities exposing people to risks from earthquakes, liquefaction, or landslides from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Result in Substantial Soil Erosion***

The survey of CEQA documents to evaluate the potential for impacts from future land use projects that could result in substantial soil erosion from the proposed project identified no primary facility categories that would significantly adversely affect soil erosion from future land use projects. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse soil erosion impacts, it was concluded that Alternative C would create significant adverse indirect soil erosion impacts in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer soil erosion impacts compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential soil erosion impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect soil erosion impacts from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Locate Project on Unstable Soil***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts from locating future land use projects on unstable soils from the proposed project identified one primary facility category, transportation facilities, that would create significant adverse indirect impacts from locating projects on unstable soils. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from locating future land use projects on unstable soils, it was concluded that the proposed project would create significant adverse indirect impacts as a result of building land use in the district on unstable soils. Because fewer facilities could be built under Alternative C, Alternative C would result in the same or fewer number of projects located on unstable soils compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential impacts from locating future affected facilities on unstable soils as a result of implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from implementing Alternative C as a result of locating them on unstable soils would be

significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Locate Project on Expansive Soil***

The survey of CEQA documents to evaluate the potential impacts from future projects located on expansive soil from the proposed project identified no primary facility categories that would be located on expansive soil. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects located on expansive soil, it was concluded that the proposed project would create significant adverse indirect impacts from future projects located on expansive soils in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts resulting from the construction of future affected facilities on expansive soils compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential impacts resulting from the construction of future affected facilities on expansive soils as a result of implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts of locating future affected facilities on expansive soils from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Project Incapable of Supporting Use of Septic Tanks/Alternative Waste Water Systems***

The survey of CEQA documents to evaluate the potential impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems from the proposed project identified no primary facility categories that would be incapable of supporting the use of septic tanks or alternative waste water systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems, it was concluded that the proposed project would create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems in the district.

Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of constructing future affected facilities in areas incapable of supporting the use of septic tanks or alternative wastewater disposal systems compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential impacts as a result of constructing future affected facilities in areas incapable of supporting the use of septic tanks or alternative wastewater disposal systems from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to from Alternative C as a result of constructing future affected facilities in areas incapable of supporting the use of septic tanks or alternative wastewater disposal systems would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

##### ***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The survey of CEQA documents to evaluate the potential for risk impacts from exposing people to earthquakes, liquefaction, or landslides the proposed project identified the following primary facility category that would create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides: entertainment/recreational facilities, and transportation facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides, it was concluded that the proposed project would create significant adverse indirect impacts in the district from future land use projects that could expose people to earthquakes, liquefaction, or landslides. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exposing people to risks from earthquakes, liquefaction, or landslides.

Based upon the above information, indirect impacts from exposing people to earthquakes, liquefaction, or landslides as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets is expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts

from Alternative D are expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from projects that have the potential to expose people to risks from earthquakes, liquefaction, or landslides, but indirect cumulative exposure impacts would be less than the proposed project.

### ***Result in Substantial Soil Erosion***

The survey of CEQA documents to evaluate the potential for impacts from future land use projects that could result in substantial soil erosion from the proposed project identified no primary facility categories that would significantly adversely affect soil erosion from future land use projects. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse soil erosion impacts, it was concluded that the proposed project would create significant adverse indirect soil erosion impacts. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of soil erosion.

Based upon the above information, indirect impacts from construction future land use projects that could result in substantial soil erosion during site preparation as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative soil erosion impacts, but indirect cumulative soil erosion impacts would be less than the proposed project.

### ***Locate Project on Unstable Soil***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts from locating future land use projects on unstable soils from the proposed project identified one primary facility category, transportation facilities, that would create significant adverse indirect impacts from locating projects on unstable soils. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from locating future land use projects on unstable soils, it was concluded that the proposed project would create significant adverse indirect impacts as a result of building land use in the district on unstable soils. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of locating projects on unstable soil.

Based upon the above information, indirect impacts from locating future land use projects on unstable soils as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from locating future projects on unstable soils, but indirect cumulative unstable soils impacts would be less than the proposed project.

### ***Locate Project on Expansive Soil***

The survey of CEQA documents to evaluate the potential impacts from future projects located on expansive soil from the proposed project identified no primary facility categories that would be located on expansive soil. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects located on expansive soil, it was concluded that the proposed project would create significant adverse indirect impacts from future projects located on expansive soil. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of locating projects on expansive soil.

Based upon the above information, indirect impacts from future projects located on expansive soil as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts as a result of locating future projects on expansive soils, but indirect cumulative expansive soil impacts would be less than the proposed project.

***Project Incapable of Supporting Use of Septic Tanks/Alternative Waste Water Systems***

The survey of CEQA documents to evaluate the potential impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems from the proposed project identified no primary facility categories that would be incapable of supporting the use of septic tanks or alternative waste water systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems, it was concluded that the proposed project would create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of septic tanks and alternative wastewater systems.

Based upon the above information, indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further,

only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts as a result of locating future projects in areas incapable of supporting septic tanks or alternative waste water disposal systems, but indirect cumulative wastewater disposal impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Expose People to Risks from Earthquakes, Liquefaction or Landslides***

The survey of CEQA documents to evaluate the potential for risk impacts from exposing people to earthquakes, liquefaction, or landslides the proposed project identified the following primary facility category that would create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides: entertainment/recreational facilities, and transportation facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to earthquakes, liquefaction, or landslides, it was concluded that the proposed project would create significant adverse indirect impacts in the district from future land use projects that could expose people to earthquakes, liquefaction, or landslides. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exposure to risks from earthquakes, liquefaction or landslides.

Indirect impacts from future facilities that have the potential to expose people to risks from earthquakes, liquefaction or landslides as a result of implementing Alternative E would be less than indirect earthquake, liquefaction, or landslide impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect earthquake, liquefaction, or landslide impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative future facilities that have the potential to expose people to risks from earthquakes, liquefaction or landslides as a result of impacts from implementing Alternative E would be significant, but less than the

proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Result in Substantial Soil Erosion***

The survey of CEQA documents to evaluate the potential for impacts from future land use projects that could result in substantial soil erosion from the proposed project identified no primary facility categories that would significantly adversely affect soil erosion from future land use projects. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse soil erosion impacts, it was concluded that the proposed project would create significant adverse indirect soil erosion impacts. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of results in substantial soil erosion.

Indirect soil erosion impacts from implementing Alternative E would be less than indirect soil erosion impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect soil erosion impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative soil erosion impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Locate Project on Unstable Soil***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts from locating future land use projects on unstable soils from the proposed project identified one primary facility category, transportation facilities, that would create significant adverse indirect impacts from locating projects on unstable soils. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from locating future land use projects on unstable soils, it was concluded that the proposed project would create significant adverse indirect impacts as a result of building affected facilities in the district on

unstable soils. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of locating projects on unstable soil.

Indirect soil impacts from locating future facilities on unstable soils as a result of implementing Alternative E would be less than indirect unstable soil impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect unstable soil impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from locating future facilities on unstable soils as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Locate Project on Expansive Soil***

The survey of CEQA documents to evaluate the potential impacts from future projects located on expansive soil from the proposed project identified no primary facility categories that would be located on expansive soil. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects located on expansive soil, it was concluded that the proposed project would create significant adverse indirect impacts from future projects located on expansive soil. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of locating projects on expansive soil.

Indirect impacts from locating future facilities on expansive soils as a result of implementing Alternative E would be less than indirect expansive soils impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect expansive soils impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from locating future facilities on expansive soils

as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Project Incapable of Supporting Use of Septic Tanks/Alternative Wastewater Systems***

The survey of CEQA documents to evaluate the potential impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems from the proposed project identified no primary facility categories that would be incapable of supporting the use of septic tanks or alternative waste water systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems, it was concluded that the proposed project would create significant adverse indirect impacts from future projects incapable of supporting the use of septic tanks or alternative waste water systems. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of septic tanks and alternative wastewater systems.

Indirect impacts from future facilities that have the potential to be located in areas incapable of supporting alternative wastewater systems as a result of implementing Alternative E would be less than indirect alternative wastewater system impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect alternative wastewater systems impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to be located in areas incapable of supporting alternative wastewater systems as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Hazards and Hazardous Materials**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse hazards and hazardous materials impacts for the following

reasons. Impacts could result from exposure of persons or the environment to hazardous materials through activities that could include, but not be limited to, excavation of underground materials; accidental release of hazardous materials during transport, use, or storage; or leaking tanks.

Subchapter 5.8 concluded that the proposed project has the potential to create significant adverse impacts. Mitigation of hazards and hazardous materials impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant hazard and hazardous materials impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that utility facilities (document #43) have the potential to create significant adverse indirect impacts from transport, use, or disposal of hazardous materials. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from transport, use, or disposal of hazardous materials. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could transport, use, or dispose of hazardous materials, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Create a Hazard through Upset/Accident Conditions***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that utility facilities (document #43) have the potential to create significant adverse hazard impacts through upset or accident conditions. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse hazard impacts through upset or accident conditions. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could create hazard impacts through upset or accident conditions, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no facilities in any of the primary facility categories generated significant adverse indirect impacts that have the potential to emit hazardous emissions or material within one-quarter mile of a nearby school. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes resulting in future facilities that have the potential to emit hazardous emissions or material within one-quarter mile of a nearby school, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

***Located on a Hazardous Material Site (Government Code §65962.5)***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories generated significant adverse indirect impacts from facilities locating on a hazardous material site. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes that could result in facilities locating on hazardous material, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

***Located within Airport Land Use Plan or within Two Miles of an Airport***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories generated significant adverse hazard impacts from facilities that locate within an airport land use plan or within two miles of an airport. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes that could result in future facilities that obtain offsets from the SCAQMD's internal account locating within an airport land use plan or within two miles of an airport, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

***Located within the Vicinity of a Private Airstrip***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories generated significant adverse hazard impacts from facilities that locate

within the vicinity of a private airstrip. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes that could result in hazard impacts from facilities obtaining offsets from the SCAQMD's internal account and locating within the vicinity of a private airstrip and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Interfere with Adopted Emergency Response Plans***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories had the potential to interfere with adopted emergency response plans. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes resulting in siting future facilities in locations that could interfere with adopted emergency response plans, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Expose People to Risk from Wildland Fires***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories exposed people to risks from wildland fires. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes that could result in exposing people to risks from wildland fires from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Increase Fire Hazards from Flammable Materials***

The survey of the 52 CEQA documents shown in Table 5.8-1 revealed that no primary facility categories increased fire hazards from flammable materials. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could generate other changes that could result in an increase in fire hazards from flammable materials from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project

has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts with respect to hazards and hazardous materials could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts with respect to hazards and hazardous materials.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 is in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts.

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes that no facilities that previously obtained credits pursuant to Rules 1304 or 1309.1 would be built.

The inability to approve permits for future facilities that previously would have accessed the SCAQMD's internal accounts would result in existing facilities' inability to replace existing equipment beyond its useful lifetime or install new equipment to further accommodate population growth. Similarly, new facilities could not be constructed.

### ***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to increase hazards through transport, use or disposal of hazardous materials are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could increase have the potential to increase hazards through transport, use or disposal of hazardous materials when compared to the proposed project.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could cause accidental releases of hazardous materials, especially equipment that has already been in operation for a number of years. For example, most of the existing refineries in the district have equipment that has been operating for decades and, as such, may experience accidental releases of petroleum products or hazardous materials from aging storage tanks, process equipment, etc. Similarly, chemical manufacturing facilities may experience accidental releases of hazardous materials from old operating equipment where valves, and flanges, experience leaks from corrosion, rust, or other destructive influences. Such hazardous materials would need to be contained and transported from the release site to an appropriate disposal or handling facility.

In addition to the increased potential for accidental releases of hazardous materials from aging equipment that cannot be replaced or modified, the No Project Alternative also has the potential to delay or otherwise impede remediation efforts at contaminated sites. As can be seen in Appendix H, under the permit moratorium that temporarily ended as of January 1, 2010, there were a number of pending permit applications for equipment such as thermal oxidizers or vapor extraction that would be used to remediate soils contaminated with gasoline or other petroleum products. Similarly, there was a number of pending permit applications for equipment such as thermal or catalytic oxidizers or vapor extraction that would be used to clean up contaminated groundwater. Without approval of pending or future permits used to remediate contaminated soil or groundwater, remediation efforts could be substantially delayed until such time as currently permitted equipment is available for future remediation projects.

As time goes by it is expected that increase hazards through transport, use or disposal of hazardous materials could potentially increase. Consequently, under the No Project Alternative, new indirect fire hazards resulting from aging combustion equipment are considered to be significant and greater than the impacts of the proposed project.

### ***Create a Hazard through Upset/Accident Conditions***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to create a hazard through upset or accident conditions are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could create new indirect hazards through upset or accident conditions when compared to the proposed project.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could create hazards through upset or accident conditions from the release of hazardous materials, especially equipment that has already been in operation for a number of years. For example, most of the existing refineries in the district have equipment that has been operating for decades and, as such, may experience accidental releases of hazardous materials from aging storage tanks, process equipment, etc. Similarly, chemical manufacturing facilities may experience accidental releases of hazardous materials from old operating equipment where valves, flanges, etc., experience leaks from corrosion, rust, or other influences.

Another potential indirect hazard impact is associated with installation of backup flares, which require permits from the SCAQMD. Under certain circumstances, flares are considered safety equipment. For example, in the event of dangerous increases in pressure in some refinery operations, excess gases and vapors may be vented to an emergency backup flare to prevent explosions. Similarly, flares used at essential public services, including landfills and sewage treatment facilities, can also be used in an emergency backup capacity to prevent explosions if other types of equipment, e.g., gas turbines, internal combustion engines, boilers, etc., are used as the primary control

equipment. As indicated in Appendix H there were permit applications for backup flares, two at landfills and two at sewage treatment facilities.

As time goes by it is expected that the probability of accidental releases of hazardous materials could potentially increase. Consequently, under the No Project Alternative, new indirect hazards from accident or upset conditions resulting from aging combustion equipment are considered to be significant and greater than the impacts of the proposed project.

***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to emit hazardous emissions or material within one-quarter mile of a nearby school are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could create new indirect hazardous emissions or material impacts within one-quarter mile of a nearby school when compared to the proposed project.

After May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could cause accidental releases of hazardous materials within one-quarter mile of a school, especially equipment that has already been in operation for a number of years. For example, some industrial facilities in the district have equipment that has been operating for decades and, as such, may experience accidental releases of chemical products of other hazardous materials from aging storage tanks, process equipment, etc. For example, chemical manufacturing facilities may experience accidental releases of hazardous materials from old operating equipment where valves, flanges, etc.,

experience leaks from corrosion, rust, or other influences. It is possible that some of these types of facilities could be located within one-quarter mile of a nearby school.

As time goes by it is expected that the probability of accidental releases of hazardous materials from existing sources located within one-quarter mile of school could potentially increase. Consequently, under the No Project Alternative, new indirect hazardous emissions or material impacts within one-quarter mile of a nearby school are considered to be significant.

#### ***Located on a Hazardous Material Site (Government Code §65962.5)***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to be located on a hazardous materials site are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would be located on a hazardous material site when compared against the proposed project. As a result, under the No Project Alternative potential impacts from future projects constructed and operated in the district as a result of being located on a hazardous material site would not be expected to occur after May 1, 2012, would not be significant, and would be less than the significance determination for the proposed project.

#### ***Located within an Airport Land Use Plan or within Two Miles of an Airport***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It

should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to be located within an airport land use plan or within two miles of an airport are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would be located within an airport land use plan or within two miles of an airport when compared against the proposed project. As a result, under the No Project Alternative potential impacts from future projects constructed and operated in the district as a result of being located within an airport land use plan or within two miles of an airport would not be expected to occur after May 1, 2012, would not be significant, and would be less than the significance determination for the proposed project.

#### ***Located within the Vicinity of a Private Airstrip***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that are located within the vicinity of a private airstrip are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would be located within the vicinity of a private airstrip when compared against the proposed project. As a result, under the No Project Alternative potential impacts from future projects constructed and operated in the district as a result of being located within the vicinity of a private airstrip

would not be expected to occur after May 1, 2012, would not be significant, and would be less than the significance determination for the proposed project.

### ***Interfere with Adopted Emergency Plans***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that have the potential to interfere with adopted emergency response plans are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no facilities that have the potential to interfere with adopted emergency response plans when compared against the proposed project, so under the No Project Alternative potential future impacts from facilities that have the potential to interfere with adopted emergency response plans would not be significant when compared to the proposed project.

### ***Expose People to Risk from Wildland Fires***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to expose people to risk from wildland fires are considered to be significant. Starting May 1, 2012, future facilities that would have

had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district in areas that could expose people to risks from wildland fires when compared against the proposed project. As a result, under the No Project Alternative potential impacts from future projects constructed and operated in areas of the district that could expose people to risks from wildland fires would not be expected to occur after May 1, 2012, would not be significant, and would be less than the significance determination for the proposed project.

### ***Increase Fire Hazards from Flammable Materials***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to increase fire hazards from flammable materials are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could increase fire hazards from flammable materials when compared to the proposed project.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could increase indirect fire hazards from flammable materials, especially equipment that has already been in operation for a number of years. For example, most of the existing refineries in the district have equipment that has been operating for decades and, as such, may experience accidental fires from combustion sources such as boilers, gas turbines, etc. For example, pending permit applications in Appendix H show that one refinery is proposing to replace two older high emitting and potentially increasingly unsafe cogeneration units and four

boilers with new, state-of-the-art equipment that are more efficient, have substantially lower emissions, and are inherently safer.

Another potential indirect flammability impact is associated with installation of backup flares, which require permits from the SCAQMD. Under certain circumstances, flares are considered safety equipment. For example, in the event of dangerous increases in pressure in some refinery operations, excess gases and vapors may be vented to an emergency backup flare to prevent explosions and fires. Similarly, flares used as a means of controlling emissions at essential public services, including landfills and sewage treatment facilities, can also be used in an emergency backup capacity to prevent explosions or fires if other types of equipment, e.g., gas turbines, internal combustion engines, boilers, etc., are used as the primary control equipment. As indicated in Appendix H there were four permit applications for backup flares, two at landfills and two at sewage treatment facilities.

As time goes by it is expected that the probability of accidents involving combustion sources could potentially increase. Consequently, under the No Project Alternative, new indirect fire hazards resulting from aging combustion equipment are considered to be significant.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The survey of CEQA documents to evaluate the potential hazard impacts through transport, use, or disposal of hazardous materials from the proposed project identified one primary facility category, utility projects, that would create significant adverse hazard impacts through transport, use, or disposal of hazardous materials. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts through transport, use, or disposal of hazardous materials, it was concluded that the proposed project would create significant adverse indirect hazard impacts through transport, use, or disposal of hazardous materials in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create hazards through transport, use or disposal of hazardous materials compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not involve the use of hazardous materials that could create hazards through transport, use or disposal of such materials (e.g., product reformulation to less or non-hazardous materials), some emission

reduction projects do involve hazardous materials. For example, one emission reduction project would involve installation of new alternative fuel refueling stations. Other emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels, and fuel cells that contain phosphoric acid.

Because future individual projects in the primary facility categories could have unique characteristics and/or include the transport, use, or handling of hazardous materials, it is concluded that Alternative B would create significant adverse indirect hazard impacts. However, because emission reduction projects in the future have the potential to generate both beneficial and adverse hazard impacts, potential indirect hazard impacts from implementing Alternative B are considered to be approximately equivalent to the proposed project. The contribution to cumulative hazard impacts from Alternative B through the transport, use, or disposal of hazardous materials from Alternative B is expected to be significant and approximately equivalent to the cumulative hazard impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Create a Hazard through Upset/Accident Conditions***

The survey of CEQA documents to evaluate the potential for hazard impacts created through upset or accident conditions from the proposed project identified one primary facility category, utility projects, that would significantly adversely affect hazard impacts created through upset or accident conditions. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts created through upset or accident conditions, it was concluded that the proposed project would create significant adverse indirect hazard impacts created through upset or accident conditions in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create hazards through upset or accidents resulting in the release of hazardous materials compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not involve the use of hazardous materials that could create upset or accident conditions (e.g., product reformulation to less or non-hazardous materials), some emission reduction projects do involve hazardous materials that could be released in the event of upset or accident conditions. For example, one emission reduction project would involve installation of new alternative fuel refueling stations. Other emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels and fuel cells that contain phosphoric acid.

Because future individual projects in the primary facility categories could have unique characteristics and/or include the use of hazardous materials that could create upset or accident conditions, it is concluded that Alternative B would create significant adverse indirect hazard impacts. However, because emission reduction projects in the future have the potential to generate both beneficial and adverse hazard impacts, potential indirect hazard impacts from implementing Alternative B are considered to be approximately equivalent to the proposed project. The contribution to cumulative hazard impacts from Alternative B through upset or accident conditions from the release of hazardous materials from Alternative B is expected to be significant and greater than cumulative hazard impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The survey of CEQA documents to evaluate the potential hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school from the proposed project identified no primary facility categories that would significantly emit hazardous emission or material within one-quarter mile of a nearby school. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school, it was concluded that the proposed project would create significant adverse indirect hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect hazardous emissions impacts within one-quarter mile of a nearby school compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Generally, potential emission reduction projects are expected to reduce hazardous air pollutants as a co-benefit of reduction criteria pollutant emissions. Further, although many emission reduction projects do not involve the use of hazardous materials (e.g., product reformulation to less or non-hazardous materials), some emission reduction projects do involve hazardous materials. For example, one emission reduction project would involve installation of new alternative fuel refueling stations. Other emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels and fuel cells that contain phosphoric acid.

Because future individual projects in the primary facility categories could have unique characteristics and/or include the use of hazardous materials, it is concluded that

Alternative B would create significant adverse indirect hazard impacts if located within one-quarter mile of a school. However, because emission reduction projects in the future have the potential to generate both beneficial and adverse hazard impacts, potential indirect hazard impacts from implementing Alternative B are considered to be approximately equivalent to the proposed project. The contribution of cumulative impacts from future Alternative B facilities that have the potential to emit hazardous emissions within one-quarter mile of a nearby school is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

***Located on a Hazardous Material Site (Government Code §65962.5)***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located on a hazardous material site from the proposed project identified no primary facility categories that would be located on a hazardous material site. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located on a hazardous material site, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located on a hazardous material site in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to be located on hazardous materials sites compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. It is possible that some emission reduction projects implemented in the future could be located on a hazardous material site. For example, emission reduction projects that could be located on hazardous material sites could include installation of new alternative fuel refueling stations and anaerobic digesters, biogas generators.

Because future individual projects in the primary facility categories could have unique characteristics and/or be located on hazardous material sites, it is concluded that Alternative B would create significant adverse indirect hazard impacts. However, because emission reduction projects in the future have the potential to be located on hazardous material sites, potential indirect hazard impacts from implementing Alternative B are considered to be greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects located on hazardous materials sites from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

***Located within an Airport Land Use Plan or within Two Miles of an Airport***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located with an airport land use plan or within two miles of an airport from the proposed project identified no primary facility categories that would be located with an airport land use plan or within two miles of an airport. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located with an airport land use plan or within two miles of an airport, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located with an airport land use plan or within two miles of an airport in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect hazard impacts from future projects that have the potential to be located within an airport land use plan or within two miles of a public airport compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not involve the use of hazardous materials (e.g., product reformulation to less or non-hazardous materials), some emission reduction projects do involve hazardous materials. For example, one emission reduction project would involve installing new alternative fuel refueling stations. Other emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels, installing fuel cells that contain phosphoric acid, etc.

Because future individual projects in the primary facility categories could have unique characteristics and/or include the use of hazardous materials with an airport land use plan or within two miles of an airport, it is concluded that Alternative B would create significant adverse indirect hazard impacts in those areas. However, because emission reduction projects in the future have the potential to generate both beneficial and adverse hazard impacts near airports, potential indirect hazard impacts from implementing Alternative B are considered to be equivalent to the proposed project. The contribution to cumulative hazard impacts from future Alternative B facilities and emission reduction projects to people located within an airport land use plan or within two miles of a public airport from Alternative B is expected to be significant and equivalent to the cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Located within the Vicinity of a Private Airstrip***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located within the vicinity of a private airstrip from the proposed project identified no primary facility categories that would be located within the vicinity of a private airstrip. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located within the vicinity of a private airstrip, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located within the vicinity of a private airstrip in the district.

Alternative B also would result in Alternative B would generate similar indirect hazard impacts to people located within the vicinity of a private airstrip compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not involve the use of hazardous materials (e.g., product reformulation to less or non-hazardous materials), some emission reduction projects do involve hazardous materials. For example, one emission reduction project would involve installing new alternative fuel refueling stations. Other emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels, installing fuel cells that contain phosphoric acid, etc.

Because future individual projects in the primary facility categories could have unique characteristics and/or include the use of hazardous materials with within the vicinity of a private airstrip, it is concluded that Alternative B would create significant adverse indirect hazard impacts in those areas. However, because emission reduction projects in the future have the potential to generate both beneficial and adverse hazard impacts within the vicinity of private airstrips, potential indirect hazard impacts from implementing Alternative B are considered to be equivalent to the proposed project. The contribution to cumulative hazard impacts from future Alternative B facilities and emission reduction projects to people located within the vicinity of a private airstrip is expected to be significant and equivalent compared to the cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Interfere with Adopted Emergency Plans***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects that interfere with adopted emergency plans from the proposed project identified no primary facility categories that would significantly interfere with adopted emergency plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location

that could create significant adverse hazard impacts from future projects that interfere with adopted emergency plans, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects that interfere with adopted emergency plans in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to interfere with adopted emergency response plans compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Depending on the configuration and location of the emission reduction projects, they have the potential to interfere with business or adopted local emergency response plans.

Because future individual projects in the primary facility categories could have unique characteristics and/or could be configured or located at a site that has the potential to interfere with adopted emergency response plans, it is concluded that Alternative B would create significant adverse indirect hazard impacts. Further, because emission reduction projects in the future also have the potential to be configured or located at a site that could interfere with adopted emergency response plans, potential indirect impacts from projects interfering with adopted emergency response plans as a result of implementing Alternative B are considered to be greater than the proposed project. The contribution to cumulative impacts from future Alternative B projects that have the potential to interfere with adopted emergency response plans is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Expose People to Risk from Wildland Fires***

The survey of CEQA documents to evaluate the potential hazard impacts from exposing people to risk from wildland fires from the proposed project identified no primary facility categories that would significantly expose people to risk from wildland fires. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from exposing people to risk from wildland fires, it was concluded that the proposed project would create significant adverse indirect hazard impacts from exposing people to risk from wildland fires in the district.

Alternative B would generate similar indirect impacts from future projects that have the potential to expose people to risks from wildland fires compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would also result in the indirect effects of potential future emission reduction projects.

Some emission reduction projects in which flammable materials are used could be located in or near undeveloped woodland areas. For example, one type of emission reduction project could involve installation of new alternative fuel refueling stations. Other types of emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels.

Because future individual projects in the primary facility categories that handle flammable materials could have unique characteristics and/or may be located in undeveloped areas near woodland areas, it is concluded that Alternative B would create significant adverse indirect hazard impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to expose people to risks from wildfires is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Increase Fire Hazards from Flammable Materials***

The survey of CEQA documents to evaluate the potential increase in fire hazard impacts from flammable material from the proposed project identified no primary facility categories that would significantly adversely increase fire hazard impacts from flammable materials. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse fire hazard impacts from flammable material, it was concluded that the proposed project would create significant adverse indirect fire hazard impacts from flammable material in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to increase hazards from flammable materials compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Some emission reduction projects may involve the use of flammable materials. For example, one type of emission reduction project could involve installation of new alternative fuel refueling stations. Other types of emission reduction projects involve replacing one type of fuel, e.g., diesel, with other types of alternative clean fuels.

Because future individual projects in the primary facility categories could have unique characteristics and/or may involve handling flammable materials, it is concluded that Alternative B would create significant adverse indirect hazard impacts from flammable materials greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to increase hazards from flammable materials is expected to be significant and

greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

**Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The survey of CEQA documents to evaluate the potential hazard impacts through transport, use, or disposal of hazardous materials from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard impacts through transport, use, or disposal of hazardous materials. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts through transport, use, or disposal of hazardous materials, it was concluded that the proposed project would create significant adverse indirect hazard impacts through transport, use, or disposal of hazardous materials in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts through the transport, use, or disposal of hazardous materials compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse hazard impacts through the transport, use, or disposal of hazardous materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential hazard impacts through the transport, use, or disposal of hazardous materials from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts through the transport, use, or disposal of hazardous materials from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Create a Hazard through Upset/Accident Conditions***

The survey of CEQA documents to evaluate the potential for hazard impacts created through upset or accident conditions from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard

impacts created through upset or accident conditions. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts created through upset or accident conditions, it was concluded that Alternative C would create significant adverse indirect hazard impacts created through upset or accident conditions in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts through upset or accident conditions causing the release of hazardous materials compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse hazard impacts through upset or accident conditions causing the release of hazardous materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential hazard impacts through upset or accident conditions causing the release of hazardous materials from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts through upset or accident conditions causing the release of hazardous materials from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The survey of CEQA documents to evaluate the potential hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school from the proposed project identified no primary facility categories that would significantly emit hazardous emission or material within one-quarter mile of a nearby school. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school, it was concluded that the proposed project would create significant adverse indirect hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts as a result of locating future affected facilities that emit hazardous emissions within one-quarter mile of a nearby school compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse hazard impacts as a result of locating future affected facilities that emit hazardous emissions within one-quarter mile of a nearby school. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential hazard impacts as a result of locating future affected facilities that emit hazardous emissions within one-quarter mile of a nearby school from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts as a result of locating future affected facilities that emit hazardous emissions within one-quarter mile of a nearby school from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Located on a Hazardous Material Site (Government Code §65962.5)***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located on a hazardous material site from the proposed project identified no primary facility categories that would be located on a hazardous material site. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located on a hazardous material site, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located on a hazardous material site in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts from locating future facilities on a hazardous materials site compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential hazard impacts from locating future facilities on a hazardous materials site as a result of implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts from locating future facilities on a hazardous materials site as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Located with an Airport Land Use Plan or within Two Miles of an Airport***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located with an airport land use plan or within two miles of an airport from the proposed project identified no primary facility categories that would be located with an airport land use plan or within two miles of an airport. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located with an airport land use plan or within two miles of an airport, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located with an airport land use plan or within two miles of an airport in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard exposure impacts to people located within an airport land use plan or within two miles of a public airport compared to the proposed project.

Based upon the above information, potential hazard exposure impacts to people located within an airport land use plan or within two miles of a public airport from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard exposure impacts to people located within an airport land use plan or within two miles of a public airport from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Located within the Vicinity of a Private Airstrip***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located within the vicinity of a private airstrip from the proposed project identified no primary facility categories that would be located within the vicinity of a private airstrip. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located within the vicinity of a private airstrip, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located within the vicinity of a private airstrip in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard exposure impacts to people located within the vicinity of a private airstrip compared to the proposed project.

Based upon the above information, the potential hazard exposure impacts to people located within the vicinity of a private airstrip from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard exposure impacts to people located within the vicinity of a private airstrip from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Interfere with Adopted Emergency Plans***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects that interfere with adopted emergency plans from the proposed project identified no primary facility categories that would significantly interfere with adopted emergency plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects that interfere with adopted emergency plans, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects that interfere with adopted emergency plans in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts from future affected facilities that have the potential to interfere with adopted emergency response plans compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse hazard impacts from future affected facilities that have the potential to interfere with adopted emergency response plans. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential hazard impacts from future affected facilities that have the potential to interfere with adopted emergency response plans as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts from future affected facilities that have the potential to interfere with adopted emergency response plans as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Expose People to Risk from Wildland Fires***

The survey of CEQA documents to evaluate the potential hazard impacts from exposing people to risk from wildland fires from the proposed project identified no primary facility categories that would significantly expose people to risk from wildland fires. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from exposing people to risk from wildland fires, it was concluded that the proposed project would create significant adverse indirect hazard impacts from exposing people to risk from wildland fires in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer hazard impacts from exposing people to risks from wildland fires compared to the proposed project.

Based upon the above information, potential hazard impacts from exposing people to risks from wildland fires as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect hazard impacts from exposing people to risks from wildland fires as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Increase Fire Hazards from Flammable Materials***

The survey of CEQA documents to evaluate the potential impact from increase in fire hazards from flammable materials from the proposed project identified no primary facility categories that would significantly adversely increase fire hazard impacts from flammable materials. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse impact from increase in fire hazards from flammable materials, it was concluded that the proposed project would create significant adverse indirect impact from increase in fire hazards from flammable materials in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from exposing people to increased hazards from flammable materials compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from exposing people to increased hazards from flammable materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts from

exposing people to increased hazards from flammable materials from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from exposing people to increased hazards from flammable materials as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The survey of CEQA documents to evaluate the potential hazard impacts through transport, use, or disposal of hazardous materials from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard impacts through transport, use, or disposal of hazardous materials. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts through transport, use, or disposal of hazardous materials, it was concluded that the proposed project would create significant adverse indirect hazard impacts through transport, use, or disposal of hazardous materials. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of creating a hazard through transport, use, or disposal of hazardous materials.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse hazard impacts through transport or disposal of hazardous materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D.

In addition to the increased potential for accidental releases of hazardous materials from aging equipment that cannot be replaced or modified due to restrictions on the availability of offsets, Alternative D also has the potential to delay or otherwise impede remediation efforts at contaminated sites. As can be seen in Appendix H, under the permit moratorium that temporarily ended as of January 1, 2010, there were a number of pending permit applications for equipment such as thermal oxidizers or vapor extraction that would be used to remediate soils contaminated with gasoline or other petroleum products. Similarly, there was a number of pending permit applications for equipment such as thermal or catalytic oxidizers or vapor extraction that would be used to clean up contaminated groundwater.

Consequently, under Alternative D, new indirect hazards impacts equipment are considered to be significant and greater than the impacts of the proposed project. In addition, the contribution to cumulative impacts would be greater than the project's contribution.

### ***Create a Hazard through Upset/Accident Conditions***

The survey of CEQA documents to evaluate the potential for hazard impacts created through upset or accident conditions from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard impacts created through upset or accident conditions. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts created through upset or accident conditions, it was concluded that the proposed project would create significant adverse indirect hazard impacts created through upset or accident conditions. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of creating a hazard through upset/accident conditions.

As discussed under Alternative A, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to create hazards through upset or accident conditions from the release of hazardous materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future land use projects that have the potential to create hazard impacts through accidental releases of hazardous materials as a result of implementing Alternative D are considered to be significant.

As time goes by it is expected that increase hazards through transport, use or disposal of hazardous materials could potentially increase, but public agencies' abilities to handle such hazards would be curtailed because of the limited availability of offsets. Consequently, under Alternative D, indirect hazard impacts resulting from the restricted ability of public agencies to accommodate future growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the project's contribution.

### ***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The survey of CEQA documents to evaluate the potential hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school

from the proposed project identified no primary facility categories that would significantly emit hazardous emission or material within one-quarter mile of a nearby school. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school, it was concluded that the proposed project would create significant adverse indirect hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of hazardous emissions on material within one-quarter mile of a nearby school.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that emit hazardous materials within one-quarter mile of a nearby school. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future land use projects that have the potential to emit hazard materials within one-quarter mile of a nearby school as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that emit hazardous materials within one-quarter mile of a nearby school, but indirect cumulative impacts from facilities that emit hazardous emission within one-quarter mile of a school would be less than the proposed project.

***Located on a Hazardous Material Site (Government Code §65962.5)***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located on a hazardous material site from the proposed project identified no primary facility categories that would be located on a hazardous material site. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located on a hazardous material site, it was concluded that the proposed project would create significant adverse indirect

hazard impacts from future projects located on a hazardous material site. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of location within an airport land use plan or within two miles of an airport.

Based upon the above information, indirect impacts from future land use projects located on hazardous materials sites as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts as a result of locating future facilities on hazardous material sites, but indirect cumulative hazardous material site impacts would be less than the proposed project.

***Located within an Airport Land Use Plan or within Two Miles of an Airport***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located with an airport land use plan or within two miles of an airport from the proposed project identified no primary facility categories that would be located with an airport land use plan or within two miles of an airport. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located with an airport land use plan or within two miles of an airport, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located with an airport land use plan or within two miles of an airport.

Based upon the above information, indirect impacts from future land use projects that may be located within an airport land use plan or within two miles of an airport as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency

with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects located within two miles of an airport that could subject persons to safety hazards, but indirect cumulative safety hazard impacts would be less than the proposed project.

### ***Located within the Vicinity of a Private Airstrip***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located within the vicinity of a private airstrip from the proposed project identified no primary facility categories that would be located within the vicinity of a private airstrip. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located within the vicinity of a private airstrip, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located within the vicinity of a private airstrip. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of locating within the vicinity of a private airstrip.

Based upon the above information, indirect impacts from future land use projects that may be located within the vicinity of a private airstrip as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative hazard impacts to persons residing in the vicinity of a private airstrip, but indirect cumulative hazard impacts would be less than the proposed project.

### ***Interfere with Adopted Emergency Plans***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects that interfere with adopted emergency plans from the proposed project identified no primary facility categories that would significantly interfere with adopted emergency plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location

that could create significant adverse hazard impacts from future projects that interfere with adopted emergency plans, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects that interfere with adopted emergency plans. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of interference with adopted emergency plans.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts future projects that have the potential to interfere with adopted emergency response plans. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future land use projects that have the potential to interfere with adopted emergency response plans as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts future projects that have the potential to interfere with adopted emergency response plans, but indirect cumulative emergency response plan impacts would be less than the proposed project.

### ***Expose People to Risk from Wildland Fires***

The survey of CEQA documents to evaluate the potential hazard impacts from exposing people to risk from wildland fires from the proposed project identified no primary facility categories that would significantly expose people to risk from wildland fires. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from exposing people to risk from wildland fires, it was concluded that the proposed project would create significant adverse indirect hazard impacts from exposing people to risk from wildland fires. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exposing people to risk from wildland fires.

Based upon the above information, indirect impacts from future land use projects that have the potential to expose people to risks from wildland fires as a result of

implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to expose people to wildland fires, but indirect cumulative wildland fire impacts would be less than the proposed project.

### ***Increase Fire Hazards from Flammable Materials***

The survey of CEQA documents to evaluate the potential impact from increase in fire hazards from flammable materials from the proposed project identified no primary facility categories that would significantly adversely increase fire hazard impacts from flammable materials. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse impact from increase in fire hazards from flammable materials, it was concluded that the proposed project would create significant adverse indirect impact from increase in fire hazards from flammable materials. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of increasing fire hazards from flammable materials.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to increase fire hazards from flammable materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future land use projects that have the potential to increase fire hazards from flammable materials as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in fewer or less severe overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements.

Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be resulting in significant adverse indirect cumulative impacts from future facilities that have the potential to increase fire hazards from flammable materials, but indirect cumulative fire hazard impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Create a Hazard through Transport, Use, or Disposal of Hazardous Materials***

The survey of CEQA documents to evaluate the potential hazard impacts through transport, use, or disposal of hazardous materials from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard impacts through transport, use, or disposal of hazardous materials. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts through transport, use, or disposal of hazardous materials, it was concluded that the proposed project would create significant adverse indirect hazard impacts through transport, use, or disposal of hazardous materials. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to create hazards through transport, use, or disposal of hazardous materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E.

In addition to the increased potential for accidental releases of hazardous materials from aging equipment that cannot be replaced or modified due to restrictions on the availability of offsets, Alternative E also has the potential to delay or otherwise impede remediation efforts at contaminated sites. As can be seen in Appendix H, under the permit moratorium that temporarily ended as of January 1, 2010, there were a number of pending permit applications for equipment such as thermal oxidizers or vapor extraction that would be used to remediate soils contaminated with gasoline or other petroleum products. Similarly, there was a number of pending permit applications for equipment such as thermal or catalytic oxidizers or vapor extraction that would be used to clean up contaminated groundwater.

Consequently, under Alternative E, new indirect hazards impacts are considered to be significant and greater than the impacts of the proposed project. The contribution to cumulative impacts also would be greater than the project's contribution.

### ***Create a Hazard through Upset/Accident Conditions***

The analysis of potential adverse indirect hazard impacts created through upset or accident conditions as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for hazard impacts created through upset or accident conditions from the proposed project identified one primary facility category, utility projects, which would significantly adversely affect hazard impacts created through upset or accident conditions. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts created through upset or accident conditions, it was concluded that the proposed project would create significant adverse indirect hazard impacts created through upset or accident conditions. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of creating a hazard through upset/accident conditions.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to create hazards through upset or accident conditions. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that project-specific indirect impacts from future facilities that have the potential to create hazards through upset or accident conditions as a result of Alternative E would be significant and greater than the impacts of the proposed project. Similarly, cumulative impacts from future facilities that have the potential to create hazards through upset or accident conditions as a result of implementing Alternative E would be significant and greater than the impacts of the proposed project.

### ***Emit Hazardous Emissions or Material within One-quarter Mile of a Nearby School***

The survey of CEQA documents to evaluate the potential hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school from the proposed project identified no primary facility categories that would significantly emit hazardous emission or material within one-quarter mile of a nearby school. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from the emission of hazardous emission or material within one-quarter mile of a nearby school, it was concluded that the proposed project would create significant adverse indirect hazard impacts from the

emission of hazardous emission or material within one-quarter mile of a nearby school. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of emitting hazardous emissions or material within one-quarter mile of a nearby school.

Indirect impacts from future facilities that have the potential to emit hazardous materials within one-quarter mile of nearby schools as a result of implementing Alternative E would be less than indirect hazardous impacts to schools from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to emit hazardous materials within one-quarter mile of nearby schools. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect hazardous impacts to schools from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future facilities that have the potential to emit hazardous materials within one-quarter mile of nearby schools as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

***Located on a Hazardous Material Site (Government Code §65962.5)***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located on a hazardous material site from the proposed project identified no primary facility categories that would be located on a hazardous material site. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located on a hazardous material site, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located on a hazardous material site. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of locating on a hazardous material site.

Indirect impacts from future facilities that have the potential to be located on hazardous materials sites as a result of implementing Alternative E would be less than indirect impacts future facilities that have the potential to be located on hazardous materials sites as a result of implementing the proposed project because fewer representative facilities

would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect impacts future facilities that have the potential to be located on hazardous materials sites as a result of implementing Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to be located on hazardous materials sites as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

***Located within Airport Land Use Plan or within Two Miles of an Airport***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects located with an airport land use plan or within two miles of an airport from the proposed project identified no primary facility categories that would be located with an airport land use plan or within two miles of an airport. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located with an airport land use plan or within two miles of an airport, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located with an airport land use plan or within two miles of an airport. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of location within airport land use plan or within two miles of an airport.

Indirect hazard impacts to people from future facilities that have the potential to be located within two miles of an airport as a result of implementing Alternative E would be less than indirect hazard impacts to people from future facilities that have the potential to be located within two miles of an airport as a result of implementing the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect hazard impacts to people from future

facilities that have the potential to be located within two miles of an airport as a result of implementing Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative hazard impacts to people from future facilities that have the potential to be located within two miles of an airport as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Located within the Vicinity of a Private Airstrip***

The analysis of potential adverse indirect hazard impacts from future projects located within the vicinity of a private airstrip as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential hazard impacts from future projects located within the vicinity of a private airstrip from the proposed project identified no primary facility categories that would be located within the vicinity of a private airstrip. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects located within the vicinity of a private airstrip, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects located within the vicinity of a private airstrip. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of locating within the vicinity of a private airstrip.

Indirect hazard impacts to people from future facilities that have the potential to be located within the vicinity of a private airstrip as a result of implementing Alternative E would be less than indirect hazard impacts to people from future facilities that have the potential to be located within the vicinity of a private airstrip as a result of implementing the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect hazard impacts to people from future facilities that have the potential to be located within the vicinity of a private airstrip as a result of implementing Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative hazard impacts to people from future facilities that have the potential to be located within the vicinity of a private airstrip as a result of implementing Alternative E would be significant, but less than the

proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Interfere with Adopted Emergency Response Plans***

The survey of CEQA documents to evaluate the potential hazard impacts from future projects that interfere with adopted emergency plans from the proposed project identified no primary facility categories that would significantly interfere with adopted emergency plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from future projects that interfere with adopted emergency plans, it was concluded that the proposed project would create significant adverse indirect hazard impacts from future projects that interfere with adopted emergency plans. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of interference with adopted emergency response plans.

Indirect hazard impacts from future facilities that have the potential to interfere with adopted emergency response plans as a result of implementing Alternative E would be less than indirect emergency response plan impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to interfere with adopted emergency response plans. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect emergency response plan impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative hazard impacts from future facilities that have the potential to interfere with adopted emergency response plans as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Expose People to Risk from Wildland Fires***

The survey of CEQA documents to evaluate the potential hazard impacts from exposing people to risk from wildland fires from the proposed project identified no primary

facility categories that would significantly expose people to risk from wildland fires. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse hazard impacts from exposing people to risk from wildland fires, it was concluded that the proposed project would create significant adverse indirect hazard impacts from exposing people to risk from wildland fires in the district.

Indirect hazard impacts from future facilities that have the potential to expose people to risks from wildland fires as a result of implementing Alternative E would be less than indirect wildland fire risk impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect wildland fire risk impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative hazard impacts from future facilities that have the potential to expose people to risks from wildland fires as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Increase Fire Hazards from Flammable Materials***

The survey of CEQA documents to evaluate the potential impact from increase in fire hazards from flammable materials from the proposed project identified no primary facility categories that would significantly adversely increase fire hazard impacts from flammable materials. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse impact from increase in fire hazards from flammable materials, it was concluded that the proposed project would create significant adverse indirect impact from increase in fire hazards from flammable materials. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of increased fire hazards from flammable materials.

Indirect hazard impacts from future facilities that have the potential to increase fire hazards from flammable materials as a result of implementing Alternative E would be less than indirect fire hazard impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary

source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to increase fire hazards from flammable materials. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that project-specific indirect fire hazard impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative hazard impacts from future facilities that have the potential to increase fire hazards from flammable materials as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Hydrology and Water Quality**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse hydrology and water quality impacts for the following reasons. The proposed project could allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal accounts. These individual projects could result in runoff of sediments, construction materials, and accidental spills of fuels and/or lubricants during construction activities that could adversely affect water quality. These individual projects may be required to comply with National Pollution Discharge Elimination System (NPDES) regulations and implement an associated project-specific Storm Water Pollution Prevention Plan (SWPPP) and Source Control Program that would detail best management practices (BMPs) during construction activities, as well as post-construction operational activities. Compliance with existing regulations would minimize potential water quality impacts during construction and operation of each individual project. Construction could also result in the increase in impervious surfaces within the district, which could lead to increased surface runoff from the individual project sites. This increase in runoff could potentially affect existing or planned stormwater drainage systems.

The analysis in Subchapter 5.9 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of hydrology and water quality impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant hydrology or water quality impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Violate Water Quality/Discharge Standards***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that transportation facilities (document #39) have the potential to create significant adverse indirect impacts through violations of future water quality/discharge standards. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts through violations of future water quality/discharge standards. Based on the results of the CEQA document survey and the possibility that future individual projects in any of these facility categories could create impacts through violations of future water quality/discharge standards, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to deplete groundwater supplies/interfere with groundwater recharge. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could result in depletion of groundwater supplies/interfere with groundwater recharge from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to alter existing drainage patterns causing erosion/siltation. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could alter existing drainage patterns causing erosion/siltation from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to alter existing drainage patterns resulting in flooding. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could alter existing drainage patterns resulting in flooding from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to create runoff exceeding stormwater drainage systems. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could create runoff exceeding stormwater drainage systems from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Degrade Water Quality***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that transportation facilities (document #39) have the potential to create significant adverse indirect impacts through degradation of water quality in the future. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts through degradation of water quality in the future. Based on the results of the CEQA document survey and the possibility that future individual projects in any of these facility categories could create impacts through degradation of water quality in the future, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Placing Housing in 100-year Flood Area***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to place housing in 100-year flood areas. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could place housing in 100-year flood areas from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Impede Flows in 100-year Flood Area***

The analysis of potentially significant adverse indirect impacts in this PEA from future facilities that could impede flows in 100-year flood areas as a result of implementing the proposed project was based primarily on the review of 52 CEQA documents prepared for past projects that represent facilities in all nine primary facility categories. The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to impede flows in 100-year flood areas. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could impede flows in 100-year flood areas from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Expose People to Flooding Risks***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to expose people to flooding risks. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could expose people to flooding risks from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Inundation by Seiche, Tsunami, or Mudflow***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that transportation facilities (document #39) have the potential to create conditions for inundation by seiche, tsunami, or mudflow in the future. The CEQA documents for the

remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts because they did not create conditions for inundation, seiche, or mudflow in the future. Based on the results of the CEQA document survey and the possibility that future individual projects in these facility categories could create conditions for inundation by seiche, tsunami, or mudflow in the future, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Exceed Wastewater Treatment Requirements***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to exceed wastewater treatment requirements. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could exceed wastewater treatment requirements from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Require New Wastewater Treatment***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to require new wastewater treatment. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could require new wastewater treatment from a variety of facility categories that obtain offsets from the SCAQMD's internal account, of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Require New Stormwater Facilities***

The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that no primary facility categories were shown to require new stormwater facilities. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could require new stormwater facilities from a variety of facility categories that obtain offsets from the SCAQMD's

internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Have Sufficient Water Supplies***

The survey of the 52 CEQA documents shown in Table 5.9-1 did not identify any facilities that had insufficient water supplies. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could result in insufficient water supplies to a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to hydrology and water quality could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to hydrology and water quality.

### ***Have Adequate Wastewater Treatment Capacity***

The survey of the 52 CEQA documents shown in Table 5.9-1 did not identify any facilities that had insufficient wastewater treatment capacity. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in any of the nine facility categories could generate other changes that could result in insufficient wastewater treatment capacity to a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 is in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes that no facilities that previously obtained credits pursuant to Rules 1304 or 1309.1 would be built.

The inability to approve permits for future facilities that previously would have accessed the SCAQMD's internal accounts would result in existing facilities' inability to replace existing equipment beyond its useful lifetime or install new equipment to further accommodate population growth. Similarly, new facilities could not be constructed.

### ***Violate Water Quality/Discharge Standards***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that have the potential to violate water quality or discharge standards uses are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no facilities that have the potential to violate water quality or discharge standards when compared against the proposed project, so under the No Project Alternative potential future impacts from facilities that violate water quality or discharge standards would not be significant when compared to the proposed project.

Under Alternative A, May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly violate water quality or discharge standards when compared against the proposed project. On the other hand, projects to improve water quality also would not go forward because wastewater treatment and distribution facilities are considered essential public services,

which qualify for use of offsets from the Priority Reserve under proposed Rule 1309.1. In the long run, the impacts of not approving the project would be significant.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were approximately 70 pending permit applications for a wide variety of types of projects at sewage treatment plants. The following provides an overview of the types of sewage treatment facility projects that would be adversely affected under the No Project Alternative.

- There were approximately seven pending permit applications for emergency backup generators, which would allow the facility to continue operating in the event of an energy outage.
- There were approximately 29 pending permit applications for improvements to, or expansions of sewage treatment facilities.
- There were approximately 16 pending permit applications for miscellaneous other projects, including installation of air pollution or odor control systems at sewage treatment facilities.

As time goes by it is expected that operations at existing sewage treatment facilities might decline because of deteriorating equipment. Further, because existing sewage treatment facilities would not be able to expand and new facilities would most likely not be built in the district in the future, it may be difficult to accommodate future population growth, unless sewage can be transported out of the district. Consequently, in the long term water quality impacts as a result of the inability to expand existing, or construct and operate new sewage treatment facilities would likely be significant and greater than the proposed project.

### ***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts

from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that could deplete groundwater supplies or interfere with groundwater recharge when compared against the proposed project.

### ***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to alter existing drainage patterns causing erosion or siltation are considered to be significant. After May 1, 2012, no future projects that would be affected by the proposed project would be permitted, sited, constructed and operated, so no alteration of existing drainage patterns causing erosion or siltation would be expected to occur. As a result, after May 1, 2012, erosion and siltation impacts are not significant and less than the proposed project.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the District's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of

the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to alter existing drainage patterns resulting in flooding are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could adversely alter existing drainage patterns resulting in flooding when compared against the proposed project.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to create runoff exceeding stormwater drainage systems are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could create indirect runoff impacts exceeding stormwater drainage systems when compared against the proposed project.

### ***Degrade Water Quality***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that have the potential to degrade water quality are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could diminish the capacity of sewage treatment facilities in the district to process raw sewage, especially from equipment that has already been in operation for a number of years. More importantly, new and expanded facilities could not be constructed to accommodate population growth. Consequently, in the long term cumulative impacts as a result of the inability to expand existing, or construct and operate new sewage treatment facilities to accommodate future wastewater generation, thus, resulting in degradation of water quality would likely be significant and greater than the proposed project.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were approximately 70 pending permit applications for a wide variety of types of projects at sewage treatment plants. The number and types of projects at sewage treatment facilities that were previously on hold are summarized in the "Violate Water Quality/Discharge Standards" subsection above.

As time goes by it is expected that the probability of future facilities degrading water quality could potentially increase. Consequently, under the No Project Alternative, new indirect water degradation impacts are considered to be significant and greater than the impacts of the proposed project.

### ***Placing Housing in 100-year Flood Area***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to result in placing housing in 100-year flood areas are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would require placing housing in 100-year flood areas when compared against the proposed project.

### ***Impede Flows in 100-year Flood Area***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to impede flows in 100-year flood area are considered to be significant. Starting May 1, 2012, new facilities that previously had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly impede flows in 100-year flood areas when compared against the proposed project.

### ***Expose People to Flooding Risks***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation

pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to expose people to flooding risks are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly expose people to flooding risks when compared against the proposed project.

### ***Inundation by Seiche, Tsunami, or Mudflow***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 is in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to cause inundation by seiche, tsunami, or mudflow are considered to be significant. Starting May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would be subject to indirect inundation by seiche, tsunami, or mudflow impacts when compared against the proposed project.

### ***Exceed Wastewater Treatment Requirements***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly exceed wastewater treatment requirements when compared against the proposed project. On the other hand, projects to improve wastewater capacity also would not go forward because wastewater treatment and distribution facilities are considered essential public services, which qualify for use of offsets from the Priority Reserve under proposed Rule 1309.1. For the reasons discussed in the section above discussing the potential for violations of water quality and discharge standards, in the long run the impacts would be significant and greater than the proposed project.

### ***Require New Wastewater Treatment***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to require new wastewater treatment are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that could indirectly require new wastewater treatment when compared against the proposed project.

### ***Require New Stormwater Facilities***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation

pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to require new stormwater facilities are considered to be significant. Starting May 1, 2012, future facilities that previously had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that would increase indirect stormwater runoff impacts that would require constructing new stormwater treatment facilities when compared against the proposed project.

### ***Have Sufficient Water Supplies***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly provide sufficient water supply capacity when compared against the proposed project. On the other hand, projects to provide sufficient water supply capacity also would not go forward because water distribution facilities are considered essential public services, which qualify for use of offsets from the Priority Reserve under proposed Rule 1309.1. For these reasons, in the long run the impacts would be significant.

As time goes by it is expected that the future demand for sufficient water supplies could potentially increase. Consequently, under the No Project Alternative, new indirect water supply impacts resulting from aging equipment are considered to be significant and greater than the impact under the proposed project.

### ***Have Adequate Wastewater Treatment Capacity***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could indirectly require additional wastewater treatment capacity when compared against the proposed project. On the other hand, projects to improve wastewater capacity also would not go forward because wastewater treatment and distribution facilities are considered essential public services, which qualify for use of offsets from the Priority Reserve under proposed Rule 1309.1. In the long run the impacts would be significant.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were approximately 70 pending permit applications for a wide variety of types of projects at sewage treatment plants. The number and types of projects at sewage treatment facilities that were previously on hold are summarized in the "Violate Water Quality/Discharge Standards" subsection above.

As time goes by it is expected that the probability of future facilities requiring additional wastewater treatment capacity could potentially increase. Consequently, under the No Project Alternative, new indirect new wastewater treatment capacity impacts resulting from aging equipment are considered to be significant and greater than the impact under the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Violate Water Quality/Discharge Standards***

The survey of CEQA documents to evaluate the potential impacts from violation with water quality or discharge standards from the proposed project identified one primary facility category, transportation facilities, that would significantly violate water quality or discharge standards. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from violation

with water quality or discharge standards, it was concluded that the proposed project would create significant adverse indirect impacts from violation with water quality or discharge standards in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect water quality impacts compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not increase the volumes of wastewater generated in the district that could violate water quality standards, some emission reduction projects may result in violations of water quality or discharge standards, e.g., anaerobic digesters, and installation of new alternative fuel refueling stations.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities violating water quality standards. The contribution to cumulative water quality impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The survey of CEQA documents to evaluate the potential impacts from depletion of groundwater supplies or interference with groundwater discharge from the proposed project identified no primary facility categories that would significantly adversely deplete groundwater supplies or interfere with groundwater discharge. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge, it was concluded that the proposed project would create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to deplete groundwater supplies, compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not adversely affect groundwater supplies or interfere with groundwater recharge, some emission reduction projects have the potential to adversely affect groundwater-related processes. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking could interfere with groundwater recharge. Examples of emission reduction

projects that involve construction of structures, parking lots, etc., include anaerobic digesters, biosolids energy production, and installation of new alternative fuel refueling stations.

It is concluded that Alternative B would create significant adverse indirect groundwater-related impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1. Cumulative groundwater or groundwater recharge impacts from Alternative B are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns causing erosion or siltation from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns causing erosion or siltation. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to alter drainage patterns, etc., compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not adversely affect or alter drainage patterns causing erosion or siltation, some emission reduction projects have the potential to adversely affect drainage patterns. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking would likely alter drainage patterns causing erosion or siltation.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to alter drainage patterns. The contribution to cumulative erosion or siltation impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns resulting in flooding from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns resulting in flooding. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to alter existing drainage patterns, resulting in flooding compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not adversely affect or alter drainage patterns that could cause flooding, some emission reduction projects have the potential to adversely affect drainage patterns. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking could alter drainage patterns resulting in flooding. Examples of emission reduction projects that involve construction of structures, parking lots, etc., include anaerobic digesters, biosolids energy production, installation of new alternative fuel refueling stations, etc.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to alter drainage patterns. The contribution to cumulative flooding impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The survey of CEQA documents to evaluate the potential impacts from creating runoff exceeding stormwater drainage systems from the proposed project identified no primary facility categories that would significantly adversely create runoff exceeding stormwater drainage systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems, it was concluded that the proposed project

would create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create run-off exceeding stormwater drainage systems compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not create runoff that could exceed stormwater drainage systems, some emission reduction projects have the potential to adversely affect stormwater drainage systems. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking could increase runoff that could adversely affect stormwater drainage systems.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to substantially increase runoff. The contribution to cumulative stormwater drainage system impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Degrade Water Quality***

The survey of CEQA documents to evaluate the potential impacts from degradation of water quality from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely impact water quality. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water quality impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water quality in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar water quality impacts compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not require additional water and, thus, would not be expected to degrade water quality in the district, some emission reduction projects to require additional water supplies and, therefore, may degrade water quality, e.g., anaerobic digesters, installation of new alternative fuel refueling stations

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities degrading water quality in the district. The contribution to cumulative water quality impacts from Alternative B are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Placing Housing in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from placing housing in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely place housing in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from placing housing in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from placing housing in 100-year flood area in the district.

Because the same types of facilities would be built under Alternative B, it is concluded that Alternative B may create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to induce population growth and associated housing that could be placed in 100-year flood areas. The contribution to cumulative impacts from Alternative B as a result of placing housing in 100-year flood areas are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Impede Flows in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from impeding flow in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely impede flow in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from impeding flow in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from impeding flow in 100-year flood area in the district.

The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. It is possible that future emission reduction projects could be constructed in 100-year flood areas, which could result in impeding floodwater flows. For example, any emissions

reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking could affect floodwater flows if constructed in 100-year flood areas.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to impede floodwater flows. The contribution to cumulative impacts from future Alternative B projects and emission reduction projects that impede flows in 100-year areas is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Expose People to Flooding Risks***

The survey of CEQA documents to evaluate the potential impacts from exposing people to flooding risks from the proposed project identified no primary facility categories that would significantly adversely expose people to flooding risks. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to flooding risks, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people to flooding risks in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to expose people to flooding risks compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects. It is possible that future emission reduction projects could be constructed in areas that could expose people to flooding risks. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking could expose people to flooding risks if constructed in flood areas.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to expose people to flooding risks. The contribution to cumulative impacts from future Alternative B projects and emission reduction projects that could expose people to flooding risks is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Inundation by Seiche, Tsunami, or Mudflow***

The survey of CEQA documents to evaluate the potential impacts from inundation by seiche, tsunami, or mudflow from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect impacts from inundation by seiche, tsunami, or mudflow. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow, it was concluded that the proposed project would create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect inundation risk impacts compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. It is possible that future emission reduction projects could be constructed in areas susceptible to inundation by seiche, tsunami, or mudflow. For example, any emissions reduction projects may involve construction of a structure or related appurtenances and paving adjacent areas for parking in areas that could be affected by seiche, tsunami, or mudflow.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to be adversely affected by inundation impacts. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to expose people to risks of inundation by seiche, tsunami, or mudflow is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Exceed Wastewater Treatment Requirements***

The survey of CEQA documents to evaluate the potential impacts from exceeding wastewater treatment requirements from the proposed project identified no primary facility categories that would significantly adversely exceed wastewater treatment requirements. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding wastewater treatment requirements, it was concluded that the proposed project would create significant adverse indirect impacts from exceeding wastewater treatment requirements in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to exceed wastewater treatment requirements compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not increase the volumes of wastewater generated in the district that could exceed wastewater treatment requirements, some emission reduction projects may result in exceedances of wastewater treatment requirements, e.g., anaerobic digesters, and installation of new alternative fuel refueling stations.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that could exceed wastewater treatment requirements. The contribution to cumulative wastewater impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Require New Wastewater Treatment***

The survey of CEQA documents to evaluate the potential impacts from requiring new wastewater treatment from the proposed project identified no primary facility categories that would significantly require new wastewater treatment. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new wastewater treatment, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new wastewater treatment in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to require new wastewater treatment facilities compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects. Although many emission reduction projects would not increase demand for water and, therefore, would not be expected to increase the volumes of wastewater generated in the district that would require new wastewater treatment facilities, some emission reduction projects may increase demand for water, thus, generating additional wastewater that could require new wastewater treatment facilities, e.g., anaerobic digesters, and installation of new alternative fuel refueling stations.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that increase the demand for new wastewater treatment facilities. The contribution to cumulative impacts

from future Alternative B facilities and emission reduction projects that have the potential to increase demand for new wastewater treatment facilities is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Require New Stormwater Facilities***

The survey of CEQA documents to evaluate the potential impacts from requiring new stormwater facilities from the proposed project identified no primary facility categories that would significantly require new stormwater facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new stormwater facilities, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new stormwater facilities in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to require new stormwater facilities compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not create runoff that could require new stormwater facilities, some emission reduction projects have the potential to adversely affect stormwater drainage. For example, any emissions reduction projects that involve construction of a structure or related appurtenances and paving adjacent areas for parking would likely increase runoff that could increase demand for new stormwater facilities.

It is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that have the potential to substantially increase runoff requiring new stormwater facilities. Cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to increase demand for new stormwater facilities are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Have Sufficient Water Supplies***

The survey of CEQA documents to evaluate the potential for water supply impacts from the proposed project identified no primary facility categories that would significantly

adversely affect water supply. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water supply impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water supply in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar water demand impacts compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not adversely affect water supplies, some emission reduction projects have the potential to adversely affect water supplies. For example, any emissions reduction projects that involve construction of a structure or related appurtenances have the potential to increase demand for water.

It is concluded that Alternative B would create significant adverse indirect water-related impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1. The contribution to cumulative water supply impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Have Adequate Wastewater Treatment Capacity***

The survey of CEQA documents to evaluate the potential impacts to wastewater treatment capacity from the proposed project identified no primary facility categories that would significantly adversely affect wastewater treatment capacity. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to wastewater treatment capacity, it was concluded that the proposed project would create significant adverse indirect impacts to wastewater treatment capacity in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to overwhelm existing wastewater treatment capacity compared to the proposed project. The main difference between Alternative B and the proposed project Alternative B would also result in the indirect effects of potential future emission reduction projects. Although many emission reduction projects do not increase demand for water, which could increase the volumes of wastewater generated in the district and, therefore, result in an associated increase in demand for wastewater treatment capacity, some emission reduction projects may require additional water supplies, thus, result in increased

demand for wastewater treatment capacity, e.g., anaerobic digesters, and installation of new alternative fuel refueling stations.

Because the same types of facilities would be built under Alternative B, characteristics and/or may demand for wastewater treatment capacity, it is concluded that Alternative B would create significant adverse indirect impacts from future facilities exempt from offsets pursuant to Rules 1304 or 1309.1 that increase demand for wastewater treatment capacity. The contribution to cumulative wastewater treatment capacity impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Violate Water Quality/Discharge Standards***

The survey of CEQA documents to evaluate the potential impacts from violation with water quality or discharge standards from the proposed project identified one primary facility category, transportation facilities, that would significantly violate water quality or discharge standards. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from violation with water quality or discharge standards, it was concluded that the proposed project would create significant adverse indirect impacts from violation with water quality or discharge standards in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer water quality impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to water quality. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential water quality impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to water quality from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The survey of CEQA documents to evaluate the potential impacts from depletion of groundwater supplies or interference with groundwater discharge from the proposed project identified no primary facility categories that would significantly adversely deplete groundwater supplies or interfere with groundwater discharge. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge, it was concluded that Alternative C would create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge in the district. Because fewer facilities could be built under Alternative C, it is expected that the same type and number of primary facility categories under the proposed project would generate similar or fewer indirect impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential indirect impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge as a result of implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns causing erosion or siltation from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns causing erosion or siltation. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer erosion or siltation impacts from future facilities that have the potential to alter existing drainage patterns compared to the proposed project.

Based upon the above information, potential erosion or siltation impacts from future facilities that have the potential to alter existing drainage patterns as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect erosion or siltation impacts from future facilities that have the potential to alter existing drainage patterns as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns resulting in flooding from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns resulting in flooding. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar flooding impacts from future facilities that have the potential to alter existing drainage patterns compared to the proposed project.

Based upon the above information, potential flooding impacts from future facilities that have the potential to alter existing drainage patterns as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect flooding impacts from future facilities that have the potential to alter existing drainage patterns as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The survey of CEQA documents to evaluate the potential impacts from creating runoff exceeding stormwater drainage systems from the proposed project identified no primary

facility categories that would significantly adversely create runoff exceeding stormwater drainage systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems, it was concluded that the proposed project would create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar runoff impacts from future facilities that have the potential to exceed stormwater drainage systems compared to the proposed project.

Based upon the above information, potential runoff impacts from future facilities that have the potential to exceed stormwater drainage systems as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect runoff impacts from future facilities that have the potential to exceed stormwater drainage systems as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Degrade Water Quality***

The survey of CEQA documents to evaluate the potential impacts from degradation of water quality from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely impact water quality. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water quality impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water quality in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer water degradation impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to water degradation. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential water degradation impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect water degradation from

implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Placing Housing in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from placing housing in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely place housing in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from placing housing in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from placing housing in 100-year flood area in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer flooding impacts from placing housing in 100-year flood areas compared to the proposed project.

Based upon the above information, to the extent that future affected projects have the potential to induce population growth and associated housing, there would be significant, but fewer or less significant potential flooding impacts from placing housing in 100-year flood areas from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect flood impacts from placing housing in 100-year flood areas as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Impede Flows in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from impeding flow in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely impede flow in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from impeding flow in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from impeding flow in 100-year flood area in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect

impacts from future facilities located in 100-year flood areas that have the potential to impede or redirect flows compared to the proposed project.

Based upon the above information, potential indirect impacts from future facilities located in 100-year flood areas that have the potential to impede or redirect flows as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future facilities located in 100-year flood areas that have the potential to impede or redirect flows as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Expose People to Flooding Risks***

The survey of CEQA documents to evaluate the potential impacts from exposing people to flooding risks from the proposed project identified no primary facility categories that would significantly adversely expose people to flooding risks. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to flooding risks, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people to flooding risks in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future facilities located in 100-year flood areas that have the potential to expose people to the risk of loss, injury, or death from flooding compared to the proposed project.

Based upon the above information, potential indirect impacts from future facilities located in 100-year flood areas that have the potential to expose people to the risk of loss, injury, or death from flooding as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to from future facilities located in 100-year flood areas that have the potential to expose people to the risk of loss, injury, or death from flooding as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Inundation by Seiche, Tsunami, or Mudflow***

The survey of CEQA documents to evaluate the potential impacts from inundation by seiche, tsunami, or mudflow from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect impacts from inundation by seiche, tsunami, or mudflow. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow, it was concluded that the proposed project would create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer inundation impacts as a result of locating future affected projects in areas subject to seiche, tsunami, or mudflow compared to the proposed project.

Based upon the above information, potential inundation impacts as a result of locating future affected projects in areas subject to seiche, tsunami, or mudflow from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect inundation impacts as a result of locating future affected projects in areas subject to seiche, tsunami, or mudflow from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Exceed Wastewater Treatment Requirements***

The survey of CEQA documents to evaluate the potential impacts from exceeding wastewater treatment requirements from the proposed project identified no primary facility categories that would significantly adversely exceed wastewater treatment requirements. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding wastewater treatment requirements, it was concluded that the proposed project would create significant adverse indirect impacts from exceeding wastewater treatment requirements in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that have the potential to exceed wastewater treatment requirements compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future affected

facilities that have the potential to exceed wastewater treatment requirements. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential from future affected facilities that have the potential to exceed wastewater treatment requirements as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to exceed wastewater treatment requirements as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Require New Wastewater Treatment***

The survey of CEQA documents to evaluate the potential impacts from requiring new wastewater treatment from the proposed project identified no primary facility categories that would significantly require new wastewater treatment. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new wastewater treatment, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new wastewater treatment in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or less demand by future affected facilities for new wastewater treatment facilities compared to the proposed project.

Based upon the above information, potential demand by future affected facilities for new wastewater treatment facilities as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect demand impacts by future affected facilities for new wastewater treatment facilities as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Require New Stormwater Facilities***

The survey of CEQA documents to evaluate the potential impacts from requiring new stormwater facilities from the proposed project identified no primary facility categories that would significantly require new stormwater facilities. However, because of the

possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new stormwater facilities, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new stormwater facilities in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or less demand by future affected facilities for new stormwater facilities compared to the proposed project.

Based upon the above information, potential demand by future affected facilities for new stormwater facilities from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect demand by future affected facilities for new stormwater facilities as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Have Sufficient Water Supplies***

The survey of CEQA documents to evaluate the potential for water supply impacts from the proposed project identified no primary facility categories that would significantly adversely affect water supply. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water supply impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water supply in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar wastewater supply capacity impacts compared to the proposed project.

Based upon the above information, potential water supply impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to water supply from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Have Adequate Wastewater Treatment Capacity***

The survey of CEQA documents to evaluate the potential impacts to wastewater treatment capacity from the proposed project identified no primary facility categories that would significantly adversely affect wastewater treatment capacity. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to wastewater treatment capacity, it was concluded that the proposed project would create significant adverse indirect impacts to wastewater treatment capacity in the district. Because fewer facilities could be built under Alternative C, Alternative C would generate similar wastewater treatment capacity impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse wastewater treatment capacity impacts. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential wastewater treatment capacity impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect wastewater treatment capacity impacts from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Violate Water Quality/Discharge Standards***

The analysis of potential indirect impacts from violation with water quality or discharge standards as a result of implementing Alternative D is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential impacts from violation with water quality or discharge standards from the proposed project identified one primary facility category, transportation facilities, that would significantly violate water quality or discharge standards. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from violation with water quality or discharge standards, it was concluded that the proposed project would create significant adverse indirect impacts from violation with water quality or discharge standards in the district. Because fewer facilities could be built under Alternative D, Alternative D

would generate similar but fewer impacts in terms of violating water quality/discharge standards.

However, as discussed under Alternative A limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to violate water quality or discharge standards. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. As time goes by it is expected that operations at existing sewage treatment facilities might decline because of deteriorating equipment. Further, because existing sewage treatment facilities would not be able to expand and new facilities would most likely not be built in the district in the future, it may be difficult to accommodate future population growth, unless sewage can be transported out of the district. Consequently, in the long term water quality impacts as a result of the inability to expand existing, or construct and operate new sewage treatment facilities would likely be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative D also would be greater than the contribution from the proposed project.

#### ***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The survey of CEQA documents to evaluate the potential impacts from depletion of groundwater supplies or interference with groundwater discharge from the proposed project identified no primary facility categories that would significantly adversely deplete groundwater supplies or interfere with groundwater discharge. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge, it was concluded that the proposed project would create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of depletion of groundwater supplies or interference with groundwater recharge.

Based upon the above information, indirect impacts from future land use projects that have the potential to deplete groundwater supplies as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements.

Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge, but indirect cumulative groundwater impacts would be less than the proposed project.

### ***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns causing erosion or siltation from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns causing erosion or siltation. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of altering existing drainage patterns causing erosion/siltation.

Based upon the above information, indirect impacts from future land use projects that have the potential to alter existing drainage patterns or cause erosion or siltation as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future facilities that have the potential to alter existing drainage patterns causing erosion or siltation, but indirect cumulative erosion or siltation impacts would be less than the proposed project.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns resulting in flooding from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns resulting in flooding. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or

near a location that could create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of altering existing drainage patterns resulting in flooding.

Based upon the above information, indirect impacts from future land use projects that have the potential to alter existing drainage patterns resulting flooding impacts as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to alter existing drainage patterns resulting in flooding, but indirect cumulative flood impacts would be less than the proposed project.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The survey of CEQA documents to evaluate the potential impacts from creating runoff exceeding stormwater drainage systems from the proposed project identified no primary facility categories that would significantly adversely create runoff exceeding stormwater drainage systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems, it was concluded that the proposed project would create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of creating runoff exceeding stormwater drainage systems.

Based upon the above information, indirect impacts from future land use projects that have the potential to create runoff exceeding stormwater drainage systems as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available

from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to create runoff exceeding stormwater drainage systems, but indirect cumulative stormwater impacts would be less than the proposed project.

### ***Degrade Water Quality***

The survey of CEQA documents to evaluate the potential impacts from degradation of water quality from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely impact water quality. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water quality impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water quality in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of degrading water quality.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future projects that have the potential to degrade water quality. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were approximately 70 pending permit applications for a wide variety of types of projects at sewage treatment plants. The number and types of projects at sewage treatment facilities that were previously on hold are summarized in the "Violate Water Quality/Discharge Standards" subsection above.

As time goes by it is expected that the probability of future facilities degrading water quality could potentially increase. Consequently, under Alternative D, new indirect water degradation impacts resulting from aging equipment are considered to be significant and greater than the impacts of the proposed project. The contribution to cumulative impacts from Alternative D also would be greater than the contribution from the proposed project.

### ***Placing Housing in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from placing housing in 100-year flood area from the proposed project identified no primary facility categories

that would significantly adversely place housing in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from placing housing in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from placing housing in 100-year flood area in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of placing housing in 100-year flood area.

Based upon the above information, indirect impacts from placing housing in 100-year floor areas as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to induce population growth resulting in housing being placed in 100-year flood areas, but indirect cumulative flood risks to housing impacts would be significant, but less than the proposed project.

### ***Impede Flows in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from impeding flow in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely impede flow in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from impeding flow in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from impeding flow in 100-year flood area in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of impeding flows in 100-year flood area.

Based upon the above information, indirect impacts from future land use projects that have the potential to be located in 100-year flood areas, thus, impeding flood flows as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but

less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to be located in areas where they could impede 100-year floods, but indirect cumulative flood impacts would be less than the proposed project.

### ***Expose People to Flooding Risks***

The survey of CEQA documents to evaluate the potential impacts from exposing people to flooding risks from the proposed project identified no primary facility categories that would significantly adversely expose people to flooding risks. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to flooding risks, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people to flooding risks in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exposing people to flooding risks.

Based upon the above information, indirect impacts from future land use projects that have the potential to expose people to flooding risks as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to expose people to flooding risks, but indirect cumulative flood risk impacts would be less than the proposed project.

### ***Inundation by Seiche, Tsunami, or Mudflow***

The survey of CEQA documents to evaluate the potential impacts from inundation by seiche, tsunami, or mudflow from the proposed project identified one primary facility

category, transportation facilities, that would significantly adversely affect impacts from inundation by seiche, tsunami, or mudflow. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow, it was concluded that the proposed project would create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of inundation by seiche, tsunami, or mudflow.

Based upon the above information, indirect impacts from future land use projects that have the potential to be located in areas susceptible to inundation by seiche, tsunami, or mudflow, as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to expose people to inundation by seiche tsunami, or mudflows, but indirect cumulative inundation impacts would be less than the proposed project.

### ***Exceed Wastewater Treatment Requirements***

The survey of CEQA documents to evaluate the potential impacts from exceeding wastewater treatment requirements from the proposed project identified no primary facility categories that would significantly adversely exceed wastewater treatment requirements. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding wastewater treatment requirements, it was concluded that the proposed project would create significant adverse indirect impacts from exceeding wastewater treatment requirements in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exceeding wastewater or treatment requirements.

On the other hand, projects to improve wastewater capacity also would be restricted because wastewater treatment and distribution facilities are considered essential public services, which qualify for use of offsets from the Priority Reserve under proposed Rule

1309.1. In the long run the impacts would be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative D also would be greater than the contribution from the proposed project.

### ***Require New Wastewater Treatment***

The survey of CEQA documents to evaluate the potential impacts from requiring new wastewater treatment from the proposed project identified no primary facility categories that would significantly require new wastewater treatment. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new wastewater treatment, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new wastewater treatment in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of requiring new wastewater treatment.

Based upon the above information, indirect impacts from future land use projects that have the potential increase demand for new wastewater treatment facilities as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to require new wastewater treatment facilities, but indirect cumulative wastewater impacts would be less than the proposed project.

### ***Require New Stormwater Facilities***

The survey of CEQA documents to evaluate the potential impacts from requiring new stormwater facilities from the proposed project identified no primary facility categories that would significantly require new stormwater facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new stormwater facilities, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new stormwater facilities in the district. Because fewer facilities could be built under

Alternative D, Alternative D would generate similar but fewer impacts in terms of requiring new stormwater facilities.

Based upon the above information, indirect impacts from future land use projects that have the potential to violate increase demand for new stormwater facilities as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available each year compared to the proposed project, resulting in fewer or less significant overall impacts. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to require new stormwater facilities, but indirect cumulative stormwater impacts would be less than the proposed project.

### ***Have Sufficient Water Supplies***

The survey of CEQA documents to evaluate the potential for water supply impacts from the proposed project identified no primary facility categories that would significantly adversely affect water supply. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water supply impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water supply in the district.

Under Alternative D, existing offset accounts would be eliminated and only offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts starting in the year 2009 would be available starting in the year 2010. As a result, offsets would only be available for future replacement of existing water infrastructure equipment.

However, water delivery operations are eligible for offsets as "essential public services" under Rule 1309.1. Offsets, under Rule 1309.1 would not be available for new facilities to accommodate population growth. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were two pending permit applications for equipment at water facilities. Because of insufficient availability of offsets under Alternative D, new equipment used to provide and transport water could not be built, thereby limiting the ability to provide water to accommodate population growth.

Consequently, under Alternative D, indirect water impacts resulting from the inability of public agencies to accommodate future growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative D also would be greater than the contribution from the proposed project.

### ***Have Adequate Wastewater Treatment Capacity***

The survey of CEQA documents to evaluate the potential impacts to wastewater treatment capacity from the proposed project identified no primary facility categories that would significantly adversely affect wastewater treatment capacity. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to wastewater treatment capacity, it was concluded that the proposed project would create significant adverse indirect impacts to wastewater treatment capacity in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of having adequate wastewater treatment capacity.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future projects that have insufficient wastewater treatment capacity. Under Alternative D, existing offset accounts would be eliminated and only offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts starting in the year 2009 would be available starting in the year 2010. As a result, offsets would only be available to for future replacement of existing facilities.

Offsets, however, would not be available for new facilities to accommodate population growth. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were 12 pending permit applications for equipment at sewage treatment facilities.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were 12 pending permit applications for equipment at sewage treatment facilities. As time goes by it is expected that public agencies would be limited in their ability to provide sewage treatment services to accommodate future population growth because of the limited availability of offsets under Alternative D. Consequently, under Alternative D, indirect wastewater supply impacts resulting from the inability of public agencies to accommodate future growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative D also would be greater than the contribution from the proposed project.

## **Alternative E – Limited Offset Availability**

### ***Violate Water Quality/Discharge Standards***

The survey of CEQA documents to evaluate the potential impacts from violation with water quality or discharge standards from the proposed project identified one primary facility category, transportation facilities, that would significantly violate water quality or discharge standards. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from violation with water quality or discharge standards, it was concluded that the proposed project would create significant adverse indirect impacts from violation with water quality or discharge standards in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of violating water quality and discharge standards.

However, as discussed under Alternative A limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to violate water quality. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. As time goes by it is expected that operations at existing sewage treatment facilities might decline because of deteriorating equipment. Consequently, in the long term, water quality impacts as a result of restrictions on the ability to expand existing, or construct and operate new sewage treatment facilities would likely be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative E also would be greater than the contribution from the proposed project.

### ***Deplete Groundwater Supplies/Interfere with Groundwater Recharge***

The survey of CEQA documents to evaluate the potential impacts from depletion of groundwater supplies or interference with groundwater discharge from the proposed project identified no primary facility categories that would significantly adversely deplete groundwater supplies or interfere with groundwater discharge. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge, it was concluded that the proposed project would create significant adverse indirect impacts from depletion of groundwater supplies or interference with groundwater discharge in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of groundwater supplies and interference with groundwater recharge.

Indirect impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge as a result of implementing Alternative E would be less than indirect groundwater impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. Under Alternative E, it is assumed that the same number of new credits would be generated each year as the proposed project and all new credits generated would be used to offset emissions to demonstrate equivalency with federal offset requirements. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect groundwater impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future facilities that have the potential to deplete groundwater supplies or interfere with groundwater recharge as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

#### ***Alter Existing Drainage Patterns Causing Erosion/Siltation***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns causing erosion or siltation from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns causing erosion or siltation. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns causing erosion or siltation in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of altering existing drainage patterns resulting in flooding.

Indirect impacts from future facilities that have the potential to alter existing drainage patterns causing erosion or siltation as a result of implementing Alternative E would be less than indirect erosion or siltation impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant

industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect erosion or siltation impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to alter existing drainage patterns causing erosion or siltation as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Alter Existing Drainage Patterns Resulting in Flooding***

The survey of CEQA documents to evaluate the potential impacts from altering existing drainage patterns resulting in flooding from the proposed project identified no primary facility categories that would significantly adversely alter existing drainage patterns resulting in flooding. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding, it was concluded that the proposed project would create significant adverse indirect impacts from altering existing drainage patterns resulting in flooding in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of altering existing drainage patterns resulting in flooding.

Indirect impacts from future facilities that have the potential to alter existing drainage patterns resulting in flooding as a result of implementing Alternative E would be less than indirect flooding impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect flooding impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future facilities that have the potential to alter existing drainage patterns resulting in flooding as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Create Runoff Exceeding Stormwater Drainage Systems***

The survey of CEQA documents to evaluate the potential impacts from creating runoff exceeding stormwater drainage systems from the proposed project identified no primary

facility categories that would significantly adversely create runoff exceeding stormwater drainage systems. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems, it was concluded that the proposed project would create significant adverse indirect impacts from creating runoff exceeding stormwater drainage systems in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of creating runoff exceeding stormwater drainage systems.

Indirect impacts from future facilities that have the potential to create runoff exceeding stormwater drainage systems as a result of implementing Alternative E would be less than indirect stormwater drainage system impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect stormwater drainage system impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to create runoff exceeding stormwater drainage systems as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Degrade Water Quality***

The survey of CEQA documents to evaluate the potential impacts from degradation of water quality from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely impact water quality. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water quality impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water quality in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of degrading water quality.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse water quality impacts. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. As can be seen in Appendix H,

under the permit moratorium that ended as of January 1, 2010, there were approximately 70 pending permit applications for a wide variety of types of projects at sewage treatment plants. The number and types of projects at sewage treatment facilities that were previously on hold are summarized in the “Violate Water Quality/Discharge Standards” subsection above.

Consequently, under the Alternative E, new indirect water degradation impacts resulting from aging equipment are considered to be significant and greater than the impacts of the proposed project. The contribution to cumulative impacts from Alternative E also would be greater than the contribution from the proposed project.

### ***Placing Housing in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from placing housing in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely place housing in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from placing housing in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from placing housing in 100-year flood area in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of placing housing in 100-year flood area.

Indirect impacts from future facilities that have the potential to promote placing housing in 100-year flood areas as a result of implementing Alternative E would be less than indirect flooding impacts to housing from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect flooding impacts to housing from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to promote placing housing in 100-year flood areas as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Impede Flows in 100-year Flood Area***

The survey of CEQA documents to evaluate the potential impacts from impeding flow in 100-year flood area from the proposed project identified no primary facility categories that would significantly adversely impede flow in 100-year flood area. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from impeding flow in 100-year flood area, it was concluded that the proposed project would create significant adverse indirect impacts from impeding flow in 100-year flood area in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of impeding flows in 100-year areas.

Indirect impacts from future facilities that have the potential to be located in areas that could impede flood flows in 100-year flood areas as a result of implementing Alternative E would be less than indirect flood flow impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect flood flow impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to be located in areas that could impede flood flows in 100-year flood areas as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Expose People to Flooding Risks***

The survey of CEQA documents to evaluate the potential impacts from exposing people to flooding risks from the proposed project identified no primary facility categories that would significantly adversely expose people to flooding risks. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people to flooding risks, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people to flooding risks in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exposing people to flooding risks.

Indirect impacts from future facilities that have the potential to expose people to flooding risks as a result of implementing Alternative E would be less than indirect flooding risk impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect flooding risk impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to expose people to flooding risks as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

#### ***Inundation by Seiche, Tsunami, or Mudflow***

The survey of CEQA documents to evaluate the potential impacts from inundation by seiche, tsunami, or mudflow from the proposed project identified one primary facility category, transportation facilities, that would significantly adversely affect impacts from inundation by seiche, tsunami, or mudflow. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow, it was concluded that the proposed project would create significant adverse indirect impacts from inundation by seiche, tsunami, or mudflow in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of inundation by seiche, tsunami, or mudflow.

Indirect inundation by seiche, tsunami, or mudflow impacts from implementing Alternative E would be less than indirect inundation by seiche, tsunami, or mudflow impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect inundation by seiche, tsunami, or mudflow impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative inundation

by seiche, tsunami, or mudflow impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Exceed Wastewater Treatment Requirements***

The survey of CEQA documents to evaluate the potential impacts from exceeding wastewater treatment requirements from the proposed project identified no primary facility categories that would significantly adversely exceed wastewater treatment requirements. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding wastewater treatment requirements, it was concluded that the proposed project would create significant adverse indirect impacts from exceeding wastewater treatment requirements in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exceeding wastewater treatment requirements.

On the other hand, projects to improve wastewater capacity also would be restricted because wastewater treatment and distribution facilities are considered essential public services, which qualify for use of offsets from the Priority Reserve under proposed Rule 1309.1. In the long run the impacts would be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative E also would be greater than the contribution from the proposed project.

### ***Require New Wastewater Treatment***

The survey of CEQA documents to evaluate the potential impacts from requiring new wastewater treatment from the proposed project identified no primary facility categories that would significantly require new wastewater treatment. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new wastewater treatment, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new wastewater treatment in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of requiring new wastewater treatment.

Indirect impacts from future facilities that have the potential to require new wastewater treatment systems as a result of implementing Alternative E would be less than indirect wastewater treatment impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion

is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect wastewater treatment impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to require new wastewater treatment systems as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Require New Stormwater Facilities***

The survey of CEQA documents to evaluate the potential impacts from requiring new stormwater facilities from the proposed project identified no primary facility categories that would significantly require new stormwater facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring new stormwater facilities, it was concluded that the proposed project would create significant adverse indirect impacts from requiring new stormwater facilities in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of requiring new stormwater facilities.

Indirect impacts from future facilities that have the potential to require new stormwater treatment facilities as a result of implementing Alternative E would be less than indirect stormwater facility impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect stormwater facility impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to require new stormwater treatment facilities as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Have Sufficient Water Supplies***

The survey of CEQA documents to evaluate the potential for water supply impacts from the proposed project identified no primary facility categories that would significantly adversely affect water supply. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse water supply impacts, it was concluded that the proposed project would create significant adverse indirect impacts on water supply in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of having adequate wastewater treatment capacity.

Under Alternative E, existing offset accounts would contain 50 percent of the number of offsets from growth compared to the proposed project, although Alternative E would contain the same number of offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts (see Tables 6-100 and 6-101 in Chapter 6). This means that fewer offsets would be available in the future under Alternative E compared to the proposed project. As a result, fewer offsets would be available for future replacement of existing water infrastructure equipment or building new or expanded facilities to accommodate future population growth. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were two pending permit applications for equipment at water facilities. Because of the potential for insufficient availability of offsets under Alternative E, new equipment used by public agencies to provide and transport water would be limited compared to the proposed project, thereby limiting public agencies' ability to provided water to accommodate population growth. In addition, water delivery operations are eligible for offsets under Rule 1309.1 as "essential public services" even if they are operated by a non-governmental entry, and would be affected by Alternative E.

Consequently, under Alternative E, indirect water supply impacts resulting from the inability of public agencies to accommodate future growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative E also would be greater than the contribution from the proposed project.

### ***Have Adequate Wastewater Treatment Capacity***

The survey of CEQA documents to evaluate the potential impacts to wastewater treatment capacity from the proposed project identified no primary facility categories that would significantly adversely affect wastewater treatment capacity. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create

significant adverse indirect impacts to wastewater treatment capacity, it was concluded that the proposed project would create significant adverse indirect impacts to wastewater treatment capacity in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of having adequate wastewater treatment capacity.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse wastewater treatment capacity impacts.

Under Alternative E, offset accounts would contain 50 percent of the number of offsets from growth compared to the proposed project, although Alternative E would contain the same number of offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts (see Tables 6-100 and 6-101 in Chapter 6). This means that fewer offsets would be available in the future under Alternative E compared to the proposed project. As a result, fewer offsets would be available for new and expanded wastewater treatment facilities to accommodate future population growth.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were 12 pending permit applications for equipment at sewage treatment facilities. As time goes by it is expected that public agencies would be more limited in their ability to provide sewage treatment capacity to accommodate future population growth under Alternative E compared to the proposed project because of the more limited availability of offsets under Alternative E. Consequently, under Alternative E, indirect wastewater treatment capacity impacts resulting from the inability of public agencies to accommodate future growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts from Alternative E also would be greater than the contribution from the proposed project.

## **Land Use and Planning**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse land use and planning impacts. The rationale for this conclusion was as follows. Land use and other planning considerations are determined by local governments, and no land use or planning requirements would be directly altered by the proposed project. Individual development projects subject to the proposed rule and amended rule would still be required to comply with local land use requirements. Facilities will need to comply with any requirements and land use designations in order to obtain any necessary approval or permit for the project. Therefore, there would be no direct or indirect impacts on land use and planning.

The analysis in Subsection 5.10 concludes that the proposed project has the potential to adversely affect land use and planning. Mitigation of land use and planning impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future land use project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant land use and planning impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Physically Divide a Community***

The survey of the 52 CEQA documents shown in Table 5.10-1 did not identify any facilities that physically divided a community. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in physically dividing a community from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Conflict with Land Use Plans/Policy***

The analysis of potentially significant adverse indirect impacts resulting from conflicts with land use plans/policy in the future from implementing the proposed project was based primarily on the review of 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories. The survey of the 52 CEQA documents shown in Table 5.9-1 revealed that retail/services facilities (document #6) and large commercial facilities (document #17) have the potential to create significant adverse indirect impacts resulting from conflicts with land use plans/policy. The CEQA documents for the remaining primary facility categories: agricultural facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts resulting from conflicts with land use plans/policy. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could create impacts resulting from conflicts with land use plans/policy, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Conflict with Habitat Conservation Plans***

The survey of the 52 CEQA documents shown in Table 5.10-1 did not identify any facilities that conflicted with habitat conservation plans. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a

snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in conflicts with habitat conservation plans from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to land use and planning could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to land use and planning.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, land use and planning impacts are considered to be significant. Starting May 1, 2012, there would be no change to current land use planning practices because the past permit moratorium would be expected to be reinstated and continue into the future. The practical effect of the No Project Alternative is that after May 1, 2012, facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes that no new future projects that previously obtained offsets from the SCAQMD's internal accounts would be constructed and operated under the No Project Alternative. Consequently, after May 1, 2012, impacts from the No Project Alternative are not significant and less than the proposed project.

### ***Physically Divide a Community***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the

issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to physically divide a community are considered to be significant. Starting May 1, 2012, new future projects that previously had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be no newly constructed facilities in the future that could physically divide any communities as a result of implementing Alternative A. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could physically divide any communities in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Conflict with Land Use Plans/Policy***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to conflict with land use plans or policies are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 there would be no newly constructed facilities in the future that could conflict with land use plans or policies as a result of implementing Alternative A. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could conflict with land use plans or policies in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Conflict with Habitat Conservation Plan***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to conflict with habitat conservation plans are considered to be significant. Starting May 1, 2012, new future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be no newly constructed facilities in the future that could cause indirect conflict impacts with habitat conservation plans, so under the No Project Alternative potentially significant adverse indirect impacts that could conflict with habitat conservation plans would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Physically Divide a Community***

The survey of CEQA documents to evaluate the potential land use and planning impacts from future projects physically dividing a community from the proposed project identified no primary facility categories that would significantly adversely divide a community. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse land use and planning impacts from physically dividing a community, it was concluded that the proposed project would create significant adverse indirect land use and planning impacts from physically dividing a community.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to physically divide communities compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects, if large enough, could be located in or near areas and,

therefore, may have the potential to physically divide local communities to a certain extent, resulting in adverse land use impacts. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production

For the above reasons, it is concluded that Alternative B would create significant adverse indirect land use impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to physically divide a community is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Land Use Plans/Policy***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with land use plans or policy from the proposed project identified the following primary facility categories that would significantly adversely conflict with land use plans or policy: retail/service facilities and large commercial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with land use plans or policy, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with land use plans or policy.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to conflict with land use plans and policies compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could be located areas that may conflict with land use plans or policies, resulting in adverse indirect impacts to such resources. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect land use impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to conflict with land use plans and policies, is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Habitat Conservation Plan***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with habitat conservation plans.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to conflict with habitat conservation plans compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects that have the potential to conflict with habitat conservation plans. For example, a number of emission reduction projects could be located in or near areas that could conflict with habitat conservation plans, resulting in adverse land use impacts (and adverse biological resources impacts). Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect land use impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities and emission reduction projects that have the potential to conflict habitat conservation plans is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Physically Divide a Community***

The survey of CEQA documents to evaluate the potential land use and planning impacts from future projects physically dividing a community from the proposed project identified no primary facility categories that would significantly adversely divide a community. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse land use and planning impacts from physically dividing a community, it was concluded that the proposed project would create significant adverse indirect land use and planning impacts from physically

dividing a community. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities physically dividing communities compared to the proposed project.

Based upon the above information, potential indirect impacts from future affected facilities physically dividing communities as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities physically dividing communities as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with Land Use Plans/Policy***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with land use plans or policy from the proposed project identified the following primary facility categories that would significantly adversely conflict with land use plans or policy: retail/service facilities and large commercial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with land use plans or policy, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with land use plans or policy. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that have the potential to conflict with land use plans or policies compared to the proposed project.

Based upon the above information, potential indirect impacts from future affected facilities that have the potential to conflict with land use plans or policies as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to conflict with land use plans or policies as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with habitat conservation plans. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that have the potential to conflict with habitat conservation plans compared to the proposed project.

Based upon the above information, potential indirect impacts from future affected facilities that have the potential to conflict with habitat conservation plans as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to conflict with habitat conservation plans as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Physically Divide a Community***

The survey of CEQA documents to evaluate the potential land use and planning impacts from future projects physically dividing a community from the proposed project identified no primary facility categories that would significantly adversely divide a community. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse land use and planning impacts from physically dividing a community, it was concluded that the proposed project would create significant adverse indirect land use and planning impacts from physically dividing a community. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts from physically dividing a community.

Based upon the above information, indirect impacts from future projects that could physically divide a community as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to physically divide communities, but indirect cumulative community impacts would be less than the proposed project.

### ***Conflict with Land Use Plans/Policies***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with land use plans or policy from the proposed project identified the following primary facility categories that would significantly adversely conflict with land use plans or policy: retail/service facilities and large commercial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with land use plans or policy, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with land use plans or policy. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to land use plans or policies.

Based upon the above information, indirect impacts from future projects that could conflict with land use plans or policies as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is

likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to conflict with land use plans, policies, etc., but indirect cumulative land use impacts would be less than the proposed project.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with habitat conservation plans. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of conflicts with habitat conservation plans.

Based upon the above information, indirect impacts from future projects that could conflict with habitat conservation plans as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to conflict with habitat conservation plans, but indirect cumulative habitat plan conflict impacts would be less than the proposed project.

## **Alternative E – Limited Offset Availability**

### ***Physically Divide a Community***

The survey of CEQA documents to evaluate the potential land use and planning impacts from future projects physically dividing a community from the proposed project identified no primary facility categories that would significantly adversely divide a community. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse land use and planning impacts from physically dividing a community, it was concluded that the proposed project would create significant adverse indirect land use and planning impacts from physically dividing a community. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts from physically dividing a community.

Indirect impacts from future facilities that have the potential to physically divide communities as a result of implementing Alternative E would be less than indirect community impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, project-specific indirect community impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to physically divide communities implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Land Use Plans/Policy***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with land use plans or policy from the proposed project identified the following primary facility categories that would significantly adversely conflict with land use plans or policy: retail/service facilities and large commercial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with land use plans or policy, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with land use plans

or policy. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of conflicts with land use plans and policies.

Indirect impacts from future facilities that have the potential to conflict with land use plans or policies as a result of implementing Alternative E would be less than indirect land use plan conflict impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect land use plan conflict impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to conflict with land use plans or policies as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with habitat conservation plans from the proposed project identified no primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with habitat conservation plans. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of conflicts with habitat conservation plans.

Indirect impacts from future facilities that have the potential to conflict with habitat conservation plans or policies as a result of implementing Alternative E would be less than indirect habitat conservation plan impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant

industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect habitat conservation plan impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future facilities that have the potential to conflict with habitat conservation plans or policies as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Mineral Resources**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse mineral resources impacts. The rationale for this conclusion was as follows. There are no provisions in the proposed project that would directly result in the loss of availability of a known mineral resource of value to the region and the residents of the state, or of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan. The analysis in Subchapter 5.11 concludes, however, that the proposed project has the potential to generate significant adverse cumulative mineral resources impacts.

#### ***Loss of Availability of Known Mineral Resources***

The survey of the 52 CEQA documents shown in Table 5.11-1 did not identify any facilities that created significant losses of availability of known mineral resources. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significant cumulative loss of availability of known mineral resources from a variety of facility categories that obtain offsets from the SCAQMD's internal accounts, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Loss of Availability of a Locally Important Mineral Resource***

The survey of the 52 CEQA documents shown in Table 5.11-1 did not identify any facilities that created significant losses of availability of locally important mineral resources. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significant cumulative loss of availability of locally important mineral resources from a variety of facility categories that obtain offsets from the SCAQMD's internal account,

the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to mineral resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to mineral resources.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, mineral resources impacts are considered to be significant. Starting May 1, 2012, there would be no impacts to mineral resources in the district because a permit moratorium would be expected to continue into the future. Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes no new future projects that previously obtained offsets from the SCAQMD's internal accounts would be constructed and operated under the No Project Alternative. Consequently, after May 1, 2012, impacts from the No Project Alternative are not significant and less than the proposed project.

### ***Loss of Availability of Known Mineral Resources***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation

pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to generate losses in the availability of known mineral resources are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets because the past permit moratorium would be reinstated and continue into the future. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in the loss of known mineral resources as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in the loss of known mineral resources would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

#### ***Loss of Availability of a Locally Important Mineral Resource***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to generate losses in the availability of locally important mineral resources are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in the loss of availability of a locally important mineral resource as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in the loss of availability of a locally important mineral resource would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

## **Alternative B – Offset User Fees for Large Businesses**

### ***Loss of Availability of Known Mineral Resources***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of known mineral resources from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of known mineral resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of known mineral resources, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of known mineral resources.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar mineral resources impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could result in the loss of locally important mineral resources, resulting in significant adverse mineral resources impacts. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect mineral resources impacts greater than the proposed project. The contribution to cumulative mineral resources impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Loss of Availability of a Locally Important Mineral Resource***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of a locally important mineral resource from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of a locally important mineral resource. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of a locally important mineral resource, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of a locally important mineral resource.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to result in the loss of availability of locally important mineral resource sites delineated in local general plans compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could result in the loss of mineral resources, resulting in significant adverse mineral resources impacts. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect mineral resources impacts greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of the loss of locally important mineral resources is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### **Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

##### ***Loss of Availability of Known Mineral Resources***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of known mineral resources from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of known mineral resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of known mineral resources, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of known mineral resources. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer mineral resources impacts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential mineral resources impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect mineral resources impacts from implementing Alternative C would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Loss of Availability of a Locally Important Mineral Resource***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of a locally important mineral resource from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of a locally important mineral resource. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of a locally important mineral resource, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of a locally important mineral resource. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer locally important mineral resources impacts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential locally important mineral resources impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect locally important mineral resources impacts from implementing Alternative C would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Loss of Availability of Known Mineral Resources***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of known mineral resources from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of known mineral resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of known mineral resources, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of known mineral resources. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to known mineral resources.

Based upon the above information, indirect impacts from future projects that could result in the loss of known mineral resources as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are

that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to result in the loss of availability of known mineral resources, but indirect cumulative mineral resources impacts would be less than the proposed project.

### ***Loss of Availability of a Locally Important Mineral Resource***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of a locally important mineral resource from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of a locally important mineral resource. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of a locally important mineral resource, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of a locally important mineral resource. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to locally important mineral resources.

Based upon the above information, indirect impacts from future projects that could result in the loss of locally important mineral resource sites delineated in local general plans as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to result in the loss of locally important mineral resources delineated in local

general plans, but indirect cumulative mineral resources impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Loss of Availability of Known Mineral Resources***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of known mineral resources from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of known mineral resources. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of known mineral resources, it was concluded that the proposed project would create significant adverse indirect impacts from the loss of availability of known mineral resources. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to known mineral resources.

Indirect mineral resources impacts from implementing Alternative E would be less than indirect mineral resources impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect mineral resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative mineral resources impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

#### ***Loss of Availability of a Locally Important Mineral Resource***

The survey of CEQA documents to evaluate the potential impacts from the loss of availability of a locally important mineral resource from the proposed project identified no primary facility categories that would significantly adversely generate the loss of availability of a locally important mineral resource. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from the loss of availability of a locally important mineral resource, it was concluded that the proposed project would create significant adverse indirect

impacts from the loss of availability of a locally important mineral resource. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to locally important mineral resources.

Indirect locally important mineral resources impacts from implementing Alternative E would be less than indirect locally important mineral resources impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect locally important mineral resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative locally important mineral resources impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Noise**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse noise impacts for the following reasons. The proposed project could allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal accounts. These individual projects could result in an increase in vehicle trips (both passenger vehicles and trucks) on local roadways, which in turn could result in an increase in noise levels. The individual projects could also cause noise impacts from operation of heavy machinery, cooling towers, HVAC units, etc. Additionally, construction noise could be generated by the broad array of powered, noise-producing mechanical equipment typically used in the construction phase. Because the district encompasses a large area, the potential exists for sensitive receptors to be located within 500 feet of a construction area although it is not possible to determine what specific effects could occur, if any, in the absence of specific information relating to future development activities.

The analysis in subchapter 5.12 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of noise impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant noise impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Exceeds Local Noise Standards***

The survey of the 52 CEQA documents shown in Table 5.12-1 revealed that large commercial facilities (documents #15 and #19); entertainment/recreational facilities (document #20); and institutional facilities (document #33) have the potential to create significant adverse indirect impacts from facilities causing an exceedance of local noise standards. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from facilities causing an exceedance of local noise standards in the future. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could create impacts from exceedances of local noise standards, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Expose Persons to Excessive Noise/Vibration***

The survey of the 52 CEQA documents shown in Table 5.12-1 revealed that large commercial facilities (documents #16 and #19) and institutional facilities (documents #27 and #28) have the potential to create significant adverse indirect impacts from facilities that could expose persons to excessive noise/vibration in the future. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; entertainment facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from facilities that could expose persons to excessive noise/vibration in the future. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could create impacts exposing persons to excessive noise/vibration in the future, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Permanently Increase Ambient Noise Levels***

The survey of the 52 CEQA documents shown in Table 5.12-1 revealed that retail/services facilities (document #5); large commercial facilities (documents #16 and #19); entertainment/recreational facilities (documents #20 and #21); and institutional facilities (documents #32, #33, and #37) have the potential to create significant adverse indirect impacts from facilities that could permanently increase ambient noise levels in the future. The CEQA documents for the remaining primary facility categories: agricultural facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from facilities that could permanently increase ambient noise levels in the

future. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could permanently increase ambient noise levels in the future, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

#### ***Temporary/Periodic Increase in Noise Levels***

The survey of the 52 CEQA documents shown in Table 5.12-1 revealed that retail/services facilities (document #4); large commercial facilities (documents #12, #15, #16, #17, and #19); entertainment/recreational facilities (documents #20, #21, #22, and #23); institutional facilities (documents #25, #26, #27, #28, #29, #31, #32, #33, and #37); and light industrial/warehouse facilities (document #49) have the potential to create significant adverse indirect impacts from facilities that could cause a temporary/periodic increase noise levels in the future. The CEQA documents for the remaining primary facility categories: agricultural facilities; utility facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from facilities that could temporary/permanent increases in noise levels in the future. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could permanently increase ambient noise levels in the future, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

#### ***Expose People in Areas near Public Airports to Excessive Noise***

The survey of the 52 CEQA documents shown in Table 5.12-1 did not identify any facilities that would expose people in areas near public airports to excessive noise. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significant exposure of people in areas near public airports to excessive noise from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Expose People in Areas near Private Airports to Excessive Noise***

The survey of the 52 CEQA documents shown in Table 5.12-1 did not identify any facilities that would expose people in areas near private airports to excessive noise. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significant exposure of people in areas near private airports to excessive noise from a variety of

facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to noise could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to noise.

### **Alternative A – No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

After May 1, 2012, a permit moratorium would likely be implemented and continue into the future. Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes no new future projects that previously obtained offsets from the SCAQMD's internal accounts would be constructed and operated under the No Project Alternative. Consequently, after May 1, 2012, impacts from the No Project Alternative are not significant and less than the proposed project.

### ***Exceeds Local Noise Standards***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to exceed local noise standards are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in exceedances of local noise standards as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in exceedances of local noise standards would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Expose Persons to Excessive Noise/Vibration***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential expose persons to excessive noise or vibration are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in exposing persons to excessive noise or vibration as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in exposing persons to excessive noise or vibration would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Permanently Increase Ambient Noise Levels***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the

issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to permanently increase noise levels are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in permanently increase noise levels as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in permanently increase noise levels would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Temporary/Periodic Increase in Noise Levels***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to temporarily or periodically increase noise levels are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in temporarily or periodically increases in noise levels as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in noise impacts would not

be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

***Expose People in Areas near Public Airports to Excessive Noise***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to expose people in areas near public airports to excessive noise levels are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that would indirectly result in exposing people in areas near public airports to excessive noise levels as a result of implementing Alternative A, so under the No Project Alternative potential future impacts that could result in exposing people in areas near public airports to excessive noise levels would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

***Expose People in Areas near Private Airports to Excessive Noise***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, XXX impacts are

considered to be significant. Starting May 1, 2012, no future facilities that would have obtained offsets from the SCAQMD's internal accounts would be constructed and operated. There could, however, be a small, but not significant, increase in operations at existing facilities (and associated increases that could expose people in areas near private airports to excessive noise levels). However, indirect temporary or periodic increases in noise levels through increases in operations are not expected to expose people in areas near private airports to excessive noise levels.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Exceeds Local Noise Standards***

The survey of CEQA documents to evaluate the potential impacts from future projects exceeding local noise standards from the proposed project identified the following primary facility categories that would significantly adversely exceed local noise standards: large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding local noise standards, it was concluded that the proposed project would create significant adverse indirect impacts from future projects exceeding local noise standards.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to exceed local noise standards compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could include noise intensive equipment, resulting in significant adverse noise impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect noise impacts that could exceed local noise standards greater than the proposed project. The contributions to cumulative noise impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Expose Persons to Excessive Noise/Vibration***

The survey of CEQA documents to evaluate the potential impacts from exposing persons to excessive noise or vibration from the proposed project identified the following

primary facility categories that would significantly adversely expose persons to excessive noise or vibration: large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing persons to excessive noise or vibration, it was concluded that the proposed project would create significant adverse indirect impacts from exposing persons to excessive noise or vibration.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to expose persons to excessive noise or vibrations compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could include equipment or processes that produce excessive noise or vibrations, resulting in significant adverse noise or vibration impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts due to exposure to excessive noise or vibrations greater than the proposed project. The contribution to cumulative impacts from Alternative B from future facilities that could expose people to excess noise or vibration is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Permanently Increase Ambient Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from permanently increasing ambient noise levels from the proposed project identified the following primary facility categories that would significantly adversely permanently increase ambient noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from permanently increasing ambient noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from permanently increasing ambient noise levels.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to permanently increase ambient noise levels compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example,

a number of emission reduction projects could include noise generating equipment or processes, resulting in significant adverse permanent noise impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect permanent noise impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities that could permanently increase ambient noise levels is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Temporary/Periodic Increase in Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from a temporary or periodic increase in noise levels from the proposed project identified the following primary facility categories that would significantly adversely temporarily or periodically increase noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a temporary or periodic increase in noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from a temporary or periodic increase in noise levels.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to create temporary or periodic increases in noise levels compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, a number of emission reduction projects could include equipment or processes that generate periodic increases in noise levels, resulting in significant adverse noise impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect temporary or permanent noise impacts greater than the proposed project. The contribution to cumulative impacts from future Alternative B facilities that could create temporary or periodic increases in noise levels is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Expose People in Areas near Public Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near public airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near public airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to expose people in areas near public airports to excessive noise compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects that have the potential to expose people in areas near public airports to excessive noise levels. For example, any emission reduction projects located near public airports could expose people to excessive noise levels, resulting in significant adverse noise impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect noise impacts to people located in areas near public airports greater than the proposed project. The contribution to cumulative noise impacts to people in areas near public airports from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Expose People in Areas near Private Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near private airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near private airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to expose people in areas near private airstrips to excessive noise compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, any emission reduction projects located near private airstrips could expose people to excessive noise levels, resulting in significant adverse noise impacts. Such projects include, but are not limited to: wind turbines, anaerobic digester facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect noise impacts to people located in areas near private airstrips greater than the proposed project. The contribution to cumulative noise impacts to people in areas near private airstrips from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

##### ***Exceeds Local Noise Standards***

The survey of CEQA documents to evaluate the potential impacts from future projects exceeding local noise standards from the proposed project identified the following primary facility categories that would significantly adversely exceed local noise standards: large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding local noise standards, it was concluded that the proposed project would create significant adverse indirect impacts from future projects exceeding local noise standards. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer noise impacts compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential noise impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect noise impacts as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Expose Persons to Excessive Noise/Vibration***

The survey of CEQA documents to evaluate the potential impacts from exposing persons to excessive noise or vibration from the proposed project identified the following primary facility categories that would significantly adversely expose persons to excessive noise or vibration: large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing persons to excessive noise or vibration, it was concluded that the proposed project would create significant adverse indirect impacts from exposing persons to excessive noise or vibration. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer noise impacts that could expose persons to excessive noise or vibrations compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential noise impacts that could expose persons to excessive noise or vibrations from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect noise impacts that could expose persons to excessive noise or vibrations as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Permanently Increase Ambient Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from permanently increasing ambient noise levels from the proposed project identified the following primary facility categories that would significantly adversely permanently increase ambient noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from permanently increasing ambient noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from permanently increasing ambient noise levels. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer permanent increases in ambient noise levels compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential indirect impacts from future affected facilities that have the potential to generate permanent increases in ambient noise levels as a result of

implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to generate similar permanent increases in ambient noise levels as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Temporary/Periodic Increase in Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from a temporary or periodic increase in noise levels from the proposed project identified the following primary facility categories that would significantly adversely temporarily or periodically increase noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a temporary or periodic increase in noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from a temporary or periodic increase in noise levels. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that have the potential to create temporary or periodic increases in noise levels compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential indirect impacts from future affected facilities that have the potential to create temporary or periodic increases in noise levels as a result of implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to create temporary or periodic increases in noise levels as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Expose People in Areas near Public Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near public airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near public airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer noise impacts to people in areas near public airports compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential noise impacts to people in areas near public airports from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect noise impacts to people in areas near public airports as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Expose People in Areas near Private Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near private airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near private airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer noise impacts to people in areas near private airstrips compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential noise impacts to people in areas near private airstrips from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to

Rule 1304. The contribution to cumulative indirect noise impacts to people in areas near private airstrips as a result of Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Exceeds Local Noise Standards***

The survey of CEQA documents to evaluate the potential impacts from future projects exceeding local noise standards from the proposed project identified the following primary facility categories that would significantly adversely exceed local noise standards: large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding local noise standards, it was concluded that the proposed project would create significant adverse indirect impacts from future projects exceeding local noise standards. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of local noise standards.

Based upon the above information, indirect impacts from future projects that could exceed local noise standards as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to exceed local noise standards, but indirect cumulative noise impacts would be less than the proposed project.

### ***Expose Persons to Excessive Noise/Vibration***

The survey of CEQA documents to evaluate the potential impacts from exposing persons to excessive noise or vibration from the proposed project identified the following primary facility categories that would significantly adversely expose persons to excessive noise or vibration: large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing persons to excessive noise or vibration, it was concluded that the proposed project would create significant adverse indirect impacts from exposing persons to excessive noise or vibration. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of excessive noise or vibration.

Based upon the above information, indirect impacts from future projects that could expose persons to excessive noise or vibrations as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative noise or vibration impacts, but cumulative noise or vibration impacts less than the proposed project.

### ***Permanently Increase Ambient Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from permanently increasing ambient noise levels from the proposed project identified the following primary facility categories that would significantly adversely permanently increase ambient noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from permanently increasing ambient noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from permanently increasing ambient noise levels. Because fewer facilities could be

built under Alternative D, Alternative D would generate similar but fewer impacts to ambient noise levels.

Based upon the above information, indirect impacts from future projects that could exceed local noise standards as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to permanently increase ambient noise levels, but indirect cumulative noise impacts would be less than the proposed project.

#### ***Temporary/Periodic Increase in Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from a temporary or periodic increase in noise levels from the proposed project identified the following primary facility categories that would significantly adversely temporarily or periodically increase noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a temporary or periodic increase in noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from a temporary or periodic increase in noise levels. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to temporary or periodic increase in noise levels.

Based upon the above information, indirect impacts from future projects that have the potential to create temporary or periodic increases in noise levels as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but

less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to create temporary or periodic increases in noise levels, but indirect cumulative noise impacts would be less than the proposed project.

### ***Expose People in Areas near Public Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near public airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near public airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exposing people in areas near public airports to excessive noise.

Based upon the above information, indirect impacts from future projects that have the potential to expose people in areas near public airports to excessive noise levels as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to expose people in areas near public airports to excessive noise levels, but indirect cumulative noise impacts would be less than the proposed project.

### ***Expose People in Areas near Private Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near private airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near private airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of exposing people in areas near private airports to excessive noise.

Based upon the above information, indirect impacts from future projects that have the potential to expose people in areas near private airstrips to excessive noise levels as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D are expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to expose people in areas near private airstrips to excessive noise levels, but indirect cumulative noise impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Exceeds Local Noise Standards***

The survey of CEQA documents to evaluate the potential impacts from future projects exceeding local noise standards from the proposed project identified the following primary facility categories that would significantly adversely exceed local noise standards: large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exceeding local noise standards, it was concluded that the proposed project would create significant

adverse indirect impacts from future projects exceeding local noise standards. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of local noise standards.

Indirect impacts from future facilities that have the potential to exceed local noise standards as a result of implementing Alternative E would be less than indirect noise impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect noise impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to exceed local noise standards as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Expose Persons to Excessive Noise/Vibration***

The survey of CEQA documents to evaluate the potential impacts from exposing persons to excessive noise or vibration from the proposed project identified the following primary facility categories that would significantly adversely expose persons to excessive noise or vibration: large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing persons to excessive noise or vibration, it was concluded that the proposed project would create significant adverse indirect impacts from exposing persons to excessive noise or vibration. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exposing persons to excessive noise or vibration.

Indirect impacts from future facilities that have the potential to expose persons to excessive noise or vibration as a result of implementing Alternative E would be less than indirect noise or vibration impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect

noise or vibration impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to expose persons to excessive noise or vibration as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Permanently Increase Ambient Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from permanently increasing ambient noise levels from the proposed project identified the following primary facility categories that would significantly adversely permanently increase ambient noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from permanently increasing ambient noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from permanently increasing ambient noise levels. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to ambient noise levels.

Indirect impacts from future facilities that have the potential to permanently increase noise levels as a result of implementing Alternative E would be less than indirect permanent noise impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect permanent noise impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to permanently increase noise levels as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Temporary/Periodic Increase in Noise Levels***

The survey of CEQA documents to evaluate the potential impacts from a temporary or periodic increase in noise levels from the proposed project identified the following primary facility categories that would significantly adversely temporarily or periodically

increase noise levels: retail/service facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a temporary or periodic increase in noise levels, it was concluded that the proposed project would create significant adverse indirect impacts from a temporary or periodic increase in noise levels. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to temporary or periodic increase in noise levels.

Indirect impacts from future facilities that have the potential to temporarily or periodically increase noise levels as a result of implementing Alternative E would be less than indirect temporary or periodic noise impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect temporary or periodic noise impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to temporarily or periodically increase noise levels as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Expose People in Areas near Public Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near public airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near public airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near public airports to excessive noise. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exposing people in areas near public airports to excessive noise.

Indirect impacts from future facilities that have the potential to expose people in areas near public airports to excessive noise levels as a result of implementing Alternative E

would be less than indirect excessive noise impacts to people near airports from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect excessive noise impacts to people near airports from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to expose people in areas near public airports to excessive noise levels as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Expose People in Areas near Private Airports to Excessive Noise***

The survey of CEQA documents to evaluate the potential impacts from exposing people in areas near private airports to excessive noise from the proposed project identified no primary facility categories that would significantly adversely expose people in areas near private airports to excessive noise. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise, it was concluded that the proposed project would create significant adverse indirect impacts from exposing people in areas near private airports to excessive noise. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of exposing people in areas near private airports to excessive noise.

Indirect impacts from future facilities that have the potential to expose people in areas near private airstrips to excessive noise levels as a result of implementing Alternative E would be less than indirect excessive noise impacts to people near private airstrips from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect excessive noise impacts to people near private airstrips from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities

that have the potential to expose people in areas near private airstrips to excessive noise levels as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Population and Housing**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse population and housing impacts. The rationale for this conclusion was as follows. District population will not be affected directly or indirectly as a result of adopting and implementing the proposed project. The proposed project would not directly result in the creation of new uses and facilities that would affect population growth or induce growth. The proposed project is not expected to appreciably affect employment opportunities and, as such, is not expected to result in the relocation or redistribution of population or growth inducement.

The analysis in subchapter 5.13 concludes that the proposed project has the potential to create adverse impacts. Mitigation of population and housing impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant population and housing impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Induce Population Growth***

The survey of the 52 CEQA documents shown in Table 5.13-1 did not identify any facilities that would induce population growth. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significantly inducing population growth from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Displace/Require New Housing***

The survey of the 52 CEQA documents shown in Table 5.13-1 did not identify any facilities that would induce displace/require new housing. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significantly displacing/requiring new

housing from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Displace People and Require New Housing***

The survey of the 52 CEQA documents shown in Table 5.13-1 did not identify any facilities that would displace people and require new housing. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in significantly displacing people and requiring new housing from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to population and housing could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to population and housing.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts.

After May 1, 2012, a permit moratorium would likely be implemented and continue into the future. Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes no new future projects that previously obtained offsets from the SCAQMD's internal accounts would be constructed and operated under the No Project Alternative. Consequently, after May 1, 2012, impacts from the No Project Alternative are not significant and less than the proposed project.

### ***Induce Population Growth***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to induce population growth are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could indirectly induce population growth in the district compared to the proposed project. As a result, impacts that occur from inducing population growth in the district resulting from Alternative A would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Displace/Require New Housing***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to displace or require new housing are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could indirectly displace or require new housing in the district compared to the proposed project. As a result,

indirect impacts that occur from displacing or requiring new housing in the district resulting from Alternative A would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Displace People and Require New Housing***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to displace people and require new housing are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 there would be no newly constructed facilities in the future that could indirectly displace people or require new housing in the district compared to the proposed project. As a result, impacts that occur from displacing people or requiring new housing in the district resulting from Alternative A would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Induce Population Growth***

The survey of CEQA documents to evaluate the potential for population growth impacts from the proposed project identified no primary facility categories that would significantly adversely affect population growth. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse population growth impacts, it was concluded that the proposed project would create significant adverse indirect impacts on population growth.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect population growth impacts compared to the proposed project. The main difference between Alternative B and the proposed project is

Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include the installation of renewable energy projects, which could contribute to the local infrastructure and, therefore, induce population growth. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts from inducing population growth greater than the proposed project. The contribution of cumulative population growth impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Displace/Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace or require new housing from the proposed project identified no primary facility categories that would significantly adversely displace or require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace or require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace or require new housing.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect housing impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include the installation of renewable energy projects, which could contribute to the local infrastructure and, therefore, induce population growth which could result in displacing existing or requiring new housing. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts from inducing population growth that could affect housing to a greater extent than the proposed project. The contribution to cumulative housing impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Displace People and Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace people and require new housing from the proposed project identified no primary facility categories that would significantly adversely displace people and require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace people and require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace people and require new.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to displace people and require new housing compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include the installation of renewable energy projects, which could contribute to the local infrastructure and, therefore, displace local populations, which could increase demand for housing in the displaced population areas. Such projects include, but are not limited to: wind turbines, solar collector facilities, and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts from displacing local population and requiring housing greater than the proposed project. The contribution to cumulative population and housing impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Induce Population Growth***

The survey of CEQA documents to evaluate the potential for population growth impacts from the proposed project identified no primary facility categories that would significantly adversely affect population growth. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse population growth impacts, it was concluded that the proposed project would create significant adverse indirect impacts on population growth. Because fewer facilities

could be built under Alternative C, Alternative C has the potential to induce similar or less population growth compared to the proposed project.

Based upon the above information, potential impacts generated by future affected facilities that have the potential to induce population growth from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts generated by future affected facilities that have the potential to induce population growth as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Displace/Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace or require new housing from the proposed project identified no primary facility categories that would significantly adversely displace or require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace or require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace or require new housing. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from displacing or requiring new housing compared to the proposed project.

Based upon the above information, potential impacts from displacing or requiring new housing as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from displacing or requiring new housing as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Displace People and Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace people and require new housing from the proposed project identified no

primary facility categories that would significantly adversely displace people and require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace people and require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace people and require new housing. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from displacing people or requiring new housing compared to the proposed project.

Based upon the above information, potential impacts from displacing people or requiring new housing from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from displacing people or requiring new housing from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Induce Population Growth***

The survey of CEQA documents to evaluate the potential for population growth impacts from the proposed project identified no primary facility categories that would significantly adversely affect population growth. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse population growth impacts, it was concluded that the proposed project would create significant adverse indirect impacts on population growth. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to population growth.

Based upon the above information, indirect impacts from future projects that have the potential to induce population growth as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated

from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to induce population growth, but indirect cumulative population growth impacts would be less than the proposed project.

### ***Displace/Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace or require new housing from the proposed project identified no primary facility categories that would significantly adversely displace or require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace or require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace or require new housing. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of displacing or requiring new housing.

Based upon the above information, indirect impacts from future projects that have the potential to displace or require new housing as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contributions to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to displace or require new housing, but indirect cumulative housing impacts would be less than the proposed project.

### ***Displace People and Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace people and require new housing from the proposed project identified no primary facility categories that would significantly adversely displace people and require

new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace people and require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace people and require new housing. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of displacing people and requiring new housing.

Based upon the above information, indirect impacts from future projects that have the potential to displace people and require new housing as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to displace people and require new housing, but indirect cumulative population displacement impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Induce Population Growth***

The survey of CEQA documents to evaluate the potential for population growth impacts from the proposed project identified no primary facility categories that would significantly adversely affect population growth. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse population growth impacts, it was concluded that the proposed project would create significant adverse indirect impacts on population growth. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to population growth.

Indirect impacts from future facilities that have the potential to induce new population growth as a result of implementing Alternative E would be less than indirect population growth impacts from the proposed project because fewer facilities would be constructed

and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect population growth impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to induce new population growth as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Displace/Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace or require new housing from the proposed project identified no primary facility categories that would significantly adversely displace or require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace or require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace or require new housing in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of displacing or requiring new housing.

Indirect impacts from future facilities that have the potential to displace or require new housing as a result of implementing Alternative E would be less than indirect housing impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect housing impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contributions to cumulative impacts from future facilities that have the potential to displace or require new housing as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Displace People and Require New Housing***

The survey of CEQA documents to evaluate the potential impacts from future projects that displace people and require new housing from the proposed project identified no primary facility categories that would significantly adversely displace people and require new housing. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects that displace people and require new housing, it was concluded that the proposed project would create significant adverse indirect impacts from future projects that displace people and require new housing. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of displacing people and requiring new housing.

Indirect impacts from future facilities that have the potential to displace people and require new housing as a result of implementing Alternative E would be less than indirect displacement and housing impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offsets demand exceeds 50 percent of the 2007 AQMP growth projections for relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect displacement and housing impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to displace people and require new housing as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Public Services**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse public services impacts for the following reasons. The proposed project could allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal accounts. The representative facilities are commercial or industrial projects that could require an increase in the demand for public services, which, depending on their location, may require the construction of new public service facilities or expansion of existing public services facilities. Specifically, operation of the future development could result in an increased demand for fire or police services. Further, construction activities associated

with new development could affect emergency vehicle access and delay police and fire response times due to additional traffic congestion.

The analysis in Subchapter 5.13 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of public services impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant public services impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

#### ***Adverse indirect impacts to Fire Protection***

The survey of the 52 CEQA documents shown in Table 5.14-1 revealed that no primary facility categories were shown to adversely affect fire protection resources. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in facilities adversely affecting fire protection resources in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Adverse indirect impacts to Police Protection***

The survey of the 52 CEQA documents shown in Table 5.14-1 revealed that no primary facility categories were shown to adversely affect police protection resources. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in facilities adversely affecting police protection resources in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Adverse indirect impacts to Schools***

The survey of the 52 CEQA documents shown in Table 5.14-1 revealed that no primary facility categories were shown to adversely affect schools. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in facilities adversely affecting schools in

the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Adverse indirect impacts to Parks***

The survey of the 52 CEQA documents shown in Table 5.14-1 revealed that entertainment/recreation facilities (document #21) have the potential to create significant adverse indirect impacts to parks. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts to parks. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could adversely affect parks, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

#### ***Adverse indirect impacts to Other Public Facilities***

The survey of the 52 CEQA documents shown in Table 5.14-1 revealed that no primary facility categories were shown to adversely affect other public facilities. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in facilities adversely affecting other public facilities in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

#### ***Cumulative Impacts***

Project impacts to public services could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to public services.

#### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 is in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably

foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts.

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes that no facilities that previously obtained credits pursuant to Rules 1304 or 1309.1 would be built.

The inability to approve permits for future facilities that previously would have accessed the SCAQMD's internal accounts, would result in existing facilities' inability to replace existing equipment beyond its useful lifetime or install new equipment to further accommodate population growth. Similarly, new facilities could not be constructed.

### ***Adverse Indirect Impacts to Fire Protection***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to increase hazards, as discussed in the "Hazards and Hazardous Materials" discussions, are considered to be significant. Since fire departments are first responders to hazardous materials incidents, they would have to respond increasingly to hazardous materials events as result of increasing breakdowns of aging equipment. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district that could increase hazardous materials incidents that could increase the demand for fire protection services when compared to the proposed project.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration,

at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could increase hazardous materials incidents, especially equipment that has already been in operation for a number of years. For example, most of the existing refineries in the district have equipment that has been operating for decades and, as such, may experience accidental fires from combustion sources such as boilers, gas turbines, etc. Further, pending permit applications in Appendix H show that one refinery is proposing to replace two older high emitting and potentially increasingly unsafe cogeneration units and four boilers with new, state-of-the-art equipment that are more efficient, have substantially lower emissions, and are inherently safer.

Another potential indirect hazard impact is associated with installation of backup flares, which require permits from the SCAQMD. Under certain circumstances, flares are considered safety equipment. For example, in the event of dangerous increases in pressure in some refinery operations, excess gases and vapors may be vented to an emergency backup flare to prevent explosions and fires. Similarly, flares used as in an emergency backup capacity to prevent explosions or fires if other types of equipment, e.g., gas turbines, internal combustion engines, boilers, etc., are used as the primary control equipment. As indicated in Appendix H there were four permit applications for backup flares, two at landfills and two at sewage treatment facilities.

As time goes by it is expected that the probability of hazardous materials incidents requiring emergency responders such as fire departments could potentially increase. Further, new or expanded fire service facilities could not be constructed. Consequently, under the No Project Alternative, new indirect impacts to fire protection services are considered to be significant and greater than the impacts of the proposed project.

#### ***Adverse Indirect Impacts to Police Protection***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. However, after May 1, 2012, offsets could not be provided for new or expanded police facilities. As a result, police departments would not be able to provide sufficient services to accommodate anticipated population growth. Consequently, under the No Project Alternative, new indirect

impacts to police protection are considered to be significant and greater than the impacts of the proposed project.

### ***Adverse Indirect Impacts to Schools***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to create adverse indirect impacts to schools are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. As a result, the ability of local school districts to build new schools in the future to accommodate student population growth would likely be severely restricted because schools, which are defined as essential public services, qualify for offsets pursuant to Rule 1309.1. Consequently, under the No Project Alternative school districts would have to purchase credits on the open market, which could interfere with the school districts' ability to modernize, expand, or build new schools.

Consequently, under the No Project Alternative, new indirect impacts to schools are considered to be significant.

### ***Adverse Indirect Impacts to Parks***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, create adverse indirect impacts to parks are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be no newly constructed facilities in the future that could adversely affect parks as a result of implementing Alternative A. Parks do not typically require SCAQMD permits. For example, there are no pending permits for equipment located at parks identified in Appendix H. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could occur to parks in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

#### ***Adverse Indirect Impacts to Other Public Facilities***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to create adverse indirect impacts to other public facilities are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, the ability of a number of types of public agencies to continue to efficiently provide services in the future to would likely be severely restricted.

As shown in Appendix H and the following bullet points, after May 1, 2012, the following types of public agencies could be adversely affected by the No Project Alternative: cities and county agencies, hospitals.

- Los Angeles International Airport has put on hold a project to replace boilers and gas turbines that would reduce emissions compared to existing equipment and generate electricity more efficiently.

- The Department of General Services of City of Los Angeles has put on hold a project to install an emergency generator for LNG fueling station. The net effect is that an LNG fueling station that would serve LNG vehicles replacing diesel-fueled vehicles is delayed.
- The Riverside County Department of Facilities Management has put on hold a project to install three generators. The effect of this delay is that there could be a lack of backup power that could affect health and safety services.
- Department of Public Works' Bureau of Sanitation for City of Los Angeles has put on hold a project to install an emergency generator at LNG/CNG fueling facility. The net effect is that an LNG fueling station that would serve LNG vehicles replacing diesel-fueled vehicles is delayed.
- There was a permit application from the City of Anaheim pending for the installation of a service station and gasoline storage and dispensing.
- The City of Claremont has submitted permit applications, which were pending for the following types of equipment: one boiler less than two million British thermal units per hour (MM BTU/Hr); three emergency backup internal combustion engines (ICE) (50-500 HP); and two emergency backup ICEs (greater than 500 HP). Emergency backup generators typically provide electricity to continue operations in the event of an electricity outage.
- There was a permit application from the City of Pacoima pending for the installation of a paint and solvent spray booth.
- There was a permit application from the City of Downey pending for the installation of one emergency backup ICE (greater than 500 HP).
- There was a permit application from the City of Westminster pending for the installation of one emergency backup ICE (greater than 500 HP).

Other examples of public service facilities that would be adversely affected after May 1, 2012, by the No Project Alternative are hospitals and medical services facilities. As shown in Appendix H and the following bullet points there were a number of pending permits for projects at hospitals that could adversely affect operations and care of patients at hospitals located in the district. Operations jeopardizing patient care in the future could become more acute in the future as existing equipment becomes inoperative, but no replacement equipment can be permitted.

- Permit applications from Providence Holy Cross Medical Center were on hold for the installation of replacement burners on two existing boilers, which are typically used

to provide heating, with new state of the art, cleaner burners. This project would not only reduce emissions, but would improve efficiency and reliability.

- Permit applications from Beach Cities Health District were on hold for the installation of three boilers to provide additional heat capacity to the health care district.
- Permit applications from Beckman Coulter, Inc. Medical Services were on hold for the installation of chemical synthesis, purification and drying systems.
- Permit applications from Diversified Silicone Products Inc. Medical Services were on hold for the installation of an oven used to manufacture medical industry products.
- Permit applications from GIP 7th Street Medical Services were on hold for the installation of three emergency backup generators for use during power outages to safeguard medical and other types of records.
- Permit applications from Glendale Adventist Medical Center were on hold for the installation of emergency generators to provide additional back-up power for use during power outages.
- Permit applications from Kaiser Permanente Ontario Vineyard Medical Center were on hold for the installation of a boiler to provide additional heat capacity for medical center.
- Permit applications from Paragon Labs, Natural Life Eco Vite Labs Medical Services were on hold for the installation of an oven and a mixer to manufacture dietary supplements.
- Permit applications from Rancho Specialty Hospital were on hold for the installation of emergency generator to provide additional back-up power for use during power outages.
- Permit applications from Varian Inc. Medical Services were on hold for the installation of an oven to manufacture chemical substances for medical/health testing.

As a result, under the No Project Alternative a number of types of public services is expected to be severely restricted after May 1, 2012. Further, as time goes by it is expected that the probability of existing permitted equipment reaching the end of its useful life will increase, interfering with city and county agencies' and hospitals' abilities to continue to provide heating, cooling and backup electricity. In the long term, it is expected that indirect impacts to new and existing public services providers from the No Project Alternative would be greater than for the proposed project.

## **Alternative B – Offset User Fees for Large Businesses**

### ***Adverse Indirect Impacts to Fire Protection***

The survey of CEQA documents to evaluate the potential for fire protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect fire protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse fire protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on fire protection.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to fire protection compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include facilities that handle hazardous or flammable materials, which, in the event of an accidental release, could increase the demands on local fire departments to respond to hazardous materials releases or fires. Such projects include, but are not limited to installation of: alternative fuel refueling stations, biosolids energy production and phosphoric acid fuel cells.

For the above reasons, it is concluded that Alternative B would create significant adverse local fire department impacts greater than the proposed project. The contribution to cumulative impacts to local fire departments from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adverse Indirect Impacts to Police Protection***

The survey of CEQA documents to evaluate the potential for police protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect police protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse police protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on police protection.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts compared to the proposed project. The main

difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include facilities that handle hazardous or flammable materials, which, in the event of an accidental release, could increase the demands on local police departments to assist local fire departments to respond to hazardous materials releases or fires. Such projects include, but are not limited to installation of: alternative fuel refueling stations, biosolids energy production, and phosphoric acid fuel cells.

For the above reasons, it is concluded that Alternative B would create significant adverse local police department impacts greater than the proposed project. The contribution to cumulative impacts to local police departments from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Adverse Indirect Impacts to Schools***

The survey of CEQA documents to evaluate the potential impacts to schools from the proposed project identified no primary facility categories that would significantly adversely affect schools. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to schools, it was concluded that the proposed project would create significant adverse indirect impacts to schools in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to schools compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include facilities that handle hazardous or flammable materials, which, in the event of an accidental release, could adversely affect any nearby schools. As noted in item VIII. c., Alternative B has the potential result in locating future representative facilities and emission reduction projects that have the potential to emit hazardous materials within one-quarter mile of nearby schools. Such projects include, but are not limited to installation of: alternative fuel refueling stations, biosolids energy production and phosphoric acid fuel cells.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts to schools greater than the proposed project. The contribution to cumulative impacts to local schools from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined

effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adverse Indirect Impacts to Parks***

The survey of CEQA documents to evaluate the potential impacts to parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly adversely affect parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to parks, it was concluded that the proposed project would create significant adverse indirect impacts to parks.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to parks compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include facilities that handle hazardous or flammable materials, which, in the event of an accidental release, could adversely affect any nearby parks. Such projects include, but are not limited to installation of: alternative fuel refueling stations, biosolids energy production and phosphoric acid fuel cells.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts to parks greater than the proposed project. The contribution to cumulative impacts to parks from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adverse Indirect Impacts to Other Public Facilities***

The survey of CEQA documents to evaluate the potential impacts to other public facilities from the proposed project identified no primary facility categories that would significantly adversely affect other public facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to other public facilities, it was concluded that the proposed project would create significant adverse indirect impacts to other public facilities.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts to other public facilities compared to the proposed project. The main difference between Alternative B and the proposed project

is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include facilities that handle hazardous or flammable materials, which, in the event of an accidental release, could adversely affect other public facilities. Such projects include, but are not limited to installation of: alternative fuel refueling stations, biosolids energy production and phosphoric acid fuel cells. In addition, to the extent that the category of other public facilities includes services related hazardous materials incidences, services and response times could also be adversely affected by Alternative B.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts to other public services greater than the proposed project. The contribution to cumulative impacts to other public facilities from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Adverse Indirect Impacts to Fire Protection***

The survey of CEQA documents to evaluate the potential for fire protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect fire protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse fire protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on fire protection. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to local fire departments compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local fire departments. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts to local fire departments from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to local fire departments as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from

qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Adverse Indirect Impacts to Police Protection***

The survey of CEQA documents to evaluate the potential for police protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect police protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse police protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on police protection. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to local police departments compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local police departments. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts to local police departments from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to local police departments as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Adverse Indirect Impacts to Schools***

The survey of CEQA documents to evaluate the potential impacts to schools from the proposed project identified no primary facility categories that would significantly adversely affect schools. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to schools, it was concluded that the proposed project would create significant adverse indirect impacts to schools. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to local schools compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local schools.

Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts to local schools from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to local schools from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### ***Adverse Indirect Impacts to Parks***

The survey of CEQA documents to evaluate the potential impacts to parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly adversely affect parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to parks, it was concluded that the proposed project would create significant adverse indirect impacts to parks. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to local parks compared to the proposed project.

Based upon the above information, potential impacts to local parks from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to local parks as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### ***Adverse Indirect Impacts to Other Public Facilities***

The survey of CEQA documents to evaluate the potential impacts to other public facilities from the proposed project identified no primary facility categories that would significantly adversely affect other public facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to other public facilities, it was concluded that the proposed project would create significant adverse indirect impacts to other public facilities. Because

fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to other public facilities compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to other public facilities. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts to other public facilities from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to other public facilities as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Adverse Impacts to Fire Protection***

The analysis of potential fire protection impacts as a result of implementing Alternative D is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for fire protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect fire protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse fire protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on fire protection. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to fire protection.

However, as discussed under Alternative A limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local fire departments. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D.

Under Alternative D, existing offset accounts would be eliminated and only offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts starting in the year 2009 would be available starting in the year 2010. As a result, offsets would only be available to for future replacement of existing fire protection facilities.

Offsets, however, would not be available for new facilities to accommodate population growth. This means that no new or expanded facilities for fire protection services could be built in the future.

Consequently, under Alternative D, adverse effects to fire services are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the project's contribution.

### ***Adverse Impacts to Police Protection***

The survey of CEQA documents to evaluate the potential for police protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect police protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse police protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on police protection. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to police protection.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local police departments because of the inability to obtain permits for new or expanded police facilities.

Under Alternative D, existing offset accounts would be eliminated and only offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts starting in the year 2009 would be available starting in the year 2010. As a result, offsets would only be available to for future replacement of existing police departments.

Offsets, however, would not be available for new facilities to accommodate population growth. This means that no new or expanded police protection services could be built in the future.

Consequently, under Alternative D, adverse effects to police protection services are considered to be significant and greater than the proposed project. The contribution to cumulative effects also would be greater than the project's contribution.

### ***Adverse Impacts to Schools***

The survey of CEQA documents to evaluate the potential impacts to schools from the proposed project identified no primary facility categories that would significantly

adversely affect schools. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to schools, it was concluded that the proposed project would create significant adverse indirect impacts to schools. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to schools.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources to accommodate future growth could also potentially result in adverse impacts to local schools because fewer offsets would be available compared to the proposed project. As time goes by and population growth occurs, it is expected that the ability of school districts to expand or build new schools would be adversely affected. Consequently, under Alternative D, adverse effects to schools are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

### ***Adverse Impacts to Parks***

The survey of CEQA documents to evaluate the potential impacts to parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly adversely affect parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to parks, it was concluded that the proposed project would create significant adverse indirect impacts to parks. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to parks.

Based upon the above information, indirect impacts from future projects that have the potential to adversely affect local or regional parks as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to adversely

affect local or regional parks, but indirect cumulative park facility impacts would be less than the proposed project.

### ***Adverse Impacts to Other Public Facilities***

The survey of CEQA documents to evaluate the potential impacts to other public facilities from the proposed project identified no primary facility categories that would significantly adversely affect other public facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to other public facilities, it was concluded that the proposed project would create significant adverse indirect impacts to other public facilities. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to other public facilities.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources to accommodate future growth could also potentially result in adverse impacts to other public facilities because fewer offsets would be available compared to the proposed project.

As time goes by and population growth occurs, it is expected that the ability of public services agencies to continue providing services at the same level they currently provide would be adversely affected. Consequently, under Alternative D, adverse effects to public agency services from the inability to obtain permits to expand existing services or build new facilities to accommodate population growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Adverse Impacts to Fire Protection***

The survey of CEQA documents to evaluate the potential for fire protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect fire protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse fire protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on fire protection. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to fire protection.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to fire protection services.

Under Alternative E, existing offset accounts would contain 50 percent of the number of offsets from growth compared to the proposed project, although Alternative E would contain the same number of offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts (see Tables 6-100 and 6-101 in Chapter 6). This means that fewer offsets would be available in the future under Alternative E compared to the proposed project. As a result, fewer offsets would be available for future expansion of existing fire protection services to accommodate future population growth.

Consequently, under Alternative E, adverse effects to fire services are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

#### ***Adverse Impacts to Police Protection***

The survey of CEQA documents to evaluate the potential for police protection impacts from the proposed project identified no primary facility categories that would significantly adversely affect police protection. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse police protection impacts, it was concluded that the proposed project would create significant adverse indirect impacts on police protection in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to police protection.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to local police departments because of the inability to obtain permits for new or expanded police facilities.

Under Alternative E, existing offset accounts would contain 50 percent of the number of offsets from growth compared to the proposed project, although Alternative E would contain the same number of offsets from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts (see Tables 6-100 and 6-101 in Chapter 6). As a result, fewer offsets would be available for future new or expanded police services to accommodate future population growth.

Consequently, under Alternative E, adverse effects to police protection services are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

### ***Adverse Impacts to Schools***

The survey of CEQA documents to evaluate the potential impacts to schools from the proposed project identified no primary facility categories that would significantly adversely affect schools. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to schools, it was concluded that the proposed project would create significant adverse indirect impacts to schools. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to schools.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources to accommodate future growth could also potentially result in adverse impacts to local schools because fewer offsets would be available compared to the proposed project.

As time goes by and population growth occurs, it is expected that the ability of school districts to expand or build new schools would be adversely affected. Consequently, under Alternative E, adverse effects to schools are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

### ***Adverse Impacts to Parks***

The survey of CEQA documents to evaluate the potential impacts to parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly adversely affect parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to parks, it was concluded that the proposed project would create significant adverse indirect impacts to parks. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to parks.

Indirect adverse impacts to parks from implementing Alternative E would be less than indirect adverse impacts to parks from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect adverse impacts to parks from Alternative E would be significant, but less compared to the

proposed project. Similarly, the contribution to cumulative adverse impacts to parks from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Adverse Impacts to Other Public Facilities***

The survey of CEQA documents to evaluate the potential impacts to other public facilities from the proposed project identified no primary facility categories that would significantly adversely affect other public facilities. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to other public facilities, it was concluded that the proposed project would create significant adverse indirect impacts to other public facilities. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts to other public facilities.

Indirect adverse impacts to other public facilities from implementing Alternative E would be less than indirect adverse impacts to other public facilities from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources to accommodate future growth could also potentially result in adverse impacts to other public facilities because fewer offsets would be available compared to the proposed project.

As time goes by and population growth occurs, it is expected that the ability of public services agencies to continue providing services at the same level they currently provide would be adversely affected. Consequently, under Alternative E, adverse effects to public agency services from the inability to obtain permits to expand existing services or build new facilities to accommodate population growth are considered to be significant and greater than the proposed project. The contribution to cumulative impacts also would be greater than the proposed project.

## **Recreation**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse recreation impacts. The rationale for this conclusion was as follows. The proposed project would not directly result in an increase in the use of existing neighborhood and regional parks or other recreational facilities, or include recreational facilities, or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. With regard to the new development projects, the proposed project was determined (in the NOP/IS) to have no affect on population growth in the district, therefore, no direct or indirect effects on recreation or recreational opportunities are foreseen as a result of implementing the proposed project.

The analysis in Subsection 5.14 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of recreation impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant recreation impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Increased Use of Neighborhood Parks***

The survey of the 52 CEQA documents shown in Table 5.15-1 revealed that entertainment/recreation facilities (document #21) have the potential to create significant adverse indirect impacts as a result of increased use of neighborhood parks. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts to parks. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could adversely affect parks through increased use, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Require Construction of Neighborhood Parks***

The survey of the 52 CEQA documents shown in Table 5.15-1 revealed that entertainment/recreation facilities (document #21) have the potential to create significant adverse indirect impacts resulting from construction of neighborhood parks. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; utility

facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts from construction of neighborhood parks. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could require construction of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Cumulative Impacts***

Project impacts to recreation could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to recreation.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, recreation impacts are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, as noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could induce population growth in the district compared to the proposed project that could adversely affect recreational facilities. As a result, under the No Project Alternative potentially significant adverse indirect impacts to recreational facilities that could occur from inducing population growth in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Increased Use of Neighborhood Parks***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the

issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to increase the use of neighborhood parks are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. As noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could indirectly induce population growth in the district that could result in increased use of neighborhood parks. Similarly, construction of neighborhood parks does not typically require SCAQMD permits. For example, there are no pending permits for equipment located at neighborhood parks identified in Appendix H. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could occur from constructing neighborhood parks in the district would not be expected to occur after May 1, 2012, would be less than the significance determination for the proposed project.

### ***Require Construction of Neighborhood Parks***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to require construction of neighborhood parks are considered to be significant. Starting May 1, 2012, new future facilities that previously had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. As noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could indirectly induce population growth in the district that

could require construction of neighborhood parks. Similarly, construction of neighborhood parks does not typically require SCAQMD permits. For example, there are no pending permits for equipment located at neighborhood parks identified in Appendix H. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could occur from constructing neighborhood parks in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Increased Use of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from an increased use of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly adversely increase use of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increased use of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from an increased use of neighborhood parks.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to increase the use of neighborhood parks compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include the installation of renewable energy projects, which could contribute to the local infrastructure and, therefore, induce population growth, which has the potential to increase the use of neighborhood parks. Such projects include, but are not limited to: wind turbines, solar collector facilities and biosolids energy production.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts from increasing the use of neighborhood parks greater than the proposed project. The contribution to cumulative population growth impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Require Construction of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from requiring construction of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, that would significantly require construction of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring construction of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from requiring construction of neighborhood parks.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to increase the use of neighborhood parks compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may include the installation of renewable energy projects, which could contribute to the local infrastructure and, therefore, induce population growth, resulting in the need to construct new neighborhood parks. Such projects include, but are not limited to: wind turbines, solar collector facilities and biosolids energy production.

For the above reasons, requiring construction of neighborhood parks, it is concluded that Alternative B would create significant adverse indirect impacts as a result of the need to construct new neighborhood parks greater than the proposed project. The contribution to cumulative impacts as a result of constructing new neighborhood parks from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Increased Use of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from an increased use of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely increase use of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increased use of neighborhood parks, it was concluded that the

proposed project would create significant adverse indirect impacts from an increased use of neighborhood parks. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of future affected facilities inducing population growth, resulting in the increased usage of neighborhood parks compared to the proposed project.

Based upon the above information, there would be significant, but fewer or less significant potential impacts as a result of future affected facilities inducing population growth, resulting in the increased usage of neighborhood parks from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of future affected facilities inducing population growth, resulting in the increased usage of neighborhood parks from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for exemptions pursuant to Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Require Construction of Neighborhood Parks***

The analysis of potential impacts from requiring construction of neighborhood parks as a result of implementing Alternative C is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential impacts from requiring construction of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly require construction of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring construction of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from requiring construction of neighborhood parks. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of future affected facilities inducing population growth, resulting in the need to construct neighborhood parks compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of future affected facilities inducing population growth, resulting in the need to construct neighborhood parks from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contributions to cumulative indirect impacts as a result of future affected facilities inducing population growth, resulting in the need to construct neighborhood parks from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large

businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Increased Use of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from an increased use of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely increase use of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increased use of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from an increased use of neighborhood parks. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of increased use of neighborhood parks.

Based upon the above information, indirect impacts from future projects that have the potential to increase the use of neighborhood parks as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to increase the use of neighborhood parks, but indirect cumulative neighborhood park impacts would be less than the proposed project.

#### ***Require Construction of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from requiring construction of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly require construction of neighborhood parks. For this reason and the possibility that future

individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring construction of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from requiring construction of neighborhood parks. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of requiring construction of neighborhood parks.

Based upon the above information, indirect impacts from future projects that have the potential to induce population growth as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to induce population growth, thus, requiring the construction of neighborhood parks, but indirect cumulative neighborhood park impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Increased Use of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from an increased use of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely increase use of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increased use of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from an increased use of neighborhood parks. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of increased use of neighborhood parks.

Indirect impacts from future facilities that have the potential to increase the use of neighborhood parks as a result of implementing Alternative E would be less than indirect

neighborhood park impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect neighborhood park impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to increase the use of neighborhood parks as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Require Construction of Neighborhood Parks***

The survey of CEQA documents to evaluate the potential impacts from requiring construction of neighborhood parks from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly require construction of neighborhood parks. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from requiring construction of neighborhood parks, it was concluded that the proposed project would create significant adverse indirect impacts from requiring construction of neighborhood parks. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of requiring construction of neighborhood parks.

Indirect impacts from future facilities that have the potential to require construction of neighborhood parks as a result of implementing Alternative E would be less than indirect neighborhood park construction impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect neighborhood park construction impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to require construction of neighborhood parks as a result of implementing Alternative E would be significant,

but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Solid/Hazardous Wastes**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse solid/hazardous wastes impacts for the following reasons. The proposed project could allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal accounts. These individual projects could result in impacts on solid/hazardous waste by increasing the generation of solid waste such that the daily permitted capacity of the regional landfills are exceeded.

The analysis in Subchapter 5.15 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of noise impacts would primarily be the responsibility of the local agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant solid/hazardous wastes impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Have Sufficient Landfill Capacity to Accommodate Project***

The survey of the 52 CEQA documents shown in Table 5.16-1 revealed that retail/services facilities (document #5); large commercial facilities (documents #11 and #17); and institutional facilities (document #33) have the potential to create significant adverse indirect impacts as a result of insufficient landfill capacity to accommodate projects. The CEQA documents for the remaining primary facility categories: agricultural facilities; entertainment/recreational facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts to parks. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could adversely affect parks, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

The survey of the 52 CEQA documents shown in Table 5.16-1 revealed that no primary facility categories were shown to violate regulations regarding solid/hazardous wastes. However, SCAQMD staff acknowledges that the survey of CEQA documents used for

this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in facilities violating regulations regarding solid/hazardous wastes in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to solid or hazardous wastes could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to solid or hazardous waste.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets after May 1, 2012, when applying for a permit for new or modified equipment. As a result, the analysis in this PEA assumes that no facilities that previously obtained credits pursuant to Rules 1304 or 1309.1 would be built after May 1, 2012.

After May 1, 2012, other indirect may be generated because of the inability to approve permits for future facilities that previously would have accessed the SCAQMD's internal accounts would result in existing facilities' inability to replace existing equipment beyond its useful lifetime or install new equipment to further accommodate population growth. Similarly, new facilities could not be constructed.

### ***Have Sufficient Landfill Capacity to Accommodate Project***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the

issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to create insufficient landfill capacity to accommodate the projects are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated at landfills in the future in the district when compared against the proposed project.

New and existing landfills are subject to SCAQMD Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills, which generally requires landfill gas collection and control systems. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could cause accidental releases of hazardous material, especially equipment that has already been in operation for a number of years. Under this scenario, unless collection and control equipment could be replaced or modified, landfills would increasingly violate Rule 1150.1.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were pending permit applications for:

- gas collection systems and flares at landfills in Thousand Palms and Rubidoux;
- a gas collection system and flare at landfill in Corona; and
- a gas collection system and flare at a landfill in Carson.

Further, under the No Project Alternative existing landfills could no longer expand and new landfills could no longer be developed in the district. Therefore, in order to accommodate future population growth, municipal and solid wastes would likely have to be transported out the district, resulting in potential transportation and air quality impacts.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were pending permit applications for:

- five electrical generating engines at a landfill in Irvine;
- electrical generating engines at a landfill in Rolling Hills Estates;
- electrical generating engines at a landfill in West Covina;
- replacement of an old, inefficient boiler with a more efficient boiler to generate steam at a landfill in Fountain Valley;
- electrical generating engines at a landfill in Brea;
- electrical generating engines at a landfill in Sylmar, and
- one other miscellaneous permit application for equipment at a fire station.

In the long term, it is expected that impacts to landfills' ability to accommodate future waste capacity under the No Project Alternative would be significant and greater than the proposed project because future installation of new collection and control systems or modifications/expansions of existing landfill collection and control systems would not occur.

#### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to violate regulations regarding solid or hazardous wastes are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be no newly constructed facilities in the future that could adversely affect a facility's ability to comply with regulations regarding solid or hazardous wastes compared to the proposed project. In the long term, it is expected that impacts in terms of compliance with regulations regarding solid or hazardous wastes,

under the No Project Alternative would be significant and greater than the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Have Sufficient Landfill Capacity to Accommodate Project***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to overwhelm existing landfill capacities in the district compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may have the potential to increase solid or hazard wastes requiring disposal, which could adversely affect the capacity of landfills to accommodate such waste increases. Such projects include, but are not limited to installation of: biosolids energy production, phosphoric acid fuel cells and replacement of conventional lawn and garden equipment with electric equipment.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts to landfills as a result of insufficient capacity to accommodate future projects greater than the proposed project. The contribution to cumulative impacts to local landfills from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

The survey of CEQA documents to evaluate the potential impacts from future projects violating with solid and/or hazardous waste regulations from the proposed project identified no primary facility categories that would significantly adversely violate solid and/or hazardous waste regulations. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts

from future projects violating solid and/or hazardous waste regulations, it was concluded that the proposed project would create significant adverse indirect impacts from future projects violating solid and/or hazardous waste regulations.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to violate regulations regarding solid or hazardous wastes compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects may have the potential to increase solid or hazard wastes requiring disposal, which could result in violations of applicable solid or hazardous waste regulations. Such projects include, but are not limited to installation of: biosolids energy production, phosphoric acid fuel cells and replacement of conventional lawn and garden equipment with electric equipment.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts future projects violating solid or hazardous waste regulations greater than the proposed project. The contribution to cumulative impacts as a result of future affected facilities violating waste regulations from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Have Sufficient Landfill Capacity to Accommodate Project***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer solid or hazardous waste impacts as a result of local landfills having insufficient landfill capacity to accommodate wastes from future affected facilities compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts as a result of local

landfills having insufficient landfill capacity. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential solid or hazardous waste impacts as a result of local landfills having insufficient landfill capacity to accommodate wastes from future affected facilities as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect solid or hazardous waste impacts as a result of local landfills having insufficient landfill capacity to accommodate the wastes from future affected facilities as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

survey of CEQA documents to evaluate the potential impacts from future projects violating with solid and/or hazardous waste regulations from the proposed project identified no primary facility categories that would significantly adversely violate solid and/or hazardous waste regulations. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects violating solid and/or hazardous waste regulations, it was concluded that the proposed project would create significant adverse indirect impacts from future projects violating solid and/or hazardous waste regulations. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of future affected facilities violating solid or hazardous waste regulations compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts as a result of future affected facilities violating solid or hazardous waste regulations. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential impacts as a result of future affected facilities violating solid or hazardous waste regulations from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of future affected facilities violating solid or hazardous waste regulations from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying

for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

**Alternative D - Use of Credits Generated in 2009 and Beyond Only**

***Have Sufficient Landfill Capacity to Accommodate Project***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of having sufficient landfill capacity to accommodate the project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future projects that have the potential to contribute to insufficient landfill capacity.

The reasons fewer offsets would be available are because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements.

Offsets, however, would not be available for new landfills to accommodate population growth. As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were 10 pending permit applications for equipment at landfills including landfill gas collection systems, flares, landfill condensate collection, etc., necessary for landfill operations. If offsets for essential public services are restricted, landfills could not expand and new landfills could not be built.

As time goes by it is expected that restrictions on the ability to expand or build new landfills would adversely affect sanitation districts' ability to provide refuse disposal in the future to accommodate population growth. Consequently, under Alternative D, adverse effects to landfills and landfill capacities in the future are considered to be significant and greater than the proposed project. The contribution to cumulative impacts is also greater than the proposed project.

### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of compliance with regulations regarding solid or hazardous wastes.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future projects that have the potential to result in violations of regulations regarding solid or hazardous wastes. In the long term, it is expected that impacts in terms of compliance with regulations regarding solid or hazardous wastes, under Alternative D would be significant and greater than the impacts of the proposed project. The contribution to cumulative impacts is also greater than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Have Sufficient Landfill Capacity to Accommodate Project***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of having sufficient landfill capacity to accommodate the project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to create insufficient landfill capacity.

As can be seen in Appendix H, under the permit moratorium that ended as of January 1, 2010, there were 10 pending permit applications for equipment at landfills including landfill gas collection systems, flares, landfill condensate collection, etc., necessary for

landfill operations. If offsets for essential public service are restricted, landfills could not expand and new landfills could not be built.

As time goes by it is expected that restrictions on the ability to expand or build new landfills would adversely affect sanitation districts' ability to provide refuse disposal in the future to accommodate population growth. Consequently, under Alternative E, adverse effects to landfills and landfill capacities in the future are considered to be significant and greater than the proposed project. The contribution to cumulative impacts is also greater than the proposed project.

### ***Comply with Regulations Regarding Solid/Hazardous Wastes***

The survey of CEQA documents to evaluate the potential impacts to landfill capacity from the proposed project identified the following primary facility categories that would significantly adversely affect landfill capacity: retail/services facilities, large commercial facilities and institutional facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to landfill capacity, it was concluded that the proposed project would create significant adverse indirect impacts to landfill capacity. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of compliance with regulations regarding solid or hazardous wastes.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts from future facilities that have the potential to violate solid or hazardous waste regulations. In the long term, it is expected that impacts in terms of compliance with regulations regarding solid or hazardous wastes, under the Alternative E would be significant and greater than the impacts of the proposed project. The contribution to cumulative impacts is also greater than the proposed project.

## **Transportation/Traffic**

### **Proposed Project**

The NOP/IS prepared for the proposed project indicated that it has the potential to generate significant adverse transportation/traffic impacts for the following reasons. The proposed project could allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal accounts. Typical impacts from individual projects could include an increase in vehicle trips leading to congestion and deterioration in the levels of service for the adjacent streets and intersections in the vicinity of each individual project. The projects could also result in inclusion of inadequate design features and incompatible uses that affect traffic

operations and safety, and affect emergency access due to design features and traffic congestion.

The analysis in Subsection 5.16 concludes that the proposed project has the potential to create significant adverse impacts. Mitigation of transportation/traffic impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant transportation/traffic impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Cause a Substantial Increase in Traffic***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that retail/services facilities (documents #5, #7, #8, and #10); large commercial facilities (documents #11, #12, #16, #17, #18, and #19); entertainment/recreational facilities (documents #20 and #21); institutional facilities (documents #25, #26, #28, #34, #35, and #37); light industrial/warehouse facilities (documents #46, #48, and #49); and heavy industrial facilities (document #50) have the potential to create significant adverse indirect impacts from facilities substantially increasing traffic. The CEQA documents for the remaining primary facility categories: agricultural facilities; transportation facilities; and utility facilities did not identify significant adverse indirect impacts from substantial increases in traffic. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could cause substantial increases in traffic, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Individually or Cumulatively Exceed Level of Service (LOS) Standards***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that agricultural facilities (document #1); retail/services facilities (documents #5 and #8); large commercial facilities (documents #11 and #17); entertainment/recreational facilities (documents #20 and #21); light industrial/warehouse facilities (documents #46 and #48); have the potential to individually or cumulatively exceed LOS standards. The CEQA documents for the remaining primary facility categories: institutional facilities; transportation facilities; utility facilities; and heavy industrial facilities did not identify significant adverse indirect impacts from substantial increases in traffic. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could individually or cumulatively exceed LOS standards, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Change Air Traffic Patterns***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that no primary facility categories were shown to change air traffic patterns. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could change air traffic patterns in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, using an abundance of caution, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Increase Road Hazards***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that large commercial facilities (document #17); light industrial/warehouse facilities (documents #46 and #48); and utility facilities (document #43) have the potential to increase road hazards. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; and heavy industrial facilities did not identify significant adverse indirect impacts from substantial increases in road hazards. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could increase road hazards, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Result in Inadequate Emergency Access***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that no primary facility categories were shown to result in inadequate emergency access. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could result in inadequate emergency access in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Result in Inadequate Parking***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that large commercial facilities (document #17) and heavy industrial facilities (document #50)

have the potential to result in inadequate parking. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; utility facilities; and light industrial/warehouse facilities did not identify significant adverse indirect impacts from projects that result in inadequate parking. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could result in inadequate parking, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Conflict with Alternative Transportation Policies***

The survey of the 52 CEQA documents shown in Table 5.17-1 revealed that no primary facility categories were shown to conflict with alternative transportation policies. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could conflict with alternative transportation policies in the future from a variety of facility categories that obtain offsets from the SCAQMD's internal account and, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to transportation or traffic could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to transportation or traffic.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

After May 1, 2012, a permit moratorium would likely be implemented and continue into the future. Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate

equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment after May 1, 2012. As a result, the analysis in this PEA assumes that no future new or modified facilities that previously obtained credits pursuant to Rules 1304 or 1309.1 would be built after May 1, 2012.

After May 1, 2012, however, other indirect impacts may be generated because of the inability to approve permits for future facilities that previously would have accessed the SCAQMD's internal accounts would result in existing facilities' inability to replace existing equipment beyond its useful lifetime or install new equipment to further accommodate population growth. Similarly, new facilities could not be constructed. As a result, increased traffic could occur in the district because people may have to driver farther to obtain services if nearby services have to close down and there would be an increase in commercial and industrial products that would need to be imported into the district.

### ***Cause a Substantial Increase in Traffic***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, increased traffic could occur in the district because people may have to driver farther to obtain services if nearby services have to close down and there would be an increase in commercial and industrial products that would need to be imported into the district.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could diminish the manufacturing capacity of commercial and industrial facilities in the district, especially from equipment that has already been in operation for a number of years. Consequently, in the long term vehicle miles traveled (VMT), trip rates, and congestion in the district could increase as a result of importing commercial and industrial goods into the district.

As can be seen in Appendix H, under the permit moratorium that temporarily ended as of January 1, 2010, there were pending permit applications for a wide variety of manufacturing and industrial facilities. To accommodate future population growth in the district, it is expected that under the No Project Alternative a large portion of the commercial and industrial products would be manufactured outside of the district and imported into the district. The following provides an overview of the types of commercial and industrial facilities that would be adversely affected under the No Project Alternative after May 1, 2012.

- There were seven pending permit applications for aerospace operations such as tank plating, solder leveling, abrasive blasting that could affect the ability of aerospace operations to continue operating in the district in the future.
- There were five pending permit applications for aggregate operations, which generally supply aggregate materials to build roads, construct buildings, etc.
- There were 67 pending permit applications for auto body shops, primarily for spray booths used to coat vehicle body work after auto body repair.
- There were 10 pending permit applications for auto repair shops.
- There were 136 pending permit applications for coating operations. Although the specific type of coating operation is not listed, this category would typically include spray booths for wood furniture coatings, metal parts coatings, plastics coatings, etc.
- There were four pending permit applications for concrete batch plants.
- There were 41 pending permit applications for construction services, which include, but are not limited to, a variety of services such as: concrete batch/blending services equipment, asphalt batch/blending services, tank degassing, etc.
- There were seven pending permit applications for crematory ovens or other equipment at crematoriums.
- There were 21 pending permit applications for gas fueling and dispensing stations, which consists primarily of gas station storing and dispensing of fuels, gas station soil remediation projects, etc.
- There were 224 pending permit applications for manufacturing operations, which include a variety of operations including, but not limited to: car care products, cosmetics, electronic components, foam products, food products, industrial vehicles, lawn and garden products, metal products, piping, plastic, rubber, steel, etc.
- There were 127 pending permit applications for petroleum operations, which include a variety of operations including, but not limited to: petroleum products storage

tanks, bulk petroleum products loading and unloading facilities, petroleum products distillation equipment, soil remediation projects, etc.

- There were 46 pending permit applications for printing operations, which included a variety of operations including, but not limited to: flexographic operations (air dry and ultraviolet dry processes), lithographic operations, etc.

Similarly, under the No Project Alternative, collection and control equipment at existing landfills would likely increasingly violate Rule 1150.1; it would be difficult for landfills to expand, and there would be a low probability that new landfills would be built. As a result, to accommodate growth in the future, to the extent allowed under current laws and ordinances municipal and other types of solid wastes would likely need to be transported out of the district for disposal.

As can be seen in Appendix H, under the permit moratorium that temporarily ended as of January 1, 2010, there were pending permit applications for:

- five electrical generating engines at a landfill in Irvine;
- electrical generating engines at a landfill in Rolling Hills Estates;
- electrical generating engines at a landfill in West Covina;
- replacement of an old, inefficient boiler with a more efficient boiler to generate steam at a landfill in Fountain Valley;
- electrical generating engines at a landfill in Brea; electrical generating engines at a landfill in Sylmar, and
- one other miscellaneous permit application for equipment at a fire station.

As time goes existing commercial or industrial facilities could not expand and new facilities could not be built in the district in the future, commercial and industrial products, such as those identified in the bullet points above, would have to be imported. Similarly, new landfills could not be built and existing landfills could not be expanded. As a result, in the future municipal and other types of waste would likely need to be transported out of the district. Consequently, in the long term VMT, trip rates, and congestion in the district could increase as a result of importing commercial and industrial goods into the district and exporting municipal solid wastes out of the district. In the long term, it is expected that indirect traffic and transportation impacts from importing manufactured products and exporting municipal and other types of solid waste would be significant and greater than the proposed project.

### ***Individually or Cumulatively Exceed LOS Standards***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, increased traffic could occur in the district that could individually or cumulatively exceed LOS levels because people may have to driver farther to obtain services if nearby services have to close down and there would be an increase in commercial and industrial products that would need to be imported into the district.

In the discussion in the "Cause a Substantial Increase in Traffic" subsection a list of pending permit applications listed in Appendix H shows the various types of commercial and industrial projects that would be unable to obtain permits in the future under the No Project Alternative. To accommodate future population growth in the district, it is expected that under the No Project Alternative a large portion of the same types of commercial and industrial products as described in the previous subsection would be manufactured outside of the district and imported into the district, thus, affecting LOS standards in the district.

As time goes by, new landfills could not be built and existing landfills could not be expanded as a result of the current permit moratorium. As a result, in the future municipal and other types of solid wastes would likely need to be transported out of the district, which could also affect local LOS standards in the district. See the discussion in the preceding section and Appendix for the types of landfill permit applications that would no longer be approved under the No Project Alternative.

Because existing commercial or industrial facilities could not expand and new facilities could not be built in the district in the future, commercial and industrial products, such as those identified in the bullet points in the preceding subsection, would have to be imported. Similarly, new landfills could not be built and existing landfills could not be expanded as a result of the current permit moratorium. As a result, in the future municipal and other types of waste would likely need to be transported out of the district. Consequently, in the long term VMT, trip rates, and congestion in the district could increase as a result of importing commercial and industrial goods into the district and exporting municipal solid wastes out of the district. In the long term, it is expected that traffic and transportation impacts from importing manufactured products and

exporting municipal and other types of solid waste would be significant and greater than the significance determination for the proposed project.

### ***Change Air Traffic Patterns***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets and, therefore could not be built in the future.

Under the No Project Alternative after May 1, 2012, existing equipment would be expected to operate indefinitely into the future without replacement or modification because of the permit moratorium. Since most equipment has a useful lifetime duration, at some point in the future existing equipment would be expected to experience breakdowns and other types of failures that could diminish the manufacturing capacity of commercial and industrial facilities in the district, especially from equipment that has already been in operation for a number of years. As a result, there is the potential for an increase in traffic and transportation impacts from importing manufactured products and exporting municipal and other types of solid waste into and out of the district. Under this scenario, however, it is not likely that air traffic patterns would be significantly adversely affect for the following reasons.

First, municipal and other types of solid wastes are not typically transported via airplanes; this is not expected to change in the future. Second, although there could be an increase in the import of commercial or manufactured products in the future, this increase is not expected to affect air traffic patterns because more than half of the air cargo at LAX arrives and departs in the cargo holds of passenger aircraft, while apparel is the leading imported air cargo commodity<sup>1</sup>. Freight that is transported in passenger planes is dependent on the number of passengers, so additional flights would not be expected to occur as a result of increased demand for commercial or industrial products unless there is a concurrent increase in the number of annual passengers. Manufacture of apparel does not typically require permits from the SCAQMD.

---

<sup>1</sup> Los Angeles World Airports, [http://www.lawa.org/welcome\\_lax.aspx?id=776](http://www.lawa.org/welcome_lax.aspx?id=776).

Based on the preceding information, under the No Project Alternative potentially significant adverse indirect impacts that could adversely affect air traffic patterns in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Increase Road Hazards***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, after May 1, 2012, future new or modified facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets.

As noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could induce population growth in the district that could increase the need for new or modified roadways in the vicinities of existing facilities. Further, construction of roadways does not typically require SCAQMD permits, although some of the individual pieces of equipment might require SCAQMD permits. For example, there were no pending permits for roadway projects identified in Appendix H, but under the permit moratorium that temporarily ended as of January 1, 2010, there were the following pending permits for asphalt manufacturers:

- three pending permit applications for blending and batching equipment; and
- two pending permit applications for asphalt storage.

As a result, under the No Project Alternative potentially significant adverse indirect impacts that could occur as a result of increased roadway hazards in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project. .

### ***Result in Inadequate Emergency Access***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is

reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to result in inadequate emergency access are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets.

Since no new facilities could be built that require offsets from the SCAQMD's internal accounts to obtain permits and no existing facilities could expand, indirect emergency access impacts at affected facilities are not expected to be significant under the No Project Alternative. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could result in inadequate emergency access in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Result in Inadequate Parking***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to result in inadequate parking are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets.

As noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could induce population growth in the district that could increase the need for additional parking capacity at existing facilities. Similarly,

construction of parking lots does not typically require SCAQMD permits, although some of the individual pieces of equipment might require SCAQMD permits. For example, there are no pending permits for parking lot projects identified in Appendix H, but under the permit moratorium that temporarily ended as of January 1, 2010, there were the following pending permits for asphalt manufacturers:

- three pending permit applications for blending and batching equipment; and
- two pending permit applications for asphalt storage.

However, because Alternative A is not expected to require additional parking capacity and in spite of the potential inability to permit future projects like those shown in the bullet points above, potentially significant adverse indirect impacts that could occur as a result of inadequate parking in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

### ***Conflict with Alternative Transportation Policies***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future facilities that have the potential to conflict with alternative transportation policies are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets.

As noted in the "Population and Housing" discussion above, there would be no newly constructed facilities in the future that could induce population growth in the district that could increase the need for additional transportation resources or otherwise affect existing or future transportation policies. As a result, under the No Project Alternative potentially significant adverse indirect impacts that could conflict with transportation policies in the district would not be expected to occur after May 1 2012, and would be less than the significance determination for the proposed project.

## **Alternative B – Offset User Fees for Large Businesses**

### ***Cause a Substantial Increase in Traffic***

The survey of CEQA documents to evaluate the potential impacts from a substantial increase in traffic from the proposed project identified the following primary facility categories that would significantly increase traffic: retail/services facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, light industrial/warehouse facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a substantial increase in traffic, it was concluded that the proposed project would create significant adverse indirect impacts from a substantial increase in traffic.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect traffic impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects have the potential to increase: traffic as a result of worker commute trips; the number of biosolids haul truck trips; material haul truck trips to import new equipment (e.g., replacement clean fuel backup generators, wind turbines); export construction debris and replaced equipment. Such projects include, but are not limited to installation of: wind turbine farms, solar collector facilities, alternative fuel refueling stations, biosolids energy production, and replacement of stationary source engines with portable engines or microturbines.

For the above reasons, it is concluded that Alternative B would create significant adverse traffic impacts greater than the proposed project. The contribution to cumulative traffic impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Individually or Cumulatively Exceed LOS Standards***

The survey of CEQA documents to evaluate the potential traffic impacts from future projects that individually or cumulatively exceed LOS standards from the proposed project identified the following primary facility categories that would significantly adversely exceed LOS standards either individually or cumulatively: agricultural facilities, retail/services facilities, large commercial facilities, entertainment/recreational facilities and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique

characteristics and/or be sited in or near a location that could create significant adverse traffic impacts from future projects that individually or cumulatively exceed LOS standards, it was concluded that the proposed project would create significant adverse indirect traffic impacts from future projects that individually or cumulatively exceed LOS standards.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to individually or cumulatively exceed LOS standards compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects have the potential to increase: traffic as a result of worker commute trips; the number of biosolids haul truck trips; material haul truck trips to import new equipment (e.g., replacement clean fuel backup generators and wind turbines); export construction debris and replaced equipment. Such projects include, but are not limited to installation of: wind turbine farms, solar collector facilities, alternative fuel refueling stations, biosolids energy production, replacement of stationary source engines with portable engines or microturbines.

For the above reasons, it is concluded that Alternative B would create significant adverse LOS impacts greater than the proposed project. The contribution to cumulative LOS impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Change Air Traffic Patterns***

The survey of CEQA documents to evaluate the potential impacts from future projects changing air traffic patterns from the proposed project identified no primary facility categories that would significantly adversely change air traffic patterns. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects changing air traffic patterns, it was concluded that the proposed project would create significant adverse indirect impacts from future projects changing air traffic patterns.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to change air traffic patterns compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects have the potential to increase: imports of new equipment (e.g., replacement clean fuel backup generators and wind turbines); and export replaced

equipment that may be recycled as scrap metal or put into use. Such projects include, but are not limited to installation of: wind turbine farms, solar collector facilities, replacement of stationary source engines with portable engines or microturbines.

For the above reasons, it is concluded that Alternative B would create significant adverse air traffic impacts greater than the proposed project. The contribution to cumulative LOS impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Increase Road Hazards***

The survey of CEQA documents to evaluate the potential impacts from an increase in road hazards from the proposed project identified the following primary facility categories that would significantly adversely increase in road hazards: large commercial facilities and utility projects. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increase in road hazards, it was concluded that the proposed project would create significant adverse indirect impacts from an increase in road hazards.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect road hazard impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects such as wind turbine farms, solar collector facilities, alternative fuel refueling stations, biosolids energy production, and replacement of stationary source engines with portable engines or microturbines, have the potential to increase road hazards because of the need, in some cases, to drive to equipment in remote locations, e.g., wind turbines and solar collectors.

For the above reasons, it is concluded that Alternative B would create significant adverse road hazard impacts greater than the proposed project. The contributions to cumulative road hazard impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Result in Inadequate Emergency Access***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate emergency access from the proposed project identified no

primary facility categories that would significantly result in inadequate emergency access. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects resulting in inadequate emergency access, it was concluded that the proposed project would create significant adverse indirect impacts from future projects resulting in inadequate emergency access.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to result in inadequate emergency access compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects, depending on their location and configuration, may impede or result in inadequate emergency access. Construction of emission reduction projects and any associated increases in traffic have the potential to adversely affect emergency access because of the need for: temporary parking for construction workers, lay-down areas for equipment and supplies, delivery of construction equipment and supplies, removal of demolition wastes. Such projects include, but are not limited to installation of: wind turbine farms, solar collector facilities, alternative fuel refueling stations, biosolids energy production, and replacement of stationary source engines with portable engines or microturbines.

For the above reasons, it is concluded that Alternative B would create significant adverse emergency access impacts greater than the proposed project. The contribution to cumulative emergency access impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Result in Inadequate Parking***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate parking from the proposed project identified the following primary facility categories that would significantly adversely affect parking availability: large commercial facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse parking impacts, it was concluded that the proposed project would create significant adverse indirect impacts on parking

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to result in inadequate parking compared to the proposed project. The main difference

between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. For example, some emission reduction projects have the potential to increase: traffic as a result of worker commute trips; the number of biosolids haul truck trips; material haul truck trips to import new equipment (e.g., replacement clean fuel backup generators and wind turbines); export construction debris; and replaced equipment. Construction of emission reduction projects and any associated increases in traffic have the potential to adversely affect parking because of the need for: temporary parking for construction workers, lay-down areas for equipment and supplies, delivery of construction equipment and supplies and removal of demolition wastes. Such projects include, but are not limited to installation of: wind turbine farms, solar collector facilities, alternative fuel refueling stations, biosolids energy production, replacement of stationary source engines with portable engines or microturbines.

For the above reasons, it is concluded that Alternative B would create significant adverse parking impacts greater than the proposed project. The contribution to cumulative inadequate parking impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Alternative Transportation Policies***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with alternative transportation policies from the proposed project identified no primary facility categories that would significantly adversely conflict with alternative transportation policies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with alternative transportation policies, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with alternative transportation policies.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to conflict with alternative transportation policies compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects. Such projects include, but are not limited to installation of: alternative fuel refueling stations, retrofitting heavy-duty mobile sources with particulate filters and/or oxidation catalysts and early introduction of tier 4 locomotives.

Future individual projects in the primary facility categories and some future emission reduction projects could have unique characteristics that have the potential to conflict

with alternative transportation policies. However, some future emission reduction projects have the potential to enhance or further alternative transportation policies as discussed above. As a result, it is concluded that Alternative B would create significant adverse indirect impacts to alternative transportation policies less than the proposed project. The contribution to cumulative impacts from Alternative B that have the potential to conflict with alternative transportation policies is expected to be less than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects that promote or enhance alternative transportation policies.

**Alternative C –Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

***Cause a Substantial Increase in Traffic***

The survey of CEQA documents to evaluate the potential impacts from a substantial increase in traffic from the proposed project identified the following primary facility categories that would significantly increase traffic: retail/services facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, light industrial/warehouse facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a substantial increase in traffic, it was concluded that the proposed project would create significant adverse indirect impacts from a substantial increase in traffic. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer increased traffic impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to traffic. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that the potential increased traffic impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect increased traffic impacts from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Individually or Cumulatively Exceed LOS Standards***

The survey of CEQA documents to evaluate the potential traffic impacts from future projects that individually or cumulatively exceed LOS standards from the proposed project identified the following primary facility categories that would significantly adversely exceed LOS standards either individually or cumulatively: agricultural facilities, retail/services facilities, large commercial facilities, entertainment/recreational facilities and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse traffic impacts from future projects that individually or cumulatively exceed LOS standards, it was concluded that the proposed project would create significant adverse indirect traffic impacts from future projects that individually or cumulatively exceed LOS standards. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer adverse LOS impacts compared to the proposed project.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse LOS impacts. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative C. On balance, it is concluded that potential adverse LOS impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contributions to cumulative LOS impacts from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Change Air Traffic Patterns***

The survey of CEQA documents to evaluate the potential impacts from future projects changing air traffic patterns from the proposed project identified no primary facility categories that would significantly adversely change air traffic patterns. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects changing air traffic patterns, it was concluded that the proposed project would create significant adverse indirect impacts from future projects changing air traffic patterns. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result in changes to air traffic patterns compared to the proposed project.

Based upon the above information, potential impacts as a result in changes to air traffic patterns from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contributions to cumulative indirect impacts as a result in changes to air traffic patterns from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Increase Road Hazards***

The survey of CEQA documents to evaluate the potential impacts from an increase in road hazards from the proposed project identified the following primary facility categories that would significantly adversely increase in road hazards: large commercial facilities and utility projects. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increase in road hazards, it was concluded that the proposed project would create significant adverse indirect impacts from an increase in road hazards. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer road hazard impacts due to design features compared to the proposed project.

Based upon the above information, potential road hazard impacts due to design features from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect road hazard impacts due to design features from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Result in Inadequate Emergency Access***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate emergency access from the proposed project identified no primary facility categories that would significantly result in inadequate emergency access. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects resulting in inadequate emergency access, it was concluded that the proposed project would create significant adverse indirect impacts from future projects resulting in inadequate

emergency access. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that could result in inadequate emergency access compared to the proposed project.

Based upon the above information, potential indirect impacts from future affected facilities that could result in inadequate emergency access as a result of implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that could result in inadequate emergency access from implementing Alternative C would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Result in Inadequate Parking***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate parking from the proposed project identified the following primary facility categories that would significantly adversely affect parking availability: large commercial facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse parking impacts, it was concluded that the proposed project would create significant adverse indirect impacts on parking. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of inadequate parking compared to the proposed project.

Based upon the above information, potential inadequate parking impacts from implementing Alternative C would be significant, but less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect parking impacts from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with Alternative Transportation Policies***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with alternative transportation policies from the proposed project identified

no primary facility categories that would significantly adversely conflict with alternative transportation policies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with alternative transportation policies, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with alternative transportation policies. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future affected facilities that have the potential to conflict with alternative transportation policies compared to the proposed project.

Based upon the above information, potential indirect impacts from future affected facilities that have the potential to conflict with alternative transportation policies as a result of implementing Alternative C were less compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from future affected facilities that have the potential to conflict with alternative transportation policies as a result of implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***Cause a Substantial Increase in Traffic***

The survey of CEQA documents to evaluate the potential impacts from a substantial increase in traffic from the proposed project identified the following primary facility categories that would significantly increase traffic: retail/services facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, light industrial/warehouse facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a substantial increase in traffic, it was concluded that the proposed project would create significant adverse indirect impacts from a substantial increase in traffic. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of causing a substantial increase in traffic.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to traffic. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that

indirect impacts from future projects that have the potential to cause a substantial increase in traffic as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to cause a substantial increase in traffic, but indirect cumulative traffic impacts would be less than the proposed project.

#### ***Individually or Cumulatively Exceed LOS Standards***

The survey of CEQA documents to evaluate the potential traffic impacts from future projects that individually or cumulatively exceed LOS standards from the proposed project identified the following primary facility categories that would significantly adversely exceed LOS standards either individually or cumulatively: agricultural facilities, retail/services facilities, large commercial facilities, entertainment/recreational facilities and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse traffic impacts from future projects that individually or cumulatively exceed LOS standards, it was concluded that the proposed project would create significant adverse indirect traffic impacts from future projects that individually or cumulatively exceed LOS standards. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of individually or cumulative exceeding LOS standards.

As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse LOS impacts. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative D. On balance, it is concluded that indirect impacts from future projects that have the potential to cause, either individually or cumulatively, exceedances of LOS standards as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets

are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to cause, either individually or cumulatively, exceedances of LOS standards, but indirect cumulative LOS impacts would be less than the proposed project.

### ***Change Air Traffic Patterns***

The survey of CEQA documents to evaluate the potential impacts from future projects changing air traffic patterns from the proposed project identified no primary facility categories that would significantly adversely change air traffic patterns. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects changing air traffic patterns, it was concluded that the proposed project would create significant adverse indirect impacts from future projects changing air traffic patterns. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of changes in air traffic patterns.

Based upon the above information, indirect impacts from future projects that have the potential to cause changes in air traffic patterns as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to cause changes in air traffic patterns, but indirect cumulative air traffic impacts would be less than the proposed project.

### ***Increase Road Hazards***

The survey of CEQA documents to evaluate the potential impacts from an increase in road hazards from the proposed project identified the following primary facility categories that would significantly adversely increase in road hazards: large commercial facilities and utility projects. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increase in road hazards, it was concluded that the proposed project would create significant adverse indirect impacts from an increase in road hazards. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of increased road hazards.

Based upon the above information, indirect impacts from future projects that have the potential to increase road hazards due to design features as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to increase road hazards due to design features, but indirect cumulative road hazard impacts would be less than the proposed project.

### ***Result in Inadequate Emergency Access***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate emergency access from the proposed project identified no primary facility categories that would significantly result in inadequate emergency access. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects resulting in inadequate emergency access, it was concluded that the proposed project would create significant adverse indirect impacts from future projects resulting in inadequate emergency access. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts resulting in inadequate emergency access.

Based upon the above information, indirect impacts from future projects that have the potential to result in inadequate emergency access as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to result in inadequate emergency access, but indirect cumulative emergency access impacts would be less than the proposed project.

### ***Result in Inadequate Parking***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate parking from the proposed project identified the following primary facility categories that would significantly adversely affect parking availability: large commercial facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse parking impacts, it was concluded that the proposed project would create significant adverse indirect impacts on parking in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts resulting in inadequate parking.

Based upon the above information, indirect impacts from future projects that have the potential to result in inadequate parking as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is

likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to result in inadequate parking, but indirect cumulative parking impacts would be less than the proposed project.

### ***Conflict with Alternative Transportation Policies***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with alternative transportation policies from the proposed project identified no primary facility categories that would significantly adversely conflict with alternative transportation policies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with alternative transportation policies, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with alternative transportation policies. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of conflicts with alternative transportation policies.

Based upon the above information, indirect impacts from future projects that could conflict with alternative transportation policies as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse indirect cumulative impacts from future projects that have the potential to conflict with alternative transportation policies, but indirect cumulative alternative transportation policy impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Cause a Substantial Increase in Traffic***

The survey of CEQA documents to evaluate the potential impacts from a substantial increase in traffic from the proposed project identified the following primary facility

categories that would significantly increase traffic: retail/services facilities, large commercial facilities, entertainment/recreational facilities, institutional facilities, light industrial/warehouse facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from a substantial increase in traffic, it was concluded that the proposed project would create significant adverse indirect impacts from a substantial increase in traffic. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of causing a substantial increase in traffic.

Indirect increased traffic impacts from implementing Alternative E would be less than indirect increased traffic impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse impacts to traffic. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect increased traffic impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative increased traffic impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Individually or Cumulatively Exceed LOS Standards***

The survey of CEQA documents to evaluate the potential traffic impacts from future projects that individually or cumulatively exceed LOS standards from the proposed project identified the following primary facility categories that would significantly adversely exceed LOS standards either individually or cumulatively: agricultural facilities, retail/services facilities, large commercial facilities, entertainment/recreational facilities and light industrial/warehouse facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse traffic impacts from future projects that individually or cumulatively exceed LOS standards, it was concluded that the proposed project would create significant adverse indirect traffic impacts from future projects that individually or cumulatively exceed

LOS standards. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of individually or cumulatively exceeding LOS standards.

Indirect impacts from future facilities that have the potential to individually or cumulatively exceed LOS standards as a result of implementing Alternative E would be less than indirect LOS standards impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. As discussed under Alternative A, however, limitations on the ability to modify or replace sources could also potentially result in adverse LOS impacts. Therefore, environmental impacts may not be proportional to the number of projects constructed and operated as a result of implementing Alternative E. On balance, it is concluded that indirect LOS standards impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative LOS standards impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Change Air Traffic Patterns***

The analysis of potential indirect impacts from future projects changing air traffic patterns as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential impacts from future projects changing air traffic patterns from the proposed project identified no primary facility categories that would significantly adversely change air traffic patterns. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects changing air traffic patterns, it was concluded that the proposed project would create significant adverse indirect impacts from future projects changing air traffic patterns. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of changing air traffic patterns.

Indirect air traffic pattern impacts from implementing Alternative E would be less than indirect air traffic pattern impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary

source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections, the SCAQMD would stop issuing permits. Based on the foregoing, indirect air traffic pattern impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative air traffic pattern impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Increase Road Hazards***

The analysis of potential indirect impacts from an increase in road hazards as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential impacts from an increase in road hazards from the proposed project identified the following primary facility categories that would significantly adversely increase in road hazards: large commercial facilities and utility projects. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from an increase in road hazards, it was concluded that the proposed project would create significant adverse indirect impacts from an increase in road hazards. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of increased road hazards.

Indirect increased road hazards impacts from implementing Alternative E would be less than indirect increased road hazards impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect increased road hazards impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative increased road hazards impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Result in Inadequate Emergency Access***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate emergency access from the proposed project identified no primary facility categories that would significantly result in inadequate emergency access. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects resulting in inadequate emergency access, it was concluded that the proposed project would create significant adverse indirect impacts from future projects resulting in inadequate emergency access. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts resulting in inadequate emergency access.

Indirect inadequate emergency access impacts from implementing Alternative E would be less than indirect inadequate emergency access impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect inadequate emergency access impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative inadequate emergency access impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Result in Inadequate Parking***

The survey of CEQA documents to evaluate the potential impacts from future projects resulting in inadequate parking from the proposed project identified the following primary facility categories that would significantly adversely affect parking availability: large commercial facilities and heavy industrial facilities. For this reason and the possibility that future individual projects in these and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse parking impacts, it was concluded that the proposed project would create significant adverse indirect impacts on parking. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer resulting in inadequate parking.

Indirect inadequate parking impacts from implementing Alternative E would be less than indirect inadequate parking impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect inadequate parking impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative inadequate parking impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Alternative Transportation Policies***

The survey of CEQA documents to evaluate the potential impacts from future projects conflicting with alternative transportation policies from the proposed project identified no primary facility categories that would significantly adversely conflict with alternative transportation policies. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts from future projects conflicting with alternative transportation policies, it was concluded that the proposed project would create significant adverse indirect impacts from future projects conflicting with alternative transportation policies. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of conflicts with alternative transportation policies.

Indirect impacts from future facilities that have the potential to conflict with alternative transportation policies as a result of implementing Alternative E would be less than indirect alternative transportation policy impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, specific indirect alternative transportation policy impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future facilities that have the potential to conflict with alternative transportation policies as a result of implementing Alternative E would be

significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **CHAPTER 8**

---

### **RESPONSES TO THE COURT'S DECISION ON AMENDED RULE 1309.1 AND RULE 1315**

## INTRODUCTION

This PEA's analysis of the impacts from re-adopting proposed Rule 1315, with the modifications described in Chapter 2, addresses the final decision by the Superior Court of the State of California, County of Los Angeles in its Decision on Ruling on Respondent's Motion for Summary Adjudication in *Natural Resources Defense Council, Inc., et al. (Petitioners) v. SCAQMD (Respondent)* (Case No. BS 110792) (filed July 28, 2008).

The purpose of this Chapter of the PEA is to provide a convenient way for the reader to identify how the SCAQMD has responded to each of the Court's determinations and where the revised analysis is located in the PEA.

## SUMMARY OF COURT'S DECISION

In the July, 2008 Decision on Ruling on Respondent's Motion for Summary Judgment, the Superior Court found the SCAQMD's CEQA analysis for its adoption of Rule 1315 (in its previous form) and amendment of Rule 1309.1 to be inadequate regarding its description of the proposed project, the analyses of impacts from air emissions on health, aesthetics and climate change, and its treatment of certain mitigation measures.

A more detailed description of the Court's decision as to each of these topics, and a summary of the PEA's response to each topic follows.

## PROJECT DESCRIPTION

Court Decision:

The Superior Court found that the SCAQMD had not provided an adequate project description for the adoption of Rule 1315 and amendment of Rule 1309.1. The Court stated that the "District impermissibly disaggregated the two rules and failed to consider the obvious and intended impacts of the rules operating in tandem. In the Project Objectives, the District separated the objectives of the amendments to Rule 1309.1 and the proposed objectives of Rule 1315. By doing so, the District failed to describe the objectives of both rules as a coherent whole."(Page 11, lines 14-20).

Response:

The rule changes that were the subject of the Court's decision included an amendment to SCAQMD Rule 1309.1 that would have allowed new power plants to qualify for offsets from the SCAQMD's Priority Reserve for a limited period of time. That rule amendment is no longer proposed. Therefore, the project description for the proposed project is limited to the re-adoption of Rule 1315, with the modifications described in Chapter 2.

As explained in Chapter 2, under the provisions of AB 1318, enacted in 2009, SCAQMD is required to provide offsets from its internal accounts to the CPV Sentinel Energy Project, and it is possible that similar legislation will be adopted for one other power

plant (Walnut Creek Mission Energy Project). In addition, when preparation of the PEA commenced, it was possible that similar legislation would be adopted for the NRG El Segundo Repowering project. However, implementation of legislation for these power plants is not part of the proposed project, and would not depend upon approval of the proposed project. The environmental impacts of each of the three power plants were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs). The CEC's analysis and conclusions regarding criteria pollutant and GHG emissions for these plants, as supplemented by SCAQMD staff analysis where needed, have been summarized and incorporated in the cumulative analysis in subchapter 4.1.

Court Decision:

The Superior Court's decision also stated: "The mischief in the PEA begins with the District's repeated assertions that Rule 1315 will have no environmental impacts and therefore, need not be analyzed in the PEA. But, it is the universe of emissions credits (and, foreseeably and consequently, the emissions that will be allowed thereby to be released in the environment) that is at the heart of a programmatic assessment of the rule-making." (Page 11 line 27 to 12 line 10) The Court went on to say: "The scope and foreseeable impact of Rule 1315 on the environment is greater, in fact, than the Rule 1309.1 amendments upon which respondents focus. Nor is the impact of Rule 1315-on a programmatic basis-limited to the eleven power plants currently in line for Priority Reserve access."(Page 12 lines 14-18). Further, the Court stated: "The environmental effects of Rule 1315, in conjunction with the current and future amendments to Rule 1309.1 are real, capable of being quantified, and not remote or speculative." (Page 13, lines 9-11).

Response:

The project description for the readoption of Rule 1315 (as modified) has been revised to include as a project objective the ability for the SCAQMD to establish a tracking system to continue to implement its New Source Review offset program, including making offsets available from its internal accounts for sources that qualify for offsets under Rule 1309.1 as it existed before the 2006 amendments, (primarily essential public services) as well as projects exempt from offsets under Rule 1304 but not exempt under federal law. Therefore, the environmental analysis of the proposed project includes an analysis of the environmental impacts of permitting all such sources. (see Chapters 4 and 5) The analysis includes a quantitative discussion of the direct air quality, health, visibility and greenhouse gas impacts from sources permitted under Rules 1304 and 1309.1, compared to a situation in which no new or modified sources would be permitted under Rules 1309.1 and 1304 after June, 2010. In addition, the analysis includes a qualitative discussion of the types of other environmental impacts that may result from the construction and operation of facilities with sources permitted under Rules 1309.1 and 1304.

In addition, the PEA's analysis of cumulative impacts includes an analysis of the environmental impacts of other sources permitted in reliance on the SCAQMD internal account offsets, including the sources permitted under earlier versions of Rule 1315 and SB 827 and the three power plants that potentially could be granted access to SCAQMD internal accounts offsets through legislation.

In sum, the SCAQMD previously took the position that the adoption of Rule 1315 did not create new environmental impacts other than those associated with the power plants that would have qualified for offsets from the SCAQMD's Priority Reserve under amended Rule 1309.1, because the other sources that accessed offsets under proposed Rule 1315 were the same types of sources that had always accessed the SCAQMD internal accounts. In this PEA, the SCAQMD has responded to the Court's decision by analyzing the impacts resulting from all new or modified sources potentially eligible to receive permits under Rules 1309.1 and 1304 in reliance upon SCAQMD internal account offsets tracked under proposed Rule 1315. The PEA also analyzes the cumulative impacts of the proposed project plus emissions from other sources that may rely upon the SCAQMD's internal account offsets pursuant to State legislation. See Chapters 4 and 5.

## HEALTH EFFECTS

### Court Decision:

The Superior Court decision stated: "The PEA analyzes the health effects of the project at only one location, the Vernon Power Plant. Rather than conduct the analysis necessary to quantify (at least approximately) the health effects of the entire program, the PEA instead simply says that such a task is 'not possible.'" (Page 16, lines 12-22). The Court went on to say: "Further, the District also fails to analyze meaningfully the cumulative health impacts of Rule 1315's introduction of millions of pounds of new pollution—pollution credits that are intended to be and will be converted into new emissions-into the Basin. There is no analysis performed of the health impacts of increased smog precursors, particularly for inland regions like Riverside where it accumulates. (AR 6063) The District also failed to analyze the collective health effects of increasing particulate matter in an area already exceeding state and federal health standards. (AR 5442)" (Page 17, line 21 through 18, line 2)

### Response:

The PEA includes an analysis of the health effects of the incremental change in particulate and ozone pollution on a regional basis resulting from the emissions of these pollutants and their precursors attributed to the proposed project, i.e. the emissions from sources potentially eligible for permits issued under Rules 1304 and 1309.1 after June, 2010 (see subchapter 4.1).

The emissions resulting from facilities with sources to be issued permits under Rules 1304 and 1309.1 are included in the 2007 AQMP growth projections. As a result of control measures identified in the AQMP, adverse health effects from particulate matter

and ozone will be reduced over time, even if the regional growth accounted for in the AQMP occurs. Because adverse health effects will continue to be reduced over time, the health effects of the proposed project are expressed as potential additional benefits beyond those contemplated by the 2007 AQMP that would be foregone by approving the proposed project.

The PEA also includes a cumulative impacts analysis that quantifies the health effects from emissions of particulates and ozone precursors attributed to the proposed project plus the emissions from other sources permitted in reliance on the SCAQMD internal account offsets, including the sources permitted pursuant to prior versions of Rule 1315 and SB 827. The PEA also specifically quantifies the health impacts of each of the three power plants that may receive access to offsets through legislation individually, as well as including their emissions in the cumulative health impacts analysis. (see subchapter 4.1).

In addition to addressing health effects from emissions of particulates and ozone precursors, the PEA analyzes cancer and non-cancer health risk from region-wide emissions of toxic air contaminants (TACs) attributed to the proposed project. The PEA also assesses the cumulative cancer and non-cancer health risk from TACs attributed to the proposed project plus TACs resulting from other sources permitted in reliance on the SCAQMD internal account offsets, including the sources permitted pursuant to prior versions of Rule 1315 and SB 827 and the three potential power plants (see subchapter 4.1).

Finally, the PEA qualitatively discusses cancer and non-cancer health risk from localized concentrations of TACs resulting from individual facilities with sources permitted under Rules 1304 and 1309.1. The PEA also discloses the cancer and non-cancer health risks from localized concentrations of TACs resulting from the three potential power plants, as determined by the California Energy Commission.

## **AESTHETIC IMPACTS**

Court Decision:

The Superior Court stated: “the PEA suffers from the District’s failure to consider the impact of increasing significantly the particulate and sulfuric emissions that are the foreseeable consequence of the program. And, to the extent the PEA does analyze aesthetic impacts, the discussion is impermissibly disaggregated and limited to the speculative musings as to the aesthetic implications of as-yet undesigned and yet-to-be constructed power plants....The most obvious visual effect of allowing millions of pounds of new pollution to be introduced into the already polluted air of the Basin—the further browning of the sky—is completely unaddressed in the PEA.” (Page 19, lines 10-26)

Response:

The PEA analyzes the impacts on region-wide visibility resulting from the operation of the sources potentially eligible to be issued permits under Rules 1304 and 1309.1 in reliance on the SCAQMD's internal accounts (see subchapter 4.1). It should be noted that visibility will improve in the future due to the control measures described in the 2007 AQMP, as explained in subchapter 4.1. However, the PEA analyzes the incremental impacts on visibility resulting from the emissions from sources potentially eligible to be issued permits under Rules 1304 and 1309.1 after June, 2010 to determine whether the collective emissions from those sources would result in a significant decrease in visibility. The results are shown in subchapter 4.1. In addition, the PEA analyzes the cumulative impacts on visibility from the proposed project plus the other reasonably foreseeable sources that may be issued permits in reliance on the SCAQMD's internal accounts, including the sources permitted under prior versions of Rule 1315 and SB 827 and the three potential power plants.

## **GREENHOUSE GASES**

Court Decision:

The Superior Court stated: "The District's PEA limited its discussion of the greenhouse gas/global warming consequences of the project to the increased generation of a single greenhouse gas—carbon dioxide. The emission credits captured and tracked under the new Rule 1315 and their use to allow the construction of new electric generating facilities has a certain and foreseeable effect on global warming."(Page 21, lines 8-14)

Response:

This PEA quantifies the greenhouse gases expected to be emitted by sources potentially eligible to be issued permits under Rules 1309.1 and 1304 after June, 2010 (see subchapter 4.1). The analysis includes the six greenhouse gases identified under AB 32, and includes both the increased emissions of greenhouse gases associated with combustion processes, which can be correlated with SOx emissions, as well as increased emissions of other greenhouse gases associated with the types of facilities that may receive permits under Rules 1309.1 and 1304. (see subchapter 4.1)

The PEA also includes an analysis of cumulative greenhouse gas emissions attributed to the proposed project plus the greenhouse gas emissions from the other reasonably foreseeable sources that may be issued permits in reliance on the SCAQMD's internal account offsets, including the projects permitted under prior versions of Rule 1315 and SB 827 and the three potential power plants (see subchapter 4.1).

## **SCOPE OF EMISSIONS ATTRIBUTED TO THE PROPOSED PROJECT**

### Court's Decision:

Based upon the information in the prior record, the Superior Court concluded that all of the newly-tracked types of credits would be used. The Superior Court stated: “The size and breadth of the Priority Reserve has clear, obvious and measurable consequences in a world in which those credits will be accessed and used by credit-hungry polluters... Nor does the court find convincing respondents’ assertion that they have no plans for the use of all of the credits in the reserve and have no idea whether anyone will ever use this burgeoning collection of Priority Reserve emission credits.” The court further stated: “it cannot be doubted that in a world of ever-scarcer emission credits that a huge cache of district-held credits in a now-accessible Priority Reserve will be used.” (Decision, p. 10)

### Response:

In preparing this PEA, the SCAQMD carefully considered whether it would be reasonably likely that all credits tracked in the SCAQMD internal accounts would be used to permit new or modified sources. Under proposed Rule 1315, the sources that can receive permits in reliance upon the SCAQMD internal account offsets are limited to sources permitted under Rules 1304 and 1309.1. The only other reasonably foreseeable sources that may receive permits in reliance upon credits in the SCAQMD internal accounts are those sources that are not relying upon proposed Rule 1315. Instead, they are sources that the State Legislature has instructed must be permitted in reliance upon those accounts. The PEA accounts for emissions from those other sources in the analysis of cumulative impacts.

Proposed Rule 1315 sunsets in 2030, which further limits the extent to which sources can be permitted in reliance upon the tracking system established under proposed Rule 1315. Accordingly, the universe of sources that could be permitted in reliance upon the SCAQMD internal account offsets under proposed Rule 1315 is limited to sources permitted under Rules 1304 and 1309.1 from the date Rule 1315 takes effect until 2030. As explained in subchapter 4.0, the growth in such sources is included in the 2007 AQMP. Moreover, the revised rule includes a “cap” which limits the amount of emissions from sources permitted under Rule 1304 and Rule 1309.1 to the amount analyzed in the PEA. This PEA analyzed the impact of the proposed project based on the difference between emissions with the project and without it. The analysis used the AQMP growth projections for source categories which could use Rule 1304 and Rule 1309.1 as the potential increase in emissions. Thus, including the cap assures that future emissions from the project will not exceed the amount analyzed in this PEA. Thus, the revised proposed rule precludes the occurrence of the situation envisioned by the court in which all available credits would be used.

This Chapter presents historical information indicating that offsets in the SCAQMD’s internal accounts are not used at the same rate as credits are generated. Nevertheless, to

respond further to the Court's decision, the incremental emissions associated with use of all potential credits have been calculated and are presented below under a "maximum use scenario." The air quality, health, visibility, and greenhouse gas impacts from the maximum use scenario would be greater than the impacts attributed to the proposed project in Chapter 4. The "maximum use scenario" assumes that all the offsets in the SCAQMD's internal accounts are used over the 20 year life of the project. The analysis uses the balances in the SCAQMD accounts as of 12-31-06 as the amounts to be used. This amount is used because it is the last annual balance reported to the SCAQMD Governing Board under the prior version of Rule 1315 before it was invalidated by the court.

### **Historic Use of Credits in SCAQMD Internal Accounts**

Growth in the use of offsets represents growth in emissions from new or modified sources in the region. The ability of the region to attract or support growth is not unlimited. Each AQMP submitted by the SCAQMD to U.S. EPA projects future economic, population, and transportation growth. The growth projections are based on analyses provided by the Southern California Association of Governments (SCAG), the metropolitan planning organization for the district. The SCAQMD is required by state law to use SCAG's growth projections. Health & Safety Code § 40460(b). The SCAQMD then formulates its air quality plan to demonstrate attainment as required by federal law with the national ambient air quality standards assuming that such growth will occur. Thus, the most accurate estimate of the demand for offsets is the AQMP growth projections. It should be noted that consistently, the AQMP's growth projections have been overly optimistic, such that actual growth has been less than projected by SCAG.

Historically, the availability of offsets in the SCAQMD internal accounts has been greater than demand. A "credit" to the SCAQMD internal accounts represents an emission reduction, most often due to an "orphan shutdown." (This is defined in Rule 1315(b)(3) as an emission reduction resulting from the removal of a permitted source that is not otherwise required and does not result in the issuance of an "emission reduction credit" on the private market. In other words, if the owner of a source fails to claim any credits upon shutdown, the SCAQMD claims them and puts them in its internal accounts.) A "debit" is the use of an offset to support a new or modified source. Typically, there are more credits coming into the SCAQMD internal accounts than debits leaving the accounts for each year and for each pollutant.

The SCAQMD regularly reports on its tracking of credits and debits from its internal offset accounts. SCAQMD Rule 1310 – Analysis and Reporting, requires SCAQMD staff to report to the SCAQMD Governing Board on an annual basis the effectiveness of Regulation XIII in meeting the state and federal NSR requirements. The last report to the Board (February 2, 2007) presents final determinations of equivalency (FDE) covering the following two reporting periods: August 2002 through July 2003 and August 2003 through July 2004. The February 2, 2007 report to the board also presented a preliminary determination of equivalency (PDE) for the period August 2004 through December 2005. The FDEs and PDE in the Board report demonstrate compliance with federal NSR

requirements by establishing aggregate equivalence with federal offset requirements for sources that obtained their offsets from SCAQMD.

The FDEs for the August 2002 through July 2003 and August 2003 through July 2004 timeframes are summarized below in Tables 8-1 and 8-2, respectively. Additionally, the projections of SCAQMD's internal account offset balances for the August 2004 through December 2005, the January 2006 through December 2006, and January 2007 through December 2007 timeframes are presented in Table 8-3. These reports show that not all the offsets in the SCAQMD internal accounts have been used.

For example, Table 8-1 shows total credit activity for the period August 2002 – July 2003. As indicated in the August 2002 – July 2003 reporting period in Table 8-1, 1,424 pounds per day (approximately 0.71 ton per day) of VOC offsets were used (debited) from the SCAQMD's internal accounts. However, as of August 2002, 68.70 tons per day of VOC offsets were available. Similarly, VOC credits activity during the reporting period showed that the ending VOC balance, 74.29 tons per day, exceeded the starting balance, 68.70 tons per day, by 5.59 tons per day, which confirms that not only were all credits in the SCAQMD's internal accounts not used, but additional credits were generated that were also not used. For all pollutants shown in Table 8-1, the sum of credits/debits is positive, meaning that more emission reductions were deposited into the SCAQMD internal accounts than were used.

**TABLE 8-1**

**Final Determination of Equivalency for August 2002 through July 2003\***

DESCRIPTION	VOC	NO <sub>x</sub>	SO <sub>x</sub>	CO	PM <sub>10</sub>
Starting Balance (tons/day)	68.70	28.84	10.72	7.84	7.68
Total Credits** (pounds/day)	13,515	5,908	545	7,149	3,480
Total Debits** (pounds/day)	-1,424	-2,066	-135	-4,544	-211
<b>Sum of Credits/Debits** (pounds/day)</b>	<b>12,091</b>	<b>3,842</b>	<b>410</b>	<b>2,605</b>	<b>3,269</b>
<b>Sum of Credits/Debits** (tons/day)</b>	<b>6.05</b>	<b>1.92</b>	<b>0.20</b>	<b>1.30</b>	<b>1.63</b>
Surplus Adjustment*** (tons/day)	-0.46	-0.44	0.00	0.00	0.00
<b>Ending Balance**** (tons/day)</b>	<b>74.29</b>	<b>30.32</b>	<b>10.92</b>	<b>9.14</b>	<b>9.31</b>

\* Source: Board agenda item #37, February 2, 2007.

\*\* Credits are shown as positive and Debits as negative, while sum of Credits/Debits and Net Activity are shown as positive or negative, as appropriate.

\*\*\* Surplus at the time of use discount pursuant to the 2006 version of Rule 1315(b)(4), which has since been rescinded.

\*\*\*\* Ending Balance" equals the "Starting Balance" plus the sum of credits and debits and plus any surplus adjustments.

For PM<sub>10</sub>, Table 8-1 shows that 211 pounds per day (approximately 0.10 ton per day) were used (debited), while 7.68 tons per day were available. Similarly, PM<sub>10</sub> credit activity during the reporting period showed that the ending PM<sub>10</sub> balance, 9.31 tons per

day, exceeded the starting balance, 7.68 tons per day, by 1.63 tons per day, which confirms that not only were all PM10 credits in the SCAQMD's internal accounts not used, but additional PM10 credits were generated that were also not used.

For SOx, Table 8-1 shows that 135 pounds per day (approximately 0.06 ton per day) were used (debited), while 10.72 tons per day were available. Similarly, SOx credit activity during the reporting period showed that the ending SOx balance, 10.92 tons per day, exceeded the starting balance, 10.72 tons per day, by 0.20 ton per day, which confirms that not only were all SOx credits in the SCAQMD's internal accounts not used, but additional SOx credits were generated that were also not used.

For NOx, Table 8-1 shows that 2,066 pounds per day (approximately 1.03 tons per day) were used (debited), while 28.84 tons per day were available. Similarly, NOx credit activity during the reporting period showed that the ending NOx balance, 30.32 tons per day, exceeded the starting balance, 28.84 tons per day, by 1.48 tons per day, which confirms that not only were all NOx credits in the SCAQMD's internal accounts not used, but additional NOx credits were generated that were also not used.

Table 8-2 shows total credit activity for the period August 2003 – July 2004. As indicated in the August 2003 – July 2004 reporting period in the Table 8-2, 539 pounds per day (approximately 0.26 ton per day) of VOC offsets were used (debited) from the SCAQMD's internal accounts. However, as of August 2003, 74.29 tons per day of VOC offsets were available. Similarly, VOC credits activity during the reporting period showed that the ending VOC balance, 82.90 tons per day, exceeded the starting balance, 74.29 tons per day, by 8.61 tons per day, which confirms that not only were all VOC credits in the SCAQMD's internal accounts not used, but additional VOC credits were generated that were also not used.

**TABLE 8-2****Final Determination of Equivalency for August 2003 through July 2004\***

<b>DESCRIPTION</b>	<b>VOC</b>	<b>NO<sub>x</sub></b>	<b>SO<sub>x</sub></b>	<b>CO</b>	<b>PM<sub>10</sub></b>

\* Same as "Ending Balance" from Table 8-1.

\*\* Credits are shown as positive and Debits as negative, while sum of Credits/Debits and Net Activity are shown as positive or negative, as appropriate.

\*\*\* Surplus at the time of use discount pursuant to the 2006 version of Rule 1315(b)(4), which has since been rescinded.

\*\*\*\* Ending Balance" equals the "Starting Balance" plus the sum of credits and debits and plus any surplus adjustments.

Source: Board agenda item #37, February 2, 2007.

For PM<sub>10</sub>, Table 8-2 shows that 245 pounds per day (approximately 0.12 ton per day) were used (debited), while 9.31 tons per day were available. Similarly, PM<sub>10</sub> credit activity during the reporting period showed that the ending PM<sub>10</sub> balance, 10.51 tons per day, exceeded the starting balance, 9.31 tons per day, by 1.20 tons per day, which confirms that not only were all PM<sub>10</sub> credits in the SCAQMD's internal accounts not used, but additional PM<sub>10</sub> credits were generated that were also not used.

For SO<sub>x</sub>, Table 8-2 shows that three pounds per day (approximately 0.001 ton per day) were used (debited), while 10.92 tons per day were available. Similarly, SO<sub>x</sub> credit activity during the reporting period showed that the ending SO<sub>x</sub> balance, 11.24 tons per day, exceeded the starting balance, 10.92 tons per day, by 0.32 ton per day, which confirms that not only were all SO<sub>x</sub> credits in the SCAQMD's internal accounts not used, but additional SO<sub>x</sub> credits were generated that were also not used.

For NO<sub>x</sub>, Table 8-2 shows that 1,610 pounds per day (approximately 0.80 ton per day) were used (debited), while 30.32 tons per day were available. During this reporting period, NO<sub>x</sub> credit activity during the reporting period showed that the ending NO<sub>x</sub> balance, 29.26 tons per day, was less than the starting balance, 30.32 tons per day, by 1.06 tons per day. Although the ending NO<sub>x</sub> balance was slightly less than the beginning balance, the data show that there were excess NO<sub>x</sub> credits (29.26 tons per day) that were not used, which still confirms that not all NO<sub>x</sub> credits in the SCAQMD's internal accounts were used.

As can be seen from the above Tables 8-1 and 8-2, consistently the demand for credits has not been anywhere near the total amount of credits available. Moreover, generally there have been more emission reductions (credits deposited) than emissions increases (offsets used) in any given year. Thus, it is clear that based on past history, not all available credits will be used. Nevertheless, to further ensure that emissions increases do not exceed the amount analyzed in this PEA, proposed Rule 1315 contains a CEQA backstop provision that requires that permits relying on SCAQMD internal accounts may no longer be issued once the amount analyzed in this PEA is reached.

Another way to evaluate the data provided in Tables 8-1 and 8-2 is to compare actual offset usage with the total offset usage that could occur if all offsets were used. For example, in the reporting period August 2002 – July 2003 the total number of offsets debited from the SCAQMD's internal accounts was 0.71 ton per day out of a total of 68.70 tons of available VOCs. Therefore, actual VOC offset activity represented approximately one percent of the total available VOC offsets. Similarly, for the same reporting period the actual number of PM10 offsets used was 0.10 ton per day out of a total of 7.68 tons per day of available PM10 offsets. Therefore, actual PM10 offset activity represented approximately 1.3 percent of the total PM10 offsets available for use. For past AQMPs, growth projections have ranged between approximately one and two percent per year. For example, the future growth factor provided by SCAG for the 2007 AQMP relied on an annual growth factor of one percent per year for the district. The future population growth that would have to occur in the district to deplete all available credits even over a period of 20 years, would far exceed these growth projections.

#### **Impact Analysis Assuming Full Use of Credits (Maximum Use Scenario)**

Based on the above considerations, usage of all offsets in the SCAQMD's internal accounts for permits issued under Rule 1304 and 1309.1 by 2030 is considered unlikely. Moreover, the proposed project has been designed so that it is not possible for all offsets in the beginning balance plus those deposited in future years to be used. The proposed project now includes a cap on the amount of offsets that can be used.

Nevertheless, to address the concern in Court's decision regarding impacts of use of all offsets, this Chapter presents an analysis of air quality, health, visibility and greenhouse gas impacts that would occur if all the offsets in the SCAQMD's internal accounts were used over the next 20 years.

### **Mass Emissions of Criteria Pollutants**

The SCAQMD staff used the actual starting balances as of 12-31-06 as the “maximum use scenario” emissions that would occur.

**TABLE 8-3**

#### **Maximum Use Scenario Mass Emissions of Criteria Pollutants**

	<b>VOC</b>	<b>NO<sub>x</sub></b>	<b>SO<sub>x</sub></b>	<b>PM<sub>10</sub></b>	<b>Lead</b>
Tons per Day					
2007-2030	66.55	25.50	2.33	11.18	0.003
Pounds per Day					
2007-2030	133,100	51,000	4,660	22,360	1.08

### **Modeled Concentrations of Criteria Pollutant Emissions**

The SCAQMD used the same methodology as is described in subchapter 4.0 to model region-wide concentrations of pollutants attributed to the maximum use scenario. Modeling was based on the assumption on that actual emissions from permitted facilities would be 80% of permitted emissions, reflecting the fact that facilities do not typically operate full time at full capacity.

#### *Ozone*

The maximum use of credits emissions scenario would result in nominally lower ozone concentrations in the Basin but higher ozone in Coachella Valley. Increased Basin NO<sub>x</sub> emissions act to reduce local ozone concentrations due to titration of ozone to nitrogen dioxide. The nitrogen dioxide is transported downwind remains available for ozone formation at a later time. As a consequence, the maximum use emission scenario would result in fewer foregone ozone benefits in the Basin but would increase the foregone ozone benefits in the Coachella Valley. The impact of this scenario on attainment of the federal standards attainment (foregone earlier attainment date) for either basin would be nominal.

**TABLE 8-4**  
**Maximum Use of Credits Regional Ozone Impacts**

Year	Basin Average Ozone Impact (ppb)	Basin Maximum Station Ozone Impact (ppb)	Coachella Valley Average Ozone Impact (ppb)	Coachella Valley Maximum Station Ozone Impact (ppb)
2014	0.2	0.4	0.3	0.4
2023	0.9	1.5	1.0	1.3
2030	2.1	2.8	1.6	2.0

Note: The contribution to regional ozone contributions for the Basin is less than from the proposed project even though emissions of ozone precursors are greater. This is because the emissions in the maximum use scenario contain a greater amount of NO<sub>x</sub> relative to the VOC. The change in ratio changes the resulting ozone concentrations.

*Particulate Matter*

Annual average and 24-hour average PM<sub>2.5</sub> concentration under the maximum use of credits scenario would result roughly in a doubling of the PM<sub>2.5</sub> impact compared with the impact predicted for the proposed project. The increase in PM<sub>2.5</sub> (and PM<sub>10</sub>) resulted from increased emissions of both NO<sub>x</sub> and directly emitted particulates.

Under the maximum use of credits scenario, greater amounts of health impacts would be foregone including 34, 79 and 81 percent increases in mortality, pulmonary impacts, cardiac response and lost activity by 2014, 2023 and 2030 respectively.

**TABLE 8-5**  
**Maximum Use of Credits Regional PM<sub>2.5</sub> and PM<sub>10</sub> Impacts**

Year	Basin Annual PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Basin Annual PM <sub>10</sub> (µg/m <sup>3</sup> )	Basin Daily PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Basin Daily PM <sub>10</sub> (µg/m <sup>3</sup> )	Coachella Valley Annual PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Coachella Valley Annual PM <sub>10</sub> (µg/m <sup>3</sup> )	Coachella Valley Daily PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Coachella Valley Daily PM <sub>10</sub> (µg/m <sup>3</sup> )
2014	0.08	0.18	0.7	1.0	0.02	0.02	0.1	0.1
2023	0.24	0.53	2.3	3.4	0.05	0.05	0.2	0.2
2030	0.38	0.83	3.5	5.2	0.08	0.08	0.4	0.4

Localized concentrations of pollutants from individual facilities using offsets would be the same as reported in Chapter 4.

### **Health Effects**

Using the same methodology as described in subchapter 4.0, the SCAQMD staff calculated the health effects from the emissions attributed to the maximum use scenario. Because the maximum use scenario assumes growth that far exceeds the growth analyzed in the 2007 AQMP, this scenario would result in substantial adverse health effects, as compared with the health effects that would occur under the proposed project.

**TABLE 8-6**

**Maximum Use Scenario's Estimated Foregone PM2.5 and PM10 Health Impacts**

	<b>Mortality Deaths</b> (people)	<b>Acute Bronchitis</b> (people)	<b>Chronic Bronchitis</b> (people)	<b>Non-fatal Heart Attacks</b> (people)	<b>Upper/Lower Respiratory</b> (people)	<b>Emergency Room Visits</b>	<b>Hospital Admissions</b> (people)	<b>Minor Restricted Activity Days</b>	<b>Annual Work Loss</b> (days)
Year 2014	52	93	28	45	1,978	17	21	36,643	6,387
Year 2023	168	303	90	146	6,435	55	67	119,182	20,775
Year 2030	259	466	138	225	9,898	86	104	183,334	31,958

The maximum credit use scenario resulted in overall nominally lower foregone ozone health benefits than for the proposed project. This is because of a different ratio of VOC to NO<sub>x</sub>, as explained under Table 8.2.

**TABLE 8-7**

**Estimated Health Effects from the Maximum Use Scenario's Ozone Impacts**

<b>Year</b>	<b>Mortality Premature Deaths</b> (people)	<b>Hospital Admissions</b> (people)	<b>Minor Restricted Activity</b> (days)	<b>School Absences</b> (days)
2014	2	10	6,987	7,364
2023	7	40	28,133	29,652
2030	16	98	68,828	72,544

### **Toxic Impacts**

Increased VOC and particulate emissions resulting from the maximum use of credits scenario would result in a greater toxic risk. The foregone benefit of four fewer additional cases of cancer in a population of one million individuals that are exposed over a 70-year lifetime for 2030 represents approximately one percent of the estimated 2030 risk from all sources in the Basin.

**TABLE 8-8**

#### **Maximum Use of Credits Estimated Regional Foregone Toxic Risk**

<b>Year</b>	<b>Project Toxic Impact: Risk Reduction Not Achieved (Cases of Cancer)</b>
2014	1.72
2023	5.57
2030	8.58

### **Visibility**

Under the maximum use of credits emissions scenario, visual range would be reduced beyond that of the proposed project by approximately one-half of a mile in 2030, as compared to a baseline visual range of 40 miles or more. The foregone visibility improvement would not result in a significant change in visibility perception as measured by deciviews since the maximum impact is about 2-tenths of a deciview, and EPA's significance threshold is one-half of a deciview.

**TABLE 8-9**

#### **Visibility Improvements Foregone under the Maximum Use Scenario Measured in Deciviews and Visual Range (Miles)**

<b>Area Impacted</b>	<b>Classification</b>	<b>Difference in Deciviews</b>	<b>Difference in Miles</b>
<b>2014</b>			
Agua Tibia	Class-I Wilderness	0.008	-0.034
San Gabriel	Class-I Wilderness	0.021	-0.095
Cucamonga	Class-I Wilderness	0.017	-0.082
San Gorgonio	Class-I Wilderness	0.010	-0.064
San Jacinto	Class-I Wilderness	0.008	-0.050
Joshua Tree	Class-I Wilderness	0.008	-0.052
Rubidoux	District Monitoring	0.000	0.000
<b>2023</b>			
Agua Tibia	Class-I Wilderness	0.030	-0.120

**TABLE 8-9 (Concluded)**  
**Visibility Improvements Foregone under the Maximum Use Scenario**  
**Measured in Deciviews and Visual Range (Miles)**

<b>Area Impacted</b>	<b>Classification</b>	<b>Difference in Deciviews</b>	<b>Difference in Miles</b>
San Gabriel	Class-I Wilderness	0.076	-0.340
Cucamonga	Class-I Wilderness	0.057	-0.282
San Gorgonio	Class-I Wilderness	0.033	-0.204
San Jacinto	Class-I Wilderness	0.028	-0.168
Joshua Tree	Class-I Wilderness	0.022	-0.139
Rubidoux	District Monitoring	0.163	-0.300
<b>2030</b>			
Agua Tibia	Class-I Wilderness	0.049	-0.203
San Gabriel	Class-I Wilderness	0.112	-0.505
Cucamonga	Class-I Wilderness	0.096	-0.470
San Gorgonio	Class-I Wilderness	0.049	-0.296
San Jacinto	Class-I Wilderness	0.041	-0.245
Joshua Tree	Class-I Wilderness	0.033	-0.204
Rubidoux	District Monitoring	0.221	-0.400

### **Greenhouse Gases**

The GHG emissions analysis for the maximum use scenario is based on the same methodologies as is used to determine greenhouse gas emissions attributed to the proposed project in Chapter 4.

Table 8-10 provides the estimated SO<sub>x</sub> emissions from the maximum use scenario and applies the ratio factors described in Chapter 4 to calculate the GHG emissions from the maximum use scenario.

**TABLE 8-10**  
**SO<sub>x</sub> Emissions and Greenhouse Gas Emissions from the Maximum Use Scenario**

<b>Attainment Year Periods</b>	<b>SO<sub>x</sub> Emissions (tons/day)</b>	<b>SO<sub>x</sub> Emissions (tons/year)</b>	<b>AQMP SO<sub>x</sub> to GHG Emissions Ratio</b>	<b>GHG Emissions (million MT CO<sub>2</sub> eq /year)</b>
2007-2030	2.33	850.5	0.0824	70.08

## **CHAPTER 9**

---

### **ACRONYMS**

---

$\mu\text{g}/\text{m}^3$	microgram per cubic meter
AB	Assembly Bill
afy	acre-feet per year
AIRFA	American Indian Religious Freedom Act
ALUC	Airport Land Use Commission
AMSL	above mean sea level
AQMP	Air Quality Management Plan
ARPA	Archaeological Resources Protection Act
ATF	Bureau of Alcohol, Tobacco, Firearms and Explosives
AWOS	Automated Weather Observing System
BACT	Best Available Control Technology
BARCT	Best Available Retrofit Control Technology
Basin	South Coast Air Basin
BAT	Best Available Technology Economically Achievable
BCT	Best Conventional Control Technology
BLM	Bureau of Land Management
BMP	Best Management Practice
BNSF	Burlington Northern Santa Fe Railway
BP	before present
BTU	British Thermal Unit
BUR	Bob Hope Airport
Bwh	dry-hot desert climate
Bwhh	dry-very hot desert climate
CAA	Clean Air Act
CAAQS	California Ambient Air Quality Standards

---

CAFE	Corporate Average Fuel Economy
Cal/EPA	California Environmental Protection Agency
CalARP	California Accidental Release Prevention
Caltrans	California Department of Transportation
CARB	California Air Resources Board
CAT	Climate Action Team
CBC	California Building Code
CCA	California Coastal Act
CCC	California Coastal Commission
CDC	California Department of Conservation
CDF	California Department of Forestry and Fire Protection
CDFG	California Department of Fish and Game
CDPR	California Department of Parks and Recreation
CEC	California Energy Commission
CEDD	California Economic Development Department
CEQ	Council on Environmental Quality
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CERCLIS	Comprehensive Environmental Response, Compensation, and Liability Information System
CESA	California Endangered Species Act
CFCP	California Farmland Conservancy Program
CFR	Code of Federal Regulations
CGS	California Geological Survey
CH <sub>4</sub>	methane

---

CHL	California Historical Landmarks
CHP	California Highway Patrol
CIWMB	California Integrated Waste Management Board
CLG	Certified Local Government
CMA	Congestion Management Agency
CMP	Congestion Management Program
CNEL	Community Noise Equivalent Level
CO	carbon monoxide
CO <sub>2</sub>	carbon dioxide
CO <sub>2</sub> e	carbon dioxide equivalent
CPUC	California Public Utilities Commission
CRA	Colorado River Aqueduct
CSE	Countywide Siting Element
CSI	California Solar Initiative
CT	conversion technologies
CUPA	Certified Uniform Program Agencies
CWA	Clean Water Act
dB	decibel
dBA	“A”-weighted decibel
DG	distributed generation
DNL	Day-Night Average Noise Level
DOF	Department of Finance
DPH	Department of Public Health
DTSC	Department of Toxic Substances Control
DWR	Department of Water Resources

EGF	Electric Generating Facility
EIR	Environmental Impact Report
EPAct	Energy Policy Act
EQIP	Environmental Quality Incentives Program
ERC	Emissions Reduction Credit
ERPG	Emergency Response Planning Guideline
FAA	Federal Aviation Administration
FBI	Federal Bureau of Investigation
FDE	Final Determination of Equivalency
FEIR	Final Environmental Impact Report
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FFV	Flex fuel vehicles
FHWA	Federal Highway Administration
FPP	Farmland Protection Program
FPPA	Farmland Protection Policy Act
FRA	Federal Rail Administration
FSZ	Farmland Security Zone
FTA	Federal Transit Administration
FUA	Fuel Use Act
GHG	Greenhouse gas
GMC	Growth Management Chapter
HABS	Historic American Building Survey
HFC	Hydrofluorocarbon
HHWE	Household Hazardous Waste Element

---

HI	Hazard Index
HID	High intensity discharge
HOT	High-occupancy toll
HOV	High-occupancy vehicle
HSA	Historic Sites Act
HUC	Hydrologic Unit Code
HWMP	Hazardous Waste Management Plan
IOU	Investor-owned utilities
IS	Initial Study
kWh	kiloWatt-hour
LAA	Los Angeles Aqueduct
LADWP	Los Angeles Department of Water and Power
LAER	Lowest achievable emission rate
LAFCO	Local Agency Formation Commission
LAX	Los Angeles International Airport
LCFS	Low Carbon Fuel Standard
LCP	Local Coastal Program
LEA	Local Enforcement Agency
LED	Light-emitting diode
$L_{eq}$	Energy-Equivalent Noise Level
LGB	Long Beach Airport
$L_{max}$	Maximum Measured Noise Level
LOS	Level of Service
LUP	Land Use Plan
MBTA	Migratory Bird Treaty Act

---

MCL	Maximum Contaminant Level
MDAB	Mojave Desert Air Basin
MeTHF	methyltetrahydrofuran
Metro	Los Angeles County Metropolitan Transportation Authority
MM	Modified Mercalli
mm/yr	millimeters per year
MMT CO <sub>2</sub> e	million metric tons of carbon dioxide equivalent
MPO	Metropolitan Planning Organization
MRF	Material Recovery Facility
MRZ	Mineral Resource Zone
MSHCP	Multi-Species Habitat Conservation Plan
MW	megawatts
MWD	Metropolitan Water District of Southern California
N <sub>2</sub> O	nitrous oxide
NAAQS	National Ambient Air Quality Standards
NAGPRA	Native American Graves Protection and Repatriation Act
NAHC	Native American Heritage Commission
NAICS	North American Industrial Category System
NCCP	Natural Communities Conservation Program
NCP	National Contingency Plan
NDFE	Non-Disposal Facility Element
NEPA	National Environmental Policy Act
NESHAP	National Emission Standards for Hazardous Air Pollutants
NHL	National Historic Landmarks
NHPA	National Historic Preservation Act

---

NNI	no net increase
NO	Nitric oxide
NO <sub>2</sub>	Nitrogen dioxide
NOE	Notice of Exemption
NOP	Notice of Preparation
NO <sub>x</sub>	Nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPDWR	National Primary Drinking Water Regulations
NPL	National Priorities List
NPPA	Native Plant Protection Act
NPS	National Parks Service
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NSR	New Source Review
O <sub>3</sub>	Ozone
OCHCA	Orange County Health Care Agency
OCTA	Orange County Transportation Authority
OEHHA	Office of Environmental Health Hazard Assessment
OES	Office of Emergency Services
OHP	Office of Historic Preservation
ONT	Ontario International Airport
OPR	Office of Planning and Research
OSHA	Occupational Safety and Health Administration
PAH	Polynuclear aromatic hydrocarbons
Pb	Lead

---

PDE	Preliminary Determination of Equivalency
PEA	Program Environmental Assessment
PFC	Perfluorocarbon
PHI	Points of Historical Interest
PM10	Particulate matter 10 microns in diameter or less
PM2.5	Particulate matter 2.5 microns in diameter or less
PMD	Palmdale Regional Airport
POTW	Publicly-Owned Treatment Works
ppm	Parts per million
PPV	Peak Particle Velocity
PRC	Public Resources Code
PURPA	Public Utilities Regulatory Policies Act
PVMRM	Plume volume molar ratio method
Qfs	Qualifying facilities
RAC	Rubberized asphalt concrete
RCPG	Regional Comprehensive Plan and Guide
RCRA	Resource Conservation and Recovery Act
RELOOC	Regional Landfill Options for Orange County
RFS	Renewable Fuel Standard
RHNA	Regional Housing Needs Assessment
RIV	March Inland Port
RMP	Regional Mobility Element
RMP	Risk Management Programs
RMS	Root mean square
ROC	Reactive organic compound

---

ROG	Reactive organic gas
RPS	Renewables Portfolio Standard
RTA	Riverside Transit Agency
RTIP	Regional Transportation Improvement Program
RTP	Regional Transportation Plan
RWQCB	Regional Water Quality Control Board
SANBAG	San Bernardino Associated Governments
SARA	Superfund Amendments and Reauthorization Act
SB	Senate Bill
SBD	San Bernardino International Airport
SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCE	Southern California Edison
SCHWMA	Southern California Hazardous Waste Management Authority
SCRRA	Southern California Regional Rail Authority
SDG&E	San Diego Gas and Electric Company
SDWA	Safe Drinking Water Act
SEA	Significant Ecological Area
SEDAB	Southeast Desert Air Basin
SEL	Sound Exposure Level
SF <sub>6</sub>	Sulfur hexafluoride
SHPO	State Historic Preservation Office
SHRC	State Historical Resources Commission
SIP	State Implementation Plan
SMARA	Surface Mining Reclamation Area Act

---

SNA	John Wayne Airport
SO <sub>2</sub>	Sulfur dioxide
SONGS	San Onofre Nuclear Generating Station
SOV	Single-occupancy vehicle
SO <sub>x</sub>	Sulfur oxides
SPCC	Spill Prevention Containment and Countermeasures
SRA	Source Receptor Area
SRRE	Source Reduction and Recycling Element
SSAB	Salton Sea Air Basin
STC	Short-term credits
SWFP	Solid Waste Facility Permits
SWP	State Water Project
SWPPP	Stormwater Pollution Prevention Plan
SWRCB	State Water Resources Control Board
TAC	Toxic air contaminant
TDA	Tire-derived aggregate
TDM	Transportation Demand Management
TEA-21	Transportation Equity Act for the 21st Century
TMDL	Total Maximum Daily Load
TOG	Total organic gas
TSCA	Toxic Substances Control Act
TSD	Technical support document
TSDF	Treatment, Storage, and Disposal Facilities
UBC	Uniform Building Code
UCLA	University of California Los Angeles

USACE	United States Army Corps of Engineers
USBR	United States Bureau of Reclamation
USC	United States Code
USDA	United States Department of Agriculture
USDOT	United States Department of Transportation
USEPA	United States Environmental Protection Agency
USFS	United States Forest Service
USFWS	United States Fish and Wildlife Service
USGS	United States Geological Survey
UST	Underground storage tank
VCV	Southern California Logistics Airport
VOC	Volatile organic compounds
WDR	Water Discharge Requirements

**EXECUTIVE OFFICER:**  
BARRY R. WALLERSTEIN, D.Env.

## **APPENDIX A**

---

### **REVISED PROPOSED RULE 1315**

Thirty days before the January 7, 2011 Board Meeting, a revised version of proposed Rule 1315 was made available for public review and is included herein. Revisions to proposed Rule 1315 were made to clarify the rule's requirements to ensure that the rule would operate as intended. SCAQMD staff's evaluation of these revisions concluded that the revisions would not result in any changes to the analysis in the PEA.

**PROPOSED RULE 1315 FEDERAL NEW SOURCE REVIEW TRACKING  
SYSTEM**

(a) Purpose

The purpose of this rule is to:

- (1) Maintain the District's ability to continue through December 31, 2030 to issue permits to major sources that obtain offset credits from the Priority Reserve under Rule 1309.1 and/or that are exempt from offsets under Rule 1304;
- (2) Memorialize in rule form the procedures to be followed by the Executive Officer for:
  - (A) Establishing the District's NSR program equivalency with federal NSR offset requirements for such major sources; and
  - (B) Demonstrating that sufficient emission reductions, including previously-untracked emission reductions, existed beyond regulatory requirements under federal law to be used as offset credits to establish that the District's NSR program is equivalent with federal NSR offset requirements for major sources that are exempt from offsets under Rule 1304 or obtain offset credits from the Priority Reserve under Rule 1309.1.

(b) Definitions

- (1) COMMUNITY BANK means the Community Bank as established by Rule 1309.1 – Community Bank, as adopted June 28, 1990 and by Rule 1309.1 – Community Bank And Priority Reserve, as amended May 3, 1991, and became unavailable to applications deemed complete after the December 7, 1995 amendments to Rule 1309.1 – Priority Reserve, which eliminated the Community Bank.
- (2) NET EMISSION INCREASE means the aggregate increase in potential to emit from permitted major and minor stationary sources of a nonattainment air contaminant subject to tracking pursuant to paragraph (c)(2) of this rule that are offset from the Priority Reserve or exempt from offsets pursuant to Rule 1304 minus the aggregate emissions reductions of the same nonattainment air contaminant tracked pursuant to paragraph (c)(3) of this rule over the same time period.

- (3) OFFSET RATIO means the ratio of the quantity of offset credits provided (in pounds per day) to the increase in potential emissions (in pounds per day) requiring offsets.
  - (4) ORPHAN REDUCTION means any reduction in actual emissions from a permitted source within the District resulting from a physical change to the source and/or a change to the method of operation of the source provided the change is reflected in a revised permit for the source and provided such reduction is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan and does not result in issuance of an ERC.
  - (5) ORPHAN SHUTDOWN means any reduction in actual emissions from a permitted source within the District resulting from removal of the source from service and inactivation of the permit without subsequent reinstatement of such permit provided such reduction is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan and does not result in issuance of an ERC.
  - (6) PRIORITY RESERVE means the Priority Reserve as established by the June 28, 1990 adoption of Rule 1309.1 – Community Bank and as amended by the May 3, 1991 amendments to Rule 1309.1 – Community Bank and Priority Reserve and by the December 7, 1995 and subsequent amendments to Rule 1309.1 – Priority Reserve.
  - (7) SHORTFALL means a negative net balance in any of the District offset accounts described in paragraph (c)(1) of this rule as demonstrated through an FDE prepared pursuant to paragraph (d)(3) of this rule or projected pursuant to subdivision (e) of this rule.
- (c) Offset Accounts for Federal NSR Equivalency
- (1) District Offset Accounts for Federal Nonattainment Air Contaminants  
The Executive Officer shall maintain a separate District offset account for each federal nonattainment air contaminant excluding PM<sub>2.5</sub>. The District offset accounts were established as of October 1, 1990 with valid emission reductions that had occurred prior to that date, as reflected in various facilities' negative NSR account balances and that were aggregated as the initial account balances listed in Table A for each nonattainment air contaminant. Any portions of the initial account

balances identified in Table A remaining in the District offset accounts at the end of calendar year 2005 were removed from the District offset accounts as an environmental benefit by the Executive Officer and are not used for purposes of demonstrating equivalency between federal NSR offset requirements and the District’s NSR program. Additional District offset accounts are to be established by the Executive Officer in the event that additional federal nonattainment air contaminants other than PM2.5 or their precursors become subject to federal nonattainment NSR offset requirements, unless by rule the District establishes that Rule 1304 and Rule 1309.1 do not apply to such contaminants or their precursors. If the United States Environmental Protection Agency (EPA) re-designates the District’s attainment status from nonattainment to attainment for a specific air contaminant the Executive Officer may discontinue tracking and reporting the associated District offset account for that air contaminant provided there is a showing in the maintenance plan that the continued use of emissions offsets for that air contaminant is not necessary to maintain attainment for that air contaminant. The District’s NSR program shall be considered equivalent to federal nonattainment NSR offset requirements for a nonattainment air contaminant so long as the procedures specified in this rule are followed and the balance in the District offset account for that air contaminant remains positive.

TABLE A  
Initial District Offset Account Balances

Air Contaminant	Initial Account Balance (tons per day)
Volatile Organic Compounds (VOC)	38.46
Nitrogen Oxides (NOx)	23.92
Sulfur Oxides (SOx)	8.04
Carbon Monoxide (CO)	8.45
Particulate Matter (PM10)	2.67

- (2) Tracking of Offset Account Debits for Federal NSR Equivalency  
The Executive Officer shall track the amount of emissions and debit from the District offset accounts for the following types of offset allocations or exemptions provided from the District offset accounts for sources located

at major polluting facilities and that are not exempt from the offset requirements of federal nonattainment NSR:

- (A) Emission offsets from the Priority Reserve or Community Bank pursuant to Rule 1309.1; and
- (B) Exemptions from the offset requirements of Rule 1303 – Requirements pursuant to Rule 1304 – Exemptions.

The applicable offset ratios for offsets tracked by the Executive Officer pursuant to this paragraph is 1.2-to-1.0 for extreme nonattainment air contaminants and their precursors and is 1.0-to-1.0 for all other nonattainment air contaminants.

- (3) Tracking of Offset Account Credits for Federal NSR Equivalency
  - (A) The Executive Officer shall track and verify the amount of the following types of emission reductions that have occurred since October 1, 1990 to the District offset accounts:
    - (i) Orphan shutdowns;
    - (ii) Orphan reductions;
    - (iii) ERCs provided as emission offsets for sources located at minor facilities;
    - (iv) The difference between the quantity of ERCs provided for a source located at a major polluting facility at a 1.2-to-1.0 offset ratio pursuant to Rule 1303(b)(2)(A) and the quantity of ERCs required to offset the emission increases at a ratio of 1.0-to-1.0 for all non-attainment air contaminants except extreme nonattainment air contaminants and their precursors.
    - (v) The amount of emission reductions associated with a facility's NSR balance, Community Bank and Priority Reserve allocations, and offset exemptions that is subtracted from the emission reductions quantified pursuant to Rule 1306(c) as part of the Executive Officer's evaluation of an ERC banking application; and
    - (vi) The difference between the actual daily emission reductions calculated pursuant to Rule 1306(c) with and without the BACT adjustment required in Rule 1306(c)(2) as part of the Executive Officer's evaluation of an ERC banking application. This clause applies only in cases

where the Executive Officer demonstrates and EPA concurs that the subtracted amount is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan. This clause is not applicable to emission reductions that occur in the Riverside County portion of the Salton Sea Air Basin (SSAB) or the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (MDAB).

- (B) The Executive Officer shall quantify and deposit emission reductions that are tracked pursuant to subparagraph (c)(3)(A) of this rule into the District offset accounts according to the following procedures:
- (i) From orphan sources tracked pursuant to clauses (c)(3)(A)(i) or (c)(3)(A)(ii) of this rule at eighty percent of the total or change in the source's NSR permitted emission levels, respectively; and
  - (ii) From ERCs tracked pursuant to clauses (c)(3)(A)(iii), (c)(3)(A)(iv), (c)(3)(A)(v), and (c)(3)(A)(vi) of this rule in the amounts specified pursuant to those clauses.
- (C) The Executive Officer may choose not to track all potential sources of credits in any reporting period if the Executive Officer determines that sufficient credits remain in the District offset accounts to demonstrate equivalency in each reporting period.
- (4) Surplus at the Time of Use  
All credits deposited into the District offset accounts pursuant to clauses (c)(3)(A)(i), (c)(3)(A)(ii), and (c)(3)(A)(vi) of this rule shall be discounted by the Executive Officer to ensure that they remain surplus at the time of use. Such discounting shall be performed annually and shall be based on the percentage reduction in overall permitted emissions projected to be achieved as a result of implementation of control requirements that became effective during the previous calendar year for each specific nonattainment air contaminant within the District.
- (5) Tracking Sequence  
The tracking elements described in paragraphs (c)(2) through (c)(4) of this rule shall be carried out separately for each District Offset Account in the

following sequence for each reporting period as defined in paragraph (d)(1) of this rule:

- (A) Apply the surplus at the time of use discount described in paragraph (c)(4) of this rule to the offsets tracked pursuant to subparagraph (c)(3)(A) of this rule remaining in the District Offset Account, if any;
- (B) Subtract as much of the aggregate District Offset Account debits tracked and quantified pursuant to paragraph (c)(2) of this rule from the unused Table A initial balance remaining in the corresponding District Offset Account, if any, as possible without resulting in a negative District Offset Account balance;
- (C) Subtract the aggregate District Offset Account debits tracked and quantified pursuant to paragraph (c)(2) of this rule remaining after conducting the subtraction specified in subparagraph (c)(5)(A) of this rule, if any, from the corresponding District Offset Account balance; and
- (D) Add the emission reductions tracked pursuant to subparagraph (c)(3)(A) of this rule for the current reporting period to the corresponding District Offset Account Balance.

The PDE for each reporting period through the 2005 reporting period shall follow the tracking sequence identified in subparagraphs (c)(5)(A), (c)(5)(B), and (c)(5)(C) and the PDE for each reporting period commencing with the 2006 reporting period shall follow the tracking sequence identified in subparagraphs (c)(5)(A) and (c)(5)(C). The FDE for each reporting period shall be completed by adding the results of subparagraph (c)(5)(A) tracking to the PDE results for the same reporting period.

(6) Federal Offset Criteria

Offset account credits used to offset debits pursuant to Rule 1304 or Rule 1309.1, as specified in paragraph (c)(2), are real as specified in subparagraphs (c)(3)(A) and (c)(3)(B), surplus as specified in paragraphs (b)(4), (b)(5), and (c)(4), permanent as specified in paragraphs (b)(4) and (b)(5) and subparagraph (c)(3)(A), quantifiable as specified in paragraphs (c)(1), (c)(3), (c)(4), and (c)(5), and enforceable as specified in paragraphs (b)(4), (b)(5), and (c)(3).

**(d) Federal NSR Equivalency Determination Reports****(1) Reporting Periods**

The Executive Officer shall aggregate and track offsets debited from and offsets deposited to the District offset accounts into the following reporting periods for purposes of making periodic determinations of equivalency:

(A) October 1, 1990 through July 31, 1995;

(B) Each of the consecutive twelve-month periods commencing with August 1995 through July 1996 and concluding with August 2003 through July 2004;

(C) August 2004 through December 2005;

(D) Each calendar year from 2006 through 2009; and

(E) Each calendar year from 2010 through 2030.

**(2) Preliminary Determinations of Equivalency**

Commencing with the calendar year 2010 reporting period, and for each reporting period thereafter, the Executive Officer shall, no later than twelve months after the completion of the reporting period, complete a Preliminary Determination of Equivalency (PDE) with federal nonattainment NSR offset requirements. The Executive Officer shall report the PDE to the District's Governing Board and EPA no later than the second regularly-scheduled monthly Governing Board meeting after the completion deadline for the PDE. The PDE is a conservative assessment of the District offset account balances without accounting for orphan and other credits that become available during the subject reporting period. Each PDE shall include the debit accounting elements identified in paragraph (c)(2) of this rule and the running balances in the District offset accounts at the beginning and at the end of the subject reporting period.

**(3) Final Determinations of Equivalency**

Commencing with the calendar year 2010 reporting period, and for each reporting period thereafter, the Executive Officer shall complete a Final Determination of Equivalency (FDE) with federal nonattainment NSR offset requirements for each District Offset Account. The FDE for each account shall be completed no later than eighteen months after the completion of the subject reporting period. The Executive Officer shall report the FDE to the District's Governing Board and EPA no later than

the second regularly-scheduled monthly Governing Board meeting after the completion deadline for the FDE for any account(s) for which the PDE did not demonstrate equivalence. Each FDE shall include both the debit and the credit accounting elements identified in paragraphs (c)(2) and (c)(3) of this rule, respectively, and the running balances in the District offset accounts at the beginning and at the end of the subject reporting period. The Executive Officer shall report the FDE for any account(s) for which the PDE did demonstrate equivalence no later than the reporting deadline for the subsequent reporting period's PDE specified in paragraph (d)(2) of this rule.

(4) Early FDE Subsuming PDE

In lieu of preparing both a PDE and an FDE for a single reporting period, the Executive Officer may opt to include the PDE in the FDE for the same reporting period. Such FDEs are subject to the same completion and reporting deadlines as are the PDEs that they subsume.

(e) Projections of District Offset Account Balances

Each PDE report and each FDE report the Executive Officer prepares and presents to the Governing Board and EPA shall also include projections of the District offset account balances at the end of each of the two subsequent reporting periods. The Executive Officer shall make the projections of the District offset account balances based upon the average of the total annual debits and the average of the total annual credits for the five reporting periods most recently included in a PDE or an FDE. Although these projections are to be reported with the results of the PDEs and FDEs, they are separate from the determinations of equivalency and do not constitute an element of the determinations of equivalency.

(f) Equivalency Backstop Provisions

(1) Funding of the Priority Reserve and Issuance of Permits

If the most recent District offset account balances determined by an FDE pursuant to paragraph (d)(3) of this rule demonstrate a shortfall for any air contaminant, the Executive Officer shall:

- (A) Discontinue funding the Priority Reserve for any air contaminant that the most recent FDE has demonstrated does not have a positive balance in its District offset account no later than the

completion deadline for the FDE specified in paragraph (d)(3) of this rule. The Executive Officer may resume funding the Priority Reserve upon completion of an FDE demonstrating that the shortfall no longer exists.

- (B) Discontinue issuing permits to construct and permits to operate that are subject to paragraph (c)(2) Offset Account debits resulting in the further use of Rule 1304 exemptions or Priority Reserve offsets from Rule 1309.1 for the air contaminant that has a shortfall to sources that are major sources of that air contaminant commencing no later than the completion deadline for the FDE demonstrating the shortfall. Additionally, the Executive Officer shall place all major source applications that would otherwise qualify for an offset exemption pursuant to Rule 1304 or to access the Priority Reserve for the air contaminant that has a shortfall on hold until the results of an FDE demonstrating that the shortfall has been rectified have been reported to and approved by the Governing Board unless the applicant elects to provide sufficient ERCs to offset the emissions increase pursuant to Rule 1303(b)(2). The Executive Officer may resume issuance of such permits upon completion of an FDE demonstrating that the shortfall no longer exists.

- (2) Report to the Governing Board: Rectification of a Shortfall  
If an FDE demonstrates that a shortfall exists in any of the District offset accounts, or the most recent projected District offset balances calculated pursuant to subdivision (e) of this rule predict that such a shortfall will exist, the Executive Officer shall prepare a report to the Governing Board recommending appropriate action to rectify the shortfall. The Executive Officer shall present this report to the Governing Board no later than six months after the paragraph (d)(2) or (d)(3) completion deadline for the PDE projecting or the FDE demonstrating or projecting the shortfall. The report shall either recommend implementing one or more of the following backstop provisions as needed to correct the shortfall or include an explanation of why it is not necessary to implement any of the following backstop provisions by making a demonstration that the District remains in compliance with federal nonattainment NSR offset requirements on an aggregate basis:

- (A) Provide additional credits to the District offset account(s) that have a shortfall within six months of the FDE that demonstrated the shortfall or the subdivision (e) projection that predicted it. The Executive Officer may obtain such credits by purchasing them, by funding emission reduction projects using quantification protocols approved by EPA, by applying BACT (federal LAER) in excess of federal requirements, or by other methods approved by EPA; and/or
- (B) Propose amendments to Rule 1304 and/or Rule 1309.1 to eliminate certain offset exemptions or to eliminate certain sources' eligibility to receive offsets from the Priority Reserve, respectively.

The report shall also include a proposed timeline for implementation of the actions it recommends.

(g) California Environmental Quality Act Backstop Provisions

(1) Net Emission Increases

(A) Emission Increases at Major and Minor Facilities

In addition to the tracking of offset account debits provided to sources at major polluting facilities pursuant to paragraph (c)(2) of this rule, the Executive Officer shall track all increases in potential to emit that occur at major and minor facilities pursuant to Rule 1304 or Rule 1309.1. Increases in potential to emit at minor facilities tracked pursuant to this paragraph shall not constitute debits from the District offset accounts.

(B) Calculation of Net Emission Increases

The Executive Officer shall calculate the cumulative net emission increase of each nonattainment air contaminant that is tracked pursuant to paragraphs (c)(2) and (c)(3) of this rule from [date of adoption] through the end of the calendar year 2011 reporting period and through the end of each subsequent reporting period no later than the FDE completion deadline for each such reporting period specified in paragraph (d)(3) of this rule.

(C) Reporting Net Emission Increases

The Executive Officer's report to the Governing Board of each FDE commencing with the FDE for the calendar year 2011 reporting period shall include the cumulative net emission

increases from [date of adoption] through the end of the reporting period analyzed by the FDE calculated pursuant to paragraph (d)(3) of this rule. In cases where, pursuant to paragraph (d)(3) of this rule, the Executive Officer reports the credit accounting elements identified in paragraph (c)(3) of this rule with the PDE for the subsequent reporting period, the Executive Officer shall also report the cumulative net emission increase(s) for the same air contaminant(s) with the PDE for the subsequent reporting period. Although net emission increases are to be reported with the results of the FDEs, they are separate from the FDEs and do not constitute an element of the FDEs.

(2) Projections of Cumulative Net Emission Increases

Each PDE report and each FDE report the Executive Officer prepares and presents to the Governing Board and EPA commencing with the reports analyzing the 2011 reporting period shall also include projections of the cumulative net emission increases at the end of each of the two subsequent reporting periods. The Executive Officer shall make the projections of the cumulative net emission increases from both major sources and minor sources based upon the average of the aggregate increase in potential to emit of each nonattainment air contaminant subject to tracking pursuant to paragraph (c)(2) of this rule and the average of the aggregate emissions reductions of the same nonattainment air contaminant for the five reporting periods most recently included in a PDE or an FDE or each of the reporting periods commencing with the 2011 reporting period, whichever is fewer reporting periods. Although these projections are to be reported with the results of the PDEs and FDEs, they are separate from the determinations of equivalency and do not constitute an element of the determinations of equivalency.

(3) Issuance of Permits

If the cumulative net emission increase of a nonattainment air contaminant, as tracked pursuant to subparagraph (g)(1)(B) of this rule and reported with an FDE pursuant to subparagraph (g)(1)(C) of this rule, exceeds the paragraph (g)(4) threshold or is projected pursuant to paragraph (g)(2) of this rule to exceed the paragraph (g)(4) threshold for that air contaminant, the Executive Officer shall discontinue issuing permits to construct and permits to operate that rely on further use of Rule

1304 exemptions or Rule 1309.1 Priority Reserve offsets for that air contaminant to major and minor sources of that air contaminant. Such permit issuance shall cease no later than the paragraph (d)(2) PDE completion deadline or the paragraph (d)(3) FDE completion deadline applicable to the PDE or FDE with which the paragraph (g)(4) threshold exceedance or projected exceedance will be reported to the Governing Board. The Executive Officer shall not resume issuing such permits unless and until the corresponding cumulative net emission increase returns to a level at least ten percent below the threshold for the year in which permitting is to resume, as shown in Table B.

(4) Cumulative Net Emission Increase Thresholds

The cumulative net emission increase thresholds based upon the growth assumptions in the 2007 AQMP for [date of adoption] through December of 2011 and each subsequent year through 2030 are presented in Table B.

TABLE B  
Cumulative Net Emission Increase Thresholds  
(tons per day)

[date of adoption] through December of	VOC	NOx	SOx	PM10

**Subject: NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL ASSESSMENT**

**Project Title: RE-ADOPTION OF PROPOSED RULE 1315 – FEDERAL NEW SOURCE REVIEW TRACKING SYSTEM, AND ADOPTION OF PROPOSED AMENDMENTS TO RULE 1309.2 – OFFSET BUDGET**

In accordance with the California Environmental Quality Act (CEQA), the South Coast Air Quality Management District (SCAQMD), as the Lead Agency, has prepared this Notice of Preparation (NOP) and Initial Study (IS). This NOP/IS serves two purposes: 1) to solicit information on the scope of the environmental analysis for the proposed project, and 2) to notify the public that the SCAQMD will prepare a Draft Program Environmental Assessment (PEA) to further assess potential environmental impacts that may result from implementing the proposed project.

This letter, NOP, and the attached IS are not SCAQMD applications or forms requiring a response from you. Their purpose is simply to provide information to you on the above project. If the proposed project has no bearing on you or your organization, no action on your part is necessary.

Comments focusing on issues relative to the environmental analysis for the proposed project should be addressed to Mr. Michael Krause at the address shown above, or sent by FAX to (909) 396-3324 or by e-mail to [mkrause@aqmd.gov](mailto:mkrause@aqmd.gov). Comments must be received no later than 5:00 PM on April 15, 2009. If submitting comments, please include your name and phone number. Questions relative to the proposed rules should be directed to Mr. Mohsen Nazemi at (909) 396-2662.

A public Scoping Meeting to solicit comments on the scope of the PEA analysis is scheduled for April 8, 2009. The Public Hearing for the proposed project is currently scheduled for October 2, 2009; however, this date is subject to change. Both meetings will take place at 9:00 a.m. at the SCAQMD Headquarters.

### NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL ASSESSMENT

---

**Project Title:**

Initial Study: Re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System, and Adoption of Proposed Amendments to Rule 1309.2 – Offset Budget

---

**Project Location:**

South Coast Air Quality Management District: the four-county South Coast Air Basin (Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties) and the Riverside County portions of the Salton Sea Air Basin and the Mojave Desert Air Basin.

---

**Description of Nature, Purpose, and Beneficiaries of Project:**

The project to be considered involves the re-adoption of proposed Rule 1315 and adoption of proposed amendments to Rule 1309.2. Rule 1315 would codify existing procedures for establishing equivalency with federal offset requirements for the use of internal offsets by operators of various projects subject to Rule 1309.1 – Priority Reserve, Rule 1309.2 – Offset Budget, (which is pending approval by the United States Environmental Protection Agency), and Rule 1304 – Exemptions, and would specify the types of reductions that may be deposited in the SCAQMD's internal offset account, including newly tracked reductions. Rule 1309.2 establishes an offset budget pre-funded by surplus shutdowns from non-major polluting facilities and requires mitigation fees for access to the offset budget. The proposed amendments to Rule 1309.2 would preclude fossil fuel-fired thermal power plants from accessing credits from the Rule 1309.2 Offset Budget other than certain facilities that generate electricity for their own use, update the mitigation fees based on current market prices of emission reduction credits, and clarify the public notice requirements. The analysis in the Initial Study (IS) shows that access to, and use of, emission offsets from the SCAQMD's internal offset accounts could generate potentially significant direct adverse air quality impacts from new or modified facilities using the emission offsets. In addition, significant adverse indirect environmental impacts from siting, constructing, and operating these facilities could occur. Potential direct and indirect impacts from the proposed project will be evaluated in the Draft Program Environmental Assessment.

## INTRODUCTION

The South Coast Air Quality Management District (SCAQMD) will be preparing a Program Environmental Assessment (PEA) for the re-adoption of proposed Rule 1315 – Federal New Source Review Tracking System, and the adoption of proposed amendments to Rule 1309.2 – Offset Budget. Proposed Rule 1315 would codify existing procedures for establishing equivalency under federal New Source Review requirements for the use of internal offsets by operators of various projects who either obtain emissions offsets pursuant to Rule 1309.1 – Priority Reserve, or Rule 1309.2 – Offset Budget (which is currently pending approval by the United States Environmental Protection Agency (USEPA) into the State Implementation Plan), or are exempt from the emissions offsets requirements of Rule 1303 – Requirements pursuant to Rule 1304 – Exemptions. Proposed Rule 1315 would also specify the types of reductions that may be deposited into the SCAQMD’s internal offset accounts, including newly-tracked reductions. The term “equivalency” means that the SCAQMD provides sufficient offsets from its internal offset accounts to cover the emission increases from new or modified sources that are exempt from offsets under the SCAQMD rules or that obtain credits from the Priority Reserve or Offset Budget, but are subject to offset requirements under federal law. The PEA will analyze direct and indirect impacts from major sources relying on the SCAQMD’s internal offset accounts for purposes of federal new source review. The PEA will also analyze direct and indirect impacts from both major and minor sources relying on credits from the Rule 1309.1 Priority Reserve, Rule 1309.2 Offset Budget, or Rule 1304 offset exemptions. The analysis in the PEA will include the worst-case assumption that all newly- tracked credits will be used.

The SCAQMD is re-adopting proposed Rule 1315 in response to litigation challenging the SCAQMD’s CEQA determinations for former versions of Rule 1315 and amended Rule 1309.1. In particular, the Los Angeles County Superior Court issued a writ of mandate ordering the SCAQMD to, *inter alia*, set aside its August 2007 adoption of Rule 1315 and amended Rule 1309.1 (“the 2007 Project”). The Court held that the SCAQMD violated CEQA in adopting the rules and also included injunctions that enjoined the SCAQMD from undertaking any actions to implement the 2007 Project pending CEQA compliance and required it to rescind permits it had issued prior to entry of judgment. As a result of the Court’s decision, the SCAQMD is not considering re-amending Rule 1309.1 to allow electric generating facilities access to the SCAQMD’s internal emission offsets in its Priority Reserve. If proposed Rule 1315 is readopted, USEPA may consider approving Rule 1309.2 into the State Implementation Plan (SIP). Rule 1309.2 would become effective upon such approval into the SIP. Implementing Rule 1309.2 would make offsets available to operators of facilities that require external offsets, but do not qualify for Rule 1304 exemptions or allocations from the Priority Reserve. The SCAQMD is proposing to amend Rule 1309.2 to exclude access to offsets by fossil fuel-fired thermal power plants that generate electricity primarily for distribution through the state grid system and to update the mitigation fee for offsets to reflect current market value.

The PEA is a substitute CEQA document, prepared in lieu of an environmental impact report (EIR) [Cal. Code Reg. tit. 14 §15252], pursuant to the SCAQMD’s Certified Regulatory Program (CEQA Guidelines §15251(1) codified in Rule 110). It is being

prepared for proposed Rule 1315 and proposed amended Rule 1309.2 to address the Court’s decision regarding the previous CEQA analysis for Rules 1315 and 1309.1. To provide a conservative analysis, the PEA will include an analysis of direct and indirect impacts from major sources relying on offsets in the SCAQMD’s internal offset accounts to ensure equivalency with federal new source review requirements. The PEA will also include an analysis of direct and indirect impacts from both major and minor sources relying on credits from the Rule 1309.1 Priority Reserve, Rule 1309.2 Offset Budget, or Rule 1304 offset exemptions. The analysis in the PEA will assume that all offsets in the SCAQMD’s accounts, including previously-untracked offsets, will be used.

## **LEGISLATIVE AUTHORITY**

The California Legislature created the SCAQMD in 1977<sup>1</sup> as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin) and portions of the Salton Sea Air Basin and Mojave Desert Air Basin, (this geographic area is referred to hereinafter as the district). The political and geographical boundaries of the district are described in greater detail in the discussion of the project location (below). By statute, the SCAQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the district<sup>2</sup>. Furthermore, the SCAQMD must adopt rules and regulations that carry out the AQMP<sup>3</sup>. The 2003 and 2007 AQMPs concluded that major reductions in emissions of volatile organic compounds (VOC) and oxides of nitrogen (NO<sub>x</sub>) were necessary to attain the air quality standards for ozone and inhalable particulate matter (PM<sub>10</sub>). As part of the strategy to achieve ambient air quality standards, federal and state laws require the development and implementation of air quality permitting programs, commonly known as New Source Review (NSR) programs. Local NSR programs must, at a minimum, comply with the requirements established pursuant to federal and state law. The general requirements of NSR programs include: (1) pre-construction review; (2) installing California best available control technology (BACT)<sup>4</sup>; and (3) mitigating emission increases by providing emission offsets.

The SCAQMD is proposing to re-adopt Rule 1315 and to amend Rule 1309.2 in order to maintain the SCAQMD’s ability to (1) administer its NSR program for major and minor sources, (2) specify the types of surplus emission reductions that may be deposited into the SCAQMD’s internal accounts and used to offset emission increases, (3) memorialize in rule form the accounting procedures used by the SCAQMD to establish equivalency with federal offset requirements, and (4) establish mechanisms that ensure valid emission offsets are available before a source relying on those emission offsets obtains an approved permit, in order to prevent a net increase in criteria and precursor emissions.

---

<sup>1</sup> The Lewis-Presley Air Quality Management Act, 1976 Cal. Stats., Ch 324 (codified at Cal. Health & Safety Code, §§ 40400-40540).

<sup>2</sup> Cal. Health & Safety Code, § 40460 (a).

<sup>3</sup> Cal. Health & Safety Code, § 40440 (a).

<sup>4</sup> California BACT is comparable to federal lowest achievable emission rate (LAER).

## **CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

Proposed Rule 1315 and proposed amended Rule 1309.2 comprise a "project" as defined by CEQA (Cal. Public Resources Code §21000, *et. seq.*). The SCAQMD is the lead agency for the proposed project and will prepare an appropriate environmental analysis pursuant to its certified regulatory program. California Public Resources Code §21080.5 allows public agencies with certified regulatory programs to prepare a plan or other written document in lieu of an environmental impact report once the Secretary of the Resources Agency has certified the regulatory program. The SCAQMD's regulatory program was certified by the Secretary of the Resources Agency on March 1, 1989, and is codified as SCAQMD Rule 110.

CEQA requires that potential adverse environmental impacts of proposed projects be evaluated and that feasible methods to reduce or avoid significant adverse environmental impacts of these projects be identified. To fulfill the purpose and intent of CEQA, the SCAQMD has prepared this Initial Study (IS) to identify potential adverse environmental impacts associated with adopting and implementing proposed Rule 1315 and proposed amended Rule 1309.2, which will be further analyzed in a Draft PEA.

The purpose of the IS is to provide the SCAQMD, as lead agency, with the information to use as the basis for deciding whether to prepare a CEQA document identifying significant adverse impacts (EIR or EIR equivalent) or one that does not identify significant adverse impacts (negative declaration or negative declaration equivalent). If the lead agency decides, on the basis of preparing an IS, that an EIR or EIR-equivalent CEQA document is warranted, the IS assists in the preparation of the CEQA document by identifying potentially significant adverse effects, identifying insignificant effects, and explaining the reasons for determining why potentially-significant effects would not be significant. Based on the analysis in this IS, the SCAQMD has concluded that proposed Rule 1315 and the proposed amendments to Rule 1309.2 have the potential to generate significant adverse environmental impacts. Therefore, this IS, along with a Notice of Preparation (NOP), is being circulated for a 30-day public review period to solicit comments from public agencies, and the public in general, on potential impacts from the proposed project. All comments received during the public comment period on the NOP/IS will be responded to and will be included in the Draft PEA.

CEQA includes provisions for program CEQA documents in connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program, including adoptions of broad policy programs as distinguished from those prepared for specific types of projects (e.g., land use projects) [Cal. Code Reg. tit. 14 (hereinafter referred to as CEQA Guidelines) §15168]. The environmental assessment for the proposed project will be a PEA because it examines the environmental effects of a proposed rule and proposed amended rule, which would establish criteria to govern the conduct of a continuing program (CEQA Guidelines §15168).

A program CEQA document allows consideration of broad policy alternatives and program-wide mitigation measures at a time when an agency has greater flexibility to deal with basic problems of cumulative impacts. A PEA also plays an important role in establishing a

structure within which CEQA reviews of future related actions can effectively be conducted. This concept of covering broad policies in a PEA and incorporating the information contained therein by reference into subsequent EAs for specific projects is known as “tiering” (CEQA Guidelines §15152). A PEA will provide the basis for future environmental analyses and will allow future project-specific CEQA documents, if necessary, to focus solely on the new effects or detailed environmental issues not previously considered. If an agency finds that no new effects could occur, or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the PEA and no new environmental document would be required [CEQA Guidelines §15168(c)(2)].

As explained in more detail in Chapter 2, the Draft PEA will evaluate the use of offsets by the SCAQMD to demonstrate equivalency with federal offset requirements applicable to future projects obtaining permits subject to Regulation XIII New Source Review requirements. Under the CEQA provision for tiering, as explained above, the lead agency may rely on this PEA to form the basis of a project-specific analysis for projects that access the Priority Reserve or Offset Budget, or are exempt from offsets under Rule 1304.

The degree of specificity required in a CEQA document corresponds to the degree of specificity involved in the underlying activity described in the CEQA document (CEQA Guidelines §15146). A CEQA document on a construction project will necessarily be more detailed regarding the analysis of environmental impacts from the project than will be a CEQA document on the adoption of a local general plan, for example, because the effect of a construction project can be predicted with greater accuracy (CEQA Guidelines §15146(a)). Because the level of information regarding some potential impacts related to the siting and consideration of future projects requires making certain assumptions and projections, some of the environmental impact forecasts of cumulative impacts from these projects may be general or qualitative in nature. In certain instances, such as future construction and operation of affected facilities, impacts are quantified or modeled to the degree feasible.

## **PROJECT LOCATION**

Proposed Rule 1315 and proposed amended Rule 1309.2 would apply to proposed projects located in the SCAQMD’s entire area of jurisdiction (i.e., the entire district). The district is an area of 10,473 square miles, consisting of the four-county South Coast Air Basin (Basin) and the Riverside County portions of the Salton Sea Air Basin (SSAB) and the Mojave Desert Air Basin (MDAB). The Basin, which is a sub area of the SCAQMD’s jurisdiction, is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The 6,745 square-mile Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB and MDAB is bounded by the San Jacinto Mountains to the west and spans eastward up to the Palo Verde Valley. The federal nonattainment area (known as the Coachella Valley Planning Area) is a sub region of both Riverside County and the SSAB and is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (Figure 1-1).

**FIGURE 1-1**

South Coast Air Quality Management District Boundaries

## BACKGROUND

The enactment of the Clean Air Act of 1970 (1970 CAA) required the development of comprehensive federal and state regulations to limit emissions from both stationary (industrial) sources and mobile sources by establishing the following four major regulatory programs affecting stationary sources: 1) the National Ambient Air Quality Standards (NAAQS), 2) State Implementation Plans (SIPs), 3) National Emission Standards for Hazardous Air Pollutants (NESHAPs) and 4) New Source Performance Standards for new and modified stationary sources. Furthermore, enforcement authority of 1970 CAA Act requirements was substantially expanded.

## New Source Review

New Source Review, which is part of the CAA, and California statutes require the development and implementation of NSR programs to ensure that the operation of new, modified, or relocated stationary emission sources in nonattainment areas does not impede with the attainment and maintenance of NAAQS and California ambient air quality standards (CAAQS). Local NSR programs must, at a minimum, comply with the federal and state requirements, which include: (1) pre-construction review; (2) compliance with

LAER (SCAQMD’s BACT is equivalent to LAER); and, (3) offsetting of emission increases by providing emission reductions or purchasing emissions reduction credits (ERCs).

### **Overview of SCAQMD’s New Source Review Program – Federal and California No Net Increase Provisions**

SCAQMD’s NSR regulation sets forth pre-construction review requirements for new, modified, or relocated facilities to ensure that the operation of such facilities does not interfere with progress in attaining the NAAQs and that future economic growth within the district is not unnecessarily restricted. The specific air quality goal of this regulation is to achieve no net increases from new or modified permitted sources of nonattainment air contaminants or their precursors.

In general, the Federal Clean Air Act requires that, among other things, emission increases of nonattainment air pollutants from new and modified federal major sources be offset with emissions reductions. The specific quantity of emission reductions required to offset a specific increase in federal nonattainment emissions is dependent upon the pollutant’s federal nonattainment designation for the air basin in which the increase occurs. In the case of the Basin, the applicable offset ratios are 1.2 pounds of reductions for every 1.0 pound of increase for VOC and NOx<sup>5</sup> and at least 1.0 pound of reduction for every 1.0 pound of increase for all other nonattainment pollutants and their precursors.

Some aspects of the offset requirements in the SCAQMD’s NSR program (Regulation XIII – New Source Review<sup>6</sup>) are more stringent than the federal offset requirements, while other aspects are less stringent. For example, Regulation XIII is more stringent in that it requires offsets for increases from sources that are not federal major sources (federal minor sources) and an offset ratio of 1.2-to-1.0 for all nonattainment pollutants and their precursors (rather than the federally-required 1.0-to-1.0 for pollutants other than VOC and NOx) and is less stringent in that it includes a variety of exemptions from the offset requirement that do not exist in federal NSR.

In addition to the emissions offset requirements, the SCAQMD’s NSR program also requires that new and modified stationary sources with the potential-to-increase emissions employ BACT, which is comparable to federal LAER, and use modeling to demonstrate that the increase will not “cause a violation, or make significantly worse an existing violation...of any state or national ambient air quality standards at any receptor location in the District.” Provisions for banking emissions reductions as emission reduction credits (ERCs) and for transferring ERCs are also included in Regulation XIII. Each of the existing rules that

---

<sup>5</sup> The federally-required offset ratio for VOC and NOx applicable to the Basin, as an extreme nonattainment area, would be 1.5-to-1.0, but SCAQMD’s NSR program requires installation of best available control technology (BACT), which is comparable to federal lowest achievable emission rate (LAER), on new and modified federal non-major sources, making SCAQMD eligible to use a 1.2-to-1.0 offset ratio for VOC and NOx under the federal Clean Air Act.

<sup>6</sup> SCAQMD’s Regional Clean Air Incentives Market (RECLAIM) program includes its own NSR requirements for new and modified sources of NOx and/or SOx subject to RECLAIM in its Rule 2005 – New Source Review for RECLAIM. PR 1315 is not applicable to RECLAIM emissions, so Rule 2005 is outside the scope of this discussion.

collectively comprise the SCAQMD’s NSR program (Regulation XIII – New Source Review) as it currently exists is summarized in the following bulleted items:

- Rule 1301 – General (adopted October 5, 1979, last amended December 7, 1995): Rule 1301 describes the purpose and applicability of Regulation XIII.
- Rule 1302 – Definitions (adopted October 5, 1979, last amended December 6, 2002): Rule 1302 provides definitions for 42 terms and phrases used throughout Regulation XIII.
- Rule 1303 – Requirements (adopted October 5, 1979, last amended December 6, 2002): Rule 1303 presents the pre-construction review requirements that make up the core of SCAQMD’s NSR program. These requirements include BACT for all new or modified sources with an increase in potential to emit any nonattainment air contaminant, any ozone depleting compound, or ammonia, as well as modeling and emissions offsets for any new or modified source with an increase in potential to emit any nonattainment air contaminant. The rule also includes additional requirements for new major sources and major modifications at existing major sources, including an analysis of alternatives (similar to CEQA requirements for an environmental analysis), demonstration of statewide compliance, and modeling of plume visibility for certain sources of PM10 or NOx located near specified Federal Class I areas.
- Rule 1304 - Exemptions (adopted October 5, 1979, last amended June 14, 1996): Rule 1304 establishes exemptions from Rule 1303 modeling and offset requirements for certain specified categories of projects (e.g., functionally identical replacements, emergency equipment, and air pollution control strategies) and exemptions from Rule 1303 offset requirements for other specified categories of projects (e.g., relocations, concurrent facility modifications, regulatory compliance, replacement of ozone depleting compounds, and new and modified facilities with potential to emit below established thresholds).
- Rule 1306 – Emissions Calculations (adopted October 5, 1979, last amended December 6, 2002): Rule 1306 codifies the basis for quantifying emissions increases and emissions reductions for specified Regulation XIII purposes (e.g., determining applicability of BACT, quantifying the amount of emission offsets required or the amount of ERCs to be banked).
- Rule 1309 – Emission Reduction Credits and Short Term Credits (adopted September 10, 1982, last amended December 6, 2002): Rule 1309 “addresses the application, eligibility, registration, use, and transfer of [ERCs] and Short Term Credits (STCs).” It addresses the conversion of pre-1990 negative balances to ERCs and the conversion of pre-1990 ERCs to post-1990 ERCs, the application process for banking new ERCs and STCs, transfer and use of ERCs and STCs, interpollutant offsets, and inter-basin and inter-district offsets.
- Rule 1309.1 – Priority Reserve (adopted June 28, 1990, last amended August 3, 2007): Rule 1309.1 establishes the Priority Reserve of offsets, specifies the types of essential public service projects that are eligible to obtain offsets from the Priority Reserve, and requires that any facility operator who holds ERCs must use them as offsets prior to obtaining Priority Reserve offsets for the same pollutant.

- Rule 1309.2 – Offset Budget (adopted December 6, 2002): Rule 1309.2 establishes an Offset Budget and the eligibility requirements applicable to project proponents requesting emissions offsets from the Offset Budget, provides guidance to the Executive Officer for implementing the Offset Budget, and specifies the public notice requirements applicable to the use of offsets from the Offset Budget and to the banking and use of STCs. Rule 1309.2 does not become effective unless and until it is approved into the SIP by USEPA.
- Rule 1310 – Analysis and Reporting (adopted October 5, 1979, last amended December 7, 1995): Rule 1310 addresses the Executive Officer’s application completeness determinations, annual reports to the Governing Board “regarding the effectiveness of Regulation XIII in meeting the state and federal NSR requirements,” and public notice requirements for banking ERCs above specified threshold amounts.
- Rule 1313 – Permits to Operate (adopted October 5, 1979, last amended December 7, 1995): Rule 1313 exempts permit renewal, change of operator, or change in Rule 219 – Equipment Not Requiring a Written Permit Pursuant to Regulation II from the SCAQMD’s NSR program, specifies that an application for a permit to operate a source that was constructed without a prior permit to construct is considered an application for a permit to construct for purposes of the SCAQMD’s NSR program, establishes a 90-day deadline for facilities to provide emissions offsets requested by the Executive Officer for a permit to operate, provides a window of up to 90 days for a replacement source to operate concurrently with the source it is replacing, specifies the inclusion of NSR permit conditions on permits, and specifies that relaxing or removing a condition limiting mass emissions from a permit is subject to NSR if that condition limited the source’s obligations under NSR.
- Rule 1316 – Federal Major Modifications (Adopted December 2, 2005) Rule 1316 establishes that if a major source demonstrates that “a proposed modification to an existing stationary source would not constitute a Federal Major Modification” the proposed modification is exempt from the analysis of alternatives otherwise required by Rule 1303 and that if an operator of a major stationary source applies for and receives a plantwide applicability limit (PAL), transactions allowable under the PAL are exempt from the analysis of alternatives for the pollutant covered by the PAL.

**Offset Tracking** – SCAQMD submitted its NSR program to CARB for approval, and incorporation into the SIP. CARB then forwarded the SCAQMD’s NSR program to USEPA. USEPA approved of the SCAQMD’s NSR program in 1996, the SCAQMD has implemented an NSR tracking system to demonstrate programmatic equivalence between its NSR program and the offset requirements of the federal program.

However, USEPA’s approval included the assumption that the SCAQMD would implement a tracking system to account for emission reductions of federal nonattainment air pollutants that occur under the SCAQMD’s NSR program, but that are surplus under federal NSR, as well as emission increases of federal nonattainment pollutants that occur under the SCAQMD’s NSR program, even though the SCAQMD’s NSR program does not comply

with a small number of the specific individual federal NSR’s offset requirements<sup>7</sup>. The purpose of this tracking system is to “continuously show that in the aggregate the SCAQMD is able to provide for the necessary offsets required to meet the appropriate statutory offset ratio” (TSD, p. 16). The TSD further states that “USEPA determined that the District’s proposal to offset all emissions increases with emissions reductions not otherwise required by the Act could be met in the aggregate was consistent with the language of the Act” (p. 16). The tracking system accounts for the differences in emissions reductions achieved through offset requirements under SCAQMD Regulation XIII and federal NSR programs.

As a part of the effort to track emissions offsets SCAQMD staff has prepared a series of reports that track credits and debits from August 1990 through July 2002 and present the remaining balances of credits in the SCAQMD’s federal and California offset accounts. These NSR tracking reports go back to the year 1990 because that was the year when fundamental amendments were made to the SCAQMD’s Regulation XIII. A key source of creditable reductions in these tracking reports was orphan shutdowns of federal major sources and of sources with potential to emit above California’s NNI applicability thresholds. Other creditable reduction sources included “negative NSR balances” resulting from permit actions prior to 1990 and the “BACT discount” currently required by Regulation XIII when banking ERCs.

**New Source Review Balance** – Prior to 1990, in order to implement its offset requirements, SCAQMD kept a running “NSR balance” for each facility with permitted sources. The NSR balance included an entry for every increase and every decrease in emissions at the facility that resulted from a permit action. The entries in the NSR balance were based on maximum allowable emissions, i.e. the maximum amount of emissions that a source could emit given its physical capabilities and permit limitations and rule requirements. However, the NSR balance was initially determined for each piece of equipment that had not previously undergone an NSR analysis (i.e., pre-NSR equipment) from an actual emissions baseline for that equipment. Any subsequent NSR activity for such equipment was conducted on a potential-to-potential emissions basis. Therefore, a pre-NSR source modified under NSR would be subject to NSR on an actual-to potential emissions basis (i.e., actual pre-modification emissions to potential post-modification emissions)—a very conservative approach.

NSR balance entries had to be quantifiable and enforceable. Balance entries only occurred pursuant to permit applications with sufficient substantiating data to ensure quantifiability after evaluation by SCAQMD engineers, review by supervisory staff pursuant to Regulation XIII rules and implementing policies established by the SCAQMD, and upon issuance of permits or permit modifications that were enforceable under state law.

---

<sup>7</sup> USEPA, Region IX Air & Toxics Division Technical Support Document (TSD) for USEPA’s Notice of Final Rulemaking for the California State Implementation Plan South Coast Air Quality Management District New Source Review by Gerardo C. Rios, October 24, 1996.

## Existing SCAQMD Rules Affected by Proposed Rule 1315

Proposed Rule 1315 identifies sources of emissions offsets, including orphan shutdowns, surplus reductions, and prior NSR balances. These emission offsets may be used by various permit projects subject to Rule 1304 – Exemptions, Rule 1309.1 – Priority Reserve, and Rule 1309.2 – Offset Budget.

**Rule 1304** – Rule 1304 – Exemptions, provides exemptions from specific Regulation XIII requirements, including offset requirements for the following sources:

- replacements of functionally identical sources;
- electric utility steam boiler replacement;
- abrasive blasting equipment;
- emergency non-utility electrical power generation equipment;
- air pollution control strategies, i.e., source modifications for the sole purpose of reducing emissions;
- equipment used exclusively for emergency activities;
- portable equipment;
- portable internal combustion engines;
- intra-facility portable equipment;
- relocations of existing equipment;
- concurrent facility modification;
- resource recovery and energy conservation projects;
- regulatory compliance. i.e., modifications to comply with federal, state, or SCAQMD pollution control requirements;
- regulatory compliance for essential public services;
- replacement of ozone depleting compounds;
- methyl bromide fumigation; And
- new and modified facilities with minimal potential to emit (less than four tons per year of VOC, NO<sub>x</sub>, SO<sub>x</sub> or PM<sub>0</sub>, or less than 29 tons per year of CO).

For each of these exemption types, specific detailed conditions apply.

**Rule 1309.1** – The Rule 1309.1 Priority Reserve was established to provide emissions offsets for specific priority sources, including essential public services, innovative technology, and research operations. Essential public services include sewage treatment facilities, prisons, police facilities, fire fighting facilities, schools, hospitals, landfills, water operations and public transit. To draw from the Priority Reserve bank of credits, an essential public service must either provide all required offsets available by modifying sources at the same facility to best available retrofit control technology (BARCT) levels or

demonstrate that no sources within the facility could be modified to BARCT levels to provide offsets.

**Rule 1309.2** – In 2002, the SCAQMD adopted an Offset Budget rule (Rule 1309.2 – Offset Budget) as part of the SCAQMD’s NSR program to address some of the shortage problems with ERCs. As adopted, Rule 1309.2 makes the Offset Budget available as a “bank of last resort” to sources that are subject to the SCAQMD’s NSR offset requirements but are unable to obtain sufficient NO<sub>x</sub>, SO<sub>x</sub>, CO, or PM<sub>10</sub> ERCs to provide as emissions offsets on the open market. Offsets are available to such sources from the Offset Budget provided the sources pay a non-refundable mitigation fee based on the quantity and species of offsets obtained from the Offset Budget. Rule 1309.2 also includes the public notice requirements that are applicable to the issuance and use of short term credits (STCs). As part of the discussions between USEPA and the SCAQMD regarding Rule 1309.2, USEPA raised some questions related to the offsets in the SCAQMD’s internal offset accounts for use in the Offset Budget. Among the key issues raised by USEPA are the following:

- creditability of pre-1990 emission reductions, particularly availability of existing records associated with such reductions;
- creditability of reductions resulting from the BACT discount of newly-banked ERCs, since the discount is presumably also used to satisfy the federal surplus at the time of use discount requirement;
- baseline calculation procedures to assure an “actual” baseline;
- surplus adjustment at time of use for credits in the tracking system; and
- consistency of offset use with assumptions in the SIP.

USEPA staff requested that these issues be resolved prior to USEPA considering approval of Rule 1309.2 into the SIP. USEPA staff also requested that the SCAQMD adopt a rule specifying how the tracking of debits and credits into the offset bank would occur in the future. Therefore, USEPA and the SCAQMD staff engaged in a series of discussions to develop a proposed revised NSR Tracking System intended to demonstrate continued programmatic equivalency of the SCAQMD’s NSR program with federal NSR requirements and to address USEPA’s above-described concerns. Rule 1315 – Federal New Source Review Tracking System, as adopted September 8, 2006, was the result of this process.

### **Legal Challenges to Rules 1309.1 and 1315**

Re-adoption of Rule 1315 is necessary because of a judgment in a lawsuit challenging the CEQA analyses for former adoptions of Rule 1315 and former versions of amended Rule 1309.1 – Priority Reserve. The intent of the former versions of Rule 1309.1 was to allow electric generating facilities (EGFs) temporary access to the Priority Reserve, thus, providing scarce emissions offsets to EGFs. In 2006, the first version of Rule 1309.1 incorporating such EGF access to the Priority Reserve was adopted, relying upon a statutory exemption from CEQA pertaining to actions relating to thermal power plants (CEQA Guidelines §15271) and the first version of Rule 1315 was adopted, relying on the general rule exemption [CEQA Guidelines§15061(b)(3)] from CEQA. After the SCAQMD

Governing Board adopted Rule 1315 and PAR 1309.1, a number of environmental and community groups filed a lawsuit challenging the SCAQMD’s determination that these rules were exempt from CEQA.

Prior to the Court reaching a final decision, SCAQMD started the process of readopting Rule 1315 and re-amending Rule 1309.1 to avoid the possibility of the rules being vacated by the judge, which would require readopting Rule 1315 and the amendments to Rule 1309.1 after many months of delay. As part of the re-adoption process, the SCAQMD prepared a PEA that analyzed direct and indirect impacts of the proposed project... The Governing Board certified the PEA and re-adopted Rule 1315 and adopted a revised version of PAR 1309.1 on August 3, 2007 (2007 Project). A number of environmental and community groups filed a lawsuit on the PEA, citing alleged deficiencies in complying with substantive and procedural CEQA requirements.

The Los Angeles County Superior Court issued a writ of mandate ordering the SCAQMD to, *inter alia*, set aside its August 2007 adoption of Rule 1315 and amended Rule 1309.1. The Court held that the SCAQMD’s PEA violated CEQA. The Court also issued injunctions that enjoined the SCAQMD from undertaking any actions to implement the 2007 Project pending CEQA compliance. It also enjoined the SCAQMD to rescind any other approvals or actions taken since the approval of and pursuant to the 2007 Project.

Subsequent to the Court’s decision, the SCAQMD does not intend to pursue re-adopting amendments to Rule 1309.1 that would allow EGFs to access internal offsets in the SCAQMD’s Priority Reserve. Because re-adoption of PR 1315 would make Rule 1309.2 effective following approval into the SIP by USEPA, the PEA will analyze potential adverse direct and indirect impacts from all credits in the internal accounts and the use of offsets from the 1309.2 Offset Budget. The SCAQMD is proposing amendments to Rule 1309.2 that would preclude issuance of Offset Budget offsets to most fossil-fuel fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts, where at least 70 percent of the generated electricity is for its own use.

## **PROJECT DESCRIPTION**

The proposed project consists of re-adopting proposed Rule 1315 and adopting the proposed amendments to Rule 1309.2. Together, the proposed changes, re-adoption of Rule 1315 and adoption of the amendments to Rule 1309.2, constitute the “proposed project.” The major components of proposed Rules 1315 and 1309.2 are briefly summarized in the following subsections. Complete copies of proposed Rule 1315 and proposed amended Rule 1309.2 can be found in Appendices A and B, respectively.

### ***Proposed Rule 1315***

Proposed Rule 1315 would ensure that exempt sources (under Rule 1304), sources relying on the Offset Budget (under Rule 1309.2), and Priority Reserve sources (under Rule 1309.1) are fully offset to the extent required by federal law by valid emission reductions from the SCAQMD’s internal offset accounts. The proposed rule would achieve this by establishing

what types of reductions are eligible to be used to offset emissions and how those reductions are tracked. The proposed rule would also allow the use of certain previously-untracked reductions to offset emission increases. For example, proposed Rule 1315 would allow the SCAQMD to recognize emission reductions generated from minor source “orphan shutdowns” that were not previously accounted for in the SCAQMD’s federal equivalency demonstrations, to offset emission increases from other sources. Proposed Rule 1315 would also continue to exclude from the applicable equivalency obligation emissions from any new or modified permits that are not required to provide offsets under federal law.

Proposed Rule 1315 would specify procedures to be followed by the Executive Officer to make annual demonstrations that the SCAQMD’s NSR program, in the aggregate, satisfies federal offset requirements for major sources under Clean Air Act section 173. SCAQMD Rule 1304 exempts certain types of projects from NSR offset requirements<sup>8</sup>. Additionally, specific essential public services may obtain offsets from the SCAQMD’s Priority Reserve pursuant to SCAQMD Rule 1309.1. Following SIP approval of Rule 1309.2 by USEPA, other sources might access the SCAQMD’s internal offset accounts under Rule 1309.2. Proposed Rule 1315 would ensure that the SCAQMD’s NSR program is equivalent in the aggregate to the federal nonattainment NSR offset requirements under the CAA, even after the removal from the SCAQMD’s internal offset account of certain pre-1990 credits pursuant to a 2006 agreement with the USEPA. Specific components of proposed Rule 1315 are briefly summarized below.

Purpose (subdivision a)

The purpose of this rule is the following:

- Maintain the ability to issue permits to major sources that obtain offset credits from the Priority Reserve under Rule 1309.1, from the Offset Budget under Rule 1309.2, and/or are exempt from offsets under Rule 1304 [paragraph (a)(1)];
- Memorialize in rule form the accounting procedures used to establish NSR program equivalency with federal NSR offset requirements [subparagraph (a)(2)(A)]; and
- Demonstrate that sufficient emission reductions, including previously untracked emission reductions, existed beyond federal regulatory requirements, and could propose to be used as offsets to establish that the SCAQMD’s NSR program is equivalent to federal NSR offset requirements for major sources exempt under Rules 1304, 1309.1 and/or 1309.2 [subparagraph (a)(2)(B)].

Definitions (subdivision b)

A definition for “Community Bank” [paragraph (b)(1)] has been included for clarification sake.

---

<sup>8</sup> Note that, although SCAQMD Rule 1304 exempts certain types of projects from offset requirements, emission increases from these projects are still subject to federal offset requirements pursuant to the Clean Air Act or state no net increase in emissions requirements.

Other proposed definitions added to PR 1315 include:

- “Offset Budget” [paragraph (b)(2)]
- “Offset Ratio” [paragraph (b)(3)];
- “Orphan Reduction” [paragraph (b)(4)];
- “Orphan Shutdown” [paragraph (b)(5)]; and
- “Priority Reserve” [paragraph (b)(6)]

Offset Accounts for Federal NSR Equivalency (subdivision c)

- The Executive Officer shall maintain a separate offset account for each federal nonattainment air contaminant that is subject to federal NSR offset requirements (federal offset account) [paragraph (c)(1)].
- The Executive Officer shall track and debit the eligible types of offset allocations or exemptions (e.g. Priority Reserve, Community Bank, Offset Budget, Rule 1304) located at major polluting facilities not exempt from federal offset requirements [paragraph (c)(2)];
- The Executive Officer shall track and credit the eligible types of emission reductions (e.g., orphan shutdowns, orphan reductions, ERCs provided for sources located at minor facilities) that have occurred since October 1, 1990 to the federal offset accounts [subparagraph (c)(3)(A)].
- The Executive Officer shall deposit emission reductions into the federal offset accounts according to procedures, which make the credits real, quantifiable, permanent and enforceable [subparagraph (c)(3)(B)].
- All unused orphan shutdown and orphan reduction credits in the federal offset accounts shall be discounted annually by the Executive Officer to ensure that they remain surplus at the time of use [paragraph (c)(4)].

Federal NSR Equivalency Determination Reports (subdivision d)

- The Executive Officer shall aggregate tracked offsets provided from the offset accounts into specific reporting periods [paragraph (d)(1)].
- Commencing with calendar year 2008 reporting period, the Executive Officer shall, no later than twelve months after the completion of the reporting period, complete a Preliminary Determination of Equivalency (PDE) with federal nonattainment NSR offset requirements [paragraph (d)(2)].
- Commencing with calendar year 2008 reporting period, the Executive Officer shall, no later than eighteen months after the completion of the reporting period, complete a Final Determination of Equivalency (FDE) with federal nonattainment NSR offset requirements accounting for both debits and credits during the subject reporting period for any account(s) for which the PDE did not demonstrate equivalence [paragraph (d)(3)].

- In lieu of preparing both a PDE and FDE for a single reporting period, the Executive Officer may opt to include the PDE in the FDE for the same reporting period [paragraph (d)(4)].

Projections of Federal Offset Account Balances (subdivision e)

Each PDE and FDE report the Executive Officer prepares and presents to the Governing Board and USEPA shall also include projections of the federal offset account balances at the end of each of the two subsequent calendar year reporting periods.

Backstop Provisions (subdivision f)

- The Executive Officer shall discontinue funding the Priority Reserve for any air contaminant that the most recent FDE has demonstrated does not have a positive balance in its federal offset account [subparagraph (f)(1)(A)].
- The Executive Officer shall discontinue issuing permits to construct or operate that rely on Rule 1304 exemptions, the Priority Reserve, or the Offset Budget for any air contaminant that has a shortfall to sources that are major sources of that air contaminant [subparagraph (f)(1)(B)].
- If an FDE demonstrates that a shortfall exists in any of the federal offset accounts or a subdivision (e) projection predicts a shortfall, the Executive Officer shall prepare a report to the Governing Board recommending implementation of one or more backstop provisions as needed to correct the shortfall or demonstrating that the backstop provisions are not necessary by demonstrating continued compliance with federal NSR offset requirements on an aggregate basis [paragraph (f)(2)].

Please refer to Appendix A for the text of proposed Rule 1315.

***Proposed Amended Rule 1309.2***

The proposed project also includes proposed amendments to existing Rule 1309.2 – Offset Budget that would preclude most fossil fuel-fired thermal power plants, as described below, from accessing emission offsets from the Rule 1309.2 Offset Budget. Existing Rule 1309.2 establishes an Offset Budget pre-funded by surplus shutdowns from non-major polluting facilities and requires qualified facilities to pay a mitigation fee in order to access the Offset Budget. The proposed amendments to Rule 1309.2 include revising existing mitigation fees, clarifying public notice requirements, and would preclude issuance of Offset Budget credits to fossil fuel-fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts, where at least 70 percent of the generated electricity is for its own use.

Offset Budget (subdivision a)

Proposed amended Rule 1309.2 would delete CO from the list of nonattainment air contaminants for which emissions offsets may be obtained from the Offset Budget because CO is no longer a nonattainment air contaminant within the district.

Eligibility Requirements (subdivision b)

Updated mitigation fees are proposed for both permanent credits and short-term credits reflecting the current market value for criteria pollutant emission credits plus a ten percent premium to make the Offset Budget a “last resort” source of emissions offsets and a fifteen percent administrative fee.

The Executive Officer (subdivision c)

The amendments propose adding a prohibition on granting allocations from the Offset Budget to fossil fuel-fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts where at least 70 percent of the generated electricity is for its own use [paragraph (c)(12)].

Public Notice (subdivision d)

Exclusion of the conversion of ERCs to short-term credits from the public notice requirements is proposed.

Please refer to Appendix B for the full text of proposed amended Rule 1309.2.

## **PROJECT OBJECTIVES**

CEQA Guidelines §15124(b) requires the project description to include a statement of objectives sought by the proposed project, including the underlying purpose of the proposed project. Compatibility with project objectives is one criterion for selecting a range of reasonable project alternatives and provides a standard against which to measure project alternatives. The proposed project objectives are as follows:

- Maintain the SCAQMD’s ability to continue to administer its new source review program for major and minor sources (i.e., implement Rule 1304 and Rule 1309.1 and, following approval by the USEPA, Rule 1309.2);
- Memorialize in rule form the accounting procedures the SCAQMD uses to establish equivalency for new source review with federal offset requirements;
- Recognize sufficient previously-unused emission reductions beyond those required by applicable regulatory requirements in order to demonstrate federal equivalency for

- sources that are exempt under Rule 1304 or that obtain credits from the Priority Reserve under Rule 1309.1 or the Offset Budget under Rule 1309.2;
- Establish mechanisms to assure that valid offsets are projected to be available in the existing SCAQMD internal offset account before a source relying on such credits is permitted, and establish backstop provisions, thus assuring that increases in emissions resulting from such sources are fully offset.
  - Specify that offset allocations from Rule 1309.2 will not be provided to most fossil fuel-fired power plants, and clarify public notice requirements.

## **PROJECT ALTERNATIVES**

The Draft PEA will discuss and compare the relative merits of alternatives to the proposed project, as required by CEQA and SCAQMD Rule 110, when the project poses significant adverse environmental impacts. Alternatives will include realistic measures for attaining the basic objectives of the proposed project and provide a means for evaluating the comparative merits of each alternative. Alternatives should be designed to mitigate the significant adverse environmental impacts of the project. In addition, the range of alternatives must be sufficient to permit a reasoned choice and need not include every conceivable project alternative. The key issue is whether the selection and discussion of alternatives fosters informed decision making and public participation. A CEQA document need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative. Suggestions on alternatives submitted by the public will be evaluated for inclusion in the Draft PEA.

SCAQMD Rule 110 does not impose any greater requirements for a discussion of project alternatives in an environmental assessment than is required for an Environmental Impact Report under CEQA. Alternatives will be developed based in part on modifying major components of the proposed project. The rationale for selecting alternatives rests on CEQA's requirement to present “realistic” alternatives; that is, alternatives that can actually be implemented. CEQA also requires an evaluation of a “No Project Alternative.” Written suggestions on potential project alternatives received during the comment period for the Initial Study will be evaluated for feasibility to be considered when preparing the Draft PEA.

## **ENVIRONMENTAL ANALYSIS**

Chapter 2, the environmental checklist, is a standard tool for assisting lead agencies with identifying potential adverse impacts for proposed projects. Chapter 2 identifies some of the overarching assumptions that will be used to analyze potential adverse environmental impacts from proposed Rule 1315 and proposed amended Rule 1309.2. In addition, the approach taken to determine representative facilities that would use the available offsets is provided before the checklist in Chapter 2 under a section called “Environmental Checklist and Discussion.” Environmental topic areas that will be further analyzed in the Draft PEA have been identified in the checklist portion of the chapter, while environmental topic areas that are not expected to be significantly adversely impacted by the proposed project are also

noted, and reasons are provided regarding why significant adverse impacts are not anticipated for these environmental topic areas. The public may comment on any aspect of the Initial Study, including any suggestions for dropping some environmental topic areas from further analysis or adding additional environmental topic areas for further analysis.

## **CHAPTER 2 - ENVIRONMENTAL CHECKLIST**

---

**Introduction**

**General Information**

**Potentially Significant Impact Areas**

**Determination**

**Environmental Checklist and Discussion**

## INTRODUCTION

The environmental checklist provides a standard evaluation tool to identify a project's adverse environmental impacts. This checklist identifies and evaluates potential adverse environmental impacts that may be created by the re-adoption of proposed Rule 1315 - Federal New Source Review Tracking System and the adoption of the proposed amendments to Rule 1309.2 – Offset Budget.

## GENERAL INFORMATION

Project Title:	Re-Adoption of Proposed Rule 1315 – Federal New Source Review Tracking System and Proposed Amendments to Rule 1309.2 – Offset Budget
Lead Agency Name:	South Coast Air Quality Management District
Lead Agency Address:	21865 Copley Drive Diamond Bar, CA 91765
CEQA Contact Person:	Michael Krause (909) 396-2706
Rule Contact Person:	Mohsen Nazemi (909) 396-2662
Project's Sponsor Name:	South Coast Air Quality Management District
Project's Sponsor Address:	21865 Copley Drive Diamond Bar, CA 91765
General Plan Designation:	Not Applicable
Zoning:	Not Applicable
Description of Project:	Proposed Rule 1315 would be used to establish that exempt sources (under Rule 1304), sources relying on the Offset Budget (under Rule 1309.2, pending approval by the USEPA), and Priority Reserve sources (under Rule 1309.1) are fully offset to the extent required by federal law by valid emission reductions from the SCAQMD's internal offset accounts. The proposed rule would establish what types of reductions are eligible to be used to offset emissions. The proposed rule would also allow the use of certain previously untracked reductions that are eligible to offset emission increases. Proposed Rule 1315 would also specify procedures to be followed by the Executive Officer to make annual demonstrations of equivalency with federal offset requirements for major sources under Clean Air Act Section 173. Certain types of projects are not subject to the SCAQMD's New Source Review (NSR) offset requirements because they are exempt under SCAQMD Rule 1304. Additionally, specific priority sources may obtain offsets

from the SCAQMD's Priority Reserve under SCAQMD Rule 1309.1. Proposed Rule 1315 would be used to establish that the SCAQMD's NSR program is in the aggregate equivalent to the federal nonattainment NSR offset requirements under the federal Clean Air Act, even after the SCAQMD removed certain pre-1990 credits from its internal offset account of certain pre-1990 credits pursuant to a 2006 agreement with EPA.

Rule 1309.2 establishes an offset budget pre-funded by surplus shutdowns from non-major polluting facilities, and requires qualified facilities to pay a mitigation fee in order to access the offset budget. The proposed amendments to Rule 1309.2 would update mitigation fees based on current market prices of emission reduction credits, clarify public notice requirements, and preclude issuance of Offset Budget credits to fossil fuel-fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts, where at least 70 percent of the generated electricity is for its own use. Rule 1309.2 is an existing rule that will become effective upon adoption of Rule 1315 and SIP approval by USEPA of Rule 1309.2.

Together, the proposed re-adoption of Rule 1315 and adoption of amendments to Rule 1309.2 are referred to in this document as the "proposed project."

Surrounding Land Uses and Setting      Not Applicable

Other Public Agencies Whose Approval is Required:      Not Applicable

## ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The following environmental impact areas have been assessed to determine their potential to be affected by the proposed project. Any checked items represent areas that may be adversely affected by the proposed project. An explanation relative to the determination of impacts can be found following the checklist for each area.

- |  |   |   |
|--|---|---|
| <input checked="" type="checkbox"/> Aesthetics           | <input checked="" type="checkbox"/> Geology and Soils               | <input type="checkbox"/> Population and Housing             |
| <input type="checkbox"/> Agricultural Resources          | <input checked="" type="checkbox"/> Hazards and Hazardous Materials | <input checked="" type="checkbox"/> Public Services         |
| <input checked="" type="checkbox"/> Air Quality          | <input checked="" type="checkbox"/> Hydrology and Water Quality     | <input type="checkbox"/> Recreation                         |
| <input checked="" type="checkbox"/> Biological Resources | <input type="checkbox"/> Land Use and Planning                      | <input checked="" type="checkbox"/> Solid/Hazardous Waste   |
| <input type="checkbox"/> Cultural Resources              | <input type="checkbox"/> Mineral Resources                          | <input checked="" type="checkbox"/> Transportation./Traffic |
| <input checked="" type="checkbox"/> Energy               | <input checked="" type="checkbox"/> Noise                           | <input checked="" type="checkbox"/> Mandatory Findings      |

**DETERMINATION**

On the basis of this initial evaluation:

- I find the proposed project, in accordance with those findings made pursuant to CEQA Guidelines Section 15252, COULD NOT have a significant effect on the environment, and that an ENVIRONMENTAL ASSESSMENT with no significant impacts will be prepared.
- I find that although the proposed project could have a significant effect on the environment, there will NOT be significant effects in this case because revisions in the project have been made by or agreed to by the project proponent. An ENVIRONMENTAL ASSESSMENT with no significant impacts will be prepared.
- I find that the proposed project MAY have a significant effect(s) on the environment, and an ENVIRONMENTAL ASSESSMENT will be prepared.
- I find that the proposed project MAY have a "potentially significant impact" on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL ASSESSMENT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL ASSESSMENT pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL ASSESSMENT, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date March 17, 2009

Program Supervisor

## ENVIRONMENTAL CHECKLIST AND DISCUSSION

As stated in Chapter 1, the SCAQMD is proposing to re-adopt proposed Rule 1315 in response to litigation on the 2007 adoption of Rule 1315. Proposed Re-adopted Rule 1315 would specify procedures to be followed by the SCAQMD's Executive Officer to make annual demonstrations of equivalency with federal offset requirements for major sources and specify what types of reductions may be deposited into the SCAQMD's internal accounts. The re-adoption of proposed Rule 1315 may assist permit applicants with complying with offset requirements through increased availability of emissions offsets, the acquiring of which is a critical step in obtaining an approval to begin construction of a project.

In addition to re-adopting Rule 1315, the SCAQMD is also proposing to amend Rule 1309.2, which would revise existing mitigation fees, clarify public notice requirements, and preclude issuance of Offset Budget credits to most fossil fuel-fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts where at least 70 percent of the generated electricity is for its own use. Rule 1309.2 is an existing rule that becomes effective upon adoption of Rule 1315 and SIP approval of Rule 1309.2 by USEPA. Together, the proposed re-adoption of Rule 1315 and adoption of amendments to Rule 1309.2, are referred to in this document as the "proposed project."

To address the Los Angeles County Superior Court's ruling regarding the CEQA document prepared for the 2007 project, out of an abundance of caution the environmental analysis for the currently-proposed project will include the conservative assumption that, in the future, all previously tracked offsets and newly-tracked offsets (e.g., offsets obtained from minor source orphan shutdowns and reductions) in the SCAQMD's internal accounts will be used. Under this assumption, the environmental analysis will treat all newly-tracked offsets as new offsets. This assumption is overly conservative for the following reasons.

- The assumption is not supported by SCAQMD's past experience in that prior to the original adoption of Rule 1315 and the Court decision, the SCAQMD could and did issue tracked offsets from its internal accounts and only a limited amount of credits were used per year. Many of the sources of offsets that would be tracked by proposed Rule 1315 were also tracking what was in place prior to the original adoption of Rule 1315.
- If all offsets in the SCAQMD's internal accounts are used, emissions from project relying on these offsets would represent a large portion of the total future emission inventories. Under this scenario it is unlikely that the SCAQMD would be able to demonstrate attainment of all air quality standards, and would therefore be in violation of federal law.

The PEA will include an analysis of the direct and indirect adverse environmental impacts created by the proposed project by permit applicants who would use the offsets in constructing and operating facilities for which the SCAQMD is making emission offsets available from its internal accounts. The analysis will also include the assumption that facilities expected to use future emissions offsets made available as a result of Rule 1315 would more likely be sited, thus, potentially generating construction and operation impacts. In addition to the analysis of the proposed project based on conservative assumptions, the PEA will also include an analysis of

reasonably-foreseeable future environmental impacts associated with siting, constructing and operating future new and modified facilities.

As noted in CEQA Guidelines §15144, preparing a CEQA document necessarily involves some degree of forecasting. For most projects, forecasting impacts is typically done for a specific project or, more generally, a plan, e.g., general or specific plan, where specific activities or land use classifications are known. SCAQMD staff will need to make a number of assumptions to identify projects that may access the SCAQMD's internal accounts in the future. Therefore, in order to evaluate the potential adverse environmental impacts from the use of the offsets by future facilities, the following approach will be taken.

- First, SCAQMD staff will survey past and pending air quality permit applications to identify the types and sizes of facilities that have accessed offsets pursuant to Rule 1309.1, that would be able to access 1309.2 in the future, or exempt projects pursuant to Rule 1304 where the SCAQMD has provided offsets to demonstrate equivalency with federal offset requirements.
- Then, based on the survey of these past and pending permit applications, representative facilities will be identified and established. These representative facilities will be prime examples of affected facilities at various locations in the district where local zoning ordinances or land use designations would allow such commercial or industrial facilities.

To assist in evaluating the potential adverse environmental impacts from representative facilities, existing CEQA documents will be surveyed to identify projects similar to the representative facilities. The corresponding impact analysis in those CEQA documents will then be reviewed to augment the determination of potential impacts from the representative facilities. In addition, the representative projects will be evaluated on their potential to emit air pollutants, including toxics, as well as their location relative to sensitive receptors and effect on other environmental topics. Finally, the analysis will assume that projects will comply with all applicable laws, rules, regulations, codes, ordinances, required standards and land use designations because, otherwise, the facility could not obtain a permit or project approval. The potential environmental impacts of these representative facilities will be analyzed and disclosed in the Draft Program PEA.

---

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>I. AESTHETICS.</b> Would the project:			
a) Have a substantial adverse effect on a scenic vista?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### SIGNIFICANCE CRITERIA

The proposed project impacts on aesthetics would be considered significant if:

- The project would block views from a scenic highway or corridor.
- The project would adversely affect the visual continuity of the surrounding area.
- The impacts on light and glare would be considered significant if the project adds lighting which would add glare to residential areas or sensitive receptors.

### DISCUSSION

- I. a) - c): **Potentially Significant Impact.** The proposed project specifies regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. Accordingly, the proposed project would have no direct impact on a scenic vista and would not substantially damage scenic resources or substantially degrade the existing visual character or quality of any specific site or its surroundings. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. These projects could result in either new construction or modification of existing structures. Such projects could potentially result in a scale and mass of the built form that is inconsistent with adjoining development, remove trees or historic buildings, or obstruct regionally or locally important views.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future aesthetic impacts associated with the siting of a new facility/project (e.g., obstruction of scenic vistas and resources, degradation of an area’s visual character, etc.). However, in order to identify typical impacts on the scenic and visual quality of an area or a neighborhood that could be expected in the event that development projects or existing facility modifications occur in a sensitive area within the district, representative projects will be identified for the purpose of this assessment. As discussed earlier in this chapter, the representative projects will be established based on past and pending air quality permit applications for facilities that have and/or could have access to Rules 1304, 1309.1 and 1309.2. The aesthetic impacts of these representative facilities will be analyzed in the Draft PEA. In addition, the construction and operation of permitted facilities will result in the emission of air pollutants that could cause impacts on visibility. The PEA will analyze direct and indirect impacts, including visibility, based on the assumption that all newly tracked reductions are used, which could potentially be significant.

- II. d): **Potentially Significant Impact.** There are no components of the proposed project that would directly alter existing work practices or require activities at night. Therefore, the proposed project is not expected to directly create a new source of substantial light or glare that would affect day or nighttime views in an area. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD’s internal offset accounts. These individual projects could result in new development that may create substantial shade or cast long shadows or result in glare and increased nighttime illumination causing inappropriate light spillover.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future light and glare impacts associated with the siting of a new facility/project (e.g., increased illumination in sensitive areas, increased glare along transportation corridors, increased shading in areas that need sunlight, etc.). Representative projects identified for the purpose of this assessment will be used to identify typical light and glare impacts that could be expected in the event that development projects or existing facility modifications occur in a sensitive area within the district. The impacts of these representative facilities related to shadows, light, and glare will be analyzed in the Draft PEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>II. AGRICULTURE RESOURCES.</b> Would the project:			
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland mapping and Monitoring Program of	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant Impact	No Impact
the California Resources Agency, to non-agricultural use?			
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

Project-related impacts on agricultural resources would be considered significant if any of the following conditions are met:

- The proposed project would conflict with existing zoning or agricultural use or Williamson Act contracts.
- The proposed project would convert prime farmland, unique farmland or farmland of statewide importance as shown on the maps prepared pursuant to the farmland mapping and monitoring program of the California Resources Agency, to non-agricultural use.
- The proposed project would involve changes in the existing environment, which due to their location or nature, could result in conversion of farmland to non-agricultural uses.

**DISCUSSION**

II. a) - c): **No Impact.** The proposed project specifies regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not directly result in any construction of new buildings or other structures that would convert farmland to non-agricultural use or conflict with zoning for agricultural use or a Williamson Act contract. There are no provisions in the proposed rule or amended rule that would convert farmland to non-agricultural uses, thus, affecting land use plans, policies, or regulations related to agricultural resources. Land use and other planning considerations are determined by local governments, and no land use or planning requirements would be directly or indirectly altered by the proposed project. As such, the proposed project does not have direct or indirect impacts on agricultural resources. While is unknown at this time where a developer may wish to site a particular facility, agricultural land is not expected to be such a location because the action would require a change in zoning of the land and compliance with CEQA requirements. If such zoning would take place, it would likely be for other business reasons.

Thus, these commercial and industrial projects are not expected to result in the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to non-agricultural uses. Nor, are these projects anticipated to conflict with existing zoning by using land zoned for agricultural uses or under the Williamson Act contract for non-agricultural purposes.

Based on the above considerations, significant adverse impacts to agriculture resources are not expected from implementing the proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>III. AIR QUALITY.</b> Would the project:			
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Violate any air quality standard or contribute to an existing or projected air quality violation?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutant(s)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment, based on any applicable threshold of significance?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

- h) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

### SIGNIFICANCE CRITERIA

Impacts will be evaluated and compared to the significance criteria in Table 2-1. If impacts equal or exceed any of the following criteria, they would be considered significant.

**TABLE 2-1**  
Air Quality Significance Thresholds<sup>a</sup>

<i>Mass Daily Thresholds<sup>a</sup></i>		
<b>Pollutant</b>	<b>Construction<sup>d</sup></b>	<b>Operation<sup>e</sup></b>
NO <sub>x</sub>	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM <sub>10</sub>	150 lbs/day	150 lbs/day
PM <sub>2.5</sub>	55 lbs/day	55 lbs/day
SO <sub>x</sub>	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
<i>Ambient Air Quality for Criteria Pollutants<sup>b</sup></i>		
NO <sub>2</sub>	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.03 ppm (federal)	
1-hour average annual average		
PM <sub>10</sub>	10.4 µg/m <sup>3</sup> (construction) <sup>c</sup> & 2.5 µg/m <sup>3</sup> (operation) 1.0 µg/m <sup>3</sup> 20 µg/m <sup>3</sup>	
24-hour average annual geometric average annual arithmetic mean		
PM <sub>2.5</sub>	10.4 µg/m <sup>3</sup> (construction) <sup>c</sup> & 2.5 µg/m <sup>3</sup> (operation)	
24-hour average		
Sulfate	1 µg/m <sup>3</sup>	
24-hour average		
CO	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) 9.0 ppm (state/federal)	
1-hour average 8-hour average		
<i>Toxic Air Contaminants (TACs) and Odor Thresholds</i>		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 10 in 1 million Hazard Index ≥ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	

<sup>a</sup> Source: SCAQMD CEQA Handbook (SCAQMD, 1993)

<sup>b</sup> Ambient air quality thresholds for criteria pollutants based on SCAQMD Rule 1303, Table A-2 of the *SCAQMD CEQA Handbook* unless otherwise stated.

<sup>c</sup> Ambient air quality threshold based on SCAQMD Rule 403.

<sup>d</sup> Construction thresholds apply to both the South Coast Air Basin and Coachella Valley (Salton Sea and Mojave Desert Air Basins).

<sup>e</sup> For Coachella Valley, the mass daily thresholds for operation are the same as the construction thresholds.

KEY: lbs/day = pounds per day ppm = parts per million  
µg/m<sup>3</sup> = microgram per cubic meter ≥ = greater than or equal to

**Greenhouse Gases:** SCAQMD's approved<sup>1</sup> interim GHG significance threshold is a tiered approach to determining GHG significance of projects. The first two tiers involve (1) exempting the project because of potential reductions of GHG emissions allowed under CEQA and (2) demonstrating that the project's GHG emissions are consistent with a local general plan. Tier 3 proposes a limit of 10,000 MT CO<sub>2</sub> equivalent (CO<sub>2</sub>E) per year for industrial projects as the incremental increase signifying significance. Projects with incremental increases below this threshold will not be cumulatively considerable. Under Tier 5, the project proponent would implement mitigation (GHG reduction projects) to reduce GHG emission impacts to less than the proposed screening level. Tier 4 was not recommended for approval by the Board.

## DISCUSSION

SCAQMD's NSR regulation sets forth pre-construction review requirements for new, modified, or relocated facilities, to ensure that the operation of such facilities does not interfere with progress toward attainment of the NAAQSs, and that future economic growth within the district is not unnecessarily restricted. The specific air quality goal of this regulation is to achieve no net increases from new or modified permitted sources of nonattainment air contaminants or their precursors. Similarly, the SCAQMD's AQMP must demonstrate attainment of all ambient air quality standards (AAQSs), while still accommodating future anticipated population and economic growth.

- III. a): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project is, therefore, consistent with the existing purposes of Regulation XIII to ensure that there are no net increases in emissions from new or modified permitted sources. However, the proposed project would enable the issuance of permits for sources that will emit air contaminants. If it is assumed that all previously untracked offsets (e.g., minor source orphan shutdowns) are used at the same time, and therefore result in emissions, these emissions could hinder the attainment of the National Ambient Air Quality Standards (NAAQA) and California Ambient Air Quality Standards (CAAQS), violating federal and state requirements and, thus, implementation of the air quality management plan. This issue will be further addressed in the Draft PEA.
- III b - e): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project itself does not include development components and, therefore, would not result in direct air quality-related impacts. However, under the revised tracking requirements of proposed Rule 1315,

---

<sup>1</sup> Approved SCAQMD CEQA GHG Significance Threshold for projects where SCAQMD is Lead Agency was approved by the Governing Board at its December 5, 2008. <http://www.aqmd.gov/hb/2008/December/081231a.htm>

previously untracked offsets could be made available to the SCAQMD's internal offset accounts due to inclusion of offsets generated from orphan shutdown and orphan reduction<sup>2</sup> of minor sources, emission reduction credits (ERCs) provided as emissions offsets by minor sources, and ERCs provided by major sources in excess of the federally-required 1.0-to-1.0 offset ratio for non-attainment air contaminants other than extreme nonattainment air contaminants and their precursors. Prior to 2006, offsets from the previously-mentioned components were not included in the federal tracking system. In response to the Court decision and to provide a conservative analysis of potential adverse impacts from the proposed project, the analysis will include the assumption that all offsets from the SCAQMD's internal accounts will be used. Further, potential adverse criteria pollutants, air toxic, and greenhouse gases (GHG) emission impacts will be analyzed at the project level for representative projects and cumulatively with other related projects, as necessary, in the Draft PEA.

As discussed on page 2-5, this analysis represents an overly conservative approach because the usage of all credits could violate federal and state requirements by hindering the attainment of all NAAQS and CAAQS, and past experience shows that not all the credits are used.

#### *Criteria Pollutant Emissions*

Some individual projects would result in combustion-source criteria pollutant emissions from construction activity through the use of heavy-duty construction equipment and from vehicle trips generated by construction workers/haul trucks traveling to and from the project site, as well as fugitive dust emissions related to site work and general grading. Mobile source emissions, primarily NO<sub>x</sub> and diesel particulate, typically result from the use of construction equipment such as graders, scrapers, bulldozers, wheeled loaders, cranes, etc. During structure erection/finishing phases, paving operations and the application of architectural coatings (i.e., paints) and other building materials, reactive organic compounds would be released. Operation-period impacts, which could include criteria pollutant emissions from permitted stationary sources, may also occur. Individual development projects that could indirectly occur as a result of use of emissions offsets from the SCAQMD's offset accounts through proposed Rule 1315 and proposed amended Rule 1309.2 could potentially result in an increase in vehicle trips (both passenger vehicles and trucks) on local roadways, which could in turn result in an increase in operational-period criteria pollutant emissions. As such, the impacts of implementing these rules could:

- Violate an air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of a criteria pollutant for which the Basin is in non-attainment under federal or state AAQS;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Expose sensitive receptors to objectionable odors.

---

<sup>2</sup> ORPHAN REDUCTION means any reduction in actual emissions from a permitted source within AQMD resulting from a physical change to the source and/or a change to the method of operation of the source provided the change is reflected in a revised permit for the source and provided such reduction is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan and does not result in issuance of an ERC.

*Visibility*

These projects, when considered cumulatively, could potentially significantly affect visibility. These and the other issues identified above would be considered potentially significant impacts and further analyzed in the Draft PEA.

*Health Effects*

Increases in criteria pollutant emissions may result in potential adverse health effects, including cardiovascular, neurological, reproductive and respiratory diseases. These potential health impacts will be further analyzed in the Draft PEA.

*Toxic Air Contaminant Emissions*

As part of the permit application process, individual projects must demonstrate that localized impacts related to toxic air contaminant (TAC) emissions are less than significant. As such, a permit to operate cannot be issued unless localized impacts are demonstrated to be less than significant. However, these individual projects, when considered cumulatively, could potentially have a significant effect on cancer risk Basin-wide. The potential effect on Basin-wide cancer risk related to cumulative TAC emissions is considered a potentially significant impact and, therefore, will be further analyzed in the Draft PEA.

- III. f): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The various major source projects with emissions increases offset by the Priority Reserve or the Offset Budget or exempt from offsets pursuant to Rule 1304 would be subject to best available control technology (BACT) and modeling, and would receive emissions offsets (at applicable offset ratios) from the SCAQMD's internal offset accounts tracked pursuant to the proposed project. As such, the proposed rule and amended rule would continue to be consistent with NSR and, thus, the existing air quality rules and future compliance requirements would not be weakened. .
- III. g - h): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project itself does not include development components and, therefore, would not result in direct emissions of greenhouse gases (GHGs). However, as discussed in Checklist Response III.b-e above, previously untracked offsets could be made available from the SCAQMD's internal offset accounts, which may result in additional new projects that could be constructed within the district. Thus, many projects that would be eligible for emission offsets from the SCAQMD's internal offset accounts through proposed Rule 1315 and proposed amended Rule 1309.2 would generate GHG emissions that may result in a significant impact on the environment or possibly conflict with an applicable plan, policy, or regulation of an agency

adopted for the purpose of reducing the emissions of GHG. These potential impacts will be analyzed in the Draft PEA.

Individual projects could result in combustion-source GHG emissions from construction activity through the use of heavy-duty construction equipment and from vehicle trips generated by construction workers/haul trucks traveling to and from the individual project sites. In addition, operation-period GHG emissions could result from permitted stationary sources, as well as from vehicular travel to/from the permitted stationary sources related to commercial and employee trips. Potential impacts related to GHG emissions would be considered potentially significant and further analyzed in the Draft PEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>IV. BIOLOGICAL RESOURCES.</b> Would the project:			
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflicting with any local policies or ordinances	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant Impact	No Impact
protecting biological resources, such as a tree preservation policy or ordinance?			
f) Conflict with the provisions of an adopted Habitat Conservation plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

Impacts on biological resources would be considered significant if any of the following criteria apply:

- The project would result in a loss of plant communities or animal habitat considered to be rare, threatened or endangered by federal, state or local agencies.
- The project would interfere substantially with the movement of any resident or migratory wildlife species.
- The project would adversely affect aquatic communities through construction or operation of the project.

**DISCUSSION**

IV a) - b), d): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. Accordingly, the proposed project would not have direct impacts on plant or animal species or the habitats that support them. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD’s internal offset accounts. Generally, typical impacts of a project on biological resources could include loss or destruction of sensitive species or degradation of sensitive habitat. Habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors, or wildlife nursery sites may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas. Projects that create long-term or episodic impacts to natural areas, such as by generating toxic fumes or fugitive dust, could also result in degradation or destruction of a natural habitat.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts

to plant or animal species or the habitats that support them. Representative projects identified for the purpose of this assessment will be used to identify typical impacts on plant and animal species and the habitats that could be expected in the event that development projects or existing facility modifications occur in an ecologically sensitive area within the district. The potential impacts of these representative facilities on sensitive biological resources will be analyzed in the Draft PEA.

- IV. c): **No Impact.** The proposed project would not require or compel various project proponents to directly remove, fill, or interrupt any hydrological system or have a significant impact on federally-protected wetlands. Generally, individual projects eligible for emissions offsets from the SCAQMD’s internal offset accounts under the proposed project would not affect federally-protected wetlands as defined by Section 404 of the Clean Water Act because the projects at representative facilities are not expected to result in the removal, filling, hydrological interruption of protected wetlands, or interruption of fresh or salt water supplies on federally-protected wetlands.
- IV. e) - f): **No Impact.** There are no provisions in the proposed project that would significantly affect land use plans, local policies or ordinances, or regulations. Land use and other planning considerations are determined by local governments, and no land use or planning requirements would be altered by the proposed project. It is expected that various projects subject to proposed Rule 1315 and proposed amended Rule 1309.2 would continue to comply with local land use requirements. Thus, individual projects are not expected to conflict with local policies or ordinances protecting biological resources, habitat conservation plans, and natural community conservation plans due to the loss or destruction of individuals of a sensitive species, or through degradation of sensitive habitat. .

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>V. CULTURAL RESOURCES.</b> Would the project:			
a) Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource as defined in Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
---	---	------------------

interred outside formal cemeteries?

**SIGNIFICANCE CRITERIA**

Impacts to cultural resources would be considered significant if:

- The project would result in the disturbance of a significant prehistoric or historic archaeological site or a property of historic or cultural significance to a community or ethnic or social group.
- Unique paleontological resources are present that could be disturbed by construction of the proposed project.
- The project would disturb human remains.

**DISCUSSION**

V. a) - d): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD’s internal offset accounts. There are existing laws in place that are designed to protect and mitigate potential impacts to cultural resources. Historical or archaeological resource databases are expected to be checked before a new facility is constructed. CEQA Guidelines §15064.5 states that resources listed in the California Register of Historical Resources or in a local register of historical resources are considered “historical resources.” If any human remains are discovered during the construction or modification process, proper notification procedures are expected to take place.

For existing facilities, any existing cultural resources will have already been disturbed so facility modifications are not expected to change any historical or archaeological resource, or destroy a unique paleontological resource or site or unique geologic feature. The extent of any previous earth disturbance reduces the likelihood that previously unknown archaeological or paleontological resources will be encountered during project construction.

While the likelihood of encountering cultural resources is low, it is possible that intact prehistoric deposits may occur below the disturbed horizon for either new construction or modification. If such resources were to be encountered unexpectedly during ground disturbance associated with construction of facilities enabled by proposed project, there would be the potential for adverse impacts. To minimize the risk of adverse impacts occurring, project construction would be required to incorporate a number of standard protective measures during earth-disturbing activities:

- If cultural resources are exposed, a professional archaeologist and a Native American representative will be retained to monitor the subsurface work;
- The archaeological monitor will have the authority to temporarily halt or redirect earth disturbance work in the vicinity of the exposed cultural resources, so the find can be evaluated and mitigated as appropriate; and
- As required by State law, if human remains are unearthed, no further disturbance will occur until the County Coroner has made the necessary findings concerning the origin and disposition of these remains. The Native American Heritage Commission will be notified if the remains are determined to be of Native American descent.

Therefore, cultural resources are not expected be disturbed in any way. As a result, the proposed project has no potential to cause a substantial adverse change to a historical or archaeological resource, directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or disturb any human remains, including those interred outside formal cemeteries.

Based on the above considerations, significant adverse impacts to cultural resources are not expected from implementing the proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>VI. ENERGY.</b> Would the project:			
a) Conflict with adopted energy conservation plans?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the need for new or substantially altered power or natural gas utility systems?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Create any significant effects on local or regional energy supplies and on requirements for additional energy?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create any significant effects on peak and base period demands for electricity and other forms of energy?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Comply with existing energy standards?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

## SIGNIFICANCE CRITERIA

The impacts to energy resources would be considered significant if any of the following criteria are met:

- The project would conflict with adopted energy conservation plans or standards.
- The project would result in substantial depletion of existing energy resource supplies.
- An increase in demand for utilities would impact the current capacities of the electric and natural gas utilities.
- The project would use non-renewable resources in a wasteful and/or inefficient manner.

## DISCUSSION

VI. a), e): **No Impact.** While there is a potential need for additional electricity and natural gas to operate representative facilities, the amount is not expected to conflict with adopted energy conservation plans. In addition, new, more efficient equipment and design features should reduce the demand for fuel and electricity. Affected facilities would still be expected to comply with any existing energy conservation standards, to the extent that affected equipment are subject to energy conservation standards.

VI. b) - d): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not directly use non-renewable resources in a wasteful manner, or result in the need for new or substantially altered power or natural gas systems. Additional emissions offsets would be made available in the SCAQMD's internal offset accounts under the proposed project due to the inclusion of offsets from minor source orphan shutdowns and reductions. The proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Typical impacts on energy from individual projects could include increased energy consumption. To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts to energy resources. Representative projects identified for the purpose of this assessment will be used to identify energy impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district where additional supplies of electrical power and natural gas are in great demand. The potential impacts of these representative facilities on energy resources will be analyzed in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>VII. GEOLOGY AND SOILS.</b> Would the project:			
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
• Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
• Strong seismic ground shaking?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
• Seismic-related ground failure, including liquefaction?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
• Landslides?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

Impacts on the geological environment would be considered significant if any of the following criteria apply:

- Topographic alterations would result in significant changes, disruptions, displacement, excavation, and compaction or over covering of large amounts of soil.
- Unique geological resources (paleontological resources or unique outcrops) are present that could be disturbed by the construction of the proposed project.

- Exposure of people or structures to major geologic hazards such as earthquake surface rupture, ground shaking, liquefaction or landslides.
- Secondary seismic effects could occur which could damage facility structures (e.g., liquefaction).
- Other geological hazards would exist which could adversely affect the facility (e.g., landslides and mudslides).

## DISCUSSION

VII. a),c), d) - e): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would have no direct impact on geological resources. However, the proposed project would allow the development of individual projects that qualify to receive emission offsets available from the SCAQMD's internal offset accounts. Individual projects could occur along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual projects could be located in areas subject to liquefaction and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future geology and soils impacts. Representative projects identified for the purpose of this assessment will be used to identify typical geology and soils impacts that could be expected in the event that development projects or existing facility modifications occur in geologically sensitive areas within the district. The potential impacts of these representative facilities on geology and soils will be analyzed in the Draft PEA.

VII. b): **No Impact.** The representative facilities would most likely be located on property that has already been developed, so no potential impacts to existing geophysical conditions are anticipated. New construction will be evaluated for potential substantial soil erosion in order to get a building permit and, thus, would be expected to stabilize the land to assist in evading soil erosion. Therefore, no substantial soil erosion or loss of topsoil is expected from the proposed project. Any soil disturbance that does occur will be subject to the dust control requirements of SCAQMD Rule 403, which would minimize any wind erosion.

VII. e): **No Impact.** The projects at the affected facilities could use septic tanks or alternative waste water disposal systems, however, the projects are not expected to be approved if soils are incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water. In addition,

industrial project areas in the district are built-out and typically provide disposal of waste water, thus not requiring the use of septic tanks or alternative waste water disposal systems.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>VIII. HAZARDS AND HAZARDOUS MATERIALS.</b> Would the project:			
a) Create a significant hazard to the public or the environment through the routine transport, use, disposal of hazardous materials?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions, or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires,	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?			
i) Significantly increased fire hazard in areas with flammable materials?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SIGNIFICANCE CRITERIA**

The impacts associated with hazards would be considered significant if any of the following occur:

- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.
- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

**DISCUSSION**

VIII.a), b), c), e), and f): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not directly result an increased transport, storage, or use of hazardous materials. Therefore, the proposed project would have no direct hazards or hazardous materials impacts. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD’s internal offset accounts. Individual projects could result in either new construction or modification of existing structures. Impacts could result from exposure of persons or the environment to hazardous materials through activities that could include, but not be limited to, excavation of underground materials, accidental release of handled materials, or leaking tanks,. The extent of the impact would be dependent upon the characteristics of the project being proposed and the specific site conditions related to hazardous materials, which cannot be known until the project or project site is identified. Hazardous materials like asbestos, lead based paints (LBPs), and polychlorinated biphenyls (PCBs) are present in many buildings. During renovation or demolition activities, these hazardous materials may be disturbed.

Disturbance of asbestos, LBPs, and PCBs could expose construction workers and residents to health hazards. However, the USEPA and SCAQMD have regulations intended to minimize asbestos exposure during demolition and renovation activities.

Any future development project occurring as an indirect result of the proposed project that involves demolition activity could result in impacts related to hazardous materials. To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts associated with hazards and hazardous materials. Representative projects identified for the purpose of this assessment will be used to identify typical impacts that could be expected in the event that development projects or existing facility modifications occur on sites or in areas within the district exposed to hazardous materials or hazardous wastes. The potential impacts of these representative facilities related to hazards and hazardous materials will be analyzed in the Draft PEA.

VIII. d): **No Impact.** Government code §65962.5 refers to hazardous waste handling practices at facilities subject to the Resources Conservation and Recovery Act (RCRA). If any future affected facilities are identified on such a list, construction of new or modified permit units enabled by the proposed project is not expected to affect in any way any facility's hazardous waste handling practices.

VIII. g): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. Such activities do not impose any new emergency conditions at the facility that would warrant amendments to adopted emergency response plans and emergency evacuation plans, nor would the proposed project be expected to physically interfere with implementing any adopted emergency response plans and emergency evacuation plans.

VIII.h) - i): **Potentially Significant Impact.** The Uniform Fire Code and Uniform Building Code set standards intended to minimize risks from flammable or otherwise hazardous materials and wildland fires. Local jurisdictions are required to adopt the uniform codes or comparable regulations. Local fire agencies require permits for the use or storage of hazardous materials and permit modifications for proposed increases in their use. Permit conditions depend on the type and quantity of the hazardous materials at the facility or risk of wildland fire to the property. Permit conditions may include, but are not limited to, specifications for sprinkler systems, electrical systems, ventilation, and containment. The fire departments make annual business inspections to ensure compliance with permit conditions and other appropriate regulations. Consequently, local fire departments ensure that adequate permit conditions are in place to protect against potential risk of upset from the use of hazardous materials and wildland fires.

Although the proposed project would not result in direct impacts involving wildland fires or fire hazards from flammable materials, development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts through proposed Rule 1315 and amended Rule 1309.2 could result in indirect impacts. Individual development projects could be located within a Wildfire Hazard Area or could require storage of flammable materials, such as diesel and flammable chemicals, during construction or operation. To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts associated with hazards and hazardous materials and wildland fires. Representative projects identified for the purpose of this assessment will be used to identify typical hazards and hazardous materials and wildland fires impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district that are subject to wildland fires or fire hazards. The potential impacts of these representative facilities associated with wildland fires and fire hazard areas will be analyzed in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>IX. HYDROLOGY AND WATER QUALITY.</b>			
Would the project:			
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

	Potentially Significant Impact	Less Than Significant Impact	No Impact
site?			
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
j) Inundation by seiche, tsunami, or mudflow?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
k) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
l) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
m) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
n) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

	Potentially Significant Impact	Less Than Significant Impact	No Impact
o) Require in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SIGNIFICANCE CRITERIA**

Potential impacts on water resources would be considered significant if any of the following criteria apply:

**Water Quality:**

- The project would cause degradation or depletion of ground water resources substantially affecting current or future uses.
- The project would cause the degradation of surface water substantially affecting current or future uses.
- The project would result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements.
- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system would not be sufficient to meet the needs of the project.
- The project would result in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project would result in alterations to the course or flow of floodwaters.

**Water Demand:**

- The existing water supply would not have the capacity to meet the increased demands of the project, or the project would use a substantial amount of potable water.
- The project would increase demand for water by more than five million gallons per day.

**DISCUSSION**

IX. a): **No Impact.** The affected facilities are not expected to violate any water quality standards or waste discharge requirements because, if a violation was to occur, the affected facility would not get the approval or permit for the project and, if permit was already obtained, would be subject to applicable agency enforcement and penalty actions.

IX. b) - f): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would have no direct impact on hydrology and water quality. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. These individual projects could result in runoff of sediments, construction materials, and accidental spills of fuels and/or lubricants during construction activities that could adversely affect water quality. These individual projects may be required to comply with National Pollution Discharge Elimination System (NPDES) regulations and implement an associated project-specific Storm Water Pollution Prevention Plan (SWPPP) and Source Control Program that would detail best management practices (BMPs) during construction activities, as well as post-construction operational activities. Compliance with existing regulations would minimize potential water quality impacts during construction and operation of each individual project. Construction could also result in the increase in impervious surfaces within the district, which could lead to increased surface runoff from the individual project sites. This increase in runoff could potentially affect existing or planned stormwater drainage systems.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future hydrological and water quality impacts. Representative projects identified for the purpose of this assessment will be used to identify typical hydrological and water quality impacts that could be expected in the event that development projects or existing facility modifications occur in hydrologically sensitive areas (e.g., located adjacent to water bodies, flood zone areas, etc.) within the district. The impacts of these representative facilities on hydrology and water quality will be analyzed in the Draft PEA.

IX. g): **No Impact.** The proposed project would not involve construction of housing or affect residential siting so it would not result in placing housing in 100-year flood hazard areas that could create new flood hazards.

IX. h) - j): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would have no direct impact on flooding and inundation. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Depending on the location of each affected commercial or industrial project, the site may be located within a 100-year flood hazard area, as designated by the Federal Emergency Management Agency (FEMA), an inundation zone, a coastal area, or a hillside, which could result in potential impacts related to flooding, inundation, or mudslides.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future flooding, inundation, and mudslide impacts. Representative projects identified for the purpose of this assessment will be used to identify typical impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district that are subject to flooding, inundation, and/or mudslide. The potential impacts of these representative facilities related to flooding, inundation, and mudslide will be analyzed in the Draft PEA.

- IX. k): **No Impact.** Affected facilities are expected to comply with existing wastewater treatment requirements or conditions from any applicable Regional Water Quality Control Board or local sanitation district because violating the requirements or conditions would subject the affected facility to enforcement and penalty actions, which could jeopardize the approval or permit allowing the facility to operate.
- IX. l) - o): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would have no direct impact on water, wastewater treatment, and stormwater drainage facilities. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Each development project would be required to comply with all federal, state, and local statutes and regulations related to all water, wastewater, and storm drainage facilities. Depending on the location of each development project, the site may be located in an area with deficient water or wastewater treatment facilities, insufficient water supplies, or substandard stormwater drainage facilities, which could result in potential impacts on these facilities and services.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts to water, wastewater, and storm drainage facilities. Representative projects identified for the purpose of this assessment will be used to identify typical water, wastewater, and storm drainage facilities impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district that have deficient water or wastewater treatment facilities, insufficient water supplies, or substandard stormwater drainage facilities. The potential impacts of these representative facilities on water, wastewater, and storm drainage facilities will be analyzed in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>X. LAND USE AND PLANNING.</b> Would the project:			
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with any applicable habitat conservation or natural community conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

- Land use and planning impacts would be considered significant if the project conflicts with the land use and zoning designations established by local jurisdictions.

**DISCUSSION**

X. a) - c): **No Impact.** There are no provisions in the proposed project that would affect land use plans, policies, or regulations. Land use and other planning considerations are determined by local governments, and no land use or planning requirements would be directly altered by the proposed project. Individual development projects subject to the proposed rule and amended rule would still be required to comply with local land use requirements. Facilities will need to comply with any requirements and land use designations in order to obtain any necessary approval or permit for the project. Therefore, there would be no direct or indirect impacts on land use and planning.

Based on the above considerations, significant adverse impacts to land use and planning are not expected from implementing the proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XI. MINERAL RESOURCES.</b> Would the project:			
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

Project-related impacts on mineral resources would be considered significant if any of the following conditions are met:

- The project would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
- The project would result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

**DISCUSSION**

XI. a) - b): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. There are no provisions in the proposed project that would directly result in the loss of availability of a known mineral resource of value to the region and the residents of the state, or of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

Based on the above considerations, significant adverse impacts to mineral resources are not expected from implementing proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>XII. NOISE.</b> Would the project result in:			
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### SIGNIFICANCE CRITERIA

Impacts on noise would be considered significant if:

- Construction noise levels would exceed local noise ordinances or, if the noise threshold is currently exceeded, project noise sources would increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels would be considered significant if they would exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels would exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project

noise sources would increase ambient noise levels by more than three dBA at the site boundary.

## DISCUSSION

XII. a). **No Impact.** Although the representative facilities could generate an increase in noise from their new or modified equipment, they are not expected to expose persons to or generate noise levels in excess of standards established in a local general plan or noise ordinance because violating such standards and ordinances would subject the affected facilities to local jurisdiction enforcement and penalty actions, which could jeopardize further operation of the facility.

XII. b) - f): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would have no direct noise impacts. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. These individual projects could result in an increase in vehicle trips (both passenger vehicles and trucks) on local roadways, which in turn could result in an increase in noise levels. The individual projects could also cause noise impacts from operation of heavy machinery, cooling towers, HVAC units, etc. Additionally, construction noise could be generated by the broad array of powered, noise-producing mechanical equipment typically used in the construction phase. Because the district encompasses a large area, the potential exists for sensitive receptors to be located within 500 feet of a construction area although it is not possible to determine what specific effects could occur, if any, in the absence of specific information relating to future development activities.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future noise impacts from the construction and operation of various projects resulting from the individual projects accessing the SCAQMD's internal offset accounts under the proposed project. Representative projects identified for the purpose of this assessment will be used to identify typical noise impacts that could be expected in the event that development projects or existing facility modifications occur in noise-sensitive areas within the district. The potential impacts of these representative facilities related to noise will be analyzed in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>XIII. POPULATION AND HOUSING.</b> Would the project:			
a) Induce substantial growth in an area either directly (for example, by proposing new homes and businesses) or indirectly (e.g. through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

The impacts of the proposed project on population and housing would be considered significant if the following criteria are exceeded:

- The demand for temporary or permanent housing would exceed the existing supply.
- The proposed project would produce additional population, housing or employment inconsistent with adopted plans either in terms of overall amount or location.

**DISCUSSION**

XIII.a) - c): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. District population will not be affected directly or indirectly as a result of adopting and implementing the proposed project. The proposed project would not directly result in the creation of new uses and facilities that would affect population growth or induce growth. The proposed project is not expected to appreciably affect employment opportunities and, as such, is not expected to result in the relocation or redistribution of population or growth inducement.

Based on the above considerations, significant adverse impacts to population and housing are not expected from implementing the proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
---	---	------------------

**XIV. PUBLIC SERVICES.** Would the proposal result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

- |                             |                                     |                          |                                     |
|-----------------------------|-------------------------------------|--------------------------|-------------------------------------|
| a) Fire protection?         | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/>            |
| b) Police protection?       | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/>            |
| c) Schools?                 | <input type="checkbox"/>            | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| d) Parks?                   | <input type="checkbox"/>            | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| e) Other public facilities? | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/>            |

**SIGNIFICANCE CRITERIA**

- Impacts on public services would be considered significant if the project would result in substantial physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response time or other performance objectives.

**DISCUSSION**

XIV.a), b) and e): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not directly result in the creation of new uses and facilities that would directly result in significant impacts to public services. The proposed project would not result in the need for new or physically altered government facilities in order to maintain acceptable service ratios, response times, or other performance objectives. However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD’s internal offset accounts. The representative facilities are commercial or industrial projects that could require an increase in the demand for public services, which, depending on their location, may require the construction of new public service facilities or expansion of existing public services facilities. Specifically,

operation of the future development could result in an increased demand for fire or police services. Further, construction activities associated with new development could affect emergency vehicle access and delay police and fire response times due to additional traffic congestion.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts to public services from the construction and operation of various projects subject to the proposed project. Representative projects identified for the purpose of this assessment will be used to identify typical public services impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district that may have the need for new or upgraded public facilities to maintain acceptable levels of service, response times, or other performance standards. The potential impacts of these representative facilities on public services will be analyzed in the Draft PEA.

XIV. c) and d): **No Impact.** Because the proposed project has no affect on population growth in the district (see “Population and Housing”), no direct or indirect effects on schools, parks or other recreational facilities are foreseen as a result of implementing the proposed project.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>XV. RECREATION.</b>			
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

The impacts to recreation would be considered significant if:

- The project would result in an increased demand for neighborhood or regional parks or other recreational facilities.
- The project would adversely affect existing recreational opportunities.

**DISCUSSION**

XV. a) - b): **No Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. Thus, the proposed project would not directly result in an increase in the use of existing neighborhood and regional parks or other recreational facilities, or include recreational facilities, or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. With regard to the new development projects, the proposed project is determined to have no affect on population growth in the district (see “Population and Housing”), therefore, no direct or indirect effects on recreation or recreational opportunities are foreseen as a result of implementing the proposed project.

Based on the above considerations, significant adverse impacts to recreation are not expected from implementing proposed project. Since there are no significant adverse impacts, no mitigation measures are required. This environmental topic will not be further evaluated in the Draft PEA.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>XVI. SOLID/HAZARDOUS WASTE.</b> Would the project:			
a) Be served by a landfill with sufficient permitted capacity to accommodate the project’s solid waste disposal needs?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Comply with federal, state, and local statutes and regulations related to solid and hazardous waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

The proposed project impacts on solid/hazardous waste would be considered significant if the following occur:

- The generation and disposal of hazardous and non-hazardous waste would exceed the capacity of designated landfills.

**DISCUSSION**

XVI.a): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects

using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not directly increase the volume of solid or hazardous waste generation, require additional waste disposal capacity, or generate waste that does not meet applicable local, state, or federal regulations. However, the proposed project would allow the development of individual projects that qualify to receive emission offsets available from the SCAQMD's internal offset accounts. These individual projects could result in impacts on solid/hazardous waste by increasing the generation of solid waste such that the daily permitted capacity of the regional landfills are exceeded.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future solid and hazardous waste impacts from the construction and operation of various projects. Representative projects identified for the purpose of this assessment will be used to identify typical solid/hazardous waste impacts that could be expected from development projects or existing facility modifications proposed within the district. The potential impacts of these representative facilities on solid waste (both hazardous and non-hazardous waste) will be analyzed in the Draft PEA.

XVI. b): **No Impact.** Although the representative facilities could generate an increase in solid/hazardous waste from their new or modified equipment, they are expected to comply with federal, state, and local statutes and regulations relating to solid and hazardous waste because violating such statutes and regulations would subject the affected facilities to applicable agency enforcement and penalty actions, which could jeopardize further operation of the facility.

	Potentially Significant Impact	Less Than Significant Impact	No Impact
<b>XVII. TRANSPORTATION/TRAFFIC.</b> Would the project:			
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a change in air traffic patterns, including	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant Impact	No Impact
either an increase in traffic levels or a change in location that results in substantial safety risks?			
d) Substantially increase hazards due to a design feature (e.g. sharp curves or dangerous intersections) or incompatible uses (e.g. farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access or?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Result in inadequate parking capacity?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g. bus turnouts, bicycle racks)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**SIGNIFICANCE CRITERIA**

The impacts on transportation/traffic would be considered significant if any of the following criteria apply:

- Peak period levels on major arterials would be disrupted to a point where level of service (LOS) is reduced to D, E or F for more than one month.
- An intersection’s volume to capacity ratio increase by 0.02 (two percent) or more when the LOS is already D, E or F.
- A major roadway is closed to all through traffic, and no alternate route is available.
- There is an increase in traffic (e.g., 350 heavy-duty truck round-trips per day) that is substantial in relation to the existing traffic load and capacity of the street system.
- The demand for parking facilities is substantially increased.
- Water borne, rail car or air traffic is substantially altered.
- Traffic hazards to motor vehicles, bicyclists or pedestrians are substantially increased.

**DISCUSSION**

XVI.a), b) and e): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked

reductions, eligible to offset emission increases. The proposed project does not directly propose any new site-specific or modified projects that would directly increase worker commute trips, raw material or finished product transport trips, adversely affect parking, or conflict with adopted policies associated with alternative transportation. However, the proposed project would allow the development of individual projects that qualify to receive emission offsets available from the SCAQMD's internal offset accounts. Typical impacts from individual projects could include an increase in vehicle trips leading to congestion and deterioration in the levels of service for the adjacent streets and intersections in the vicinity of each individual project. The projects could also result in inclusion of inadequate design features and incompatible uses that affect traffic operations and safety, and affect emergency access due to design features and traffic congestion.

To the extent possible, the analysis of impacts in the Draft PEA will be based on conservative assumptions and projections to identify reasonably foreseeable future impacts to traffic and transportation impacts from the construction and operation of various projects resulting from the individual projects accessing the SCAQMD's internal offset accounts under the proposed project. Representative projects identified for the purpose of this assessment will be used to identify typical traffic and transportation impacts that could be expected in the event that development projects or existing facility modifications occur in areas within the district that are already congested or in residential neighborhoods. The potential impacts of these representative facilities on traffic and transportation will be analyzed in the Draft PEA.

XVI. c): **No Impact.** Air traffic patterns are not expected to be directly or indirectly affected by the proposed project because the proposed rules and the representative facilities do not require or involve transport of equipment or other materials by air nor does the implementation of the proposed project interfere with air traffic because no project requires construction of structures that would exceed height limitations identified in Federal Aviation Regulation Part 77. All applicable local, state and federal requirements would continue to be complied with so no increase in any safety risks is expected.

XVI. d): **No Impact.** The proposed project is not expected to create or increase roadway hazards due to construction design features because the proposed project does not require or induce the construction of any roadways or other transportation roadway design features.

XVI. f): **No Impact.** The proposed project would have no direct affect on parking or existing parking capacity. While the affected commercial or industrial projects could result in an indirect increase in existing traffic, the parking capacity is not expected to substantially worsen by the proposed project because the representative facilities are expected to provide adequate parking capacity.

XVI. g): **No Impact.** Affected facilities would still be expected to comply with, and not interfere with adopted policies, plans, or programs supporting alternative transportation. In order to obtain and maintain approval for individual projects, representative facilities are not expected to hinder compliance with any applicable alternative transportation plans or policies.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XVIII. MANDATORY FINDINGS OF SIGNIFICANCE.</b>			
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

XVIII. a) and c): **Potentially Significant Impact.** As indicated in the environmental checklist responses in the preceding sections, potential project-specific impacts to biological sources (e.g., substantial reduction in the habitat of a fish or wildlife species, drop in fish or wildlife population below self sustaining levels, potential elimination of a plant or animal community, and reduction in the number or restriction of the range of a rare or endangered plant or animal) could occur. The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project is not expected to directly create new or substantially worsen existing impacts. Since the proposed project reflects changes in regulatory procedures, there would not be any direct physical environmental impact.

However, the proposed project would allow the development of individual projects that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. As discussed in individual impact sections, these individual projects could result in significant environmental impacts. Because the proposed project has the

potential to indirectly generate significant project-specific impacts, the proposed project also has the potential to create significant cumulative impacts. Therefore, this issue will be further evaluated in the Draft PEA.

XVIII. b): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not have any direct physical impacts. However, individual projects qualified to receive emissions offsets from the SCAQMD's internal offset accounts through proposed Rule 1315 and proposed amended Rule 1309.2 could result in significant environmental impacts individually and cumulatively. Representative projects identified for the purpose of this assessment will be used to identify typical cumulative impacts that could be expected from development projects or existing facility modifications proposed within the district. The cumulative impacts of these representative facilities and the other facilities which may utilize credits from the internal accounts will be analyzed in the Draft PEA.

XVIII. c): **Potentially Significant Impact.** The proposed project would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. It also would revise mitigation fees and noticing requirements for projects using the Offset Budget (after approval by USEPA), prohibit access to that budget by most electricity generating facilities, and establish types of reductions, including newly-tracked reductions, eligible to offset emission increases. The proposed project would not have any direct physical impacts. However, individual projects qualified to receive emissions offsets from the SCAQMD's internal offset accounts through proposed Rule 1315 and proposed amended Rule 1309.2 could emit criteria and toxic air contaminants, which in turn could result in health impacts. The potential health impacts from these emissions, on an aggregate basis, will be analyzed in the Draft PEA. Health impacts associated with representative projects identified for purposes of this assessment will also be analyzed to the extent feasible. In addition, GHG emissions from the construction and operation related to the development of individual projects qualified to receive emissions offsets from the SCAQMD's internal offset accounts through proposed Rule 1315 and amended Rule 1309.2 will be analyzed.

**APPENDIX A**

---

**PROPOSED RULE 1315 FOR RE-ADOPTION**

**PROPOSED RULE 1315 – FEDERAL NEW SOURCE REVIEW TRACKING SYSTEM**

(a) Purpose

The purpose of this rule is to:

(1) Maintain the District's ability to continue to issue permits to major sources that obtain offset credits from the Priority Reserve under Rule 1309.1, from the Offset Budget under Rule 1309.2, and/or that are exempt from offsets under Rule 1304;

(2) Memorialize in rule form the ~~specify~~ procedures to be followed by the Executive Officer ~~to~~for:

(A) Establishing the District's NSR program equivalency with federal NSR offset requirements for such major sources; and

(B) Demonstrating that sufficient emission reductions, including previously-untracked emission reductions, existed beyond regulatory requirements under federal law to be used as offset credits to establish that the District's NSR program is equivalent with federal NSR offset requirements for major sources that are exempt from offsets under Rule 1304, obtain offset credits from the Priority Reserve under Rule 1309.1 and/or the Offset Budget under Rule 1309.2.

~~make annual demonstrations of equivalency to verify that specific provisions in the District's New Source Review (NSR) program related to sources that are either exempt from offsets or which obtain their offsets from the District's offset accounts meet in aggregate the federal nonattainment NSR offset requirements. The procedures specified in this rule are used by the Executive Officer to demonstrate that the sources which are subject to the federal NSR emission offset requirements and which obtain emission credits through allocations from District Rule 1309.1 – Priority Reserve or Rule 1309.2 – Offset Budget or which utilize the emission offset exemptions contained in Rule 1304 – Exemptions are fully offset by valid emission credits.~~

(b) Definitions

(1) COMMUNITY BANK means the Community Bank as established by Rule 1309.1 – Community Bank, as adopted June 28, 1990 and by Rule

1309.1 – Community Bank And Priority Reserve, as amended May 3, 1991, and became unavailable to applications deemed complete after the December 7, 1995 amendments to Rule 1309.1 – Priority Reserve, which eliminated the Community Bank.

- (2) OFFSET BUDGET means the Offset Budget as established by Rule 1309.2.
- ~~(3)(4)~~ OFFSET RATIO means the ratio of the quantity of offset credits provided (in pounds per day) to offset a specific quantity of increase in potential emissions (in pounds per day).
- ~~(4)(2)~~ ORPHAN REDUCTION means any reduction in actual emissions from a permitted source within AQMD resulting from a physical change to the source and/or a change to the method of operation of the source provided the change is reflected in a revised permit for the source and provided such reduction is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan and does not result in issuance of an ERC.
- ~~(5)(3)~~ ORPHAN SHUTDOWN means any reduction in actual emissions from a permitted source within AQMD resulting from removal of the source from service and inactivation of the permit without subsequent reinstatement of such permit provided such reduction is not otherwise required by rule, regulation, law, approved Air Quality Management Plan Control Measure, or the State Implementation Plan and does not result in issuance of an ERC.
- (6) PRIORITY RESERVE means the Priority Reserve as established by the May 3, 1991 amendments to Rule 1309.1 – Community Bank and Priority Reserve and as amended by the December 7, 1995 and subsequent amendments to Rule 1309.1 – Priority Reserve.
- (c) Offset Accounts for Federal NSR Equivalency
- (1) District Offset Accounts
- The Executive Officer shall maintain a separate District offset account for each federal nonattainment air contaminant. The District offset accounts are established with valid credits effective October 1, 1990 for the air contaminants and with the initial account balances as listed in Table A. Any portions of the initial account balances identified in Table A remaining in the District offset accounts at the end of calendar year 2005

shall be removed from the District offset accounts by the Executive Officer and shall not be used for purposes of demonstrating equivalency between federal NSR offset requirements and the District’s NSR program. Additional District offset accounts are to be established by the Executive Officer in the event that additional federal nonattainment air contaminants or their precursors become subject to federal nonattainment NSR offset requirements. If the United States Environmental Protection Agency (EPA) changes the District’s attainment designation from nonattainment to attainment for a specific air contaminant the Executive Officer may discontinue tracking and reporting the associated District offset account for that air contaminant. The District’s NSR program shall be considered equivalent to federal nonattainment NSR offset requirements for an air contaminant so long as the procedures specified in this rule are followed and the balance in the District offset account for that contaminant remains positive.

TABLE A  
Initial District Offset Account Balances

Air Contaminant	Initial Account Balance (tons per day)
Volatile Organic Compounds (VOC)	38.46
Nitrogen Oxides (NOx)	23.92
Sulfur Oxides (SOx)	8.04
Carbon Monoxide (CO)	8.45
Fine Particulate Matter (PM10)	2.67

- (2) Tracking of Offset Account Debits for Federal NSR Equivalency  
The Executive Officer shall track and debit from the District offset accounts the following types of offset allocations or exemptions provided from the District offset accounts for sources located at major polluting facilities and which are not exempt from the offset requirements of federal nonattainment NSR:
  - (A) Emission offsets from the Priority Reserve or Community Bank pursuant to Rule 1309.1 ~~Priority Reserve~~;
  - (B) Emission Offsets from the Offset Budget pursuant to Rule 1309.2—Offset Budget; and

- (C) Exemptions from the offset requirements of Rule 1303 –  
Requirements pursuant to Rule 1304 – Exemptions.

The applicable offset ratios for offsets tracked by the Executive Officer pursuant to this paragraph is 1.2-to-1.0 for extreme nonattainment air contaminants and their precursors and is 1.0-to-1.0 for all other nonattainment air contaminants.

- (3) Tracking of Offset Account Credits for Federal NSR Equivalency
- (A) The Executive Officer shall track and credit the following types of emission reductions to the District offset accounts:
- (i) Orphan shutdowns;
  - (ii) Orphan reductions;
  - (iii) ERCs provided as emission offsets for sources located at minor facilities;
  - (iv) The difference between the quantity of ERCs provided for a source located at a major polluting facility at a 1.2-to-1.0 offset ratio pursuant to Rule 1303(b)(2)(A) and the quantity of ERCs required to offset the emission increases at a ratio of 1.0-to-1.0 for all non-attainment air contaminants except extreme nonattainment air contaminants and their precursors.
  - (v) The amount of emission reductions associated with a facility's NSR balance, Community Bank, Offset Budget, and Priority Reserve allocations, and offset exemptions which is subtracted from the emission reductions quantified pursuant to Rule 1306(c) as part of the Executive Officer's evaluation of an ERC banking application; and
  - (vi) The portion of all emission reductions quantified pursuant to Rule 1306(c) as part of the Executive Officer's - evaluation of an ERC banking application which is subtracted from the emission credit prior to issuance of the banked ERC pursuant to Rule 1309(b)(4)(E). This clause applies only in cases where the Executive Officer demonstrates and EPA concurs that the subtracted amount exceeds the discount that would be required by approved SIP rules and rules scheduled to be approved by the District in the following year's rule cycle.

- (B) The Executive Officer shall deposit emission reductions into the District offset accounts according to the following procedures:
    - (i) From orphan sources tracked pursuant to clauses (c)(3)(A)(i) or (c)(3)(A)(ii) at eighty percent of the total or change in the source's permitted emission levels, respectively; and
    - (ii) From ERCs tracked pursuant to clauses (c)(3)(A)(iii), (c)(3)(A)(iv), (c)(3)(A)(v), and (c)(3)(A)(vi).
  - (C) The Executive Officer may choose not to track all potential sources of credits in each reporting period if the Executive Officer determines that sufficient credits remain in the District offset accounts to demonstrate equivalency in each reporting period.
- (4) Surplus at the Time of Use
- All credits deposited into the District offset accounts pursuant to clauses (c)(3)(A)(i) and (c)(3)(A)(ii) shall be discounted by the Executive Officer to ensure that they remain surplus at the time of use. Such discounting shall be performed annually and shall be based on the percentage reduction in overall permitted emissions projected to be achieved as a result of implementation of control requirements that become effective during the year for each specific pollutant within the District.
- (d) Federal NSR Equivalency Determinations
- (1) Reporting Periods
- The Executive Officer shall aggregate tracked offsets provided from the District offset accounts - into the following reporting periods for purposes of making periodic determinations of equivalency:
- (A) October 1, 1990 through July 31, 1995;
  - (B) Each of the consecutive twelve-month periods commencing with August 1995 through July 1996 and concluding with August 2003 through July 2004;
  - (C) August 2004 through December 2005; and
  - (D) Each calendar year commencing with 2006.
- (2) Preliminary Determinations of Equivalency
- Commencing with the ~~August 2004 through December 2005~~ calendar year 2008 reporting period, the Executive Officer shall, no later than twelve months after the completion of the reporting period, complete a

Preliminary Determination of Equivalency (PDE) with federal nonattainment NSR offset requirements. The Executive Officer shall report the PDE to the District's Governing Board and EPA no later than the second regularly-scheduled monthly Governing Board meeting after the completion deadline for the PDE. The PDE is a conservative assessment of available balances of credits without accounting for orphan and other credits which become available during the reporting period. As a result, each PDE shall include the debit accounting elements identified in paragraph (c)(2) and the running balances in the District offset accounts at the beginning and at the end of the subject reporting period.

(3) Final Determinations of Equivalency

Commencing with the ~~August 2004 through December 2005~~ calendar year 2008 reporting period, the Executive Officer shall complete a Final Determination of Equivalency (FDE) with federal nonattainment NSR offset requirements for any account(s) for which the PDE did not demonstrate equivalence. The FDE for any such account(s) shall be completed no later than eighteen months after the completion of the subject reporting period. The Executive Officer shall report the FDE to the District's Governing Board and EPA no later than the second regularly-scheduled monthly Governing Board meeting after the completion deadline for the FDE for any account(s) for which the PDE did not demonstrate equivalence. Each FDE shall include both the debit and the credit accounting elements identified in paragraphs (c)(2) and (c)(3), respectively, and the running balances in the District offset accounts at the beginning and at the end of the subject reporting period. The Executive Officer shall report the credit accounting elements identified in paragraph (c)(3) for any account(s) for which the PDE did demonstrate equivalence either with the FDE for the same reporting period or with the PDE for the subsequent reporting period.

(4) Early FDE Subsuming PDE

In lieu of preparing both a PDE and an FDE for a single reporting period, the Executive Officer may opt to include the PDE in the FDE for the same reporting period. Such FDEs are subject to the same completion and reporting deadlines as are the PDEs which they subsume.

## (e) Projections of District Offset Account Balances

Each PDE and each FDE report the Executive Officer prepares and presents to the Governing Board and EPA shall also include projections of the District offset account balances at the end of each of the two subsequent reporting periods. The Executive Officer shall make the projections of the District offset account balances based upon the average of the total annual debits and the average of the total annual credits for the five reporting periods most recently included in a PDE or an FDE. Although these projections are to be reported with the results of the PDEs and FDEs, they are separate from the determinations of equivalency and do not constitute an element of the determinations of equivalency.

## (f) Backstop Provisions

## (1) Funding of the Priority Reserve

If the most recent actual District offset account balances determined by an FDE pursuant to paragraph (d)(3) demonstrate a shortfall for any air contaminant, the Executive Officer shall:

(A) Discontinue funding the Priority Reserve for any air contaminant which the most recent FDE has demonstrated does not have a positive balance in its District offset account no later than the completion deadline for the FDE specified in paragraph (d)(3). If the most recent projections of the District offset account balances prepared pursuant to subdivision (e) in conjunction with a PDE or an FDE predict a shortfall for any air contaminant, the Executive Officer shall discontinue funding the Priority Reserve for that contaminant during the year which the shortfall is projected to exist. The Executive Officer may resume funding the Priority Reserve according to the following schedule:

~~(A) — In cases where the Executive Officer has discontinued funding the Priority Reserve due to an actual account shortfall demonstrated pursuant to paragraph (d)(3), the Executive Officer may resume funding the Priority Reserve upon completion of a PDE or an FDE demonstrating that the shortfall no longer exists.~~

~~(B) — In cases where the Executive Officer has discontinued funding the Priority Reserve due to an offset account shortfall projected pursuant to subdivision (e), the Executive Officer~~

~~may resume funding the Priority Reserve upon either completing a PDE or an FDE pursuant to paragraphs (d)(2) or (d)(3), respectively, demonstrating that no actual shortfall exists for the reporting period in which the shortfall was projected to occur; or completing a new projection pursuant to subdivision (e) for the same reporting period demonstrating that the shortfall is no longer projected to occur.~~

(B) Discontinue issuing permits to construct and permits to operate that rely on Rule 1304 exemptions, Priority Reserve offsets from Rule 1309.1, or the Rule 1309.2 Offset Budget for the air contaminant that has a shortfall to sources that are major sources of that air contaminant. The Executive Officer may resume issuance of such permits upon completion of an FDE demonstrating that the shortfall no longer exists.

(2) If an FDE demonstrates that a shortfall exists in any of the District offset accounts, or the most recent projected District offset balances calculated pursuant to subdivision (e) predict that such a shortfall will exist, the Executive Officer shall prepare a report to the Governing Board recommending appropriate action to rectify the shortfall. The Executive Officer shall present this report to the Governing Board no later than six months after the completion deadline for the FDE pursuant to paragraph (d)(3) demonstrating, or for the projections pursuant to subdivision (e) projecting the shortfall. The report shall either recommend implementing one or more of the following backstop provisions as needed to correct the shortfall or include an explanation of why it is not necessary to implement any of the following backstop provisions by making a demonstration that the District remains in compliance with federal NSR offset requirements on an aggregate basis:

(A) Provide additional credits to the District offset account(s) which have a shortfall within six months of the FDE that demonstrated the shortfall or the subdivision (e) projection that predicted it. The Executive Officer may obtain such credits by purchasing them, by funding emission reduction projects using quantification protocols approved by EPA, application of BACT (federal LAER) in excess

of federal requirements, or other credit sources approved by EPA;  
and/or

- (B) Suspend funding of the Offset Budget within 90 days of the Executive Officer's report to the Governing Board recommending implementation of this backstop measure~~FDE that demonstrated the shortfall,~~ with funding not to be resumed until equivalency has been reestablished; and/or
- (C) Propose amendments to Rule 1304, Rule 1309.1, and/or Rule 1309.2 to eliminate certain offset exemptions or to eliminate certain sources' eligibility to receive offsets from the Priority Reserve or from the Offset Budget, respectively.

**APPENDIX B**

---

**PROPOSED AMENDMENTS TO RULE 1309.2**

**PROPOSED AMENDED RULE 1309.2. - OFFSET BUDGET**

(a) Offset Budget

The Executive Officer shall establish an Offset Budget to provide credits for sources that require external emission offsets for NOx, SOx, and PM<sub>10</sub>~~and CO~~, upon approval by CARB and U.S. EPA.

(b) Eligibility Requirements

(1) Operators of facilities that are not exempt from offset requirements pursuant to Rule 1304 nor are eligible for allocations from the Priority Reserve (Rule 1309.1), and require external offsets may be eligible for allocations from the Offset Budget.

(2) Prior to receiving an allocation from the Offset Budget, an operator shall:

~~(A)(a)~~ Demonstrate that all sources the applicant owns or operates in the AQMD meet Best Available Retrofit Control Technology (BARCT) levels as defined in Regulation XI rules, or demonstrate to the satisfaction of the Executive Officer that the applicant owns or operates no sources which could be modified to BARCT levels; and

~~(B)(b)~~ Conduct a due diligence effort (limited to costs not to exceed the Rule 1309.2 mitigation fee for that pollutant) approved by the Executive Officer or designee to secure available credits, including STCs; and

~~(C)(c)~~ Pay a non-refundable mitigation fee of the following amounts:

(i) For permanent credits ~~(for the period November 1, 2002 through June 30, 2003)~~

CO	\$15,000
NOx	\$77,20322,875
PM <sub>10</sub>	\$145,56231,250
SOx	\$61,04811,125

for each pound per day of each pollutant obtained from the Offset Budget; or,

(ii) For short-term credits ~~(for the period November 1, 2002~~

~~through June 30, 2003)~~

CO	\$1,100
NO <sub>x</sub>	\$5,681,800
PM <sub>10</sub>	\$10,7112,300
SO <sub>x</sub>	\$4,492820

for each pound per day per year by pollutant obtained from the Offset Budget.

~~The mitigation fee for Offset Budget allocations will be identified in Regulation III—Fees, for the period subsequent to June 30, 2003.~~

(c) The Executive Officer:

- (1) Will prioritize allocations based on meeting the qualification of subdivision (b) above and the date the application is deemed complete; and
- (2) Will issue no one facility more than 15% of the allocations available in any one year nor more than necessary for permit issuance; and
- (3) Will track and maintain records of all credits generated and allocations granted for use from the Offset Budget and annually report this activity to the District Governing Board at a regularly scheduled public meeting, CARB and the U.S. EPA; and
- (4) May pre-fund the Offset Budget with year 2000 through 2002 Expired Permit Source Shutdown Credits (EPSSCs), from non-major polluting facilities with emissions greater than 4 tons per year ~~(29 tons per year for CO)~~, that are not used to demonstrate equivalency with federal or state NSR requirements based on actual emissions prior to shutdown. Actual emissions from EPSSCs shall be determined based on emissions reported by the facility as part of the two most recent annual emissions inventory reports, prior to shutdown, submitted pursuant to Rule 301-Permit Fees. In the absence of Rule 301 emissions inventory reports, NSR permit levels discounted by 20% will be used to reflect actual emissions; and
- (5) May accrue ongoing funding for the Offset Budget from:
  - (A) EPSSCs in years 2003 and beyond, from non-major polluting facilities with emissions greater than 4 tons per year ~~(29 tons per year for CO)~~, based on actual emissions determined as specified in paragraph (c) (4),

- (B) Emission reduction projects funded by Offset Budget mitigation funds, as approved by CARB and U.S. EPA, or
  - (C) Other methods as approved by the Executive Officer, CARB and U.S. EPA; and
- (6) ~~The EO~~ shall not use any EPSSCs to fund the Offset Budget, unless equivalency with the state and federal NSR requirements is demonstrated first; and
  - (7) Will adjust all allocations to the Offset Budget to be surplus to any emission reductions otherwise required by the federal Clean Air Act including federal emission limitations and control requirements, state regulations that are approved into the State Implementation Plan, and other requirements relied upon for meeting requirements of the federal Clean Air Act; and
  - (8) Will publish the available allocations in the Offset Budget at the January Board hearing for that calendar year; and
  - (9) Will limit the allocations available from the Offset Budget during that calendar year. Allocations shall not be granted in excess of those available in the Offset Budget; and
  - (10) Shall not allow allocations from the Offset Budget to be banked, transferred, or used by an operator to generate ERCs or STCs except that the District may purchase the unused credits at a price of 66% of the original purchase price; and
  - (11) Shall subject the operator of facilities obtaining allocations from the Offset Budget an offset ratio of 1.2:1; and
  - (12) Shall not grant allocations from the Offset Budget to fossil fuel-fired thermal power plants that generate electricity for distribution in the state grid system, except for any facility with electric generating equipment totaling less than 50 megawatts where at least 70 % of the generated electricity is for its own use.
- (d) Public Notice
- Prior to issuance or granting the use of the allocations or STCs, the operator of a facility requesting allocations from the Offset Budget, or requesting the initial generation (excluding conversion of ERC(s) to STC(s)) or use of any STCs shall:

- (1) Publish a notice, prepared by the Executive Officer, containing source information and the District's analysis on air quality, in a newspaper of general circulation in each of the four counties in the AQMD, and
- (2) Mail a copy of the notice required in paragraph (d)(1) to the Administrator of U.S. EPA Region IX and the Executive Officer of the California Air Resources Board, and
- (3) Respond to all public comments received within 30 days of the notice publication. Copies of all comments and responses shall be provided to the Executive Officer. The Executive Officer will consider all comments and responses prior to final approval of the allocations or STCs and
- (4) Provide proof of publication of the notice to the Executive Officer.

Gentlemen:

Notice of Preparation of Draft Program Environmental Assessment for PR 1315 and PAR 1309.2

Thank you for hosting the public scoping meeting on April 8, 2009 for the subject rulemaking and associated environmental assessment work. We have one comment on your environmental proposal and one comment on your proposed rule language at this time.

Initial Study Comment

Our principal comment pertains to the two year "look-back" period and the evaluation of "representative" facilities as shown partly in your slide presentation and on Page 2-6 of the Initial Study. We believe that a "look-back" period longer than the two years stated in your slide presentation would be a more appropriate timeframe to pick up the larger, more traditional public works construction projects that the Sanitation Districts engage in. Ten years seems a more appropriate timeframe to capture traditional infrastructure construction.

1-1

Future projects, however, may not be accurately predicted by past actions. In the AB 32 Scoping Plan, for instance, six water industry greenhouse gas control measures are targeted for the water/wastewater industry including renewable energy production and water recycling. We are aware of a number of innovative proposals in these areas that might not be adequately addressed by looking back at the past, particularly for the purposes of quantifying direct and indirect adverse impacts.

1-2

If it would be of assistance to you, we could canvass our trade association members quickly and develop a shortlist of projects likely to be carried out to accommodate AB 32 and other regulatory programs being developed by the State of California.

1-3

Proposed Rule 1315 Amendment Comment

We question the wisdom of the addition of section (f)(1)(B) language, **obligating** the District to discontinue issuing permits to major sources upon a FDE actual shortfall, to Proposed Rule 1315. This language seems to almost guarantee future permitting moratoriums similar to the current situation we are facing as a result of the Priority Reserve lawsuits. Surely for projects/sources that have already gone through New Source Review and which result in a reduction of actual emissions or provide for the installation of air pollution control equipment or which mitigate other negative environmental impacts (such as groundwater remediation), some special considerations could be made. The proposed language completely closes the door on these possibilities for major sources. Such language would, for instance, unilaterally stop the current permitting of emergency standby generators, even those that have an increase of less than ½ pound of pollution per day.

1-4

We do appreciate your efforts to move forward the preparation of the environmental documentation for these important rules as rapidly as possible.

1-4  
Con't

Yours very truly,

Stephen R. Maguin

Responses to Draft NOP/IS Comment Letter #1

**County Sanitation District of Los Angeles County  
Gregory M. Adams**

March 13, 2009

**Response 1-1**

SCAQMD staff considered your comment regarding the appropriateness of “looking back” back at two years of past and pending permit applications and whether the evaluation should include more projects that would have applied for an air quality permit over a longer period of time. While the commentator suggested a ten-year timeframe, SCAQMD staff believes ten years is excessive and will not produce any different type of facility than would be discovered when evaluating a smaller timeframe. As such, SCAQMD staff modified the analysis to “look back” five years of past and pending permit applications. As shown in the indirect impacts analysis (Chapter 5) and Appendix E of the Draft PEA, public works projects have been captured as “representative” facilities.

**Response 1-2**

Future projects, in some cases, may not be predicted by past actions, but past projects do provide the most accurate information in forecasting the types of projects that could take place in the future. It would be speculative to guess the future projects. Pursuant to the CEQA Guidelines § 15145, “if a lead agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.” Nevertheless, the potential indirect environmental impacts of an extremely wide variety of projects have been evaluated in Chapter 5. It is expected that the scope of impacts discussed will encompass probable impacts of implementing GHG control measures.

**Response 1-3**

The SCAQMD would be interested in learning about the shortlist of projects that would be implemented to carry out regulatory action under AB 32. The commentator has sent a subsequent comment letter (see comment letter #4) providing the results from the canvassing of trade association members as promised in this comment. See Comment 4-1. No projects could be identified in sufficient detail at this time.

## **Response 1-4**

To discontinue offset funding when a shortfall occurs is not a newly introduced requirement in the modified version of Rule 1315. Previously, Rule 1315 had a backstop provision to discontinue funding specifically to the Priority Reserve when a shortfall for any air contaminant is demonstrated by a Final Determination of Equivalency (FDE). The latest proposal expands the backstop provision, under subparagraph (f)(1)(B), to include other SCAQMD internal offset accounts, such as Rule 1304 exemptions. The concept that offsets from the SCAQMD internal offset accounts should not be distributed if there is a known shortfall does not change from the previously adopted rule and does not lack wisdom as suggested by the commentator. The SCAQMD believes this makes common sense not to issue offsets that are not available. If offsets are not issued, the permits to construct and operate relying on those offsets can also not be issued. Permits that do not rely on the SCAQMD internal offset accounts are not restricted by the backstop provision and can be issued if in compliance with all other rules and regulations. Equipment that does not increase in emissions may not require offsets. In addition, the operator does not have to rely on the SCAQMD internal offset accounts to offset emissions. The operator does have the option to obtain the offsets from the open market and, thereby, not be subject to the backstop provision.

Re: Notice of Preparation of a Draft Program Environmental Assessment for Re-Adoption of Proposed Rule 1315 – Federal New Source Review Tracking System, and Adoption of Proposed Amendments to Rule 1309.2 – Offset Budget

Dear Mr. Krause:

Latham & Watkins LLP submits the following comments on the Notice of Preparation and Initial Study (NOP/IS) of a Draft Program Environmental Assessment (PEA) for Re-Adoption of Proposed Rule 1315 – Federal New Source Review Tracking System, and Adoption of Proposed Amendments to Rule 1309.2 – Offset Budget, which was released for public review on March 17, 2009.

It is our understanding that the purpose of the proposed amendments to Rule 1309.2, when combined with the South Coast Air Quality Management District's (District) decision to not re-amend Rule 1309.1 to allow electric generating facilities to access the Priority Reserve,<sup>1</sup> is to somehow simplify the environmental analysis in the PEA by eliminating the need to analyze the power generation sector. The NOP/IS envisions that the PEA will "analyze direct and indirect impacts from both major and minor sources relying on credits from the Rule 1309.1 Priority Reserve, Rule 1309.2 Offset Budget, or Rule 1304 offset exemptions." NOP/IS at 1-1. The staff appears to infer that under a scenario where power plants cannot access offsets from the District's internal accounts, the PEA need not analyze environmental impacts associated with power plants.

We regard such reasoning as flawed and ultimately counterproductive to the District's commendable efforts to re-adopt Proposed Rule 1315. A reasonable alternative to the proposed

<sup>1</sup> NOP/IS at 1-1.

Mr. Michael Krause  
April 15, 2009  
Page 2

LATHAM & WATKINS<sup>LLP</sup>

project analyzed in the PEA is the re-adoption of Rule 1315 with no amendments to Rule 1309.2. That alternative must be analyzed in the PEA. Further, even if the project is approved as proposed by staff, the PEA must analyze the potential adverse environmental impacts of denying power plants access to the Offset Budget. Finally, by constraining the scope of the PEA as proposed, staff is usurping the Governing Board's policy authority and improperly circumscribing the Board's discretion to consider alternatives. For all of these reasons, the PEA must include an analysis of the power sector.

2-1  
Con't

**I. DISTRICT SHOULD INCLUDE AN ALTERNATIVE THAT DOES NOT AMEND RULE 1309.2.**

The District must consider a reasonable range of alternatives for evaluation in the PEA. 14 Cal Code Regs (CCR) § 15126.6(a); *Citizens of Goleta Valley v Board of Supervisors*, 52 Cal. 3d 553, 566 (1990); *Save San Francisco Bay Ass'n v San Francisco Bay Conserv. & Dev. Comm'n*, 10 Cal. App. 4th 908, 919 (1992). The California Supreme Court has described the discussion of alternatives, along with mitigation measures, as "the core of an EIR." *Citizens of Goleta Valley v Board of Supervisors*, 52 Cal. 3d 553, 564 (1990). Accordingly, the PEA should include evaluation of a highly likely outcome of this rulemaking process (perhaps even more likely than the proposed project) – an alternative that involves re-adoption of Rule 1315 but no amendments to Rule 1309.2.

**A. The Staff has Artificially and Impermissibly Narrowed the Project Objectives.**

The NOP/IS presents the objectives of the project in two different places within the document. Tellingly, the two lists differ in one important respect. Early on in the document, it states that the objectives are "to maintain the SCAQMD's ability to:

- (1) administer its NSR [New Source Review] program for major and minor sources,
- (2) specify the types of surplus emission reductions that may be deposited into the SCAQMD's internal accounts and used to offset emission increases,
- (3) memorialize in rule form the accounting procedures used by the SCAQMD to establish equivalency with federal offset requirements, and
- (4) establish mechanisms that ensure valid emission offsets are available before a source relying on those emission offsets obtains an approved permit, in order to prevent a net increase in criteria and precursor emissions." NOP/IS at 1-2.

2-2

Notably, denying power plants access to the Offset Budget is not included in this first list.

Only later in the document is denying power plants access to the Offset Budget identified as a project objective. NOP/IS at 1-16-17. It appears that this objective was grafted onto the

Mr. Michael Krause  
 April 15, 2009  
 Page 3

LATHAM & WATKINS<sup>LLP</sup>

core project objectives as an afterthought to justify the proposal to amend Rule 1309.2, and to set up the argument that failure to amend Rule 1309.2 would fail to meet this project objective. Such an approach is not permitted under CEQA because overly narrow project objectives may unduly circumscribe a lead agency’s consideration of project alternatives – just as they would here. A lead agency may not give a project’s purpose an artificially narrow definition. *In re Bay-Delta Programmatic Environmental Impact Report*, 43 Cal. 4th 1143, 1166 (2008). The staff’s crafting of the project objectives is an impermissible effort to artificially narrow the project’s purpose and prevent consideration of what is clearly a reasonable alternative to the proposed project.

2-2  
 Con’t

**B. Alternative Need Only Attain Most of the Basic Project Objectives.**

Even if one were to accept as appropriate staff’s attempts to craft the project objectives in a manner that narrows the range of possible alternatives, it is indisputable that an alternative that does not amend Rule 1309.2 would still “attain most of the basic objectives of the project,” thereby satisfying the applicable CEQA standard for valid project alternatives. *See* 14 CCR § 15126.6(a). The PEA must describe a reasonable range of alternatives that would “attain *most of the basic* objectives of the project.” 14 CCR § 15126.6(a)(emphasis added). In other words, the PEA should not exclude an alternative from detailed consideration merely because it would impede to some degree the attainment of project objectives. 14 CCR § 15126.6(b).

2-3

**C. Alternative is Potentially Feasible.**

Alternatives only need to be “potentially feasible.” 14 CCR § 15126.6(a). An alternative that does not amend Rule 1309.2 clearly is not only potentially feasible, but also feasible in fact. Such an alternative merely requires the District to refrain from taking a discretionary action and to preserve the status quo.

2-4

Indeed, such an alternative is akin to a no-project alternative. As acknowledged by the NOP/IS, “CEQA also requires an evaluation of a ‘No Project Alternative.’” NOP/IS at 1-17; 14 CCR § 15126.6(e). When a project involves revision of an existing plan, policy, or ongoing operation, the no-project alternative should reflect continuation of the existing plan, policy, or operation. 14 CCR § 15126.6(e)(3)(A). Here, the no-project alternative should reflect continuation of Rule 1309.2 as-is. Notably, the no-project alternative must be evaluated whether or not it is feasible. *Planning & Conserv. League v Department of Water Resources*, 83 Cal. App. 4th 892, 917-18 (2000).

**D. Alternative Can Reduce Significant Environmental Impacts.**

Alternatives need to be environmentally superior, but only in some respects. *Sierra Club v. City of Orange*, 163 Cal. App. 4th 523, 547 (2008). Environmental assessments may present alternatives that provide greater benefits at higher environmental cost; indeed, such a discussion helps to highlight policy trade-offs.

2-5

An alternative that does not amend Rule 1309.2 would maintain access for power plants to the Offset Budget, which could allow new power plants to come on-line. While the

Mr. Michael Krause  
April 15, 2009  
Page 4

LATHAM & WATKINS LLP

construction and operation of new power plants would generate environmental impacts, it would also provide significant environmental benefits. The primary environmental benefits are associated with turning over the existing fleet of power plants in the South Coast Basin.

As explained by the District’s Executive Officer in a March 2, 2009 presentation to a Joint Assembly Hearing of the Utilities & Commerce And Natural Resources Committees, 56% of the generation capacity of the existing fleet is 35 years or older. See enclosure at 10. As recognized by the District, the “CEC believes many power plants are currently 40 to 60 years old and are at high risk of retirement.” SCAQMD, Final Program Environmental Assessment for: Proposed Amended Rule 1309.1 – Priority Reserve and Re-Adoption of Rule 1315 – Federal New Source Review Tracking System (July 10, 2007) at 2-5.

As new plants come on-line, it facilitates the retirement of older plants. As recognized by the District, “Modern day EGFs are significantly cleaner than the power plants built years earlier.” SCAQMD, Final Staff Report: Proposed Amended Rule 1309.1 – Priority Reserve; and Proposed Re-Adopted Rule 1315 – Federal New Source Review Tracking System (July 2007) at 4. Also, “[c]lean and efficient new power plants are desirable not only because they will help meet increasing electricity demand, but also would minimize the use of emergency standby diesel generators that would be used as an alternative power source in the event of future blackouts.” SCAQMD, Final Program Environmental Assessment for: Proposed Amended Rule 1309.1 – Priority Reserve and Re-Adoption of Rule 1315 – Federal New Source Review Tracking System (July 10, 2007) at 4-1. The District acknowledges that standby diesel generators are “old” and “high-polluting,” and reducing their use further “avoids an increase in criteria pollutant and toxic emissions.” *Id.* at 2-19.

As such, the integration of new power plants into the South Coast Basin fleet ultimately will result in fewer criteria pollutant, toxic, and greenhouse gas emissions. Accordingly, an alternative that does not amend Rule 1309.2 would be environmentally superior in some respects to the proposed project.

**E. Alternative is Reasonable and Realistic.**

CEQA requires that alternatives be reasonable and realistic. 14 CCR § 15126.6. An alternative that does not amend Rule 1309.2 is both. Such an alternative merely requires the District to refrain from taking a discretionary action, i.e., to preserve the status quo.

**F. Programmatic Nature of District’s Environmental Assessment Requires an Exhaustive Consideration of Alternatives.**

As recognized by the NOP/IS,<sup>2</sup> because the District’s environmental assessment will be programmatic, it is even more crucial that the PEA extensively evaluate alternatives, especially

<sup>2</sup> “A program CEQA document allows consideration of broad policy alternatives and program-wide mitigation measures at a time when an agency has greater flexibility to deal with basic problems of cumulative impacts.” NOP/IS at 1-3.

2-5  
Con’t

2-6

2-7

Mr. Michael Krause  
 April 15, 2009  
 Page 5

LATHAM & WATKINS<sup>LLP</sup>

policy alternatives. A Program Environmental Impact Report (PEIR) allows the “lead agency to consider broad policy alternatives...at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts.” *In re Bay-Delta Programmatic Environmental Impact Report*, 43 Cal. 4th 1143, 1169 (2008)(citing 14 CCR § 15168(b)(4)). Similarly, PEIRs and PEAs “[p]rovide an occasion for a more exhaustive consideration of effects and alternatives....” 14 CCR § 15168(b)(1).

An alternative that does not amend Rule 1309.2 is precisely the type of broad policy alternative that the PEA should address. The Governing Board could make a policy decision to leave Rule 1309.2 as-is. As such, the PEA should evaluate the environmental implications of such a decision in order to aid the Governing Board’s deliberations. The need to consider an alternative that does not amend Rule 1309.2 is especially acute because the District intends to “rely on this PEA to form the basis of a project-specific analysis for projects that access the Priority Reserve or Offset Budget.” NOP/IS at 1-4. Unless the PEA includes the proffered alternative, the District may find itself unable to rely on the PEA for future projects accessing the Offset Budget.

**II. EVEN IF THE PROPOSED PROJECT IS APPROVED AS-IS, DISTRICT MUST ASSESS ADVERSE ENVIRONMENTAL IMPACTS OF DENYING POWER PLANTS ACCESS TO THE OFFSET BUDGET.**

Even if the proposed project is approved as-is, the PEA must analyze the potential adverse environmental impacts of denying power plants access to the Offset Budget. Without access to the Offset Budget, it will be exceedingly difficult for new power plants to come on-line in the South Coast Basin. While the construction and operation of new power plants would generate environmental impacts, it would also provide significant environmental benefits. The primary environmental benefits are associated with turning over the existing fleet of power plants.<sup>3</sup> By altering the status quo and denying power plants access to the Offset Budget, the District is preventing a ‘greening’ of the fleet.

As explained by the District’s Executive Officer in a March 2, 2009 presentation to a Joint Assembly Hearing of the Utilities & Commerce And Natural Resources Committees, 56% of the generation capacity of the existing fleet is 35 years or older. See enclosure at 10. As recognized by the District, the “CEC believes many power plants are currently 40 to 60 years old and are at high risk of retirement.” SCAQMD, Final Program Environmental Assessment for: Proposed Amended Rule 1309.1 – Priority Reserve and Re-Adoption of Rule 1315 – Federal New Source Review Tracking System (July 10, 2007) at 2-5.

As new plants come on-line, it facilitates the retirement of older plants. As recognized by the District, “Modern day EGFs are significantly cleaner than the power plants built years earlier.” SCAQMD, Final Staff Report: Proposed Amended Rule 1309.1 – Priority Reserve;

<sup>3</sup> While the environmental benefits of turning over the existing fleet of power plants are detailed in Part I.C of this comment letter, we reiterate the benefits here because of the typically splintered nature of lead agencies’ responses to public comments.

Mr. Michael Krause  
 April 15, 2009  
 Page 6

**LATHAM & WATKINS LLP**

and Proposed Re-Adopted Rule 1315 – Federal New Source Review Tracking System (July 2007) at 4. Also, “[c]lean and efficient new power plants are desirable not only because they will help meet increasing electricity demand, but also would minimize the use of emergency standby diesel generators that would be used as an alternative power source in the event of future blackouts.” SCAQMD, Final Program Environmental Assessment for: Proposed Amended Rule 1309.1 – Priority Reserve and Re-Adoption of Rule 1315 – Federal New Source Review Tracking System (July 10, 2007) at 4-1. The District acknowledges that standby diesel generators are “old” and “high-polluting,” and reducing their use further “avoids an increase in criteria pollutant and toxic emissions.” *Id.* at 2-19.

2-8  
 Con't

In sum, the integration of new power plants into the South Coast Basin fleet ultimately will result in fewer criteria pollutant, toxic, and greenhouse gas emissions. The District’s approval of the proposed project as-is will alter the status quo by denying power plants access to crucial credits, potentially triggering significant adverse environmental impacts.

**III. DISTRICT STAFF IS USURPING AUTHORITY OF THE GOVERNING BOARD.**

By defining the proposed project as it does, staff is usurping the Governing Board’s policy authority and unduly circumscribing the Governing Board’s discretion to consider and approve project alternatives. CEQA gives a lead agency authority, consistent with its available powers, to adopt a project alternative rather than the proposed project. Pub Res Code §§ 21002-21002.1, 21004; 14 CCR §15002(a). A lead agency is not required to grant a “blanket approval” of the proposed project described in an EIR or PEA; rather, decision-makers can approve an alternative to the project as proposed because they have “the flexibility to implement that portion of a project that satisfies their environmental concerns.” *Sierra Club v City of Orange*, 163 Cal. App. 4th 523, 533 (2008).

The Governing Board, the pertinent decision-makers, could make a policy choice to leave Rule 1309.2 as-is. As such, the PEA should evaluate the environmental implications of such a decision as a project alternative in order to aid the Governing Board’s deliberations. However, District Staff is doing exactly the opposite. District Staff is engineering a situation where the Governing Board would encounter intense pressure to approve the project as-is.

2-9

If the PEA neglects to evaluate an alternative that does not amend Rule 1309.2, the Governing Board would face a scenario where the PEA would arguably not be adequate to support a policy decision to maintain power plant access to the Offset Budget. Under such a scenario, the Governing Board would be offered a Hobson’s choice: either (1) approve the project as-is; or (2) trigger months of delay as the PEA is rewritten to evaluate power plants potentially accessing the Offset Budget. Given the demonstrated need for the District to speedily repair its ability to administer its NSR program, as evidenced by the District-wide Permit Moratorium announced in January 2009, the Governing Board could be compelled to acquiesce to the staff’s preemptive policy choice. Staff is impermissibly stripping the Governing Board of its authority under CEQA to adopt project alternatives.

Responses to Draft NOP/IS Comment Letter #2

**Latham & Watkins LLP**  
**Michael J. Carroll**

April 15, 2009

**Response 2-1**

The commentator is correct that the current SCAQMD policy decision is to not re-amend Rule 1309.1 – Priority Reserve, defining electric generating facilities (EGFs) as essential public services, thus, not allow EGFs access to the Priority Reserve. As discussed in the Initial Study, the Los Angeles County Superior Court enjoined the SCAQMD from undertaking any actions to implement the “2007 Project” (i.e., proposed Rule 1315 and amended Rule 1309.1) pending CEQA compliance. Thus, a permit moratorium was triggered for those projects relying on the SCAQMD internal offset accounts, which constitutes Rule 1309.1 priority reserve, Rule 1309.2 offset budget and Rule 1304 offset exemptions. Because the court required CEQA analysis on the usage of credits from the SCAQMD internal offset accounts, credits from the priority reserve were included because priority reserve is an SCAQMD internal offset account. Because no inclusion of EGFs as an essential public service is being proposed, the PEA does not analyze impacts from the siting, constructing and operation of power plants as direct impacts of the project. However, it should be noted that equipment located at power plant facilities that qualify for a Rule 1304 offset exemption could be provided offsets from that SCAQMD account. Contrary to the commentator’s opinion, these policy decisions are not flawed or counterproductive, but rather responsive to the court decisions and reflective of the SCAQMD’s discretion. Also, the PEA includes an analysis of reasonably foreseeable power plants as part of the cumulative impacts analysis.

Alternatives should “feasibly attain most of the basic objectives... but would avoid or substantially lessen any of the significant effects” [CEQA Guidelines § 15126.6(a), (b)]. Allowing power plants access to the offset budget would not lessen any significant effect. The PEA does examine the potential environmental impacts of not approving the project through the No Project Alternative. The concept of analyzing the impacts from denying the power plants access to the offset budget is not warranted because more recently, Rule 1309.2 has been completely rescinded. Because the 2007 power plant amendments to Rule 1309.1 have been set aside by the court and subsequently repealed, the baseline conditions are that power plants do not have access to offsets under either Rule 1309.1 or Rule 1309.2. Therefore, the SCAQMD does not need to analyze those impacts.

**Response 2-2**

See Response 2-1 regarding the consideration of a fossil fueled power plant alternative. Project alternatives are chosen based on feasibility to attain the project objectives and their potential to lessen any of the significant effects [CEQA Guidelines § 15126.6(a),(b)]. The proposed project alternatives meet these parameters. Project objectives are based on SCAQMD policy and clearly listed on page 1-16 of the Initial Study under the title “Project Objectives” as required by CEQA Guidelines § 15124(b). Earlier references as to why the SCAQMD is proposing the project can be found under the “Legislative Authority” discussion with regards to implementing the NSR program, and is not a reference to the project objectives. An alternative which allowed fossil fueled power plants access to internal offset accounts would not lessen any significant environmental impact.

### **Response 2-3**

See Responses 2-1 and 2-2 with regard to a project alternative that would not exclude large power plants to access the offset budget.

### **Response 2-4**

As discussed in Response 2-1, an alternative to include fossil fueled power plants was considered but not carried forward for detailed analysis. Taking no action, as suggested by the commentator, is considered under the No Project Alternative. As such, the No Project Alternative does evaluate the effects from not implementing a federal tracking system (Rule 1315). However, Rule 1309.2 has now been rescinded.

### **Response 2-5**

The SCAQMD staff agrees with the commentator that new, cleaner, more efficient equipment provides environmental benefit for air quality and energy as compared to an increased usage of older, dirtier equipment. The proposed project does not completely restrict new power plants from coming on-line because operators have the option to obtain offsets from the open market to permit their facility and because some power plant projects can still qualify for Rule 1304 exemptions. Also, as discussed in Response 2-1, a fossil fueled power plant alternative was considered but determined to be infeasible.

### **Response 2-6**

As discussed in Response 2-1, a fossil fueled power plant alternative was considered but not carried forward for detailed analysis.

### **Response 2-7**

In crafting project alternatives, SCAQMD staff examined the major components of proposed Rule 1315 and five alternatives, including the no project alternative, are further evaluated in the alternatives section. All of the alternatives addressed policy implications as well as the ability to avoid significant adverse environmental impacts if implemented. One of the alternatives determined not to substantially reduce environmental effects was a fossil fueled power plant alternative. The reasons for not evaluating such an alternative further are discussed in Response 2-1.

### **Response 2-8**

As discussed in Responses 2-4, 2-5, and 2-6, taking no action is evaluated under the No Project Alternative. Also, the proposed project does not restrict large power plants from being built because it does not alter the status quo.

### **Response 2-9**

The SCAQMD Governing Board has already made its policy decision by rescinding Rule 1309.2 in its entirety.

STEPHEN R. MAGUIN  
Chief Engineer and General Manager

August 3, 2009

Mr. Michael Krause  
South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, California 91765-4182

Dear Mr. Krause:

**Notice of Preparation of Draft Program Environmental Assessment (DPEA)  
for PR 1315 and PAR 1309.2**

The Sanitation Districts wish to clarify our earlier letter written in response to your release of the Notice of Preparation for the DPEA on the subject rules on March 13, 2009. In our Initial Study comments, we raised the concern that future projects may be so innovative, particularly those dealing with climate change, that a historical look back would not capture the projects' idiosyncrasies. As indicated in our earlier letter, we canvassed our trade association members to develop a short list of such projects likely to be carried out. We concluded, however, that no innovative projects could be identified in sufficient detail at this time. Many of the proposals on renewable energy production envisioned in our letter are speculative at this time and could take several years and many dollars before they come to fruition. These are university-research level theories and studies for the most part.

4-1

The Sanitation Districts interpret the Notice of Preparation to include consideration in SCAQMD's analysis of the flow of credits to those future projects that comport with SCAQMD's permitting procedures that are in effect at that time, including the New Source Review rules. Based on this interpretation, the Sanitation Districts have no objections to the use of past projects as a means of estimating future potential impacts from the proposed rules.

4-2

Very truly yours,  
Stephen R. Maguin

Gregory M. Adams  
Assistant Departmental Engineer

Responses to Draft NOP/IS Comment Letter #4

**County Sanitation District of Los Angeles County  
Gregory M. Adams**

August 3, 2009

**Response 4-1**

The SCAQMD staff appreciates that the follow-up to the commentator's March 13, 2009, letter expressing concern over whether a historical look at past projects would not reflect future projects that could be innovative and new. As noted in your comment letter, after canvassing trade association members for a shortlist of innovative projects, sufficient details could not be provided for inclusion in the analysis of projects in the Draft PEA. The SCAQMD strongly supports actions taken to reduce greenhouse gases, as well as renewable energy production and water recycling projects. The proposed project will not affect these future projects. Further, with regard to CEQA compliance, it is anticipated that these innovative projects will be still be subject to CEQA requirements in the future so siting, constructing and operating of the projects will be evaluated for potential environmental impacts at a later date when more sufficient details are available.

**Response 4-2**

The SCAQMD staff appreciates the support from the Los Angeles County Sanitation District to use the past projects as a means of estimating future potential impacts from the proposed rules.

## **Acronyms and Abbreviations**

AF	Adjustment factor
AV30	30-day average
BCAT	Basic category
CARB	California Air Resources Board
CCAT	Control category
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulation
CO	Carbon monoxide
DPM	Diesel Particulate Matter
EVF	Exposure value factor
FIPS	Federal information processing standards
g	gram
HI	Hazard Index
K	Kelvin
km	kilometer
LST	Localized significance threshold
m	meter
MBTU	One million British Thermal Units
MM5	Fifth-generation NCAR/Penn State Mesoscale Model
MP	Multipathway factor
MW	megawatt
NEI	National Emissions Inventory
NO <sub>2</sub>	Nitrogen dioxide
PEA	Programmatic environmental assessment
PM	Particulate matter
PVMRM	Plume Volume Molar Ratio Method
REL	Reference exposure level
ROG	Total organic gases
SCAB	South Coast Air Basin
SCAQMD	South Coast Air Quality Management District
SCC	Source Classification Code
SO <sub>2</sub>	Sulfur dioxide
TOG	Reactive organic gases
USEPA	U.S. Environmental Protection Agency

# 1 Introduction

This document describes the methods and results of the technical analyses conducted in support of the evaluation of impacts on air quality in the vicinity of individual facilities resulting from air emission permits awarded under South Coast Air Quality Management District (SCAQMD or the District) Rule 1315. The methodology, key inputs, modeling outputs, and impact determinations are presented in this document, in support of the conclusions regarding air quality impacts as presented in this programmatic environmental assessment (PEA).

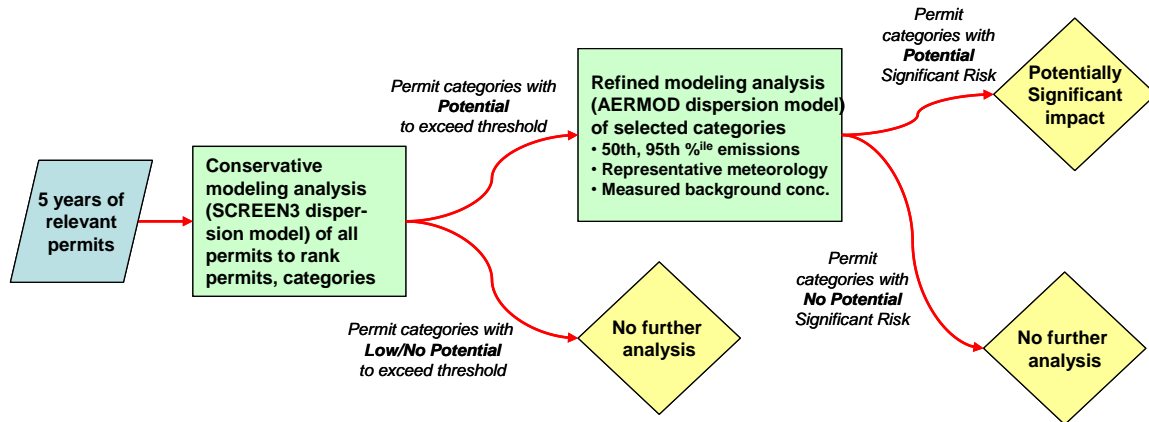

The approach used to evaluate future potential impacts of the proposed project at individual facilities (also referred to as the “local” analysis in the PEA) is summarized in Figure 1. In the absence of information about specific facilities that will (in the future) be affected by the rule modification, this evaluation was made on the basis of air dispersion modeling of recently permitted emissions of actual facilities. Modeling of existing permitted emissions was intended to provide an estimate of the potential impacts of anticipated criteria pollutant emission increases in the near vicinity of individual facilities as a result of future permits awarded under the proposed project. A key assumption inherent to this approach is that previously-permitted sources are representative of the types of sources that will be permitted in the future under this rule (and that the mass and type of air pollutants emitted by these sources will be similar to previously permitted emissions). This assumption appears reasonable as there is no known factor that would significantly change the types of permits issued in the future from those issued in the past.

Emissions and available characteristics regarding type of emission source (e.g., source category) were tabulated from a five year data set of all past (for the years 2003 through 2008) and pending SCAQMD air emission permits covered under Rule 1315 with access to offsets under Rules 1304 and 1309.1 and facilities that would have had access to Rule 1309.2 if it had been in effect. Since the analysis was performed, Rule 1309.2 has been repealed. Nevertheless, since Rule 1309.2 would have allowed virtually any type of facility to receive offsets from the District’s internal offset account, including an analysis of potential Rule 1309.2 facilities represents a conservative (i.e., worst case) analysis. Given the relatively large size of the data set (51,265 pollutant records<sup>1</sup> affecting 12,315 permits), an iterative approach was employed to evaluate the potential for significant impacts. First, the permits were grouped into categories based on release characteristics (e.g., stack parameters) so that similar source types were grouped together. Then an analysis was conducted by applying a screening-level air dispersion model (SCREEN3) to each permit and ranking the categories. The model was used to rank and prioritize permit categories on the basis of maximum ambient exposure. The results of this analysis were used to inform the selection of a smaller set of permit categories for further, more refined analysis intended to estimate impacts.

---

<sup>1</sup> The original pollutant record list totaled 89,314 records, however, it was discovered that a majority of the pollutants were listed twice with different units –one daily and one hourly. When the list was regenerated to eliminate the duplication, the revised pollutant record list totaled 51,265 pollutant records.

**Figure 1. Process for Selecting Permits for Refined Analysis**

The refined analysis was conducted on this subset of permits to evaluate the potential for significant impacts. A refined air dispersion model (AERMOD) was used to estimate the short- and long-term maximum ambient concentrations of criteria pollutants associated with selected permitted emissions. Input parameters for modeled sources were defined such that a reasonable worst-case potential human exposure scenario for each permit category was evaluated. However, refinements were implemented to reduce the conservatism included in the screening-level modeling. More refined aspects of the AERMOD analysis included the following refinements:

- use of an ozone-dependent method for converting NO<sub>x</sub> to NO<sub>2</sub> based on the NO<sub>x</sub> within the plume and the ozone contained within the volume of the plume between the source and receptor (Plume Volume Molar Ratio Method [PVMRM]);
- use of three years of meteorological data for locations within the SCAQMD boundaries; and
- use of specific meteorological station locations selected on the basis of statistical evaluations designed to ensure that reasonable worst-case conditions were evaluated.

The overall approach thus takes into account the possibility of future permits being awarded across a wide range of geographic locations within the District.

Modeled criteria pollutant concentrations estimated by AERMOD were compared to SCAQMD localized significance thresholds (LSTs) to evaluate air quality impacts. Potential impacts from both short- and long-term exposures were evaluated using different averaging times for outputs and corresponding thresholds. Average long-term operational emissions associated with permitted sources were also compared to SCAQMD operational emission significance thresholds to provide an additional metric of the potential for significant impacts.

The sections that follow provide a more detailed overview of the local impact analysis for this environmental assessment. A description of the emissions data that are the basis for this analysis is presented in Section 2, along with descriptions of processing conducted to

prepare the emissions data for modeling and estimating impacts. Significance criteria used to evaluate modeled air quality impact results are presented in Section 3. Because these criteria were used in both the screening and refined components of this analysis, they are presented separately in this section of the document. Descriptions and explanations of the dispersion models used in the assessment, model inputs and options, and model outputs for the screening-level and refined analyses are presented in Sections 4 and 5, respectively. Predicted air quality impacts are presented in Section 6, and references cited in this report are listed in Section 7. Supporting technical information related to this assessment is also provided in Appendices C1 through C4 of this report.

## 2 Development of Emission Scenarios

To develop the representative data set for this evaluation, emissions data were collected for existing permits that would be representative of future projects that will be subject to the proposed project. Permits were obtained with the assistance of District staff from SCAQMD permit files.

Air pollutants permitted for emissions included criteria pollutants, including particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>), carbon monoxide (CO), oxides of nitrogen (NO<sub>x</sub>), and oxides of sulfur (SO<sub>x</sub>) and reactive organic gases (ROG). Only primary pollutant emissions included in the permit were included in this analysis; no pollutants formed as secondary reaction products were evaluated, with the exception of NO<sub>2</sub> production from NO<sub>x</sub> (Section 5.2). Secondary pollutants (created due to the reaction of pollutants in the atmosphere) do not create localized impacts. However, they are evaluated in the regional air quality analysis.

To facilitate the analysis of over 12,000 permits, each permit was assigned to a permit category (Section 2.2.1) and crosswalked<sup>2</sup> to a Source Classification Code (SCC; Section 2.2.2). SCCs were used for two purposes in this analysis: (1) to assign stack parameters to emission sources for modeling on the basis of source type; and (2) to estimate chemical speciation of permitted emissions reported as PM and organic gases (with respect to particle size composition of PM emissions (Section 2.2.3).

This analysis was intended to evaluate only local (i.e., permit-specific) impacts potentially resulting from operational emissions of permitted sources. Analyses of impacts of other project-related emissions, such as emissions from equipment and vehicles during facility construction, are described in the PEA main report.

### 2.1 Source of Emissions Data

As noted in Section 1, it was assumed that permit actions from the recent past and pending permit actions that used or will use credits tracked under Rules 1315 and which would have been eligible for Rule 1309.2 had it been in effect are representative of the types of emissions that would be permitted in the future and tracked under the proposed

---

<sup>2</sup> Individual permit process characteristics (i.e., the basic category (BCAT) and control category (CCAT) descriptions in the permit database) were “crosswalked” by matching Source Classification Code (SCC) descriptions to unique BCAT/CCAT descriptions. The SCC code description that best matched the BCAT/CCAT code description was used to assign an SCC code to each permit. Please see Section 2.2.2 and 4.2 for additional details.

project. The permit data provided by the District for this analysis originated from the following three categories:

- Permits issued during the previous five years (from September 8, 2003, to November 4, 2008) that would be covered under 1315 because they were permitted either using offset exemptions (Rule 1304) or as an essential public service (Rule 1309.1) (9,726 permits at 7,196 facilities).
- Permits issued during the previous five years that would have been covered under Rule 1315 because they could use credits from the offset budget under Rule 1309.2 (339 permits at 200 facilities).
- Permit applications SCAQMD had in-hand, currently pending approval that would be covered under 1315 (2,250 permits at 336 facilities).

In total, 12,315 permits from 7,732 facilities were included in the original combined data set used in this analysis. These permits are summarized in Table 1.

**Table 1. Summary of 5-year Data Set**

<b>Permits in Full Data Set</b>	
Total permits	12,315
Unknown permits <sup>a</sup>	560
Zero emission permits	1,151
Other permits removed	2
Total permits used in analysis <sup>b</sup>	10,602
Unique facilities	7,732
<b>Permits for Individual Pollutants</b>	
Carbon monoxide (CO)	2,818
Nitrogen oxide (NO <sub>x</sub> )	4,226
Particulate matter (PM10/PM)	3,328
Sulfur oxide (SO <sub>x</sub> )	427
Total/reactive organic gases (TOG/ROG)	7,932

- a) If no BCAT or CCAT code was included in the raw data set for a permit, all records for that permit were assigned to the “unknown” permit category.
- b) Unknown permits and zero-emission permits were not used in this analysis, and two additional permits were removed after further analysis; see Section 2.2.

## 2.2 Processing of Permit Data for Evaluation

This section describes the processing conducted on the data set prior to any modeling. Permit data were prepared for analysis by removing any “unknown permits” (see Section 2.2.1 a definition of these permits) and records with zero emissions (i.e. those entries for which a facility reported zero emissions for a specific pollutant). Individual permits were then assigned an SCC and grouped into permit categories.

## 2.2.1 Permit Categories

In order to better organize the thousands of permits into representative groupings, permits were grouped into permit categories. This was done according to process characteristics identified on the basis of basic category (BCAT) and/or control category (CCAT) codes associated with individual permits. A list of the 111 unique permit categories and the number of permits in each category is presented in Table 2. These permit categories were used throughout the analysis.

If no BCAT or CCAT code was included in the raw data set for a permit, all records for that permit were assigned to the “unknown” permit category and subsequently removed from the analysis. Permits in the unknown category were removed from the analysis because without easily-accessible information on source type, reasonable defaults for stack parameters could not be assigned. A total of 562 permits (5 percent of the permit data set) were lacking both BCAT and CCAT codes and were assigned to the “unknown” category and removed from the analysis.

**Table 2. Permit Categories Assigned for this Analysis**

Permit Category	No. of Permits	Permit Category	No. of Permits	Permit Category	No. of Permits
Spray Booth and Equipment	2,494	Drying	26	Alkylation	3
Tanks and Storage	1,857	Semiconductor	24	Biofilter	3

## 2.2.2 Source Classification Codes

Stack parameters were required for both screening and refined modeling scenarios of individual permits. Process-specific stack parameters were not readily available for individual permits from the SCAQMD. In order to assign stack parameters, and also to speciate permitted emissions, permits were crosswalked to SCCs on the basis of their BCAT and/or CCAT codes.<sup>3</sup>

SCCs are codes defined for specific types of emission sources by the U.S. Environmental Protection Agency (USEPA) on the basis of emission release point characteristics, the process an emission point is associated with, and other attributes unique to a specific type of emission source. Average or typical stack parameters can be derived for a given type of source using existing USEPA and other databases that contain SCCs. For example, in their National Emissions Inventory (NEI), USEPA has developed SCC-specific default stack parameters (stack height, stack diameter, exit gas velocity, and exit gas temperature) that are used in quality-assurance and gap-filling routines conducted in the development of this national-scale inventory.<sup>4</sup>

<sup>3</sup> In all cases, a set of permits with a unique combination of BCAT and CCAT codes were assigned to a single “permit category” as described in the previous section. However, because of the diversity of release point characteristics for sources included in some permit categories, SCCs (and, consequently, stack parameters and speciation factors) were assigned to unique BCAT/CCAT combinations, not unique permit categories. In other words, a single BCAT/CCAT combination was assigned a single SCC, but multiple combinations of BCAT/CCAT (and therefore multiple SCCs as well) were in many cases assigned to a single permit category.

<sup>4</sup> For additional information on USEPA’s National Emission Inventory, see <http://www.epa.gov/ttn/chief/eiinformation.html>.

SCCs were assigned to permits and used to define the stack parameters used in the screening-level modeling. This SCC crosswalk was then used as the starting point for determining appropriate stack parameters for permit categories included in the refined modeling. Refer to the relevant text in Sections 4 and 5 for additional information on assigning stack parameters using SCCs.

The SCCs assigned to permits were also used as the basis for speciating permitted emissions of PM and organic gases. Some additional processing was required for this step, as explained in the following section.

### 2.2.3 Chemical Speciation of Emissions

This section describes speciation calculations conducted for permitted emissions in the data set. The California Air Resources Board (CARB) has developed speciation profiles that describe the chemical composition of emissions reported as PM or TOG.<sup>5</sup> Speciation profiles in the CARB database have been developed for a range of SCCs, and therefore SCCs could be used to assign a CARB chemical speciation profile to a reported PM or TOG emission value in the permit data set. Factors associated with these speciation profiles were used to estimate the emissions of size-specific PM fractions (from emissions of total PM).

The SCCs assigned for stack parameter analysis were used in cases where a match was found within the speciation database. In some cases, however, the SCC assigned to a permit record for the purposes of assigning stack parameters (as described in the previous section) was not included in the CARB speciation profiles (i.e., the CARB database does not include every SCC). In these cases, an additional SCC was assigned for speciation to individual TACs. The original assigned SCC was retained for assigning default stack parameters.

#### Particulate Matter

Of the criteria pollutants evaluated in this analysis, emissions of NO<sub>x</sub>, SO<sub>x</sub>, and CO were not modified before conducting modeling or analysis. Emissions of PM were reported in SCAQMD permit records as either “PM” or “PM10”. The CARB speciation profile for the assigned SCC was used to convert total particulate matter (reported as “PM” in the permit data base) to PM10. The following equation was used to convert PM to PM10:

$$PM10 \text{ Emissions} = PM \text{ Emissions} * wfracpm10_{SCC}$$

where the parameter  $wfracpm10_{SCC}$  is the weight fraction of PM that is PM10 for a given SCC.

Emissions reported as PM10 were not altered. Since PM2.5 is a subset of PM10, the fraction of PM that is PM2.5 is always equal to or less than PM10. Because SCAQMD air quality significance thresholds are the same for both PM10 and PM2.5, only permits that exceed the PM10 ambient air threshold have the potential to exceed the PM2.5 threshold of significance. For efficiency, permits were evaluated for their impact with

---

<sup>5</sup> The CARB speciation profiles and supporting information for these data can be found at <http://www.arb.ca.gov/ei/speciate/speciate.htm>.

respect to PM10, and these results were judged to also represent the impacts with respect to PM2.5.

## 2.2.4 Temporal Characteristics of Emissions

For criteria air pollutants, the monthly (30-day average [AV30]) permitted emissions values in pounds per day were used to evaluate long-term (>24-hour) air quality impacts. Permit-specific operation schedules were used to scale the monthly AV30 permitted emissions to evaluate short-term (< 24-hour) air quality impacts. For more information on scaling permitted emissions, see Section 4.2.4.

# 3 Significance Criteria

SCAQMD has established thresholds to determine the significance of ambient air quality impacts from proposed land use development projects (SCAQMD 2006). Because these thresholds were used in both the screening-level-ranking analysis and the refined modeling analysis used to assess the significance of impacts, they are discussed in this section of this appendix prior to the discussion of the analyses conducted to estimate impacts.

## 3.1 Air Quality

Ambient concentration thresholds for criteria pollutants in the SCAQMD are presented in Table 3. The PM values reported here are incremental thresholds. The other criteria presented here are absolute thresholds that are intended for comparison with total (i.e., incremental plus background) concentrations. Operational emission thresholds have also been developed by the District. These thresholds are presented in Table 4.

**Table 3. SCAQMD Thresholds for Ambient Air Quality Concentrations**

Air Pollutant	Ambient Concentration Threshold
Nitrogen dioxide (NO <sub>2</sub> )	
1-hour average	0.18 ppm (338 µg/m <sup>3</sup> )
Annual average	0.03 ppm (56 µg/m <sup>3</sup> )
Particulates (PM <sub>10</sub> or PM <sub>2.5</sub> )	
24-hour average	2.5 µg/m <sup>3</sup>
Annual average	1.0 µg/m <sup>3</sup>
Carbon monoxide (CO)	
1-hour average	20 ppm (23,000 µg/m <sup>3</sup> )
8-hour average	9.0 ppm (10,000 µg/m <sup>3</sup> )
Sulfur Dioxide (SO <sub>2</sub> )	
1-hour average	0.25 ppm (655 µg/m <sup>3</sup> )
24-hour average	0.04 ppm (105 µg/m <sup>3</sup> )

- 
- a) The NO<sub>2</sub>, SO<sub>2</sub>, and CO thresholds are absolute thresholds; the maximum predicted impact from permitted emissions is added to the background concentration for the project vicinity and compared to the threshold.
  - b) The particulates (PM<sub>10</sub> and PM<sub>2.5</sub>) threshold is an incremental threshold to which no background concentration is added for impact determination.
- 

**Table 4. SCAQMD Operational Emission Rate Thresholds of Significance**

Air Pollutant	Operational Emissions Threshold (pounds/day)
Volatile organic compounds (VOCs)	55
Carbon monoxide (CO)	550
Nitrogen oxides (NO <sub>x</sub> )	55
Sulfur oxides (SO <sub>x</sub> )	150
Particulates (PM10)	150
Particulates (PM2.5)	55

## 4 Screening-level Analysis (SCREEN3)

The objective of the screening-level component of the analysis was to develop a manageable set of representative permit records that could be used to characterize a reasonably foreseeable worst-case set of air quality impacts for potential future projects that may be permitted as a result of the proposed project. The screening evaluation was conducted using a conservative but realistic approach to identify permitted sources of greatest concern. Using this approach was likely to overestimate the actual air quality impacts associated with the project, but (more importantly at this stage in the assessment) was unlikely to underestimate impacts. The outcome of this ranking analysis was not used to quantify impacts, but rather was conducted to identify permit categories for more refined dispersion modeling (Section 5). The results of the refined analysis were subsequently used to estimate the local air quality impacts of individual permits eligible under the proposed project (Section 6).

### 4.1 Approach and Selection of Model

The purpose of this component of the evaluation was to narrow the full 5-year data set of over 12,000 permits to a manageable subset of permits that could be evaluated in the refined analysis. USEPA's SCREEN3 dispersion model was employed to develop metrics for ranking permits.<sup>6</sup> SCREEN3 is a single source Gaussian plume model that provides maximum 1-hr ground-level concentrations for point, area, flare, and volume

---

<sup>6</sup> Additional information on SCREEN3 can be found at [http://www.epa.gov/scram001/dispersion\\_screening.htm#screen3](http://www.epa.gov/scram001/dispersion_screening.htm#screen3).

sources, as well as concentrations in the cavity zone, and concentrations due to inversion break-up and shoreline fumigation. This model was employed in the screening-level ranking analysis because it could be used to efficiently derive a conservative estimate of off-site exposure for all permitted emissions in the data set. The results for criteria pollutants were then evaluated in conjunction with significance criteria to select permits for refined modeling.

## 4.2 Model Inputs and Options for SCREEN3

Stack parameters specific to each permit that were required for SCREEN3 modeling included:

- Emission rates
- Emission release heights
- Emission release diameters
- Emission release temperatures
- Emission release velocities

Inputs for these parameters were developed primarily using the SCCs assigned to each permit, as described below. SCAQMD defaults were used for receptor height, ambient air temperature, and meteorological settings. The meteorological option selected allowed the model to run through all stability classes and wind speeds and report the highest ground-level concentration estimated for a stack with the specified parameters. An urban setting was used to represent the urban Los Angeles environment. Other modeling inputs required by SCREEN3 were defaulted to appropriate reasonable or conservative values as described in the following sections.

### 4.2.1 Point Sources

All permits were modeled as point sources except permits specifically identified in the BCAT or CCAT code description as flares (any permit with the term “flare” in the BCAT or CCAT code was assumed to be a flare).

As noted in Section 2.2.2, SCCs were used to assign default values for the four stack parameters used in the SCREEN3 modeling. In order to assign SCCs for each of the thousands of SCAQMD permits included in the data set used for the screening-level analysis, a search tool was created. This tool assisted in identifying relevant SCCs for the BCAT and/or CCAT codes associated with each permit, using an automated process that identified terms found in (or related to) the BCAT and CCAT descriptions. An appropriate SCC was then manually assigned to each permit record by selecting the “best fitting” SCC description from the matches and close matches generated by the automated cross-walking routine. In general, where multiple SCCs were relevant but an exact match could not be made, a conservative approach was used to assign an SCC, usually on the basis of the default stack parameters associated with a given SCC (for example, an SCC with a lower default stack height would be preferentially selected, all other factors being equal, because lower stack heights generally result in higher ground-level ambient concentrations).

Default stack parameter values were derived using records for point sources included in USEPA's 2002 National Emissions Inventory (NEI). The 2002 NEI for point sources was queried on the basis of Federal information processing standards (FIPS) codes to pull out all records for sources located within (or close to) SCAQMD boundaries (i.e., records with FIPS codes 06037, 06059, 06065, or 06071). Then, within this subset of NEI records, the arithmetic average value for the four parameters of interest was calculated for each SCC. For this process, it was required that at least five individual stack-specific records be available to assign average stack parameter values. In cases where less than five records were available within the SCAQMD subset of NEI records, average values were calculated using all California NEI records (i.e., records with FIPS code 06) instead. If the number of California-specific records was also less than five, the NEI's national default stack parameters developed by USEPA for each SCC were used. For the 2002 NEI, these national-level NEI defaults are equal to the median stack parameter values of all stacks in the 1999 point source NEI assigned to a given SCC.

Because the initial assignment of SCCs to permits for the purposes of defining stack parameters was intentionally conservative, an iterative methodology was used to reduce overly conservative assignments. In cases when a permit was assigned highly conservative stack parameters (such as a very short stack height) on the basis of default values for the assigned SCC, additional research was conducted to determine whether the assigned stack parameters were appropriate. This included researching additional information on the process associated with the BCAT or CCAT code (e.g., from information on emissions and emission factors, such as that compiled in USEPA's AP 42 chapters, or from general descriptions of industrial processes published by trade groups), as well as reviewing example permits to determine the most appropriate stack parameters for the codes under review. Although this detailed level of analysis could not be performed for all permits due to the number of permits evaluated, a reasonable effort (taking into account the timeframe and resources available) was made to evaluate all of the most conservative SCC assignments. Table C1-1 of Appendix C1 lists the Permit Categories and SCCs used throughout the analysis and the BCAT/CCAT code associated with each SCC.

The maximum distance of interest was set at 10,000 m for point sources. Table C2-1 of Appendix C2 lists the input parameters used for the point source SCREEN3 analysis.

## 4.2.2 Flares

Flares are modeled differently from other point sources in SCREEN3 to account for the additional buoyancy from the high temperature. Any BCAT/CCAT code that included the term "flare" in the description was grouped into the flare permit category and modeled separately. The most important difference between point and flare source categories in SCREEN3 is that plume rise for flares is calculated based on the thermal effects of the flame that result in lift and expansion of the plume. This is included by calculating an effective release height and an effective stack diameter that is based on an assumed exit velocity of 20 m/s and flare temperature of 1,273 K and the heat of release, rather than a combination of buoyancy and momentum flux. Thus, the user is required to input a heat release rate rather than a release diameter, temperature, and velocity. Because the total heat release rate is not included in SCAQMD permit data, a Landfill Gas Flaring System was selected to be a representative "flare" permit and was used to derive an average flare heat release rate. A maximum distance of interest was set to

10,000 m for flares. The input parameters for flares can be found in Table C2-2 of Appendix C2.

### 4.2.3 Fenceline

An important input during the screening phase was the distance to the facility fenceline (i.e., the distance between the modeled source and the edge of the facility boundary where off-site impacts can occur). The distance to the fenceline is defined by the user for a SCREEN3 simulation to determine the minimum distance from the source at which the model will report ambient air concentrations. For example, if a dry cleaner is located on a city street in Los Angeles, the distance to an individual exposed at an offsite location is expected to be smaller than the distance between emission sources at a large petroleum facility and the facility's fenceline. The distances to fenceline were assigned for each permit category, based on the general characteristics of the facilities at which the sources in that category would be located. In most cases, a distance to fenceline of 50 m was used. Fifty meters is consistent with SCAQMD's guidance on performing the analysis from individual facilities for obtaining emission permits (SCAQMD, 2005). For some permit categories where the source could be located in close proximity to people (e.g., tar pots), a fenceline of 10 m was used. Table C2-3 of Appendix C2 lists the fenceline used for each permit category in the screening analysis.

In some cases, a permit category contained a variety of BCAT and CCAT codes, and it was not possible to assign a single representative fenceline. In general, a fenceline of 50 m was used for large facilities. If a source was expected to be located at a very small facility, 10 m was used. The fenceline for the flare permit category was set at 50 m, which is consistent with other analyses.

### 4.2.4 Emission Rate and Timescale

Using the AV30 emission rate for dispersion modeling implicitly assumes the facility is operating for fifty-two weeks per year, seven days per week, and twenty-four hours per day. While this approach is appropriate for evaluating impacts from long-term exposures, it does not appropriately capture short-term impacts. Consequently, SCREEN3 output concentrations were scaled to account for actual operating hours for each permit.

To estimate short-term maximum concentrations, SCREEN3 concentration predictions based on AV30 emission rates were adjusted for short-term variations using operating schedules obtained from SCAQMD for each permit. The adjustments were made with short-term emission scaling factors calculated as follows:

$$\text{Scaling factor for short-term emissions} = (7 \text{ days per week} / \text{number of operating days per week}) * (24 \text{ hours per day} / \text{number of operating hours per day})$$

For example, when a facility operates its equipment for 5 days per week, 8 hours per day, the emissions will be scaled by  $(7/5) * (24/8)$ , or by a factor of 4.2.

### 4.2.5 Background Concentrations

As noted in Section 3.1, for all criteria pollutants except PM10, the SCAQMD thresholds for the California Environmental Quality Act (CEQA) typically requires a background

concentration to be added to the maximum concentration increment predicted by the model <sup>7</sup> and compared to the SCAQMD designated threshold concentration, which is equal to the ambient air quality standard. For these pollutants, the 2007 maximum ambient air concentration for the entire South Coast Air Basin (SCAB) was used for background concentrations in this screening-level analysis. PM10 and PM2.5 emissions are not added to the background because the background already exceeds the NAAQS. It is not feasible to prohibit all projects that result in any PM10 or PM2.5 emissions. Accordingly, Regulation XIII significance thresholds are used for both PM10 and PM 2.5.

PM10 concentrations were compared to the SCAQMD incremental 24-hour significance threshold of 2.5 µg/m<sup>3</sup> and annual standard of 1 µg/m<sup>3</sup>; no background concentration was used in evaluating PM. For NO<sub>2</sub>, the maximum annual background NO<sub>2</sub> concentration reported in the District exceeded the total ambient air quality standard. As a result, screening-level concentrations were compared to the incremental 1-hour significance threshold of 20 µg/m<sup>3</sup> and annual significant threshold of 1 µg/m<sup>3</sup>. Table 5 lists the background concentrations used in the screening-level analysis.

**Table 5. Background Concentrations Added to SCREEN3 Output Concentrations**

Pollutant	Averaging Time	2007 SCAQMD Maximum Ambient Concentration (µg/m <sup>3</sup> ) <sup>a</sup>	SCAQMD Ambient Concentration Threshold (µg/m <sup>3</sup> ) <sup>b</sup>
PM10 <sup>c</sup>	24-hour	N/A	2.5
	Annual	N/A	1.0
NO <sub>2</sub> <sup>d</sup>	1-hour	N/A	20
	Annual	N/A	1.0
SO <sub>x</sub>	1-hour	290	655
	24-hour	28.8	105
CO	1-hour	9,200	23,000
	8-hour	5,865	10,000

N/A: Not applicable (the maximum background concentrations for PM10 and NO<sub>2</sub> were higher than the maximum ambient threshold; therefore, only incremental concentrations of these pollutants were evaluated in the screening analysis).

- a) 2007 Air Quality, South Coast Air Quality Management District. <http://www.aqmd.gov/smog/AQSCR2007/aq07card.pdf>.
- b) The SO<sub>2</sub>, and CO thresholds are absolute thresholds; the maximum predicted impact from permitted emissions is added to the background concentration for the project and compared to the threshold.
- c) The particulates (PM10 and PM2.5) threshold is an incremental threshold.
- d) Because 2007 annual background concentration (59.8 µg/m<sup>3</sup>) was higher than the ambient threshold (56 µg/m<sup>3</sup>), an incremental value of 20 µg/m<sup>3</sup> for 1-hour and 1 µg/m<sup>3</sup> for annual was used instead.

<sup>7</sup> Incremental concentrations were scaled for facility operating schedules, as described in Section 4.2.4, and for averaging time, as described in Section 4.2.6.

## 4.2.6 Adjustment of Concentration Averaging Time

Results from SCREEN3 are reported as maximum one-hour ambient concentrations. To obtain exposure estimates for longer averaging periods, the outputs from SCREEN3 were adjusted using scaling factors derived by USEPA. The scaling factors applied are listed in Table 6 for each averaging time of interest.

**Table 6. Averaging Time Scaling Factor for Adjustment of SCREEN3 Output Concentrations**

<b>Averaging Time</b>	<b>Scaling Factor<sup>a</sup></b>
1-hour	1.00
8-hour	0.70
24-hour	0.40
Annual	0.08

a) USEPA. Screening Procedures for Estimating the Air Quality Impact of Stationary Sources, Revised. 1992. EPA-454/R-92-019, pg 15.

## 4.3 Screening Model Outputs and Prioritization of Permits

As discussed above, for criteria pollutants, SCREEN3 outputs used in the screening analysis were the estimated maximum offsite ambient concentration increments for the specified averaging time. These results were compared to ambient thresholds, taking into account background, as appropriate, to obtain a screening-level measure of impact (i.e., “exceeds threshold” or “does not exceed threshold”). The total number of permits exceeding the ambient air concentration thresholds for each pollutant is presented in Table 7. The number of permits within each permit category that exceeded the SCAQMD threshold of significance for each pollutant is presented in Appendix C2 of this report. The number of permits exceeding the SCAQMD operational emission rate thresholds for each category is presented in Table 8, and a complete list of emissions rate thresholds exceedances by permit category are presented in Table C2-6 of Appendix C2 of this report.

**Table 7. Results of the Screening Analysis: Permits Exceeding the Pollutant-Specific SCAQMD Ambient Air Quality Thresholds of Significance**

Pollutant	Total Permits	Number of Permits Exceeding SCAQMD Ambient Air Quality Thresholds			
		Short-term without background	Short-term with background	Long-term without background	Long-term with background
CO	2843	13	21	3	12
SO <sub>x</sub>	368	21	39	25	28
NO <sub>x</sub>	4247	2,512	N/A	1,581	N/A
PM10	3917	2,689	N/A	2,345	N/A

N/A = Not Applicable. NO<sub>x</sub> and PM10 ambient air concentration in the South Coast Air Basin are higher than the District ambient concentration threshold; therefore incremental thresholds provided in Section 2.3.1 were used.

**Table 8. Number of Permits Exceeding SCAQMD Operation Emission Rate Thresholds**

Pollutant	Number of Permits Exceeding the Threshold	SCAQMD Operational Emission Rate Threshold (pounds per day)
Carbon monoxide (CO)	23	550
Nitrogen oxide (NO <sub>x</sub> )	112	55
Particulate matter (PM10)	22	150
Particulate matter (PM2.5)	67	55
Sulfur oxide (SO <sub>x</sub> )	6	150
Volatile Organic Carbon (VOC)	98	55

Compared to PM and NO<sub>x</sub>, relatively few permitted emissions of CO and SO<sub>x</sub> exceeded the thresholds of significance. Given the conservative assumptions used in the screening-level model, it was assumed that emissions of CO and SO<sub>x</sub> in the permit database would be unlikely to cause adverse impacts, at least in comparison to the impacts resulting from other pollutant emissions. Therefore, CO and SO<sub>x</sub> were not included in the refined analysis.

For each remaining pollutant, the ten permit categories with the highest number of permits exceeding the threshold were selected for refined analysis. Several permit categories appear in the top ten lists for more than one pollutant. This approach covered the majority of exceedances estimated using the screening approach, as indicated by the following summary statistics.

- The total number of unique combinations of permit ID, pollutant and averaging period was 48,739, counting only those combinations for which emissions were reported.
- Of this total, the number of unique combinations (permit ID + pollutant + averaging period) that exceeded the District's significance criteria based on the screening results was 20,745, or about 43%.

- Of the number of unique combinations (permit ID + pollutant + averaging period) that exceeded the District’s significance criteria, the number of unique combinations that were associated with permit categories evaluated in the refined analysis was 18,375, or about 89% (of the 43%).

Table 9 lists all the permit categories included in the refined assessment.

**Table 9. Permit Categories for Refined Analysis**

Permit Category	Justification for Including in Refined Analysis (Criteria Pollutant)
Spray Booth and Equipment	PM, NO <sub>x</sub>
Tanks and Storage	PM
Blasting	PM
Blending	PM
Heater/Furnace	PM, NO <sub>x</sub>
Equipment Process	PM, NO <sub>x</sub>
Tar Pot	PM, NO <sub>x</sub>
Afterburner	PM, NO <sub>x</sub>
Asphalt	PM, NO <sub>x</sub>
Turbine Engine > 50 MW	PM
Internal Combustion Engine	NO <sub>x</sub>
Soil Treat Vapor Extract	NO <sub>x</sub>
Oven	NO <sub>x</sub>
Printing	NO <sub>x</sub>

MW = Megawatt, PM = Particulate matter, NO<sub>x</sub> = Nitrogen oxide

## 5 Refined Analysis (AERMOD)

### 5.1 Approach and Selection of Model

The air dispersion modeling for the refined analysis of air quality impacts from air pollutants was performed using the U.S. Environmental Protection Agency’s AERMOD Modeling System (2004), version 010709, based on the Guideline on Air Quality Models (40 Code of Federal Regulations [CFR], Part 51, Appendix W, November 2005). Criteria pollutants, including NO<sub>x</sub>, and PM10 were modeled for the project operational emissions. The predicted ground-level concentrations were compared to relevant SCAQMD air quality significance thresholds to determine the air quality impacts of the proposed project.

The AERMOD model is a steady-state, multiple-source, Gaussian dispersion model. The AERMOD model uses hourly surface meteorological data, including wind direction, wind speed, and temperature, as well as cloud cover and upper-air meteorological temperature data. The selection of the AERMOD model is well-suited for this component of the PEA local air quality analysis based on (1) the general acceptance by the modeling community and regulatory agencies of its ability to provide reasonable results for large industrial complexes with multiple emission sources, (2) the availability

of an annual set of hourly meteorological data for use by AERMOD, and (3) the ability of the model to handle the various physical characteristics of emission sources, including “point,” “area,” and “volume” source types. AERMOD is a USEPA-approved dispersion model, and SCAQMD recommends its use in their permitting process.

## 5.2 Model Inputs and Options

### 5.2.1 Emission Inputs

For each permit category evaluated in the refined analysis, emission rates for a given pollutant type (i.e., NO<sub>2</sub>, PM<sub>10</sub>, or TACs) were selected from the permits in the category to represent both a typical and a reasonable maximum expected emission rate. These emission rates were assumed to be represented by the emission rate of the permits at the 50<sup>th</sup> and 95<sup>th</sup> percentile of the distribution of emission rates, respectively, within each permit category (and evaluating pollutant types separately) to demonstrate typical and reasonably foreseeable worst-case emission scenarios.

Emission rates provided by the District were 30 calendar-day average daily emissions in pounds per day. AERMOD requires emission units of grams per second, as well as a temporal profile indicating any hour-by-hour variations in emission rate over the modeling period (temporal emission profiles are discussed in Section 5.2.3).

The 30-day average daily emission rate provided by the District is calculated under the assumption that the facility is operating 7 days a week. Therefore, the emission rates were adjusted to take into account the actual number of operating days per week of the representative facilities, as indicated by the permit. In addition, when converting emission rates from pounds per day to grams per second, rates were adjusted to reflect the rates that would occur during operating hours as indicated by the permit. That is, like the short-term emission rate in the screening analysis (Section 4.2.4), the AERMOD emission rate for operating hours on operating days was scaled using a factor calculated from the following equation:

$$AV30 \text{ Emissions Rate} * (7/\text{No. of operating days per week}) * (24/\text{No. of operating hours per day})$$

### 5.2.2 Temporal Profiles

AERMOD can accommodate temporal variation in the emission rate over time, including periods when no emissions occur. For this analysis, permitted emissions were assumed to occur according to the operating schedule included in the permit data set provided by SCAQMD (Section 5.2.1). During hours when emissions occur, the emission rate was assumed to be constant. For permits for which operations and emissions do not occur continuously (i.e., less than 24 hrs/day, 7 days/week, 52 weeks/yr), some assumptions were made regarding time of day when emissions occur. For example, emissions were generally assumed to preferentially occur during weekdays, daylight hours and, for emissions occurring less than 52 weeks per year, at the beginning of the year. Emission factors were developed to turn the emission “on” or “off” based on this approach. For example, if the facility operates 52 weeks per year, 5 days per week, 8 hours per day, the emissions were “on” Monday through Friday from 9am-5pm. Table C4-2 of Appendix C4 of this report lists the various operating schedule used in the refined assessment.

### 5.2.3 Source Parameters

Other important required inputs for AERMOD include stack parameters of the release point, including release height, exit gas temperature, stack (or release point) diameter, exit gas velocity, and exit gas flow rate (note that diameter, exit velocity, and flow rate are correlated). For this analysis, in the absence of other information, it was assumed that all emissions from a given permit are released from a single release point.

The SCCs assigned to the permits for the purposes of the screening analysis were used as a starting point to identify appropriate stack parameters for the refined modeling analysis. However, some additional processing was conducted to ensure that the stack parameter values associated with the permits (i.e., those selected to represent 50<sup>th</sup> and 95<sup>th</sup> percentile emission rates) were also representative of “typical” and “high end” conditions, and also were logical and consistent parameter values to use for the emission rates.

The permits selected to represent the median and 95<sup>th</sup> percentile emission rates were reviewed to ensure the SCCs assigned to each were representative of other “nearby” permits included in that permit category (i.e., the other emission-ranked permits corresponding to percentiles similar to the 50<sup>th</sup> and 95<sup>th</sup> percentile emission rate). For example, in cases where the majority (i.e., 90%) of the top 10% of permits by emissions were characterized by a single SCC, but the permit selected to represent the 95<sup>th</sup> percentile emission rate was characterized by a different SCC, the SCC code for that permit was changed to match the SCC representing the majority of permits in the permit category.

This SCC was then used to define the stack parameters for each permit category/emission percentile combination using USEPA’s 2002 NEI database of point source emissions as a primary data source for parameter values.<sup>8</sup> First, the full set of release points in NEI associated with that SCC was obtained. These were investigated to determine the origin of the stack parameter value, as original values (usually reported by the facility), SCC default values, or generic national default values developed by EPA. Any NEI records with national default values were removed from this analysis (these records do not take into account the process emitting the pollutant). If the NEI records for a given SCC included 10 or more records with original stack parameters, these records were used in a SCREEN3 simulation to determine the set of parameters that resulted in median (50<sup>th</sup> percentile) and high (95<sup>th</sup> percentile) output concentrations for a given emission rate (see Appendix C4 of this report for the complete list of permits selected for the 50<sup>th</sup> and 95<sup>th</sup> percentile emissions). This median set of stack parameters was then used for the AERMOD simulations. If less than 10 original sets of stack parameters were available, the SCC default values for stack parameters developed by USEPA for NEI were used.

In most cases the median or default set of stack parameters were used for both the 50<sup>th</sup> and 95<sup>th</sup> percentile emissions. For certain permit categories, however, it was not realistic for a source with a high emission rate (represented by the 95<sup>th</sup> percentile) to have the same set of stack parameters as one releasing typical emissions (50<sup>th</sup> percentile) because a higher emission rate may be associated with (and require) a higher volumetric flow rate. In such cases, a higher stack height, higher exit velocity, and larger stack diameter were used in the refined modeling of the 95<sup>th</sup> percentile emissions.

---

<sup>8</sup> Stack parameters obtained from NEI were selected in “sets” (i.e., all four stack parameters from a single record were pulled and remained together) rather than independently, so that the combinations of stack parameters used in the simulations would be realistic for the given SCC.

The median and SCC default sets of stack parameters were also scrutinized to ensure that they were appropriate. In a case where an abnormal or unexpected value occurred, additional research was conducted to find a more appropriate set of stack parameters. For example, the SCC default exit temperature of a tar pot was at room temperature. A more accurate exit temperature for tar pots was identified from the literature as 523 K (Rogge 1997). Table 10 lists the modifications made to the stack parameters for refined modeling.

**Table 3. Modifications to Stack Parameters for Refined Analysis**

Permit Category	Emissions Percentile	Modification	Reason
Asphalt	50 <sup>th</sup>	Temperature changed to 523K	More appropriate exit temperature <sup>a</sup>
Blasting	50 <sup>th</sup>	Representative SCC changed to 30900299	More reasonable for median emissions
Blending	95 <sup>th</sup>	Representative SCC changed to 30509202	More reasonable for 95 <sup>th</sup> percentile emissions
Heater/Furnace	95 <sup>th</sup>	Representative SCC changed to 30501414	More reasonable for 95 <sup>th</sup> percentile emissions
ICE	Both	Representative SCC changed to 20100101	SCC default more reasonable for source type
Spray Booth and Equipment	50 <sup>th</sup>	Representative SCC changed to 30906099	More reasonable for median emissions
Tar Pot	Both	Temperature changed to 523K	More appropriate exit temperature <sup>a</sup>

## 5.2.4 Meteorological Data

The geographic and topographic features of the SCAB cause a significant variation in meteorological conditions between various parts of the Basin, which in turn lead to varying levels of air quality impacts from permitted facilities depending on the location of the facilities. Because of the time and resource requirements associated with AERMOD modeling and the results processing to determine ambient air quality impacts in the refined modeling, it was not feasible to evaluate the entire range of possible variations of meteorological conditions that occur in the SCAB. In order to ensure that this analysis evaluated locations with meteorology conducive to higher exposures and impacts while also accounting for some variation, three meteorological zones with conditions resulting in higher ground-level ambient concentrations were identified, and measurements from representative meteorological stations within those zones were used as inputs to AERMOD.

Surface wind speed and atmospheric stability are dominant factors in determining the dispersion characteristics of emitted pollutants. A statistical analysis of these parameters was conducted to define the boundaries of seven meteorological zones with similar dispersion characteristics. This analysis was conducted using the gridded meteorological conditions extracted from the fifth-generation NCAR/Penn State Mesoscale Model (MM5) outputs provided by the District. The parts of the SCAB encompassing the

following seven SCAQMD General Forecast Areas were included in this analysis: (1) Coastal; (2) Metropolitan; (3) San Fernando Valley; (4) San Gabriel Valley; (5) Inland Orange; (6) Riverside Valley; and (7) San Bernardino Valley. These seven forecast areas (out of a total of 14 Areas) are the regions in the Basin where the vast majority of the population in the District resides and most of the permits will be issued.

Although use of the MM5 outputs was determined to be the best approach to the statistical analyses regarding delineation of the meteorological zones, observational data collected at locations within the District was used in the AERMOD simulations for the refined analysis. To facilitate the SCAQMD's air permitting process, AERMOD-ready meteorological data sets were recently developed for the District for 25 monitoring locations in the SCAB three complete years (2005 – 2007). These AERMOD-ready observational data sets were used to conduct the refined air dispersion modeling because these data cover a three-year period and therefore were assumed to better represent long-term meteorological conditions. In addition, the District is planning to use this observational data set for future permitting assessments.

After defining the boundaries for seven meteorological zones using the MM5 data, dispersion modeling using the AERMOD-ready data and two sets of stack parameters was conducted to determine the three zones that are, on the whole, most conducive to higher ground-level ambient concentrations and representative locations within those zones. The following three meteorological stations were identified as representative locations for conducting the refined air dispersion modeling of selected permitted facilities.

- La Habra (LAHB) in Orange County,
- Azusa (AZUS) in Los Angeles County, and
- Burbank (BURK) in Los Angeles County.

The statistical analyses and model runs conducted to select these three stations are described in detail in Appendix C3 of this report.

## 5.2.5 Receptor Locations

Receptor locations (i.e., locations where individuals could potentially be exposed to ambient concentrations resulting from emitted pollutants) were arrayed in a polar grid at 10 degree intervals, with radials extending out to 5 km and spacing between radials varying from 10 to 400 m, with the finer resolution close to the source. Receptors began at the fenceline of the facility, which was assumed to be 50 m for all permit categories in the refined analysis, consistent with SCAQMD guidance (SCAQMD, 2005). In addition, a flat terrain was assumed since the representative facilities were not associated with a particular location in the basin.

## 5.2.6 Model Options

Model simulations for pollutants other than NO<sub>x</sub> were conducted using a unit emission rate. Pollutant-specific concentrations were then obtained by scaling the resulting concentration outputs by permitted or estimated emission rates during a post-processing

step. All emissions sources were modeled with the urban source option because most of the SCAB region is considered an urban area.

The production of NO<sub>2</sub> depends on non-linear atmospheric production and decay processes whose rates are influenced by the ambient ozone concentrations. For these model runs, the chemistry of NO to NO<sub>2</sub> conversion was incorporated using the PVMRM option in AERMOD, with actual estimated emission rates of NO and NO<sub>2</sub> used in these simulations. The required hourly ozone concentrations were input from the District's air quality monitoring network for the year 2005. Because the permit data contained total NO<sub>x</sub> emissions, a default NO<sub>2</sub>/NO<sub>x</sub> emission ratio of 0.1 was assumed.

### 5.3 Refined Modeling Outputs

Maximum 1-hour, 24-hour, and annual concentrations were obtained for each dispersion modeling run. Because each representative source was modeled with three sets of meteorological data individually (one for each of the three years of data), a set of nine concentration grids was generated for each modeled source and pollutant (with an additional dimension of results obtained for the two emission percentiles evaluated). For each pollutant and temporal averaging period, the maximum concentration from these nine sets of concentrations was compared with the District's ambient threshold for criteria pollutants (as described in greater detail in Section 6). The maximum annual concentrations for each dispersion modeling simulation are presented in Appendix C4 of this report.

### 5.4 Background Concentrations

As explained previously in Section 4.2.5, for all criteria pollutants except PM<sub>10</sub>, the SCAQMD's CEQA thresholds typically require a background concentration to be added to the maximum concentration increment predicted by the model and compared to the SCAQMD designated threshold concentration (i.e., the ambient air quality standard). For the screening-level analysis, the 2007 maximum ambient air concentrations across the entire SCAB were used for background concentrations for non-PM<sub>10</sub> criteria pollutants. In the refined analysis, CO and SO<sub>2</sub> were not evaluated and therefore no background concentrations of these pollutants were required, and NO<sub>2</sub> was the only criteria pollutant for which background was included.

Several approaches were considered for estimating appropriate NO<sub>2</sub> background concentrations. Because background concentrations vary across the SCAB and are expected to change in future years as emissions change, NO<sub>2</sub> background concentrations were estimated based on dispersion modeling being conducted by SCAQMD as part of the parallel cumulative air quality analysis. These predictions provide finer spatial and temporal resolution of concentration estimates than do monitoring data, and in particular can project the effect of future emissions changes on air quality. Thus, for the base year and each future year, a background NO<sub>2</sub> concentration was selected for each of the three meteorological zones represented in this analysis and for each averaging time (maximum 1-hour average, annual average) as follows.

- The average monitor-to-model concentration ratio for monitors in the zone for the base year was calculated.

- The highest grid cell model prediction in the zone for base year or future year was selected and the base-year average monitor-to-model ratio was applied.

By adjusting the cumulative model predictions by the monitor-to-model ratios, the uncertainty associated with using model predictions was reduced.

## 6 Impact Determination

### 6.1 Approach and Methods

Air quality impact estimates for the representative facilities were evaluated on a chemical-specific basis as follows.

- PM10 and PM2.5: Highest estimated incremental operational project contribution concentrations were compared to the SCAQMD localized significance threshold (LST) of 2.5 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) for 24-hour impacts and 1.0 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) for annual average impacts.
- NO<sub>2</sub>: Highest incremental ambient concentration predictions for the appropriate time-averaging periods were added to ambient background concentrations (based on SCAQMD model results) and compared to the 1-hour and annual average significance thresholds of 338  $\mu\text{g}/\text{m}^3$  and 56  $\mu\text{g}/\text{m}^3$ . In cases where either the estimated background NO<sub>2</sub> concentrations exceeded the California ambient air quality standard or the combined model prediction and estimated background concentration exceeded the standard, the modeled incremental ambient concentration predictions were compared to the NO<sub>2</sub> incremental thresholds of 20  $\mu\text{g}/\text{m}^3$  (1-hour average) and 1  $\mu\text{g}/\text{m}^3$  (annual average).
- Operational Emissions: To supplement the aforementioned assessments of PM and NO<sub>2</sub>, permitted criteria pollutant mass emissions were compared to applicable SCAQMD pollutant-specific daily significance thresholds for operational emissions.

### 6.2 Predicted Impacts

This section presents predicted impacts estimated from the refined modeling results. For each pollutant included in the refined analysis, impacts are presented in tabular fashion. Air quality results for criteria pollutants presented in this section include estimated concentrations for both the 50<sup>th</sup> and 95<sup>th</sup> percentile emission estimates at both short- and long-term exposure periods. These concentrations were compared to the appropriate threshold concentrations, and any exceedances are noted. In all cases (all pollutants), the results in this section are presented for each of the three meteorological station locations evaluated (i.e., Azusa, and Burbank, and La Habra), but only the highest result from the three modeled years is presented here (recall that three years of meteorological data were modeled, with each year modeled individually). Additional results, including results from all three modeled years, are presented in various tables appended to this report.

In general, the estimated impacts were relatively low for the representative permits assessed, with most estimates below levels of significance. In many cases, permitted emissions for which the estimated air quality impacts exceeded thresholds of significance (i.e., “exceedances” as indicated in the tables that follow) were of the magnitude that the threshold was not exceeded by a large amount, and likely within the margin of error considering the uncertainties and variability associated with this analysis. See Table 11 for a summary of threshold exceedances by pollutant.

**Table 4. Summary of Refined Analysis: Number of Permits Exceeding the Thresholds of Significance**

Criteria Pollutant	Time Scale	Number of Categories with at Least One Exceedance		Permit Categories with Significant Impacts
		50 <sup>th</sup> % <sup>ile</sup> Emissions	95 <sup>th</sup> % <sup>ile</sup> Emissions	
<b>Criteria Pollutants</b>				
NO <sub>x</sub>	1-hour	0	0	Any exceedances are due to background concentrations
	Annual	0	0	Any exceedances are due to background concentrations
PM	24-hour	3	6	Spray booth and equipment; tar pot; blasting; equipment process; turbine engine > 50 MW; asphalt
	Annual	1	2	Spray booth and equipment; equipment process; asphalt

NO<sub>x</sub> = Nitrogen oxide, PM = Particulate matter, MW = Megawatt

## 6.2.1 Air Quality Impacts

Assessment of operational emissions for the permit categories included in the refined assessment resulted in some estimated offsite ambient air pollutant concentrations exceeding the SCAQMD threshold of significance. Summaries of the maximum ambient concentrations for each permit category for each of the three representative worst-case locations in the SCAQMD and by pollutant for PM and NO<sub>2</sub> are displayed in Tables 12 through 16, with threshold exceedances noted in bold.<sup>9</sup> The concentrations shown are the maximum values at each site that occurred over the three-year period of 2005 to 2007. See Appendix C3 of this report for the concentrations at each meteorological station for all three years modeled.

### Particulate Matter

For PM<sub>2.5</sub>, three categories resulted in potential impacts at the 50<sup>th</sup> percentile emissions: Tar Pots, Blasting (abrasive), and Equipment Processing (typically cement processing). Exceedances were estimated for all three permit categories for the maximum 24-hour time period; the annual threshold was also exceeded for equipment processing. Of these

<sup>9</sup> Few exceedances were observed in the screening analysis for CO and SO<sub>2</sub>. It was assumed that these few permits would pass using more refined modeling methods.

permit categories, only emissions modeled for the Tar Pot category resulted in ambient concentrations exceeding the threshold value by a substantial amount, with exceedances observed for all three meteorological stations modeled. Tar Pot emissions include emissions both from molten asphalt inside the kettle and from the combustion of liquefied petroleum gas (used to heat the asphalt).

At the 95<sup>th</sup> percentile emission rate, three additional permit categories were modeled as exceeding thresholds of significance, including Spray Booths, Turbine Engines > 50 megawatts (MW), and Asphalt. Tar Pots again was estimated to exceed the threshold by the largest interval, with exceedances again only estimated for the 24-hour averaging period (it was assumed that tar pots would not remain in one location for a long duration; thus, the annually-averaged exposures are relatively low). The Blasting permit category also showed potential for exceedance of the 24-hour threshold level. Sources covered by Tar Pots and Blasting permits were assumed to operate for fewer weeks per year and days per week than most other categories, which results in this increase in modeled 24-hour concentrations.

**Table 5. PM2.5 Maximum Concentration over 3 years (2005-2007) with 50<sup>th</sup> Percentile Emissions**

Permit Category	Time Scale	Estimated Proposed Project Concentration (µg/m <sup>3</sup> )			Threshold (µg/m <sup>3</sup> )
		Azusa	Burbank	La Habra	
Spray Booth and Equipment	24-hour	1.2	1.4	1.7	2.5
	Annual	0.46	0.33	0.47	1
Heater/Furnace	24-hour	0.59	0.58	0.39	2.5
	Annual	0.13	0.13	0.13	1
Tar Pot	24-hour	<b>9.2</b>	<b>8.8</b>	<b>12.5</b>	2.5
	Annual	0.07	0.06	0.07	1

<sup>a</sup> = Incremental impacts for 50th percentile emissions may be higher than 95th percentile emissions in cases where the stack parameters for 95th percentile emission were higher than the 50th percentile stack parameters. ICF used both average NEI stack parameters and a review of their representativeness for both the 50th and 95th percentile to select stack parameters that were appropriate for both the facility type and emission intensity. The

assignments for stack parameters were reviewed and evaluated for appropriateness as discussed in section 5.2.3. Appendix C4, Table C4-9, provides the stack parameters used for each permit in the refined modeling.

b- Tar pots and sandblasting equipment assumed to be portable equipment is exempt from modeling under Regulation XIII and could create significant impacts.

c – It should be noted that permits in this category are subject to air quality modeling under Regulation XIII and will not receive permits if they are projected to exceed Regulation XIII significance thresholds , which are the same as CEQA thresholds.

## NO<sub>2</sub>

Background concentrations were added to the incremental NO<sub>2</sub> concentrations obtained from AERMOD modeling. Table 14 presents the background values added to the maximum incremental concentrations at each meteorological station in 2005, 2010, and 2030. The background concentrations exceed the SCAQMD ambient air threshold at the Burbank and Azusa locations in 2005 and at the Azusa location in 2030. The gridded background concentrations of NO<sub>2</sub> were provided by SCAQMD to ICF. SCAQMD modeled future NO<sub>2</sub> concentrations to conduct a parallel cumulative analysis.

As per the 2007 Air Quality Management Plan, adopted by the district to demonstrate the attainment of ozone eight-hour NAAQS, several regulations and technological advances are expected to significantly decrease basin-wide NO emissions in the future. Since NO<sub>2</sub> is produced in the atmosphere from the oxidation of NO, a decrease in future NO emissions generally decreases future NO<sub>2</sub> concentrations. However, some individual locations may deviate from this trend because the local or upstream growth in emissions may outpace emission reductions. Consequently, future NO<sub>2</sub> concentrations at most locations in the basin show a decrease. Burbank deviates from this trend for the annual NO<sub>2</sub> concentration.

Tables 15 and 16 show the maximum incremental concentration across the years 2005 and 2007 at each meteorological station for NO<sub>2</sub> estimated by the AERMOD modeling. In all cases where the background concentrations are below the state standard, the total NO<sub>2</sub> concentration (i.e., incremental plus background) are also below the SCAQMD ambient standard.

## Screening-Level Results: Threshold Exceedances by Permit Category

In the next three tables, the value in the “No Impact” column indicates the number of permits for which pollutant-specific emissions did not exceed the SCAQMD ambient air quality localized significance threshold. The value in the “Exceeds Threshold” column indicates the number of permits for which pollutant-specific emissions did exceed the indicated SCAQMD significance thresholds. “Total” is the number total number of permits in the indicated permit category for that pollutant included in the screening assessment. A dash (“-”) indicates that no permits in that category report the indicated pollutant.

**Table C2-4. Screening Results: Number of Permits Exceeding Thresholds by Permit Category – Long-term Criteria**

Permit Category	CO, including background			NOx, incremental			PM10, incremental			SOx, including background		
	No Impact	Exceeds Threshold	Total	No Impact	Exceeds Threshold	Total	No Impact	Exceeds Threshold	Total	No Impact	Exceeds Threshold	Total

MW = megawatt

a) No Impact denotes the permits for which pollutant-specific emissions did not exceed the SCAQMD ambient air quality localized significance threshold. Significant Impact denotes the permits for which pollutant-specific emissions did exceed one or more SCAQMD ambient air quality localized significance thresholds.

MW = megawatt

a) No Impact denotes the permits for which pollutant-specific emissions did not exceed a cancer risk of 10 in a million or a chronic or acute hazard index of 1. Significant Impact denotes the permits for which pollutant-specific emissions did exceed a cancer risk of 10 in a million or a chronic or acute hazard index of 1.

**Table C2-6. Number of Permits Exceeding the Operational Emission Rate Threshold by Permit Category**

The operational emission rate thresholds are 550 pounds per day for carbon monoxide (CO); 55 pounds per day for nitrogen oxides (NO<sub>x</sub>), volatile organic carbons (VOCs), and particulate matter (PM<sub>2.5</sub>); and 150 pounds per day for sulfur oxides (SO<sub>x</sub>) and particulate matter (PM<sub>10</sub>).

Permit Category	CO	NO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>x</sub>	VOC

# Development of Meteorological Zones for Dispersion Modeling of Emissions from Individual Facilities

Refined air dispersion modeling of pollutants from representative facilities requires hourly meteorological data. This data includes key meteorological parameters such as hourly average of wind speed, wind direction, and measures of atmospheric stability that together determine the ambient concentration of air pollutants from permitted facilities at a given receptor location. The unique geographic and topographic features of the South Coast Air Basin (SCAB) cause a significant variation in meteorological conditions between various parts of the basin, which in turn lead to varying levels of air quality and health impacts from permitted facilities depending on the location of the facilities. Since it is expected that a large number of dispersion modeling runs will be required to determine ambient air quality impacts from representative facilities of permitted categories selected for refined modeling, it is not feasible to apply all possible variations of meteorological conditions that occur in the SCAB. Therefore the approach taken in this study was to identify a limited number of zones with similar meteorological characteristics and select representative locations within the zones. Furthermore, since there is no particular location associated with representative facilities, so that these facilities could potentially be installed anywhere in the basin, the choice of locations for the meteorological data should be made conservatively in order to calculate the impacts that are likely to be highest. This section presents the analysis conducted to determine boundaries of meteorological zones, to determine which of these zones is most conducive to high ambient concentrations, and to select representative meteorological stations within those zones for conducting refined air dispersion modeling.

## Description and Processing of Meteorological Data

Two meteorological datasets were obtained from the South Coast AQMD. The first dataset was the output of the MM5 prognostic meteorological model that was developed by the AQMD for the year 2005. This gridded meteorological data was incorporated into various air quality modeling studies by the AQMD, including demonstrating the attainment of federal 8-hour ozone and PM<sub>2.5</sub> standards.

The MM5 modeling domain encompasses the SCAB and surrounding areas at a 5x5 km horizontal grid resolution. The vertical structure of MM5 domain consists of 30 layers defined in a terrain-following sigma coordinate system based on a normalized pressure index ( $\sigma$  levels), and extends up to 15,000 m above ground level (AGL). For each grid location, the MM5 dataset contains hourly values of all meteorological variables required for the refined local scale air quality modeling. These include horizontal and vertical components of wind, temperature, sensitive heat flux, and frictional velocity. As proposed in the protocol, the MM5 data was utilized to evaluate the variability of meteorological conditions in the basin and define appropriate zones for refined air quality modeling. In order to perform this analysis, ICF Jones and Stokes developed a set of customized tools to extract meteorological variables of interest from large binary MM5 output datasets. Since the MM5 data is reported on a staggered grid, where vector variables are computed on the edges of the grid cell and scalar variables at the center of grid cells, necessary interpolation was performed in order to obtain all meteorological parameters at the center of the grid cell.

The second dataset is comprised of AERMOD-ready meteorological files, covering three years, at 25 monitoring locations in the SCAB. This data was recently developed for the SCAQMD using the hourly meteorological observations from the years 2005 – 2007 and is intended to facilitate the district's permitting process. Although the MM5 data are being used in the parallel cumulative portion of this

study, based on the discussions with the SCAQMD staff, it was decided to use the AERMOD-ready observational data to conduct the refined air dispersion modeling because these data cover a three-year period and therefore can better represent long-term meteorological conditions. In addition, this is the dataset that will be used in the future permitting assessments that are the subject of the analysis.

## Variability of Meteorology in the SCAB

The topography of the SCAB region is defined by San Gabriel and San Bernardino Mountains on the North, and by the San Jacinto Mountains on the east. The mountains on the perimeter of the basin encompass a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean on the west. These topographic features have significant bearing on the transport of pollutants in the region and leads to a wide range of air quality concentrations. In addition, the geographic extent of the region – 300 km from West to East and 150 km from South to North – results in natural variability in meteorological conditions.

The variability in dispersion characteristics of air pollutants from permitted facilities in SCAB can be quantified by analyzing the variability in meteorological parameters across the basin. Wind speed and atmospheric stability play a major role in determining how an emitted material is dispersed. High wind speed results in atmospheric transport of pollutant to a greater distance and leads to lower ambient concentrations near the emission source. Conversely, lower wind speed leads to generally high ambient concentrations in the areas in close proximity to the emission source.

Atmospheric stability is a measure of resistance to the vertical motion of air parcels in the atmosphere. Stability can be broadly classified as stable, neutral and unstable. Stable atmospheric conditions restrict the vertical movement of air parcels thus creating conditions conducive for the accumulation of pollutants near the surface. Unstable atmospheric conditions accelerate the vertical movement of air parcels and promote the dispersion of pollutants. At neutral conditions, the dispersion of pollutants depends mostly on the wind speed. Therefore, geographic variation in atmospheric stability characteristics will lead to variability in dispersion characteristics. Historically, stability has been characterized into six stability classes, A – F where A is most unstable and F is stable, based on the criteria developed by Pasquill in 1961. This classification is based on surface wind speed, incident solar radiation and cloud cover. However, more recently the stability parameter recognized as most appropriate for the surface layer is the Monin-Obukhov length (L), where L is the ratio of the rate of production of the turbulence by shear to the rate of production of turbulence by buoyancy and is calculated as:

$$L = -\rho c_p T u_*^3 / k g H$$

where T is ambient temperature in Kelvin (K),  
ρ is the density of dry air (kg/m<sup>3</sup>),  
u<sub>\*</sub> is the surface friction velocity,  
c<sub>p</sub> is the specific heat capacity of dry air (J/kg/K),  
k is the von Karman constant (0.4),  
g is the acceleration due to gravity (m/s<sup>2</sup>), and  
H is the sensitive heat flux (W/m<sup>2</sup>).

To account for any tall stacks at permitted facilities that may extend beyond the lowest layer, for each grid cell wind speeds in the 6 lowest vertical layers and up to 0.96 σ were extracted from the MM5 data and averaged for every hour. The 6 lowest layers typically cover the first 310 m above the ground

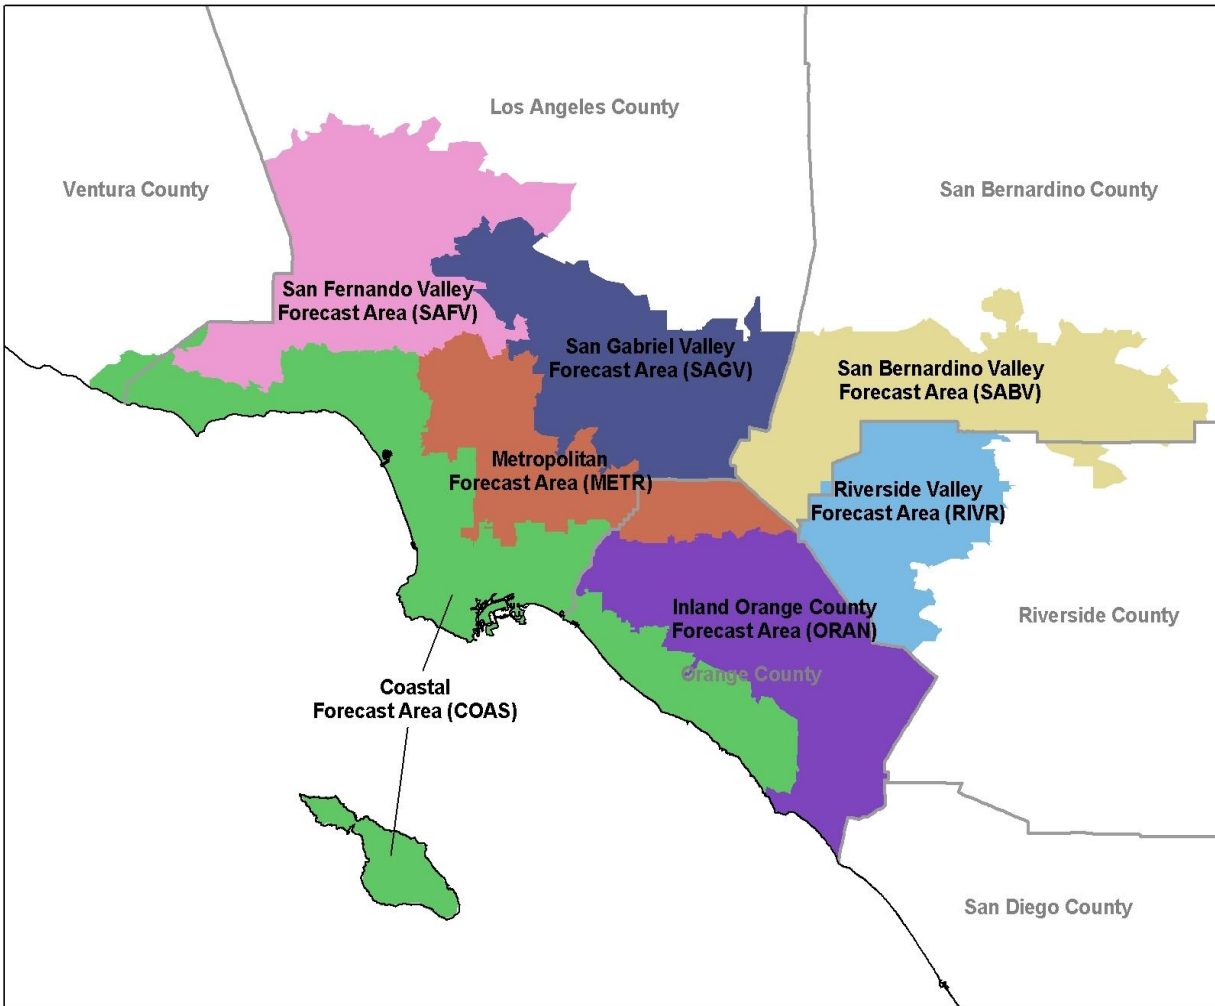

level. All other parameters needed for the determining the Monin-Obukhov length are also extracted from MM5 data for each grid cell.

Since  $L$  is a continuous function, discrete stability bins are required to conduct the analysis. Golder (1972) provides a relationship between atmospheric stability class and Monin-Obukhov length as a function of surface roughness length. This relationship was used to derive the seven Pasquill-Gifford-Turner (PGT) stability classes for each grid cell at every hour. PGT stability classes range from 1 to 7 with the following interpretation: Extremely Unstable (1), Unstable (2), Slightly Unstable (3), Neutral (4), Slightly Stable (5), Stable (6), and Extremely Stable (7). Surface roughness length was obtained from the AERMOD-ready meteorological data files.

The geographic variability of wind speed and atmospheric stability in the SCAB was first analyzed using the SCAQMD's classification of the SCAB into air quality forecast areas. The SCAB is divided into fourteen general forecast areas in order to inform the general public of air quality conditions. Figure C3-1 shows a map of all forecast areas in the district. The delimitation of these forecast areas is based on air transport features in the valley, political and postal boundaries. If the variability is sufficiently minimal across these areas, representative meteorological zones may be developed by aggregating the forecast areas. For this analysis, seven forecast areas were considered: Coastal (COAS), Metropolitan (METR), San Fernando Valley (SAFV), San Gabriel Valley (SAGV), Inland Orange (ORAN), Riverside Valley (RIVR), and San Bernardino Valley (SABV). These seven forecast areas are regions in the basin where the vast majority of the population in the District resides and most of the permits are issued.

Tables C3-1 and C3-2 show the variation in wind speed among the seven forecast areas based on analysis of the MM5 data for each of the four seasonal periods – Spring (March – May), Summer (June – August), Fall (September – November) and Winter (December – February). The highest wind speeds are predicted in the north of the basin throughout the year while inland areas experience the lowest. Higher wind speeds are generally predicted to occur during the winter, while summertime has lower wind speeds. Correspondingly, the variation in wind speeds among forecast areas is higher during winter than rest of the year. However, the lower quartile wind speed shows significant variation among forecast areas throughout the year and is likely to lead to wide variation in the air quality impacts. Similarly, median wind speeds also vary considerably among the forecast areas. Table C3-3 shows the distribution of atmospheric stability conditions for each of the forecast areas. While the forecast areas that are inland (RIVR, SABV) have high fractions of hours with stable atmospheric conditions, coastal forecast areas (COAS, METR, and ORAN) generally experience high fractions of hours with unstable atmospheric conditions, likely due to the onshore wind from the Pacific Ocean.

In order to quantify the degree of similarity or dissimilarity of meteorological parameters among the forecast areas in the SCAB, the ICF Jones and Stokes calculated the joint frequency distribution of wind speed and stability class for each grid cell and also for each forecast area.<sup>1</sup> For this analysis it was assumed that dispersion characteristics at hours that are within a given stability class *and* wind speed bin combination are similar. For example, all hours with stable atmospheric conditions and wind speeds in the lowest quartile – often occurring during the nighttime – are expected to result in high ambient concentrations from emitted sources. At the other extreme, meteorological conditions at hours with unstable atmospheric conditions and wind speeds in the highest quartile result in rapid dispersion of the emitted plume. Similarly, other stability class and wind speed combinations are assumed to aggregate hours with common dispersion characteristics. Therefore, the similarity in dispersion characteristics between any two grid cells can be quantified by calculating the vector distance between the joint frequency distribution vectors.

Stability classes were aggregated into the following three categories for the purposes of calculating joint frequency distribution vectors:

- Unstable (PGT classes 1, 2 and 3),
- Neutral (PGT class 4) and
- Stable (PGT classes 5, 6, and 7).

Wind speed was distributed into four bins with cut-off value based on the quantiles of wind speed distribution of the whole domain. Therefore, the joint frequency distribution vector consisted of 12 elements – i.e. 12 wind speed and stability class combinations.

In order to compare the similarity or dissimilarity among forecast areas, the joint frequency vector is calculated for each season after aggregating the wind speed and stability data for all hours and all grid cells within each of the forecast areas. In addition, the joint frequency vector is also calculated for all grid cells within the entire domain under the analysis – i.e., all grid cells in the seven forecast areas. Table C3-4 shows the vector distances<sup>2</sup> between forecast area pairs for each of the season. The larger the distance, the higher is the dissimilarity between the two forecast areas in dispersion characteristics. As expected, there is significant dissimilarity between the inland forecast areas (RIVR and SABV) and coastal forecast areas (COAS). This trend is observed for all seasons.

The variability within the forecast areas is also analyzed using a similar approach. However, in this case, the joint frequency vectors for each grid cell are calculated and the distances between all grid cell pairs within each of the forecast areas are analyzed. Since this similarity metric is interpreted in a relative sense, the distances between grid cell pairs for the entire domain are also calculated for the comparison purposes. It can reasonably be assumed that the variability in a given forecast area is significant if the vector distance metrics for that particular forecast area are comparable to that of the entire domain. Table C3-5 shows the median and 95<sup>th</sup> percentile of vector distances between grid cell pairs within each of the forecast areas. The Metropolitan (METR) forecast area has least variability while the Coastal (COAS), San Bernardino Valley (SABV), and San Gabriel Valley (SAGV) areas show high

---

<sup>1</sup> Since the variance of a proportion depends upon the proportion, the joint frequency distribution vector is transformed using the arcsine transformation to stabilize the variance. Thus if  $p$  is the proportion of hours in a given bin, then transform  $p$  to  $f(p) = \arcsin(\sqrt{p})$ , except for  $p = 0$  or  $1$  where  $f(0) = \arcsin(\sqrt{1/2n})$  and  $f(1) = \arcsin(\sqrt{1-1/2n})$ , based on  $n$  hourly values. The variance of the transformed frequency distribution is approximately independent of  $p$ , although it will depend on  $n$ . The transformed values will also tend to be more closely approximated by the normal distribution.

<sup>2</sup> The vector distance is calculated as the chi-squared distance. To compare two grid cells, for each of the 12 wind speed and stability class bins, compute the proportions of hours in that bin,  $p_1$  and  $p_2$ . Also compute  $N$ , the total number of hours in that bin summed over all grid cells. The chi-square distance is the square root of the sum of  $(p_1 - p_2)^2 / N$ , summed over all 12 bins. Dividing by  $N$  stabilizes the variance by accounting for the fact that the more frequent bins have higher variances. A similar calculation applies when comparing two forecast areas.

variability that is comparable to that of the entire domain. This trend is generally consistent across all the seasons, although higher variability is generally observed during the Winter season.

Since the analysis of dispersion characteristics within the forecast areas suggested that the variability is significant, an alternative approach – cluster analysis – was used to re-group the MM5 grid cells into zones with similar meteorological conditions that are more closely matched and is described in the following section.

## Development of Meteorological Zones Using Hierarchical Clustering Approach

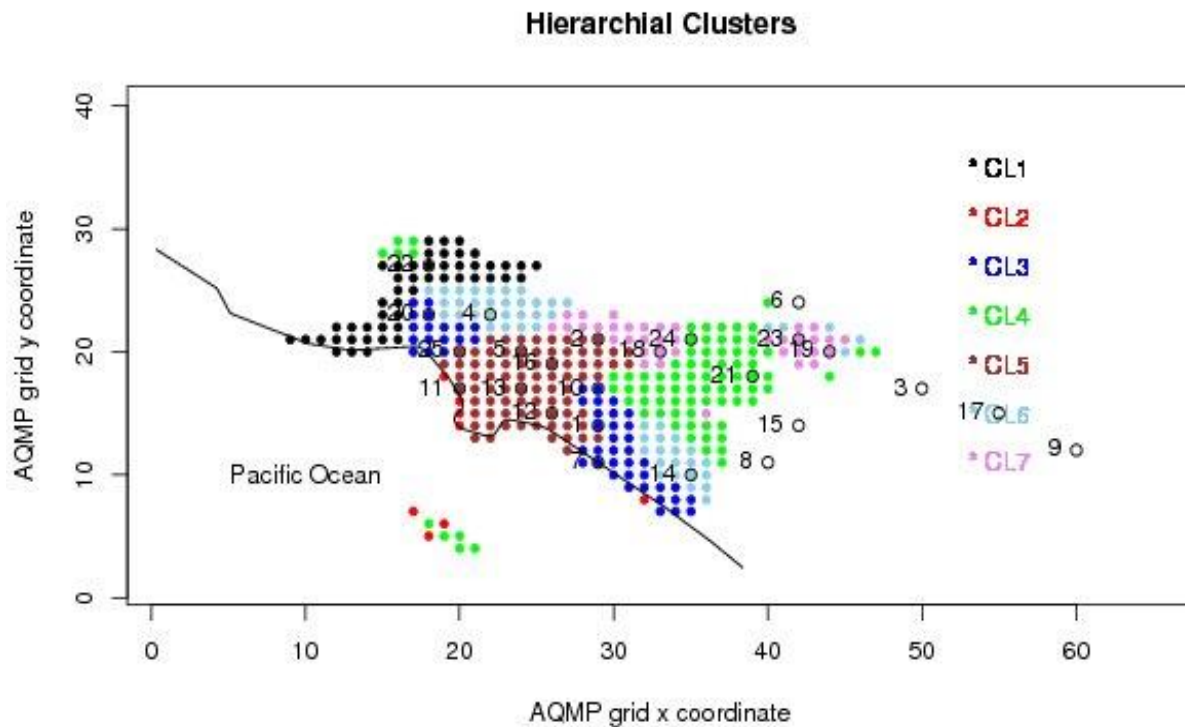

Hierarchical clustering is a statistical technique to divide a set of objects into groups with similar properties based on a similarity metric. In order to obtain regions with similar meteorological features from the perspective of pollutant dispersion, a hierarchical clustering method is applied to develop clusters of grid cells using the MM5 meteorological data. Although several meteorological parameters determine the dispersion properties of the air pollutants and resulting ambient concentrations, wind speed and atmospheric stability play a dominant role.

For clustering analysis, a vector of the arc sine-transformed joint frequency distribution of wind speed and stability class was calculated for each grid cell based on the hourly data as described above. Like the similarity analysis for the forecast areas described above, it was assumed that dispersion characteristics at hours that are within a given stability class and wind speed bin combination are similar. The cluster analysis was used to generate zones that have similar meteorological dispersion characteristics by combining grid cells in such a way as to minimize the difference between the arc sine-transformed joint frequency distribution vectors within each zone.

Hierarchical clustering is a group of techniques that proceed through a sequence of steps and are broadly divided into agglomerative or divisive methods. In agglomerative methods, which are most widely used clustering techniques, initially all data points are individual clusters in themselves. In subsequent steps, “nearby” clusters are joined, where distances are defined using the similarity metric, and the various clustering schemes differ on how the similarity is defined between two clusters. In divisive methods, all data points are initially in one cluster and are separated into finer groupings in the subsequent steps. For this analysis, Ward’s agglomerative scheme was used and the distance between two grid cells was defined as the Euclidean distance between the vectors of the arc-sine transformed joint distribution of wind speed and atmospheric stability class. The resulting clusters of grid cells are considered as meteorological zones with similar dispersion characteristics.

Figure C3-2 shows the grid cells grouped into seven meteorological zones. The locations of meteorological stations are also shown (the numerical labels correspond to those in Table C3-6). The largest zone includes most of the Los Angeles County and includes several meteorological stations. Most of the inland grid cells also form a meteorological zone. The smallest zone contains only six grid cells and does not include any meteorological station. Although a large fraction of grid cells in a given zone are geographically contiguous, a small number of grid cells from various zones are distributed throughout the basin. This is attributed to the complex topography of the region which plays a significant role in determining the wind speed. Note that only the grid cells that are inside the seven forecast areas previously specified are included in the clustering analysis. Consequently, some SCAQMD meteorological stations are outside the seven meteorological zones. Table C3-6 contains the location of meteorological stations in the basin and identifies their respective zones.

**Figure C3-2. Grid Cells in Seven Meteorological Zones Obtained Using Hierarchical Clustering of Meteorological Data.**

<sup>1</sup> Forecast areas are labeled as follows: Coastal (1), San Fernando Valley (2), Metropolitan (3), Inland Orange (4), San Gabriel Valley (5), San Bernardino Valley (6) and Riverside Valley (7).

<sup>2</sup> Station outside the area of clustering analysis.

## Selection of Meteorological Cluster Zones and Representative Meteorological Stations

The meteorological zones that are most conducive to higher ground-level ambient concentrations were determined based on AERMOD simulations using the AERMOD-ready data for the meteorological stations within each cluster zone. In addition to meteorology, stack parameters also have significant influence on ambient concentrations resulting from a given emission source. Therefore, AERMOD simulations were performed using the data from each SCAQMD meteorological station combined with two sets of representative stack parameters.

- 1) Stack parameter set I: elevated stack
- 2) Stack parameter set II: low-level stack

A uniform emissions profile was assumed for the stacks and resulting maximum 24-hour averaged concentrations are analyzed in order select the meteorological stations for the refined air quality modeling.

The results are summarized in Table C3-7. Figures C3-3 and C3-4 show the maximum 24-hour average ambient concentrations for each meteorological station grouped according to the meteorological cluster group and forecast area, respectively, for representative stack I. Similarly, Figures C3-5 and C3-6 show the maximum 24-hour average ambient concentrations obtained using the representative stack II. In both cases the results show that concentrations vary more widely within the forecast areas than within the meteorological cluster groups ..

Examination of Table C3-7 and Figures C3-3 and C3-5 suggest that the meteorological cluster zones with the most adverse meteorological conditions are likely to be zones 3, 5, and 6.

The meteorological stations selected to be representative of these zones were as follows:

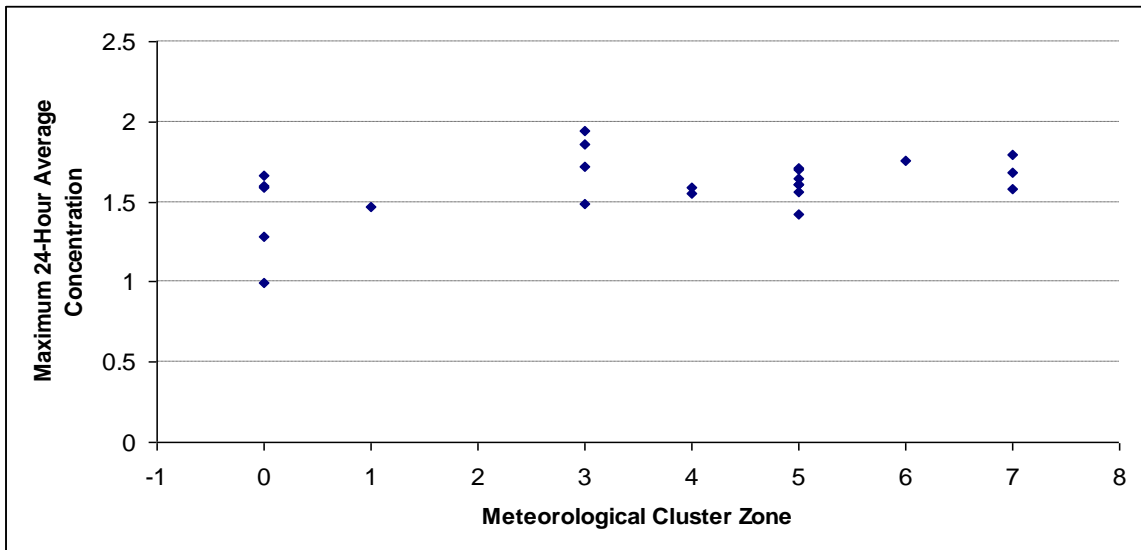

Cluster zone 3 – La Habra (LAHB) in Orange County  
Cluster zone 5 –Azusa (AZUS) in Los Angeles County, and  
Cluster zone 6 – Burbank (BURK) in Los Angeles County.

**Table C3-7. 24-hour Maximum Concentrations Using Data from All Meteorological Stations in the SCAB for Two Sets of Stack Parameters**

<b>Meteorological Station</b>	<b>Meteorological Zone</b>	<b>Ambient Concentration from Elevated Stack</b>	<b>Ambient Concentration from Low-Level Stack</b>

	Asphalt	475391	441464	NEI SCC default

MW = Megawatt

- a) “NEI SCC default” indicates that the SCC-specific default stack parameters developed by USEPA for NEI were used. “Calculated median from NEI” indicates that typical stack parameters were calculated as a part of the current analysis by estimating the median exposure concentration from available SCC-specific NEI records and using the corresponding stack parameter values. Unless otherwise specified, the same stack parameters were used for the assessment of 50th and 95th percentile emissions estimates for the listed permit categories.

## Operating Schedules for Refined Analysis

## **APPENDIX D**

---

### **GREENHOUSE GAS EMISSIONS ANALYSIS**

## **INTRODUCTION**

This document describes the methods used to estimate greenhouse gas (GHG) emissions associated with implementation of the South Coast Air Quality Management District (SCAQMD) Proposed Rule 1315 program. The granting of offsets to a permit applicant under Proposed Rule 1315 would result, after the permittee's facility begins operation, in emissions occurring that would not have occurred in the absence of the use of offsets. This methodology explains how the GHG emissions that would be associated with the offset usage were estimated. There are four evaluations to this appendix: 1) direct GHG impacts from the proposed project (starting in year 2010); 2) the cumulative GHG impacts from the proposed project (starting in year 2007); 3) the GHG impacts from the power plants eligible for offsets under legislation; and 4) the total cumulative GHG impacts from the proposed project and power plants.

## **DIRECT GHG IMPACTS FROM PROPOSED PROJECT**

The GHG emissions analysis for the proposed project, as described in Chapter 2, is based on Basin-wide 2002 source category emissions data from the 2007 AQMP that includes sources seeking exemptions from federal offset requirements or Priority Reserve credits through either Rule 1304 or 1309.1. Offsets used to demonstrate equivalency with federal offset requirements would be tracked pursuant to PR 1315. Basin wide year 2002 GHG emissions were calculated as part of the 2007 AQMP. The GHG pollutants that were included in the AQMP calculations were carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous oxide (N<sub>2</sub>O). Emissions of these pollutants were reported as CO<sub>2</sub> equivalent based on the global warming potentials (GWP) used by CARB in its AB32 scoping plan. The GHG analysis for the proposed project includes all six pollutants including CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride (SF<sub>6</sub>).

For purpose of this analysis, GHG (CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O) emissions and their corresponding criteria pollutant emissions were extracted from the 2007 AQMP basin wide inventory for R1304 and R1309.1-related source categories only. Affected source categories include fuel combustion (e.g., electric utilities, petroleum refining, food and agricultural processing, etc.), waste disposal (e.g., landfills, sewage treatment, etc.), cleaning and surface coatings (e.g., printing, degreasing, etc.), and industrial processes (e.g., chemical, mineral and metal processes, electronics, etc.) The inventory for the combustion sources was based on fuel-use data and the inventory for the non-combustion sources was based on the methane emissions from the total organic gases (TOG) inventory and CARB profiles. The 2007 AQMP CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions inventory from both combustion and non-combustion sources are shown in Table D-1. According to the 2007 AQMP, the CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions from all affected major source categories totaled 72 million MT per year. In order to calculate the GHG emissions from the proposed project without

specific knowledge of the affected equipment types, sizes, operation activity, ratings, load factors, etc., a ratio was derived to correlate criteria pollutants to CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions using the latest 2007 AQMP emissions data (see Table D-1). In order to determine the share of total GHGs represented by stationary source emissions from the industry categories eligible for permits under Rules 1309.1 and 1304, staff determined the share of total AQMP stationary source combustion emissions of SO<sub>x</sub> that is represented by SO<sub>x</sub> emissions from the relevant industry categories. SO<sub>x</sub> emissions were selected as a surrogate to prorate the CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions because SO<sub>x</sub> emissions result primarily from sulfur contained in fossil fuels. The primary fuel used for stationary source combustion in the South Coast region is natural gas. To a much smaller extent diesel fuel is used by emergency backup engines used during periodic engine testing and maintenance and when there is a power outage. For both fuel types, the control levels for SO<sub>x</sub> between existing equipment and the new equipment (PR1315 users) are the same. Therefore, SO<sub>x</sub> provides a more direct linkage than other pollutants to estimate the corresponding CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions. Total SO<sub>x</sub> emissions from all affected major source categories are 931 tons per year. Table D-1 provides a list of the affected source categories, CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions, CO<sub>2</sub>e emissions and corresponding SO<sub>x</sub> emissions from the 2007 AQMP.

In order to account for the remaining GHGs including hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF<sub>6</sub>), a ratio was calculated based on the statewide inventory of high GWP pollutants (HFCs, PFCs, SF<sub>6</sub>) to statewide GHG emissions inventory from all sources qualified for offsets under the proposed project (e.g., commercial, industrial, etc). Table D-2 provides the statewide inventory values over a three-year period and determines a ratio of HFCs, PFCs, and SF<sub>6</sub> emissions within the total GHG emissions from all sources. Specifically, the ratio was calculated by dividing the total high GWPs by the total GHG emissions from all affected sources (14.48/223.32 = 0.065).

Source: CARB GHG Inventory (<http://www.arb.ca.gov/cc/inventory/data/data.htm>)

By applying the ratio of high GWPs to all GHG sources (0.065) to the CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emissions from 2007 AQMP (72 million MT/year), the total amount of GHG emissions of all AQMP sources can be determined ( $72 \times 1.065 = 76.68$ ). Thus, a ratio of 76.68 million MT/year of total GHG emissions to 931 tons per year of total SO<sub>x</sub> emissions ( $76.68/931 = 0.0824$ ) from the 2007 AQMP, the total GHG emissions from the proposed project can be calculated using the estimated SO<sub>x</sub> emissions from the proposed project. Estimated SO<sub>x</sub> emission from the proposed project are listed in tons per day in Chapter 4.1 (Air Quality Direct Impacts) and converted into tons per year in Table D-3 in order to properly multiply by the ratio factor, which is based on SO<sub>x</sub> emissions in tons per year. The years listed in Table D-3 are time periods leading to each attainment date (e.g., demonstrate attainment of the PM<sub>2.5</sub> standard with reduction occurring by year 2014, demonstrate attainment of the ozone standard with reductions occurring by year 2023, and the estimated end of the project in year 2030).

**TABLE D-3**

**SO<sub>x</sub> Emissions and Greenhouse Gas Emissions from the Proposed Project  
(Starting in 2010)**

<b>Attainment Year Periods</b>	<b>Proposed Project SO<sub>x</sub> Emissions (tons/day)</b>	<b>Proposed Project SO<sub>x</sub> Emissions (tons/year)</b>	<b>AQMP SO<sub>x</sub> to GHG Emissions Ratio</b>	<b>Proposed Project GHG Emissions (million MT CO<sub>2</sub> eq /year)</b>
2010-2014	0.16	58.4	0.0824	4.81
2010-2023	0.49	178.85	0.0824	14.74
2010-2030	0.74	270.1	0.0824	22.26

The estimated increase of 4.81 million MT CO<sub>2</sub>e/yr by 2014, 14.74 million MT CO<sub>2</sub>e/yr by 2023, and 22.26 million MT CO<sub>2</sub>e/yr by 2030 as a result of the proposed project is greater than the SCAQMD's GHG significance threshold of 10,000 MT CO<sub>2</sub>e/yr for projects in which SCAQMD is lead agency. As such, potential GHG emissions from the proposed project are concluded to be cumulatively considerable and, thus, significant.

The same methodology is used to determine GHG emissions from each of the alternatives.

### **CUMULATIVE GHG IMPACTS FROM THE PROPOSED PROJECT**

The cumulative GHG emissions are different from the direct GHG impacts from the proposed project as it evaluates the impact from the issuance of offsets from year 2007 compared to year 2010 as part of the proposed project. Using the same methodology described above, the

cumulative GHG impacts using the same SOx emissions to total GHG emissions ratio from the 2007 AQMP inventory to determine the cumulative GHG emissions. As discussed above, the total GHG emissions includes all six pollutants including CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O, HFCs, PFCs, and SF<sub>6</sub>. As discussed later in this appendix, three power plants may be eligible under current or pending legislation to access the SCAQMD’s internal offset accounts. Thus, the impacts from the legislation are not a direct impact from the proposed project (re-adoption of Rule 1315) but rather a related cumulative impact. In addition, one power plant will be required to a mitigation fee for SOx offsets that will be used to fund emission reduction projects that would reduce the cumulative GHG impact because the SOx is used to calculate the GHG emissions. GHG emissions from the three power plants have been evaluated and will be presented later in the appendix. Table D-4 shows the cumulative impacts from the proposed project without the power plant and mitigation fee impacts.

**TABLE D-4**

(Starting in 2007)**

<b>Attainment Year Periods</b>	<b>Cumulative Proposed Project SOx Emissions (tons/day)</b>	<b>Cumulative Proposed Project SOx Emissions (tons/year)</b>	<b>AQMP SOx to GHG Emissions Ratio</b>	<b>Cumulative Proposed Project GHG Emissions (million MT CO<sub>2</sub> eq /year)</b>
2007-2014	0.29	106.22	0.0824	8.79
2007-2023	0.61	223.02	0.0824	18.47
2007-2030	0.86	314.27	0.0824	26.06

**CUMULATIVE GHG IMPACTS FROM POWER PLANTS ELIGIBLE  
UNDER AB1318 AND PENDING SB388**

Power plant facilities per Assembly Bill (AB) No. 1318, proposed Senate Bill (SB) 388, and possible future legislation would require transfer of emission reduction credits for certain pollutants from SCAQMD’s internal credit accounts to eligible electrical generating facilities and exempt from CEQA from certain actions undertaken. AB 1318 would repeal on January 1, 2012 and proposed SB 388 would sunset on January 1, 2013. Under AB 1318, pending SB 388 and potential future legislation, at the time the analysis was performed, it was reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD’s internal accounts. The three power plants are not directly affected by PR 1315, but indirect environmental impacts from the siting, construction and operation of those facilities

are considered to be cumulatively related to the proposed project (CEQA Guidelines §15130(a)(1)). The three power plant projects, CPV Sentinel Energy (Sentinel), Walnut Creek Energy Park (Walnut Creek) and NRG's El Segundo Power Redevelopment (El Segundo) were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). Since the analysis was performed, El Segundo has received its permits under a Rule 1304 exemption.

The CEC did not include greenhouse (GHG) impacts in the FSAs for the El Segundo and Walnut Creek projects. However, the FSA prepared by the CEC for the Sentinel project did include GHG emissions from both the construction and operational phases of the project. Because the primary sources of emissions are combustion stationary sources, the GHG emissions evaluated are carbon dioxide (CO<sub>2</sub>), nitrous oxide (N<sub>2</sub>O), and methane (CH<sub>4</sub>). Sulfur hexafluoride (SF<sub>6</sub>) was determined to be emitted from high voltage equipment at Sentinel, specifically from gas insulated switches. The other GHGs, such as hydrofluorocarbons (HFCs) and perfluorocarbons, are not typically byproduct emissions from combustion sources and not included in the GHG analysis for the Sentinel project. In general, GHG emissions are emitted from power plants sources such as combustion turbine generators (CTGs) during operation and start-up/shutdown; firewater pumps; black start generators; and boilers. The established methodology to equate emissions from the different GHGs is to apply a global warming potential (GWP). GWP is a measure of how much a given mass of a GHG is estimated to contribute to global warming based on a relative scale comparing the gas in question to that of the same mass of carbon dioxide (whose GWP is by convention equal to 1). Table D-5 lists the GWPs for the applicable GHGs and the emission factors for both the CTGs and engines operated at the Sentinel site.

**TABLE D-5**  
**GWPs and Emission Factors from the CPV Sentinel Project**

<b>GHG</b>	<b>Global Warming Potential (GWP)</b>	<b>CTG Emission Factor (lbs/mmBTU)</b>	<b>Engine Emission Factor (lbs/mmBTU)</b>
CO <sub>2</sub>	1	114.5	161
CH <sub>4</sub>	21	0.003	0.002
N <sub>2</sub> O	310	0.0086	0.0008
SF <sub>6</sub>	23,900	n/a	n/a

The appropriate GWP for N<sub>2</sub>O, CH<sub>4</sub> and SF<sub>6</sub> emissions was applied to each to add to CO<sub>2</sub> emissions to determine total CO<sub>2</sub> equivalence (CO<sub>2</sub>eq) in metric tons (MT). The heat and fuel input for the applicable equipment, along with the rated capacity and hours of operation, that

were provided in the FSA prepared by the CEC for the Sentinel project are listed in Table D-4. Table D-4 also shows the annual CO<sub>2</sub>eq emissions from each group of equipment. Annual CO<sub>2</sub>eq emissions are calculated by multiplying the heat or fuel input rate to the default emission factors (in Table D-3) and hours of operation for each piece of equipment.

SF<sub>6</sub> emissions are calculated using a different methodology. In that case, the capacity of SF<sub>6</sub> is needed to determine the annual emissions (one percent of capacity) and the “end of the life” emissions (70 percent of capacity). The annual emissions are multiplied by the lifetime period (30 years) and added to the “end of the life” emissions for total 30-year emissions, which are then divided by the lifetime period to determine the average annual SF<sub>6</sub> emissions. The GWP for SF<sub>6</sub> is applied to the average annual SF<sub>6</sub> emissions from one gas insulated switch to obtain the CO<sub>2</sub>eq, then converted to MT and multiplied by eight since the project has eight switches.

The CO<sub>2</sub>eq emissions from all equipment were added to calculate the total GHG emissions from the Sentinel project and can be found in Table D-6. Table D-7 lists the GHG emissions from all equipment as presented in the Sentinel FSA prepared by the CEC. The total CO<sub>2</sub>eq emissions recreated in Table D-6 and those provided in the FSA (Table D-7) are not identical due to a slight difference in rounding numbers, but comparatively the same.

\* SF6

The FSAs for the El Segundo and Walnut Creek projects provided rated capacity and hours of operation for the equipment but did not provide heat or fuel input. Using the heat input, fuel input, and default emission factors provided in the Sentinel FSA (see Table D-6), the GHG emissions from the El Segundo and Walnut Creek projects were calculated. A ratio of the rated

capacity to heat/fuel input from the Sentinel project was used to determine the heat and fuel input at the El Segundo and Walnut Creek projects. Based on the available emission factors and methodology from the Sentinel project, the CO<sub>2</sub>eq emissions from the equipment to operate the El Segundo and Walnut Creek projects could be calculated and found in Tables D-8 and D-9.

**TABLE D-8**

## TOTAL CUMULATIVE GHG IMPACTS FROM THE CUMULATIVE PROPOSED PROJECT, POWER PLANTS AND CPV SENTINEL MITIGATION FEE

Pursuant to AB 1318, CPV Sentinel will be paying a mitigation fee for SO<sub>x</sub> and PM<sub>10</sub> offsets that will be spent on emission reduction projects. Because SO<sub>x</sub> emissions have been used to determine GHG emissions, a change in SO<sub>x</sub> emissions from the cumulative proposed project would affect the resulting GHG emissions impact. SO<sub>x</sub> and PM<sub>10</sub> emissions reduced by emission reduction projects funded by the mitigation fee to be paid by CPV Sentinel have been estimated, based on current best available control technology (BACT) incremental cost effectiveness. BACT incremental cost effectiveness refers to the maximum cost per ton of emission reductions for a given pollutant specified in SCAQMD's BACT Guidelines. Table D-11 lists the minor source BACT incremental cost effectiveness that were originally adopted in the SCAQMD 1995 BACT Guidelines, adjusted to second quarter 2003 dollars and published in the July 14, 2006 SCAQMD BACT Guidelines. The adjustment was done using the Marshall and Swift Equipment Cost Index, the same index used to adjust the 2003 dollars to first quarter 2010 dollars as listed in Chemical Engineering (April 2010). Both sets of BACT incremental cost effectiveness can be found in Table D-11.

**TABLE D-11**  
**BACT Incremental Cost Effectiveness**

	<b>VOC</b> (\$/ton)	<b>CO</b> (\$/ton)	<b>NO<sub>x</sub></b> (\$/ton)	<b>SO<sub>x</sub></b> (\$/ton)	<b>PM<sub>10</sub></b> (\$/ton)	<b>PM<sub>2.5</sub></b> (\$/ton)
Minor Source BACT, July 2004	60,600	1,150	57,200	30,300	13,400	13,400
Adjusted for 2010	78,356	1,487	73,960	39,178	17,326	17,326

As noted above, CPV Sentinel will be paying a mitigation fee for SO<sub>x</sub> and PM<sub>10</sub> offsets, as adopted by the Governing Board. Table D-12 outlines the SO<sub>x</sub> and PM<sub>10</sub> emissions, based on limits set in AB1318, and the mitigation fee expected to be paid. Table D-12 also shows the daily emission reductions from the spending of the fees on emission reductions project. To calculate the daily reductions, multiply the fee to the emissions and divide by the adjusted 2010 BACT incremental cost effectiveness (listed in Table D-11). Finally, to put the life of the equipment into perspective, a capital recovery factor (CRF) is applied. It is assumed a 10-year project life (CRF factor = 0.123) and 365 days of operation per year.

**TABLE D-12**  
**CPV Sentinel Mitigation Fee and Daily Emission Reductions**

	VOC	CO	NOx	SOx	PM10	PM2.5
Sentinel Mitigation Fee (\$/lb) <sup>1</sup>	n/a	n/a	n/a	15,083	50,417	n/a
Emissions from AB1318 (lbs/day) <sup>2</sup>	n/a	n/a	n/a	38	324	n/a
CRF Factor <sup>3</sup>	n/a	n/a	n/a	0.123	0.123	0.123
<b>DAILY EMISSION REDUCTIONS (tons/day)<sup>4</sup></b>						
2010-2014 <sup>5</sup>	n/a	n/a	n/a	0.001	0.06	0.04
2010-2023 <sup>5</sup>	n/a	n/a	n/a	0.003	0.21	0.13
2010-2030	n/a	n/a	n/a	0.005	0.32	0.20

1. Based on July 13, 2007 PAR 1309.1 Zone 1 Fee
2. AB 1318 lists SOx (13,870) and PM10 (118,260) in pounds per year; assume 365 days of operation per year
3. Based on a 10-year project life; 365 days of operation per year
4. Sample Equation at 2030: SOx Fee x SOx Emissions/SOx BACT cost effectiveness x CRF/365 days/year. (15,083 x 38/39,178 x 0.123/365 = 0.005)
5. The previous years are an increment of PR1315's 20-year project life ending in 2030 (Example: 2010-2014 is 4/20 of 0.011 = 0.002 and 2010-2023 is 13/20 x 0.011 = 0.007)

The SOx emission reductions from the implementation of emission reductions projects funded by the CPV Sentinel results in corresponding GHG emissions using the same methodology as described in determining GHG emissions from the direct proposed project described earlier in the this appendix. Table D-13 calculates the GHG emission benefit by applying the AQMP SOx to GHG emissions ratio to the SOx emissions calculated in Table D-12.

**TABLE D-13**  
**SOx Emission Reductions and Greenhouse Gas Emissions Benefits from the Implementation of Emission Reduction Projects Funded by CPV Sentinel Fee**

Year	SOx Emission Reductions (tons/day)	SOx Emission Reductions (tons/year)	AQMP SOx to GHG Emissions Ratio	GHG Emission Benefits (million MT CO <sub>2</sub> eq /year)
2014	0.001	0.37	0.0824	0.03
2023	0.003	1.10	0.0824	0.09
2030	0.005	1.83	0.0824	0.15

The GHG emissions for the power plant projects were based on the CEC’s GHG analysis for the CPV Sentinel project applied to the El Segundo and Walnut Creek projects. The total GHG emissions from the construction and operation of the three power projects were determined to be 3.22 million metric tons of CO<sub>2</sub>e per year as shown earlier in this appendix. Table D-14 provides the total cumulative GHG impact from the proposed project, which includes a benefit from implementing emission reduction projects funded by the CPV Sentinel mitigation fee. The benefit is an amount subtracted from the total of cumulative proposed project and power plant GHG emissions.

**TABLE D-14**

**Total Cumulative Proposed Project GHG Impacts (Including Power Plants Impacts and CPV Sentinel Mitigation Fee Benefits)**

<b>Attainment Year Periods</b>	<b>Cumulative Proposed Project GHG Emissions</b> (million MT CO <sub>2</sub> eq /year)	<b>Power Plant GHG Emissions</b> (million MT CO <sub>2</sub> eq /year)	<b>GHG Emission Benefits</b> (million MT CO <sub>2</sub> eq /year)	<b>Total Cumulative Proposed Project GHG Emissions</b> (million MT CO <sub>2</sub> eq /year)
2007-2014	8.79	3.22	0.03	11.98
2007-2023	18.47	3.22	0.09	21.61
2007-2030	26.06	3.22	0.15	<b>29.13</b>

The estimated increase of approximately 12 million MT CO<sub>2</sub>e/yr by 2014, 22 million MT CO<sub>2</sub>e/yr by 2023, and 29 million MT CO<sub>2</sub>e/yr by 2030 as a result of the total cumulative proposed project is greater than the SCAQMD’s GHG significance threshold of 10,000 MTCO<sub>2</sub>e/yr for projects in which SCAQMD is lead agency. As such, potential GHG emissions from the proposed project are concluded to be cumulatively considerable and, thus, significant.

**(APPENDIX G HAS BEEN WITHDRAWN)**

## **APPENDIX H**

---

### **FACILITIES AFFECTED BY PERMIT MORATORIUM**

## Examples of Projects Affected by the SCAQMD Permit Moratorium

EMISSION REDUCTION PROJECTS					EMISSION REDUCTIONS NOT ACHIEVED				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project	NOx	CO	PM10	VOC	SOx
Advanced Cardiovascular System	Medical Services	Temecula	Facility makes most heart stents used in the U.S.	Replace three existing boilers with three new state of the art, cleaner units that are more energy efficient	10 lbs/day	2 lbs/day			
Allergan	Medical Services	Irvine	Pharmaceutical company	Replace an existing emergency back up generator with a new state of the art, cleaner unit that is more energy efficient.	31 lbs/day	2 lbs/day	3 lbs/day		
Armorcast Products	Manufacturer	North Hollywood	Facility manufactures utility boxes.	Install a new air pollution control system (regenerative thermal oxidizer) to control emissions from 3 spray booths and a resin mixing and pouring enclosure.				43 lbs/day	
Avalon Glass & Mirror	Manufacturer	Carson	Facility manufactures mirrors.	Replacing an old air pollution control system with a new unit to reduce VOC emissions from their mirror backing coating equipment.	7 lbs/day			2 lbs/day	
Cal Pet Crematory	Crematory	Sun Valley	Crematory	Replacing six existing crematories with six state of the art units that are more energy efficient.	Small reduction				

EMISSION REDUCTION PROJECTS					EMISSION REDUCTIONS NOT ACHIEVED				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project	NOx	CO	PM10	VOC	SOx
Clean Air Logix	Contractor	Various locations in Ports of Los Angeles and Long Beach	Contractor	Providing shore side power for ships during loading and unloading at the berth by using a natural gas-fired engine with state of the art controls so that ships can shut down high emitting auxiliary boilers and engines during loading and unloading operations.	125 lbs/day	11 lbs/day	13 lbs/day		96 lbs/day
New Basis	Manufacturer	Riverside	Facility manufactures polymer concrete cast enclosures for cables.	Replacing its old air pollution control system with a new and more efficient unit	2 lbs/day			27 lbs/day	
Pacific Fruit Processors	Food Services	Southgate	Food production facility.	Replacing an existing boiler with a new state of the art, cleaner unit that is more efficient	3 lbs/day				
Providence Holy Cross Medical Center	Medical Services	Mission Hills	Hospital	Replacing burners on two (2) existing boilers with new state of the art, cleaner burners.	16 lbs/day	136 lbs/day			
S A Recycling LLC	Recycling Services	Anaheim	Auto shredding and recycling plant	Modifying the existing air pollution control system by adding a regenerative thermal oxidizer				60 lbs/day	

EMISSION REDUCTION PROJECTS					EMISSION REDUCTIONS NOT ACHIEVED				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project	NOx	CO	PM10	VOC	SOx
Tesoro Los Angeles Refinery	Refinery	Wilmington	Refinery	Installing a new 42 MW cogeneration plant and two new boilers to replace two older and dirtier cogeneration units (60 MW total) and four older boilers.	1,527 lbs/day	1,913 lbs/day	1 lb/day	4 lbs/day	416 lbs/day
The Kroger Co/Ralphs Grocery	Food Services	La Habra	Supermarkets	Replacing an existing oven with a new state of the art, cleaner unit that has a lower heat input rating	Small reduction				
<b>TOTAL EMISSION REDUCTIONS NOT ACHIEVED</b>					1,721 lbs/day	2,064 lbs/day	17 lbs/day	136 lbs/day	512 lbs/day

MEDICAL AND HEALTH CARE PROJECTS				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project
Beach Cities Health District	Medical Services	Redondo Beach	Hospitals, medical centers	Installing three boilers to provide additional heat capacity to the health care district
Beckman Coulter, Inc.	Medical Services	Brea	Facility manufactures raw material for medical instruments.	Install a chemical synthesis, purification and drying systems.
Diversified Silicone Products Inc	Medical Services	Santa Fe Springs	Facility manufactures medical industry products	Installing an oven.
GIP 7th Street	Medical Services	Los Angeles	Facility is a large data center that maintains medical as well as other records	In order to safeguard these records, the company is proposing to install 3 emergency backup generators for use during power outages.

<b>MEDICAL AND HEALTH CARE PROJECTS</b>				
<b>Facility Name</b>	<b>Facility Type</b>	<b>Project Location</b>	<b>Facility Operation</b>	<b>Proposed Project</b>
Glendale Adventist Medical Center	Medical Services	Glendale	Hospital	Installing emergency generators to provide additional back-up power for use during power outages
Kaiser Permanente Ontario Vineyard Medical Center	Medical Services	Ontario	Hospital	Installing boiler to provide additional heat capacity for medical center
Paragon Labs, Natural Life Eco Vite Labs	Medical Services	Torrance	Facility manufactures dietary supplements	Installing an oven and a mixer.
Providence Holy Cross Medical Center	Medical Services	Mission Hills	Hospital	Replacing burners on two (2) existing boilers with new state of the art, cleaner burners.
Rancho Specialty Hospital	Medical Services	Rancho Cucamonga	Hospital	Installing emergency generator to provide additional back-up power for use during power outages
Varian Inc.	Medical Services	Lake Forest	Facility manufactures chemical substances for medical/health testing	Installing an oven.

<b>RENEWABLE ENERGY PROJECTS, SEWAGE TREATMENT PLANTS, LANDFILLS &amp; WATER SERVICE OPERATIONS</b>				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project
Banning City	Essential Public Services	Banning	Sewage treatment plant	Installing a new boiler and a backup flare to utilize renewable digester gas to generate steam for in-plant use
Bowerman Power Lfg, Llc	Essential Public Services	Irvine	Landfill	5 electrical generating units and control system (flares) to use renewable landfill gas to produce electricity and reduce release of methane, a greenhouse gas, and odors into the atmosphere
City Of Huntington Beach- Water Operations	Essential Public Services	Huntington Beach	Water treatment plant	Replacing older engine with new state of the art and cleaner natural gas fired engine
City Of Monrovia, Dept Of Public Works	Essential Public Services	Monrovia	Water treatment plant	Modifying groundwater treatment system to cleanup contaminated well water to increase drinking water supply
City Of Torrance	Essential Public Services	Torrance	Landfill	Installing landfill gas collection system to collect landfill gas generated at dump site to prevent migration offsite and release of methane and odors into the atmosphere
Coachella City	Essential Public Services	Coachella	Sewage treatment plant	Installing emergency backup generator for use during power outages and continue treating raw sewage sludge
Eastern Municipal Water District	Essential Public Services	Temecula, Perris, San Jacinto, Moreno Valley	Sewage treatment plant	Modification to upgrade sewage treatment plant and biofilter used to control emission of organic gases and install emergency backup generator for use during power outages
Irvine Ranch Water District	Essential Public Services	Irvine	Sewage treatment plant	Installing internal combustion engine for sewage pumping and emergency backup generator for use during power outages

<b>RENEWABLE ENERGY PROJECTS, SEWAGE TREATMENT PLANTS, LANDFILLS &amp; WATER SERVICE OPERATIONS</b>				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project
La City Bureau Of Sanitation, Hyperion Treatment Plant	Essential Public Services	Playa Del Rey	Sewage treatment plant	Installing control system (flare) to mitigate odors and dispose of excess digester gas when it is not used as renewable energy
La County Sanitation District	Essential Public Services	Rolling Hills Estates	Landfill	Installing electrical generating units and a backup flare to use renewable landfill gas to produce electricity to replace older and less efficient units
Mm West Covina LLC	Essential Public Services	West Covina	Landfill	Utilizing renewable energy (landfill gas) for power generation
Orange County Sanitation District	Essential Public Services	Fountain Valley	Landfill	Replacement of older less efficient boiler using renewable fuel (digester gas) for steam generation with new state of the art and cleaner unit
Ridgewood Power Management, LLC	Essential Public Services	Brea	Landfill	Utilizing renewable energy (landfill gas) for power generation
Riverside City	Essential Public Services	Riverside	Sewage treatment plant	Modification to expand existing sewage treatment plant
Riverside County Waste Management	Essential Public Services	Thousand Palms, Rubidoux	Landfill	Landfill condensate collection and handling and control system (flares) to dispose of landfill gas and reduce release of methane, a greenhouse gas, and odors into the atmosphere
Running Springs Water Dist	Essential Public Services	Running Springs	Sewage treatment plant	Improvements to sewage treatment plant for handling raw sewage
San Bernardino County Special Services	Essential Public Services	Devore Heights	Sewage treatment plant	Improvements to sewage treatment plant, addition of odor control system (odor scrubber) and emergency backup generator for use during power outages

<b>RENEWABLE ENERGY PROJECTS, SEWAGE TREATMENT PLANTS, LANDFILLS &amp; WATER SERVICE OPERATIONS</b>				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project
South Orange County Wastewater Authority	Essential Public Services	Laguna Niguel	Sewage treatment plant	Improvements to sewage treatment plant, addition of odor control system (odor scrubber), boiler, and emergency backup generator for use during power outages
Sunshine Gas Producers LLC	Essential Public Services	Sylmar	Landfill	Installation of electrical generating units to use renewable landfill gas to produce electricity at sunshine canyon landfill
Tetra Tech Inc	Essential Public Services	Carson	Landfill	Control system (flare) to dispose of landfill gas and reduce release of methane, a greenhouse gas, and odors into the atmosphere
USA Waste Of California	Essential Public Services	Corona	Landfill	Control system (flare) to dispose of landfill gas to minimize odors and reduce release of methane, a greenhouse gas, and odors into the atmosphere
Valley Sanitary District	Essential Public Services	Indio	Sewage treatment plant	Improvements to sewage treatment plant
West Basin Municipal Water District	Essential Public Services	El Segundo	Water treatment plant	Treatment system for reclaimed water
Yucaipa Valley Water District	Essential Public Services	Yucaipa	Sewage treatment plant	Improvements to sewage treatment plant

<b>POLICE, FIRE PROTECTION &amp; SCHOOLS</b>				
Facility Name	Facility Type	Project Location	Facility Operation	Proposed Project
Anaheim City, Police Dept	Essential Public Services	Anaheim	Police Facility	Modification of existing gasoline dispensing facility to comply with state law and to increase throughput
Cal State University, Dominguez Hills	Essential Public Services	Carson	School	Installing trigeneration plant for electrical generation, heating and cooling at the university
Crafton Hills College	Essential Public Services	Yucaipa	School	Installing two boilers to provide additional heat capacity for students and staff
La County, Fire Dept - Forest & Fire Warden	Essential Public Services	Pacoima	Fire Station	Installing control system (spray booth) for coating operations for carpentry shop used by the fire department
La Unified School District, Woodrow Wilson High	Essential Public Services	Los Angeles	School	Installing three boilers to provide additional heating capacity for students and staff
Rio Hondo Community College	Essential Public Services	Whittier	School	Installing two boilers to provide additional heat capacity for students and staff

Declarations Submitted by Permit Holders Regarding the Effects of SCAQMD Permit Moratorium

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>EMISSION REDUCTION PROJECTS</b>						
Ernie Bacon	Baker-Furnace, Inc	Control equipment manufacturer	Yorba Linda	Thermal oxidizers, ovens, afterburners, soil remediation	Air Quality: no emission reductions; Hydrology: potential adverse impacts to water quality and groundwater (without cleanup)	
Ken Barker	Sully-Miller Contracting Co.	Asphalt/aggregate manufacturer	Southern California	Control equipment; new facilities (reducing distance to transport aggregate)	Air Quality: no emission reductions; increase in diesel fuel emissions; Energy: reduction Transportation: traffic reduction (if less truck VMT)	
Stephen Bledsoe	California Construction and Industrial Materials Association	Cement/aggregate manufacturer	Southern California	Control equipment; new facilities (reducing distance to transport aggregate)	Air Quality: no emission reductions; increase in diesel fuel emissions; Energy: reduction Transportation: traffic reduction (if less truck VMT)	
Mark Christie	Mattivi Bros. Leasing Company	Asphalt rubber blending plant	Sun Valley	Blending equipment (replacing diesel powered equipment with natural gas or electric)	Air Quality: no emission reductions	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>EMISSION REDUCTION PROJECTS</b>						
John Engelhart	Resources Environmental LLC	Remediation services	Hawthorne	Soil vapor extraction and vapor treatment equipment; thermal/catalytic oxidizers	Air Quality: no emission reductions; Hydrology: potential adverse impacts to water quality and groundwater (without cleanup)	
Robert Freeman	LAX	Airport	Los Angeles	Boilers and turbines replacement	Air Quality: no NOx and GHG emission reductions; Energy: no gain in energy efficiency	
Torbjorn Helland	M.W. Sausse & Co.	Equipment manufacturer (steel)	Valencia	Spray booth replacement	Air Quality: no PM or VOC emission reductions	Use 1.5 gallons/day
Linda Holcomb	J.R. Sandavol Enterprises & Consulting	Spray booth manufacturer	Monrovia	Spray booths	Air Quality: no PM or VOC emission reductions (if spray booth not purchased)	
David Hummel	Lehigh Hanson	Cement/aggregate manufacturer	Southern California	Control equipment; new facilities (reducing distance to transport aggregate)	Air Quality: no emission reductions; increase in diesel fuel emissions; Energy: reduction Transportation: traffic reduction (if less truck VMT)	
Ian Hurlock-Jones	Fox Interactive Media, Inc.	Media services	Playa Vista	Emergency electrical generator	Public Services: safety concerns if no emergency power	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>EMISSION REDUCTION PROJECTS</b>						
Pat Kelly	Granite Construction Co.	Construction/ aggregate services	Indio	Control equipment; new facilities (reducing distance to transport aggregate)	Air Quality: no emission reductions; increase in diesel fuel emissions; Energy: reduction Transportation: traffic reduction (if less truck VMT)	
Michael Lewis	Construction Industry Air Quality Coalition	Construction services	West Covina	Emergency generators	Public Services: safety concerns if no emergency power	
Earl Mahan	Coast Booth Services	Spray booth repairer	Chino	Spray booths	Air Quality: potential increase in PM emissions (if spray booths are not repaired)	
William McKenna	Platinum Coachworks	Auto Body Shop	Covina	Spray booths (2)	Air Quality: no emission reduction	
Larry Padfield	U.S. Development Group, LLC	Ethanol unloading and distribution	Southern California	Rail car-to-truck unloading facility	Air Quality: no emission reduction; Transportation: no traffic reduction	15,000 140-mile RT truck trips reduced to 2-miles.
Michael Renwick	CRE Spray Booths & Metal Buildings	Auto Body Shops	Southern California	Spray booths	Air Quality: no PM or VOC emission reductions (if spray booth not permitted and used)	
Tony Royster	Department of General Services of City of Los Angeles	Maintenance facility	Los Angeles	Emergency generator for LNG fueling station	Air Quality: no emission reductions from replacing diesel vehicles with LNG/CNG powered vehicles	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>EMISSION REDUCTION PROJECTS</b>						
Henrik Scherer	Solar Turbines Inc.	Solar turbine manufacturer	San Diego	Solar turbines (to replace combustion turbines)	Air Quality: no NOx and PM10 emission reductions; Energy: no gain in energy efficiency	
Claudia Steiding	Riverside County Dept. of Facilities Mgmt	Communication facilities (3)	Riverside	3 generators	Public Services: lack of backup power could affect health and safety services	
Karma Thompson	Tesoro Refinery	Refinery	Los Angeles	Replace existing cogeneration units and boilers	Air Quality: no NOx emissions reductions	
Enrique Zaldivar	Dept of Public Works' Bureau of Sanitation for City of Los Angeles	Alternative fueling stations	Los Angeles	Emergency generator at LNG/CNG fueling facility	Air Quality: no emission reductions from replacing diesel vehicles with LNG/CNG powered vehicles	
<b>MEDICAL AND HEALTH CARE PROJECTS</b>						
Roger Richter	California Hospital Association	Hospital	25 hospitals throughout So. California	Emergency generator and boilers	Public/Emergency Services	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>RENEWABLE ENERGY PROJECTS, SEWAGE TREATMENT PLANTS, LANDFILLS &amp; WATER SERVICE OPERATIONS</b>						
Gregory Adams	County Sanitation Districts of LA County	Landfill/Wastewater treatment/ Reclamation plants	Los Angeles County	Landfill gas to energy equipment; boilers; emergency standby generators	Air Quality: no NOx and GHG emission reductions; Energy: no gain in energy efficiency; Public Services: impact essential public services	
Shane Chapman	Metropolitan Water District of Southern California	Water treatment plants	Southern California	Emergency standby generators	Hydrology: water quality/supply concerns if no emergency power	
Stephen Galowitz	Ridgewood Renewable Power LLC	5 MW landfill gas to electric generating facility	Brea	30 MW turbine (fueled by landfill gas) to replace flaring	Air Quality: no NOx and GHG emission reductions; Energy: no gain in energy efficiency	
Robert Lawhn	Reliant Energy	Electric generating facility	Rancho Cucamonga	Installing efficient electric generating equipment	Energy: no energy efficiency gains	
Joseph McCann	Riverside County Waste Management Dept	Landfills (39)	Moreno Valley	Landfill gas to energy projects (avoiding use of flares)	Air Quality: no NOx and GHG emission reductions; Energy: no gain in energy efficiency	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>RENEWABLE ENERGY PROJECTS, SEWAGE TREATMENT PLANTS, LANDFILLS &amp; WATER SERVICE OPERATIONS</b>						
Anthony Pack	Eastern Municipal Water District	Wastewater collection and treatment facility	Perris	Pumps, emergency engines, scrubber, waste gas flare, boilers, blowers, fuel cells and dryers with control equipment	Hydrology and Water Quality: without updated infrastructure, potential adverse water quality and supply impacts	
Martin Ryan	Bowerman Power LFG	Landfill renewable energy	Irvine	20 MW electric generation facility (fueled by landfill gas) to replace flaring	Air Quality: no NOx and GHG emission reductions; Energy: no gain in energy efficiency	
Ed Torres	Orange County Sanitation District	Wastewater treatment plants	Fountain Valley; Huntington Beach	Infrastructure/ modifications	Public services – school, hospitals	
Enrique Zaldivar	Dept of Public Works' Bureau of Sanitation for City of Los Angeles	Wastewater treatment plants	Los Angeles (Playa del Rey)	60 MW cogeneration system (to replace flaring digester gas)	Air Quality: no NOx and GHG emissions reductions; Aesthetics: flare remains; no improvement	

Contact Name	Company Name	Affected Facility Type	Location	Project - Affected Equipment	Environmental Impact	Quantification Analysis of Impact
<b>POLICE, FIRE PROTECTION &amp; SCHOOLS</b>						
Joseph Mehula	LAUSD	Schools	Los Angeles	Operating equipment	Public Services: schools	
Thomas Robinson	City of La Mirada	Fire Station	La Mirada	Emergency generator	Public/Emergency Services	
Willem Van der Pol	California State University, Fullerton	School	Fullerton	4.5 MW trigeneration facility	Energy; Public services (schools)	

## SCAQMD Permit Applications (1,178) Affected by the Permit Moratorium Pursuant to Rules 1304 and 1309.1

Facility Type	Facility Location	Equipment Description
Aerospace	Monrovia	Oven, Drying
Aerospace	Monrovia	Oven, Drying
Aerospace	Los Angeles	Tank, Plating (Other)
Aerospace	Los Angeles	Tank, Plating (Other)
Aerospace	Manhattan Beach	Solder Leveling
Aerospace	Carson	Abrasive Blasting (Cabinet/Machine/Room)
Aerospace	Carson	Abrasive Blasting (Cabinet/Machine/Room)
Aggregate Industry	Irwindale	Aggregate Products/Crush >= 5000 tons per day (tpd)
Aggregate Industry	Rialto	Aggregate Crushing (<5000 tpd)
Aggregate Industry	Rialto	Asphalt Blending/Batching Equipment
Aggregate Industry	Cabazon	Aggregate Products/Crush >= 5000 tpd
Aggregate Industry	Riverside	Aggregate Products/Crushing (<5000 tpd)
Asphalt Operation	Irwindale	Asphalt Blending/Batching Equipment
Auto Body Shop	Rialto	Spray Booth, Automotive
Auto Body Shop	Van Nuys	Spray Booth, Automotive
Auto Body Shop	El Monte	Spray Booth Automotive
Auto Body Shop	Rubidoux	Spray Booth, Automotive
Auto Body Shop	Santa Ana	Spray Booth, Automotive
Auto Body Shop	La Habra	Spray Booth, Automotive
Auto Body Shop	Sun Valley	Spray Booth Paint And Solvent
Auto Body Shop	Riverside	Spray Booth, Automotive

Facility Type	Facility Location	Equipment Description
Auto Body Shop	Torrance	Spray Booth, Automotive
Auto Body Shop	Sun Valley	Spray Booth, Automotive
Auto Body Shop	La Puente	Spray Booth, Automotive
Auto Body Shop	Huntington Park	Spray Booth, Automotive
Auto Body Shop	Long Beach	Spray Booth, Automotive
Auto Body Shop	Fullerton	Spray Booth, Automotive
Auto Body Shop	Tujunga	Spray Booth, Automotive
Auto Body Shop	Stanton	Spray Booth, Automotive
Auto Body Shop	Stanton	Spray Booth, Automotive
Auto Body Shop	Costa Mesa	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth Paint And Solvent
Auto Body Shop	Wilmington	Spray Booth, Automotive
Auto Body Shop	Van Nuys	Spray Booth, Automotive
Auto Body Shop	Hawaiian Gardens	Spray Booth, Automotive
Auto Body Shop	Tarzana	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Paramount	Spray Booth/Enclosure, Powder Coating System
Auto Body Shop	Paramount	Oven, Powder Coating
Auto Body Shop	Paramount	Spray Booth/Enclosure, Powder Coating System
Auto Body Shop	Paramount	Oven, Powder Coating
Auto Body Shop	Sun Valley	Spray Booth, Automotive
Auto Body Shop	Santa Ana	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive

Facility Type	Facility Location	Equipment Description
Auto Body Shop	Torrance	Spray Booth, Automotive
Auto Body Shop	Riverside	Spray Booth, Automotive
Auto Body Shop	North Hollywood	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Huntington Park	Spray Booth Paint & Solvent
Auto Body Shop	Montebello	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Norco	Spray Booth, Automotive
Auto Body Shop	Arcadia	Spray Booth
Auto Body Shop	Arcadia	Spray Booth
Auto Body Shop	South Gate	Spray Booth, Automotive
Auto Body Shop	South Gate	Spray Booth, Automotive
Auto Body Shop	North Hollywood	Spray Booth, Automotive
Auto Body Shop	Van Nuys	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth
Auto Body Shop	South El Monte	Spray Booth, Automotive
Auto Body Shop	Fontana	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	El Monte	Spray Booth Paint And Solvent
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Lake Elsinore	Spray Booth, Automotive
Auto Body Shop	Banning	Spray Booth, Automotive
Auto Body Shop	Stanton	Spray Booth, Automotive

Facility Type	Facility Location	Equipment Description
Auto Body Shop	South El Monte	Spray Booth, Automotive
Auto Body Shop	Fullerton	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spraybooth Automotive
Auto Body Shop	San Clemente	Spray Booth, Automotive
Auto Body Shop	Temecula	Spray Booth, Automotive
Auto Body Shop	Van Nuys	Perp. Station
Auto Body Shop	Lake Elsinore	Spray Booth, Automotive
Auto Body Shop	Lakewood	Spray Booth Paint And Solvent
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Bloomington	Spray Booth Paint And Solvent
Auto Body Shop	North Hollywood	Spray Booth, Automotive
Auto Body Shop	Los Angeles	Spray Booth, Automotive
Auto Body Shop	Riverside	Spray Booth, Automotive
Auto Repair Shop	Montebello	Tire Buffer
Auto Repair Shop	Montebello	Tire Buffer
Auto Repair Shop	Van Nuys	Spray Booth, Automotive
Auto Repair Shop	Los Angeles	Spray Booth, Automotive
Auto Repair Shop	Los Angeles	Tire Buffer
Auto Repair Shop	Los Angeles	Tire Buffer
Auto Repair Shop	Fontana	Tire Buffer
Auto Repair Shop	Sylmar	Spray Booth, Automotive
Auto Repair Shop	Long Beach	Spray Booth Paint And Solvent
Auto Repair Shop	Murrieta	Spray Booth, Automotive

Facility Type	Facility Location	Equipment Description
Auto Sales	Fontana	I C E (>500 HP) Emergency Elec Gen Diesel
Brewery	Van Nuys	I C E (50-500 HP) Emergency Elec Gen-Diesel
Coating Operation	Fontana	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Fontana	Oven, Powder Coating]
Coating Operation	Anaheim	Spray Booth Paint And Solvent
Coating Operation	Anaheim	Spray Booth Paint And Solvent
Coating Operation	Westminster	Spray Booth Paint And Solvent
Coating Operation	Chino	Spray Booth Paint And Solvent
Coating Operation	San Fernando	Spray Booth(s) (1 - 5) w/ Afterburner
Coating Operation	San Fernando	Oven, Other
Coating Operation	North Hollywood	Spray Booth(s) (1 - 5) w/ Afterburner
Coating Operation	Montebello	Abrasive Blasting (Cabinet/Machine/Room)
Coating Operation	Montebello	Oven, Cooking Or Curing
Coating Operation	San Bernardino	Spray Booth Paint And Solvent
Coating Operation	San Bernardino	Spray Equipment Open
Coating Operation	Costa Mesa	Spray Booth Paint And Solvent
Coating Operation	North Hollywood	Spray Booth Styrenated Resins
Coating Operation	Hemet	Spray Booth Styrenated Resins
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending

Facility Type	Facility Location	Equipment Description
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation	North Hollywood	Paints Blending
Coating Operation		Spray Booth Paint & Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Placentia	Spray Booth Paint And Solvent
Coating Operation	Gardena	Spray Booth Paint And Solvent
Coating Operation	Gardena	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Pomona	Spray Booth Paint And Solvent
Coating Operation	Pomona	Spray Booth Paint And Solvent
Coating Operation	Commerce	Spray Booth Paint And Solvent
Coating Operation	Commerce	Spray Booth Paint And Solvent
Coating Operation	Commerce	Oven, Drying
Coating Operation	Commerce	Oven, Drying
Coating Operation	Anaheim	Spray Booth Styrenated Resins
Coating Operation	Los Angeles	Spray Machine - Coating
Coating Operation	Chatsworth	Spray Booths (Multiple) With Multiple VOC Control Equipment
Coating Operation	Chatsworth	Oven, Powder Coating
Coating Operation	Chatsworth	Spray Machine - Coating
Coating Operation	Chatsworth	Spray Machine - Coating
Coating Operation	Chatsworth	Spray Machine - Coating

Facility Type	Facility Location	Equipment Description
Coating Operation	Los Angeles	Paints Blending
Coating Operation	Los Angeles	Paints Blending
Coating Operation	Los Angeles	Paints Blending
Coating Operation	Los Angeles	Paints Blending
Coating Operation	Los Angeles	Paints Blending
Coating Operation	Northridge	Spray Booth Paint And Solvent
Coating Operation	Valencia	Abrasive Blasting (Cabinet/Machine/Room)
Coating Operation	Santa Fe Springs	Spray Booth Paint And Solvent
Coating Operation	Anaheim	Spray Booth Paint And Solvent
Coating Operation	Sun Valley	Spray Booth Paint And Solvent
Coating Operation	Sun Valley	Oven, Drying
Coating Operation	Fontana	Spray Booth Paint And Solvent
Coating Operation	Fontana	Spray Booth Paint And Solvent
Coating Operation	Rancho Cucamonga	Spray Booth Paint And Solvent
Coating Operation	Rancho Cucamonga	Oven, Rubber Curing
Coating Operation	Torrance	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Pico Rivera	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Oven, Powder Coating
Coating Operation	Los Angeles	Spray Booth/Enclosure, Powder Coating System
Coating Operation	N. Hollywood	Spray Booth
Coating Operation	N. Hollywood	Spray Booth

Facility Type	Facility Location	Equipment Description
Coating Operation	San Bernardino	Spray Booth Paint And Solvent
Coating Operation	Chatsworth	Paints Blending
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Spray Booth Paint And Solvent
Coating Operation	Long Beach	Mist Eliminator, HEPA Filter
Coating Operation	Long Beach	Tank, Surface Preparation - Other Acids
Coating Operation	Long Beach	Tank, Chromic Acid - Anodizing
Coating Operation	City Of Industry	Spray Booth Paint And Solvent
Coating Operation	Topanga	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Monrovia	Spray Booth, Automotive
Coating Operation	North Hills	Oven, Powder Coating
Coating Operation	Fullerton	Oven, Powder Coating
Coating Operation	Fullerton	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Fountain Valley	Oven, Drying
Coating Operation	Fullerton	Tank, Sulfuric/Phosphoric Acid - Anodizing
Coating Operation	Riverside	Paints Blending
Coating Operation	Riverside	Paints Blending
Coating Operation	Riverside	Paints Blending

Facility Type	Facility Location	Equipment Description
Coating Operation	Riverside	Paints Blending
Coating Operation	Inglewood	Spray Booth Paint And Solvent
Coating Operation	Sun Valley	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Orange	Spray Booth Paint And Solvent
Coating Operation	Northridge	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	La Verne	Spray Booth Paint And Solvent
Coating Operation	Los Angeles	Spray Booth Paint And Solvent
Coating Operation	Fontana	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Fontana	Abrasive Blasting (Cabinet/Machine/Room)
Coating Operation	Fontana	Baghouse, Ambient Temp (>500 Sq Ft)
Coating Operation	Fontana	Baghouse, Ambient Temp (>500 Sq Ft)
Coating Operation	Fontana	Abrasive Blasting (Cabinet/Machine/Room)
Coating Operation	Costa Mesa	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Arcadia	Spray Booth Paint And Solvent
Coating Operation	Anaheim	Spray Booth Paint And Solvent
Coating Operation	Santa Fe Springs	Spray Booth Paint And Solvent
Coating Operation	Diamond Bar	Spray Equipment Open
Coating Operation	Valencia	Spray Booth Paint And Solvent
Coating Operation	Valencia	Oven, Other
Coating Operation	Valencia	Spray Booth Paint And Solvent
Coating Operation	Valencia	Spray Booth Paint And Solvent

Facility Type	Facility Location	Equipment Description
Coating Operation	Valencia	Spray Booth Paint And Solvent
Coating Operation	Panorama City	Spray Booth Paint And Solvent
Coating Operation	Corona	Spray Booth Paint And Solvent
Coating Operation	Corona	Spray Booth Other
Coating Operation	Corona	Oven, Drying
Coating Operation	Lynwood	Spray Booth Paint And Solvent
Coating Operation	Valencia	Spray Booth Paint And Solvent
Coating Operation	Van Nuys	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Van Nuys	Spray Booth/Enclosure, Powder Coating System
Coating Operation	Van Nuys	Oven, Powder Coating]
Coating Operation	Van Nuys	Baghouse, Ambient Temp (>500 Sq Ft)
Coating Operation	Van Nuys	Abrasive Blasting (Cabinet/Machine/Room)
Coating Operation	Van Nuys	Oven, Powder Coating
Communications	Pasadena	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Anaheim	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Irwindale	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Costa Mesa	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Riverside	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Commerce	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Anaheim	I C E (>500 HP) Emergency Elec Gen Diesel
Communications	Mission Hills	I C E (>500 HP) Emergency Elec Gen Diesel
Concrete Batch Plant	Ontario	Storage Silo Cement
Concrete Batch Plant	Ontario	Concrete Batch Equipment

Facility Type	Facility Location	Equipment Description
Concrete Batch Plant	Ontario	Baghouse, Ambient Temp (<=100 Sq Ft)
Concrete Batch Plant	Chino	Concrete Batch Equipment
Construction Services	Colton	Pigments Blending
Construction Services	Colton	Storage Silo Cement
Construction Services	Santa Ana	Storage Tank Cement
Construction Services	Santa Ana	Storage Tank Cement
Construction Services	Santa Ana	Storage Tank Cement
Construction Services	Santa Ana	Concrete Batch Equipment
Construction Services	City Of Industry	Misc Minerals Conveying
Construction Services	Fontana	Storage Tank Cement

## **APPENDIX I**

---

### **MODELING INPUT/OUTPUT FILES**

To obtain copies of the Modeling input/output files used for the Draft PEA analysis, it is necessary to bring an electronic storage device, e.g., portable hard drive, to SCAQMD headquarters at the following address: 21865 Copley Drive, Diamond Bar CA., 91765. The electronic storage device must be capable of storing at least one to two terabytes of information. To obtain the input/output modeling files, please contact Steve Smith at 909.396.3054 or by e-mail at [ssmith@aqmd.gov](mailto:ssmith@aqmd.gov).

## **APPENDIX J**

---

### **COMMENTS AND RESPONSES TO COMMENTS ON THE DRAFT PROGRAM ENVIRONMENTAL ASSESSMENT**

The following is a list of persons, organizations, and public agencies commenting on the Draft Program Environmental Assessment for Proposed Rule 1315.

#### **Comment Letter #1**

Communities for a Better Environment – Maya Golden-Krasner  
Communities for a Safe Environment – Adriano Martinez  
Natural Resources Defense Council – Adriano Martinez  
California Communities Against Toxics – Angela Johnson Meszaros

#### **Comment Letter #2**

California Council for Environmental and Economic Balance – Bill Quinn

#### **Comment Letter #3**

Latham & Watkins, LLP, on behalf of the Regulatory Flexibility Group – Michael J. Carroll

#### **Comment Letter #4**

Department of Water and Power, the City of Los Angeles – Mark J. Sedlacek

#### **Comment Letter #5**

County Sanitation Districts of Los Angeles County – Gregory M. Adams

#### **Comment Letter #5**

Walnut Creek Energy, LLC – Jenifer Morris Lee

**RE: Comments on Draft Program Environmental Assessment for Re-  
adoption of Proposed Rule 1315—Federal New Source Review  
Tracking System**

Dear Mr. Krause:

1-1 We submit these comments on the South Coast Air Quality Management  
District's ("SCAQMD" or "District") Draft Program Environmental Assessment for Re-  
adoption of Proposed Rule 1315—Federal New Source Review Tracking System  
("DPEA") on behalf of the above-captioned organizations. These groups are  
environmental and environmental justice organizations that work to improve air  
quality and community health for residents in the South Coast Air Basin and other  
affected areas. We request that the District consider and respond to these comments  
and objections in the Final Program Environmental Assessment in accordance with  
1-2 CEQA Guidelines section 15088.<sup>2</sup>

**INTRODUCTION**

1-3 We are deeply distressed to learn that, in the SCAQMD's assessment, the  
adoption of Rule 1315 will result in staggering negative health impacts—most notably  
that use of the Rule will result in 1 premature death every 3 weeks.<sup>3</sup> We are not aware

<sup>1</sup> Corrected version sent November 10, 2010.

<sup>2</sup> On October 11, 2010, a large collection of organizations from across the State asked the SCAQMD for an extension of time to November 23 to comment on this DPEA. On October 15, the SCAQMD responded allowing only until November 9 for comment based upon a recitation of CEQA Guidelines § 15105. For the record, we direct the SCAQMD's attention to CEQA Guidelines § 15141 - Page Limits: The text of draft EIRs should normally be less than 150 pages and for proposals of unusual scope or complexity should normally be less than 300 pages. Given that the DPEA is approximately 1,900 pages, granting the entire extension requested would have been entirely reasonable.

<sup>3</sup> We note, however, that the SCAQMD has historically taken the position that Rule 1315 does "not, directly or indirectly, result in any adverse effect on the environment." 2007 Final Program Environmental Assessment 1-10. See generally, Comments on Draft Program Environmental Assessment for Proposed Amended Rule 1309.1 - Priority Reserve and Proposed Re-adopted Rule 1315 - Federal New Source Tracking System, June 29, 2007. As a result, it is not surprising that despite a direct order from

1-3  
Cont.

of any air pollution control district in the country that has ever proposed to undertake a project that would result in the massive negative health and environmental impacts described by the SCAQMD in this DPEA. We are equally distressed to find that the SCAQMD staff has offered no mitigation for this massive air pollution project and has proposed that the Governing Board reject the *Environmentally Superior, Least Toxic Alternative* ("Alternative D") to the proposed project. Even as the SCAQMD staff notes that Alternative D will meet the project's objectives, it refuses to recommend Alternative D, even though it would "result in substantially lower air quality, health, and greenhouse gas impacts for most milestone years than the proposed project and the other projects."

1-4

Although the admitted magnitude of impacts from the proposed project is enormous, the DPEA still understates the true scope and impact of the proposed project. If implemented, it is reasonably foreseeable that even more death and illness will occur than is detailed in the document.

While this is the third time that the SCAQMD has attempted to adopt this project, the project still lacks a clear and stable project description that corresponds to the project that the SCAQMD has analyzed in the DPEA. Further, the SCAQMD has proposed a "future baseline" that not only fails to provide information about the actual existing environment by which to measure the impacts of the project, but also works as an artificial and implausible rationale for the SCAQMD's failure to analyze the project's true impacts. In fact, the DPEA systematically under-discloses the impacts of the real project the SCAQMD seeks to undertake: creating and banking hundreds of thousands of pounds per day of air pollution emission reduction credits. Once created and banked, it is reasonably foreseeable that the credits will result in air pollution emissions. CEQA generally, and the ruling from the Los Angeles Superior Court in particular on this exact issue, require the SCAQMD to disclose, analyze, and mitigate the impacts of the massive expansion of the SCAQMD's emissions bank. Yet, after disclosing the impacts caused by only a portion of the real project, the SCAQMD fails to provide any mitigation of its staggeringly large impacts and refuses to adopt a scaled-down version of the project that is both feasible and meets the objectives of the project.

The SCAQMD has proposed a project that would create *at least* 222,000 pounds *per day* of pollution credits,<sup>4</sup> but has decided to analyze the impacts of only subset of those emissions credits because, according to the SCAQMD, the rest of the credits will not be used. If a project proponent were to build 222,000 houses, but decided to analyze the impacts of building only some of them because some would always be vacant, the absurdity of the project proponent's position would be clear. The

---

the Los Angeles Superior Court to consider the project to be the impact of emission all the credits created by Rule 1315, SCAQMD persists in analyzing only a subset of the credits this project will create.

<sup>4</sup> This sum is based upon the numbers disclosed by the SCAQMD in its 2007 PEA as tabulated and presented to the Los Angeles Superior Court in NRDC v. SCAQMD, Los Angeles Super. Ct. Case No BS110792. These numbers covered the period between 1990 and 2003 and were never disputed by the SCAQMD. Oddly, the SCAQMD notes in the Staff Report that accompanied the release of the DPEA that the information about how many thousands of pounds per day of pollution emissions the SCAQMD plans to credit to its bank "will be available no later than November 3, 2010 or 30 days before the Board Meeting at which the Proposed Rule 1315 is considered, whichever comes later." Staff Report at p. 20 and I-1. As of November 9, 2010, we do not have the information. Without this number, it is not even possible to know, much less evaluate the impacts of the project on the environment.

1-4  
cont.

proposition from the SCAQMD that it does not have to analyze all of the emissions it creates and banks, all of which could be distributed if the SCAQMD or the legislature so chooses, but that instead it can analyze just a subset of emission credits it creates and banks, is equally problematic.

For reasons that are unclear, the SCAQMD has decided to embark on a massive (nearly 1,900 page) undertaking in its most recent DPEA, comprised of a complex story of purported detailed analysis of the impacts of its project. And still, despite all of this effort, the SCAQMD has failed to disclose, analyze, and mitigate what the project actually is: creating and banking at least 222,000 pounds per day of air pollution emissions credits, including retroactively creating and banking credits for pollution that has not been in the air since 1990, in addition to the amount that would be created prospectively from the new methods of creating pollution credits for use in the South Coast Air Basin and beyond. All these changes are being undertaken to facilitate the addition of more sources of air pollution to this already desperately over-polluted region (and for export to other regions).

In this, the third attempt to adopt this project, the DPEA remains fatally flawed.

#### DISCUSSION

CEQA compels an interactive process of assessment of environmental impacts and responsive project modification which must be genuine. It must be open to the public, premised upon a full and meaningful disclosure of the scope, purposes, and effect of a consistently described project, with flexibility to respond to unforeseen insights that emerge from the process. In short, a project must be open for public discussion and subject to agency modification during the CEQA process. This process helps demonstrate to the public that the agency has in fact analyzed and considered the environmental implications of its action.<sup>5</sup>

1-5

The DPEA is substantively inadequate, failing to meet even the most basic requirements of CEQA. The DPEA makes clear that the SCAQMD is doggedly determined to adopt a rule with the exact same pollution generation provisions as the rule adopted in 2006, to provide no mitigation for the rule's impacts, and to refuse to adopt a feasible alternative that significantly reduces the number of people who would suffer from the project. In so doing, the SCAQMD's DPEA shows that the project is not "open for public discussion and subject to agency modification during the CEQA process." This approach contravenes CEQA, the policies of the state, and the trust of the people of the South Coast, Coachella, Antelope, Mojave, and Salton Sea Air Basins.<sup>6</sup>

<sup>5</sup> *Concerned Citizens of Costa Mesa, et al v. 32nd District Agricultural Association* (1986) 42 Cal. 3d 929, 936.

<sup>6</sup> The creation of the emission reduction credits by the SCAQMD has impacts beyond the South Coast Air Basin because the credits banked here can be transferred to those other Basins. See, e.g., Health and Safety Code section 40709.6 (allowing the transfer of credits to other basins.) The attempted transfer to the Antelope Air Basin of credits through the rescinded Rule 1309.1 for use by two power plants in that air basin, and the use of emission reduction credits by the Sentinel Power Project, located in the Coachella Valley Air Basin are two recent examples of these kinds of transfers. This history shows that

**I. The Project Description and Objectives are Fatally Flawed**

CEQA requires that a project description and statement of objectives be accurate and consistent throughout an EIR. An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR.<sup>7</sup> Such a description is critical in order for agencies and the public to fully and accurately evaluate the potential impacts of a project. This premise is entrenched in CEQA and in its jurisprudence. Indeed since 1977, courts have repeatedly stated that:

1-6

A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental costs, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance.<sup>8</sup>

Similarly, "[a] clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project."<sup>9</sup>

**A. The Project Description Fails to Describe the Actual Project, and Masks the Nature of the Project**

The DPEA includes a Project Description chapter that is 23 pages long, with the sub-section titled "Project Description" covering 7 pages. The language of the Project fails to provide necessary substantive information as required by CEQA. The very first sentence under the title "Project Description," states:

1-7

The proposed project consists of adopting a revised version of Rule 1315. The major components of proposed Rule 1315 are briefly summarized in the following subsections. A complete copy of proposed Rule 1315 can be found in Appendix A.<sup>10</sup>

Telling in this language is the concept of the project as "adopting a revised version of Rule 1315." It is beyond dispute that no current version of Rule 1315 exists, as it was rescinded by the SCAQMD Governing Board, pursuant to an order by the Los Angeles Superior Court. Under CEQA, a "Project" means the whole of an action, which has a potential for resulting in either a direct physical change in the

1-8

---

such transfers are reasonably foreseeable, especially since the SCAQMD has shown an eagerness to support power plants' bids to obtain CEQA exemptions from the legislature, allowing them access to the SCAQMD's bank of credits.

1-8  
Cont.

environment, or a reasonably foreseeable indirect physical change in the environment.”<sup>11</sup> While in some sense “adopting a revised version of Rule 1315” is the act that will result in the impact on the environment, such a description is completely devoid of content, failing to provide the information needed for decision-making.

1-9

Actually, the “project” proposed by the SCAQMD is: create and bank *at least* 222,000 pounds *per day* of air pollution emissions reductions, including retroactively creating and banking credits for pollution that has not been in the air since 1990, in addition to the amount that would be created prospectively from the new methods of creating pollution credits for use in the South Coast Air Basin and beyond.<sup>12</sup> The DPEA does not articulate this—or anything like this—as the project. Indeed, there is really no way to know by reading the project description anything about the size and scope of the project. Indeed, the DPEA does not disclose anywhere how many credits will be created by the project.<sup>13</sup>

1-10

1-11

The SCAQMD’s choice to emphasize the readoption of the previous Rule as its project demonstrates that, rather than figuring out the environmentally superior, least toxic way to accommodate its stated objectives, the SCAQMD has determined that its real goal is to adopt essentially the same Rule it adopted in 2006 regardless of massive environmental impacts its long-delayed environmental review identified.

1-12

Further, even if the proposed project description of “adopting a revised version of Rule 1315” were adequate and meaningful, the DPEA does not then proceed to analyze the impacts of adopting the Rule, but instead analyzes the impacts of Rules 1304 and Rules 1309.1. This highlights a fundamental flaw of the DPEA: it does not disclose, analyze, or mitigate the impact of the proposed Rule.

The DPEA states that the proposed project does not include the emission reduction credits created by the SCAQMD under the District-sponsored SB 827 (Wright, 2009) and District-supported AB 1318 (M. Perez, 2009). Excluding those emission reduction credits is improper for three reasons. First, the legislative direction in both of those statutes was clear: the District is to follow all of the mandates of the Superior Court detailed in *NRDC v. SCAQMD*. The Court directed the SCAQMD to undertake environmental review of all of the credits it creates. Second, the SCAQMD’s decision to include the impacts of the credits created with identical language in SB 827 and AB 1318 for the period beginning July 2010, but not the impacts of the creation of credits for the period of January 2010 through June 2010 is completely arbitrary and is another way that the DPEA hides the true impacts of the proposed project. Third, the project is the creation of credits both retroactively to 1990 and prospectively into the future; it is improper to carve out the six month period between January 2010 and June 2010—or any other period—from the analysis of the impacts of the project.

//

<sup>11</sup> CEQA Guidelines § 15378(a).

<sup>12</sup> The contention that the “project” will end in 2030 is misleading and inappropriate since the need for and use of the banked emission reduction credits will continue as long as the South Coast Air Basin fails to attain either the federal or state Ambient Air Quality Standards.

<sup>13</sup> In Chapter 8, *Response to the Court’s Decision*, the DPEA purports to analyze the “starting balances as of 12-31-06 as the ‘maximum use scenario.’” The starting balances on 12-31-06 are not the amount of emission credits created by this project.

**B. The Project Objectives are Likely to Mislead the Public and Agencies**

The primary purpose of an EIR (or EA, in this case) is to inform the public, and agencies that may be concerned, of the project's purpose, scope and impacts. The DPEA provides three "Project Objectives": 1) maintain the ability to administer the new source review program for major and minor sources and to accommodate population growth through implementation of Rule 1304 and Rule 1309.1; 2) memorialize in rule form the accounting procedures used to establish equivalency of the New Source Review Program; and 3) recognize sufficient previously-unused emission reductions to demonstrate federal equivalency.<sup>14</sup>

In this list, the SCAQMD has offered as objectives a series of justifications, based on unreasonable and inconsistent assumptions, for the SCAQMD's chosen rule. The three articulated objectives of the project do not clarify the project description, and all three objectives, in fact, hide important aspects of the project.

1-13

First, the SCAQMD's objective of "accommodat[ing] [the] population growth" predicted in the 2007 AQMP<sup>15</sup> provides an illustration of shifting assumptions underlying its objectives in order to justify the project. In the project Description, as well as discussion of impacts, the District insists the project is intended merely (read: benignly) to accommodate population growth that is already predicted to occur.<sup>16</sup> To the contrary, however, in the District's Baseline discussion, the District assumes the project will, in fact, *effect* this growth.<sup>17</sup> This sleight of hand appears throughout the document, and provides a convenient way for the District to justify its pre-chosen Rule 1315. For instance, one reason the District notes Alternative D is the environmentally superior alternative is because it will not cause as much emissions growth, and will therefore lead to fewer air impacts than the preferred project. At the same time, one reason the District simultaneously *rejects* Alternative D is that it would not accommodate the population growth predicted in the AQMP.

One important reason for the confusion about accommodating and facilitating growth in the PEA is that the District conflates population growth, economic growth, and emissions growth throughout the document. The District assumes accommodating population growth means allowing increased emissions, necessitating an increased supply of emissions credits. On the contrary, AQMP predictions about future population growth do not necessarily translate into increased emissions, and neither does the desire to facilitate economic growth.

1-14

The SCAQMD indeed must plan to accommodate the population growth predicted in the AQMP. The measures used, however, must comply with the state and

<sup>14</sup> DPEA p. 2-20.

<sup>15</sup> *Id.*

<sup>16</sup> The DPEA states one of the Project's objectives is to "maintain the SCAQMD's ability to continue to administer its new source review program for major and minor sources for facility modernization and to accommodate population growth through implementation of Rule 1304 and 1309.1." (DPEA, pp. 1-1, 2-20, emphasis added.)

<sup>17</sup> "The analysis assumes that if the project were not approved, a portion of the regional growth projected in the AQMP would not occur and future regional emissions without the project would be lower than they would be with the future project." (DPEA, pp. 1-5, 4.0-3.)

1-14  
Cont.

federal Clean Air Act mandates to achieve attainment of the National and California Ambient Air Quality Standards.<sup>18</sup> Yet, the SCAQMD admits that the Project may well slow attainment for PM and ozone:

In the future, additional emissions reduction measures will be needed beyond the control measures identified in the 2007 AQMP in order to reduce ambient ozone levels to achieve attainment of the ... [ozone standards].... It cannot be ascertained precisely when these standards will be attained.... It is possible that, without the project, attainment of the ozone and particulate matter NAAQS and CAAQS could occur at an earlier date than under the conditions of the proposed project....<sup>19</sup>

Generating credits from pollution that disappeared from the South Coast's skies in 1990 is anathema to the legal requirement that the South Coast achieve and maintain air quality standards; nor does the creation and distribution of credits contribute to the District's mandate to encourage economic growth based on cleaner technologies, such as alternative fuels.<sup>20</sup>

1-15

In the second stated objective, the SCAQMD uses the word "memorializing" to describe its activities related to the new "accounting procedure", implying that it is not changing its past "accounting" practices. In fact, the District is inventing new, never before ways to generate emission credits to deposit into its accounts—changing its generation procedures not only prospectively, but also retroactively back thirty years. This new system has never legitimately been approved. In 2008, the Superior Court issued an injunction prohibiting the SCAQMD from relying on, or in any way using, the system described in the 2006/2007 version of Rule 1315. If the SCAQMD's representation that these generation methods are in use were true, the SCAQMD would be in direct violation of a court's injunction. The second objective hides the fact that the SCAQMD's intention is to adopt a rule that articulates new credit generation procedures to be used, changing the existing procedures both prospectively and retroactively. To cast these changes as simply memorializing the status quo, could lead reviewers to believe that the accounting system currently is, and has been, in use.

1-16

The third objective is likewise misleading. It suggests that the project would recognize only enough previously-unused emission reductions to show federal equivalency, when in fact, the project would create hundreds of thousands of pounds of new pollution credits per day, far in excess of what would be required to replace credits the U.S. EPA found the District relied upon in violation of federal law.

<sup>18</sup> See, e.g., Health & Safety Code § 40910, which requires that the SCAQMD achieve and maintain state ambient air quality standards by the earliest practicable date. See also Health & Safety Code § 40440(c), which requires the SCAQMD to "adopt rules and regulations that will assure that all its administrative practices and the carrying out of its programs are...consistent with the goals of achieving and maintaining federal and state ambient air quality standards and achieving the purposes of this chapter." One of these purposes includes "the rapid abatement of existing emission levels to levels which will result in the achievement and maintenance of the state and federal ambient air quality standards and to ensure that new sources of emissions are planned and operated so as to be consistent with the basin's air quality goals." Health and Safety Code § 40402(e).

<sup>19</sup> DPEA, p. 1-10.

<sup>20</sup> See Health & Safety Code § 40440(b), which requires the SCAQMD to adopt rules and regulations that, for instance, "promote cleaner burning alternative fuels."

1-17

This potential confusion is compounded by the fact that the project description is inconsistent in its discussion of what types of emission reductions will be credited to its internal accounts. The PEA states that the project allows credits to be used for federal purposes that although they were tracked under state law, had not previously been tracked before for federal purposes.<sup>21</sup> In a footnote, however, the PEA admits that:

Many, but not all, of the sources of offset credits that had not previously been accounted for in federal tracking were previously tracked for purposes of demonstrated equivalency with California "No Net Increase" (NNI) requirements. Specifically, shutdowns and reductions from minor sources, regardless of how small, were tracked for state purposes for VOC and NOx. Shutdowns and reductions from minor sources of CO, PM10 and SOx were tracked for state purposes if emissions were 15 tons per year or more, the threshold for state NNI tracking.<sup>22</sup>

The Rule appears to use these reductions, previously untracked even for state purposes, as new sources of credits in the District's internal accounts.

Thus, neither the "project objectives" nor the project description as a whole accurately represents the project. As such, they are woefully inadequate to inform the public or other decision-makers of what the project *actually is*.<sup>23</sup> Overall, the District fails to provide the public or other decision makers with an accurate, stable, consistent, and finite description of the program. This failing permeates the entire PEA, and is based on flawed assumptions about the baseline, the program's end dates, and about how many credits will be generated and used, all of which serve to undermine the SCAQMD's impacts and alternatives analyses.

1-18

## II. The DPEA Fails to Analyze the True Impacts of the Project

A PEA must articulate and analyze all direct and indirect impacts the proposed project may have. As noted in our comments on the 2007 DPEA, the DPEA for the previous attempt to adopt Rule 1315 and Rule 1309.1 ("2007 Comments"), the Air Resources Board has estimated that more California residents die from their exposure to air pollution than those who die from traffic accidents and homicide, combined.<sup>24</sup> California is truly facing a public health crisis due to air pollution. Further, there is now a clear consensus that particulate matter has devastating impacts on health, particularly on the health of children.<sup>25</sup> The 2007 Comments describe in detail the

<sup>21</sup> DPEA, p. 1-4.

<sup>22</sup> DPEA, p. 2-13.

<sup>23</sup> The contention that the "project" will end in 2030 is misleading and inappropriate since the need for and use of the banked emission reduction credits will continue as long as the South Coast Air Basin fails to attain either the federal or state Ambient Air Quality Standards.

<sup>24</sup> Air Resources Board, Recent Research Findings: Health Effects of Particulate Matter and Ozone Air Pollution, January 2004 (<http://www.arb.ca.gov/research/health/fr/PM-03fr.pdf>)

<sup>25</sup> California Communities Against Toxics et al., Comments on Proposed Amended Rule 1309.1 - Priority Reserve; and Proposed re-adopted Rule 1315 - Federal New Source Tracking System (May 29, 2007) ("2007 Comments"), p. 2.

1-18  
Cont. ↑ air quality, health, aesthetic, and regulatory impacts of Rule 1315.<sup>26</sup> Although the SCAQMD attempts to address these impacts in its DPEA, because the analysis incorrectly focuses on how many credits will be distributed rather than generated, and places artificial limitations on its analysis, the document grossly underestimates and minimizes the impacts the project will have on health and the environment.

1-19 The SCAQMD's misconception begins with its definition of the project as limited to distribution of permits, instead of the creation and banking of emission reduction credits and the reasonably foreseeable result of creation and banking of credits: that emissions will be allowed by those credits. As the superior court stated with respect to the SCAQMD's 2006 PEA for Rules 1315 and 1309.1, however,

[i]t is the universe of emission credits (and, foreseeably and consequently, the emissions that will be allowed thereby to be released into the environment) that is at the heart of a programmatic assessment of the rule-making.... Nor is the impact of Rule 1315—on a programmatic basis—limited to the eleven power plants currently in line for Priority Reserve access.<sup>27</sup>

1-20 Nor, here, is the impact limited to the District's new suggested foreseeable projects—three power plants and facilities under current versions of 1304 and 1309.1—that will likely receive Priority Reserve credits. Rather, the District must analyze the consequences of all the credits available being used.

1-21 Compounding the SCAQMD's low estimate of the impacts of the project, the SCAQMD artificially and inexplicably limits its analysis of the health effects of the pollution to the effects on people over 25 years old.<sup>28</sup> Yet, in one of the nation's most comprehensive studies on the impact of pollution on children, USC Keck School of Medicine preventive medicine researchers have clearly demonstrated the significant relationship between PM 2.5 and slow lung growth in children.<sup>29</sup> Elderly, women of child-bearing age, people with existing heart and lung disease, and other subpopulations with limited access to healthcare are also particularly vulnerable to the adverse health impacts of PM 2.5 and PM10.

↓ The SCAQMD did provide an estimate (albeit based on faulty assumptions that emissions will be lower than the project actually creates) of excess morbidity cases from cancer, decreased respiratory function (bronchitis, respiratory illness) and heart attacks, as well as the increase in emergency

<sup>26</sup> See *id.*, pp. 2-8.

Peters, "Association between Air Pollution and Lung Function Growth in Southern California Children: Results from a Second Cohort," *American Journal of Respiratory and Critical Care Medicine*, Vol. 165, No. 13, July 1, 2002.

1-21  
Cont.

room and hospital visits, as well as lost activity and work (though not school) days. In addition to these numbers in themselves being low estimates, the SCAQMD seems to ignore substantial evidence linking PM and ozone to elevated risks for other illnesses and causes of death, including, but not limited to: diabetes, neurological diseases, low birth weight, infant bronchiolitis, postneonatal mortality, infant mortality, sleep apnea, and suicide.<sup>30</sup> Further, studies have also shown that climate change will exacerbate the environmental and health impacts of ozone and PM,<sup>31</sup> a fact the SCAQMD ignores despite the project's 20-year timeline.

1-22

For most other potential impacts, the SCAQMD simply punts any analysis to future environmental review, rather than examining the impacts from the project as a whole. For instance, the SCAQMD believes that the only impacts on biological resources are from facility construction and siting.<sup>32</sup> By ignoring the impacts of the entire project, the SCAQMD fails to analyze the impact of increased air pollution on sensitive species, such as lichens,<sup>33</sup> other species, such as leafy vegetables,<sup>34</sup> and even whole ecosystems, such as Southern California's mixed conifer forests.<sup>35</sup>

<sup>30</sup> See, e.g., J.F. Pearson, C. Bachireddy C, S. Shyamprasad, A.B. Goldfine, J.S. 1-23

In addition to deferring much of its impacts analysis to future projects, and basing its air quality impacts analysis on speculative musings about how many credits the SCAQMD thinks it might give out, rather on the very concrete number of credits the project is generating, the impacts analysis is handicapped by other flaws in the DPEA. Unreasonable assumptions about future conditions permeate the DPEA, and consistently lead the SCAQMD to underestimate the project's impacts.<sup>36</sup>

**III. The Baseline is the Condition at the Time of the Notice of Preparation, not Future, Hypothetical Conditions**

Pursuant to section 15125 of the CEQA Guidelines:

An EIR must include a description of the *physical environmental conditions* in the vicinity of the project, as they exist at the time the notice of preparation is published, .... This environmental setting will normally constitute the baseline . . . .

**A. Imposing a Future Baseline Dramatically Understates the Project's Scope**

The DPEA states that "because the project will be carried out over the next twenty years, a 'future' baseline is appropriate for assessing the project's emission-related effects."<sup>37</sup> This baseline assumes reduced future "regional emissions of all pollutants" as a result of effectuation and success of the 2007 AQMP, instead of simply looking to existing actual levels to set a baseline from which to measure impacts. The document explains:

1-24

The PEAs therefore compares forecasts of future emissions with the proposed project in place to forecasts of future emissions without the proposed project. The analysis assumes that if the project were not approved, a portion of the regional growth projected in the AQMD would not occur and future regional emissions without the project would be lower than they would be with the project.<sup>38</sup>

In other words, the "baseline" chosen by the SCAQMD is the forecasted world with the project and then the analysis of the project consists of subtracting emissions from the future, hypothetical world. In that future, hypothetical world, the SCAQMD attains the federal NAAQS in various milestone years thereby eliminating the need to use the emission reduction credits that this project creates. Further, in this future, hypothetical world the emission growth levels are the predicted levels from the 2007 AQMP. Not only is the use of a "future baseline" legally unwarranted, the practical

195. 2005. For more studies on biological resources and air pollution, see California Air Resource Board, Air Pollution Research Reports/Studies – Ecological Effects of Air Pollution, available at: <http://www.arb.ca.gov/research/apr/past/ecol.htm>.

<sup>36</sup> An EIR prepared for a temporary project may be found deficient if evidence shows a reasonable probability that the project will last longer than identified in the project description. (*City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1450-1455.) Further, assumptions about future activities must be reasonable, and supported by substantial evidence and expert opinion. (*Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018; *San Francisco Ecology Ctr. v. County of San Francisco* (1975) 48 Cal.App.3d 584.)

<sup>37</sup> DPEA, p. 1-5.

<sup>38</sup> DPEA, p. 1-5.

1-24  
Cont.

effect of this “future baseline” is that the SCAQMD discloses the impacts of some, but not all of the emission reduction credits created by the proposed project. This is exactly what the courts have consistently and clearly prohibited. As the Supreme Court noted in March of this year in a case in which the SCAQMD was a defendant: “An approach using hypothetical allowable conditions as the baseline results in ‘illusory’ comparisons that ‘can only mislead the public as to the reality of the impacts and subvert full consideration of the actual environmental impacts,’ a result at direct odds with CEQA’s intent.”<sup>39</sup>

Every project analyzed by CEQA will occur in the future, so the fact that this project will occur in the future is not a rational justification for reliance upon a “future baseline.” CEQA clearly provides that the baseline against which to measure the project’s impacts are the environmental conditions that exist when the agency embarks on its CEQA review, not hypothetical conditions, whether future or past. The baseline is different from the “No Project Alternative,” which should look forward to see the distinction between a future with the project and a future without the project.<sup>40</sup> The DPEA’s reliance on a future baseline prematurely ends the analysis of the Project’s impacts by assuming attainment in attainment years. Unfortunately, the District may not meet the NAAQS in the projected year, and as explained further below it does not have a plan in place to meet the NAAQS with respect to the 1997 annual PM<sub>2.5</sub> standard or the 8-hour ozone standard, contrary to the DPEA’s assumption.

By assuming that future environmental gains will occur, and relying on three specific future years during the project’s 20-year life, the DPEA adopts an improper baseline and fails to account for the actual impacts the Project will impose on the environment.

The DPEA’s reliance upon a future baseline does not result in a fuller exposition of project impacts that might otherwise be hidden by reductions in permitted emissions. It instead serves to shift the focus of decision-makers away from the impacts of this project, to focus on “reductions forgone” by the project. By employing this shift in focus, the DPEA invites decision-makers and the public to view the air quality as being much cleaner than today, even with this project instead of having the clear-eyed discussion of the air getting dirtier *because* of this project.

This future, hypothetical baseline is the justification provided in the DPEA to stop attributing emissions to new facilities that would rely upon the emission reduction credits created and banked by the project after 2014 for PM, 2023 for SO<sub>x</sub>, and 2030 for ozone. The incorrect baseline masks the impacts and significance of changing how the SCAQMD creates pollution credits. The change allows the District to capture and bank at least 222,000 pounds *per day* of air pollution emissions reductions retroactively to 1990, plus whatever the amount that would be created prospectively from the policy change, for use in—and beyond—the South Coast Air Basin to facilitate the addition of more sources of air pollution. The use of an incorrect hypothetical baseline leads to a vast underestimate of project’s impacts.

The baseline is not the place to calculate the scope of the Project – the baseline is the actual environment as it exists in March 2009, when the District issued the

<sup>39</sup> *CBE v. SCAQMD* (2010) 48 Cal.4th 310, 322 (quoting *Environmental Planning Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 358).

1-24  
Cont.

Notice of Preparation for Rule 1315. To that actual baseline, the DPEA must compare the impact of the total new credits to be created.

1-25

**B. The DPEA Cannot Use an Unsubstantiated Attainment Argument to Curtail Analysis of Impacts from Harmful Particulate Matter Emissions.**

In analyzing the air quality impacts from the proposed project, the DPEA dramatically underestimates the health impacts from PM emissions.<sup>41</sup> Specifically, the DPEA includes a curtailed analysis by presuming no emission reduction credits will be issued from the SCAQMDs bank after 2014. The DPEA substantiates this decision by improperly claiming that the 2007 AQMP “demonstrated attainment with the annual [PM2.5] NAAQS by 2015.”<sup>42</sup> This statement is wrong for two distinct reasons: EPA has not approved the 2007 attainment demonstration for the PM2.5 plan, and EPA’s regulations preclude the SCAQMD from assuming the 2007 PM 2.5 plan demonstrates attainment.

First, EPA has not approved the attainment demonstration for the PM2.5 plan that was submitted in 2007. In fact, the EPA released a Federal Register Notice that provided for the following action:

EPA is proposing to disapprove the attainment demonstration because it does not provide sufficient emissions reductions from adopted and EPA approved measures to provide for attainment of the NAAQS.<sup>43</sup>

EPA clearly does not believe the SCAQMD, under its current plan, will come into attainment by 2015, nor does EPA intend to extend the attainment deadline. Besides, absent this approval of the attainment demonstration by EPA, the DPEA cannot rely on the fact that the 2007 PM2.5 plan will attain the annual PM2.5 standard by 2014.

1-26

Second, even if the commitments to adopt regulations in the 2007 PM SIP actually could meet attainment requirements, EPA’s regulations preclude the DPEA from assuming the 2007 PM SIP demonstrates attainment. Specifically, EPA requires states and regions to submit adopted, enforceable control measures. In pertinent part, EPA’s regulations provide the following:

Emission limitations and other measures necessary for attainment and maintenance of any standard, including any measures necessary to implement the requirements of subpart L must be adopted as rules and regulations enforceable by the State agency. Copies of all such rules and regulations must be submitted with the plan. Submittal of a plan setting forth proposed rules and regulations will not satisfy the requirements of this section nor will it be considered a timely submittal.<sup>44</sup>

Many of the regulations that form the basis for the attainment demonstration have not been submitted to EPA for approval as part of the 2007 PM2.5 plan. Absent actual submission of rules like the statewide heavy-duty truck rule, the DPEA is wrong that the 2007 AQMP demonstrates attainment of the annual PM2.5 standard. The

<sup>44</sup> 40 C.F.R. § 51.281.

1-26  
Cont.

proposed federal register notice confirms this position by proposing disapproval of the attainment demonstration.

The DPEA's assumption that the 2007 South Coast Plan will attain the annual PM standard is not supported by substantial evidence on the record. Moreover, the DPEA fails to mention that there will be future PM standards that need to be met, which requires extension of analysis of these impacts. Absent SCAQMD showing that it has an EPA-approved attainment demonstration or that the actual measures committed in the 2007 PM AQMP have been submitted to and approved by the EPA, this assumption renders the PEA inadequate for environmental disclosure purposes under CEQA.

1-27

#### IV. The SCAQMD Fails to Offer Any Mitigation for this Massive Project

"It is the policy of the state that public agencies should not approve projects as proposed if there are . . . feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects."<sup>45</sup> The mitigation and alternatives sections are considered "the core" of an EIR.<sup>46</sup> Moreover, "[a]n adequate EIR must respond to specific suggestions for mitigating a significant environmental impact unless the suggested mitigation is facially infeasible."<sup>47</sup>

The DPEA provides one act that it describes as a mitigation measure:

the proposed project includes a cap on total emissions offsets to be provided from the SCAQMD internal accounts...to ensure that the net emissions increase ... do not exceed the emissions analyzed in this PEA.<sup>48</sup>

Basically, the SCAQMD has proposed as "mitigation" to not expand the project more than what it analyzed in the DPEA. To refrain from polluting more than it said it would pollute is not "mitigation." This is especially troubling given that the impacts that the SCAQMD admits will occur are so staggering. None of the harm that the SCAQMD predicts will be lessened or changed in any way by the "mitigation" the District has proposed. Further, again, the failure to properly describe the project causes the SCAQMD to fail to properly develop and apply reasonable mitigation measures. When the "project" is to "adopt Rule 1315" then it is impossible to properly conceptualize appropriate mitigation measures for the project.

The complete failure of the SCAQMD's analysis is highlighted in the following passage:

. . . the regional emissions directly resulting from Proposed Rule 1315 equal the quantity of the Rule 1315 offsets that are used pursuant to Rules 1304 and 1309.1. Thus, any reduction or limitation on the use of the offsets will directly reduce the quantity of regional air pollutant emissions.<sup>49</sup>

While that is true, the project is the *creation and banking* of the credits. The SCAQMD simply cannot have it both ways—to propose a project that creates hundreds

<sup>49</sup> DPEA, p. 4.1-58-59.

1-27  
Cont.

of thousands of pounds of emission reduction credits and then analyze the impacts of a subset of what was created based upon some “future baseline” and a completely implausible cap. (A “cap” that will be, as a practical matter, unenforceable by the public since there is no way for the public to track the credits distributed by the SCAQMD. The proposed reporting will come far too late prevent the environmental harm caused by exceeding the “cap”.) The complete implausibility of the “cap” is not speculative, but proven by the SCAQMDs own actions. As the District recited in the DPEA itself, in 2009 legislation that was adopted by the State of California under which “the SCAMQD was required to use internal account offsets” it created and put into its account.<sup>50</sup> Also in 2009, legislation was adopted “requiring that [certain power plants] be provided with offsets from the SCAQMD’s internal accounts.”<sup>51</sup> The activities of 2009 demonstrate in the starkest possible way that the SCAQMD cannot plausibility say that they can “cap” the emissions credits that will be used.

1-28

Further, the SCAQMD cannot simply limit its analysis to the credits’ use by current 1304 and 1309.1 facilities. As the Los Angeles Superior Court noted in its Decision on this question:

[I]t cannot be doubted that in a world of ever-scarcer emission credits that a huge cache of district-held credits in a now-accessible Priority Reserve will be used. This foreseeable consequence is particularly apparent where, as in this case, the District has articulated a willingness to open the Priority Reserve for uses far removed from the entities who historically could obtain access to those reserves.<sup>52</sup>

While the SCAQMD has now decided not to include an amended Rule 1309.1 for use by power plants, or adopt a Rule1309.2 to open the bank of credits to any proposed source of air pollution willing to buy credits from the District, it is reasonably foreseeable that revisions would be made to those rules (or completely new rules could be adopted either by the SCAQMD or the legislature) that would draw upon this newly expanded bank of credits. Since *this* project is the creation and banking of credits, the creation and banking is what must be analyzed.

1-29

**V. The District Fails to Choose A Feasible Alternative that can Substantially Lessen or Avoid Environmental Effects.**

The District has an obligation, under both CEQA’s substantive mandates and to the people who breathe the air in the South Coast Air Basin, to refrain from approving this proposed project when feasible alternatives exist that can substantially lessen or avoid harmful effects. It is for this reason that the alternatives and mitigation analysis have been called “the core” of CEQA’s environmental review process.<sup>53</sup>

In particular, Section 21002 of the Public Resources Code states:

The Legislature finds and declares that it is the policy of the state that public agencies *should not* approve projects as proposed if there are *feasible*

<sup>50</sup> The SCAQMD fails to acknowledge that it was the sponsor of the proposed legislation, took a very active role in writing the language of the statute, and that it lobbied heavily for passage of the legislation.

<sup>51</sup> DPEA, p. 2-21.

<sup>52</sup> 2008 Decision, pp. 8, 12.

<sup>53</sup> LAUSD, 58 Cal App.4<sup>th</sup> at 1029; *County of San Diego v Grossmont-Cuyamaca Community College Dist.* (2006) 141 Cal. App. 4<sup>th</sup> 86, 98.

1-29  
Cont.

*alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects, and that the procedures required by this division are intended to assist public agencies in systematically identifying both the significant effects of proposed projects and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects. (emphasis added)*

In the Alternatives section of the District's DPEA, the SCAQMD identified five alternatives in addition to the required "no-project" Alternative,<sup>54</sup> and rejected four Alternatives as "infeasible." Alternatives can function as mitigation for a proposed project when the proposed project's impacts are very difficult to mitigate.<sup>55</sup>

The SCAQMD's proposed project will create at least 222,000 pounds per day of emission reduction credits. While the SCAQMD's analysis has systematically underestimated the true environmental impacts of the foreseeable use of the credits in the South Coast Air Basin and beyond, its analysis still predicts staggering environmental health impacts—including significant levels of death and illness for people living in the South Coast Air Basin—caused by the proposed project. For all practical purposes, the SCAQMD has proposed no mitigation at all for the proposed project. In this type of circumstance, choosing one of the alternatives described in the environmental review document would meet the requirement that an agency refrain from approving a project that has substantial negative impacts on the environment.

1-30

Alternative D is titled "Use of Credits Generated in 2009 and Beyond Only."<sup>56</sup> As its name suggests, Alternative D is like the proposed project in every way, except it generates and banks only those credits created after 2009.<sup>57</sup> As the SCAQMD describes it: "[t]he primary effect of implementing Alternative D is that a fewer number of new credits would be available each year after adoption of this alternative compared to the proposed project."<sup>58</sup> SCAQMD finds that

Alternative D is concluded to be the environmentally superior alternative. Alternative D has the potential to result in substantially lower air quality, health, greenhouse gas impacts for most milestone years than the proposed project and the other project alternatives.<sup>59</sup>

Nowhere in the 513 pages that the SCAQMD devotes to its analysis of the Alternatives is there an explanation of why Alternative D—identified by the SCAQMD as the Environmentally Superior and Least Toxic Alternative—was not recommended as the agency's proposed project. Alternative D meets the project's articulated goals. What it would not do, however, is result in a large surplus of credits in the SCAQMD's internal accounts. As Judge Jones observed, it is a strange delusion to imagine that, when credits are scarce or expensive on the open market, credits held in the SCAQMD's internal bank would remain unused. The actions of both the SCAQMD and of Power plant lobbyists have already demonstrated how easily the SCAQMD's

<sup>54</sup> See, generally, DPEA Chapter 6.

<sup>55</sup> See, e.g., *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal 3d 376, 403 ("alternatives and mitigation measures have the same function—diminishing or avoiding adverse environmental effects").

<sup>56</sup> The analysis of all the alternatives is negatively by all of the shortcomings discussed in this letter, however, as compared to the proposed project. Alternative D has significantly fewer impacts.

↑  
rules limiting access can be overridden with timely lobbying in Sacramento. The only honest and lawful approach to this project is to consider the impact of creating the entire pool of credits. The only way to mitigate that pool is to shrink the pool. Alternative D does exactly that, by limiting the generation emissions reductions that occurred in 2009 and beyond.

**COMMENT LETTER #1**

**CALIFORNIA COMMUNITIES AGAINST TOXICS  
COALITION FOR A SAFE ENVIRONMENT  
COMMUNITIES FOR A BETTER ENVIRONMENT  
NATURAL RESOURCE DEFENSE COUNCIL**

**November 10, 2010**

**Time for comments on the Draft PEA and provision of responses. Responses to Comment 1-1 and 1-2**

The introductory paragraph of the comment letter identifies the environmental organizations who submitted comment letter No. 1 on the Draft Program Environmental Assessment (PEA).

The comment requests that the SCAQMD respond to all “comments and objections” in the Final PEA. Specific responses to the comments in this comment letter have been prepared by SCAQMD staff and are set forth below. The responses are generally organized by topic and references to the particular comments being responded to are provided.

Footnote #2 in the comment letter notes that the SCAQMD granted a two-week extension to comment on the Draft PEA, and states that granting a longer extension would have been reasonable. The Draft PEA was released and made available to the public on September 9, 2010, with the comment period scheduled to close on October 26, 2010. On October 11, 2010, the commenters requested an extension of 28 days until November 23, 2010. To accommodate the request for additional time, while balancing desires of other members of the public for the SCAQMD to take prompt action on Proposed Rule 1315, SCAQMD extended the comment period to November 9, 2010, which provided a total of 62 days for comment on the Draft PEA.

**Overall comments about the health impacts of the rule, mitigation measures and alternatives. Responses to Comment 1-3**

The comment raises concerns regarding the significant adverse health impacts associated with project-related emissions, and argues that the negative health and environmental effects of the proposed project are unique.

The Draft PEA clearly recognizes that there is a relationship between the emissions from sources receiving permits in reliance on the SCAQMD’s internal offset accounts and health effects. The Draft PEA assumes that if Proposed Rule 1315 is not adopted, then the sources that would otherwise be expected to receive permits in reliance on offsets in the SCAQMD’s internal offset accounts over the next 20 years would not be permitted, and the emissions expected to result from those permits would not occur. This assumption extends to all such sources, including new and modified sources that would replace existing sources that close down or reduce emissions as well as new and modified sources that reflect regional growth. By including a detailed analysis assessing the health effects associated with such emissions, the Draft PEA fulfills its role as an informational document that will inform public agency decision makers and the public of the significant environmental effects of the project.

The comment objects to the fact that the Draft PEA did not recommend Alternative D even though it would result in substantially lower air quality, health and greenhouse gas emissions than the proposed project. The ultimate decision regarding whether to approve the proposed project, one of the alternatives, or take other action relating to the proposed rule rests with the decision-making body, the SCAQMD Governing Board. Additional information relating to Alternative D is provided in the Responses to Comment 1-11.

The statement in Comment 1-3 indicating that no mitigation has been proposed to reduce impacts from the proposed project is responded to along with the other comments relating to mitigation, below in the Responses to Comment 1-27.

**Introductory summary of comments. Responses to Comment 1-4**

Comment 1-4 summarizes the comments in the comment letter. The issues summarized in Comment 1-4 are addressed in the responses to the following comments:

Scope and impact of the proposed project: Responses to Comments 1-9, 1-10, 1-12, 1-18, 1-19, 1-20, and 1-21.

Clarity of the project description: Responses to Comments 1-6, 1-7, 1-8, 1-12, 1-13, 1-15, 1-16, and 1-17.

Use of a “future baseline” to analyze the project’s air pollution impacts: Responses to Comment 1-24.

Project description’s treatment of offset creation and banking: Responses to Comments 1-9 and 1-10.

Relationship between creation and banking of offsets and the impacts of the proposed project: Responses to Comments 1-18, 1-19 and 1-20.

Requirements of the Superior Court’s ruling relating to the impact analysis: Responses to Comments 1-18, 1-19 and 1-20.

The mitigation for the impacts of the proposed project: Responses to Comment 1-27.

The quantity of offsets that will be credited to the internal accounts: Responses to Comments 1-9, 1-10 and 1-12.

Potential to expand offset use beyond the level analyzed in the Draft PEA: Responses to Comments 1-23 and 1-28.

Alternatives to the proposed project: Responses to Comments 1-11, 1-29 and 1-30.

Effect of banking “retroactive” offsets: Responses to Comment 1-14.

**Legal adequacy of Draft PEA, the CEQA process and the rulemaking procedure.  
Responses to Comment 1-5**

**Legal adequacy of the Draft PEA.** The comment expresses the view that the Draft PEA is substantively inadequate. The SCAQMD Governing Board will be responsible for determining whether to certify the PEA. That determination will be made based upon the information in the Draft PEA, combined with the Responses to Comments on the Draft PEA and changes and corrections made to the Draft PEA in the Final PEA. It is SCAQMD staff's objective to complete a PEA that fully complies with all relevant substantive and procedural CEQA requirements. The PEA's analysis of environmental impacts related to the proposed project is detailed, comprehensive, and employs conservative assumptions to ensure that impacts are not understated. The PEA serves its purpose as an informational document by providing the public and decision-makers with a technically sound discussion and analysis of environmental impacts related to the proposed project.

**Differences between prior rule and proposed rule** The comment maintains that the SCAQMD is seeking to adopt a rule with the "exact same pollution generation provisions as the rule adopted in 2006." (Comment 1-5) The Proposed Rule 1315, like the prior version of Rule 1315 that was rescinded in response to the Superior Court's decision, is being promulgated in response to a request from U.S. EPA that the SCAQMD describe its internal offset tracking system in a formally adopted rule. There are several important distinctions between Proposed Rule 1315 and the rule adopted in 2006.

One key difference is the inclusion of backstop provisions in the rule, which will limit the issuance of offsets from the SCAQMD internal accounts so that emissions from sources relying on internal offsets cannot exceed cumulative net emission increase thresholds. This assures that emissions from the project will not exceed the amount analyzed in the PEA. See Responses to Comment 1-27 for a detailed discussion of the backstop provisions of the proposed rule. Furthermore, under the previously adopted version of Rule 1315, many more categories of sources would have been able to access offsets from the internal offset accounts pursuant to two rules that have since been rescinded: former Rule 1309.2, which provided access to a wide range of new and modified sources, and the former power plant amendments to Rule 1309.1 which provided access to large power plants. Because these rules have been rescinded, these sources will not be able to access the SCAQMD's internal offset accounts under Proposed Rule 1315. See Responses to Comments 1-18, 1-19 and 1-20 for a further discussion.

In addition, Proposed Rule 1315 substantially strengthens federal equivalency provisions. It would require that the Executive Officer immediately discontinue issuing permits for major sources for any pollutant for which a final determination of equivalency shows a shortfall. Proposed Rule 1315 would also require the Executive Officer to annually prepare a projection of cumulative emission increases for the next two years. If these projections indicate that a shortfall will exist, the Executive Officer would be required to prepare a report to the Governing Board recommending specific action to rectify the shortfall, thus making it highly unlikely that an actual shortfall would ever occur. Neither of these provisions was included in the previously-adopted rule.

**The rule development and environmental review process.** The rule promulgation and environmental review processes have been open and fully transparent since the SCAQMD began working on a new proposed rule in response to the decision of the Los Angeles Superior Court that set aside the previously adopted version of Rule 1315. SCAQMD staff prepared a Notice of Preparation and Initial Study for Proposed Rule 1315 that was circulated for a 30-day review period beginning on March 17, 2009. Four comment letters were received on the NOP/IS and responses to those comments were prepared. The authors of the comment letter did not provide any written comments on the NOP/IS. In addition, a joint scoping meeting for the Environmental Assessment and public consultation on the proposed rule was held on April 8, 2009, at which time the public was invited to comment on the scope and contents of the environmental assessment and on Proposed Rule 1315. Thirty-one interested parties attended the scoping and public consultation meeting. Further, a public workshop on Proposed Rule 1315 was held on September 22, 2010, with 25 interested parties attending. Copies of the proposed rule, staff report and the Draft PEA were available at the public workshop. The Draft PEA was circulated for public review and comment for a total of 62 days. Once the Final PEA is completed it will be considered for certification, and Rule 1315 will be considered for approval, at a noticed public hearing which will provide a further opportunity for public participation.

Release of the Notice of Preparation/Initial Study and release of the Draft PEA were accompanied by extensive notice to the public and interested agencies, which included: mailing hardcopies of the Draft PEA to interested parties, e-mailing notices of completion to a large list of interested parties, and providing notice of the availability of the Draft PEA in the Los Angeles Times. Over 1,200 e-mail notices were sent to county clerks, city planners, government agencies, citizen groups, fire departments, school districts, transit agencies, forestry agencies, Native American groups, and interested parties including attendees to the consultation meeting and scoping meeting. Copies of the Draft PEA were also submitted to the State Clearinghouse for distribution to state agencies. Further, the complete Draft PEA was made immediately available online for downloading, hardcopy and cd-rom versions were available at the SCAQMD Public Information Center, and, consistent with past procedures, offered to be mailed for free.

The comment relating to SCAQMD decisionmaking on the proposed project and the alternatives is discussed in the Responses to Comments 1-11, 1-29 and 1-30 below, and the comment on mitigation measures is discussed in Responses to Comment 1-27, below.

**General comments relating to adequacy of the project description and statement of objectives. Responses to Comments 1-6, 1-7 and 1-8.**

**Compliance with the requirements of CEQA.** The comment letter summarizes CEQA requirements relating to an environmental impact report's project description and statement of objectives (Comment 1-6), and asserts that the project description "fails to provide necessary substantive information as required by CEQA." (Comment 1-7). The necessary substantive information required by CEQA is provided. The project that is proposed for consideration by the SCAQMD Governing Board is adoption of Proposed Rule 1315. The Draft PEA's project description provides a comprehensive and detailed description of all of the components of Proposed Rule 1315 that are relevant to its potential environmental impacts. The comments do not identify any substantive information required by CEQA that has been omitted from the project description and the project description chapter of the Draft PEA contains all of the

elements of a project description identified in CEQA Guidelines §15124, including the following: providing the location of the proposed project, statement of objectives, general description of the proposed project, project background, permits and approvals, together with a discussion of other issues relevant to the project description. A “statement briefly describing the intended uses of the EIR” can be found in Chapter 1.

**Content of project description.** The comment letter also indicates that describing the proposed project as “adopting a revised version of Rule 1315” does not contain the content needed for decision making. (Comment 1-8) It should be recognized, however, that the description of the proposed project is amplified by a detailed discussion and explanation of each element of the proposed rule. (Draft PEA at pages 2-12 through 2-19.) In addition, to put the project description in context, the project description chapter of the Draft PEA includes a detailed background section that describes relevant legal requirements relating to New Source Review permitting and offset requirements, a summary of SCAQMD’s New Source Review permitting program, and the history of the SCAQMD’s offset tracking system, including the events leading to the current proposal to adopt a revised version of Rule 1315.

**Quantification of offsets that would be banked under Proposed Rule 1315. Responses to Comments 1-9, 1-10.**

The comment letter asserts that the proposed project would result in the “creation and banking” of “at least 220,000 pounds per day of air pollution emission reductions . . . .” (Comment 1-9) The commenter states this is a figure derived from numbers in the SCAQMD’s 2007 PEA. (See Comment Letter 1, footnote 4) The comment contends that the project description should include the quantity of offsets that would be “banked” under Rule 1315, and that the project description should emphasize that the proposed rule would result in both retrospective and prospective “creation and banking” of offsets. Comment 1-9. The comment letter further contends that quantification of these offsets is necessary in order to measure the size and scope of the proposed project. Comment 1-10. These contentions are repeated in several other comments. See Comments 1-4, 1-11, 1-17, 1-18, 1-19, 1-20, 1-21, 1-23, 1-24, 1-27, 1-28, and 1-29.

First, it should be noted that the proposed project would not “create” emissions reductions. Rule 1315 provides for tracking emissions reductions in SCAQMD’s internal accounts and their use as offsets in accordance with Rules 1304 and 1309.1.

Quantification of the offsets that would be tracked in SCAQMD’s internal accounts under Rule 1315 is not necessary to an adequate description of the proposed project or to an adequate analysis of its impacts. The comments on this topic are premised on the assumption that the quantity of emissions that would result from the proposed project, and therefore the air quality impacts of the proposed project, would be equivalent to the quantity of emissions reductions tracked in the SCAQMD’s internal accounts under Rule 1315. This assumption is incorrect for three reasons. First, as explained in the Responses to Comments 1-19 and 1-20, the Rule 1315 tracking system would only result in emissions to the extent emission reductions tracked under Rule 1315 are used as offsets for permits issued under Rules 1304 and 1309.1. As explained in Responses to Comment 1-13, the emissions analysis in the Draft PEA, which is based on

forecasted emissions attributable to sources projected to be permitted under Rules 1304 and 1309.1, provides the most accurate and reliable forecast of actual project-related impacts.

Second, as is explained in the Responses to Comments 1-18, 1-19 and 1-20, emission reductions tracked under Proposed Rule 1315 would not translate to an equivalent amount of offsets that would then be used as emissions offsets for new permits and there is no direct correlation as assumed by the comment. Furthermore, as is explained in the Responses to Comment 1-27, the CEQA Backstop provisions of Proposed Rule 1315, by limiting emissions, would ensure that future emissions due to the proposed project would not exceed the emissions forecasts made in the PEA.

It should also be noted that Chapter 8 of the Draft PEA includes a description and analysis of a “maximum use scenario” that analyzes a hypothetical scenario under which all the offsets in the SCAQMD’s internal accounts calculated as of December 31, 2006 would be used over the 20-year life of the proposed project. (Draft PEA 8.0-7). This analysis was completed even though, as is explained in Chapter 8, the SCAQMD has never experienced a situation in which all the offsets in the account are used.

The commenters have estimated that the project will result in at least 220,000 pounds per day of emission offsets being “created.” This translates to 111 tons per day (of all pollutants together). However, some of those offsets have already been used to support permits that were previously supported by pre-1990 offsets and other offsets that the SCAQMD has retroactively removed from its accounts. See Responses to Comment 1-16. Only those offsets that remain in the accounts after supporting the previously-issued permits can be used to support new permits resulting in increased emissions.

**Consideration of alternatives to the proposed project. Responses to Comments 1-11, 1-29, 1-30.**

The comment letter states that the SCAQMD’s emphasis on proposing a rule that is a revised version of prior Rule 1315, rather than an environmentally superior alternative, indicates that “SCAQMD’s real goal is to adopt essentially the same Rule it adopted in 2006” regardless of the environmental impacts. Comment 1-11. To the extent the comment is premised on the assumption that the effects of Proposed Rule 1315 would be the same as the 2006 and 2007 version of Rule 1315, the comment is misplaced. Proposed Rule 1315 is very different from prior Rule 1315 in several important respects. See Responses to Comment 1-5.

The Draft PEA eliminated four potential alternatives from detailed consideration on various grounds, including infeasibility. See Draft PEA pages 6-1 through 6-6. It then goes on to analyze in detail five alternatives, including the No Project alternative. None of these alternatives is rejected by the Draft PEA. In addition, it is incorrect to assume, as does this comment and several other comments (see Comments 1-3, 1-5, 1-13, 1-29 and 1-30) that the SCAQMD has predetermined to adopt Proposed Rule 1315, or to adopt such a rule in the form recommended by staff. The Draft PEA contains a range of alternatives to the proposed project, and each alternative will be considered on its merits by the SCAQMD Governing Board. The ultimate decision whether to approve the proposed project, adopt an alternative, or take other action will be up to the SCAQMD Governing Board.

Another comment refers to general CEQA requirements and states that the Draft PEA fails to choose a feasible alternative that reduces impacts, and contends that choosing one of the alternatives would meet the requirement to refrain from adopting a project with substantial environmental impacts. See Comment 1-29. However, it is not the function of the Draft PEA to accept or reject the proposed project or the alternatives to the proposed project. Rather, the function the Draft PEA is to evaluate the proposed project and alternatives to it in order to provide relevant environmental information to the public and the decision-makers. As noted above, the ultimate decision relating to what action to take on the proposed project and the alternatives is up to the SCAQMD Governing Board.

A related comment asserts that there is no explanation why Alternative D was not proposed in the Draft PEA as the recommended project. See Comment 1-30. Chapter 6 of the Draft PEA identifies Alternative D as the environmentally superior alternative, as required by CEQA Guidelines §15126.6 (e)(2). Chapter 6 of the Draft PEA also identifies the least toxic alternative, which is also alternative D. The ultimate decision regarding whether or not to approve the proposed project, one of the alternatives, or take some other action rests with the SCAQMD Governing Board. See response to comment 1-30 for a further discussion of Alternative D.

The second paragraph in Comment 1-11 relating to the methodology used in the impact analysis, is addressed below in the Responses to Comments 1-18 and 1-19.

**Exclusion of SB 827 and AB 1318 sources from the project. Responses to Comment 1-12.**

The comment letter suggests that emissions associated with permits issued under SB 827 and AB 1318 should be treated as emissions resulting from the proposed project. However, the permits issued under SB 827 and AB 1318 were not issued as a result of Proposed Rule 1315. Those permits exist, and will continue to exist, regardless of whether Rule 1315 is adopted. As a result, permits issued under SB 827 and AB 1318 are not part of the proposed project because the use of offsets from the SCAQMD's internal offset accounts for those permits was independent of Proposed Rule 1315, and did not depend in any way upon adoption of Proposed Rule 1315. However, emissions from SB 827 projects and AB 1318 (Sentinel power plant) are included in the cumulative impacts analysis.

As noted in the comment letter, the Draft PEA's quantification of emissions attributable to the proposed project does include a relatively small quantity of emissions that are actually attributable to sources that would be permitted under SB 827 after June 2010 and before adoption of Rule 1315. During the preparation of the Draft PEA, July 2010 was used as the projected start date for implementation of Proposed Rule 1315 in the event of its adoption. The impact analysis in the Draft PEA accordingly assumes that all permits projected to be issued under Rules 1304 and 1309.1 after July 2010 would rely on offsets tracked under new Rule 1315. Completion of the PEA has taken longer than was originally anticipated. The impacts the Draft PEA attributes to Proposed Rule 1315 are therefore overstated for the period that the SCAQMD continues to issue permits under the provisions of SB 827, since those permits are not actually issued in reliance on Proposed Rule 1315, although they were assumed to be in the Draft PEA. As discussed in the Draft PEA, the use of the July 2010 start date results in a relatively small over-estimate of the impacts of the proposed project and therefore does not understate the effects of the proposed project.

**Relationship between the proposed project and regional growth. Responses to Comment 1-13.**

The comment letter indicates that there is an inconsistency between the project description, which states that Proposed Rule 1315 will accommodate population growth, and the baseline discussion, which, according to the comment, “assumes the project will...effect this growth.” There is no inconsistency. As growth within the region occurs, essential public services in the region will have to be expanded and modernized to serve that growth; the proposed project will allow these essential public services to obtain the emissions permits needed for expansion and modernization. Similarly, the proposed project will allow sources that qualify for exemptions to obtain necessary emissions permits. The Draft PEA assumes that without the project, permits would not be issued under Rules 1309.1 and 1304, none of these sources would be constructed and operated, and the emissions attributable to those facilities would not occur. In addition, the Draft PEA also recognizes that growth within the region would, as a result, be constrained if these sources cannot be permitted under Rule 1309.1 and Rule 1304.

The comment letter asserts, without explanation, that population growth does not necessarily translate into emission increases. It is undisputed, however, that public services and economic activity must expand with population growth. Essential public services such as water, sewer, police, fire, waste disposal, and hospitals, will need to expand in response to population growth. The sectors of the economy that provide the goods, services and jobs needed by the increased population will also have to expand. Expansion in these areas will in turn result in the emissions associated with the new and modified sources in the new and expanded facilities.

The emissions attributable to emissions sources at such new and expanded facilities are reflected in the AQMP emissions projections, which is the best available information about the emissions forecasted to result from growth. It is correct that, due to the beneficial effect of pollution control rules and regulations in reducing emissions over time, growth does not necessarily translate to a proportionate increase in regional emissions in comparison with current conditions. That is, there would be more emissions with growth than without growth, but—due to effects of other changes occurring over the same period as the growth occurs—the net change in regional emissions over time may or may not result in an overall increase in emissions. However, it is also true that if growth in the region is reduced, emissions would also decline, and so future emissions with growth will be greater than future emissions without growth.

The emissions forecasts in the 2007 AQMP include all emissions projections for existing and new and expanded sources in the district, including those that would be approved in the future under Rules 1304 and 1309.1. The analysis in the Draft PEA accordingly reflects the fact that if the proposed project is not approved, no new or expanded sources would be approved under Rules 1304 or 1309.1, and the emissions forecasted for those sources in the 2007 AQMP would not occur. In addition, the social and economic effects that would result from the inability of essential public services in the region to modernize and expand, and for sectors of the economy that provide goods, services and jobs to expand, would in turn affect population and economic growth in the region.

It should also be recognized that new and modified equipment is required to use Best Available Control Technology (BACT) pursuant to Rule 1303. Application of BACT ensures that the

source uses the cleanest equipment available. Further, as existing businesses within the region cease operations over time and are replaced, the application of BACT will increase within the region. This will result in fewer emissions per unit of production than continuing to operate existing equipment that does not employ BACT. Use of the Priority Reserve pursuant to Rule 1309.1 and of the offset exemptions in Rule 1304 significantly helps this process occur; without the continued ability for facilities to obtain offsets from SCAQMD's internal offset accounts, the replacement of older, high-emitting sources with newer, BACT-equipped sources would be drastically slowed.

**Compatibility of use of existing emissions reductions as offsets with the Clean Air Act.  
Responses to Comment 1-14.**

The comment letter indicates that tracking past emissions reductions associated with pollution that has not been in the air going back to 1990, violates the federal and state Clean Air Acts. This comment does not address the physical environmental effects that would result from the use of such offsets, which have been disclosed in the PEA. The Draft PEA fully evaluates those environmental impacts because it treats emissions from sources that would rely on offsets tracked under Rule 1315 as new emissions that would not occur in the absence of Rule 1315.

No authority is cited for the proposition that use of previously existing emissions reductions would violate the Clean Air Act. Further, EPA has rejected the petition the commenters filed with the EPA (Letter dated September 23, 2010, from Lisa P. Jackson, EPA Administrator, to commentators Adriano Martinez (NRDC), Shana Lazerow (CBE) and Angela Johnson-Mezaros). On page 7 of its letter, EPA makes clear that it knew the SCAQMD proposed to use "certain post-1990 surplus reductions (i.e. minor source orphan shutdowns) for which, due to the large sum of credits in its offsets accounts, SCAQMD had not previously accounted". The EPA Administrator concluded, "The offsets from minor orphan shutdowns, therefore, meet the requirements of 40 C.F.R. 51.165(a)(3)(C)(1)(i), and I have found nothing in Regulation XIII that would preclude the SCAQMD from using these offsets to demonstrate equivalency with federal NSR requirements." (Jackson Letter, page 11) Thus EPA does not agree that the use of previously-existing emissions reductions violates the Clean Air Act.

The comment letter also states that the "creation and distribution of credits" does not "contribute to the SCAQMD's mandate to encourage economic growth based on cleaner technologies, such as alternative fuels," citing Health & Safety Code §40440(b). This comment appears to reflect a policy concern, rather than a critique of the PEA's analysis of the project's physical environmental effects. In any case, the SCAQMD's rules require the cleanest possible fuels and most advanced control technology for all new and modified sources, including those that are permitted in reliance upon offsets in the SCAQMD's internal accounts. Rule 1303(a)(1) requires all new and modified sources resulting in an emissions increase to use Best Available Control Technology (BACT). In implementing this requirement, the SCAQMD requires the use of the cleanest available fuel, which in most cases is natural gas, and the SCAQMD also requires the most advanced pollution controls to be used to further reduce emissions from those fuels, such as selective catalytic reduction for NOx.

In addition, the SCAQMD encourages development of the cleanest possible alternative fuels as part of its Clean Fuels Program, which receives funds from a vehicle registration fee and from an

emissions fee surcharge on stationary sources. Health & Safety Code §40514. These fees are used, among other things to promote renewable and alternative energy projects, such as solar roof projects.

The comment letter recognizes that “the SCAQMD indeed must plan to accommodate the population growth predicted in the AQMP.” However, the comment notes that this must be done in compliance with state and federal Clean Air Act requirements, and quotes the Draft PEA as saying that “It is possible that, without the project, attainment of the ozone and particulate matter NAAQS and CAAQS could occur at an earlier date than under the conditions of the proposed project.” (citing the Draft PEA, 1-10). The comment omits the immediately following two sentences in the Draft PEA, which state: “However, for several reasons, it cannot be determined whether the without project scenario would in fact achieve attainment at an earlier date than under the proposed project, and if so when. These reasons include the long-term nature of the control measures needed to reduce ozone and PM levels; and the relatively small amount that the project would contribute to ozone concentrations (from 0.5 to 2.9 ppb) PM2.5 concentrations (from 0.01 to 1.6 micrograms per cubic meter) and PM10 concentrations (from 0.01 to 2.5 micrograms per cubic meter.)” (Draft PEA, 1-10 to 1.11).

Nevertheless, the Draft PEA discloses that “emissions attributable to the proposed project are considered to result in a significant air quality impact because the emissions will exceed the applicable operational significance threshold for each of the following criteria pollutants: VOC, NOx, SOx, CO, PM10, and PM2.5.” (Draft PEA, 1-9). The Draft PEA also identifies the health risks associated with the emissions, and concludes those risks are significant. The Draft PEA further acknowledges that accommodating the population growth predicted in the AQMP results in significant, adverse environmental effects compared to conditions without the project, which would constrain growth. For a further discussion of the relationship between the proposed project and regional growth, see Responses to Comment 1-13.

**Project objective relating to credit accounting procedures. Responses to Comment 1-15**

The comment letter asserts that the use of the word “memorializing” in the statement of project objectives regarding the SCAQMD’s accounting procedures implies that the SCAQMD is not changing its past practices, and does not explain that the SCAQMD is using new ways to “generate” offsets. Comment 1-15. However, this comment ignores the fact that the project objectives also state that one of the purposes of the project is to “Recognize sufficient previously-unused emission reductions that are beyond those required by applicable regulatory requirements in order to demonstrate federal equivalency for major sources that are exempt under Rule 1304 or that are allocated credits from the Priority Reserve under Rule 1309.1.” (Draft PEA 2-20). The fact that the project objectives describes these reductions as “previously-unused” makes clear the fact that these are types of reductions that were not used in the SCAQMD’s prior uncodified accounting system. Furthermore, other aspects of the project description also makes this clear. The Draft PEA states: “The proposed rule would provide for the use of certain types of offsets that previously had not been accounted for in the SCAQMD’s federal tracking system.” (Draft PEA 2-13) The project description goes on to identify which types of offsets had not previously been accounted for in federal tracking in footnote 14, page 2-13.

**Project objective relating to recognition of previously unused emissions reductions as offsets. Responses to Comment 1-16.**

The comment letter asserts that the third project objective is misleading because it suggests that the project would recognize only enough previously-unused emission reductions to show federal equivalency, when the project would create “new” credits. This is an incorrect characterization of the third project objective, which is to “Recognize sufficient previously-unused emission reductions that are beyond those required by applicable regulatory requirements in order to demonstrate federal equivalency for major sources that are exempt under Rule 1304 or that obtain credits from the Priority Reserve under Rule 1309.1.” This objective in no way limits the tracking of previously-unused emission reductions to the amounts needed to demonstrate federal equivalency and no more. Furthermore, as discussed in Responses to Comment 1-15, both this project objective and other aspects of the project description in the Draft PEA make it clear that, if the Proposed Rule is adopted, the SCAQMD will be using certain types of emission reductions that had not previously been accounted for. However, the emissions reductions that would be accounted for have always existed and in that sense are not “new;” the change is that under Proposed Rule 1315 they would be tracked in the SCAQMD’s internal accounts for use as offsets.

Further, the comment letter asserts that the U.S. EPA found the SCAQMD had “violated federal law” by relying on certain offset credits, and that under the proposed rule, SCAQMD will be accounting for reductions in amounts far in excess of what would be required to replace those credits. First, the U.S. EPA did not find that the SCAQMD had relied on credits in violation of federal law. Instead, the SCAQMD agreed with EPA to remove from its internal offset accounts certain pre-1990 offsets for which the SCAQMD no longer had adequate documentation, and also agreed to remove offsets derived from Best Available Control Technology discounting of emission reductions used to generate Emission Reduction Credits<sup>1</sup>. Further, SCAQMD agreed to retire all remaining valid pre-1990 offsets (33.45 tons per day overall, and 4.52 tons per day of NOx) as of the end of calendar year 2005.

Table J-1 summarizes the quantities of removed offsets and of newly tracked offsets through the end of the 2001-2002 reporting period (July 31, 2002). Table J-1 shows that the quantities removed exceed the newly tracked quantities overall and for four of the five individually tracked air contaminants.

---

<sup>1</sup> The portion of CO offsets that satisfy the requirements of PR 1315(c)(3)(A)(vi) are excluded. The SCAQMD agreed to remove these credits even though U.S. EPA had previously approved such BACT discounting as a source of offsets to the internal offset accounts. U.S. EPA Region IX Air & Toxics Division, “Technical Support Document for EPA’s Notice of Final Rulemaking for the California State Implementation Plan South Coast Air Quality Management District New Source Review,” Gerardo C. Rios, October 24, 1996, page 17.

**Table J-1**

**Previously Tracked Offsets Removed from SCAQMD’s Internal Offset Accounts and Newly Tracked Credits Added to SCAQMD’s Internal Offset Accounts through July 2002 (tons per day)**

	VOC	NOx	Sox	CO	PM10	Overall
Pre-1990 Offsets removed due to lack of records*	-53.95	-1.88	-10.36	-26.45	-31.83	-124.47
BACT discount of ERCs offsets removed	-12.14	-4.50	-0.12	-3.08	-4.15	-23.99
Newly Tracked Credits	40.35	15.06	2.59	12.24	12.91	83.15

\* Does not include remaining unused pre-1990 offsets that were removed after the calendar year 2005 reporting period.

**Discussion of tracking for purpose of State NNI requirements. Responses to Comment 1-17.**

Comment 1-17 asserts there is a conflict between the discussion on page 1-4 and the discussion on page 2-13 regarding the types of emission reductions that will be credited to SCAQMD’s internal accounts under Proposed Rule 1315. The comment does not correctly characterize the cited text on page 1-4 in the Draft PEA. Page 1-4 states “ The proposed rule would provide for the use of certain types of offsets that, prior to the initial adoption of Rule 1315 in 2006, had not been accounted for in the SCAQMD’s federal tracking system.” (Draft PEA, 1-4) This statement is consistent with the statement, cited by the comment, that “Many, but not all, of the sources of offset credits that had not previously been accounted for in federal tracking were previously tracked for purposes of demonstrating California “No Net Increase” (NNI) requirements.” (Draft PEA 2-13, footnote 14) The specific types of emissions reductions that were not previously tracked for federal purposes are then listed.

With regard to the project objectives, please refer to Responses to Comment 1-13. With regard to the project description, please refer to Responses to Comments 1-7, 1-8, and 1-10. With regard to the baseline for environmental analysis, please refer to Responses to Comment 1-24. With regard to the year 2030 sunset date, please refer to Responses to Comment 19.

**Scope of impact analysis and methodology for forecasting impacts. Responses to Comments 1-18, 1-19 and 1-20.**

The comment letter criticizes the Draft PEA’s impact analysis suggesting that it should have analyzed and described the impacts of “creation and banking” offsets under Proposed Rule 1315 rather than the projected use of those offsets. (Comment 1-19) It contends that the Draft PEA’s impact analysis incorrectly focuses on “how many credits will be distributed rather than

generated,” and this “minimizes” and “underestimates” the project’s impacts. (Comment 1-18) The comment letter objects to the methodology used in the Draft PEA for forecasting project-related emissions because it is based on projected use of offsets under Rules 1304 and 1309.1 rather than the total quantity of offsets that would be tracked. (Comment 1-19) The comment letter supports this by arguing that it is “reasonably foreseeable” that once offsets are banked, they will all necessarily be used, and an equivalent amount of air pollution will result. (Comment 1-19); other comments raise the same issue, see Comment 1-4, ¶2; Comment 1-11, ¶2, Comment 1-27.

**Analytical basis for using emissions forecasts for permits projected to be issued under Rules 1304 and 1309.1.** The analysis in the Draft PEA recognizes that offsets tracked under Rule 1315 would result in emissions only if and when they are used to support permit issuance and debited from the internal accounts created by Rule 1315. Under Proposed Rule 1315, potential offsets identified under the Rule’s tracking system will only be drawn on for permits issued under Rules 1304 and 1309.1. For this reason, the Draft PEA’s forecasts of emissions attributable to Rule 1315 are based upon projections of emissions from sources that would receive permits under either Rule 1304 or Rule 1309.1 in the future if Proposed Rule 1315 is adopted.

The effect of Rule 1315 cannot be severed from Rules 1304 and 1309.1 as proposed by the commenter because Rule 1315 is designed to provide the ability for the SCAQMD to issue permits under Rules 1304 and 1309.1, and Rule 1315 has no function that would result in emissions independent of Rules 1304 and 1309.1. Rule 1315 provides for tracking of emissions reductions in an internal offset account created to allow permits to be issued to sources that are exempt from offset requirements under Rule 1304 or that are entitled to receive offsets from the internal accounts under Rule 1309.1. This means that the only sources that will be permitted based on offsets tracked under Rule 1315 are sources that qualify for a permit issued under either Rule 1304 or Rule 1309.1.

This limitation is fundamental to Rule 1315. A stated purpose of the proposed rule 1315 is to “[m]aintain the SCAQMD’s ability to continue to issue permits to major sources that obtain offset credits from the Priority Reserve under Rule 1309.1 and/or that are exempt from offsets under Rule 1304 through December 31, 2030.” Proposed Rule 1315(a)(1). The proposed rule would accomplish this objective by: (1) setting forth the procedures the SCAQMD will follow for meeting federal NSR offset requirements for major sources that are exempt from offsets under Rule 1304 or that obtain offset credits from the Priority Reserve under Rule 1309.1; and (2) specifying that debits shall be made in the SCAQMD’s internal offset accounts for emissions offsets used pursuant to Rule 1309.1 and exemptions pursuant to Rule 1304. Proposed Rules 1315(a)(2) and (c)(2).

Proposed Rule 1315 thus describes the procedures the SCAQMD would follow to account for offsets that would enable Rules 1304 and 1309.1 to be implemented: For Rule 1309.1, it does so by providing the means for sources that qualify under Rule 1309.1 to obtain offsets as contemplated by that Rule; for Rule 1304, it does so by ensuring that offsets will be available to meet offset requirements applicable to sources that qualify for exemption under Rule 1304. In light of the foregoing, the analysis in the Draft PEA is predicated on the fact that emissions attributable to offsets tracked under Rule 1315 would be equal to the emissions that would result from sources permitted under Rules 1304 and 1309.1.

Contrary to the statements in the comment letter, this methodology does not underestimate emissions that would result from approval of the project. Emissions from sources that might receive permits under rules other than Rule 1304 and 1309.1 would have no causal connection to adoption of Rule 1315 because any such sources would not be exempt from offset requirements and would not be eligible to use offsets in the SCAQMD's internal offset accounts.

With respect to comments that the scope of the project may change in the future, see Responses to Comment 23.

**Suggestion that emissions be estimated based on offsets tracked rather than offsets used.** While the comment suggests that the impact analysis should have based its forecasts of future pollution attributed to Rule 1315 on estimates of the total amount of offsets that would be tracked in the SCAQMD's internal offset accounts, such an approach would give an inaccurate and misleading depiction of the actual impacts associated with adoption of Proposed Rule 1315. The limitations discussed above are integral to Rule 1315. An impact analysis predicated on the hypothetical assumption that all offsets that are tracked will result in a commensurate level of emissions would be inconsistent with the purpose and effect of Proposed Rule 1315 and with the specific limitations built into the rule. Because it would not be reflective of the project as it is proposed for approval, it would provide an artificial analysis of a hypothetical set of circumstances rather than of the project that is proposed for approval.

Furthermore, the CEQA Backstop provisions of Proposed Rule 1315 would prevent offsets in the SCAQMD's internal offset accounts from being used in amounts that would result in emissions exceeding the forecasts in the Draft PEA. Proposed Rule 1315 includes yearly Cumulative Net Emission Increase Thresholds, which will act as caps on the use of emission reduction credits under Proposed Rule 1315 for VOC, NO<sub>x</sub>, SO<sub>x</sub> and PM<sub>10</sub>. Under these CEQA Backstop provisions, if, at any time, the cumulative net emission increase for a nonattainment pollutant exceeds the specified cumulative emissions increase threshold, issuance of permits under Rules 1304 and 1309.1 will be suspended. Further permits could be issued only after the cumulative net emission increase returns to a level that is at least ten percent below the corresponding cumulative emission increase threshold. See Responses to Comment 1-27 for a further discussion.

**Effect of tracking excess emission reductions.** Several of the comments question why the SCAQMD would potentially be "banking" more emission reductions under Rule 1315 than would be necessary to offset emissions from permits issued under Rules 1304 and 1309.1.

There are several reasons why the total quantity of offsets tracked could exceed the amount of emissions forecasted in the PEA for permits issued in reliance on internal account offsets. First, emissions offsets in the SCAQMD's internal accounts would be adjusted downward on an annual basis to reflect new control measures and technologies that would have been required at the sources that had shut down or been modified; this would reduce the quantity of tracked emissions reductions that qualify as "surplus" reductions, and that are then available for use as offsets. Proposed Rule 1315(c)(4). Second, the ratio of offsets required to emissions permitted is not always a 1:1 ratio. For example, to demonstrate equivalency with federal offset requirements, the ratio of offsets that currently must be allocated from the SCAQMD's offset accounts is 1.2 to 1.0 for extreme nonattainment air contaminants and their precursors. Third, changes to offset ratios could occur in the future that would require a greater number of offsets

than is currently required be used to offset a given amount of emissions in order to demonstrate equivalency.

Furthermore, as a practical matter, it is not feasible to design a tracking system that would track just enough offsets to supply the demand. Doing so would require detailed advance knowledge of future demand, future generation, and future surplus at the time of use adjustments to the District Offset Account Balances pursuant to Proposed Rule 1315(c)(4). For example, neither the rate of offset use nor the rate of offset generation would be consistent from year to year. Use would generally be higher in years when the economy is doing well and lower in years during economic hard times. On the other hand, offset generation would tend to be higher when the economy is struggling and lower when it is booming. If a period of economic recession is followed by a growing economy, and if only sufficient offsets were tracked to cover concurrent demand during the recession, then there may not be adequate offsets available to allow the economy to grow when the recession ends even though overall total emission reductions that were trackable were adequate to supply the demand simply because the peak demand and peak generation did not occur concurrently. Finally, there is no logical reason why the tracking system should be designed to only track the amount of emission reductions that will ultimately be used as offsets. Rather, the appropriate way to design any accounting system is to identify and accurately track all sources of credits and all sources of debits.

**Effect of the Superior Court’s ruling on the impact analysis methodology.** The comment letter’s suggestion that the ruling of the Los Angeles Superior Court requires that the PEA assume that all offset credits recorded in the SCAQMD’s internal offset accounts would be used is not correct. The court concluded that adoption of the prior version of Rule 1315 in 2007 would allow the SCAQMD to significantly expand the quantity of offset credits in the SCAQMD’s internal accounts by recognizing types of emissions reductions that had not previously been accounted for, and these offsets would then be available for use in permitting new and modified sources. The court also concluded that these additional offsets would result in pollution when the SCAQMD allows permit applicants to “access” them. The Draft PEA’s methodology of forecasting project-related emissions based on projections of internal offsets that will be accessed, rather than based on the emissions reductions that will be tracked in the SCAQMD’s internal accounts, is consistent with this aspect of the court’s decision.

Further, the court found the impact analysis that had been completed was flawed because it “disaggregated” Rules 1315 and 1309.1, and “failed to consider the obvious and intended consequences of the rules operating in tandem.” This part of the court’s ruling indicates that a proper impact analysis must consider the effect of Rule 1315 (internal offset tracking) operating “in tandem” with Rules 1304 and 1309.1 (providing access to those internal offsets). The analysis in the Draft PEA complies with this direction.

In addition, the allowed uses of offsets in the SCAQMD’s internal accounts under Proposed Rule 1315 would be different than under the prior version of the rule that was reviewed by the court. Under the prior version of the rule, a broad range of new and modified sources would have been eligible to obtain offsets from the SCAQMD’s internal offset accounts under the offset budget provisions of Rule 1309.2, once that rule was approved into the SIP. In addition, power plants would have been given access to offsets from the SCAQMD’s internal offset accounts under the power plant amendments to Rule 1309.1 the SCAQMD had adopted in 2006 and 2007. The

SCAQMD has since rescinded Rule 1309.2. The SCAQMD also set aside the power plant amendments to Rule 1309.1 in response to the court's ruling and has not proposed to re-adopt them. As a result, many of the sources that would have been able to rely on offsets in the SCAQMD's internal offset accounts under the prior version of the rule would not be able to access the internal offset accounts under Proposed Rule 1315. Accordingly, the effect of Proposed Rule 1315 operating in tandem with Rules 1304 and Rule 1309.1 would be significantly more limited than the effect of prior Rule 1315 operating in tandem with the access rules then in effect.

In addition, the former version of Rule 1315 did not include any limitations on the quantity of internal account offsets that could be used to support issuance of permits. By contrast, the annual pollutant-specific net emissions increase caps built into Proposed Rule 1315 would prevent offsets in the SCAQMD's internal offset accounts from being used in amounts that would exceed the emissions forecasts in the Draft PEA. The proposed rule by its terms thus precludes the occurrence of a situation in which all available credits would be used. (Draft PEA, 8.06) See Responses to Comment 1-27 for a further discussion of this provision of Proposed Rule 1315.

Finally, the overall direction provided by the court in its decision was that the environmental assessment prepared by the SCAQMD comply with CEQA's standards for an adequate analysis of the project's environmental impacts. The methodology used in the Draft PEA to assess project-related emissions was designed to give the most accurate, reliable and realistic assessment that can be provided of the actual effects the project would have on pollution emissions, and the resulting impacts to air quality, human health, greenhouse gases and visibility.

**Use of the Year 2030 as the end date for the project.** The comment letter disagrees with the statement that the project will end in 2030, asserting that the need for and use of offsets will continue as long as the South Coast Air Basin fails to attain either the federal or state ambient air quality standards. (See Footnote 12, appended to comment 1-9.) The proposed Rule includes a sunset date of January 1, 2031. (See the Project Description in the Draft PEA, page 2-19) This sunset date is included in the Rule to correspond to the end year of analysis under the 2007 AQMP. (See 2007 AQMP, Appendix III, "Base and Future Year Emission Inventories" Table C-10) At this time, it is not possible to predict what the ambient air quality standards will be after this sunset date, what offset requirements for new or modified sources will be in effect or the region's attainment status. After Rule 1315 sunsets, the SCAQMD Governing Board would be free to decide not to adopt a replacement rule even if offsets are still required. This would eliminate the availability of internal account offsets altogether, which would mean that all new or modified sources, including Rule 1309.1 priority reserve sources and Rule 1304 exempt sources, would have to rely on private-market offsets to the extent required by the new source review provisions in effect at the time. In the event adoption of a replacement rule is proposed, that would be a new project under CEQA, and the SCAQMD would be required to complete an environmental assessment for that project. Any attempt to assess the impacts of adopting a potential replacement rule twenty years from now in the current PEA could be based on nothing more than speculation about whether and for what pollutant or pollutants the South Coast Air Basin may remain in nonattainment of future as yet unpromulgated ambient air quality standards after the year 2030, as well as speculation about the sources that would obtain permits and what their emissions would be.

**Scope of analysis of health impacts. Responses to Comment 1-21**

**Health impacts to persons under 25 years of age.** The comment raises a concern that the analysis in the Draft PEA was limited to people over 25 years of age. The Draft PEA, however, analyzed health effects on persons of varying ages, including infants and children. As explained in the Draft PEA, the methods of health impacts estimations were based on those used in the 2007 AQMP. That analysis provided an estimate of health effects for which there were methods available to quantify such effects, including effects on infants and children.

The health effects selected for analysis in the AQMP were those for which there was sufficient information that allowed for a quantitative estimate of effects from pollutant exposure. See report from Stratus Consulting that reviewed the available data and methods for assessing health effects for air pollutant exposures. (Recommended Health Benefit Assessment Methods for the 2007 AQMP Socioeconomic Assessment Final Report, Stratus Consulting Inc., 2008) Table 2-2 from the report lists the basis for the assessments, and is reproduced below. Note that effects on infants and children are included.

**Table 2.2. Summary of recommended central concentration-response functions for quantified health effects of PM<sub>2.5</sub> and ozone**

Health effect	Relative risk	Pollutant
<b>Mortality</b>		
Adults, ages 30+	1.11 <sup>a</sup>	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
Infants, ages 1-12 months	1.07	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
All ages	1.004	10 ppb ozone (daily max. 1-hr)
<b>New cases of chronic bronchitis</b>		
Adults, ages 27+	1.14	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Respiratory hospital admissions</b>		
All respiratory, ages 65+	Weighted <sup>b</sup>	10 ppb ozone (daily avg.)
Pneumonia, ages 65+	1.04	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
COPD, ages 65+	Weighted <sup>b</sup>	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
All respiratory, ages 18-64	1.017	10 ppb ozone (daily avg.)
All respiratory, ages < 2	1.065	10 ppb ozone (daily avg.)
COPD, ages 18-64	1.02	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Cardiovascular hospital admissions</b>		
Ages 65+	Weighted <sup>b</sup>	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
Ages < 65	1.014	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Asthma emergency room visits</b>		
Asthmatics, all ages	Weighted <sup>b</sup>	10 ppb ozone (daily avg.)
Asthmatics, ages < 18	1.017	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Nonfatal heart attacks</b>		
Adults, ages 18+	1.09	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Acute bronchitis episodes</b>		
Children, ages 5-17	1.27	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Upper respiratory symptom days</b>		
Asthmatics, ages 5-17	1.04	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Lower respiratory symptom days</b>		
Children, ages 5-17	1.17	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Work loss days</b>		
Adults, ages 18-64	1.07	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
<b>Minor restricted activity day</b>		
Adults, ages 18-64	1.077	10 µg/m <sup>3</sup> PM <sub>2.5</sub> (annual avg.)
Adults, ages 18-64	1.022	10 ppb ozone (daily avg.)
<b>School absence day</b>		
Children, ages 5-17	1.075	10 ppb ozone (daily max. 8-hr)

ppb = parts per billion; chronic obstructive pulmonary disease = COPD.

a. This is a weighted mean RR from results of Pope et al. (2002), Laden et al. (2006), and Jerrett et al. (2005).

b. These RR are based on weighted averages from two or more study results. The weighting is done in the Benefits Mapping and Analysis Program after the number of cases is calculated for each individual study RR result for the air pollution change in each location.

The commenter cites data files that accompanied the Draft PEA to support the proposition that the health effects analysis was limited to individuals over the age of 25. The files the comment refers to relate to a particular analysis of PM<sub>2.5</sub> impacts of three power plants. For purposes of the Draft PEA, the health effects of emissions from these power plants were included in the cumulative health impacts analyses, which are found in Tables 4.1-32 and 4.1-33 of the Draft PEA, which includes impacts to individuals of all age groups. The particular studies used to derive the source-specific PM<sub>2.5</sub> mortality data for the power plants did not include children. However, that is the approved methodology used by CARB and allowed by CARB to be used for relatively smaller sources (as distinguished from regional modeling). For purposes of the Draft PEA, which analyzed regional impacts, the health effects of emissions from these power plants

were included in the cumulative health impacts analyses, which are found in Tables 4.1-32 and 4.1-33 of the Draft PEA, which includes impacts to individuals of all age groups.

The comment also states that lost school days were not included in the Draft PEA analyses. This is also erroneous, as school absences were, in fact, included with ozone estimated impacts (Tables 4.1-29 and 4.1-32 of the Draft PEA).

With respect to PM<sub>2.5</sub> effects, the following updated information is provided. The methods used to calculate premature mortality from exposures to PM<sub>2.5</sub> in the analysis gives estimates that are higher than if the methodology presented by the California Air Resources Board in their most recent estimates of PM<sub>2.5</sub> mortality effects were used [Estimate of Premature Deaths Associated with Fine Particle Pollution (PM<sub>2.5</sub>) in California Using a U.S. Environmental Protection Agency Methodology, California Air Resources Board, August 31, 2010. [http://www.arb.ca.gov/research/health/pm-mort/pm-report\\_2010.pdf](http://www.arb.ca.gov/research/health/pm-mort/pm-report_2010.pdf)]. If this recently reported methodology were used, the mortality estimates from PM<sub>2.5</sub> would be reduced by about half. This is because of a lower value for the dose effect relationship between pollution exposure and mortality. Thus, compared to CARB's recent report, the mortality estimates may be on the high side by a factor of 2.

To put some perspective on the mortality estimates, it may be useful to compare the Draft PEA incremental estimates to those related to current air quality. According to the CARB report referenced above, recent PM 2.5 levels (2006 – 2008 annual average) are associated with up to 4,900 mortalities annually in SOCAB. According to the CARB report, attaining the PM<sub>2.5</sub> NAAQS in SOCAB would result in reducing this PM<sub>2.5</sub> related mortality by up to 2,000 deaths annually. The PEA estimates annual mortalities related to the project of from 7 to 20 for ozone (Table 4.1-29), and from 33 to 125 for PM exposures Table 4.1-31.

**Relationship of PM and ozone to elevated risks from other illnesses and causes of death.** There are numerous reports and publications suggesting a link between PM and ozone to health effects. The effects chosen for the impact analyses in the Draft PEA were those for which there is sufficient evidence of a causal association, and for which there are sufficient data available to conduct a credible analysis. The US EPA has exhaustively reviewed the health effects of PM and ozone, and has indicated the strength of evidence for causality for health effects. [See references: U.S. EPA. Integrated Science Assessment for Particulate Matter (Final Report), U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-08/139F, 2009; and U.S. EPA, Review of the National Ambient Air Quality Standards for Ozone: Policy Assessment of Scientific and Technical Information, U.S. Environmental Protection Agency, Washington, DC, EPA-452/R-07-007, July 2007] The analyses conducted by SCAQMD include those effects for which EPA has concluded the level of evidence for effects is causal or likely to be causal. Where EPA has not found a causal or likely to be causal effect, those effects were not included in the quantitative estimates of impacts. The analyses presented are adequate to assess the potential for adverse effects from emissions related to the project.

The comment asserts that SCAQMD ignores studies that indicate that climate change will exacerbate the environmental and health impacts of ozone and PM. The comment relates to the potential impact of climate change on ozone and PM, with resulting health impacts. Scientists

are beginning to study the effects of climate change on ground level ozone and particulate matter. So far, different studies have yielded different results.

For example, a recent study for the California Air Resources Board, “*Climate Change Impact on Air Quality in California*”, Michael J. Kleeman, et al., No. 04-349, June 2010 (<http://www.arb.ca.gov/research/apr/past/04-349.pdf>.) notes that most earlier studies have predicted that climate change will reduce global tropospheric ozone concentrations. (pg. 29) However, the report also noted studies indicating that climate change was likely to cause increased ozone in North America, including California. (pg. 30) The report also noted a study indicating that annual average PM2.5 concentrations would decrease as a result of climate change, and that California would experience an average decrease of 186 cases of premature death, with decreasing trends in other PM2.5 related health issues. (pg. 31). The Kleeman study itself found mixed results. Regional ozone concentrations increased the most in response to increased temperatures while small decreases were noted in some areas. (pg. 39) Regional annual average PM2.5 concentrations, in contrast, were expected to decrease as a result of climate change by 3 to 15 micrograms per cubic meter. (pg. 44) Combining the increased ozone with climate change impacts leads to an increase in PM2.5 in some areas and a decrease in others. (pg. 45) As distinguished from annual average concentrations, (relevant to the annual average standard), peak PM2.5 concentrations (relevant to the 24-hour standard), generally increased, as a result of increased ozone. (pg.54) However, an important limitation of the Kleeman study is it assumes that regional criteria pollutant emissions would be the same far into the future as they were in 1990-2004 (pg. 25). This is not likely realistic, given the stringent control programs being implemented now and in the future. One study cited by the commenters, Chang et al., noted that it also assumed that ozone precursor emissions remained unchanged. *Int. J. Environ. Res. Public Health*, 2010, pg. 2876. The other study cited by the commenters also reported mixed results in the literature, Ebi et al., “Climate Change, Tropospheric Ozone and Particulate Matter, and Health Impacts,” *Ciencia & Saude Coletiva*, vol. 14 no.6, Dec. 2009., page at fn. 50, and fns. 49, 58, and 64-65. In view of the mixed results of various studies, it is not possible to predict with certainty how climate change will affect future ozone and particulate matter, and whether health effects will be substantially changed.

### **Impacts to Biological Resources. Responses to Comment 1-22**

The comment letter asserts that the Draft PEA did not consider adverse air quality impacts to sensitive species such as lichens, leafy vegetables, and ecosystems, such as Southern California’s mixed conifer forests.

The Draft PEA evaluated the air quality impacts from ozone, particulate matter, SO<sub>2</sub>, NO<sub>2</sub>, lead and CO concentrations due to the proposed project. The analysis concluded the impacts to be significant because of exceedances of the SCAQMD’s mass significance thresholds. The Draft PEA also discusses the project’s contribution to exceedances, if any, of the ambient air quality standards.. These standards encompass both primary (human health) and secondary (public welfare) effects. Public welfare effects encompass effects other than effects to human health, including effects on vegetation and ecosystems. The ambient air quality standards are currently the same for both primary and secondary effects, with the exception that the SO<sub>2</sub> primary 1-hour standard is more stringent than the secondary SO<sub>2</sub> standard. Thus, the impact to biological resources as measured against the secondary ambient air quality standards applicable to

biological resources has been assessed in the Draft PEA through the impact evaluation against the primary standard.

There are numerous reports and publications in the scientific literature such as the studies cited in the comment letter that relate air pollutants to effects on biological resources. Most of these studies have focused on the effects of ozone. However, only a few provide information that might be used to develop methods to estimate effects from ambient exposures quantitatively and there are a number of factors that complicate such an evaluation. For, example, there is little or no data regarding precise dose (exposure) and response (effects) of air quality on biological resources. Further, most information on the effects of ozone on ecosystems is inferred from ozone exposures to individual plants and processes and it is difficult to use this information to quantify ecosystem-level productivity losses because of the complexity in scaling this information to the ecosystem level. Further difficulties in attributing growth losses to ozone can arise due to confounding factors with other stresses present in ecosystems including climate, insect damage, soil moisture, disease and other air pollutants. See U.S. EPA. 2007. Review of the National Ambient Air Quality Standards for Ozone: Policy Assessment of Scientific and Technical Information<sup>2</sup>; California Air Resource Board, Air Pollution Research Reports/Studies – Ecological Effects of Air Pollution, California Air Resource Board, Air Pollution Research Reports/Studies – Ecological Effects of Air Pollution;<sup>3</sup> ASL Associates, Reconsidered Comments<sup>4</sup>.

Nevertheless, to provide a general perspective on potential impacts to biological resources, an analysis of crop yield and biomass loss in the district due to project-related ozone impacts has been performed for three periods: 2010 through 2014, 2010 through 2023 and 2010 through 2030. The analysis uses the biomass loss functions presented in U.S. EPA’s “Technical Report on Ozone Exposure, Risk and Impact Assessments for Vegetation,” (January, 2007) together with the project-related ozone impacts predicted from the regional modeling analyses.

With respect to crops, the EPA report provides concentration-response yield loss functions for selected crop exposures to ozone concentrations. Biomass loss functions ranged from a low value of near zero for corn to a high value of 0.77 percent per ppb exposure for grapes. The primary agricultural areas of the District produce corn, oranges, potatoes, grapes, lettuce, tomatoes and beans. To provide a conservative estimate, the Basin maximum incremental project-related ozone concentrations and Coachella Valley maximum incremental project-related ozone concentrations were used to estimate representative ozone effects on crops. Using the biomass loss functions from the technical report for grapes as representative of the most sensitive crop, the projected maximum biomass effect would be approximately 2.1 percent in 2030 for the Basin and 1.2 percent in 2030 for the Coachella Valley. This means that, absent the emissions attributed to the proposed Project, grape plants and other crops could have up to 2.1 percent more biomass in the Basin in 2030 and 1.2 percent more biomass in the Coachella Valley in 2030 than they would be expected to have under conditions with the Project. Effects on crop biomass for either area in 2014 and 2023 are estimated to be less than 1.0 and 1.5 percent respectively. It

<sup>3</sup> <http://www.arb.ca.gov/research/apr/past/ecol.htm>.

<sup>4</sup> [http://www.asl-associates.com/Reconsidered\\_comments\\_ozone\\_standard.htm](http://www.asl-associates.com/Reconsidered_comments_ozone_standard.htm)

should be noted that these estimates represent the outer bound of the impact because they use figures for maximum ozone impacts and the highest value for biomass loss function.

To further characterize vegetation effects, effects on trees in the Angeles and San Bernardino National Forests, which ring the South Coast Air Basin, were estimated. The representative species of trees include the Ponderosa Pine and the Douglas Fir. The EPA technical report provides the concentration-response functions for selected tree species' exposure to ozone concentrations. The percentage biomass loss for the Ponderosa Pine was conservatively estimated at 0.24 percent per ppb exposed and near zero for the Douglas Fir. The maximum ozone concentrations resulting from the proposed project at the San Bernardino Mountains were 0.6, 1.9 and 3.0 ppb for 2014, 2023 and 2030 respectively. Using the biomass loss function for the Ponderosa Pine, the project would result in an approximate maximum potential biomass loss of 0.9 percent by 2030 compared to conditions without the project. Biomass loss for 2014 and 2023 would be less than 0.5 percent compared to conditions without the project.

The commentator also expressed concern about potential impacts from air quality on lichens and cited to a 1996 literature review paper on the effects of deteriorating air quality on lichens in the Pacific Northwest and a link to a webpage. According to this reference<sup>5</sup> provided by the commentator, "SO<sub>2</sub> is considered to be the primary factor causing the death of lichens" and "most lichens cannot survive extended periods of SO<sub>2</sub> exposure above 60 mg/m<sup>3</sup>." An SO<sub>2</sub> concentration of 60 mg/m<sup>3</sup> is approximately equivalent to 21 parts per million (ppm). The proposed project and cumulative proposed project will result in a maximum exposure of 1.0 ppb of SO<sub>2</sub> emissions, which equates to 2.86 mg/m<sup>3</sup>.

**Potential for future changes to project. Responses to Comment 1-23 and 1-28**

The comment letter suggests that it is foreseeable that revisions could be made to Rules 1304 and 1309.1 to expand access to Rule 1315 offsets, and that the possibility that this might occur requires that the PEA evaluate the impacts of "all of the credits available being used." See Comment 1-23.

The SCAQMD has no plans to expand access to Rule 1315 offset accounts beyond the provisions of existing Rules 1304 and 1309.1. Amendments to Rules 1304 or 1309.1, or other actions to expand access to Rule 1315 offset accounts are not part of the project proposed for approval and such actions would not result from project approval. The Draft PEA accordingly appropriately analyzes the impacts of Rule 1315 operating in conjunction with existing Rules 1304 and 1309.1.

The Draft PEA's impact assessment is based on projections of internal offset use over the life of the project. Rather than being speculative as asserted in the comment (Comment 1-23), these projections are based on reliable historical data relating to permit issuance, as well as forecasts of future growth within the relevant industry categories. Given the conservative approach to developing these projections, if anything, they overestimate the extent of Rule 1315 internal

---

<sup>5</sup> Jenifer Hutchinson, Debbie Maynard, and Linda Geiser, "Air Quality and Lichens - A Literature Review Emphasizing the Pacific Northwest, USA," USDA Forest Service, Pacific Northwest Region Air Resource Management Program, Dec. 16, 1996, available at: <http://www.fs.fed.us/r6/aq/lichen/almanac.htm>

offset use in the future. On the other hand, basing the impact analysis on the total number of internal offsets that would accrue in the SCAQMD's accounts, without considering their use, as suggested by the comments, would be grounded on a hypothetical assumption that cannot be supported by empirical data. See Responses to Comment 1-20.

The comment letter also indicates that it is foreseeable that new rules or legislation could be adopted that would "open the bank of credits to any proposed source of air pollution . . . ." (Comment 1-28) See also comments 1-18--1-20. However, the use that can be made of Rule 1315 offset accounts is defined by Proposed Rule 1315 and the credits that are tracked under the proposed rule cannot be used for any purposes other than those envisioned by the proposed rule and the environmental analysis that was completed for adoption of the proposed rule. Accordingly all Rule 1315 offsets that are "drawn upon" for purposes of federal New Source Review offset requirements must be used consistent with the provisions of Proposed Rule 1315. In addition, adoption of new or amended rules relating to the use of offsets in the SCAQMD's internal bank as hypothesized by the comments would constitute a separate, independent project, and a new review under CEQA would be required for that project.

It also bears noting that with SB 827, the California legislature exercised its authority to direct SCAQMD to provide sources access to internally tracked offsets during the permit moratorium that followed from the Superior Court decision that resulted in previously adopted Rule 1315 being vacated. As a result of the court decision, over 1200 permits ultimately were placed on hold, involving essential public services and a myriad of business operations, including small business. Equipment replacement projects that would result in newer, cleaner and more efficient equipment could not be implemented. Therefore, the legislature saw the need to provide interim relief, to allow these projects to go forward, and adopted SB 827. There is no reason to believe that the opposite situation -- having a tracking rule such as Proposed Rule 1315 in place -- would cause the legislature to take a similar action.

**Baseline for projecting emissions attributed to the project and assessing impacts of the project. Responses to Comment 1-24.**

The comment, which refers to provisions of the CEQA Guidelines relating to the environmental "baseline" mixes three distinct concepts relevant to the analysis of the project's air quality impacts: measuring the project's impact by estimating the quantity of emissions expected to result from it, projecting when those emissions will take place, and then providing a further analysis of the impact of those emissions as they occur over time within the context of other emissions in the region.

To measure the emissions impact of the project, the PEA's emissions analysis quantifies emissions of the relevant pollutants from sources expected to receive permits under Rules 1304 and 1309.1. The analysis derives project-related emissions in relation to an existing conditions baseline under which there is no internal offset tracking rule so no permits can be issued under Rule 1304 or 1309.1.<sup>6</sup> Because such permits would be issued over the 20-year life of the project,

---

<sup>6</sup> Under existing conditions, permits actually are being issued under Rules 1304 and 1309.1 pursuant to SB 827; however, SB 827 sunsets in May, 2012 so for purposes of the analysis in the PEA it is assumed that no such permits would be issued.

**APPENDIX J: RESPONSES TO COMMENTS ON DRAFT PEA**

---

the Draft PEA contains time-based projections of the growth in project-related related emissions for three cumulative time periods through the end of the project in 2030. These projections are designed to provide a complete accounting of the magnitude of the criteria pollutant emissions impact of the proposed project. See Tables 4.1-3, 4.1-4. The data show that the daily emissions in tons per day expected to result from the proposed project by 2030 (the end date for the project), are as follows:

VOC	NOx	Sox	PM10	PM2.5	CO
44.59	3.31	0.74	4.44	2.82	6.26

The Draft PEA then applies the SCAQMD’s numeric significance thresholds to assess the significance of these impacts. See Draft PEA page 4.1-10.

Because project-related permits will be issued over a 20 year period, the Draft PEA expands on this analysis by also evaluating the impact of project-related emissions within the context of expected future conditions, what the Draft PEA refers to as the “future baseline.” It does so using relevant points of comparison in order to assess the project’s impacts on the environment as its impacts increase over time.

First, the Draft PEA characterizes these impacts by comparing the incremental increase in daily emissions expected to result from the project with forecasts for all regional, cumulative emissions in 2030. This comparison is made with all stationary and area source emissions and is also made with emissions from all sources including mobile sources. (See Draft PEA page 4.1-14 through 4.1-15) This analysis shows the proportion of forecasted regional emissions expected to result from the proposed project and demonstrates how much higher regional emissions would be with the project than without the project.

In addition, the PEA provides a further analysis by examining the project’s effect on regional concentrations of pollutants over time. This analysis makes clear the extent to which the project would be expected to increase the concentrations of pollutants in the air as the project is implemented. As explained above, the emission concentrations attributed to the project are based upon the quantity of emissions projected to result with the project in place compared to existing conditions under which no permits would be issued. The analysis evaluates this project effect by considering it within the framework of forecasts relating to attainment of air quality standards. Draft PEA pages 4.1-15 through 4.1-24

This concentration-based air pollution analysis also is used in the analysis of the project’s effects on human health. That analysis shows the health effects of the emissions attributed to the proposed project. Draft PEA pages 4.1-33 through 4.1-41. The concentration-based analysis of the project’s pollution impacts is also used in the analysis of the extent to which emissions attributed to the project would impair visibility. Draft PEA pages 4.1-45 through 4.1-47.

The comment letter objects to this methodology, suggesting the analysis should have been conducted by “simply looking to existing actual levels [of regional emissions] to set a baseline from which to measure impacts.” If this comment refers to measurement of the emissions attributable to the proposed project, as noted above the analysis derives the quantity of project-related emissions in relation to an existing conditions baseline, without proposed Rule 1315. If,

however, the comment is suggesting that the impact analysis should have assumed that all project-related emissions would occur in the past when the NOP was issued, such a procedure would not provide any meaningful information about the effect the project would have on air quality. It would instead provide a hypothetical analysis that would have no relation to what would actually occur in the real world in the event the project is approved. Because the project's impacts would unfold and increase over a 20-year period, such a static form of analysis would not provide a meaningful assessment of the project's actual effect on air quality.

The comment letter implies that the Draft PEA's forecasts of future project-related emissions understate project-related emissions by "assuming that future environmental gains will occur." This is incorrect. The emissions forecasts in the Draft PEA are based upon the emissions control rules and regulations already in effect at the time the AQMD was adopted. The analysis does not consider emissions control rules and regulations that might be adopted in the future. As a result, the quantity of mass emissions attributable to the project would not change if all permits issued under the project were assumed to be issued immediately, as is suggested by the comment, instead of being issued over the twenty year life of the project. Of course, a scenario under which all permits would be issued immediately would not be consistent with the economic forecasts that form the basis for the growth projections, nor would such a scenario be possible in light of the yearly net emission increase thresholds embedded in the CEQA Backstop provisions of the proposed rule.

The comment letter also disagrees with the Draft PEA's emission forecasts by incorrectly contending that the Draft PEA's assessment of future air quality impacts "prematurely ends the analysis of the Project's impacts by assuming attainment in attainment years." As discussed in response to Comment 1-25, it is also incorrect to state that the Draft PEA stops attributing emissions to new facilities that would rely on Rule 1315 after attainment for various pollutants is achieved. The methodology used in the Draft PEA conservatively assumes that emissions offsets in the SCAQMD's internal offset accounts would be used for permits issued under Rule 1304 and Rule 1309.1 for the life of Proposed Rule 1315, through 2030. The Draft PEA does not reduce the emission estimates for sources projected to be permitted under these rules based upon projected attainment dates for particular pollutants.

**Comparison with CBE decision.** The methodology used in the Draft PEA bears no resemblance to the methodology disapproved by the Supreme Court in *Communities for a Better Environment v. South Coast Air Quality Management District*, 43 Cal. 4th 310, 322 (2010). There, the Supreme Court rejected an impact analysis that compared emissions that would be caused by expansion of a refinery with emission levels that would be allowed by an existing permit for some of the equipment at the refinery; such a comparison to permitted levels did not measure the actual increase in emissions that would result from the project, because it assumed all emissions allowed by the existing permit were already occurring. Here, however, the Draft PEA provides data for all of the emissions that would result from all of the permits expected to be issued in reliance on Rule 1315, and those emissions are calculated using a zero emissions reference point: the analysis assumes that none of the emissions attributed to the project would occur if the project is not approved. Then, as the next step of the analysis, the Draft PEA evaluates the effect on regional air quality over the life of the project. Thus, the method of analysis is not at all similar to the method of analysis the court rejected in the *CBE* case.

**Forecasts of future regional emissions.** To the extent the comment letter criticizes the Draft PEA's forecasts of future emissions in the region, it should be noted that those forecasts are taken from the 2007 AQMP. As is explained in Appendix III to the 2007 AQMP, the

forecasts are grounded on an inventory of emissions by source category and industry. Growth rates for each industry are projected based on the Southern California Association of Governments 2004 Regional Transportation Plan, adjusted by recent data from the relevant state and federal agencies: the Bureau of Labor Statistics, California Department of Finance, California Employment Development Department and U.S. Census Bureau. The AQMP forecasts thus take account of industrial growth, population growth, job growth and resulting changes in transportation patterns. Appendix III to the 2007 AQMP identifies the growth rate used in its forecasts for each industry and source category, and explains how the resulting emissions growth was distributed by county. This is the best available and most comprehensive data for the relevant time period.

To the extent the commenters seek information regarding the emissions inventory under existing conditions in 2010, that information is found in Appendix III to the 2007 AQMP at Table A-4. As set forth in the AQMP, total 2010 annual average emissions for stationary and area sources are as follows: VOC-248.44 tons/day; NO<sub>x</sub>- 79.65 tons/day; SO<sub>x</sub>- 16.32 tons/day; PM<sub>10</sub>- 236.63 tons/day; and PM<sub>2.5</sub>- 66.21 tons/day. Total 2010 annual average emissions from all sources (including mobile sources) are as follows: VOC-572.42 tons/day; NO<sub>x</sub>- 774.65 tons/day; SO<sub>x</sub>- 39.22 tons/day; PM<sub>10</sub>- 280.89 tons/day; and PM<sub>2.5</sub>- 101.36 tons/day.

**PM 2.5 analysis and PM 2.5 attainment. Responses to Comments 1-25 and 1-26.**

**Analysis of PM 2.5 impacts.** The comment letter (comment 1-25) states that the Draft PEA curtails the analysis of particulate matter emissions, and associated health effects, by presuming that no offsets would be issued from the SCAQMD's internal accounts after 2014, citing the Draft PEA page 4.1-36. Table 4.1-30 on that page describes estimated PM<sub>2.5</sub> and PM<sub>10</sub> health benefits that are expected to result from implementation of the 2007 AQMP in the year 2014. This table does not describe the impacts of the proposed project. The health effects from particulate matter attributed to the proposed project are set forth in Table 4.1-31 on page 4.1-37. Table 4.1-31 shows the particulate matter-related health effects of implementing the proposed project for the three time periods used to assess project impacts through the year 2030. The impact analysis does not assume that offsets would no longer be issued from the SCAQMD's internal accounts after 2014 and for that reason provides impact data showing the increases in impacts through 2030.

**Attainment demonstration.** The comment letter (comment 1-26) asserts that the Draft PEA's statement (page 4.1-19) that the 2007 AQMP demonstrates attainment with the PM<sub>2.5</sub> NAAQS is incorrect. The first cited reason is that EPA has proposed to disapprove the 2007 AQMP PM<sub>2.5</sub> attainment demonstration, and according to the comment, this means that EPA does not believe the SCAQMD will come into attainment by 2015 and that EPA does not intend to extend the attainment deadline to 2015. The second cited reason is the commenter's assertion that EPA's rules preclude the Draft PEA from assuming that the 2007 AQMP demonstrates attainment. The comment contends that the impact analysis for PM<sub>2.5</sub> rests on an incorrect conclusion about attainment and is therefore flawed.

However, the date that PM<sub>2.5</sub> attainment will be achieved does not affect the analysis of PM<sub>2.5</sub> impacts in the Draft PEA. As explained in the Responses to Comment 1-25 above, the Draft PEA does not limit the analysis of project effects based on the assumption that offsets will not be needed for PM<sub>2.5</sub> after 2014. To the contrary, the EA continues to attribute particulate matter

emissions to the project throughout the life of Proposed Rule 1315, through the year 2030. This ensures that the potential environmental effects of the project are fully described and not understated in any way.

Although issues raised in the comment relating to EPA approval of the attainment demonstration do not relate to the scope of the impact analysis for PM<sub>2.5</sub> emissions, the following responses address the comments about EPA's pending decision on the attainment demonstration:

First, the cited EPA proposed disapproval is not a final decision. EPA may ultimately decide to approve the AQMP's PM<sub>2.5</sub> attainment demonstration, especially if the state submits a revised state implementation plan as part of the "mid-course review" EPA has scheduled for April 2011. (EPA, page 57, 75 Fed. Reg. 71294, 71314, Nov. 22, 2010) EPA has stated to the SCAQMD that it does not plan to take final action on the proposed disapproval prior to Fall 2011, so the SCAQMD and CARB will have time to revise the plan and address any issues identified by EPA.

Second, EPA's proposed disapproval is based on issues relating to EPA's interpretation of its duties under the Clean Air Act relating to the status of rule adoption, and does not mean that the region will not in fact attain the standard by 2015. EPA explains that it is able to approve enforceable commitments to adopt rules, in lieu of fully-adopted rules, where the commitment is for a "limited portion" of the reductions needed to attain the applicable standard. EPA recognizes that "the majority of emission reductions needed to demonstrate attainment and all of the emission reductions needed to demonstrate [reasonable further progress] come from rules that were adopted prior to the AQMP's submittal..." (EPA pages 63-64, 75 Fed. Reg. 71294, 71308) However, EPA concludes that the AQMP relies on enforceable commitments for 27 percent of the necessary reductions, and that this amount exceeds the 10 percent "generally accepted" by EPA. (EPA pages 70-71, 75 Fed. Reg. 71294, 71308) This technical conclusion does not mean that EPA has concluded the region will not attain the applicable standard by 2015. Indeed, EPA has stated that "Given the evidence of the State's and District's efforts to date, and their continuing program to adopt controls, we believe that the State and the SCAQMD are capable of meeting their enforceable commitments to achieve the necessary reductions in the South Coast nonattainment area by 2014." (EPA page 67, 75 Fed. Reg. 71294, 71309)

Comment 1-26 also states that the Draft PEA does not discuss future PM<sub>2.5</sub> standards that will need to be met. However, the Draft PEA describes the future 24-hour PM<sub>2.5</sub> standard at page 4.1-19. While EPA may adopt additional more stringent standards in the future, it is not possible at present to define what these standards will be.

### **Mitigation for emissions impacts. Responses to Comment 1-27**

Several comments suggest that the Draft PEA does not offer mitigation for the impacts of the project. Comment 1-27. See also Comments 1-3, 1-4, 1-5 and 1-29.

First, it should be recognized that the SCAQMD's rules require that the most advanced control technology be employed for all new and modified sources, and these requirements apply to sources that are permitted in reliance upon offsets in the SCAQMD's internal accounts. Under Rule 1303(a)(1), all new and modified sources resulting in an increase of nonattainment

pollutants and their precursors are required to use Best Available Control Technology (BACT). Further, the Best Available Control Technology for Toxic Air Pollutants (T-BACT) is required for new and modified sources that emit toxic air contaminants over established risk levels. These requirements mean that the cleanest available technology must be used by new and modified sources. The application of these rules to permits for new and modified sources ensures that emissions by each new or modified source are mitigated by being reduced to the maximum extent feasible.

Because the SCAQMD's rules relating to issuance of permits require that emissions be mitigated on a source by source basis to the extent it is feasible to do so, the remaining mitigation strategy that would further reduce project-related emissions would involve restricting the number of permits for new or modified sources that can be issued by limiting the availability of internal offsets for those permits. The Draft PEA's Alternatives analysis examines the possibility of doing so.

The CEQA Backstop limitations on cumulative net emission increases contained in the proposed rule is designed to mitigate project-related emissions impacts by ensuring that emissions will not exceed the levels forecasted in the Draft PEA. The comment contends, however, that the caps on the use of offset credits contained in the proposed rule are not enforceable. (Comment 1-27) Contrary to the statements in the comment, the caps on the use of offset credits built into the proposed rule would act as effective, mandatory limitations on project-related emissions. Under the proposed rule's Backstop Provisions, any time the cumulative net emission increase of a nonattainment air contaminant from both major and minor sources exceeds the specified cumulative net emission increase threshold for that contaminant, the SCAQMD would be required to discontinue issuing permits to construct or permits to operate for sources that rely on Rule 1304 exemptions or 1309.1 Priority Reserve offsets for that air contaminant. This requirement would apply even if there are sufficient offsets remaining in the account for the permits. The calculation of cumulative net emissions increases would be based on the maximum amount of emissions allowed ("potential to emit") under each permit that is issued. Because the cumulative net emission increase thresholds that would be imposed by the backstop provisions are derived from the emissions projections used in the Draft PEA's impact analysis, these backstop provisions of the proposed rule will ensure that the level of emissions from implementation of the Proposed Rule will not exceed the level of emissions impacts forecasted in the PEA.

With respect to the comment that the 2009 legislation (SB 827 and AB 1318) shows that the caps on use of emissions credits will not be effective, see Responses to Comment 1-23.

The comment also suggests that the public would not be able to track credit use, and therefore the cumulative net emission increase thresholds would not be enforceable by the public. However, the proposed rule includes detailed provisions directing the Executive Officer to track credit use, to calculate cumulative net emissions increases for each tracked air contaminant and compare the results to the cumulative net emissions increase thresholds included in the proposed rule, to report the findings to the Governing Board, and to take corrective action if a threshold is exceeded or if an exceedance is projected. This entire process will be disclosed to the public.

The comment further suggests that the limitations on emissions would not be effective because the “reporting will come too late to prevent the environmental harm caused by exceeding the cap.” The procedure for tracking of cumulative net emissions increases is designed to prevent permit issuance relying on the internal offset accounts until the cumulative net emissions increase has returned to a level at least ten percent below the applicable threshold. The inherent lag in the process is the very reason that, under the proposed rule, the Executive Officer would be required to project two years of future cumulative net emissions increases on an annual basis. Such projections should identify a potential threshold exceedance before it occurs and help prevent it from actually occurring. Finally, the Executive Officer and SCAQMD staff would monitor trends in offset generation and use, as well as in cumulative net emissions increases, with an eye to identifying and responding to potential threshold exceedances or offset account deficits before they are realized.

For a discussion of the project description and baseline issues referred to in comment 1-27, see Responses to Comments 1-8 and 1-24.

**Potential for future changes to rules relating to use of credits. Comment 1-28.**

The response to this comment is included in the Responses to Comment 1-23.

**Draft PEA’s treatment of alternatives and suggestion that Alternative D be adopted. Comment 1-29 and 1-30.**

Responses these comments are included in the Responses to Comment 1-11.

In addition, one factor that the Governing Board will consider is the ability of each alternative to accomplish the project objectives. By limiting offset use to those offsets in the internal offset accounts that result from emissions reductions that occur in 2009 and beyond, Alternative D would potentially constrain regional growth. This is because new offsets tracked when a shutdown occurs will often be needed for new or modified sources that replace the shutdown source, and the emissions reductions resulting from the shutdown are discounted when they are tracked offsets. Moreover, the amount of offsets deposited may vary from year to year. During a time of a prosperous economy, demand for new offsets may easily outstrip supply, since both new and existing businesses would be less likely to shut down. Therefore, Alternative D would result in uncertainty concerning whether there would be sufficient offsets to accommodate projected population growth, as stated in the project objectives. Nevertheless, the PEA presents the environmental benefits of Alternative D so that those benefits can be weighed against the alternative’s reduced ability to accomplish the project objectives, and the SCAQMD Governing Board can decide, as a policy matter, whether to approve the alternative.

RE: Comments on Program Environmental Assessment for the Re-Adoption of  
Proposed Rule 1315– Federal New Source Review Tracking System

Dear Steve,

2-1

The California Council for Environmental and Economic Balance (CCEEB) is a coalition of business, labor and public leaders that advances strategies for a sound economy and a healthy environment. We have many members that operate facilities and provide large work forces in the South Coast Air Basin. The ability to secure permits from the AQMD is vital to the operations of these companies and to the continued progress of the economic recovery. Rule 1315 forms the cornerstone of the District's New Source Review program and ensures that exempt sources under Rule 1304 and 1309.1 are using valid emission reductions from AQMD's internal offset accounts. A thorough Program Environmental Assessment (PEA) is critical for our members that are eligible for 1304 exemptions and to have access to 1309.1. With this document, CCEEB believes staff has successfully accomplished this task.

2-2

Early on in the environmental review process, AQMD identified alternatives to the "project" (re-adoption of proposed Rule 1315) that were rejected as infeasible in the scoping process:

- Prohibit the use of offsets from shutdowns or reductions at minor sources to demonstrate equivalency with federal offset requirements
- Prohibit the use of any credits not previously recognized prior to adoption of rule
- Allow fossil fueled power plant projects access to AQMD's internal offset accounts
- Other project alternatives suggested by the Superior Court
- Issue offsets to priority projects first

We concur with the elimination of these alternatives based on the following CEQA Guidelines:

- Failure to meet most of the project objectives
- Infeasible as defined by CEQA Guidelines, Section 15364

- 2-2  
Cont. ↑
- Inability to avoid significant impacts (CEQA Guidelines, Section 15126.6 (c))
- In terms of the remaining alternatives described in the PEA, AQMD Rule 110, which implements the District's certified regulatory program, does not impose any greater requirements for a discussion of project alternatives in an environmental assessment than is required for an EIR under CEQA. As such, the document describes a range of alternatives to the proposed project that would attain most of the project objectives, but would avoid or lessen some of the effects of the project. The PEA also analyzes the effects of the "no project" alternative, as required by CEQA.
- 2-3
- CCEEB strongly supports the adoption of the project as proposed* and opposes the adoption of any of the five (5) alternatives, either in part or in its entirety, or variations thereof.
- 2-4
- Alternative A – No Project Alternative (No Re-Adoption of Rule 1315)  
We oppose this alternative, as we believe it would be extremely harmful to the region's economic recovery. While we await the re-adoption of Rule 1315, the region is relying on the language contained in SB 827 (Wright, 2009) as a means to have a valid credit system to support the District's New Source Review program. However, SB 827 contains a sunset provision of May 1, 2012. Without additional legislative action, the failure to gain federal approval of a re-adopted Rule 1315 would trigger another permit moratorium as the region experienced in 2009.
- 2-5
- Alternative B – Offset User Fees for Large Businesses  
The alternative looks at charging a fee for large businesses using the Rule 1304(d) exemption. The fee would be set at a level higher than the cost of purchasing ERCs. We need only look back at the experience during the permit moratorium to recognize the significant impact this option would cause to businesses. The private credit markets play a vital role to the NSR program and CCEEB supports that structure. However, the moratorium showed that businesses of all sizes rely on Rule 1304(d). Charging a fee higher than market rates would essentially eliminate this option. CCEEB opposes this alternative.
- 2-6
- Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions  
While Alternative B sets an extremely high cost to allow use of Rule 1304(d), this alternative is an outright prohibition. Without access to the 1304 Offset Budget, it would be exceedingly difficult for large businesses to achieve facility modernization. Implementation of this alternative would result in significant adverse impacts to facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the AQMD's 1304 offset account. Impacts associated with limiting access to 1304 have not been analyzed and quantified in the PEA.
- Furthermore, this alternative fails to meet the main project objective to continue to administer its NSR program for major and minor sources for facility modernization. As documented in the PEA, facility modernization results in increased efficiency and reduction in air pollution. As older units are replaced with new ones, environmental benefits are achieved and result in fewer criteria pollutant, toxic and GHG emissions. CCEEB strongly opposes this alternative.
- 2-7 ↓
- Alternative D – Use of Credits Generated in 2009 and Beyond Only  
This alternative would drastically reduce the credits available for use under Rule 1304 and 1309.1 by eliminating the District's existing offset accounts. CCEEB is aware of the extraordinary effort the District has undertaken with EPA over the past several years to verify the balances of credits in the District's offset accounts. We believe the agreement reached between the two agencies is sound and provides the needed assurance that the balances in the District's offset accounts are

2-7  
Cont.

valid. Elimination of these accounts would be detrimental to the businesses relying in Rules 1304 and 1309.1. CCEEB opposes this alternative.

2-8

Alternative E – Limited Offset Availability

This alternative would essentially impose a 50 percent cap on the use of credits from the District's internal accounts. CCEEB believes this option would place an undue hardship on businesses intending to use Rules 1304 and 1309.1 without a justified benefit to the environment. CCEEB opposes this alternative.

2-9

In conclusion, CCEEB supports the project as proposed by staff (the re-adoption of proposed Rule 1315) and we oppose each of the alternatives presented in the PEA.

Please feel free to contact me if you wish to discuss our comments in further detail.

Thank you for considering our views.

Sincerely,

Vice President and Chief Operating Officer

cc: Gerald D. Secundy  
Members, South Coast Air Project

**COMMENT LETTER NO. 2**

**CALIFORNIA COUNCIL FOR ENVIRONMENTAL AND ECONOMIC BALANCE**

**November 9, 2010**

**Response to Comment 2-1**

In addition to including information about the organization submitting comment letter #2, the comment states that a thorough PEA is necessary to analyze impacts from the proposed project and that the SCAQMD has successfully accomplished this task. These comments are noted and no further response is required.

**Response to Comment 2-2**

The comment lists the potential alternatives that were rejected during the scoping process and agrees with elimination of these alternatives from detailed consideration in the Draft PEA. The comment also notes that the PEA includes a range of alternatives, including a no project alternative and expresses the view that legal requirements relating to alternatives have been met. These comments are noted and no further response is required.

**Response to Comment 2-3**

The comment states support for the proposed project and opposition to adoption of one of the project alternatives or variations on those alternatives. These comments are noted and no further response is required.

**Response to Comment 2-4**

The comment opposes adoption of Alternative A, the No Project Alternative, noting that after SB 827 sunsets on May 1, 2012, a permit moratorium would again be in effect. The comment also states that CCEEB believes that Alternative A would be extremely harmful to the region's economic recovery. These comments are noted and no further response is required.

**Response to Comment 2-5**

The comment states that CCEEB opposes Alternative B asserting that it would effectively eliminate the option of relying on Rule 1304(d) for affected businesses because the fee would be set higher than the cost of purchasing ERCs. These comments are noted and no further response is required.

**Response to Comment 2-6**

The comment states that under Alternative C, large businesses that previously qualified for an exemption from offsets pursuant to Rule 1304 would no longer be able to modernize. The comment states that CCEEB opposes Alternative C on that ground. With respect to the impacts of Alternative C, Chapter 6 of the Draft PEA includes a comprehensive analysis of direct and indirect air quality, health, visibility and greenhouse gas impacts, while Chapter 7 includes a comprehensive analysis of indirect impacts. In general, the analysis of air quality, health, visibility and greenhouse gas impacts and indirect impacts from Alternative C shows they would be significant, but less than the proposed project. As noted in the comment, the Draft PEA also recognizes that facility modernization results in increased efficiency and reduced air pollution, and that replacement of older units with new ones provides environmental benefits in terms of reduced emissions.

**Response to Comment 2-7**

The comment states that CCEEB is opposed to Alternative D because it would reduce the available credits and would be detrimental to businesses relying on Rules 1309.1 and 1304. These comments are noted and no further response is required..

**Response to Comment 2-8**

The comment states that CCEEB is opposed to Alternative E because it would place undue hardships on facilities attempting to seek an exemption from offsets pursuant to Rules 1304 and 1309.1 with no justified benefit to the environment. These comments are noted and no further response is required..

**Response to Comment 2-9**

The comment states that CCEEB supports the proposed project and is opposed to the project alternatives. These comments are noted and no further response is required..

File No. 018282-0000

Re: Comments on Draft Program Environmental Assessment for Re-adoption of Proposed Rule 1315

Dear Mr. Krause:

3-1 On behalf of the Regulatory Flexibility Group, we submit these comments on the South Coast Air Quality Management District's (SCAQMD) Draft Program Environmental Assessment (PEA) prepared for the re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System.<sup>1</sup> We wish to direct the SCAQMD's attention to two issues: (1) the PEA's ultra-conservative analysis of air quality impacts; and (2) flaws in two of the PEA's proffered alternatives.

Ultra-Conservative Analysis

3-2 The PEA's analysis of projected air quality impacts from the re-adoption of Rule 1315 is ultra-conservative. While such conservatism may be an appropriate strategy to minimize litigation risk under the California Environmental Quality Act, it also leads to the PEA overstating environmental impacts caused by the re-adoption of Rule 1315. We submit these comments to provide perspective for the PEA's analysis of projected air quality impacts. Examples of the PEA's conservatism are listed below:

---

<sup>1</sup> Pursuant to a SCAQMD notice dated October 15, 2010, the public review and comment period for the Draft PEA was extended an additional 14 days, ending on November 9, 2010. The notice is available at <http://www.aqmd.gov/ceqa/documents/2010/aqmd/draftEA/1315/NOC-extension.pdf> (last visited 11/5/2010).

LATHAM & WATKINS LLP

- 3-3
  - The PEA arbitrarily adds an additional 15 percent to the air emission projections for each pollutant.
- 3-4
  - The PEA assumes all increases in permitted stationary source emissions would be attributable to re-adoption of Rule 1315. While Table 4.0-1 in the PEA indicates that the historic share of emissions from sources permitted under Rules 1304 and 1309.1 is high, the PEA's assumption nevertheless is conservative. Moreover, as explained in the 2007 Air Quality Management Plan (AQMP), permitted stationary sources represent a very small fraction of the SCAQMD's overall inventory – area, off-road, and on-road sources collectively account for the overwhelming majority of emissions.<sup>2</sup>
- 3-5
  - The PEA generally fails to take full credit for the benefits associated with projects permitted under Rules 1304 and 1309.1. In particular, such projects often result in the replacement of older sources that are less efficient and have less effective pollution controls.
- 3-6
  - The PEA's "without project condition" is similarly conservative; it assumes that none of the 2007 AQMP's projected growth in stationary source emissions from industry categories potentially eligible to receive permits under Rules 1304 and 1309.1 would occur. This assumption overstates emissions attributable to the re-adoption of Rule 1315 because emissions growth comes from three types of stationary sources (i.e., existing sources for which no new or modified permits are needed or from non-permitted sources, sources receiving permits based upon private-market emission reduction credits, and increased emissions from sources receiving permits issued under Rules 1304 and 1309.1 in reliance upon the SCAQMD internal account offsets), of which only the third component would be affected by the project.
- 3-7
  - The rate of shutdowns would be slower under the "without project condition" than it has been in the past because without the SCAQMD internal account offsets, there would be fewer new sources receiving permits, so there would be less competition from new sources, and existing sources would be expected to stay in operation longer to meet demand. Nonetheless, the PEA does not quantify this phenomenon and instead uses the historical rate of shutdowns.
- 3-8
  - Further, "as a safety margin," the PEA adds an additional 10 percent to the emission reductions from shut downs for NOx, SOx, and PM10 and 20 percent for VOC.
- 3-9
  - The PEA's assumes that emissions attributable to sources permitted pursuant to SB 827 and AB 1318 actually were approved under re-adopted Rule 1315, further overestimating environmental impacts.
- 3-10 

Flawed Alternatives

PEA Alternatives B and C would be counterproductive if selected, in whole or in part, by the Governing Board. The SCAQMD previously has determined that Rule 1304 projects are environmental and/or economically beneficial to society, which is why they are exempt from the

<sup>2</sup> See 2007 AQMP, Appendix III, Figures 2-2, 2-3, 2-4, 2-5 (illustrating 2002 inventory); 2007 AQMP, Chapter 3, Figure 3-3 (illustrating projected 2023 inventory).

LATHAM & WATKINS<sup>LLP</sup>

3-10  
Cont.

↑ requirement to provide their own offsets.<sup>3</sup> For example, Rule 1304 exemptions provide an incentive for the development of resource recovery projects, which convert waste products into useful energy and reduce our collective dependence on fossil fuels. Rule 1304 exemptions also allow air pollution control and regulatory compliance projects to proceed.

As acknowledged by the PEA, if Alternatives B and C are implemented, fewer facilities would be able to obtain permits for new or modified sources. This reduction in the use of Rule 1304 would impede achievement of the project objectives identified in the PEA.<sup>4</sup> Such projects should continue to be encouraged via the Rule 1304 exemptions – regardless of the size of their proponent. Accordingly, Alternatives B and C should be removed from the PEA.

Best regards,

Michael J. Carroll  
of LATHAM & WATKINS LLP

cc: Regulatory Flexibility Group  
Robert Wyman  
Joshua Bledsoe

<sup>3</sup> See, e.g., SCAQMD Governing Board Meeting February 14, 1997, Agenda Item No. 25 (“Several offset exemptions are provided in Rule 1304 in keeping with the AQMD’s policy for fair and equitable treatment of business. While a complete explanation may be found in earlier staff reports for Regulation XIII revisions, most of these exemptions are either beneficial to the environment or driven by severe economic needs.”)(available at <http://www.aqmd.gov/hb/1997/970225a.html>)(last visited 11/9/2010).

<sup>4</sup> See PEA at 2-20 (“The project objectives are as follows: ... 1) allow facility modernization which will increase efficiency and reduce air pollution, 2) allow facilities to install pollution control equipment, 3) allow emergency equipment to be installed, 4) allow permitting of equipment necessary for essential public services and small emitters, 5) allow operation of portable equipment and other sources determined as a policy matter to be exempt from offsets or eligible for Priority Reserve credits, and 6) take into account environmental and socioeconomic benefits as well as environmental and socioeconomic impacts....”).

**COMMENT LETTER NO. 3**

**LATHAM & WATKINS**

**November 9, 2010**

**Response to Comment 3-1**

The comment identifies two issues that are discussed in more detail in subsequent comments. These comments are noted and no further response is required..

**Response to Comment 3-2**

The comment notes that the Draft PEA’s analysis of projected air quality impacts of adopting Proposed Rule 1315 is “ultra-conservative,” and states that it overstates projected air quality impacts. The methodology used in the Draft PEA to assess project-related emissions was designed to provide the most realistic evaluation that can be provided of the project’s emissions impacts given the inherent difficulties of making such forecasts over a 20-year time horizon. To ensure that potential emissions impacts are not understated, where parameters for analysis fall within a range or for other reasons could not be precisely defined, the Draft PEA employs conservative assumptions so that the analysis in the Draft PEA would not underestimate impacts.

**Responses to Comments 3-3 through 3-9.**

Comments 3-3 through 3.9 list what the comment refers to as examples of the Draft PEA’s conservatism in its analysis of projected air quality impacts attributed to the project. The comments generally summarize various premises of the impact analysis which may result in project-related impacts being overstated to some degree. It should be noted that each of the premises referred to in the comments are discussed in the Draft PEA so that the methodology used is fully described.

**Response to Comment 3-10**

The comment states that adopting Alternatives B or C in whole or in part would be counterproductive because the SCAQMD has previously concluded that Rule 1304 projects are environmental and/or economically beneficial to society in determining to allow them to be exempted from the requirement to provide their own offsets. The comment also states that Rule 1304 exemptions allow air pollution control and regulatory compliance projects to proceed. With respect to the suggestion in the comment that Alternatives B and C be “removed from the PEA” because they would impede achievement of project objectives, it should be noted that the alternatives discussed in the Draft PEA are presented in provide an evaluation of a range of alternatives to the project as proposed for consideration by the decision makers. The ultimate decision about what action to take regarding the proposed project and the alternatives discussed in the Draft PEA will be made by the SCAQMD Governing Board.

Mr. Michael Krause  
Program Supervisor, CEQA Section  
South Coast Air Quality Management District  
Planning, Rule Development & Area Sources  
21865 Copley Drive  
Diamond Bar, California 91765

Dear Mr. Krause:

Subject: Comments on Program Environmental Assessment for the Re-Adoption of  
Proposed Rule 1315 – Federal New Source Review Tracking System

4-1

Thank you for the opportunity to submit comments on the Program Environmental Assessment (PEA) for proposed Rule 1315. The purpose of the document is to evaluate the environmental impacts associated with the re-adoption of Rule 1315 – Federal New Source Review (NSR) Tracking System. Proposed Rule 1315 ensures that exempt sources under Rule 1304 are fully offset to the extent required by federal law, using valid emission reductions from the South Coast Air Quality Management District's (SCAQMD) internal offset account. Accordingly, the proposed PEA intends to provide an overall analysis of the direct and indirect impacts of sources expected to receive permits under Rules 1304 and 1309.1 through 2030.

4-2

The Los Angeles Department of Water and Power (LADWP), a proprietary department of the City of Los Angeles, is the nation's largest municipally owned utility with a net maximum plant capacity of 7,977 megawatts and net dependable capacity of 7,226 megawatts as of December 31, 2009. LADWP is the sole owner and operator of four (4) in-basin natural gas-fired power plants. With a strong commitment toward a greener future, LADWP has been implementing a massive modernization program at all four in-basin power plants over the past decade. There is an urgent need to upgrade existing generating units since most of these units were built in the late 1950s and early 1960s.

Through the process known as "repowering," older, higher polluting units are being replaced with new, state-of-the-art equipment that conserves fuel, and reduces greenhouse gas (GHG) and Nitrogen Oxide (NOx) emissions, and other environmental impacts. The new units are also needed to provide transitional energy as LADWP integrates more renewable resources into its grid. As a result of more than \$1 billion spent on modernizing Haynes and

### Water and Power Conservation ... a way of life

111 North Hope Street, Los Angeles, California 90012-2607 Mailing address: Box 51111, Los Angeles 90051-5700  
Telephone: (213) 367-4211 Cable address: DEWAPOLA

- 4-2  
Cont.
- Valley Generating Stations and installing pollution control equipment, LADWP has reduced its NOx emissions in the South Coast Air Basin by over 90 percent.
- The ability to secure permits from the SCAQMD and utilize Rule 1304 exemptions has been crucial to the continued progress of the power plants' in-basin modernization. As such, a thorough PEA is critical to LADWP's strategic facility modernization. Rule 1315 forms the cornerstone of the District's NSR program and provides the necessary accounting for the Rule 1304 internal offset account that LADWP has relied upon. Previous access to Rule 1304 exemptions has allowed LADWP to implement facility modernization which increases efficiency and reduces air pollution.
- 4-3
- The PEA describes a range of alternatives to the proposed project that would feasibly attain most of the project objectives but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives (CEQA Section 15126.6). The PEA also analyzes the effects of the "no project" alternative, as required by CEQA.
- 4-4
- LADWP supports the adoption of the project as proposed*** and believes that the adoption of any of the five (5) alternatives, either in part or in its entirety, or variations thereof would not be consistent with the CEQA Guidelines. We support the elimination of any project alternatives based on the following CEQA criteria:
- Failure to meet most of the project objectives
  - Infeasible as defined by CEQA Guidelines, Section 15364
  - Inability to avoid significant impacts (CEQA Guidelines, Section 15126.6 (c))
- 4-5
- The following are specific comments on the PEA as it relates to potentially significant impacts to the progress of LADWP's in-basin plant modernization program:
- Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions**  
This Alternative has potentially significant impacts to LADWP operations and the overall in-basin power plant modernization program. Without access to the Rule 1304 offset account, it would be exceedingly difficult for any new projects to go forward. Implementation of this alternative would result in significant adverse impacts to LADWP and its ability to receive emissions offsets from SCAQMD's Rule 1304 offset account. Direct and indirect impacts to power plants associated with limiting or capping access to Rule 1304 offsets would need further analysis if this alternative were selected.
- In addition, this alternative may not meet the main project objective, allowing SCAQMD to continue to administer its NSR program for major and minor sources for purposes of facility modernization. As documented in the PEA, facility modernization results in increased efficiency and reduction in air pollution. As older units are replaced with new ones,

Mr. Michael Krause  
Page 3  
November 9, 2010

4-5  
Cont.

↑ environmental benefits are achieved and results in fewer criteria pollutant, toxic and GHG emissions.

4-6

**Equivalency Backstop Provisions**

The backstop provision would require SCAQMD to discontinue issuing permits to major sources that rely on the offset accounts resulting from the use of Rule 1304 exemptions. It also establishes the procedure for SCAQMD to demonstrate and restore access to the internal accounts. If the cap is exceeded for any pollutant, SCAQMD would deny permits to applicants that require offsets from the internal offset account until consistency with the cap is restored. However, it is not clear how long a major source would be on hold until access to the offset accounts is restored. The PEA should discuss in more detail impacts to large facilities, such as LADWP that are currently in the process of implementing re-powering projects in the next several years and will rely on Rule 1304 exemptions to complete their projects. Denying access would have significant impacts on operations. A clear method of expediting access to the Rule 1304 offset account should be included in the backstop provision in order to minimize potential impacts.

I appreciate your consideration of these comments and look forward to SCAQMD's final PEA. Should you have any questions, please contact Ms. Leila Barker at (213) 367-2743.

Sincerely,

Mark J. Sedlacek  
Director of Environmental Affairs

LB:db  
c: Ms. Leila Barker

**COMMENT LETTER NO. 4**

**DEPARTMENT OF WATER AND POWER**

**November 9, 2010**

**Response to Comment 4-1**

The comment provides general comments on the purpose of the PEA for the proposed project including the analysis of direct and indirect impacts from sources expected to receive permits under Rules 1304 and 1309.1 through 2030. These comments are noted and no further response is required..

**Response to Comment 4-2**

The comment provides information about the Department of Water and Power, including the need to upgrade existing generating units since most of these units were built in the late 1950s and early 1960s. The comment further explains that the ability of LADWP to secure permits from the SCAQMD through Rule 1304 exemptions has been important to the continued progress for in-Basin facility modernizations which increase efficiency and reduce air pollution. These comments are noted and no further response is required..

**Response to Comments 4-3 through 4-5.**

The comments indicate that the Draft PEA describes a range of reasonable alternatives and state that LADWP supports adoption of the project as proposed, while adoption of any of the five alternatives, or variations on those alternatives, would not be consistent with the CEQA Guidelines relating to the alternatives. Comment 4-5 states that Alternative C could significantly affect LADWP operations and the overall in-Basin power plant modernization program. The comment states that without access to Rule 1304 offset accounts it would be extremely difficult for new projects to go forward due to the difficulty of LADWP receiving offsets from the Rule 1304 offset account. The comment also states that Alternative C may not meet the main project objectives relating to continued administration of the NSR program for purposes for facility modernization which results in reduced emissions as older units are replaced. These comments are noted and no further response is required.

**Response to Comment 4-6**

The comment notes that the backstop provisions of the proposed rule would require the SCAQMD to discontinue issuing permits to major sources that rely on the offset accounts under the Rule 1304 exemptions. It notes that denying access to operations in such a situation would have a significant effect on LADWP's operations. Under proposed rule 1315, the SCAQMD Executive Officer would be required to project two years of future cumulative net emissions increases on an annual basis. This procedure should identify a potential threshold exceedance before it occurs so that an exceedance would be prevented from occurring. The Executive

**APPENDIX J: RESPONSES TO COMMENTS ON DRAFT PEA**

---

Officer and SCAQMD staff would monitor trends in offset generation and use, as well as in cumulative net emissions increases, in order to identify and respond to potential threshold exceedances or offset account deficits before they occur.

## COUNTY SANITATION DISTRICTS OF LOS ANGELES COUNTY

STEPHEN R. MAGUIN  
Chief Engineer and General Manager

November 9, 2010  
File No.: 31-380.10

Steve Smith, Ph.D.  
Program Supervisor-CEQA Section  
South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, California 91765

Dear Mr. Smith:

**Draft Program Environmental Assessment  
Re-Adoption of Proposed Rule 1315  
Federal New Source Review Tracking System**

5-1

The Sanitation Districts of Los Angeles County (Sanitation Districts) appreciate the opportunity to comment on the Draft Program Environmental Assessment (DPEA) for the re-adoption of PR 1315 - Federal New Source Review Tracking System. The Sanitation Districts provide environmentally sound, cost-effective wastewater and solid waste management for about 5.7 million people in Los Angeles County and, in the process, convert waste into resources such as reclaimed water, recycled materials and approximately 128 MW of renewable electrical energy. The Sanitation Districts' service area covers approximately 800 square miles and encompasses 78 cities and unincorporated territory within the County through a partnership agreement with 23 independent special districts.

Our review of the DPEA documents leads us to recognize the prodigious effort on the part of your staff and consultants in performing such a comprehensive analysis. We appreciate the thoroughness of the effort and in particular the supporting calculations and modeling analyses that are included in the appendices.

5-2

The Sanitation Districts support SCAQMD's proposed project and discourage the adoption of any of the project alternatives. Implementation of Alternative A, the NO PROJECT alternative, would adversely impact essential public services and businesses alike in that neither entity could modernize or replace their aging infrastructure or facilities beyond their useful lives. Also, neither entity could provide the infrastructure or services and jobs needed to accommodate projected, inevitable population growth. As you correctly state in Chapter 7, this alternative would also have a significant adverse effect on the production of renewable energy such as what was witnessed during the recent permit moratorium at the Palos Verdes Landfill.

Realization of Alternative A would also restrict even the most fundamental health protective and safety oriented projects. Emergency standby generators could not be installed at sewage lift pump stations, in an abundance of caution, to prevent spilling of raw, untreated

5-2  
Cont.

sewage into the neighboring streets. Similarly, emergency flares to combust excess gases both at landfills and sewage treatment plants would be denied, potentially jeopardizing public health.

5-3

The remaining project alternatives B through E limit offset availability to businesses alone or to both businesses and essential public services. While essential public services might be treated more favorably than businesses in some of these project alternatives, we believe that any such restriction ultimately impacts the economic vitality of the region.

5-4

Other minor comments are as follows:

- Subchapter 3.6 Existing Setting-Energy

We believe the description of the future of distributed generation (DG) on Page 3.6-5 is much too sanguine. Incremental amounts of distributed generation (~100 MW per year) might have been the case in years past but with new rules mandating central utility emission standards on such units, we do not believe there will be continued development at this rate. The lack of future smaller DG projects only serves to underline the importance of a viable credit supply for energy supply alternatives for the region.

5-5

- Subchapter 5.8 Indirect Environmental Impacts-Hazards and Hazardous Materials

On Page 5.8-43 of this section, in the FSA paragraph, it should be mentioned that the *reason* for the use of certain listed chemicals is for air pollution control (aqueous ammonia) or water pollution control, as the case may be.

Again, we greatly appreciate the staff's effort on assembling this important document. We support the recommended project and the speedy adoption of the proposed rule.

Very truly yours,  
Stephen R. Maguin

Gregory M. Adams

Barbara Baird - SCAQMD  
Elaine Chang - SCAQMD

**COMMENT LETTER NO. 5**

**COUNTY SANITATION DISTRICTS OF LOS ANGELES COUNTY**

**November 9, 2010**

**Response to Comment 5-1**

The comment provides general information about the County Sanitation Districts of Los Angeles County. Further, the comment states that the analysis in the Draft PEA of the proposed project and supporting documentation is comprehensive. These comments are noted and no further response is required.

**Response to Comment 5-2**

The comment states that CSDLAC supports the proposed project and discourages adopting Alternative A, the No Project Alternative. The comment states that adopting Alternative A would adversely impact essential public services and businesses because neither would be able to modernize or replace their aging infrastructure and it would also adversely affect the production of renewable energy. The comment also states that Alternative A would restrict fundamental health protective and safety oriented projects such as emergency generators and flares potentially jeopardizing public health. These comments are noted and no further response is required.

**Response to Comment 5-3**

The comments state that Alternatives B through E would limit offset availability to businesses and/or essential public services, which would affect the economic vitality of the region. These comments are noted and no further response is required.

**Response to Comment 5-4**

The comment states that the Subchapter 3.6 description of distributed generation (DG) is too optimistic. Further, the commentator states that future development of DG at an average of 100 MWs per year is unlikely to occur. As a reminder, the subchapters in Chapter 3 describe the existing setting for each of the environmental categories to be evaluated in Chapters 4 and 5 of the PEA. The information about DG, in particular the rate of growth of 100 MWs per year is based on historical information as noted in the text. A lower level of DG than described in subchapter 3.6 would not affect the impact analysis for the impacts of the proposed project.

**Response to Comment 5-5**

The comment states that on page 5.8-43 it should be mentioned that the reason certain chemicals are listed in the Final Staff Assessments (FSAs) is that they are for pollution control, e.g., aqueous ammonia. The majority of the discussion of hazardous materials is related to lubricants,

solvents, paints, etc. On page 5.8-45 aqueous ammonia is mentioned. However, it should be specifically noted, as requested by the comment letter, that aqueous ammonia is used for air pollution control.

Walnut Creek Energy, LLC

October 26, 2010

Mr. Michael Krause  
CEQA Section, Planning, Rule Development and Area Sources  
South Coast Air Quality Management District (SCAQMD)  
21865 Copley Drive  
Diamond Bar, California 91765-4182

VIA FACSIMILE (909- 396-3324)  
VIA EMAIL TO mkrause@aqmd.gov

**Subject: Comments on Proposed Rule 1315 DRAFT Program Environmental Assessment (PEA)**

Dear Mr. Krause:

In response to your September 8, 2010 notice regarding the DRAFT Program Environmental Assessment (PEA) of Proposed Rule 1315, we have reviewed the PEA and have significant comments and questions that are detailed below.

6-1

Walnut Creek Energy Park [CEC Docket # 05-AFC-2c] is a licensed site under the CEC's CEQA equivalent process. As part of the CEC licensing process, the South Coast Air Quality Management District (SCAQMD) has previously analyzed the project air quality and human health impacts and issued Determinations of Compliance. The CEC Commission approved a Final Decision on February 27, 2008.

In the DRAFT PEA of Proposed Rule 1315 SCAQMD staff reaches unprecedented conclusions regarding project-specific impacts that are not supported by the extensive Walnut Creek CEC docket record or well-established procedures for evaluating ambient air quality impacts and human health risks for gas-fired project in SCAQMD and the CEC.

***The methodology in the PEA does not follow well-established industry procedures and uses analyses that do not apply to specific projects.***

6-2

There are well-established industry standard procedures and peer-reviewed processes for analyzing the ambient air quality and human health risk impacts as part of the environmental analysis for a proposed project. The estimate of potential increase in the annual adult mortality is the result of the region-wide assessment of particulate emissions applicable to air quality planning, but not a specific project.

On page 4.1-39, second paragraph, the document states "*Based on this methodology, the SCAQMD estimates that there may be an increase in annual adult mortality of 1.77 persons in the area of the Walnut Creek Energy Park . . .*" As noted above, this estimate is the result of

## Walnut Creek Energy, LLC

6-2  
Cont.

region-wide assessment of particulate emissions and should not be directly related to the impact from a specific project.

***This PEA contradicts SCAQMD's more detailed analysis contained in its Final Determination of Compliance for Walnut Creek Energy Park (WCEP), in which SCAQMD found the human health impacts from the project to be below significance thresholds.***

**Rule 1401 – New Source Review of Toxic Air Contaminants:**

This rule specifies limits for maximum individual cancer risk (MICR), acute hazard index (HIA), chronic hazard index (HIC) and cancer burden (CB) from new permit units, relocations, or modifications to existing permits which emit toxic air contaminants. Rule 1401 requirements are summarized as follows:

Table 21 – Rule 1401 Requirements

Parameters and Specifications	Rule 1401 Requirements
MICR, without T-BACT	$\leq 1 \times 10^{-6}$
MICR, with T-BACT	$\leq 1 \times 10^{-6}$
Acute Hazard Index	$\leq 1.0$
Chronic Hazard Index	$\leq 1.0$
Cancer Burden	$\leq 0.5$

The applicant performed a Tier 4 health risk assessment using the Hot Spots Analysis and Reporting Program (HARP, version 1.2a). The analysis included an estimate of the MICR for the nearest residential and commercial receptors, the acute and chronic hazard indices for the entire facility. PRA modeling staff reviewed the applicant's methodology and procedures used, and re-ran the HARP model and verified the health risk and hazard indices which were presented by the applicant. PRA staff concluded that each of the health risk values for MICR, HIA and HIC were appropriately estimated (see memorandum in file, dated August 30, 2006 from Ms. Jill Whynot to Mr. Mike Mills). Table 22 below is a summary of the modeled health risk assessment results. The cancer burden is not calculated because the MICR is less than  $1 \times 10^{-6}$  for both residential and commercial receptors.

6-3

Table 22 – Rule 1401 Modeled Results

Risk Parameter	Residential	Commercial	Rule 1401 Requirements	Compliance (Yes/No)
MICR	$6.23 \times 10^{-7}$	$1.06 \times 10^{-6}$	$\leq 1 \times 10^{-6}$	Yes
HIA	0.0635	0.000879	$\leq 1.0$	Yes
HIC	0.0124	0.0000156	$\leq 1.0$	Yes
Receptor UTM	413480E / 3764940N	413123E / 3763141N		

Table 22 shows that WCEP will comply with the applicable requirements of Rule 1401. The cancer burden is not computed because the highest MICR (in this case, the residential MICR) is less than  $1 \times 10^{-6}$ .

SCAQMD's conclusion regarding the insignificance of WCEP's air quality impacts is corroborated by the Final Staff Assessment prepared by the California Energy Commission, which states:

*“With the inclusion of Conditions of Certification AQ-SC1 through AQ-SC12 and Conditions of Certification AQ-1 through AQ-16 herein, staff concludes that the Walnut Creek Energy Project will comply with all applicable laws, ordinances, regulations and statutes and that the air quality emission impacts from construction and operation of the project are mitigated to a level of insignificance.”*

Walnut Creek Energy, LLC

***The analysis in the Rule 1315 PEA is, not only inapplicable to a specific project, it exaggerates the potential impacts.***

On page 4.1-3, the report states that “with respect to the health effects associated with region-wide emissions of criteria pollutants, the SCAQMD has not adopted formal significance thresholds for health impacts of ozone and PM2.5, as distinguished from the concentration-based significance thresholds set forth in Table 4.1-2”.

6-4 Technically, there is an inconsistency if the emission rates in Table 4.1-7 of the PEA have been used to calculate annual emissions, as is implied by Table 4.1-4. The daily maximum emissions shown for WCEP in Table 4.1-7 are the theoretical amounts if WCEP – a peaking power plant – was operated for 24 hours in a day, which it is not permitted to do except during an electrical system emergency. The permit conditions imposed on WCEP limit its operation to no more than 58% of the time in its maximum month and no more than 46% of the year, and the impacts are, therefore, exaggerated and not useful for policy and public decision making.

We question the value and procedural basis for a high-level, superficial analysis of a project that both SCAQMD and CEC have completed extensive and detailed project-specific analyses, concluded that the impacts are less than significant, and the CEC Decision has been approved.

6-5 We fully support SCAQMD’s efforts to advance Rule 1315 and recognize the challenges associated with region-wide air quality planning and impact assessment. We strongly request that SCAQMD staff consider the issues and concerns we have identified. Inconsistent and duplicative analysis can inadvertently create barriers to much-needed infrastructure in California and prevent siting projects like Walnut Creek Energy Park that:

- Use 34% less fuel per megawatt hour generated than the aging coastal fleet.
- Are necessary to replace once-through-cooling at coast power plants in accordance with State Water Resource Control Board’s requirements.
- Can start in ten minutes and prevent running aging units unnecessarily at negative prices because they take hours of startup to be prepared to serve peak loads.
- Are necessary to integrate renewable energy reliability to the South California grid.

Thank you very much for the opportunity to provide comments. Please let us know if you have any questions.

Sincerely,

Jenifer Morris Lee  
Managing Director, Environmental

c: Mitch Haimov, SCAQMD  
Steve Smith, SCAQMD

**COMMENT LETTER NO. 6**

**WALNUT CREEK ENERGY, LLC**

**October 26, 2010**

**Response to Comment 6-1**

The comment provides general information on the Walnut Creek Energy Park (WCEP). Impacts from this facility are analyzed in the PEA as contributing to cumulative impacts. The comment also states that the PEA for the proposed project includes “unprecedented conclusions” regarding project-specific impacts that are not supported in the CEC docket record for the WCEP. As already noted, impacts from the WCEP plant are not part of the project-specific analysis of impacts from the proposed project, but are considered as contributing to cumulative impacts.

**Responses to Comments 6-2**

The comments state the Draft PEA on page 4.1-39 provides a region-wide assessment of particulate emissions which should not be directly related to the impact from a specific project. The reasons for use of this assessment methodology are explained in the Draft PEA on page 4.1-39, as are the uncertainties and limitations in application of such a methodology in the context of a specific facility.

**Responses to Comments 6-3.**

The comments refer to the SCAQMD’s detailed analysis contained in the Final Determination of Compliance for the WCEP project. The cancer risk, acute health index and chronic health index found in the PEA for the proposed project (Chapter 4, Table 4.1-37, Page 4.1-44) were extracted from the CEC’s Final Staff Assessment (April 2007, Public Health, Table 2, Page 4.7-13) and, therefore, are accurate. The modeled results provided in the comment letter can be found in the same CEC document. Both sets of risk values reach the same conclusion that cancer risk and acute and chronic health impacts from the Walnut Creek project would not exceed the relevant significance thresholds and, therefore, would be less than significant.

**Response to Comment 6-4**

The comment notes that the mass emissions rates shown for the WCEP in Table 4.1-7 are the theoretical amounts if WCEP, which is a peaking power plant, was operated for 24 hours in a day. It further notes that permit conditions place specific limits on its operation. The mass daily emissions from power plant operations in Table 4.1-7 in the Draft PEA were retrieved from the CEC’s FSA. It is recognized that while equipment will not operate at full capacity, the CEQA analysis in the PEA analyzed the maximum potential impacts from peak operations that could be achieved. The analysis in the PEA does not in any way change the conclusions in the FSA prepared by the CEC or approval status of that project.

**Response to Comment 6-5**

The comment states support for the proposed project and describes the benefits of the WCEP. This comment is noted and no further response is required.

BOARD MEETING DATE: February 4, 2011

AGENDA NO. 27

**PROPOSAL:** Receive Public Input on Executive Officer's Proposed Program Goals/Objectives for FY 2011-12

**SYNOPSIS:** A set of priority goals for the FY 2011-12 Budget has been developed. The Executive Officer wishes to receive public and Board Member input on these priority goals as they serve as the foundation of AQMD's Work Program.

**COMMITTEE:** Administrative, January 14, 2011, Reviewed

**RECOMMENDED ACTION:**

Set a Public Hearing May 6, 2011 to adopt the FY 2011-12 AQMD Budget.

Barry R. Wallerstein, D.Env.  
Executive Officer

BRW:drw

---

### **Background**

Each year, as part of the budget process, staff brings forward to the Board and public the AQMD's proposed Program Goals/Objectives for the new budget year. Staff believes it is important for as many interested parties as possible to have early input into the budget process. These goals/objectives (Attachment 1), which may be modified as a result of public input and Board direction, will be used in developing next year's work program and budget request.

A public workshop to present the AQMD's Budget and Work Program request for FY 2011-12 has been tentatively planned for April 12, 2011. The draft Budget and Work Program is expected to be available for public review in early April. The Administrative Committee requested cross references from the Goals/Objectives to the draft Budget which will occur for the April release of the draft Budget. Furthermore, a number of other additions/modifications to the draft Goals/Objectives were also made at the request of the Administrative Committee which are shown in underline and strikethrough.

### **Attachments**

AQMD Goals & Objectives for FY 2011-12

## **SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT**

### **DRAFT GOALS/OBJECTIVES FOR FY 2011-2012**

#### **MISSION STATEMENT**

“The South Coast AQMD believes all residents have a right to live and work in an environment of clean air and is committed to undertaking all necessary steps to protect public health from air pollution with sensitivity to the impacts of its actions on the community and businesses.”

#### **GOALS**

- I. Ensure expeditious progress toward meeting clean air standards and protecting public health.
- II. Enhance public education and ensure equitable treatment for all communities.
- III. Operate efficiently and in a manner sensitive to businesses, the public and AQMD staff.
- IV. Operate a “Clean and Green” program to promote and support sustainable practice strategies.

#### **PRIORITY PROJECTS**

District programs have many important objectives, but AQMD wishes to highlight the following three priority projects for 2011 which are particularly important to achieving the District’s mission and goals:

1. Commence demonstration/deployment of a zero-emission cargo container movement system.
2. Incentivize five megawatts of in-basin renewable distributed electricity generation and storage to support electric technology applications.
3. Make substantial progress in creating programs to facilitate construction of new and modified stationary sources in areas where the supply of emissions offsets is limited, consistent with AQMD’s clean air objectives.

#### **PROGRAM OBJECTIVES**

- I. ENSURE EXPEDITIOUS PROGRESS TOWARD MEETING CLEAN AIR STANDARDS AND PROTECTING PUBLIC HEALTH

- A. Develop a comprehensive program to achieve emission reductions to meet federal and state clean air standards by:
- 1) implementing the Air Quality Management Plan (AQMP) that seeks equitable and expeditious reduction of emissions from all sources to meet clean air targets and protect public health,
  - 2) protecting the region's economy by working with stakeholders to develop means of complying with federal air quality attainment requirements in ways that (a) promote local clean technology businesses, (b) minimize compliance burdens by seeking coordinated federal, state and local energy, climate and transportation programs that provide air quality co-benefits, and (c) avoid potential sanctions for failure to meet federal air quality requirements,
  - 3) improving data and understanding of toxic emissions, through MATES III and other study results, current peer reviewed literature, and other controls and their associated public health benefits, and reducing emissions of toxic air contaminants, and implementing the Clean Communities Plan adopted 2010 which takes a community-based approach to addressing cumulative impacts, nuisance issues, and exposure to air toxic emissions,
  - 4) seeking legislative amendments to provide the necessary authority and funding to implement measures in the AQMP,
  - 5) providing input to state and federal regulatory activities to seek the greatest emission reductions as early as possible, while being sensitive to the economy,
  - 6) assisting the federal, multi-state, state and local governments in implementing federal and state greenhouse gas reporting, SB 375 and AB 32, assisting state and local governments with AB 118, and continuing in other efforts to implement AQMD policies to reduce global warming gases,
  - 7) seeking a fair share of more than \$1 billion in air quality improvement funds, and ensuring inclusion of air quality considerations for the \$2 billion Proposition 1B Transportation Corridor Infrastructure Funds, to achieve emissions reductions for this region,
  - 8) seeking policy considerations and funding for transportation plans and infrastructure projects that will support attainment of long-term air quality needs by enabling and utilizing the cleanest technologies,
  - 9) seeking additional emissions reductions for this region by ensuring inclusion of air quality considerations in policy, and in allocation of federal transportation funds through the Surface Transportation Reauthorization legislation,

including the Congestion Management & Air Quality program, sponsoring legislation to require maximum feasible controls for ships and locomotives, ~~and~~

10) working closely with SCAG and local governments to develop and implement SB 375 strategies and other transportation/land-use measures related to urban form in a manner consistent with air quality objectives,

~~10)11)~~ implementing the Board-approved climate change policy and maximizing synergies with programs to reduce toxics and smog-forming emissions,

~~11)12)~~ seeking greater support for local authority and decision-making in the implementation of local, state and federal programs which impact air quality or climate change, ~~and~~

~~12)13)~~ working jointly with public and private partners to effectuate the design, development and deployment of clean, renewable energy to supply the greater electricity needs of Southern California, as needed to meet the national, health-based, clean air standards.

B. Ensure compliance through a program that includes:

- 1) Monitoring for the presence/identification and/or quantification of air pollutants in the ambient air, including any new U.S. EPA requirements for near-freeway monitoring of NO<sub>2</sub>, and stationary source-oriented monitoring for SO<sub>2</sub>, NO<sub>2</sub> and lead,
- 2) inventorying, monitoring and testing air pollutant emissions from stationary sources,
- 3) processing permit applications for stationary sources in a manner to:
  - a) prioritize processing of permit applications for installation and implementation of air pollution control measures to reduce emissions,
  - b) expeditiously issue all permits for equipment complying with all applicable air quality rules and regulations,
  - c) ensure all applicable requirements for public notification and public comments are met prior to permit issuance,
  - d) impose enforceable conditions on permits to ensure continued compliance and compliance with all environmental and public health rules and regulations, and

- e) streamline application processing and expeditiously approve or deny (as appropriate) permits, plans and emission reduction credits to improve efficiency and customer service at AQMD.
  - 4) using community-based and/or industry-specific deployment of field personnel for:
    - a) timely compliance determinations and prompt remediation of non-compliance, and
    - b) prompt resolution of community air quality complaints.
  - 5) training field personnel to ensure consistent and fair field enforcement practice and good customer service,
  - 6) implementing programs to inform the public and regulated sources of air quality and regulatory compliance requirements,
  - 7) assisting the regulated sources in identifying and meeting their air quality permitting and compliance needs,
  - 8) implementing programs to better inform local government, agencies and schools regarding compatible land uses, and
  - 9) using civil penalties and criminal referrals strategically to incentivize compliance and to deter non-compliance.
- C. Make substantial progress to develop and implement programs to enable construction and modification of stationary sources in areas where the supply of emission offsets is limited, consistent with AQMD's clean air objectives.
- D. Work with the United States Congress, California Legislature, U.S. Environmental Protection Agency, California Air Resources Board, and other federal, state, regional and local agencies and authorities to obtain a proportionate fair share of funding for essential programs to reduce emissions.
- E. Work with all stakeholders and decision-makers to protect, sustain and augment state and federal funding as well as local implementation and local control, for air quality programs administered by AQMD for public health protection.
- E-F. Continue partnering with utilities, faith communities, and educational groups and institutions to embrace and involve all stakeholders as partners in reducing air pollution by developing and implementing programs that are technologically advanced, more energy efficient and less dependent on polluting fuels, cost-effective, and sensitive to business, environmental, and community interests. Stakeholders include, but are not limited to, local, regional, state and federal

governments, small business owners/operators, other members of the regulated community, environmental and community leaders, students, and residents.

| F.G. Promote programs to reduce mobile source emissions by:

- 1) reducing emissions from on-road and off-road vehicles,
- 2) supporting the increased use of clean-fuel, and other near zero- and zero-emission vehicles and engines,
- 3) assisting employers, local governments, including Clean Cities, and the private sector in reducing mobile source emissions,
- 4) providing guidance and technical assistance to local governments to ensure AB 2766 funds are utilized for cost-effective and quantifiable mobile emission reduction programs,
- 5) working with EPA, CARB, and other federal, state, regional and local government agencies to encourage and support efforts to reduce emissions from primarily federal and state sources, such as ships, trains, planes, and off-road engines. Seek/support legislative amendments necessary to reduce emissions from marine vessels and locomotives, as required by the AQMP to attain clean air standards.
- 6) seeking to obtain additional legal authority over mobile sources, when necessary, to reduce emission control burdens that will otherwise be placed on stationary sources or as necessary to attain federal or state standards,
- 7) developing indirect source programs as authorized by state law to reduce mobile source emissions,
- 8) partnering with state and federal agencies in developing engine and vehicle certification and retrofit verification regulations to maximize criteria, toxic and GHG pollutant emissions benefits,
- 9) achieving maximum emission reductions and cost-leveraging through state programs, such as CARB's Carl Moyer Program, Proposition 1B, and AQIP, and CEC's AB 118 and PIER,
- 10) achieving maximum emission reductions and cost-leveraging through federal programs, especially DOE Clean Cities, DOE American Recovery and Reinvestment Act and EPA Diesel Emission Reduction Act Programs,
- 11) conducting high-emitting vehicle identification program using pre-screening techniques including remote sensing, and offering consumer repair/retirement/replacement assistance, and

~~12) working with the state and Metropolitan Planning Organizations to develop quantification methods and strategies to implement SB 375.~~

G.H. \_\_\_\_\_ Facilitate development of new air quality-enhancing technologies by:

- 1) encouraging public/private partnerships to develop new and innovative technologies,
- 2) reducing financial, bureaucratic, regulatory and technological barriers that limit the use of clean fuels and new lower-emitting technologies,
- 3) promoting development of clean renewable and alternative electrical energy generation technologies,
- 4) supporting projects to reduce emissions from surface coatings and solvents,
- 5) working with all stakeholders to accomplish advanced technology goals, such as use of hydrogen fuel, fuel cells, plug-in hybrids, and reviewing existing regulatory requirements to minimize barriers to the development and commercialization of new lower-emitting technologies,
- 6) conducting demonstration projects in reducing emissions from off-road mobile sources, including construction and railroad-related equipment, and
- 7) conducting feasibility studies related to the removal of emissions generated from freeway systems.

H.I. \_\_\_\_\_ Continue to implement the Chairman's Clean Port Initiative, including taking the following actions:

- 1) adopting AQMD port backstop rules,
- 2) implementing enhanced port / community air monitoring program,
- 3) arranging and participating in port conferences and other actions to coordinate control actions with Asian ports,
- 4) monitoring and assisting with implementation of San Pedro Bay Ports Clean Air Action Plan,
- 5) monitoring and commenting on CEQA / NEPA documents for port projects,
- 6) working with the Ports, CARB and others to incentivize the replacement of older drayage trucks and port equipment with newer, cleaner and alternative fueled technologies, and

- 7) testing and deploying high-performance air pollution filtration systems in classrooms at port community schools, ~~and~~

J. Further develop, demonstrate, incentivize, and promote electric vehicles and plug-in electric vehicles, by

- 1) Hosting public workshops on streamlining and supporting electric vehicle charging infrastructure,
- 2) Securing federal, state and local incentives for end-users to purchase and lease electric vehicles and plug-in vehicles and offset charging infrastructure costs,
- 3) Supporting City and Neighborhood electric vehicles for municipalities, counties and other organizations where the technology has the ability to displace conventional vehicle trips,
- 4) Continuing support for public infrastructure rollout,
- 5) Maintaining efforts to develop and demonstrate medium and heavy-duty plug-in vehicles, and
- 6) Continue collaboration with the SoCalEV Coalition to engage regional support for electric vehicles and plug-in vehicles, infrastructure and policies.

~~H.K.~~ Continue to enhance public health protection by offering additional health services to impacted communities using primarily penalties and settlement funds.

L. Secure maximum levels of funding and promote the priority use of air quality criteria in allocating State bond fund resources for emission reduction projects in Southern California.

II. ENHANCE PUBLIC EDUCATION AND ENSURE EQUITABLE TREATMENT FOR ALL COMMUNITIES

A. Continue to implement AQMD's Environmental Justice policies and programs, and other initiatives directed at equitable treatment for all communities and sensitive populations through:

- 1) individual endeavors and a series of town hall meetings throughout AQMD's four-county region and mobile Board meetings in impacted areas and evaluate additional mechanisms to increase public participation to receive input from the public about air quality related community issues,
- 2) actively seeking to increase the public's participation in, and understanding of, policies under development, including increased translation of materials into multiple languages, and meetings in areas where community members can more easily participate,

- 3) working with community groups to build partnerships on air quality issues, and addressing community-level and resident concerns and issues,
  - 4) distributing incentive funding in a manner that emphasizes communities most impacted by air pollution and low income communities,
  - 5) hosting quarterly meetings of the AQMD Environmental Justice Advisory Group,
  - 6) actively providing comments on feasible methods and technologies to mitigate significant air quality impacts for new CEQA and NEPA projects in environmental justice areas,
  - 7) working with stakeholders to revise AQMD's air quality analysis handbook for CEQA and NEPA documents, and
  - 8) continuing to implement Board-adopted Environmental Justice initiatives and work plan commitments, including Clean Communities Plan.
- B. Continue to enhance AQMD's website as a two-way communication tool with up-to-date data, technical information, advice, and educational videos and literature for communities and business interests. Implement a web-based communication tool, including database management, for electronic outreach and education.
- C. Continue to promote and expand the AQMD's School Air Quality Flag program as one tool for protecting children's health, as well as educating students about air quality.
- D. Continue proactive media relations activities to increase media and public awareness of AQMD's programs and policies that support community/business efforts that create awareness and educate the public and business about the harmful impacts of air pollution from mobile sources and other forms of emissions on public health, animals, wildlife, and the environment as a whole.
- E. Enhance green job workforce via the education/training element of Chairman's Helping Hand Initiative.
- F. Host five Senior Environmental Conferences that will provide area seniors with information on air quality and healthy living.

### III. OPERATE EFFICIENTLY AND IN A MANNER SENSITIVE TO BUSINESSES, THE PUBLIC AND AQMD STAFF

- A. Administer an efficient and cost-effective organization to expeditiously clean the air while being sensitive to the operational needs of the AQMD's businesses by seeking innovative partnerships and programs to ensure compliance and minimize compliance costs.
- B. Develop a sound budget, reduce fee complexity, adjust fee schedules to recover AQMD's costs, as appropriate, and target agency resources to environmental and economic priorities.
- C. Continue to investigate technology and other means to streamline all agency functions to enhance efficiency, while maintaining effective and responsive programs that meet public, business and AQMD needs.
- D. Administer effective human resources and development programs that ensure an open and fair recruitment and selection system and, in accordance with existing law, continue AQMD's equal employment opportunity efforts to ensure diverse applicant pools in recruitments for open positions.
- E. Review the skills, management, and deployment of current staff to enhance customer service and continue to seek ways to increase efficiency and productivity.
- F. Continue AQMD's procurement processes to ensure that minority-, woman-, and disabled veteran-owned enterprises are fairly represented in accordance with existing law.
- G. Develop a workforce recruitment and retention plan.
- H. Develop a succession planning model, including mentoring by senior employees, in order to retain talent and ensure a transfer of technical expertise between staff.
- I. Enhance local, state and federal agency coordination and develop data transfer/submittal protocol to ensure that the latest inventories be used for National Air Toxics Assessment purposes.

### IV. OPERATE A "CLEAN AND GREEN" PROGRAM TO PROMOTE AND SUPPORT SUSTAINABLE OPERATIONAL STRATEGIES

- A. Continue to explore strategies for recognizing and implementing technologies and policies which reduce criteria pollutants, toxics, greenhouse gases and petroleum dependence, such as promoting incentives for plug-in hybrid electric, electric and natural gas vehicles, at the local, regional, state and federal levels.

- B. To further reduce global warming and smog-forming emissions, launch a Green Building Initiative to encourage both new and existing commercial/industrial buildings to utilize solar installation and to reduce energy, water use, vehicle miles traveled, and overall adverse impacts on the environment.
- C. Refine goals and metrics to monitor progress toward sustainable internal operations. Continue a task force of internal staff to develop recommendations for "re-greening" the AQMD headquarters building, and implement the AQMD Green Policy.
- D. Partner and collaborate with other local, regional, state and federal organizations to determine and implement "best green practices" to exemplify and showcase clean and green sustainable operations.

///

BOARD MEETING DATE: February 4, 2011

AGENDA NO. 28

**PROPOSAL:** Amend Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills

**SYNOPSIS:** The proposed amendments will incorporate provisions to make the rule consistent with a CARB statewide rule for landfills, add NESHAP requirements which are already in effect, make minor corrections for clarity and amendments to reduce recordkeeping and reporting requirements to multiple agencies.

**COMMITTEE:** Stationary Source, July 23, 2010, January 21, 2011, Reviewed

**RECOMMENDED ACTION:**

Adopt the attached resolution:

1. Certifying the Notice of Exemption for the proposed amendments to Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills; and
2. Amending Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills.

Barry R. Wallerstein, D.Env.  
Executive Officer

EC:LT:JW:DO:DEM

---

**Background**

The originally adopted Rule 1150.1 (April 5, 1985) and two subsequent administrative amendments in April 10, 1998 and March 17, 2000 were focused on controlling the non-greenhouse gas components of landfill gas because of the contribution to criteria pollutant formation from volatile organic compound (VOC) emissions, potential for public nuisance from odorous compounds, and potential detriment to public health from toxic air contaminant (TAC) emissions. Recent legislative activity has focused on controlling greenhouse gases, including the approval of the California Global Warming Solutions Act of 2006. Because CARB has adopted an early action measure under AB 32 aimed at controlling methane emissions from landfills, the primary purpose of this amendment is to incorporate the state requirements into the rule. No new controls will be

required for landfills in the District, but there are changes needed to Rule 1150.1 to align it with some state requirements.

### **Proposal**

The proposed amendment is intended to incorporate the requirements of the CARB AB 32 early action measure for municipal solid waste (MSW) landfills (Title 17, CCR, Article 4, and Subarticle 6). The proposed amendment would also improve enforceability and streamline requirements by clarifying operation standards for control devices already installed, and eliminate duplicate recordkeeping and redundant reporting.

Elements of the proposed amendment fall into four categories: (1) incorporating CARB emission control requirements for Gas Collection and Control Systems (GCCS); (2) updating operational standards for control systems, including wellhead pressure gauge monitoring, to improve enforceability; (3) streamlining recordkeeping and reporting requirements; and, (4) administrative changes.

### **AQMP and Legal Mandates**

The California Health and Safety Code requires the AQMD to adopt an Air Quality Management Plan (AQMP) to meet state and federal ambient air quality standards within the South Coast Air Basin. In addition, the California Health and Safety Code requires the AQMD to adopt rules and regulations that carry out the objectives of the AQMP. Although the goal of Control Measure MOB-07 of the 2007 AQMP is to achieve concurrent reductions from global warming strategies and could apply to Rule 1150.1, the proposed amendment does not result in additional emission reductions; however, the amendment is consistent with AQMP objectives.

### **California Environmental Quality Act**

Staff has reviewed the proposed amendments to Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste landfills, pursuant to CEQA Guidelines § 15002(k)(1) - Three Step Process, and has determined that the proposed amendments are exempt from CEQA pursuant to CEQA Guidelines § 15061(b)(3) – Review for Exemption. The proposed amendments are covered by the general rule that CEQA applies only to projects which may have a significant effect on the environment. Staff has reviewed the proposed amendments and has determined that it can be seen with certainty that there is no possibility that proposed amendments to Rule 1150.1 will have a significant impact on air quality or other environmental areas. Therefore, the proposed project is exempt from CEQA. If approved by the Board, a Notice of Exemption (NOE), prepared for the proposed project pursuant to CEQA Guidelines §15062 – Notice of Exemption, will be mailed to the county clerks of Los Angeles, Orange, Riverside, and San Bernardino counties.

**Socioeconomic Analysis**

The proposed amendment to Rule 1150.1 does not significantly affect air quality or emissions limitations, and does not impose new controls, and therefore a socioeconomic analysis pursuant to California Health and Safety Code Section 40440.8 is not required.

**Resource Impacts**

Implementation of the proposed amendment will have limited impacts on staff and fiscal resources.

**ATTACHMENT A**  
**SUMMARY OF PROPOSED AMENDMENT**

**Proposed Amended Rule 1150.1 – Control of Gaseous Emissions from  
Municipal Solid Waste (MSW) Landfills**

- ***Incorporate CARB Emission Control Requirements***

Add methane emissions control and lower the monitoring emissions limit for landfill control systems from 50 ppmv to 25 ppmv to achieve equivalency to the CARB regulation for MSW landfills.

- ***Update Operational Standards for Control Systems***

Incorporate CARB regulatory standards to require control devices (e.g., compressors, internal combustion engines, and boilers) to be in full operation at all times, unless an alternative is requested and approved. Require that wellheads operate under negative pressure at all times to ensure that landfill gases are not escaping into the atmosphere, and also require enclosed flares and enclosed combustion devices to operate with installed automatic damper, automatic shutdown devices, and flame arrestors.

- ***Streamline Recordkeeping and Reporting Requirements***

Reconcile recordkeeping and reporting content and frequency with the requirements in the CARB regulation to eliminate redundancy and minimize the burden on affected facilities.

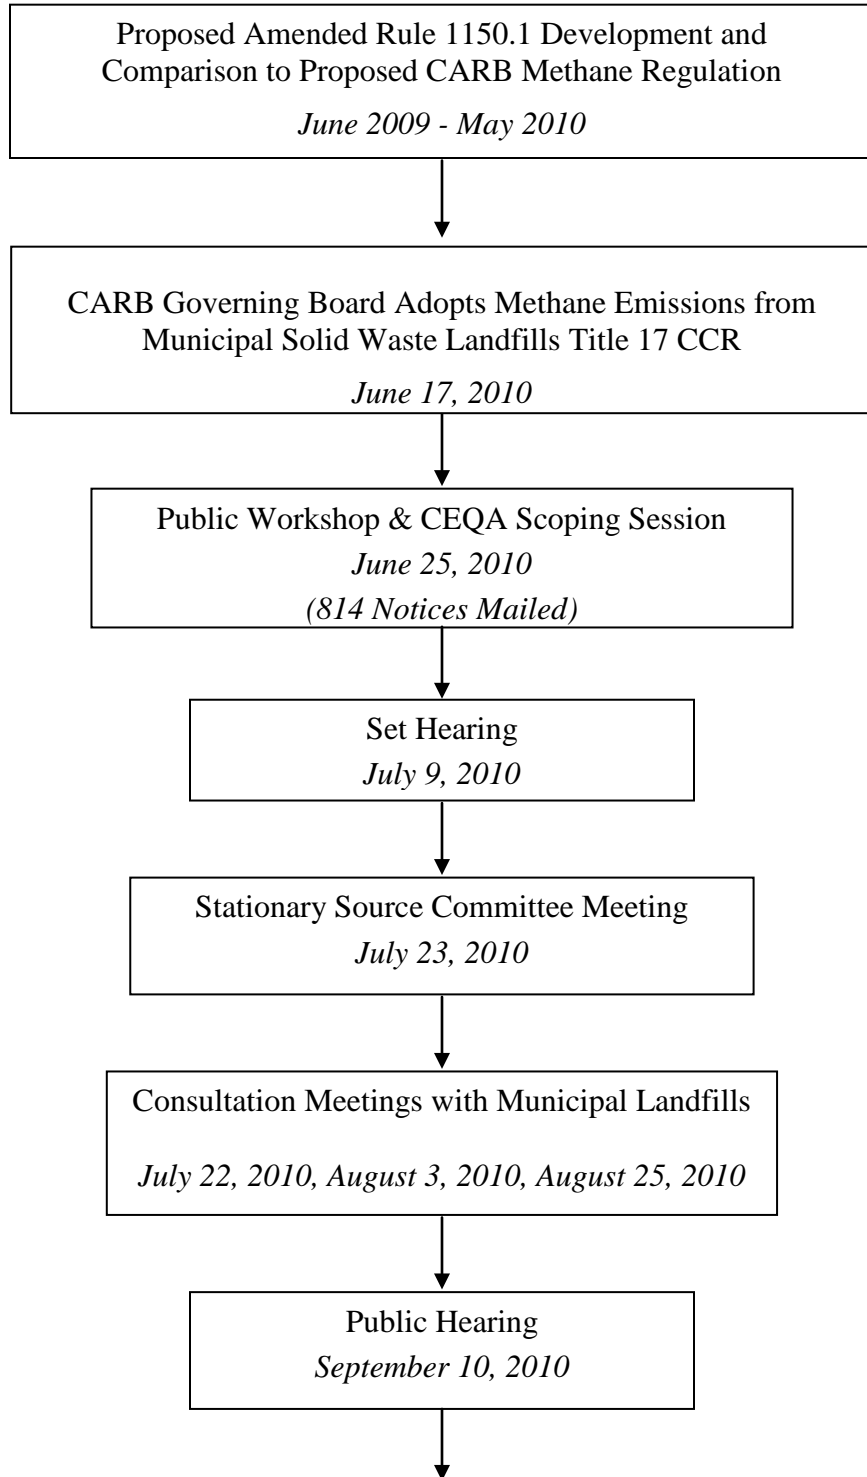

- ***Make Clarifications to Enhance Enforceability***

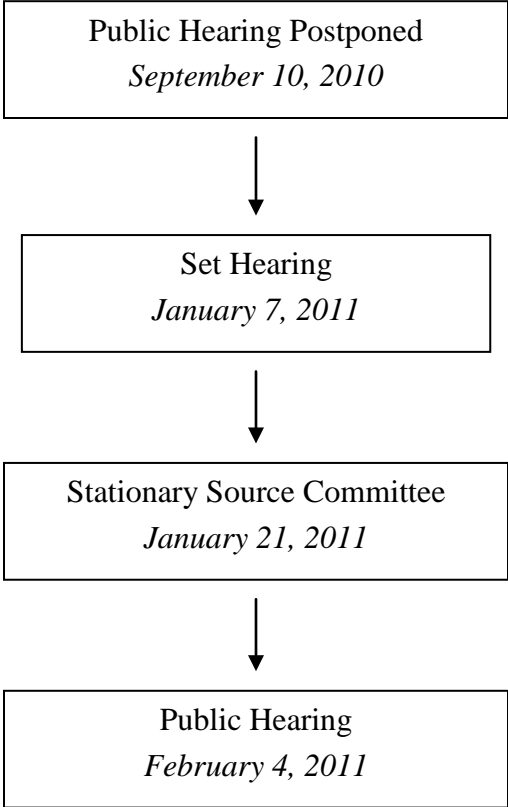

Make minor clarifications and editorial corrections to PAR1150.1 to enhance clarity and enforceability of the rule.

### **RESOLUTION NO. 11 -**

**A Resolution of the South Coast Air Quality Management District Board certifying the Notice of Exemption for the proposed amendments to Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills**

**A Resolution of the Governing Board of the South Coast Air Quality Management District Amending Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills**

**WHEREAS**, the South Coast Air Quality Management District Governing Board finds and determines that the proposed amendment to Rule 1150.1 is considered a "project" pursuant to the California Environmental Quality Act (CEQA); however, South Coast Air Quality Management District staff reviewed the proposed project and because it can be seen with certainty that there is no possibility that the proposed project in question has the potential to have a significant adverse effect on the environment, it was determined that the proposed project is exempt from CEQA pursuant to CEQA Guidelines §15061(b)(3) – Review for Exemption; and

**WHEREAS**, the AQMD has had its regulatory program certified pursuant to Public Resources Code Section 21080.5 and has conducted CEQA review and analysis pursuant to such program (AQMD Rule 110); and

**WHEREAS**, AQMD staff has prepared a Notice of Exemption (NOE) for Rule 1150.1, as proposed to be amended, that is completed in compliance with CEQA Guidelines §15002 (k)(1) - Three Step Process and §15061(b)(3) – Review for Exemption (General Rule Exemption); and

**WHEREAS**, a Mitigation Monitoring Plan pursuant to Public Resources Code Section 21081.6, has not been prepared since no significant impact and no feasible mitigation measures have been identified; and

**WHEREAS**, the AQMD Governing Board voting on Proposed Amended Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, has reviewed and considered the NOE prior to its certification; and

**WHEREAS**, the AQMD Governing Board has determined that a need exists to amend Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, to improve consistency with CARB's Regulation to Reduce Methane Emissions from Municipal Solid Waste Landfills in terms of monitoring limits and recording and reporting requirements and to implement the requirements of 40 CFR, Part 63 Subpart AAAA – National Emissions Standards for Hazardous Air Pollutants: Municipal Solid Waste Landfills; and

**WHEREAS**, the AQMD Governing Board obtains its authority to adopt, amend, or rescind rules and regulations from Sections 40000, 40001, 40440, 40500, 40501.3, 40506, 40510, 40510.5, 40512, 40522, 40522.5, 40523, 40702, 40725 through 40728, and 44380 of the California Health and Safety Code; and

**WHEREAS**, the AQMD Governing Board has determined that Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, as proposed to be amended, is written or displayed so that its meaning can be easily understood by the persons directly affected by it; and

**WHEREAS**, the AQMD Governing Board has determined that Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, as proposed to be amended, is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations; and

**WHEREAS**, the AQMD Governing Board has determined that Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills as proposed to be amended, does not impose the same requirements as any existing state or federal regulation, and the proposed amended rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD; and

**WHEREAS**, the AQMD Governing Board, in amending and adopting this regulation, references the following statutes which the District hereby implements, interprets, or makes specific: California Health and Safety Code Sections 40440(a) (rules to carry out the Air Quality Management Plan), 40440(c) (cost effectiveness), 41508, 41700, and Federal Clean Air Act Section 172(c)(1) (RACT); and

**WHEREAS**, the AQMD Governing Board finds that the proposed amendment to Rule 1150.1 does not significantly affect air quality or emissions limitations, and does not impose new controls, and therefore a socioeconomic analysis pursuant to California Health and Safety Code Section 40440.8, 40728.5, or 40728.5 is not required; and

**WHEREAS**, a public hearing has been properly noticed in accordance with the provisions of Health and Safety Code Section 40725; and

**WHEREAS**, the AQMD Governing Board has held a public hearing in accordance with all the provisions of law; and

**WHEREAS**, the AQMD specifies the Manager of Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of this proposed amendment is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

**WHEREAS**, at the conclusion of the public hearing, the AQMD Board may make other amendments to Proposed Amended Rule 1150.1 which are justified by the evidence presented, or may decline the amendments or adoption; and

**NOW, THEREFORE, BE IT RESOLVED**, that the South Coast Air Quality Management District Board does hereby certify the Notice of Exemption for Rule 1150.1, as proposed to be amended, is completed in compliance with CEQA Guidelines §15002 (k)(1) - Three Step Process and §15061(b)(3) – Review for Exemption (General Rule Exemption). This information was presented to the Governing Board, whose members reviewed, considered, and approved the information therein prior to acting on the proposed amendments.

**BE IT FURTHER RESOLVED**, that the AQMD Governing Board does hereby amend, pursuant to the authority granted by law, Rule 1150.1 – Control of Gaseous Emissions from Municipal Solid Waste Landfills, as set forth in the attached and incorporated herein by this reference.

**The reference numbers in the left hand margin of the rule refer to sections of  
40 CFR, Part 60, Subpart WWW (NSPS)**

**PROPOSED AMENDED RULE 1150.1. CONTROL OF GASEOUS EMISSIONS  
FROM MUNICIPAL SOLID WASTE LANDFILLS**

(a) Purpose

The purpose of this rule is ~~intended to limit~~reduce non-methane organic compounds (NMOC), volatile organic compound (VOC) and toxic air contaminant (TAC) emissions from Municipal Solid Waste (MSW) ~~landfill emissions~~landfills to prevent public nuisance and possible detriment to public health caused by exposure to such emissions. This rule also reduces methane emissions, a greenhouse gas.

(b) Applicability

This rule ~~applies~~is applicable to ~~each~~any owner or operator of an active ~~and~~or inactive MSW landfill.

(c) Definitions

~~Terms used but not defined in~~For the purpose of this rule ~~have the meaning given them in,~~ the following definitions shall apply:

- (1) ACTIVE COLLECTION SYSTEM as defined by 40 CFR, ~~Part 60, Section 60.751 (Definitions):~~means a gas collection system that uses gas mover equipment.
- (1) ~~ADMINISTRATOR means the Executive Officer of the South Coast Air Quality Management District (District).~~
- (2) ACTIVE MSW LANDFILL means ~~an MSW a~~ Municipal Solid Waste landfill that has received solid waste on or after November 8, 1987.
- (3) BACKGROUND means the local ambient concentration of total organic compounds (TOC) measured as methane determined by holding the instrument probe approximately 5 to 6 feet above the landfill surface.
- (4) CLOSED MSW LANDFILL means a ~~disposal facility~~Municipal Solid Waste landfill that has ceased accepting solid waste for disposal and was ~~closed~~conducted in accordance with all applicable federal, state and local statutes, regulations, and ordinances in effect at the time of closure.
- (5) COMPONENT LEAK means the concentration of methane measured one half an inch or less from a component source that exceeds 500 parts per

million by volume (ppmv), other than non-repeatable, momentary readings.

- (6) COMPONENT means any equipment that is part of the gas collection system or gas control system and that contains landfill gas including, but not limited to, wells, pipes, flanges, fittings, valves, flame arresters, knock-out drums, sampling pots, blowers, compressors, or connectors.
- (7) CONSTRUCTION AND DEMOLITION WASTE means waste building materials, packing and rubble resulting from construction, remodeling, repair and demolition operations on pavements, houses, commercial building and other structures.
- (8) CONTINUOUS OPERATION means that the gas collection and gas control systems are operated continuously, the existing gas collection wells are operating under vacuum while maintaining landfill gas flow, and the collected landfill gas is processed by a gas control system 24 hours per day.
- (9) DESTRUCTION EFFICIENCY means a measure of the ability of a gas control device to combust, transform, or otherwise prevent emissions of methane from entering the atmosphere.
- (10) ENCLOSED COMBUSTOR means an enclosed flare, steam generating boiler, internal combustion engine or gas turbine.
- (11) ENERGY RECOVERY DEVICE means any combustion device that uses landfill gas to recover energy in the form of steam or electricity including, but not limited to gas turbines, internal combustion engines, boilers, and boiler-to-steam turbine systems.
- (12) EXECUTIVE OFFICER means the Executive Officer or designee of the South Coast Air Quality Management District
- (13) GAS COLLECTION SYSTEM means any system that employs various gas collection wells and connected piping and mechanical blowers, fans, pumps or compressors to create a pressure gradient and actively extract landfill gases.
- (14) GAS CONTROL DEVICE means any device used to dispose of or treat collected landfill gas including, but not limited to, enclosed flares, open flares, internal combustion engines, boilers and boiler-to-steam systems, process heaters, fuel cells, and gas turbines.
- (15) GAS CONTROL SYSTEM means any system that disposes of or treats collected landfill gas by one or more of the following means: combustion,

gas treatment for subsequent sale, or sale for processing offsite, including for transportation fuel and injection into natural gas pipelines.

- (16) INACTIVE MSW LANDFILL means ~~an MSW~~ a Municipal Solid Waste landfill ~~where~~that has not accepted solid waste ~~had been disposed of before~~after November 8, 1987 and ~~no more~~ subsequently no further solid waste disposal activity has been conducted within the disposal facility.
- ~~(6)~~(17) LANDFILL GAS means any untreated, raw gas derived through a natural process from the decomposition of organic waste deposited in a MSW landfill from the evolution of volatile species in the waste, or from chemical reactions of substances in the waste.
- (18) LANDFILL SURFACE means the area of the landfill under which decomposable solid waste has been placed, excluding the working face.
- (19) MUNICIPAL SOLID WASTE or MSW LANDFILL means an entire disposal facility in a contiguous geographical space where solid waste is placed in or on land. An MSW landfill may be ~~either active or~~ inactive or closed.
- ~~(7)~~(20) NON-DECOMPOSABLE SOLID WASTE means materials that do not degrade biologically to form landfill gases. Examples include, but are not limited to, earth, rock, concrete, asphalt, paving fragments, clay products, inert slag, asbestos-containing waste, and demolition material containing minor amounts (less than 10 percent by volume) of wood and metals. Materials that do not meet this definition are considered decomposable solid waste.
- (21) NON-REPEATABLE MOMENTARY READINGS means indications of the presence of methane, total organic compounds, or toxic air contaminants, which persist for less than five seconds and do not recur when the sampling probe of a portable gas detector is placed in the same location.
- (22) OPERATOR means the person:
- (A) Operating the MSW landfill, or
  - (B) Operating the MSW landfill gas collection or gas control system.
- ~~(8)~~23) OWNER means the person holding ~~t~~title to the property.
- (24) PASSIVE COLLECTION SYSTEM means a gas collection system that solely uses positive pressure within the landfill to move the gas rather than using gas mover equipment, or uses the natural pressure gradient

established between the encapsulated waste and the atmosphere to move the gas through the collection system.

- (25) PERIMETER means the outer boundary of the entire waste disposal property.
- (1026) PROFESSIONAL ENGINEER means an engineer holding a valid certificate issued by the State of California Board of Registration for Professional Engineers and Land Surveyors or a state offering reciprocity with California.
- (41(27) SOLID WASTE means all decomposable and non-decomposable solid, semisolid and liquid wastes including garbage, trash, refuse, paper, rubbish, ashes, industrial waste, manure, vegetable or animal solid and semisolid waste. Solid waste also includes any material meeting the definition of solid waste in 40 CFR 60.751 (as last amended by 64 Fed. Reg. 9262, Feb. 24, 1999), as incorporated by reference herein.
- (28) SUBSURFACE GAS MIGRATION means underground landfill gases that are detected at any point on the perimeter, pursuant to California Code of Regulation Title 27, section 20921.
- (29) TOXIC AIR CONTAMINANT (TAC) means an air contaminant which has been identified as a hazardous air pollutant pursuant to Section 7412 of Title 42 of the United States Code; or has been identified as a TAC by the Air Resources Board pursuant to Health and Safety Code Section 39655 through 39662, or which may cause or contribute to an increase in mortality or an increase in serious illness, or potential hazard to human health.
- (30) WASTE IN PLACE means the total amount of solid waste placed in an MSW landfill, estimated in tons. The refuse density is assumed to be 1,300 pounds per cubic yard and the decomposable fraction is assumed to be 70 percent by weight.
- (31) WELL RAISING means a MSW landfill activity where an existing gas collection well is temporarily disconnected from a vacuum source; and the non-perforated pipe attached to the well is extended vertically to allow the addition of a new layer of solid waste or the final cover or is extended horizontally to allow extension of an existing layer of solid waste or cover material. The extended pipe is then reconnected to vacuum source in order to continue collecting gases from that well.

(32) WORKING FACE means that open area where solid waste is deposited daily and compacted with landfill equipment.

(d) Active Landfill Design and Operation Requirements

The MSW landfill owner or operator shall comply with the provisions of paragraphs (d)(1) through (d)(~~4~~20):

(1) If a valid Permit to Construct or Permit to Operate for the gas collection and gas control systems that meets the requirements of subparagraphs (d)(1)(A) through (d)(1)(C) has not been issued by the District, ~~by the adoption date of this rule, owner or operator shall~~ submit a site-specific gas collection and control system~~gas collection and gas control systems~~ design plan. The design plan shall be prepared by a Professional Engineer and ~~sent~~submitted to the Executive Officer with applications for Permits to Construct or Permits to Operate ~~no later than one year after for~~ the ~~adoption of this rule, gas collection and control system~~gas collection and gas control systems. The Executive Officer shall review the ~~gas collection and control system~~gas collection and gas control systems design and either approve it, disapprove it, or request that additional information be submitted. An approved design plan may be revised and submitted for review and approval by the Executive Officer. Revisions shall be prepared by a Professional Engineer.

~~752(b)(2)(i)  
752(b)(2)(i)(D)~~

(A) The ~~gas collection and control system~~gas collection and gas control systems shall be designed to handle the maximum expected gas flow rate from the entire area of the MSW landfill that requires control, to minimize migration of subsurface gas to comply with paragraph (d)(~~4~~10), and to collect gas at an extraction rate to comply with paragraphs (d)(~~5~~11) and (d)(~~6~~12). For the purposes of calculating the maximum expected gas generation flow rate from the landfill, the 2006 Intergovernmental Panel on Climate Change Guidelines for National Greenhouse Gas Inventories, Chapter 3 (IPCC Model), using landfill gas capture factor of 75 percent shall be used. one of the equations in 40 CFR, Part 60, Section 60.755(a)(1) shall be used. Another Any other method ~~may be~~ used to determine the maximum gas generation flow rate, ~~if the method has been~~must be submitted in writing and approved by the Executive Officer, prior to use.

~~752(b)(2)(ii)(A)(1), (3), (4)  
755(a)(1)  
758(b)(1)(i)~~

(B) If a valid Permit to Construct or Permit to Operate has not been issued by the District for the gas collection and gas control systems, the gas collection and gas control systems design plan shall either conform with specifications for active collection systems in 40 CFR, Part 60, Section 60.759 or include a demonstration to the Executive Officer's satisfaction of the sufficiency of the alternative provisions describing the design and operation of the gas collection and gas control systems, the operating parameters that would indicate proper performance, and appropriate monitoring procedures. Alternatives to this rule shall be submitted as specified in subdivision (i).

~~752(b)(2)(i)(C)~~  
~~756(e)~~

(C) The design plan shall provide for the control of collected MSW landfill emissions through the use of ~~a~~-gas collection and gas control systems meeting the applicable requirements in clauses (d)(1)(C)(i), (d)(1)(C)(ii), (d)(1)(C)(iii), and (d)(1)(C)(~~iv~~); or provide for the collection and subsequent sale of collected MSW landfill emissions as specified in clause (d)(1)(C)(v).

~~752(b)(2)(iii)~~

(i) Route all ~~the~~ collected landfill gas to a gas control system designed and to be operated ~~to either~~ continuously to reduce methane by at least 99 percent by weight and reduce NMOC by at least 98 percent by weight or reduce the outlet NMOC concentration to less than 20 parts per million by volume (ppmv), dry basis as hexane at 3 percent oxygen. The required reduction efficiency or ppmv shall be established by an initial source test, required under 40 CFR, Part 60, Section 60.8 and annually thereafter using the test methods specified in paragraph (j)(1). The annual source test shall be conducted no later than 45 days after the anniversary date of the initial source test.

~~(ii)~~ If an enclosed flare is used as the gas control device, the following requirements shall be met:

(I) The enclosed flare shall achieve a methane destruction efficiency of at least 99 percent by weight.

(II) The enclosed flare shall be equipped with an automatic damper, an automatic shutdown device, a

- flame arrestor, and a continuous recording temperature sensor.
- (III) During restart or startup, an enclosed flare shall have sufficient flow of propane or commercial natural gas to the burners to prevent unburned collected methane from being emitted to the atmosphere.
- (IV) The enclosed flare shall be operated within the parameter ranges established during the initial or the most recent source test. The operating parameters to be monitored are specified in paragraph (e)(7).
- (iii) If an open flare is used as the gas control device, the following requirements shall be met:
- (I) An open flare installed and operated prior to August 1, 2008 may operate until January 1, 2018.
- (II) Operation of an open flare on or after January 1, 2018 may be allowed if the owner or operator can demonstrate to the Executive Officer that the landfill gas heat input capacity is less than 3.0 MMBtu/hr and is insufficient to support the continuous operation of an enclosed flare or other gas control device.
- (III) The owner or operator seeking to temporarily operate an open flare during the maintenance or repair of a gas control system or while waiting for the installation on an enclosed flare or to offset gas mitigation issues must submit a written request to the Executive Officer and operate an open flare only after approval.
- (iv) If a gas control device is an enclosed combustor other than a flare and is used as a gas control device, the following requirements shall be met:
- (I) The gas control device shall achieve a methane destruction efficiency of at least 99 percent by weight. Lean burn combustion engines shall reduce

the outlet methane concentration to less than 3,000 ppmv, dry basis, corrected to 15 percent oxygen.

(III) If a boiler or process heater is used as the gas control device, the landfill gas stream shall be introduced into the flame zone. Where the landfill gas is the primary fuel for the boiler or process heater, introduction of the landfill gas stream into the flame zone is not required.

(HIII) The gas control device shall be operated within the operating parameter ranges established during the initial or most recent compliant source test. The operating parameters to be monitored are specified underin paragraph (e)(~~67~~).

(iiy) Route the ~~collected~~collection gas to a treatment system that processes the ~~collected~~collection gas for subsequent sale or use. All emissions from any atmospheric vent from the gas treatment system shall be subject to ~~the~~ requirements of clause (d)(1)(C<sub>-</sub>)(i).

(2) ~~Install~~New and Active MSW Landfills shall install and operate the gas collection and gas control systems no later than 18 months after the submittal of the design plan.

752(b)(2)(ii)

(3) Any owner or operator of existing gas collection and gas control systems who modifies those systems to meet the requirements of this rule shall submit for approval to the Executive Officer an amendment of the existing design plan to include any necessary updates or addenda. Design plan amendments shall be prepared by a professional engineer.

(4) The owner or operator of a closed or inactive landfill shall install and operate the gas collection and gas control systems no later than 30 months after the approval of the design plan.

(5) The owner or operator of an active MSW Landfill shall identify in their design plan the areas of the landfill that are closed or inactive.

(6) Any area of the landfill that contains asbestos-containing waste or non-decomposable solid waste may be excluded from collection provided that the owner or operator submits documentation to the Executive Officer regarding the nature of the material, and the date of its deposit in the area. This documentation may be included as part of the design plan.

(7) The design plan shall include a description of potential mitigation measures to be used to prevent the release of methane or other pollutants into the atmosphere during the installation or preparation of wells, piping, or other related components during repairs or the temporary shutdown of the gas collection system components; or to be used when solid waste is excavated and moved.

(8) The gas collection device and gas control systems shall be operated, maintained and expanded in accordance with the procedures and schedules set forth in the approved design plan.

(39) If the District has not issued prior written approval for subsurface refuse boundary sampling probes, the owner or operator shall design and install subsurface refuse boundary sampling probes as specified in Section 1.1 Attachment A, to determine whether landfill gas migration exists. Installation of the refuse boundary probes shall be no later than 18 months after the submittal of the gas collection and gas control systems design plan as specified in paragraph (d)(1).

(410) Operate the gas collection system to prevent the concentration of TOC measured as methane from exceeding five percent by volume in the subsurface refuse boundary sampling probes constructed for the purposes of detecting lateral migration of landfill gas away from the waste mass, as determined from collected samples.

(511) Operate the gas collection system to prevent the concentration of TOC measured as methane from exceeding 5025 ppmv as determined by integrated samples taken on numbered 50,000 square foot landfill grids.

~~(6)~~(12) Operate the gas collection system to prevent the concentration of TOC measured as methane from exceeding 500 ppmv above background as determined by instantaneous monitoring at any location on the landfill, except at the outlet of any gas control device.

753(d)

~~(7)~~(13) Operate the gas collection and gas control systems so that there are no leaks that exceed 500 ppmv TOC measured as methane at any component under positive pressure. Any component leak exceeding 500 ppmv must be tagged and repaired within 10 calendar days from the time of the first exceedance.

753(e)

(14) Operate the gas ~~control~~-collection and gas control systems ~~or treatment system~~ at all times ~~when the collected gas is routed to the system for landfills with an Active Collection System.~~ In the event the gas collection

~~, treatment or gas control systems is are~~ inoperable, the ~~gas conveying active collection~~ systems shall be shut down and all valves in the ~~gas collection, treatment and gas control systems~~ contributing to venting of the gas to the atmosphere shall be closed no later than one hour after such breakdown or no later than one hour after the time the owner or operator knew or reasonably should have known of its occurrence.

~~(8)(15)~~ Operate the ~~gas collection, treatment and gas control systems~~ until all the exemption criteria under subdivision (k) ~~has have~~ been met and the reports specified in subparagraph (f)(2)(D) have been submitted to the Executive Officer.

752(b)(2)(v)

~~(9)(16)~~ Operate all Wellheads so the gauge pressure is under a constant vacuum (negative pressure), except under the following conditions:

~~(A) During wellhead raising: When a new fill is being added or compacted in the immediate vicinity around the well and once installed, while a gas collection well extension is sealed or capped until the raised well is reconnected to vacuum source.~~

~~(B) During repair and temporary shutdown of the gas collection system due to a catastrophic event, such as an earthquake, or to extinguish landfill fires; and as a result of these events, during repair efforts to connect new landfill gas collection system components to the existing gas collection system, and to do required permitted component connection for the gas collection system, and to perform permitted construction activities provided the following requirements are met:~~

~~(i) Any new gas collection system components required to maintain compliance with this subparagraph must be included in the most recent Design Plan pursuant to paragraph (d)(3).~~

~~(ii) Methane and other landfill gas emissions are minimized during shutdown pursuant to subdivision (d).~~

~~(17)~~ Design, install, and operate a wind speed and direction monitoring system with a continuous recorder of the requirements in subparagraphs (d)~~(917)~~(A) and (d)~~(917)~~(B), at a site which is representative of the wind speed and direction in the areas being sampled. The wind velocity shall be recorded throughout the sampling period. The wind direction transmitter

shall be oriented to true north using a compass.—~~The monitor shall be installed according to the criteria set forth in 40 CFR, Part 50.~~

(A) For wind speed use a 3 cup assembly, with a range of 0 to 50 miles per hour, with a threshold of 0.75 mile per hour or less.

(B) For wind direction, use a vane, with a range of 0 to 540 degrees azimuth, with a threshold of plus-minus 2 degrees.

(18) Comply with the requirements of Section 21140 – Final Cover, of California Code of Regulations Title 27, Subchapter 5 – Closure and Post-Closure Maintenance, upon closure of a MSW landfill unit, incorporated herein as Attachment B.

(19) Comply with the requirement of Section 20200 – State Water Resources Conservation Board (SWRCB) Applicability and Classification Criteria of California Code of Regulations Title 27, Article 2 – SWRCB, Waste Classification and Management, with respect to the disposal of liquids and semi-solid waste at Class III landfills, incorporated herein as Attachment C.

(20) Comply with the requirements of National Emissions Standards for Hazardous Air Pollutants (NESHAP) 40 CFR Part 63 Subpart AAAA, as applicable.

(e) Active Landfill Sampling and Monitoring Requirements

The MSW landfill owner or operator shall comply with the provisions of paragraphs (e)(1) through (e)(~~67~~), after installation of the landfill gas control system:

(1) Monitor and collect samples for analysis as specified in Section 1.0, Attachment A, to determine the concentrations of TOC and TAC each month from the subsurface refuse boundary sampling probes, to assure continued compliance. Any measurement of 5 percent TOC by volume or greater shall be recorded as an exceedance and the actions specified in subparagraphs (e)(1)(A) through (e)(1)(C) shall be taken.

(A) The probe shall be identified and the location recorded as specified in Section 1.6, Attachment A.

(B) Adjustments to the vacuum of adjacent wells to increase the gas collection in the vicinity of the probe with the exceedance, shall be made and the probe resampled no later than 10 calendar days after detecting the exceedance.

- (C) If the resampling of the probe shows a second exceedance, additional corrective action shall be taken and the probe shall be resampled again no later than 10 calendar days after the second exceedance. If the resampling shows a third exceedance, it is a violation unless the owner or operator determines that a new or replacement gas collection well is needed. The owner or operator must install and operate the new or replacement well no later than 45 days after detecting the third exceedance.
- (2) Collect monthly integrated samples for analysis as specified in Section 2.0, Attachment A, to determine the concentrations of TOC and TAC from the landfill surface, and to assure continued compliance. Any reading of 5025 ppmv or greater shall be recorded as an exceedance and the actions specified in subparagraphs (e)(2)(A) through (e)(2)(C) shall be taken.
- (A) The grid shall be identified and the location recorded as specified in Section 2.8, Attachment A.
- (B) ~~Cover maintenance or~~ If the sample shows an exceedance, the gas collection equipment and the landfill cover shall be serviced to ensure the exceedance is repaired. If adjustments to the vacuum of adjacent wells are made to increase the gas collection in the vicinity of the grid with the exceedance ~~shall be made and~~ resample the grid ~~resampled~~ no later than 10 calendar days after detecting the exceedance. If measurable precipitation occurs within the 10 calendar days, all ~~resampling resamples~~ and analysis shall comply with Section 2.2.2, Attachment A.
- (C) If the ~~resampling~~ resample of the grid shows a second exceedance, additional corrective action shall be taken and the grid shall be resampled again no later than 10 calendar days after the second exceedance. If the ~~resampling~~ resample shows a third exceedance, it is a violation unless the owner or operator determines that a new or replacement gas collection well is needed. The owner or operator must install and operate the new or replacement well no later than 45 days after detecting the third exceedance.
- (3) ~~Monitor instantaneously~~ Instantaneous surface monitoring as specified in Section 3.0, Attachment A, shall be conducted to determine the concentration of TOC each calendar quarter, to assure continued compliance. Any reading of 500 ppmv TOC or greater other than non-

755(e)  
756(f)

repeatable momentary readings, shall be recorded as an exceedance and the actions specified in subparagraphs (e)(3)(A) through (e)(3)(C) shall be taken. Any closed or inactive MSW landfill that meets the definitions in (c)(4) or (c)(176) and has no ~~monitored exceedances of the observed monitoring readings that exceed~~ 500 ppmv ~~standard in three~~ for the last four consecutive quarterly monitoring periods may, upon approval of the Executive Officer, monitor annually. Any reading of 500 ppmv TOC or more ~~above background~~ detected during the annual monitoring or an SCAQMD compliance inspections inspection that cannot be remediated within 10 days shall result in a return to quarterly monitoring for ~~that~~ the landfill.

- (A) The location of each ~~monitored~~ exceedance shall be clearly marked and identified on a topographic map of the MSW landfill or identified by using a global positioning system and the location recorded as specified in Section 3.4, Attachment A.
- (B) ~~Cover~~ Corrective action must be taken by the owner or the operator, including, but not limited to one or more of the following: cover maintenance or repair, or well vacuum adjustments ~~to the vacuum of adjacent wells to increase the gas collection in the vicinity of each exceedance shall be made and the~~. The location shall be remonitored no later than 10 calendar days after detecting the exceedance.
- (C) If the remonitoring of the location shows a second exceedance, additional corrective action shall be taken and the location shall be remonitored again no later than 10 days after the second exceedance. If the remonitoring shows a third exceedance, it is a violation unless the owner or operator determines that a new or replacement gas collection well is needed. The owner or operator must install and operate the new or replacement well no later than 45 days after detecting the third exceedance.

(4) Wellheads shall each be monitored monthly to determine the gauge pressure. If there is any positive pressure reading, other than as provided in subparagraphs (d)(16)(A) and (d)(16)(B), the owner or operator shall take the following actions:

- (A) Initiate corrective action within 5 calendar days of the positive pressure measurement.

- (B) If the problem cannot be corrected within 15 days of the first positive pressure measurement, the owner or operator must initiate further action, including but not limited to, any necessary expansion of the gas collection system to mitigate any positive pressure readings.
- (C) All corrective actions, including any expansion of the gas collection and gas control systems, must be completed and any new wells must be in operation within 120 days of the date of the first positive pressure measurement.
- (D) Determination of gauge pressure must be determined using a hand-held manometer, magnahelic gauge or other pressure measuring device approved by the Executive Officer. The device must be calibrated and operated in accordance with the manufacturer's specifications.
- ~~(4)~~(5) Collect a monthly landfill gas sample for analysis as specified in Section 4.0, Attachment A, to determine the concentrations of TOC and TAC from the main gas collection header line entering ~~the gas treatment and/or~~any gas control systems.
- ~~(5)~~(6) Collect monthly ambient air samples for analysis as specified in Section 5.0, Attachment A, to determine the concentrations of TOC and TAC from the landfill property boundary.
- ~~(6)~~(7) Monitor the gas collection and gas control systems equipment specified under subparagraphs ~~(e)(6)~~(7)(A), ~~(e)(7)~~(B) and ~~(e)(6)(B)~~(7)(C) in order to comply with subparagraph (d)(1)(C).
- (A) For ~~an enclosed combustor install, calibrate, maintain, combustors and operate enclosed flares, the following equipment must be installed, calibrated, maintained, and operated~~ according to the manufacturer's specifications, ~~the following equipment:~~
- 756(b)
- (i) A temperature monitoring device equipped with a continuous recorder and having an accuracy of plus-minus 1 percent of the temperature being measured expressed in degrees Celsius or Fahrenheit. A temperature monitoring device is not required for boilers or process heaters with design heat input capacity greater than 44 megawatts.
- (ii) At least one gas flow rate measuring device that shall record the flow to the gas control device(s) at least every 15

~~minutes.— Determination of gauge pressure must be determined using a hand-held manometer, magnahelic gauge or other pressure measuring device approved by the Executive Officer. The device must be calibrated and operated in accordance with manufacturer's specification.~~

- (B) ~~For a device other than an enclosed combustor~~ For open flares and other non-combustion systems, demonstrate compliance with subparagraph (d)(1)(C) by providing information satisfactory to the Executive Officer describing the operation of the gas control device, the operating parameters that would indicate proper performance, and appropriate monitoring procedures. Alternatives to this rule shall be submitted as specified in subdivision (i). The Executive Officer may specify additional appropriate monitoring procedures.

(C) All components containing landfill gas that are under positive pressure shall be monitored for leaks on a quarterly basis. Any component leak must first be tagged and then repaired within 10 calendar days. Component leak testing at MSW landfills having landfill gas-to-energy facilities may conduct testing for leaks prior to scheduled maintenance or during planned outage periods.

(f) Active Landfill Recordkeeping and Reporting Requirements

The MSW landfill owner or operator shall keep all records on paper, electronic or in other suitable data formats approved by the Executive Officer, kept up-to-date, readily accessible and maintained for at least a period of 5 years ~~and~~. Such records shall be made available to ~~District staff~~ the Executive Officer upon request. Records older than 2 years may be maintained off-site, if they are retrievable no later than 4 hours after request.

758(a)

- (1) The records required in subparagraphs (f)(1)(A) through (f)(1)(~~HL~~) shall be maintained ~~at~~ and be accessible by the facility.

(A) For the life of the gas control ~~equipment~~ system, as measured during the initial source test or compliance determination:

758(b)

- (i) The gas control device vendor specifications.  
 (ii) The maximum expected gas generation flow rate as calculated ~~in~~ pursuant to subparagraph (d)(1)(A).

- (iii) When ~~seeking to demonstrate~~demonstrating compliance with subparagraph (d)(1)(C) through the use of an enclosed combustion device other than a boiler or process heater with a design heat input capacity greater than 44 megawatts:
- (I) The average combustion temperature measured at least every 15 minutes and averaged over the same time period of the source test.
- (II) The reduction of NMOC and the reduction of methane determined as specified in clause (d)(1)(C)(i) achieved by the gas control device.
- (iv) When ~~seeking to demonstrate~~demonstrating compliance with subclause (d)(1)(C)(i)~~(I)~~ through the use of a boiler or process heater of any size: a description of the location at which the collected gas vent stream is introduced into the boiler or process heater ~~over~~and is established during the same time period of the initial or most recent source testing test.
- (v) When demonstrating compliance with subparagraph (d)(1)(A) through the use of a non-enclosed combustion device, the owner or operator shall maintain records of measurement from the initial source test and from each annual performance test as specified in 40 CFR 60.18. If the combustion device is an open flare, the owner or operator shall maintain records of the flare flame monitoring and records of all periods of operation during which the pilot flame of the flare is absent.
- (B) The data required to be recorded under Section 1.6, Attachment A, for subsurface refuse boundary sampling probes and all remedial actions taken for exceedances of the 5 percent TOC standard required in paragraph (d)(~~4~~10) and all actions taken and recorded to comply with Title 27 sec. 20937 (a)(2)(B)(i) through (a)(2)(B)(iv).
- (C) The data required to be recorded under Section 2.8, Attachment A, for integrated samples and all remedial actions taken for

exceedances of the ~~5025~~ ppmv TOC standard required in paragraph (d)(~~511~~).

(D) The data required to be recorded under Section 3.4, Attachment A, for instantaneous monitoring and all remedial actions taken for exceedances of the 500 ppmv TOC standard required in paragraph (d)(~~6~~;12). Instantaneous monitoring exceedances from 200 to 499 ppmv shall also be recorded but remedial action is not required.

758(e)

(E) The data required to be recorded under Section 4.5, Attachment A, for landfill gas samples collected from the main gas collection header line entering the gas treatment and/or gas control systems.

(F) The data required to be recorded under Section 5.7, Attachment A, from ambient air collected at the landfill property boundary.

(G) A description and the duration of all periods when the gas collection, ~~treatment~~ or gas control ~~device~~ system was not operating for a period exceeding one hour and the length of time the system was not operating.

757(f)(3)

(H) During construction that requires exposing solid waste material to the atmosphere, the following records are required:

758(e)

(i) A description of actions taken, the affected area of the MSW Landfill, the reason the actions are required and a list of the landfill gas collection system components affected by actions;

(ii) Construction start and finish dates, projected equipment installation dates, and projected shut down times for individual gas collection system components; and

(iii) A description of the mitigation measures taken to minimize methane emissions and other potential air quality impacts during the construction period.

(I) All records pertaining to solid waste acceptance, solid waste acceptance rate, and the current amount of waste in place.

(J) All records pertaining to non-degradable waste acceptance, including the nature, location, amount, and the deposition for any landfill area excluded from the gas collection system.

(K) All records of positive wellhead gauge pressure measurements, the date of the measurements, the well identification number, and the corrective action taken.

(L) Continuous records of the equipment operating parameters specified to be monitored under paragraph (e)(~~67~~) as well as records for periods of operation during which the parameter boundaries established during the most recent source test are exceeded.

(i) The following constitute exceedances that shall be recorded:

(I) For enclosed combustors except for boilers and process heaters with design heat input capacity of 44 megawatts (150 million British thermal unit per hour) or greater, all 3-hour periods of operation during which the average combustion temperature was more than 28° C (82° F) below the average combustion temperature during the most recent source test at which compliance with subparagraph (d)(1)(C) was determined.

(II) For boilers or process heaters, whenever there is a change in the location at which the vent stream is introduced into the flame zone as required under clause (f)(1)(A)(iv).

(ii) Records of the indication of flow to the gas control device specified ~~under paragraph in clause~~ (e)(~~67~~)(A)(ii).

(iii) Each owner or operator who uses a boiler or process heater with a design heat input capacity of 44 megawatts or greater to comply with subparagraph (d)(1)(C) shall keep records of all periods of operation of the boiler or process heater. (Examples of such records could include records of steam use, fuel use, or monitoring data collected pursuant to other State, local, Tribal, or Federal regulatory requirements.)

(2) The reports required in subparagraphs (f)(2)(A) through (f)(2)(D) shall be submitted to the Executive Officer ~~(Either paper copy or electronic formats are acceptable).~~

(A) The initial source test report no later than 180 days after start-up and each succeeding complete annual source test report no later

than 45 days after the anniversary date of the initial source test, for all gas control systems required in subparagraph (d)(1)(C).

(B) A report no later than 45 days after the last day of each calendar quarter with the information required in clauses (f)(2)(B)(i) and (f)(2)(B)(ii).

(i) All exceedances of the emission standards required in paragraphs (d)(~~410~~), (d)(~~511~~) and (d)(~~612~~) in the format required under Sections 1.6, 2.8 and 3.4, Attachment A. All exceedances ~~resampling/remonitoring~~ and each corrective action required under paragraphs (e)(1), (e)(2) and (e)(3). If there are no exceedances, submit a letter stating there were no exceedances for that quarter.

(ii) All TAC analyses required in paragraphs (e)(1) through (e)(~~56~~).

(C) ~~Any owner or operator of a MSW landfill which has ceased accepting waste shall submit a~~ closure report to the Executive Officer no later than 30 days after waste acceptance cessation. ~~The report should include the last day solid waste was accepted, the projected date of closure for the MSW Landfill, and the estimated amount of waste-in-place.~~ The Executive Officer may request additional information as may be necessary to verify that permanent closure has taken place in accordance with the requirements of 40 CFR, Part 258, Section 258.60 or the applicable federal, state and local statutes, regulations, and ordinances in effect at the time of closure. If a closure report has been submitted to the Executive Officer, no additional wastes shall be placed into the landfill without filing a notification of modification as described under 40 CFR, Part 60, Section 60.7(a)(4).

757(d)

(D) ~~Any owner or operator of a MSW landfill which has ceased operation of a gas collection or gas control system shall submit a~~ decommissioning report to the Executive Officer 30 days prior to well capping, removal or cessation of operation of the collection, treatment or control equipment. The decommissioning report shall contain all of the items as specified in clauses (f)(2)(D)(i) through (f)(2)(D)(iii):

757(e)

- (i) A copy of the closure report submitted in accordance with subparagraph (f)(2)(C).
- (ii) A copy of the initial source test report demonstrating that the gas collection and gas control systems ~~has~~ have been installed for a minimum of 15 years.
- (iii) All records needed to verify that the landfill meets the exemption criteria under subdivision (k).

(3) An Annual Report shall be submitted by any owner or operator subject to the requirements of this rule. The Annual Report shall cover the period of January 1 through December 31 of each year. Each Annual Report shall be submitted by March 15 of the following year to the District. The Annual Report shall contain the following:

- (A) MSW Landfill name, owner and operator, address, solid waste information system (SWIS) identification number, landfill status (active, closed, inactive) and estimated waste-in-place in tons;
- (B) Total volume of landfill gas collected (reported in standard cubic feet);
- (C) Average composition of the landfill gas collected over the reporting period (reported in percent methane and percent carbon dioxide by volume);
- (D) Gas control device type, year of installation, rating, fuel type, and total amount of landfill gas combusted in each gas control device;
- (E) The date that the gas collection and gas control systems were installed and in full operation;
- (F) The percent methane destruction efficiency of each gas control device;
- (G) Type and amount of supplemental fuels burned with the landfill gas in each device;
- (H) Total volume of landfill gas shipped off-site, the composition of the landfill gas collected (reported in percent methane and percent carbon dioxide by volume), and the recipient of the gas;
- (I) Most recent topographic map of the site showing the areas with final cover and a geomembrane, and areas with final cover without a geomembrane, with corresponding percentages over the landfill surface; and

(J) The records required by paragraph (f)(1) except for records required by subparagraphs (f)(1)(B), (f)(1)(E) and (f)(1)(F).

(4) Any report or information required in paragraph (f)(2) or (f)(3) must be certified by a responsible official that the statements and information in the report are true, accurate, and complete.

(g) Active Landfill Compliance Schedule

The MSW landfill owner or operator shall comply with the active landfill requirements of this rule or ~~submit alternatives to this rule as specified in subdivision (i) no later than 90 days after April 10, 1998. Rule 1150.1 Compliance Plans previously submitted to the District shall remain in effect during the 90 days after April 10, 1998, or until the owner or operator has received an approved alternative Rule 1150.1 Compliance Plan submitted as specified in subdivision (i).~~ An MSW landfill owner or operator that requires one or more alternatives to comply with this rule due to the (date of adoption) rule amendment, shall submit a request for such alternatives as specified in subdivision (i) by April 1, 2011 that demonstrates compliance no later than July 1, 2011, and shall comply with any previously approved Rule 1150.1 Compliance Plan until July 1, 2011 or until the owner or operator has received an approved revised Rule 1150.1 Compliance Plan. On and after July 1, 2011, the MSW landfill owner or operator shall operate pursuant to an approved Rule 1150.1 Compliance Plan or, if plan approval is pending, the revised Rule 1150.1 Compliance Plan submitted on or before April 1, 2011.

(h) Inactive Landfill Requirements

The MSW landfill owner or operator shall comply with either the applicable requirements in paragraphs (h)(1) and (h)(2) or submit alternatives to this rule as specified in subdivision (i).

(1) Inactive landfills that have a landfill gas collection system shall meet all of the active landfill requirements. For those inactive landfills without a gas collection system and determined to need one, meet all of the active landfill requirements, except the gas collection and gas control systems design plan ~~and applications.~~ Applications for permits shall be submitted no later than one year after notification by the Executive Officer.

- (2) Inactive landfills without a gas collection system:
- (A) Upon discovery of TOC measured as methane exceeding ~~500~~ 200 ppmv at any location on the landfill surface, apply mitigation measures such as compaction, additional cover, and/or watering to reduce the emissions to less than ~~500-200~~ ppmv. The procedure used for measurement of TOC shall meet the requirements of Section 3.0, Attachment A.
- (B) Submit the following ~~Data~~data and/or meet the required action in paragraph (h)(1):
- (i) ~~At any time after the adoption of this rule, but not No~~ later than 30 days after the receipt of a request, submit to the Executive Officer a screening questionnaire pursuant to California Air Resources Board Health and Safety Code (H & S) 41805.5.
- (ii) No later than 90 days after the date of a second request, submit to the Executive Officer a solid waste air quality assessment test (SWAT) report pursuant to H & S 41805.5, to determine whether or not a landfill ~~gas collection and control system~~gas collection and gas control systems and/or a subsurface refuse boundary probe sampling system shall be required to be installed.
- (iii) If additional time is needed to provide the information required in clauses (h)(2)(B)(i) and (h)(2)(B)(ii), a written request for an extension may be submitted in writing to the Executive Officer, indicating the amount of time that is needed to obtain such information. Such a request for an extension may be submitted to the Executive Officer no later than 30 days after the receipt of the Executive Officer's requests as specified in clauses (h)(2)(B)(i) and (h)(2)(B)(ii).
- (iv) Upon notification by the Executive Officer that a landfill ~~gas collection and control system~~gas collection and gas control systems and/or a subsurface refuse boundary probe sampling system shall be required, comply with paragraph (h)(1).

## (i) Alternatives:

752(b)(2)(i)(B)

~~Because~~The owner or operator of ~~the many site specific factors involved in the design and operation of a MSW landfill gas systems,~~may request alternatives to the compliance requirements, monitoring requirements, test methods, and test procedures, compliance measures, monitoring, recordkeeping or reporting provisions of this rule ~~may be necessary.~~ All requests for alternatives to the requirements of this rule shall be submitted to the Executive Officer in a Rule 1150.1 Compliance Plan. The Executive Officer shall review the Rule 1150.1 Compliance Plan and either approve it, disapprove it, or request that additional information be submitted. ~~The~~Unless a determination is made by the Executive Officer ~~shall deny the plan unless he determines that~~ the Rule 1150.1 Compliance Plan will provide equivalent levels of emission control and enforceability, as would compliance with the requirements of this rule., the Executive Officer will deny the plan. Criteria that the Executive Officer may use to evaluate requests for alternatives include, but are not limited to: compliance history, documentation, containment of the landfill gas flow rate measured methane concentrations for individual gas collection wells or components, permits, component testing and surface monitoring results, gas collection and control system gas collection and gas control systems operations, maintenance and inspection records, and historical meteorological data. Requests for alternatives may include, but are not limited to, the following:

- (1) Semi-continuous operation of the gas collection and control system gas collection and gas control systems due to insufficient landfill gas flow rates.
- (2) Additional time for leak repairs for landfills having consistent issues related to the procurement and delivery of necessary parts to complete the repairs.
- (3) Alternative wind speed requirements for landfills consistently having wind speed in excess of the limit specified in Sec.2.2.1 of Attachment A.

## (j) Test Methods

## (1) Methods of Analysis

- (A) Either U.S. EPA Reference Method 25 or U.S. EPA Reference Method 18, ~~(inlet only),~~ 40 CFR, Part 60, Appendix A, SCAQMD Method 25.1 or SCAQMD Method 25.3 shall be used to determine the efficiency of the gas control system in reducing NMOC ~~by at~~

754(d)

~~least 98 percent by weight.~~ If using Method 18, the minimum list of compounds to be tested shall be those published in the most recent Compilation of Air Pollutant Emission Factors (AP-42). The equation in subparagraph (j)(1)(B) shall be used to calculate efficiency.

- (B) U.S. EPA Reference Method 25, 40 CFR, Part 60, Appendix A, SCAQMD Method 25.1, or SCAQMD Method 25.3 shall be used to determine the efficiency of the gas control system in reducing the outlet NMOC concentration to less than 20 ppmv, dry basis as hexane at 3 percent oxygen. ~~Until, but not after District Method 25.3 has met equivalency as specified in paragraph (j)(2), U.S. EPA Reference Method 18, 40 CFR, Part 60, Appendix A may be used for this source test. If using Method 18, the minimum list of compounds to be tested shall be those published in the most recent Compilation of Air Pollutant Emission Factors (AP-42).~~ The following equation shall be used to calculate efficiency:

$$\text{Control Efficiency} = (\text{NMOC}_{\text{in}} - \text{NMOC}_{\text{out}}) / (\text{NMOC}_{\text{in}})$$

$$\text{Control Efficiency (\%)} = \frac{(\text{NMOC}_{\text{in}} - \text{NMOC}_{\text{out}})}{(\text{NMOC}_{\text{in}})} \times 100\%$$

where,

NMOC<sub>in</sub> = mass of NMOC entering control device

NMOC<sub>out</sub> = mass of NMOC exiting control device

- (C) Either U.S. EPA Reference Method 25, U.S. EPA Reference Method 18, 40 CFR, Part 60, Appendix A, SCAQMD Method 25.1, SCAQMD Method 25.3, ASTM Method D1945, or ASTM Method D1946 shall be used to determine the efficiency of the gas control system in reducing methane. The equation in subparagraph (j)(1)(D) shall be used to calculate efficiency.
- (D) U.S. EPA Reference Method 25, U.S. EPA Reference Method 18, 40 CFR, Part 60, Appendix A, SCAQMD Method 25.1, SCAQMD Method 25.3, ASTM Method D1945, or ASTM Method D1946 shall be used to determine the efficiency of the gas control system in reducing the outlet methane concentration to less than 20 ppmv,

dry basis as hexane at 3 percent oxygen. The following equation shall be used to calculate efficiency:

$$\text{Control Efficiency (\%)} = \frac{(\text{Methane}_{\text{in}} - \text{Methane}_{\text{out}})}{(\text{Methane}_{\text{in}})} \times 100\%$$

where,

Methane<sub>in</sub> = mass of Methane entering control device

Methane<sub>out</sub> = mass of Methane exiting control device

(2) Equivalent Test Methods

Any other method demonstrated to be equivalent and approved in writing by the Executive Officers of the District, the California Air Resources Board (CARB), and the Regional Administrator of the United States Environmental Protection Agency (U.S. EPA), Region IX, or their designees, may be used to determine compliance with this rule.

(3) Approval for Conducting Test and Analysis

The owner or operator shall use a test laboratory approved under the SCAQMD Laboratory Approval Program for source test methods cited in subdivision (fj). If there is no approved laboratory, then approval of the testing procedures used by the laboratory shall be granted by the Executive Officer on a case-by-case basis based on SCAQMD protocols and procedures. In addition, when more than one source test method or set of source test methods are specified for any testing, the application of these source test methods to a specific set of test conditions is subject to approval by the Executive Officer.

(4) Violation of Test Methods

A violation established by any one of the specific source test methods or set of source test methods shall constitute a violation of this rule.

(k) Exemptions

An MSW landfill may be temporarily exempt from all or any portion of the requirements of this rule if the owner or operator can demonstrate to the Executive Officer that the MSW landfill emissions meet the requirements of paragraphs (k)(1) through (k)(45). temporary exemptions may be independently determined by the Executive Officer, if the MSW landfill emissions meet the requirements of paragraphs (k)(1) through (k)(45). MSW landfills issued temporary exemption

letters by the Executive Officer shall remain exempt, subject to periodic review, provided:

(1) The MSW landfill complies with the requirements of paragraphs (d)(~~410~~), (d)(~~511~~) and (d)(~~612~~).

(2) The MSW landfill emits less than 55 tons per year of NMOC as specified in 40 CFR, Part 60, Section 60.752(b) or, for a closed landfill, as specified in 40 CFR, Part 60, Section 60.752(b)(2)(v)(C).

752(b)

(3) The MSW landfill constitutes ~~an insignificant~~ less than significant health risk. In making this determination the Executive Officer shall consider the listed factors in subparagraphs (k)(3)(A) through (k)(3)(G). Where not specified, in evaluating the cancer risks and hazard ~~indexes~~ indices, the Executive Officer shall be guided by the definitions in District Rule 1401 - New Source Review of Carcinogenic Air Contaminants, and Rule 1402 - Control of Toxic Air Contaminants ~~From~~ from Existing Sources.

(A) The proximity to, and any adverse impacts on, residences, schools, hospitals or other locations or structures which have children, or elderly or sick persons.

(B) The emission migration beyond the landfill property boundary.

(C) The complaint history.

(D) The age and closure date.

(E) The amount and type of waste deposited.

(F) That the emissions of carcinogenic air contaminants, specified in Tables 1 & 2, Attachment A, from the landfill will not result in a maximum individual cancer risk greater than one in one million ( $1 \times 10^{-6}$ ) at any receptor location.

(G) That the emissions of TAC, specified in Tables 1 & 2, Attachment A, from the landfill will not result in a total acute or chronic Hazard Index of greater than 1.

(4) The MSW landfill is in compliance with District Nuisance Rule 402.

(5) The MSW landfill does not generate sufficient gas to support a gas control system. In making this determination, the Executive Officer shall apply the requirements of subparagraphs (k)(5)(A) and (k)(5)(B), and shall only consider temporary exemptions from the requirements of subdivision (d).

(A) If the MSW landfill is closed or inactive and has a landfill gas heat input capacity equal to or greater than 3.0 MMBtu/hr, the owner or

operator must demonstrate to the satisfaction of the Executive Officer that after four consecutive quarterly instantaneous monitoring periods there are no surface methane leaks exceeding 200 ppmv, and submit a waste-in-place report and all instantaneous surface monitoring records from the previous year to the Executive Officer.

(B) If the MSW landfill is active and has 450,000 tons of waste-in-place or greater and a landfill gas heat input capacity greater than or equal to 3.0 MMBTU/hr, the owner or the operator must demonstrate to the satisfaction of the Executive Officer that after four consecutive quarterly instantaneous monitoring periods there are no surface methane leaks exceeding 200 ppmv and re-calculate the heat capacity annually.

Such a temporary exemption shall be reviewed periodically by the Executive Officer, to consider the land use surrounding the landfill and gaseous emissions, and the impact on the public. Depending upon the results of the review, the Executive Officer may extend or terminate the exemption.

(l) Loss of Exemption

If an MSW landfill should have its temporary exemption terminated, the owner or operator shall comply with the active landfill requirements of this rule.

ATTACHMENT A

1.0 SUBSURFACE REFUSE BOUNDARY SAMPLING PROBES

~~Paragraph~~Paragraphs (d)(~~49~~) and (e)(1) Requirements of Rule 1150.1

1.1 Subsurface- Probe Design and Installation

Landfills which are subject to Rule 1150.1 must install and maintain a subsurface refuse boundary probe sampling system of adequate design to determine if gas migration exists for the ultimate purpose of preventing surface emissions. ~~The California Integrated Waste Management Board~~CalRecycle also requires the installation of refuse boundary probes for purposes of detecting and ultimately preventing subsurface migration of landfill gas past the permitted property boundary of the landfill/disposal site as well as the prevention of the accumulation of landfill gas in on-site structures. It is the District’s intent that the subsurface refuse boundary probes required by paragraph (d)(~~39~~) of Rule 1150.1 be designed and installed in such a manner as to comply with the requirements of ~~the California Integrated Waste Management Board~~CalRecycle (whenever possible) and Sections 1.1.1 through 1.1.4.

- 1.1.1 The probes shall be installed within the landfill property line and outside the refuse disposal area.
- 1.1.2 Wherever accessible, the probes shall be located no further than 100 feet from the refuse boundary.
- 1.1.3 The spacing between probes shall be based on the adjacent land use no further than 1320 feet (1/4 mile) from the refuse boundary and shall be determined as follows:

LAND USE	SPACING
Residential/Commercial	100 feet
Public Access	500 feet
Undeveloped Open Space, (No Public Access)	650 feet
Landfill with Liners	1000 feet

1.1.4 Each probe shall be capped, sealed, have a sampling valve and be of multiple-depth design for which the depth shall be determined based on the depth of refuse no further than 500 feet from the probe as follows:

- First Depth            10 feet below surface.
- Second Depth        25% of refuse depth or 25 feet below surface,

- whichever is deeper.
- Third Depth 50% of refuse depth or 50 feet below surface,  
whichever is deeper.
- Fourth Depth 75% of refuse depth or 75 feet below surface,  
whichever is deeper.

Second, third, or fourth depth probes may be deleted if the required depth of such probe is deeper than the depth of the refuse.

**1.2 Number of Samples**

All refuse boundary gas probes at each depth shall be monitored monthly for TOC measured as methane using a portable flame ionization detector (FID) meeting the requirements of Section 3.2 and with a tube connected to the probe sampling valve. In addition, samples shall be taken as specified in Section 1.2.1 or 1.2.2 to determine the concentration of both TOC and TAC. The Executive Officer may require additional probes to be sampled upon written request.

- 1.2.1 If the TOC concentration measured with the FID does not exceed 5% by volume in any of the probes, collect one bag sample from one probe with the highest concentration, or
- 1.2.2 If the TOC concentration measured with the FID for any of the probes exceeds 5% by volume, collect one bag sample per probe from the probes with the highest concentrations above 5% by volume, from at least five probes.

**1.3 Subsurface Refuse Boundary Probe Sampling Procedure**

- 1.3.1 Prior to collecting gas samples, evacuate the probe (the probes must be sealed during evacuation) until the TOC concentration remains constant for at least 30 seconds.
- 1.3.2 The constant TOC concentration shall be measured using an FID that meets the requirements in Section 3.2.
- 1.3.3 Collect approximately a 10-liter gas sample in a Tedlar (~~DuPont~~DuPont trade name for polyvinyl) bag or equivalent container over a continuous ten-minute period using the evacuated container sampling procedure described in Section 7.1.1 of EPA Method 18 or direct pump sampling procedure described in Section 7.1.2 of EPA Method 18. The container shall be LIGHT-SEALED.

**1.4 Subsurface Refuse Boundary Probe Analytical Procedures**

All samples collected shall be analyzed no later than 72 hours after collection for TOC using U.S. EPA Method 25, 40 CFR, Part 60, Appendix A analysis or a portable FID that meets the requirements in Section 3.2 and for the TAC specified in Table 1 and upon written request, Table II, using U.S. EPA Compendium Method TO-14.

**1.5 Chain of Custody (Required for samples sent to the lab)**

A custody sheet shall accompany the bag samples. Each time a bag changes hands, it shall be logged on the custody sheet with the time of custody transfer recorded. Laboratory personnel shall record the condition of the sample (full, three-fourths full, one-half full, one-fourth full, or empty). An example of a custody sheet is shown in Figure 4.

**1.6 Recording the Results**

1.6.1 Record the volume concentration of TOC measured as methane for each individually identified refuse boundary probe (at each depth) and the volume concentration of TAC for selected probes on a quality control sheet as shown in Figure 3. Include a topographic map drawn to scale with the location of both the refuse boundary probes and the gas collection system clearly marked and identified.

1.6.2 Maintain and submit the results as specified in subdivision (f) of Rule 1150.1.

**2.0 INTEGRATED LANDFILL SURFACE SAMPLING**

**Paragraph (d)(~~511~~) and (e)(2) Requirements of Rule 1150.1**

**2.1 Number of Samples**

The number of samples collected will depend on the area of the landfill surface. The entire landfill disposal area shall be divided into individually identified 50,000 square foot grids. One monthly sample shall be collected from each grid for analysis. Any area that the Executive Officer deems inaccessible or dangerous for a technician to enter may be excluded from the sampling grids monitored by the landfill owner or operator. To exclude an area from monitoring, the landfill owner or operator shall file a written request with the Executive Officer. Such a request shall include an explanation of the requested exclusion and photographs of the area. The Executive Officer shall notify the landfill owner or operator in

writing of the decision. Any exclusion granted shall apply only to the monitoring requirement. The ~~5025~~ ppmv limit specified in paragraph (d)(~~511~~) of Rule 1150.1 applies to all areas.

**2.2 Integrated Surface Sampling Conditions**

2.2.1. The average wind speed during this sampling procedure shall be five miles per hour or less. Surface sampling shall be terminated when the average wind speed exceeds five miles per hour or the instantaneous wind speed exceeds ten miles per hour. Average wind speed is determined on a 15-minute average.

2.2.2. Surface sampling shall be conducted when the landfill is dry. The landfill is considered dry when there has been no measurable precipitation for the preceding 72 hours prior to sampling. Most major newspapers report the amount of precipitation that has fallen in a 24-hour period throughout the Southern California area. Select the nearest reporting station that represents the landfill location or provide for measurable precipitation collection at the MSW landfill wind monitoring station.

**2.3 Integrated Surface Sampler Equipment Description**

An integrated surface sampler is a portable self-contained unit with its own internal power source. The integrated sampler consists of a stainless steel collection probe, a rotameter, a pump, and a 10-liter Tedlar bag enclosed in a LIGHT-SEALED CONTAINER to prevent photochemical reactions from occurring during sampling and transportation. The physical layout of the sampler is shown in Figure 1.

An alternate integrated surface sampler may be used, provided that the landfill owner or operator can show an equivalency with the sampler specifications in Section 2.4 and shown in Figure 1. All alternatives shall be submitted as specified in subdivision (i) of Rule 1150.1.

**2.4 Integrated Surface Sampler Equipment Specifications**

2.4.1 Power: Batteries or any other power source.

2.4.2 Pump: The diaphragm shall be made of non-lubricated Viton (Dupont trade name for co-polymer of hexafluoropropylene and vinylidene fluoride) rubber.

- 2.4.3 Bag: One 10-liter Tedlar bag with a valve. The Tedlar bag shall be contained in a LIGHT-SEALED CONTAINER. The valve shall be leak free and constructed of aluminum, stainless steel, or non-reactive plastic with a Viton or Buna-N (butadiene acrylonitrile co-polymer) o-ring seal.
- 2.4.4 Rotameter: The rotameter shall be made of borosilicate glass or other non-reactive material and have a flow range of approximately 0-to-1 liter per minute. The scale shall be in milliliters or an equivalent unit. The graduations shall be spaced to facilitate accurate flow readings.
- 2.4.5 Air Flow Control Orifice: Needle valve in the rotameter.
- 2.4.6 Funnel: 316 stainless steel.
- 2.4.7 Fittings, Tubing and Connectors: 316 stainless steel or Teflon.
- 2.5 Integrated Surface Sampling Procedure
- 2.5.1 An integrated surface sampler as described in Section 2.4 shall be used to collect a surface sample approximately 8-to-10 liters from each grid.
- 2.5.2 During sampling, the probe shall be placed 0-to-3 inches above the landfill surface.
- 2.5.3 The sampler shall be set at a flow rate of approximately 333 cubic centimeters per minute
- 2.5.4 Walk through a course of approximately 2,600 linear feet over a continuous 25-minute period. Figure 2 shows a walk pattern for the 50,000 square foot grid.
- 2.6 Integrated Surface Sample Analytical Procedures
- All samples collected shall be analyzed no later than 72 hours after collection for TOC using U.S. EPA Method 25, 40 CFR, Part 60, Appendix A analysis or a portable FID that meets the requirements in Section 3.2. In addition, the samples specified in Section 2.6.1 or 2.6.2 must be analyzed no later than 72 hours after collection for the TAC specified in Table 1 and upon written request, Table II, using U.S. EPA Compendium Method TO-14.
- 2.6.1 Ten percent of all samples which have a concentration of TOC greater than ~~5025~~ ppmv as methane, or
- 2.6.2 Two samples if all samples are ~~5025~~ ppmv or less of TOC or two samples if there are less than 20 samples above ~~5025~~ ppmv.
- The Executive Officer may require more samples to be tested for TAC if he determines there is a potential nuisance or public health problem.

**2.7 Chain of Custody (Required for samples sent to the lab)**

A custody sheet shall accompany the bag samples. Each time a bag changes hands, it shall be logged on the custody sheet with the time of custody transfer recorded. Laboratory personnel shall record the condition of the sample (full, three-fourths full, one-half full, one-fourth full, or empty). An example of a custody sheet is shown in Figure 4.

**2.8 Recording the Results**

2.8.1 Record the volume concentration of both TOC measured as methane for each grid and the volume concentration for the required TAC on a quality control sheet as shown in Figure 3. Include a topographic map drawn to scale with the location of the grids and the gas collection system clearly marked and identified.

2.8.2 Record the wind speed during the sampling period using the wind speed and direction monitoring system required in paragraph (d)(~~917~~) of Rule 1150.1.

2.8.3 Maintain and submit the results as specified in subdivision (f) of Rule 1150.1.

**3.0 INSTANTANEOUS LANDFILL SURFACE MONITORING**

**~~Subparagraph~~ Paragraphs (d)(~~612~~) and (e)(3) Requirements of Rule 1150.1**

**3.1 Monitoring Area**

The entire landfill disposal area shall be monitored once each calendar quarter. Any area of the landfill that the Executive Officer deems as inaccessible or dangerous for a technician to enter may be excluded from the area to be monitored by the landfill owner or operator. To exclude an area from monitoring, the landfill owner or operator shall file a petition with the Executive Officer. Such a request shall include an explanation of why the area should be excluded and photographs of the area. Any excluded area granted shall only apply to the monitoring requirement. The 500 ppmv limit specified in paragraph (d)(~~612~~) of Rule 1150.1 applies to all areas.

**3.2 Equipment Description and Specifications**

A portable FID shall be used to instantaneously measure the concentration of TOC measured as methane at any location on the landfill. The FID shall meet the

specifications listed in Sections 3.2.1 through 3.2.4 and shall be kept in good operating condition.

3.2.1 The portable analyzer shall meet the instrument specifications provided in Section 3 of U.S. EPA Method 21, except that:

3.2.1.1 "Methane" shall replace all references to VOC.

3.2.1.2 A response time of 15 seconds or shorter shall be used instead of 30 seconds.

3.2.1.3 A precision of 3% or better shall be used instead of 10%.

In addition the instrument shall meet the specifications in Sections 3.2.1.4 through 3.2.1.6.

3.2.1.4 A minimum detectable limit of 5 ppmv (or lower).

3.2.1.5 A flame-out indicator, audible and visual.

3.2.1.6 Operate at an ambient temperature of 0 - 50° C.

3.2.2 The calibration gas shall be methane, diluted to a nominal concentration of 10,000 ppmv in air for subsurface refuse boundary probe monitoring and sample analysis to comply with paragraph (e)(1) of Rule 1150.1, ~~5025~~ ppmv in air for integrated sample analyses to comply with paragraph (e)(2) of Rule 1150.1 and 500 ppmv in air for instantaneous monitoring to comply with paragraph (e)(3) of Rule 1150.1.

3.2.3 To meet the performance evaluation requirements in Section 3.1.3 of U.S. EPA Method 21, the instrument evaluation procedures of Section 4.4 of U.S. EPA Method 21 shall be used.

3.2.4 The calibration procedures provided in Section 4.2 of U.S. EPA Method 21 shall be followed at the beginning of each day before commencing a surface monitoring survey.

### 3.3 Monitoring Procedures

3.3.1 The owner or operator shall monitor the landfill disposal area for TOC measured as methane using the described portable equipment.

3.3.2 The sampling probe shall be placed at a distance of 0-3 inches above any location of the landfill to take the readings.

3.3.3 At a minimum, an individually identified 50,000 square foot grid shall be used and a walk pattern ~~as similar to that~~ illustrated in Figure 2 shall be implemented including areas where visual observations indicate elevated

concentrations of landfill gas, such as distressed vegetation and cracks or seeps in the cover.

**3.4 Recording the Results**

3.4.1 Record the location and concentration of TOC measured as methane for any instantaneous reading of ~~500~~200 ppmv or greater on a topographic map of the landfill, drawn to scale with the location of both the grids and the gas collection system clearly marked and identified.

3.4.2 Maintain and submit the results as specified in subdivision (f) of Rule 1150.1.

**4.0 LANDFILL GAS SAMPLE FROM GAS COLLECTION SYSTEM**

**~~Subparagraph~~Paragraph (e)(~~4~~5) Requirement of Rule 1150.1**

**4.1 Number of Samples**

Collect one monthly sample of landfill gas for analysis from the main gas collection header line entering the gas treatment and/or gas control system(s).

**4.2 Sampling Procedure**

Collect approximately a 10-liter sample in a Tedlar bag or equivalent container over a continuous ten-minute period.

**4.3 Analytical Procedures**

Samples collected shall be analyzed no later than 72 hours after collection for TOC using U.S. EPA Method 25, 40 CFR, Part 60, Appendix A analysis and for the TAC specified in Table 1 and upon written request, Table II, using U.S. EPA Compendium Method TO-14.

**4.4 Chain of Custody (Required for samples sent to the lab)**

A custody sheet shall accompany the bag samples. Each time a bag changes hands, it shall be logged on the custody sheet with the time of custody transfer recorded. Laboratory personnel shall record the condition of the sample (full, three-fourths full, one-half full, one-fourth full, or empty). An example of a custody sheet is shown in Figure 4.

**4.5 Recording the Results**

4.5.1 Record the volume concentration of both TOC measured as methane and the volume concentration for the required TAC on a quality control sheet as shown in Figure 3. Include a topographic map drawn to scale with the

location of the ~~gas collection and control system~~ gas collection and gas control systems clearly marked and identified.

4.5.2 Maintain and submit the results as specified in subdivision (f) of Rule 1150.1.

## **5.0 AMBIENT AIR SAMPLES AT THE LANDFILL PROPERTY BOUNDARY**

### **Subparagraph Paragraph (e) ~~(56)~~ Requirement of Rule 1150.1**

#### **5.1 Number of Samples**

Monthly ambient air samples shall be collected for analysis at the landfill property boundary from both an upwind and downwind sampler sited to provide good meteorological exposure to the predominant offshore (drainage land breeze) and onshore (sea breeze) wind flow patterns. The upwind and downwind samples shall be collected simultaneously over two 12 hour periods beginning between 9:00 a.m. and 10:00 a.m., and 9:00 p.m. and 10:00 p.m. on the same day or different days.

#### **5.2 Ambient Air Sampling Conditions**

Ambient air sampling shall be conducted on days when stable (offshore drainage) and unstable (onshore sea breeze) meteorological conditions are representative for the season. Preferable sampling conditions are characterized by the following meteorological conditions:

5.2.1 Clear cool nights with wind speeds of two miles per hour or less, and

5.2.2 Onshore sea breezes with wind speeds ten miles per hour or less.

No sampling will be conducted if the following adverse meteorological conditions exist:

5.2.3 Rain,

5.2.4 Average wind speeds greater than 15 miles per hour for any 30-minute period, or

5.2.5 Instantaneous wind speeds greater than 25 miles per hour.

Continuously recorded on-site wind speed and direction measurements required in paragraph (d) ~~(917)~~ of Rule 1150.1 will characterize the micrometeorology of the site and serve to verify that the meteorological criteria have been met during sampling.

**5.3 Ambient Air Sampler Equipment Description**

An ambient air sampling unit consists of a 10-liter Tedlar bag, a DC-operated pump, stainless steel capillary tubing to control the sample rate to the bag, a bypass valve to control the sample flow rate (and minimize back pressure on the pump), a Rotameter for flow indication to aid in setting the flow, a 24-hour clock timer to shut off the sampler at the end of the 24-hour sampling period, and associated tubing and connections (made of stainless steel, Teflon, or borosilicate glass to minimize contamination and reactivity). The physical layout of the sampler is shown in Figure 5.

An alternate ambient air sampler may be used, provided that the landfill owner or operator can show an equivalency with the sampler specifications in Section 5.3 and shown in Figure 5. All alternatives shall be submitted as specified in subdivision (i) of Rule 1150.1.

**5.4 Ambient Air Sampler Equipment Specifications**

The equipment used when conducting air samples at any landfill property boundary shall meet the following specifications:

- 5.4.1 Power: one 12V DC marine battery. The marine battery provides 12V DC to the pump and the clock.
- 5.4.2 Pump: one 12V DC pump. The diaphragm shall be made of non-lubricated Viton rubber. The maximum pump unloaded flow rate shall be 4.5 liters per minute.
- 5.4.3 Bag: One 10-liter Tedlar bag with a valve. The Tedlar bag shall be enclosed in a LIGHT-SEALED CONTAINER. The valve is a push-pull type constructed of aluminum and stainless steel, with a Viton or Buna-N (butadiene acrylonitrile co-polymer) o-ring seal.
- 5.4.4 Rotameter: made of borosilicate glass and has a flow range of 3-to-50 cubic centimeters per minute. The scale is in millimeters (mm) with major graduations (labeled) every 5 mm and minor graduations every 1 mm.
- 5.4.5 Air flow control orifice: 316 stainless steel capillary tubing.
- 5.4.6 Bypass valve.
- 5.4.7 Fittings, tubing, and connectors: 315 stainless steel or Teflon.
- 5.4.8 Clock timer with an accuracy of better than 1%.

5.5 Ambient Air Sample Analytical Procedures

Samples collected must be analyzed no later than 72 hours after collection for TOC using U.S. EPA Method 25, 40 CFR, Part 60, Appendix A analysis or a portable FID that meets the requirements in Section 3.2 and for the TAC specified in Table 1 and upon written request, Table II, using U.S. EPA Compendium Method TO-14.

5.6 Chain of Custody (Required for samples sent to the lab)

A custody sheet shall accompany the bag samples. Each time a bag changes hands, it shall be logged on the custody sheet with the time of custody transfer recorded. Laboratory personnel shall record the condition of the sample (full, three-fourths full, one-half full, one-fourth full, or empty). An example of a custody sheet is shown in Figure 4.

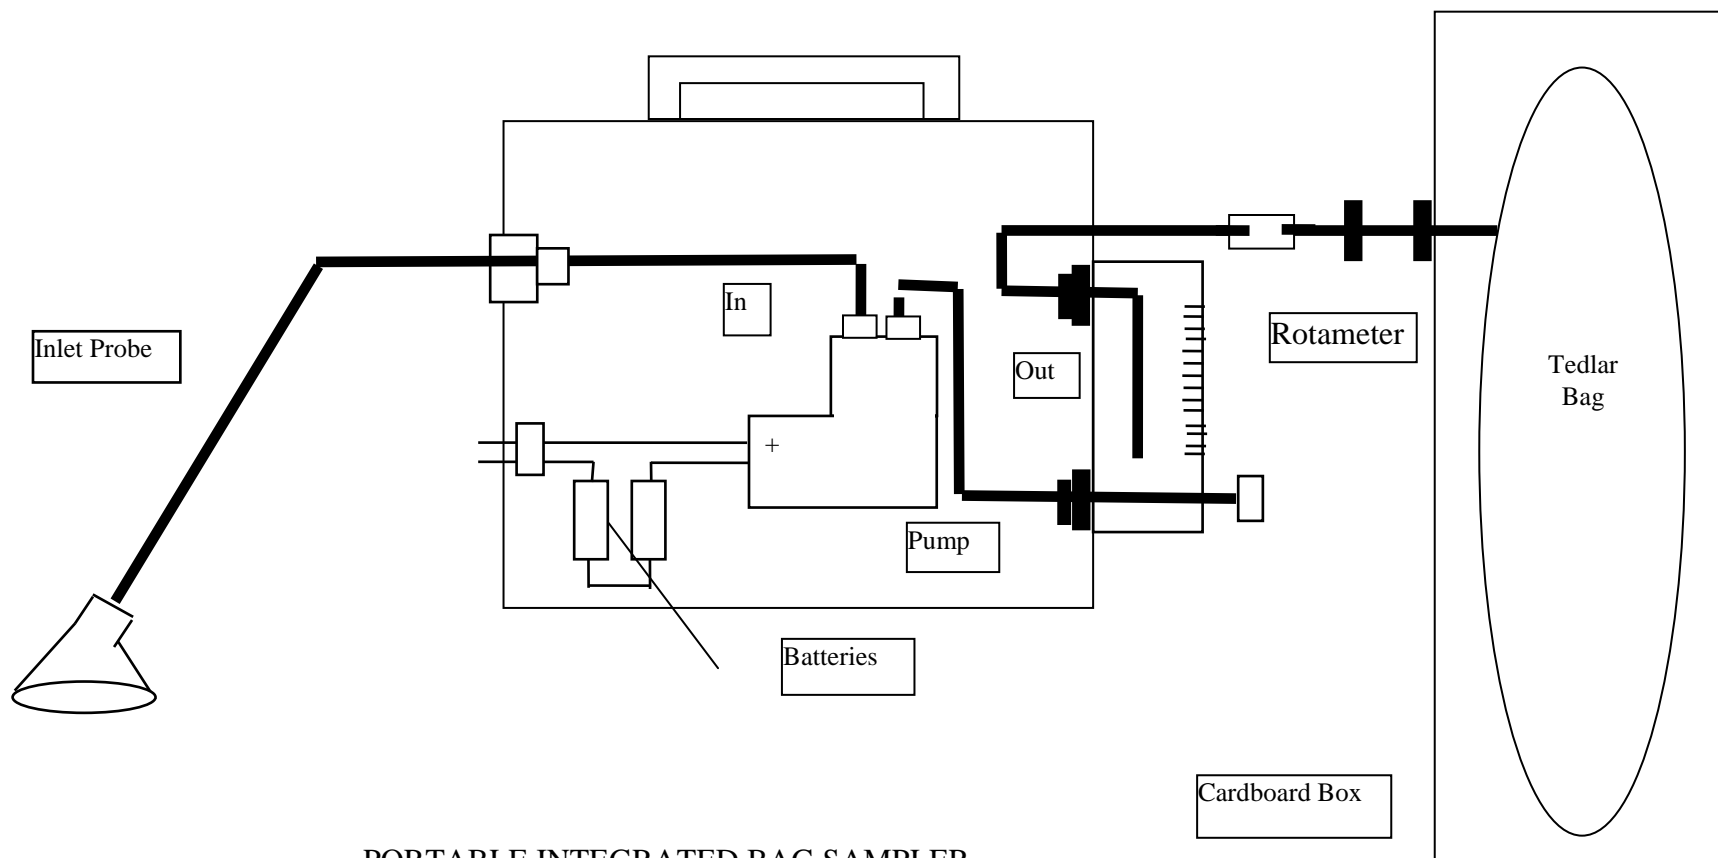

5.7 Recording the Results

5.7.1 Record the volume concentration of TOC measured as methane and the volume concentration of TAC for each sample on a quality control sheet as shown in Figure 3. Include a topographic map drawn to scale with the location of both the upwind and downwind samplers and the ~~gas collection and control system~~ gas collection and gas control systems clearly marked and identified.

5.7.2 Record the wind speed and direction during the 24-hour sampling period using the wind speed and direction monitoring system required in paragraph (d)(~~917~~) of Rule 1150.1.

5.7.3 Maintain and submit the results as specified in subdivision (f) of Rule 1150.1.

Subdivision 1. Consolidated Regulations for Treatment, Storage, Processing or Disposal of Solid

### Chapter 3. Criteria for All Waste Management Units, Facilities, and Disposal Sites

#### Subchapter S. Closure and Post-Closure Maintenance

#### Article 2. Closure and Post-Closure Maintenance Standards for Disposal Sites and

##### Landfills

##### §21140. Section CIWMB -- Final Cover. (T14:§17773)

(a) The final cover shall function with minimum maintenance and provide waste containment to protect public health and safety by controlling at a minimum, vectors, fire, odor, litter and landfill gas migration. The final cover shall also be compatible with postclosure land use.

(b) In proposing a final cover design meeting the requirements under §21090, the owner or operator shall assure that the proposal meets the requirements of this section. Alternative final cover designs shall meet the performance requirements of ¶(a) and for MSWLF units, 40 CFR 258.60(b); shall be approved by the enforcement agency for aspects of ¶(a).

(c) The EA may require additional thickness, quality, and type of final cover depending on, but not limited to the following:

- (1) a need to control landfill gas emissions and fires;
- (2) the future reuse of the site; and
- (3) provide access to all areas of the site as needed for inspection of monitoring and control facilities, etc.

### TITLE 27. Environmental Protection

#### **Division 2. Solid Waste**

#### **Subdivision 1. Consolidated Regulations for Treatment, Storage, Processing or Disposal of Solid**

Chapter 3. Criteria for All Waste Management Units, Facilities, and Disposal Sites

#### Subchapter 2. Siting and Design

#### Article 2. SWRCB -- Waste Classification and Management

#### §20200. SWRCB -- Applicability and Classification Criteria. (CI5: §2520)

(a) Concept--This article contains a waste classification system which applies to solid wastes that cannot be discharged directly or indirectly to waters of the state and which therefore must be discharged to waste management units (Units) for treatment, storage, or disposal in accordance with the requirements of this division. Wastes which can be discharged directly or indirectly (*e.g., by percolation*) to waters of the state under effluent or concentration limits that implement applicable water quality control plans (*e.g., municipal or industrial effluent or process wastewater*) are not subject to the SWRCB-promulgated provisions of this division. This waste classification system shall provide the basis for determining which wastes may be discharged at each class of Unit. Waste classifications are based on an assessment of the potential risk of water quality degradation associated with each category of waste.

(1) The waste classifications in this article shall determine where the waste can be discharged unless the waste does not consist of or contain municipal solid waste (MSW) and the discharger establishes to the satisfaction of the RWQCB that a particular waste constituent or combination of constituents presents a lower risk of water quality degradation than indicated by classification according to this article.

(2) Discharges of wastes identified in §20210 or §20220 of this article shall be permitted only at Units which have been approved and classified by the RWQCB in accordance with the criteria established in Article 3 of this subchapter, and for which WDRs have been prescribed or waived pursuant to Article 4, Subchapter 3, Chapter 4 of this subdivision (§21710 et seq.). Table 2.1 (of this article) presents a summary of discharge options for each waste category.

(b) Dedicated Units/Cells For Certain Wastes--The following wastes shall be discharged only at dedicated Units [or dedicated landfill cells (*e.g., ash monofill cell*)] which are designed and constructed to contain such wastes:

(1) wastes which cause corrosion or decay, or otherwise reduce or impair the integrity of containment structures;

(2) wastes which, if mixed or commingled with other wastes can produce a violent reaction (including heat, pressure, fire or explosion), can produce toxic byproducts, or can produce any reaction product(s) which:

(A) requires a higher level of containment;

(B) is a restricted waste; or

(C) impairs the integrity of containment structures.

(c) Waste Characterization--Dischargers shall be responsible for accurate characterization of wastes, including determinations of whether or not wastes will be

compatible with containment features and other wastes at a Unit under ¶(b), and whether or not wastes are required to be managed as hazardous wastes under Chapter 11 of Division 4.5 of Title 22 of this code.

(d) Management of Liquids at Landfills and Waste Piles--The following requirements apply to discharges of liquids at Class II waste piles and at Class II and Class III landfills, except as otherwise required for MSW landfills by more-stringent state and federal requirements under SWRCB Resolution No. 93-62 section 2908 of Title 23 of this Code (see 40CFR258.28) [*Note: see also definitions of "leachate" and "landfill gas condensate" in §20164*]:

(1) [Reserved.];

(2) wastes containing free liquids shall not be discharged to a Class II waste pile. Any waste that contains liquid in excess of the moisture-holding capacity of the waste in the Class II landfill, or which contains liquid in excess of the moisture-holding capacity as a result of waste management operations, compaction, or settlement shall only be discharged to a surface impoundment or to another Unit with containment features equivalent to a surface impoundment; and

(3) liquids or semi-solid waste (i.e., waste containing less than 50 percent solids, by weight), other than dewatered sewage or water treatment sludge as described in §20220(c), shall not be discharged to Class III landfills. Exceptions may be granted by the RWQCB if the discharger can demonstrate that such discharge will not exceed the moisture-holding capacity of the landfill, either initially or as a result of waste management operations, compaction, or settlement, so long as such discharge is not otherwise prohibited by applicable state or federal requirements.

## Preface

On August 10, 2010, the Draft Staff Report and Proposed Amended Rule (PAR) 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills were released for a thirty day public review for a September 10 Public Hearing. This Final Draft Staff Report contains the current staff proposal for PAR 1150.1 which is scheduled for a February 4, 2011 Public Hearing. The changes and clarifications made since the August release of the PAR 1150.1 materials are summarized below:

- Removed subdivision (m) from the proposed amendment, which was included with the August 2010 proposal, and to address a California ballot measure regarding California Assembly Bill 32. This provision is no longer necessary.
- Added comments received subsequent to the release of the Draft Staff Report in August 2010, summarized in the Public Comments section of the report.
- Added comments received October 2010 from the California Air Resources Board (CARB), with responses from AQMD staff, summarized in the CARB Comments section of the report. Resultant changes to the proposed amendment include:
  - Updating the gas generation calculation methodology to reference the 2006 Intergovernmental Panel on Climate Change (IPCC) Guidelines; and
  - Including additional exemption criteria based on the amount of waste-in-place and the gas generation rate.
- Updated compliance deadlines consistent with the December 2, 2010 CARB Regulatory Advisory, including:
  - Extending the compliance deadline to allow landfills to apply for and implement alternatives to this proposed amendment to April 1, 2011 and July 1, 2011, respectively; and
  - Allowing for continued operation under previously approved Rule 1150.1 Compliance Plans until July 1, 2011, or until the owner or operator has received an approved revised Rule 1150.1 Compliance Plan; and
  - For Rule 1150.1 Compliance Plan revisions submitted on or before April 1, 2011 to meet the proposed amendment, allowing operation under the submittal if the plan approval is pending; and
  - Revising the annual report due date from March 31 to March 15.
- Other minor administrative revisions and clarifications.

## EXECUTIVE SUMMARY

Rule 1150.1 – Control of Gaseous Emission from Municipal Solid Waste (MSW) Landfills, was originally adopted by the South Coast Air Quality Management District (AQMD) Governing Board on April 5, 1985 to regulate emissions from active landfills. Landfills generate gaseous emissions that are comprised of several pollutants of concern, including Non-Methane Organic Compounds (NMOC), Volatile Organic Compounds (VOC), Toxic Air Contaminant (TAC) and odorous compounds, as well as greenhouse gases in the form of methane and carbon dioxide. The originally adopted Rule 1150.1 and two subsequent administrative amendments in April 10, 1998 and March 17, 2000 were focused on controlling the non-greenhouse gas components of landfill gas because of the contribution to criteria pollutant formation from VOC emissions, potential for public nuisance from odorous compounds, and potential detriment to public health from TAC emissions. Recent legislative activity has focused on controlling greenhouse gases, including the approval of the California Global Warming Solutions Act of 2006 (AB 32). Because the California Air Resources Board (CARB) has adopted an early action measure under AB32 aimed at controlling methane emissions from landfills, the primary purpose of this amendment is to incorporate the state requirements into the rule. The proposed amendment would also improve enforceability and streamline requirements by clarifying operation standards for control devices already installed, and by eliminating duplicate recordkeeping and redundant reporting.

Elements of the proposed amendment fall into four categories: (1) incorporating CARB emission control requirements for Gas Collection and Control Systems (GCCS); (2) updating operation standards for control systems, including wellhead pressure gauge monitoring, to improve enforceability; (3) streamlining recordkeeping and reporting requirements; and, (4) revising rule language to address administrative corrections.

First, the proposed amendment would add methane emissions control and lower the monitoring emissions limit for landfill control systems from 50 ppmv to 25 ppmv to achieve equivalency to the CARB regulation for MSW landfills. CARB established the 25 ppmv limit based on data from South Coast Basin, which showed that the majority of landfills already comply with the lower limit and currently report values below the 25 ppmv limits based on currently required sampling.

Second, the proposed amendment incorporates GCCS operational requirements identified in the CARB regulation. The proposed amendment requires control devices (e.g., compressors, internal combustion engines, and boilers) to be in full operation at all times, unless an alternative is requested and approved. The proposed amendment further requires that wellheads

operate under negative pressure at all times to ensure that landfill gases are not escaping into the atmosphere, and also requires enclosed flares and enclosed combustion devices to operate with installed automatic dampers, automatic shutdown devices, and flame arrestors.

Third, the proposed amendment seeks to reconcile recordkeeping and reporting content and frequency with the requirements in the CARB regulation. While both the proposed amendment and CARB regulation have similar reporting requirements, they differ for annual reports. The proposed amendment consolidates the reporting of records into an annual reporting requirement to eliminate redundancy and minimize the burden on affected facilities.

Finally, the proposed amendment also deletes outdated language and adds definitions, minor clarifications, and editorial corrections to improve clarity and enforceability.

There is no expected significant cost increase associated with the proposed amendment because the collection and control equipment required by the CARB regulation to control methane have been installed and used by landfills within the District for over twenty years to control non-methane organic compounds. There may be administrative costs for processing requests for alternatives or changes to facility permits or plans, if needed.

The proposed amendment has no potential to adversely impact air quality or any other environmental area and is therefore exempt from CEQA pursuant to state CEQA Guidelines §15061 (b)(3) – Review for Exemption. A Notice of Exemption will be prepared upon adoption of the proposed amendment and forwarded to the four county clerks for posting.

## BACKGROUND

### Introduction

Municipal Solid Waste (MSW) landfills are classified to receive residential refuse that is collected separately from construction, hazardous and toxic waste. MSW is buried and compacted in the landfill where anaerobic decomposition generates large quantities of gas. This landfill gas, composed of near equal parts methane and carbon dioxide, also includes trace amounts (~ 1%) of non-methane organic compounds (NMOC), including volatile organic compounds (VOC), toxic air contaminants (TAC) and other odorous compounds. NMOC emissions contribute to ground level ozone formation, and represent a potential for public nuisance and detriment to public health, whereas methane is a greenhouse gas (GHG) that contributes to climate change, having a global warming potential 21 times greater than carbon

dioxide. Methane is also known to be an explosive hazard and can damage vegetation and crops. In California, MSW landfills are the second largest anthropogenic source of methane.

Control of MSW landfill gases in the District is accomplished by the use of an active collection system. An active collection system uses a prime mover to draw a vacuum on a collection system to compress the landfill gases and deliver the gases to a combustion device. MSW landfills bury and compress refuse in layers separated by non-biodegradable barriers. Interlaced between these layers are a network of vertical gas wells and horizontal collector piping that constitutes the collection system upon which the prime mover creates a vacuum to deliver landfill gases at a steady rate to the combustion device. The combustion device can be an open or enclosed flare, although more efficient landfill gas combustors are used in the District, specifically, internal combustion engines (ICE), heaters and boilers. Energy from these devices is often used to generate electricity, representing a potential supplemental revenue stream.

While the prime mover and the combustion device represent the control system, the collection system consists of the vertical wells and horizontal piping. Combined together, the control and collection systems constitute the vapor control system for MSW landfills.

The proposed amendment requires control of both NMOC and methane emissions through use of appropriate control and collection systems, and defines associated source testing, sampling, monitoring, recordkeeping, and reporting of excess emission from control and collection devices at ground level as well as subsurface migration of landfill gases towards the landfill boundary.

### Regulatory History

Rule 1150.1 was originally adopted by the AQMD Governing Board on April 5, 1985 and has since undergone two subsequent amendments on April 10, 1998 and March 17, 2000. The April 10, 1998 amendment merged the Rule 1150.1 requirements for active MSW landfills with the Rule 1150.2 requirements for inactive MSW landfills. In 1988, EPA announced a decision to regulate landfills under the authority of the Clean Air Act (CAA) and proposed New Source Performance Standards (NSPS) in 1991, with promulgation in March 1996. The AQMD Governing Board approved an amendment to Rule 1150.1 to incorporate the NSPS Emissions Guidelines (EG) for existing landfills and NSPS emissions standards for new landfills in March 2000. As part of the same amendment, Sections 21140 and 20200 of Title 27 of the California Code of Regulations (CCR) were incorporated by reference into Rule 1150.1. Specifically, Section 21140 added requirements for closure and post-closure maintenance, and Section 20200 prohibited

disposal of liquid and semi-liquid waste at Class III (municipal solid waste) landfills in order to credit emission reductions under the state implementation plan.

**Affected Industries**

The rule amendment applies to existing MSW landfill facilities and any future MSW landfill facilities.

There are currently 83 MSW landfill facilities in the District that would be subject to the proposed amendment. Of these facilities, 19 are currently active facilities or facilities that accept residential refuse, 64 landfills are inactive facilities which no longer accept refuse but still generate significant levels of landfill gas. Table 1, below, shows the breakdown of active MSW landfills and inactive MSW landfills in the District.

**Table 1.** MSW Landfills in the South Coast Basin

<b>County</b>	<b>Active Landfills</b>	<b>Inactive Landfills</b>	<b>Total</b>
Los Angeles	11	35	46
Orange	2	13	15
Riverside	3	9	12
San Bernardino	3	7	10
<b>Total:</b>	<b>19</b>	<b>64</b>	<b>83</b>

Rule 1150.1 applies to both active and inactive landfills and while there is less activity at inactive landfill sites because they have been capped with layers of earth fill, they continue to have the potential to generate landfill gas emissions for a long period of time. The proposed amendment continues to focus on landfill gas control and collection methods and elimination of associated fugitive emissions.

**SUMMARY OF PROPOSED AMENDED RULE 1150.1**

**Overview**

The proposed amendment is intended to incorporate the requirements of the CARB AB32 early action measure for MSW landfills (Title 17, CCR , Article 4, Subarticle 6). While the primary purpose of the proposed amendment is to incorporate control of methane emissions into the rule, the proposed amendment is also aimed at improving enforceability and streamlining

requirements by clarifying operation standards for control devices already installed and eliminating duplicate recordkeeping and redundant reporting.

Elements of the proposed amendment fall into the following four categories:

1. Incorporating CARB emission control requirements for gas collection and control systems (GCCS).
2. Updating operation standards for control devices, including wellhead pressure gauge monitoring, to improve enforceability.
3. Streamlining recordkeeping and reporting requirements.
4. Revising rule language for administrative changes.

### **Gas Collection and Control System Emission Control Requirements**

The proposed amendment extends the emission limits of the current rule to include methane as prescribed by the CARB regulation. These limits are associated with controlled emission levels based on system control efficiency as well as monitoring of control system components and fugitive emission concentrations at the surface and subsurface to ensure system integrity.

The proposed amendment requires instantaneous and integrated surface monitoring for MSW landfills consistent with the CARB regulation to check the gas collection system for malfunctions and leaks. Instantaneous monitoring measures instant surface emissions of total organic compounds (TOC), while integrated monitoring is done using instrument analysis of TOC over a 50,000 square foot grid and sampled for lab analysis for TAC. The proposed amendment continues to require subsurface refuse boundary monitoring, a process in which probes are placed around the perimeter of the landfill site at different depths to measure gas migration. Monthly samples are taken to determine if subsurface gases are approaching or going beyond the boundary of the landfill.

### **Gas Collection and Control Systems**

Installation and operation of a GCCS has been required since the original adoption of Rule 1150.1. The proposed amendment incorporates control of methane emissions consistent with the CARB regulation, including requirements for design and emission limits.

Although landfills within the District currently operate with existing GCCS, the proposed amendment incorporates the CARB requirements for design plans associated with site-specific gas collection and control systems that are not covered under a Permit to Construct or Permit to Operate; GCCS must be operated, maintained and expanded according to an approved design plan in

the absence of an aforementioned permit. The proposed amendment applies the Professional Engineer certification requirements for design plans to also cover certification for any plan revisions. Finally, the proposed amendment requires that design plans have a description of mitigation measures to be used in case there is release of methane or NMOC into the atmosphere during installation of landfill components or when there are repair work or system shutdowns of the GCCS.

The proposed amendment requires that the GCCS be operated as an active gas collection system on a continuous basis, including situations where there is low flow, which may require operators to supplement landfill gases to maintain combustion in GCCS control devices or pursue an approved alternative.

The conditional use of open flares has been added to the proposed amendment, even though there are very few such devices in the District. The proposed amendment restricts use of open flares by date of use. Any open flare operated before August 1, 2008 may operate until January 1, 2018. Operation of an open flare beyond 2018 will require the approval of the Executive Officer with documentation to support the request. The temporary use of open flares for repairs and maintenance while an enclosed flare is being repaired would also require approval from the Executive Officer.

The proposed amendment requires enclosed combustion devices to achieve a methane destruction rate of 99% by weight in addition to reducing NMOC by at least 98% by weight and 3,000 ppmv for internal combustion engines at the outlet. Existing controls at MSW landfills in the District will be able to meet the new CARB requirement. During startup and shutdowns there must be enough supplemental fuel for the burners to prevent landfill gas venting to the atmosphere.

The proposed amendment requires GCCS under positive pressure to operate with no leaks exceeding 500 ppmv. Any leak discovered by the facility must be tagged and repaired in 10 days.

Finally, the proposed amendment will require all wellheads to be under negative pressure at all times, except during wellhead rising and repair, during temporary shutdown of the GCCS, or after catastrophic events.

### Gas Control System Monitoring

The proposed amendment to this rule includes a leak standard of 500 ppmv for components under positive pressure, which requires monitoring of all components used in the gas collection and control system, including blowers, compressors, connectors, fittings, flame arrestors, flanges, knock-out drums, pipes, sampling ports, and valves. If excess emission leaks are identified from

these components, the proposed amendment requires repair and re-sampling consistent with the timeframes of the CARB regulation.

### Gas Collection System Monitoring

The operational efficiency of GCCS is determined by monitoring migration of underground landfill gases and liquids to the property boundary, and by monitoring leaks at the landfill surface.

Consistent with the CARB regulation, the proposed amendment lowers the limit for integrated surface monitoring from 50 ppmv to 25 ppmv, and also adds an additional requirement for recording instantaneous monitoring results that exceed 200 ppmv TOC for data collection purposes. Landfills in the District are currently meeting the 25 ppmv level.

The current version of Rule 1150.1 requires the repair of components that contribute to the exceedance of the aforementioned monitoring levels in accordance with prescribed timeframes. Following initial discovery, the GCCS must be repaired and re-monitored or re-sampled within 10 days. If the follow-up testing shows a second exceedance, another 10 days is allowed for repair and re-testing. Finally, if there is a third exceedance, corrective action is required to install and operate a replacement within 45 days from initial discovery. Although the CARB regulation provides for a final 120 days rather than 45 days from initial discovery, the District is proposing to maintain the current timeframes, based on historical implementation, and to avoid relaxing a SIP approved rule.

### Surface and Subsurface Emission Standards and Monitoring

Current Rule 1150.1 not only requires both surface landfill sampling and monitoring, but also requires a subsurface refuse probe boundary sampling system. The subsurface monitoring is absent in the CARB regulation for landfills because another State agency has jurisdiction for subsurface monitoring (CalRecycle). Attachment A of the current rule contains the requirements for subsurface monitoring, with the intent towards design and installation consistent with CalRecycle subsurface boundary probe requirements. The proposed amendment maintains these requirements.

### Instantaneous Surface Monitoring

Instantaneous monitoring is conducted by the MSW landfill owner or operator once a quarter (or every three months) by traversing a walking pattern of the grid in search of leaks that exceed the 500 ppmv emission standard. The CARB regulation requires measured methane emission leaks of 200 ppmv or greater be recorded for data collection purposes, but the emission standard that

triggers corrective action is set higher at 500 ppmv. The 200 ppmv level for recording leaks has been added to the proposed amended rule.

### Integrated Surface Monitoring

CARB used SCAQMD data obtained from monitoring records to determine that the current emission standard in Rule 1150.1 could be reduced from 50 ppmv to 25 ppmv. In order to maintain equivalent limits, the proposed amendment lowers the integrated surface monitoring limit to 25 ppmv. Integrated surface monitoring is conducted monthly and is intended to monitor the MSW landfill in greater detail than instantaneous surface monitoring provides.

Two different methods for integrated surface monitoring have been used at MSW landfills. One method includes a monitoring apparatus that slowly ingests samples while the operator traverses a portion of the grid. The sample is contained in a tedlar bag, and the content is analyzed by an approved lab. If an exceedance of the integrated surface emission standard is determined, the operator is required to return to that portion of the grid and identify the specific area of concern. The second method for conducting integrated surface monitoring includes use of a flame ionization detector, calibrated to methane. AQMD staff has witnessed some hydrocarbon detection models using this method that not only detect emission leaks but also concurrently identify the exact location, so that the operator can readily initiate corrective action. Either method is acceptable for Rule 1150.1.

### Combination Instantaneous and Integrated Surface Monitoring

Because the frequency for instantaneous monitoring is monthly and integrated monitoring is quarterly, there is an overlap in the two required events every three months. Rather than walk the same grid for two separate samplings during this overlapping period, county landfill operators in the District have reported conducting combined sampling without complication or significant procedural changes. Results are recorded separately on approved District forms and meet the intent of the current rule and proposed amendment. CARB is considering, either through regulation or on a case-by-case approval process, recognizing this practice through future guidance documents.

### Subsurface Refuse Boundary Monitoring

The Subsurface Refuse Boundary Monitoring measures and detects underground lateral movement of landfill gases and liquids from the refuse footprint toward the landfill boundary line and onto neighboring property. Attachment A of the current version of Rule 1150.1 requires monthly samples that report less than 5 percent TOC from each probe. The proposed amendment maintains this requirement.

## **Operational Standards**

### **Gas Collection and Control Devices Continuous Operation**

Currently, Rule 1150.1 requires that control or treatment systems be operated at all times when collected gas is being routed to them. Conversely, current implementation of the rule allows for shutting down system components where collected gas is not being routed. The proposed amendment incorporates the requirement of the CARB regulation that calls for documentation of minimum flow through an approved alternative. As such, the proposed amendment requires continuous operation of the active collection system at all times, except where an alternative has been approved that establishes appropriate conditions to allow periods of interrupted operation.

### **Components under Positive Pressure Monitoring**

Because it is necessary to pressurize components that deliver fuel in order to ensure a constant flow of landfill gases under pressure for combustion, the proposed amendment requires that all components that transfer landfill gases be monitored quarterly for leaks. Should a leak be detected at 500 ppmv or greater, the proposed amendment requires repairs be made in a timely manner through corrective action such as tagging the leak location and repairing the leak within 10 calendar days. Another reason for this proposed amendment is to make the requirements for compression and combustion equipment used in landfill gas generation to be comparable to the requirements subject to SCAQMD Rule 1173.

### **Wellhead Negative Pressure and Monitoring**

The proposed amendment requires that wellheads be maintained under constant vacuum or negative pressure at all times. Wellheads are above ground components that are connected to a central header in the collection system for landfills. A negative pressure ensures that landfill gas is channeled through the collection system to the control devices and into the collection control system.

Furthermore, the proposed amendment requires monthly monitoring of wellhead gauge pressure to ensure negative pressure is maintained. Positive pressure readings require corrective action within five days. If after the first five days the positive pressure persists, an additional 15 days are allowed for corrective action. Finally, all corrective measures including expansion must be completed and the gas collection system must be operational within 120 days of when the first positive pressure reading was found.

### Alternatives

Currently, Rule 1150.1 allows facilities to request and obtain District-approved alternatives to specific sections of the rule. The proposed amendment continues this practice in a manner analogous to the CARB regulation, which allows for requested “Alternative Compliance Options.” Such collective “alternatives,” if approved, would be incorporated into a facility’s Rule 1150.1 Compliance Plan. In addition, where a plan revision is required to meet the proposed amendment, facilities are allowed to operate pursuant to a previously approved Rule 1150.1 Compliance Plan or, if plan approval is pending, the revised Rule 1150.1 Compliance Plan submitted on or before April 1, 2011.

### Recordkeeping and Reporting Requirements

The proposed amendment includes requirements from the CARB regulation that have been incorporated to improve consistency and minimize duplicative recordkeeping, while also allowing for the keeping of records in paper, electronic form, or other suitable format. In short, the proposed amendment updates the monitoring exceedance levels for recordkeeping consistent with the proposed amended emission limits, adds additional requirements for keeping and retaining records of source tests, periods of GCCS non-operation, component and surface monitoring results, exceedances and corrective actions, as well as the keeping of records associated with waste acceptance, current amount of waste in place, landfill areas excluded from collection systems, and landfill closure.

The proposed amendment requires owners and operators to maintain original source test results and all annual performance tests results; if the combustion device is an open flare, all flare monitoring and records of periods when the pilot flame or flare flame is not present must also be maintained.

The proposed amendment requires any results greater than 25 ppmv during integrated monitoring sampling and corrective actions taken to be recorded.

The proposed amendment requires owners and operators to maintain records for instantaneous sampling for monitoring readings greater than 200 ppmv. Corrective action records continue to be required at the 500 ppmv level as identified in the current rule.

While the current version of Rule 1150.1 requires recording of periods where the collection or control device system has not operated for longer than an hour, the amended version of the rule extends this requirement to include recording of installations of collection or control equipment, excavation of solid waste material, and construction activities that require exposing waste to the atmosphere. The proposed amendment further requires recording of a

description of the activity, the affected area, the reason for the action, the start and finish time and date, a list of the landfill components affected or replaced, and the mitigation measures taken.

The proposed amendment requires owners and operators to maintain records of solid waste acceptance, solid waste acceptance rate, and the current amount of waste in place. Furthermore, owners and operators would be required to maintain all records of non-degradable waste acceptance, including the location, and amount deposited into any landfill area that excludes a collection system.

The proposed amendment requires the owner and or operator to keep records of positive wellhead gauge pressure measurements, including the date, measurement, well identification, and corrective action taken.

The proposed amendment adds additional recordkeeping requirements for Closure Reports, including the last day the landfill accepted solid waste, the project closure date, and the estimated waste-in-place.

### **Administrative Changes**

In addition to minor rule language updates to remove outdated language and clarify definitions, the proposed amendment includes the following:

#### **Test Methods**

The CARB regulation considers VOC and methane interchangeable for control purposes since both are contained in the landfill gas stream and subject to destruction efficiency requirements. Therefore, the proposed amendment cites various source tests applicable for VOC and methane alone or in combination. The proposed amendment requires source testing of gas control devices for VOC and for methane using EPA Methods 25 and 18, as well as AQMD Method 25.1 (for VOC and methane), AQMD Method 25.3 (VOC and methane) and ASTM Method D1945 and D1946 (for methane only).

#### **Incorporate 40 CFR, Part 63, Subpart AAAA by Reference**

Subpart AAAA of the National Emissions Standard for Hazardous Air Pollutants (NESHAP), promulgated in 2003 by the EPA under authority of the Clean Air Act (CAA), section 112, is incorporated into the proposed amended rule by reference. The incorporation of 40 CFR, Part 63 Subpart AAAA of NESHAP requires all MSW Landfills that have bioreactors, and Title V facilities, to comply with this subpart by creating and using a Start-up, Shut down, and Malfunction Plan (SSMP).

## EMISSION REDUCTIONS

The proposed amendment is not expected to result in emission reductions. In order to maintain equivalency with the CARB landfill regulation the emission limit for integrated monitoring sampling was lowered from 50 to 25 ppmv. Compliance with the 25 ppmv has been achieved in practice with control and collection systems required at the 50 ppmv level and therefore no actual emission reductions are achieved or claimed.

## COMPARATIVE ANALYSIS

As required by Health and Safety Code Section 40727.2, the purpose of this analysis is to identify and compare any other AQMD or federal regulations that apply to the same equipment or source type.

The existing and the proposed amended Rule 1150.1 are not in conflict with National Emissions Standard for Hazardous Air Pollutants (NESHAP) 40 CFR Part 63 Subpart AAAA. On January 16, 2003 the US EPA promulgated the landfill NESHAP under the authority of CAA, section 112. The Landfill NESHAP applies to major sources (Title V facilities) and contains the same requirements as landfill emissions guidelines and Landfill NSPS, but add requirements for startup, shutdown, and malfunction (SSM), operating conditions, and deviations for out-of-bound monitoring parameters (see Table 3). Table 2 below shows a breakdown of Title V and Non Title V MSW landfills by county in which they operate.

**Table 2.** Title V and Non Title V MSW Landfills by County

County	Title V	Non Title V	Total
Los Angeles	17	29	46
Orange	6	9	15
Riverside	3	9	12
San Bernardino	7	3	10
<b>Total:</b>	<b>33</b>	<b>50</b>	<b>83</b>

The NESHAP Landfill regulation makes reference to a guidance document that explains how to prepare a startup, shutdown, and malfunction plan (SSM Plan) for municipal solid waste landfills. The guidance document requires those landfills that have a collection and control system or who must install one, to prepare a SSM Plan. This subpart addresses concerns with the malfunction of landfill gas collection, control, and treatment systems and

requires landfills to document the reasons causing the malfunction, corrective measures taken, and measures taken to prevent future problems.

In the District there are thirty-three Title V MSW landfills facilities (under Standard Industrial Classification Code 4953, 1600, 9711; NAICS Code 562212) and fifty facilities that are not required to have Title V permits. The thirty-three Title V facilities are required by Part 70 and 71 of the Clean Air act to have a SSM Plan and are thereby required to follow the procedures in the plan during startups, shutdowns, and malfunction. Table 3–Comparison of MSW Regulations–has been prepared to show a comparison between the proposed amended Rule 1150.1, guidance document, and NESHP Regulation Subpart AAAA.

## Final Staff Report

**Table 3.** Comparison of MSW Regulations

Category	Proposed Amended Rule 1150.1	U.S.EPA CTG	USEPA NESHAP 40 CFR 63 Sub-Part AAAAA
Purpose	To prevent public nuisance and possible detriment to public health	The document is intended to explain how to prepare a startup, shutdown, malfunction plan for MSW facilities	Establishes National Emission Standards for Hazardous Air Pollutants for existing and new municipal solid waste landfills
Applicability	Rule 1150.1 applies to each active and inactive MSW landfill	Owner and operators of MSW landfills who need to comply with NESHAP requirement for startup shutdown malfunction plans	Applies to MSW landfills that are a major source >= 10 tons/yr HAP or 25 ton/yr combo HAP or facility > 2.5MM Mg design capacity
Averaging Provisions	None	None	None
Units	<ul style="list-style-type: none"> <li>▪ ppmv</li> <li>▪ Percent by volume</li> </ul>	None	None
Operating Parameters	Uses current source test results and conditions of S/T as operation parameters and operation limits	For equipment associated with collection and control of landfills gas regulation requires records of standard operation procedure to prevent emissions to atmosphere	The NESHAP refers to guidance document for records and reporting for control and collection equipment operation parameters
Method to Determine VOC	U.S.EPA Method 21 U.S. EPA Method 18	Not Identified	Subpart AAAAA refers to Subpart WWW for US EPA Method 21 and Method 18
Capture Efficiency	U.S.EPA Method 25 U.S. EPA Method 18	Not Identified	Subpart AAAAA refers to Subpart WWW for US EPA Method 25 and Method 18
Control Device Efficiency	U.S.EPA Method 25 & 18	Not Identified	U.S.EPA Method 25 & 18
Work Practices	<ul style="list-style-type: none"> <li>▪ Boundary monitoring</li> <li>▪ Surface and subsurface sampling and monitoring</li> <li>▪ Collection system pressure monitoring</li> </ul>	Not Identified	Active landfills must comply with subpart WWW sampling and monitoring requirements
Monitoring	Done by monthly sample collection and testing for pressure, temperature TOC and TAC	Not Identified	Regulation refers to subpart WWW for monitoring requirements
Reporting	Annual source test report, annual report, when needed closure & decommissioning report	Document outlines the content, for required records to be contained in report and form, and frequency of required reports	Regulation refers to Guidance document for SSMP for landfill control and collection systems reporting requirements
Recordkeeping	Rule requires records for: all control equipment testing, results from monthly and quarterly monitoring and sampling, combustion device temperatures readings, flow records from control devices	Document details the form and content of the SSM plan and the data from the gas control system and the gas treatment system to be recorded. Requires a description of each process and occurrence and duration of each malfunction. The action taken to correct malfunction and any deviation from the plan.	Comprehensive records required annually to support compliance with NESHAP

## **SOCIOECONOMIC ASSESSMENT**

The proposed amendment is mostly administrative and will coincide with the implementation of CARB regulations for MSW landfills which affect landfills in the South Coast Basin. The proposed amendment is not expected to result in adverse socioeconomic or environmental impacts since the proposed rule does not significantly affect air quality or emissions limitations, and does not impose new controls. However, facilities may have additional administrative costs if they choose to pursue or amend an existing Rule 1150.1 Compliance Plan to request alternatives to the new requirements of the proposed amendment. However, by including state and federal requirements in Rule 1150.1 and implementing the CARB regulation locally, these costs should be offset through the minimization of duplicate recordkeeping and reporting.

## **CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

The SCAQMD has reviewed the proposed project pursuant to the CEQA Guidelines §15002 (k)(1), the first step of a three-step process for deciding which document to prepare for a project subject to CEQA. Staff has prepared a Notice of Exemption (NOE) for Proposed Amended Rule (PAR) 1150.1 for the following reasons: 1) the proposed amendments incorporate state regulations adopted by the California Air Resources Board (CARB) that specify requirements for municipal solid waste landfills; and 2) collection and control equipment required by CARB's regulation has already been installed and is currently in operation at all affected South Coast Basin municipal solid waste landfills since the adoption of the current rule on April 5, 1985. Since the proposed project is approving established regulations and will not require new equipment that would generate new adverse environmental impacts, it can be seen with certainty that the proposed project has no potential to adversely impact air quality or any other environmental area and is exempt from CEQA pursuant to state CEQA Guidelines §15061 (b)(3) – Review for Exemption. The Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside and San Bernardino counties immediately following the adoption of the proposed project.

## **DRAFT FINDINGS UNDER CALIFORNIA HEALTH AND SAFETY CODE SECTION 40727**

Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing rules, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication and reference, based on relevant information presented at the hearing. The draft findings are as follows:

**Necessity:** The AQMD Governing Board has determined that a need exists to amend Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, to improve consistency with CARB's Regulation to Reduce Methane Emissions from Municipal Solid Waste Landfills in terms of monitoring limits and recording and reporting requirements and to implement the requirements of 40 CFR, Part 63 Subpart AAAA – National Emissions Standards for Hazardous Air Pollutants: Municipal Solid Waste Landfills.

**Authority:** The AQMD obtains its authority to adopt, amend or repeal rules and regulations from California Health and Safety Code Sections 39002, 39650, 40000, 40001, 40440, 40441, 40463, 40702, and 40725 through 40728, 41508, 41700, and 42300.

**Clarity:** Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, as proposed to be amended, is written or displayed so that its meaning can be easily understood by the persons directly affected by it.

**Consistency:** Proposed Amended Rule 1150.1 - Control of Gaseous Emissions from Municipal Waste Landfills is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or federal or state regulations.

**Non Duplication:** Rule 1150.1 - Control of Gaseous Emissions from Municipal Solid Waste Landfills, as proposed to be amended, does not impose the same requirements as any existing state or federal regulations, and the amendments are necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD. The proposed amendment consolidates existing state and federal requirements.

**Reference:** This regulation would implement, interpret or make specific the provisions of: Health and Safety Code Sections 40001 (rules to achieve ambient air quality standards), 40440(a) and (c) (rules to carry out the Air Quality Management Plan and rules which are also cost-effective and efficient), 40702 (rules to execute duties necessary to preserve original intent of rule), 40910 et seq., (California Clean Air Act), and Federal Clean Air Act §111 (New Source Performance Standards).

## COMMENTS AND RESPONSES

### Public Comments

A public workshop was held on June 25, 2010 in which approximately 15 people attended. Participants provided comments at the meeting and three followed up letters were received. The following section summarizes the comments received at the meeting and staff's responses.

### **Comment #1**

Will implementation of this AB32 regulation require additional CARB oversight or delegation to the District with respect to inspections and other enforcement activities? Full delegation to the District is preferred.

### **Response**

Local air districts that currently have regulations for landfills or adopt a rule can enter into a Memorandum of Understanding (MOU) with CARB to be responsible for implementing the rule for the state. SCAQMD is proposing to amend Rule 1150.1 to include all State requirements so as to minimize the recordkeeping and reporting burden associated with reporting to two agencies. CARB staff will likely review and audit implementation activities by air districts.

### **Comment #2**

What are the expected emission reductions from PAR 1150.1?

### **Response**

The proposed amendment to Rule 1150.1 is not expected to result in emission reductions. Although the proposed integrated monitoring limit represents a reduction from 50 to 25 ppmv because records have shown monitoring results consistently below 25 ppmv in the majority of landfills, the proposed amendment would only reflect current emission levels rather than result in actual reductions.

### **Comment #3**

Because AB32 is currently being challenged under a ballot measure in November, it may be prudent to delay consideration of PAR 1150.1 until December.

### **Response**

Consideration of PAR 1150.1 has been delayed until after the November 2010 election.

### **Comment #4**

Will landfills be allowed to maintain existing approved alternatives under PAR 1150.1, or will they need to re-apply for them?

### **Response**

Compliance plans would need to be updated for Title V facilities when their 5-year renewal cycle occurs, to reflect the most recent rule requirements. If the facility does not need to request an approved alternative because of changes to the rule, then no action would be required. To add to an existing compliance plan, an application would be necessary.

### **Comment #5**

PAR 1150.1 refers to different plans, including a design compliance plan and an alternative compliance option. What are the differences between the different plan types, and if there is no difference, can PAR 1150.1 be modified to use consistent terminology?

### **Response**

Staff agrees and the rule language has been changed to remove the term “Compliance” when referring to the Design Plan. In addition, the CARB regulation reference to use of the term “Alternative Compliance Option” is equivalent to the term “alternative” in the proposed amendment.

### **Comment #6**

Previously, Rule 1150.1 required extensive work in developing a set of alternative work practices that both the District and the landfills could agree to. Under PAR 1150.1, will the District support a collaborative effort to expedite development of additional alternatives?

### **Response**

Yes, staff will work with landfill operators to streamline the alternative approval and Rule 1150.1 Compliance Plan process.

### **Comment #7**

The translation from source test results to parameter requirements in PAR 1150.1 should be clarified further.

### **Response**

In response to this comment, staff has improved references from subparagraph (d)(1)(C) which require an operational need for source testing for control devices and refers to paragraph (e)(7) monitoring requirements which call for monitoring of parameters used in source tests.

### **Comment #8**

There is a concern about the requirement for continuous operations, while AQMD anticipates breakdowns; paragraph (d)(14) requires continuous operations. We suggest wording that would comply with CARB Rule 95464(e). Proposed paragraph (d)(14) anticipates that SCAQMD's breakdown provision is broad enough to cover the intent of the CARB provisions. However, we have at least one situation at a landfill where annual preventative maintenance on an Edison substation causes us to shut our system down for about eight hours. This is technically not a breakdown, and under the new language would cause us to now get a variance.

### **Response**

The proposed amendment allows for use of approved alternatives. This situation is appropriate for case-by-case review and evaluation, and may also be more appropriately included as permit conditions, since maintenance, and particularly scheduled maintenance, is dependent on the type of control used. This would not require a variance.

### **Comment #9**

The PAR and staff report indicate that the regulation intends to use the Title 27 probe requirements, but the rule was not adequately changed to do this, and requires compliance with both requirements. The probes should meet Title 27 requirement, if applicable, or otherwise meet AQMD requirements.

### **Response**

Paragraph (d)(9) of the proposed amendment has been revised to require all active and inactive landfills that have not been given written approval by CalRecycle for installation of subsurface refuse boundary sampling probes to be required to design and install according to Attachment A sections 1.1.

### **Comment #10**

It is our understanding that the CARB regulation allows for 120 days to install and operate new wells whereas Rule 1150.1 and PAR 1150.1 only allow 45 days, which is a financial burden with little to no air quality benefit, as the wells may not be fully compliant during initial startup. It is recommended that the time period be extended to 120 days for consistency and to reduce compliance costs.

### **Response**

The current rule requirements under subdivision (e) allow for 45 days so changing to 120 days would be a relaxation of the current SIP approved rule. However, subparagraph (i)(2) of the proposed amendment provides for use of approved alternatives for landfills that can demonstrate sufficient additional need.

### **Comment #11**

The requirement under clause (d)(1)(C)(iv)(IV) for sufficient flow of commercial natural gas is impractical to implement and would represent a significant cost impact.

### **Response**

Staff has reviewed this comment relative to the CARB regulatory requirement and removed this requirement from the proposed amendment.

### **Comment #12**

Use of the term “vapor-tight integrity” seems to be contradictory with the nature of landfills. Landfills by nature release vapors. This term should be reviewed and revised.

### **Response**

The term “vapor tight integrity” was removed from the proposed amended language and replaced with revised language to meet the intent of this comment.

### **Comment #13**

Subparagraphs (e)(4)(B) and (e)(4)(C) require 10 days and 45 days, respectively, to address wellhead pressure repairs and new well installations. The first should be modified to indicate that the 10-day clock is measured from the time of the last repair rather than the first measurement, and the second should be modified from 45 days to 120 days.

### **Response**

Changes have been made to the proposed amended rule so that it is comparable to the CARB regulatory convention of 5 days from the first positive pressure reading; if the problem is not corrected, 15 days from the first positive pressure reading, and if not resolved, 120 days from the first positive pressure reading.

### **Comment #14**

The purpose of PAR 1150.1 should be updated to note that, with respect to control of methane that the purpose is to support implementation of AB32 rather than extend the purpose of the original Rule 1150.1, which is to address public nuisance and exposure to NMOC and TACs.

### **Response**

Staff has revised the proposed section of rule language to meet the intent of this comment to segregate the inclusion of methane emissions control from NMOC and TACs.

### **Comment #15**

The term (f)(2)(C) “closure” may need to be defined for clarity.

### **Response**

Staff has reviewed the proposed language and understands that the comment is intended to distinguish the difference between “closed” and “inactive.” Because use of the term “closure” is in context with adjoining rule language (e.g., “closure report”), staff did not make this change in the rule.

### **Comment #16**

Please see rule language in Rule 1110.2 related to source testing and consideration of violation notices, and consider using the same language for PAR 1150.1.

### **Response**

Staff agrees, and has revised the proposed amended language to incorporate language similar to Rule 1110.2.

### **Comment #17**

Term “insignificant risk” in paragraph (k)(3) is too broad and should be either defined or narrowed in scope.

### **Response**

Staff has reviewed the proposed amendment language relative to use of the term “insignificant risk”. Because the criteria identified in paragraph (k)(3) relates to pre-existing regulatory thresholds that are deemed “significant”, staff has changed the language in the proposed amendment to refer to “less than significant” rather than “insignificant”. This clarification is not expected to change how this provision is implemented.

### **Comment #18**

Staff should change (d)(16) to allow operation of the gas system to “prevent” fire in addition to “extinguishing” a fire. Preventing a fire is more critical than extinguishing the fire. We believe this addition falls within the intent of this section.

### **Response**

The intent of subparagraph (d)(16)(B) is to allow exceptions for turning off control and collection devices in the event of catastrophic events, in order to make repairs as part of a temporary shutdown. Staff understands the commenter’s request to replace “extinguishing” with “preventing”; however, staff believes that doing so would weaken the intent of the section, as compared to the same provisions in the CARB regulation. Therefore no change was made in the section.

### **Comment #19**

The issue of operating parameters in (d)(1)(C)(ii)(IV) [The enclosed flare shall be operated within the parameter ranges established during the initial or most recent source test] and (d)(1)(C)(iv)(VI) needs to be clarified.

### **Response**

The requirements of clause (d)(1)(C)(ii) apply to enclosed flares while clause (d)(1)(C)(iv) applies to enclosed control devices other than flares. Both require operation within source test parameters.

### **Comment #20**

In (d)(1)(C)(i), add the Lean Burning Engine requirements due to cross-references. Revising this section allows (d)(1)(C)(iii)(I) to be eliminated.

### **Response**

Staff has reviewed the clause referring to Lean Burn Engines. Clause (d)(1)(C)(i) lists general requirements for all control devices, of which lean burn ICEs are included. The specific requirements for lean burn engines would be appropriate in clause (d)(1)(C)(iv) requirements for “enclosed combustor or other than a flare”.

### **Comment #21**

In (e)(1) we would recommend using Title 27 requirements, or retaining the existing timeline requirements. It is not clear why the requirement on the second exceedance would be reduced from 10 days to 7 days.

### **Response**

Staff agrees and has revised the proposed amended language back to 10 days for the first occurrence, 10 days for the second occurrence and 45 days for the third.

### **Comment #22**

The allowance for annual monitoring in (e)(3) differs from 95469(a)(1)(c) by leaving out the word “area.”

### **Response**

The allowance in PAR 1150.1 (e)(3) applies to closed and inactive landfills, whereas Section 95469 of the CARB regulation applies to closed and inactive landfills as well as closed and inactive sections (areas) of active landfills. This was not extended to active landfills in the proposed amendment to allow a review by the Executive Officer of documentation for areas or sections that are closed or inactive in an active landfill. This review would be handled as part of an approved alternative under the proposed amendment.

### **Comment #23**

The timeline in (e)(4) should be made consistent with the CARB timeline, as the time periods (10 days versus 15 days) should be counted from the prior monitoring and not from the initial monitoring.

### **Response**

The five days for the initial exceedance has been changed to 10 calendar days and the second exceedance has been changed from 10 days to 20 days from the initial exceedance. This is comparable to the CARB convention of 10 days for the first occurrence and 10 days for the second from the last day of the first occurrence of exceedance. See also response to Comment #13.

### **Comment #24**

PAR 1150.1 subparagraph (e)(7)(C) should include the allowance for monitoring power plant components prior to a scheduled outage.

### **Response**

The wording in subparagraph (d)(13)(A) was moved to subparagraph (e)(7)(C), maintaining the intent to allow for monitoring during scheduled outages and scheduled maintenance.

**The following include additional comments that were received subsequent to the public workshop:**

### **Comment #25**

The gas probe monitoring requirements starting in paragraph (d)(9) are redundant for facilities permitted by CalRecycle as a Solid Waste Landfill. Recent changes to Title 27 require solid waste facilities to design and implement an approved gas monitoring plan. These plans were transmitted to SCAQMD prior to approval. With this change in Title 27, the requirements in Rule 1150.1 are unnecessary and may cause future issues. Suggest relying on Title 27 approved monitoring plans for permitted facilities and PAR 1150.1 compliance for all other facilities not currently regulated under Title 27 with respect to landfill gas migration.

### **Response**

Rule 1150.1 currently defers to Title 27 in the case of design and installation of subsurface probes. Specifically, the rule requires all active and inactive landfills that have not been given written approval by CalRecycle for installation of subsurface refuse boundary sampling probes to design and install such probes in accordance with Attachment A (sections 1.1 through 1.6 of the proposed amendment).

### **Comment #26**

The corrective action timeframe in Rule 1150.1 is inconsistent with Title 27 and the federal Subtitle D requirements for landfills. Title 27 requires immediate verbal notification, written 7 day notification describing measures taken or planned to protect human health and the environment and a corrective action plan within 60 days outlining the corrective actions taken to resolve the probe exceedance.

### **Response**

The proposed amendment has been updated to reflect the intent of your comment. While Title 27 allows five days from the first exceedance rather than 10 days under the proposed amendment, and a total of 60 days rather than 65 days under the proposed amendment, it is clear that meeting the requirements of Title 27 would not conflict with the requirements of the proposed amendment.

### **Comment #27**

CARB requires quarterly integrated and instantaneous monitoring; however, Rule 1150.1 requires monthly integrated and quarterly instantaneous monitoring. Suggest that the Proposed 1150.1 be revised to be consistent with

CARB. Not aware of the benefit for monthly integrated monitoring. Data should be presented to demonstrate how the additional cost to conduct this monitoring is justified.

### **Response**

The integrated monitoring sampling provides a snapshot of the state of compliance of the entire collection system and is more helpful than the instantaneous surface monitoring which is done quarterly. This is a benefit to public health by checking on a monthly basis that the system is in compliance. Making the requested change would be a relaxation of the SIP approved version of the rule, so this change was not made.

### **Comment #28**

The timeline for corrective action for any exceedance as a result of integrated, instantaneous or probe monitoring is inconsistent with CARB. Rule 1150.1 requires that the wellhead will be expanded within 45 days from the third exceedance, instead of 120 days from the third exceedance (CARB). It has been very difficult over the years to expand the system within 45 days from the third exceedance. There are numerous variables that influence the performance of the gas collection system. Adding a well to the gas collection system is more than simply drilling a new well. It involves connecting it to the gas collection system, bringing it online slowly to avoid increasing the well temperature, and readjusting nearby wells. Given the nature of solid waste disposal, the location of a new well or wells is not an absolute science; quite to the contrary, it is more of an educated guess. A new well may or may not produce the methane predicted. In this case additional wells are needed.

### **Response**

Staff recognizes that problems arise in wellhead replacement and repairs but that not all replacements and repairs require 120 days or more for compliance. Also this change would be a rule relaxation of a SIP-approved rule. However, similar to the CARB's regulation, MSW landfills can pursue an approved alternative, especially in situations where procurement of parts may be a continuing issue.

### **Comment #29**

Sec. (d)(9) and (10), (e)(1) and Attachment A 1.0 - suggest modifying the perimeter probe requirement in this PAR to allow CCR Title 27 to take precedence and eliminate conflicts between this rule and the state regulation.

### **Response**

Rule 1150.1 currently defers to Title 27 for design and installation of subsurface probes. Section 1.1 in Attachment A defers to CalRecycle requirements for the installation and design of subsurface probes compared to compliance with sections 1.1.1 to 1.1.4 (whenever possible). Paragraph (d)(9) of the proposed amendment requires all active and inactive landfills that have not been given written approval by CalRecycle for installation of subsurface refuse boundary sampling probes to design and install such probes in accordance with sections 1.1 through 1.4 of Attachment A to the proposed amended rule.

### **Comment #30**

Sec. (d)(16) - We do not agree with the proposed requirement as it applies to older, smaller sites located in arid and semi-arid regions to keep negative pressure on wellheads. Many of these sites have several wells turned off due to poor gas quality and can show pressure is a function of temperature and barometric pressure. The wells have 0.01 to 0.05 inches of water column. We want to maintain the wells in case of wet years, which cause an increase in gas production. This section should consider the increased potential for landfill fires caused by the continuous, and perhaps unnecessary, introduction of vacuum to the refuse prism creating an oxygen rich environment.

### **Response**

The CARB regulation for MSW landfills contains the same negative pressure requirements for all wellheads, so SCAQMD staff cannot omit this requirement. Similar to the allowances provided for in the CARB regulation, subparagraph (i)(2) of the proposed amendment provides for use of an approved alternative for landfills that can demonstrate sufficient need.

### **Comment #31**

Sec. (e)(3)(A) and (f)(1) - These sections require that records be maintained at the landfill site. Most of the sites we operate are remote un-manned sites. We recommend some language that allows the records to be kept at the “agency headquarters.”

### **Response**

This has been re-worded in the proposed amendment. Please see paragraph (f)(1).

### **Comment #32**

Section (f)(1)(D) - Remedial action should not be required for exceedances of 200 ppmv as stated in this section. This should be removed as remedial action under Proposed Amended Rule 1150.1. The CARB rule only requires action for exceedances of 500 ppmv.

### **Response**

Staff has revised the proposed amended language.

### **Comment #33**

Section (k) - We strongly suggest that subdivision (k) include exemptions similar to the CARB rule based on the landfill size, such as the 450,000 tons of waste-in-place threshold set forth in the CARB rule.

### **Response**

While the CARB regulation uses a 450,000 ton threshold to determine if a Gas Collection and Control System is required, current Rule 1150.1 historically has not had an exemption threshold and to incorporate one would be a relaxation of a SIP-approved rule.

### **Comment #34**

SCAQMD should hold more public workshops so that many of these comments and suggestions may be discussed in more detail. The schedule for adoption of this rule should occur later to allow for those detailed discussions to occur.

### **Response**

Staff has met with individual commenters subsequent to the public workshop, based on expressed interest and have incorporated the results of these discussions into the proposed amendment.

**The following include additional comments that were received subsequent to the release of the draft staff report:**

### **Comment #35**

We wish to clarify that the PAR will become effective 1/1/11, per Section (g). The State has indicated that the regulation implementation date could be pushed back to July 2011. Will SCAQMD also push back the date for implementing the proposed changes to Rule 1150.1?

### Response

The District has incorporated into the amended rule an effective compliance date of July 1, 2011. This date would apply to facilities that need to amend their compliance plans in order to comply with the amended rule, provided that applications for alternatives be submitted April 1, 2011 for approval prior to the July 1, 2011 compliance date.

### Comment #36

We appreciate the added language of Section (m) that recognizes Proposition 23, however, we are concerned that if Proposition 23 passes, there could be legal challenges staying the suspension of AB32, leaving the landfill industry in “limbo” until AB32 is actually suspended [**Section (m) is triggered only if AB32 is suspended**]. Therefore, we would propose the following alternate language:

*If the state ballot measure to suspend AB32 is approved, the provisions of this rule shall not become effective until it is found that AB32 is suspended, at which time the provisions of this rule will revert to the March 17, 2000 version. If the state ballot measure is approved and its implementation stayed by legal challenges, the provisions of this rule shall only come into effect if it is found that the ballot measure is not valid for the provisions of Article 4, Subarticle 6, sections 95460 to 95476, title 17, of the California Code of Regulations (Methane Emissions from Municipal Solid Waste Landfills).*

### Response

Subdivision (m) has been removed from the proposed amendment following the November 2010 election and the resultant “no” vote outcome on Proposition 23.

### Comment #37

Section (d)(9) requires compliance with Section 1.1 through 1.6 of Attachment A if subsurface probes have not been issued prior written approval. Most landfills have gotten their existing probe systems grandfathered in as part the Compliance Plans issued under the 1998 Rule 1150.1 modifications. As the SCAQMD is aware, many of the landfills operating in the SCAB have gone through extensive upgrades to their probe systems as a result of the new Title 27 provisions that have been overseen by CalRecycle. Many of us have not yet updated our Compliance Plans to reflect these changes, nor received written approval from the SCAQMD. As currently written, the PAR 1150.1 would require all the landfill owner/operators who have upgraded, or are in the process of upgrading their probe systems to now have to reapply to the

SCAQMD and demonstrate compliance with the provisions of Section 1.1 through 1.6 of Attachment A.

The approval process undertaken by CalRecycle for new or modified probe systems is a case-by-case determination based upon the underlying geology of the landfill. The resultant probe construction and placement may or may not be fully consistent with the requirements outlined in Attachment A, but the overall system will be more protective of preventing landfill gas migration than following the more general approach outlined in Attachment A. Although the “response to comments” in the draft Staff Report seems to indicate that the Title 27 probe systems take precedence over the SCAQMD design approach, the actual rule language specifies clearly that both Title 27 and PAR 1150.1, Section 1.1 through 1.6 of Attachment A, must be met. We suggest the following amended language Section 1.1 in Attachment A to ensure that the Title 27 subsurface probe approval process under CalRecovery would be the primary authority for probe system approval:

*It is the District’s intent that subsurface refuse boundary probes required by paragraph (d)(9) of Rule 1150.1 be designed and installed in such a manner as to comply with the requirements set forth in Title 27, as administered by of CalRecycle ~~(whenever possible)~~, if applicable. If the Title 27 probe requirements are not applicable, then ~~and~~ meet the requirements set forth in Sections 1.1.1 through 1.1.4. Irrespective of Title 27 probe applicability, the Executive Officer may make a finding that more stringent probe requirements are necessary.*

### **Response**

The proposed amendment is not intended to modify the intent of existing rule language relative to Attachment A and subsurface refuse boundary sampling probes. Historically, upgrades to the subsurface monitoring system, whether driven by Title 27 or otherwise, have been addressed via the Rule 1150.1 Compliance Plan through approved alternatives. The District intends to continue this practice, and has not proposed any changes to existing rule language in this regard. While the District understands the efforts landfills have undertaken to comply with the provisions of Title 27, because the focus of CalRecycle is not identical to that of the District with respect to gas migration, the District intends to continue to reserve the option to review and evaluate subsurface gas migration monitoring systems with respect to air quality impacts, as provided for in existing rule language.

### **Comment #38**

In Section (d), it is still not clear when a Design Plan is needed or existing plans need to be updated. The language seems to indicate that if we have valid permits for the gas collection and control systems and meet the

requirements of Section (d)(1)(A) through (d)(1)(C), then a Design Plan is not needed. Is this interpretation correct? However, what happens if we are expanding the gas system or control system requiring new or modified permits? Section (d)(3) seems to indicate that in this situation, we would need to amend “*the existing design plan to include any necessary updates or addenda.*” If our interpretation of (d)(3) is correct, as stated above, we would object to this approach. Design plans have never been part of the Rule 1150.1 process and would represent additional administrative work that is unnecessary. The SCAQMD has successfully relied on permits and alternative Compliance Plans to ensure systems are in place to meet the stringent surface gas standards, and in fact by your own writings, the industry has already been mostly in compliance with the new 25 ppm integrated threshold. We see no reason to deviate from this successful approach. Therefore, to address this concern, we would suggest the following amendment to Section (d)(3):

*Any owner or operator of existing gas collection and gas control systems who modifies those systems to meet the requirements of this rule shall submit for approval to the Executive Officer an amendment of any existing design plans to include any necessary updates or addenda, unless the proposed system will be issued a valid Permit to Construct or Permit to Operate that meets the requirements of subparagraphs (d)(1)(A) through (d)(1)(C).*

This approach would now be consistent with the language in Section (d)(1).

### **Response**

If a design plan was not previously required under Rule 1150.1, updates to a design plan would not be required; rather any updates subject to the proposed amendment would be addressed through the landfill permit or compliance plan as appropriate.

### **Comment #39**

We would like to clarify that the natural gas or propane flow referred to in Section (d)(1)(C)(ii)(III) is to the pilot, not the burner.

### **Response**

The wording for subclause (d)(1)(C)(ii)(III) is identical to the CARB regulation and the District intends to maintain equivalency with both the language and the intent. *See also response to CARB comment #4.*

### Comment #40

In Section (d)(1)(C)(ii)(IV), the parameter of importance (for enclosed flares) is temperature, which already has limits contained within Rule 1150.1. Therefore, we suggest the following minor modification to the language:

*The operating parameters to be monitored are specified in paragraph (e)(7)(A)(i).*

### Response

Paragraph (e)(7) refers to subparagraph (e)(7)(A), which includes the requirements associated with (e)(7)(A)(i) and (e)(7)(A)(ii); because it accomplishes the same intent as the comment, no change is proposed.

### Comment #41

Section (d)(1)(C)(iv) is still problematic. As currently written, it could be read that engines must meet the 99% destruction efficiency. We suggest the following amendment to (iv)(I):

*The gas control device shall achieve a methane destruction efficiency of at least 99% by weight; or if a lean burn combustion engines, shall instead reduce the outlet ....*

Section (d)(1)(C)(iv)(II) should be removed because it is repetitive and once again could indicate that engines need to meet the 99% destruction efficiency.

Section (d)(1)(C)(iv)(V) is too broad. We suggest the following rule language amendment:

*The operating parameters to be monitored, for flares, are specified in paragraph (e)(7)(A)(i), and for all other devices, in paragraph (e)(7)(B).*

### Response

Subparagraph (d)(1)(C)(iv) is the same as in the CARB regulation for gas control devices other than flares. In order to maintain equivalency and intent no changes are proposed. Staff agrees that subparagraph (d)(1)(C)(iv)(II) is redundant and has revised the proposed amendment accordingly. Finally, staff believes that the proposed alternative language of the last part of this comment is not needed to improve the intent of the rule and therefore no changes are proposed.

### Comment #42

We need to discuss the temperature requirements that are established in Sections (e)(7) and (f)(1)(L)(i). When Rule 1150.1 was revised in 1998, we

received the temperature exception language for boilers, but not for other devices such as engines and turbines. The temperature requirements should only apply to flares to establish a surrogate for destruction efficiency of toxics and VOCs. Other combustion devices achieve high destruction efficiency by other means that are not easily measured. Do we need a rule change to reflect this, or can this simply be handled in the Compliance Plans as an alternative?

### **Response**

Staff believes that this situation is best handled as an alternative in an approved compliance plan, due to the case-by-case specificity of the assessment.

### **Comment #43**

In Section (f)(4), is the “responsible company official” the same as in Title V? Realize that every landfill impacted by Rule 1150.1 is not necessarily a Title V facility.

### **Response**

The proposed language “responsible company official” has been changed to “responsible official” to reflect the intent of this comment and maintain equivalency with the CARB regulatory language.

### **Comment #44**

Section (f)(1)(H), requires recordkeeping for instances of construction where solid waste material is exposed. This broad language would include installation of gas systems, for instance, that are normally exempt. We believe that this recordkeeping is unnecessary and actually satisfied by other SCAQMD requirements or regulations. For example, permits to construct for gas system installations have requirements for minimizing odors and emissions associated with these activities. Other categories of construction that expose solid waste are covered under Rule 1150, requiring a detailed plan. This extra level of recordkeeping is unnecessary and not consistent with the streamlining efforts SCAQMD is trying to achieve. We therefore recommend the following language to address these concerns:

*During construction that requires exposing solid waste material to the atmosphere, the following records are required unless adequate mitigation is prescribed in a Permit to Construct and/or operate, or a Rule 1150 Excavation Management Plan.*

### **Response**

While permit conditions may cover the same requirements for records as a regulation or rule, this does not require landfills to maintain two sets of records, rather the same set of records would satisfy both conditions. Inclusion of recordkeeping requirements as part of rule making ensures consistency for affected sources, including permitted and new sources.

### **Comment #45**

Does the current version of Rule 1150.1 that has been deemed to be equivalent to the Federal EG regulation, not the NSPS standards for new landfills, as described on page 5? The new landfill NSPS standards are enforced by AQMD separately from Rule 1150.1.

### **Response**

Although the District has incorporated the provisions of the NSPS into Rule 1150.1, federal regulations may be cited separately in enforcement matters where applicable.

### **Comment #46**

On Page 8 the required destruction efficiencies are described for enclosed combustion devices, however, it is not indicated that these requirements do not apply to engines that have a separate requirement of 3,000 ppm.

### **Response**

This section was updated to indicate that internal combustion engines have a separate requirement of 3,000 ppmv.

### **Comment #47**

Page 7 incorrectly describes wellhead pressure monitoring as an “updated standard” when it was incorporated from the CARB rule.

### **Response**

The wellhead pressure monitoring relative to the current Rule 1150.1 is an update.

### **Comment #48**

The description of integrated monitoring on the middle of page 7 is incorrect, integrated monitoring is done using instrument analysis of TOC over a 50,000 square foot grid, and selected grids are sampled for a lab analysis of TAC.

### **Response**

The wording was changed to reflect instrument analysis for TOC and lab analysis of TAC.

### **Comment #49**

Monitoring should be described as quarterly, not every 3 months (page 9).

### **Response**

The staff report correctly meets the intent of the comment by describing the period as quarterly. The parenthetical descriptor of “or every 3 months” identifies a quarter as three months and is neither regulatory language nor conflicting language.

### **Comment #50**

The method of hydrocarbon monitoring with location identification described on page 10 is under development and is not available.

### **Response**

No changes will be made to this section since the purpose of describing the hydrocarbon monitoring with location identification is not a regulatory requirement, but serves to illustrate methods that have been witnessed and may be used in the future.

### **Comment #51**

We are not aware of AQMD pre-approved forms for surface gas data, and are already monitoring using an AQMD approved instrument that integrates surface gas monitoring. Is a Guidance document (as described) being developed by the AQMD?

### **Response**

The wording “pre-approved” was changed to “approved” and refers to subdivision (f) that requires that forms, whether electronic or paper media, be approved by the Executive Officer.

### **Comment #52**

The last paragraph on page 11 should be revised to represent the rule’s timeline requirement for remediation of a positive pressure well to initiate action within 5 days, re-monitor within 15 days of the first exceedance, and if still in exceedance expand the gas collection system with any new wells being placed in operation within 120 days of the first exceedance.

**Response**

The staff report has been updated to replace the phrase “an additional 20 days” with the 5/15 day requirement to address the intent of this comment and for consistency with CARB’s regulation.

**CARB Comments**

The following summarizes the comments received from CARB (letter dated October 7, 2010) following release of the draft staff report and proposed amended rule.

**Comment #1**

General: On June 17, 2010, the Office of Administrative Law approved California Code of Regulations, title 17, article 4, subarticle 6, sections 95460 to 95476, Methane Emissions from Municipal Solid Waste Landfills (“regulation”) and filed it with the Secretary of State. The regulation became effective on the same day. ARB staff understands that SCAQMD is planning to implement and enforce the regulation by amending Rule 1150.1 to make it equivalent to, or more stringent than the regulation. We would like to make SCAQMD aware that it must enter into a Memorandum of Understanding with ARB regarding the implementation and enforcement of the regulation.

**Response**

The District is aware of the Memorandum of Understanding obligation and will enter into the appropriate agreement as needed.

**Comment #2**

Section (a) (Purpose): This section appears to isolate the reduction of methane emissions as a secondary benefit of proposed amended Rule. We suggest rewording this section as follows: “The purpose of this rule is to reduce methane (a greenhouse gas), non-methane organic compounds (NMOC), volatile organic compound (VOC), and toxic air contaminant (TAC) emissions from.....to prevent public nuisance and possible detriment to public health caused by exposure to such emissions.”

**Response**

Staff believes the currently proposed language identifies control of methane emissions as an additional benefit, not a secondary benefit. The currently proposed language was intended to address a public comment centered on the nature of methane as compared to the historically controlled pollutants.

See also response to Public Comment #14.

**Comment #3**

Section (d)(1)(A): (Active Landfill Design and Operation Requirements): This section requires the use of one of the equations in 40 CFR, Part 60, §60.755(a)(1) to determine the maximum gas generation flow rate. These equations are not equivalent because of their inability to allow for potential methane generation capacity variation on a year-to-year basis over the lifetime of the landfill, which is very important to the results. For equivalency, §95471(e) of ARB's landfill regulation (Test Methods and Procedures) requires the use of the 2006 Intergovernmental Panel on Climate Change Guidelines for National Greenhouse Gas Inventories, Chapter 3 (or, "IPCC model"), using a landfill gas capture factor of 75 percent to determine the captured gas expected flow rate from the total gas generation estimates of the IPCC model. The main advantages of the IPCC model is that it allows the user to: adjust the potential methane generation capacity on a year to year basis; use specific degradation parameters by waste type; use time delays other than six months; and correct for methane oxidation. The landfill gas tool developed by ARB staff is an acceptable method to use to compute the captured gas expected flow rate and is based on the IPCC model.

**Response**

Although the calculation models associated with subdivision (d)(1)(A) apply only to facilities that do not have gas collection and control systems and may not apply to locations within the District, staff agrees that reference to the updated equations is warranted for consistency and the proposed language has been revised accordingly.

**Comment #4**

Section (d)(1)(C)(ii)(III) (Active Landfill Design and Operation Requirements): This section reads as follows, "During restart or startup, an enclosed flare shall have sufficient flow of propane or commercial natural gas to the burners ....." For clarity, the phrase "to the burners" should be replaced with "to the pilot light."

**Response**

Although the District agrees with the intent of this comment, the wording of subclause (d)(1)(C)(ii)(III) was incorporated from CARB language [Article 4, subarticle 6 §95464, title 17, CCR (b)(2)(A)(3)]. The District would also like to maintain consistency with the adopted regulatory language and therefore has communicated consistent intent within the staff report while maintaining the regulatory language as adopted by CARB.

**Comment #5**

Section (g) (Active Landfill Compliance Schedule): This section incorrectly refers to the date “July 1, 2001.” The correct date should be “July 1, 2011.”

**Response**

The proposed amendment has been revised accordingly.

**Comment #6**

Section (h)(2) (Inactive Landfill Requirements): This section requires owners and operators of inactive MSW landfills without gas collection and control systems to install controls based on: surface methane concentrations exceeding 500 ppmv at any location on the landfill surface, the results of a screening questionnaire and solid waste air quality assessment test, and upon formal notification from the Executive Officer. This section is not equivalent to § 95463(b) of the regulation which states that owners and operators of all MSW landfills having 450,000 tons of waste-in-place or greater and a landfill gas heat input capacity of greater than or equal to 3.0 MMBtu/hr must either install a gas collection and control system, or conduct a surface test to demonstrate that there is no surface methane leaks of 200 ppmv or greater on the landfill surface after four consecutive monitoring periods.

For equivalency, section (h)(2)(B) of this section should be revised as follows:

“Submit the following data and/or meet the required action in paragraph (h)(1):

(iv) Calculate the landfill gas heat input capacity pursuant to § 95471(b) of California Code of Regulations, title 17, article 4, subarticle 6 and submit a Landfill Gas Heat Input Capacity Report to the Executive Officer. If the landfill gas heat input capacity is greater than or equal to 3.0 MMBtu/hr, the owner or operator must comply with paragraph (h)(3) or conduct a surface test to demonstrate that there is no surface methane leaks of 200 ppmv or greater on the landfill surface after four consecutive monitoring periods.

(h)(3) upon notification by the Executive Officer that a landfill gas collection and control system and/or.....comply with paragraph (h)(1).”

**Response**

The proposed language has been revised to change the surface test criteria from 500 ppmv to 200 ppmv in order to maintain equivalent stringency with the CARB regulation. It should be noted that paragraph (h)(2) is not expected

to apply to any facility located within the District, as evidenced by current district records and CARB's current inventory of inactive landfills, because there are no known inactive landfills located in the South Coast Basin without a collection system. This is due in large part to the current rule. As historically implemented, landfills that did not meet the less than 500 ppmv surface monitoring criteria (now proposed for revision to less than 200 ppmv) were required to submit information through the screening questionnaire and the solid waste air quality assessment test, pursuant to the Health & Safety Code subpart 41805.5, in order to determine the appropriate type of gas collection and control system that the landfill would be required to install. In no case has an inactive landfill been deemed to be exempted from installation of collection or control systems except as provided by provisions of subdivision (k). (*See also response to CARB comment #7*).

It is staff's position that the revised proposed amendment is at least equivalent in stringency, and perhaps more stringent to subpart 95463(b) of the CARB regulation because the revised proposed amendment, would not exempt landfills based solely on the amount of waste-in-place and gas generated rate, but also relies on additional criteria, including an evaluation of toxic air contaminant and public nuisance risk.

**Comment #7**

Section (k) Exemptions: This section temporarily exempts a MSW landfill from all or any portion of the requirements of the Rule based on toxic air contaminant emissions and health risk analysis, proximity to sensitive receptors, emission migration, and other criteria, but does not significantly consider these exemptions from a greenhouse gas perspective. This section is not equivalent to § 95463 (Determination for Installing a Gas Collection and Control System) of the regulation and should be revised as follows:

“An MSW landfill may be temporarily exempt from all or any portion of the requirements of this rule if.....

(1) The MSW landfill complies with.....

(5) The MSW landfill is closed or inactive and has a landfill gas heat input capacity of less than 3.0 MMBtu/hr. and submits a Waste-in-Place Report and all instantaneous surface monitoring records to the Executive Officer, or;

(6) The MSW landfill has 450,000 tons of waste-in-place or greater and a landfill gas heat input capacity greater than or equal to 3.0 MMBtu/hr and the owner or operator demonstrates to the satisfaction of the Executive Officer that after four consecutive quarterly instantaneous monitoring

periods there is no surface methane leak exceeding 200 ppmv. If the landfill is active the heat capacity must be re-calculated annually.

(A) If the MSW landfill is closed or inactive and passes the surface demonstration test; the owner or operator must submit a Waste-in-Place report and all instantaneous surface monitoring records to the Executive Officer.”

### **Response**

Staff understands CARB’s comment to focus on the requirement to install gas collection and control systems based on a minimum gas generation rate. As such, staff has incorporated language into the proposed amendment to limit the exemption to the requirements of paragraphs (d) and (e) related to installation of such controls and maintain consistency with the state minimum threshold levels by allowing for exemptions based on the above commented criteria of quantity of waste in place, minimum gas heat input generated, and instantaneous surface monitoring results.

### **Comment #8**

Attachment A: We recommend that Figure 2 be revised to more accurately reflect a walking pattern based on 25 foot spacing. In addition, Figure 3 does not provide a column for recording methane concentrations. We recommend adding a column for tracking surface methane concentrations for both integrated and instantaneous surface monitoring.

### **Response**

Both Figure 2 (Typical Landfill Walk Pattern for a 50,000 square foot Grid) and Figure 3 (Quality Control Sheet) of Attachment A to the proposed amendment are illustrative examples for landfill owners and operators to refer to in the development of appropriate walking patterns and recordkeeping forms specific to individual locations. Because of the variability of landscapes and operational practices, it is neither expected, nor the practice under the current rule, for landfill owners and operators to follow the exact walking pattern depicted by Figure 2, or the exact replica of the Quality Control Sheet of Figure 3. However, to provide additional clarification, the title of Figure 3 has been updated to include the word “Typical” for consistency. Staff believes that Figure 2 and Figure 3 meet the intent to provide illustrative examples rather than define prescriptive requirements, and provide landfill owners and operators the flexibility to record the information and data needed to demonstrate compliance with the proposed amendment.

### Other Comments

In addition to the above comments, staff has received and reviewed numerous comments identifying typographical and grammatical errors, as well as cross-referencing updates. Staff appreciates the input and has updated the proposed rule language as appropriate.

### CONCLUSION

If approved, the proposed amendment to Rule 1150.1 will incorporate existing federal requirements and the requirements of the CARB regulation adopted to implement the AB 32 early action measure addressing methane emissions from municipal solid waste landfills. There is no expected significant cost increase associated with the proposed amendment because the collection and control equipment required by the CARB regulation have been installed and used by landfills within the District for more than twenty years to control non-methane organic compounds. This amendment consolidates requirements and will reduce redundant recordkeeping and reporting. The only potential cost associated with this amendment are some administrative costs that may occur if an approved alternative is pursued or a change to facility permits or plans is needed

BOARD MEETING DATE: February 4, 2011

AGENDA NO. 29

PROPOSAL: Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees

SYNOPSIS: Sections 182 and 185 of the Clean Air Act, as amended in 1990, require major stationary sources of NO<sub>x</sub> and VOC located in air basins that do not attain the federal one-hour ozone standard by the statutory deadline pay mitigation fees based upon a prescribed formula each year until attainment is demonstrated. The proposed amended rule provides for compliance with the Clean Air Act by utilizing a fee equivalent approach as provided in Section 172(e) of the Act. The fee equivalent approach recognizes funding from programs that are surplus to the SIP and provide for air quality improvement projects in the SCAQMD. Proposed Amended Rule 317 replaces 2007 AQMP Control Measure MCS-08, 1997 AQMP FSS-04 (same as in 2003 AQMP), and 1994 AQMP CTY-10.

COMMITTEE: Stationary Source, January 21, 2011, Reviewed

RECOMMENDED ACTION:

Adopt the attached resolution:

- 1) Certifying the Final Subsequent Environmental Assessment for Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees, and
- 2) Amending Rule 317 – Clean Air Act Non-Attainment Fees, to replace Control Measure MCS-08 of the 2007 AQMP and its predecessor control measures.

Barry R. Wallerstein, D.Env.  
Executive Officer

## **Background**

On December 11, 2009 US EPA mailed a letter to Governor Schwarzenegger effectively giving California notice that a sanctions clock would be started by the failure to adopt a rule for Section 185 fees. The 18 month sanctions clock officially started with the publication of the January 5 Federal Register notice regarding the South Coast Air Basin (FR Vol. 175 No.2 Tuesday 1/5/10 p. 232). Should the District fail to timely adopt a Section 185 rule, sanctions including higher offset ratios and loss of highway funding would occur. The rule must be submitted to EPA and found complete by EPA by July 5, 2011 to avoid sanctions. Moreover, US EPA would be required to adopt a federal plan to implement Section 185 and would collect the fee money directly if a Section 185 program is not approved by EPA by January 5, 2012.

US EPA provided guidance on Section 185 fees in its memo of January 5, 2010. The January 2010 memo also noted that Section 172 (e) of the act allows for programs that are “not less stringent” than the Section 185 program. Fee equivalent and emissions equivalent programs were identified as possible approaches under a Section 172 (e) construct. Fee equivalency may be approvable under the 172 (e) concept if the program “clearly raises at least as much revenue as otherwise required Section 185 fee program if the proceeds are spent to pay for emissions reductions that will further improve ozone air quality.”

Proposed Amended Rule 317 was developed to satisfy federal requirements for areas classified as severe and extreme that fail to attain the one-hour ozone standard by utilizing the provisions of Section 172 (e). Major sources will no longer be required to pay a fee. Instead, a fee equivalent approach utilizing monies from programs that are surplus to the one-hour ozone SIP and approved for use by CARB and US EPA has been crafted.

## **Proposal**

PAR 317 is based on a fee equivalency approach as provided by Section 172 (e) of the Clean Air Act and outlined in the US EPA memo of January 5, 2010. Section 172 (e) is an anti-backsliding provision of the CAA that requires US EPA to develop regulations to ensure that controls are “not less stringent” than those of the Section 185 program. The proposed amended rule will generate at least as much revenue as otherwise required under a Section 185 fee program. The Executive Officer of the SCAQMD will annually calculate fee obligations that would otherwise occur under a Section 185 fee program and use equivalent funding from alternative federal, state and local air quality improvement programs that are surplus to the one-hour ozone SIP to offset the Section 185 fee obligations.

The proposed rule requires the EO to establish a fee equivalent program fund. Credits and debits will be reconciled on an annual basis. Should the fund balance in the fee

equivalent program show a deficit for the prior year or the preliminary analysis of the fund balance for the current year drop below 110% of the prior year's Section 185 fee calculation, staff is required to develop and forward for adoption an alternative rule that will provide equivalent fees, including if needed, assessing each major stationary source individually for its proportional share of the fees required if any deficit should occur in the future. The proposed amended rule has the following elements:

#### **Establish Section 172(e) Fee Equivalent Account**

The staff proposal would establish a Section 172(e) fee equivalent account. Programs with funding mechanisms that provide for ozone-related air quality improvement projects in the SCAQMD and that are surplus to the one-hour ozone SIP will be used to fund a fee equivalent program. Only those programs that have been approved for use as part of Rule 317 by the Executive Officer of the SCAQMD, the Executive Officer of CARB, and the Regional Administrator of US EPA Region IX shall be included.

#### **Calculation and Tracking of Section 185 Fee Obligation**

District staff will calculate the fees required under a Section 185 program by using the US EPA prescribed formula comparing emissions in years subsequent to the baseline with the sources' actual emissions.

#### **Annual Determination of Equivalency**

Beginning in the initial year July 1, 2012, and continuing annually thereafter, the Executive Officer shall complete an equivalency demonstration to verify that adequate funding was available in the equivalency account for the prior calendar year to meet the calculated CAA Non-Attainment (Section 185) fee obligation. Any surplus funding available in the fee equivalency account will be carried forward to the following assessment year.

#### **Initial Annual Preliminary Determination of Equivalency**

Also an initial Annual Preliminary Determination of Equivalency shall be conducted, beginning July 1, 2012, and continuing annually thereafter. The Executive Officer shall complete a preliminary determination of equivalency to determine whether adequate funding is expected to be available in the Section 172 (e) fee equivalency account to meet the CAA Non-Attainment (Section 183) fee obligation for the current calendar year.

#### **Reporting Requirements**

Beginning no later than September 3, 2012, and continuing annually thereafter, the EO shall report to CARB and US EPA on the CAA non-attainment (Section 185) fee obligation, Section 172(e) fee-equivalent account balances and equivalency demonstrations.

### **Backstop Provision**

In the event the annual equivalency demonstration shows a deficit or a preliminary equivalency demonstration shows potential inadequate funding, this backstop provision requires the EO within 90 days to develop and bring to the Governing Board a backstop rule for adoption that would allow the Executive Officer to collect and/or track adequate fees for any shortfall. The Governing Board will have to act on the backstop rule within 120 days from the time of finding inadequate funding.

Development of this backstop rule, should the backstop provision of PAR 317 be triggered, will adhere to the traditional and legally required stakeholder and public participation process of the SCAQMD rule development process.

### **Preliminary Equivalency Determination**

Staff has reviewed the programs likely to fund the fee equivalency account and conducted a preliminary evaluation of the fee equivalency. Funding prior to program initiation is about \$110.2 million. Funding available subsequent to program initialization is a onetime amount of over \$45.4 million and on-going funding of \$34 million per year. Estimated funding is more than sufficient for the first several years of the program.

### **Key Policy Issues**

The effectiveness of a direct fee on major stationary sources to reduce VOC and NOx emissions is likely not as great as the use of monies to reduce emissions of VOC and NOx from mobile sources and infrastructure. Staff's approach builds on that concept as major stationary sources are already at BACT or BARCT with limited potential for further VOC/NOx reductions through additional control. In addition, major stationary sources contribute less than 10% of all ozone precursors and mobile sources contribute about 80%.

### **Emission Inventory and Emission Reduction**

Staff is not claiming credit for the emissions reductions likely to arise from the monies spent on mobile source and infrastructure programs. The emission inventory of major stationary sources subject to Section 185 fees will be tracked and reported annually.

### **CEQA**

PAR 317 is considered a "project" as defined by the California Environmental Quality Act (CEQA) and the AQMD is the designated lead agency. Pursuant to CEQA and AQMD Rule 110, AQMD staff prepared a Draft Subsequent Environmental Assessment (EA) to analyze potentially significant adverse environmental impacts that could be generated from the proposed project. The Draft Subsequent EA was circulated for a 20-day shortened public review and comment period from January 6, 2011 through January 25, 2011. AQMD staff's review of the proposed project

showed that the project would not have a significant adverse effect on the environment; therefore, pursuant to CEQA Guidelines §15252, no alternatives or mitigation measures were included in the Draft Subsequent EA. The Final Subsequent EA is attached to this Board agenda item as Attachment G.

### **Socioeconomic Analysis**

There are no anticipated adverse socio-economic impacts from the adoption of the present rule, since staff anticipates the aggregate Section 185 fee obligation for all major sources to be fully offset by the fee equivalency account. In the event that the fee obligation is not fully offset and a backstop provision is triggered staff will analyze any future potential socio-economic impact as part of the new rule adoption process.

### **Implementations and Resources**

Proposed Rule 317 will be implemented within current staffing levels. The accounting and reporting process will be integrated into existing processes.

## **ATTACHMENT A**

### **SUMMARY OF PROPOSED AMENDED RULE 317**

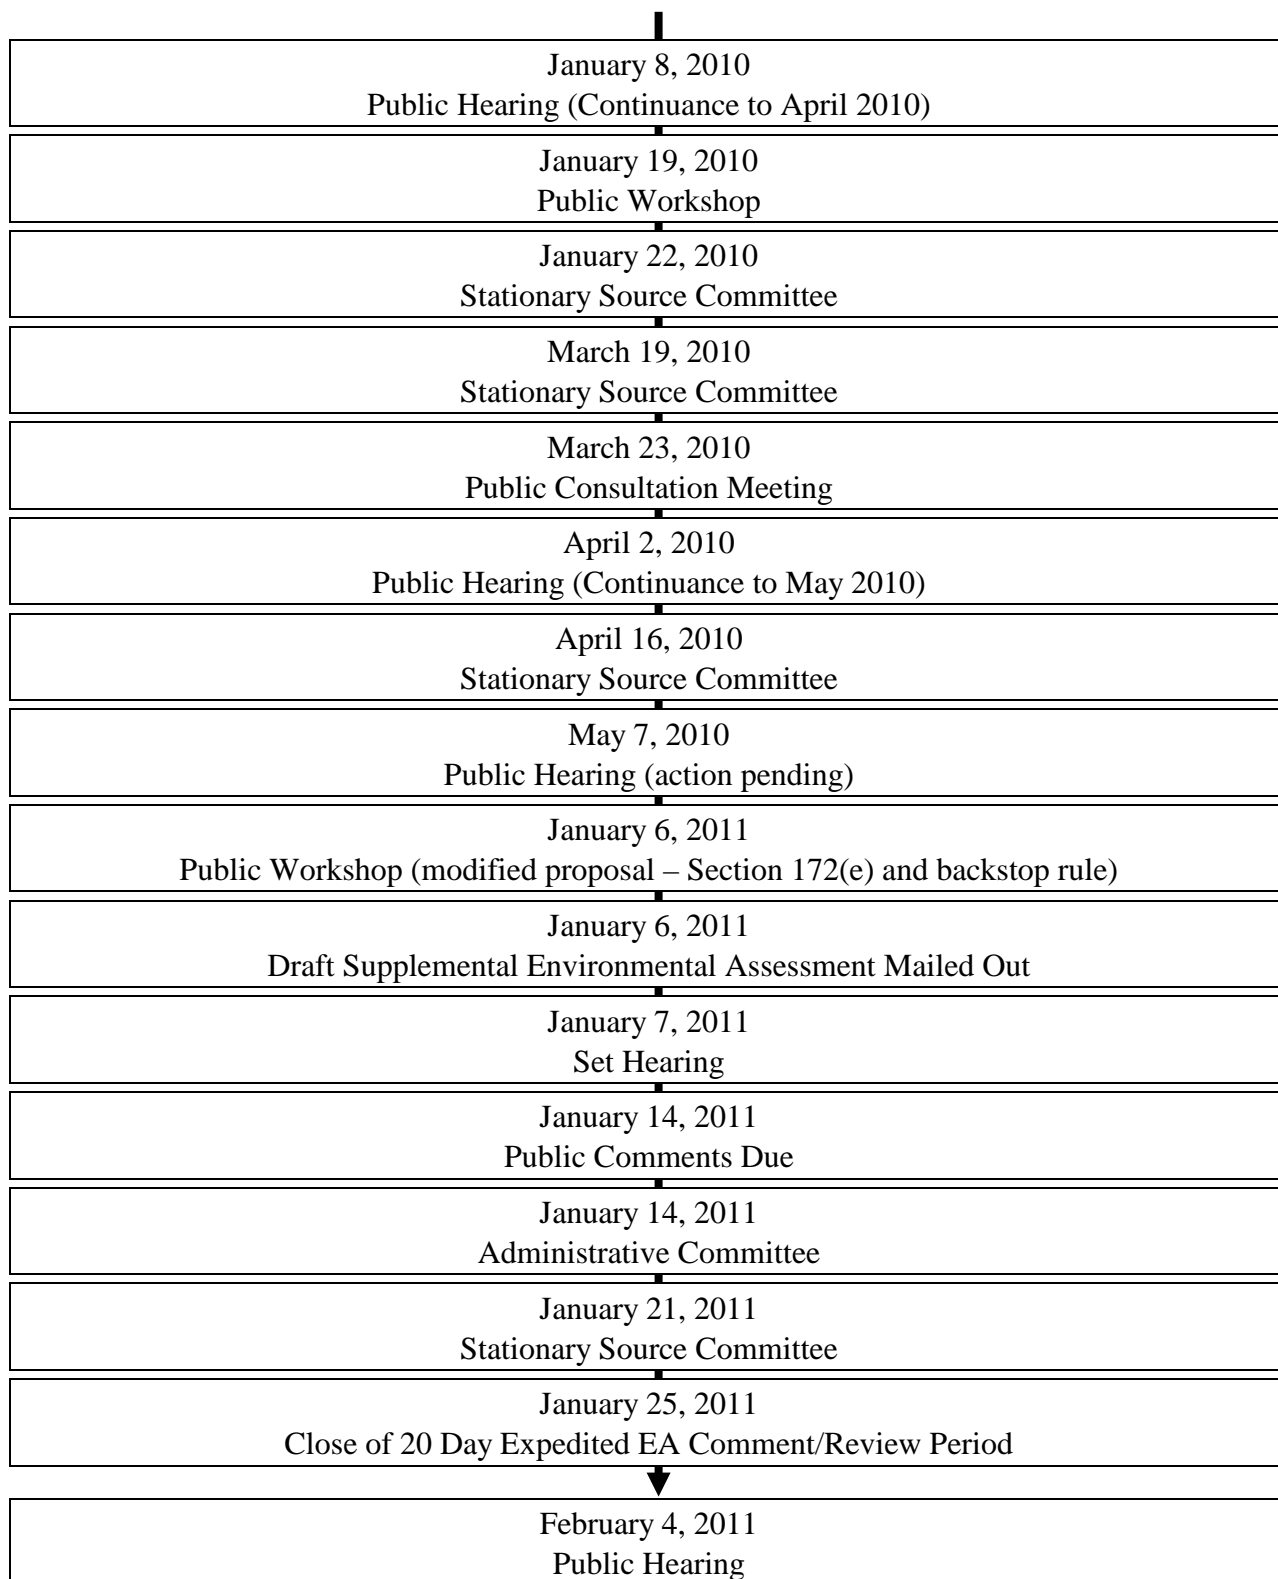

- Establishes Section 172(e) Fee Equivalent Account. Program eligibility is defined and funding established.
- Calculates and Tracks Section 185 Fee Obligation. The Executive Officer will calculate the fees that would otherwise be due under a Section 185 approach. An alternative baseline is included.
- Determines Initial Fee Equivalency. The Executive Officer will establish the account and ensure sufficient funding is available.
- Provides for Annual Reporting. An annual report will include a list of facilities, the Section 185 fee obligation, the Section 172(e) fee equivalent account balances, and the results of the equivalency determinations.
- Establishes a Mechanism for a Backstop Rule Should Funding Become Inadequate. Should funding drop below certain thresholds, the Executive Officer will forward a rule which may be based on a Section 185 approach.

**ATTACHMENT D**  
**RESOLUTION NO.**

**A Resolution of the South Coast Air Quality Management District (AQMD) Governing Board certifying the Final Subsequent Environmental Assessment (EA) for Rule 317 – Clean Air Act Non-Attainment Fees.**

**A Resolution of the AQMD Governing Board amending Rule 317 – Clean Air Act Non-Attainment Fees.**

**WHEREAS**, the AQMD Governing Board finds and determines that Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees, is considered a "project" pursuant to the California Environmental Quality Act (CEQA); and

**WHEREAS**, the AQMD has had its regulatory program certified pursuant to Public Resources Code Section 21080.5 and has conducted CEQA review and analysis pursuant to such program (Rule 110); and

**WHEREAS**, AQMD staff has prepared a Final Subsequent EA pursuant to its certified regulatory program and CEQA Guidelines §15168 and §15252, setting forth the potential environmental consequences of Proposed Amended Rule 317; and

**WHEREAS**, the Draft Subsequent EA determined the proposed project would result in no significant adverse environmental impacts; and

**WHEREAS**, the Draft Subsequent EA was circulated for 20-day shortened public review and comment period, no comments were received, and the Draft Subsequent EA has been revised such that it is now a Final Subsequent EA; and

**WHEREAS**, it is necessary that the adequacy of the Final Subsequent EA be determined by the AQMD Governing Board prior to its certification; and

**WHEREAS**, the Governing Board prior to voting on Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees, has reviewed and considered the Final Subsequent EA; and

**WHEREAS**, a Mitigation Monitoring Plan pursuant to Public Resources Code §21081.6, has not been prepared since no mitigation measures are necessary; and

**WHEREAS**, because the proposed project was determined to generate no significant adverse impacts on the environment, Findings and a Statement of Overriding Considerations were not required and, thus, not adopted for this project pursuant to CEQA guidelines §§ 15091 and 15093, respectively; and

**WHEREAS**, the AQMD staff report, the CEQA EA, this February 4, 2011 Board letter, and other supporting documentation was presented to the AQMD Governing Board and that the Board has reviewed and considered the entirety of this information prior to approving the project; and

**WHEREAS**, the AQMD Governing Board has determined that a need exists to adopt Proposed Amended Rule 317 - Clean Air Act Non-Attainment Fees, for the South Coast Air Basin also, in order to comply with the mandatory provisions of the 1990 amendments to the Clean Air Act §§181(d), 182(e), 182(f) and 185; and

**WHEREAS**, the AQMD Governing Board directs staff, in the event the backstop needs to be developed, to work closely with US EPA on rule language that ensures any fee credit given for Title V fees paid does not negatively impact implementation of Title V programs; and

**WHEREAS**, the AQMD Governing Board obtains its authority to adopt, amend, or repeal rules and regulations from Sections 39002, 40000, 40001, 40440, 40441, 40522.5, 40523, 40702, 40725 through 40728, and 41508 of the California Health and Safety Code and Clean Air Act §§182, 185 and 172(e); and

**WHEREAS**, The AQMD Governing Board has determined that Proposed Amended Rule 317 - Clean Air Act Non-Attainment Fees is written and displayed so that the meaning can be easily understood by persons directly affected.

**WHEREAS**, the AQMD Governing Board has determined that Proposed Amended Rule 317 - Clean Air Act Non-Attainment Fees, as proposed, is in harmony with, and not in conflict with, or contradictory to, existing statutes, court decisions, or state or federal regulations; and

**WHEREAS**, the AQMD Governing Board has determined that Proposed Amended Rule 317 - Clean Air Act Non-Attainment Fees, as proposed, does not impose the same requirements as any existing state or federal regulation, and the proposed amended rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD; and

**WHEREAS**, the AQMD Governing Board references the following statutes which the AQMD hereby implements, interprets or makes specific: Health and Safety Code Sections 40001 (rules to achieve ambient air quality standards), 40440(a) (rules to carry out the Air Quality Management Plan), Clean Air Act §185, Clean Air Act §§172(e), 181 and 182; and

**WHEREAS**, the AQMD Governing Board has determined that the socioeconomic impact assessment of Proposed Amended Rule 317 — Clean Air Act Non-Attainment Fees is consistent with the March 17, 1989 Board Socioeconomic Resolution for rule adoption and California Health and Safety Code § 40440.8(a) and (b) and 40728.5; and

**WHEREAS**, the AQMD Governing Board has determined that no adverse socioeconomic impact of Proposed Amended Rule 317—Clean Air Act Non-Attainment Fees— is anticipated; and

**WHEREAS**, a public hearing has been properly noticed in accordance with all provisions of Health and Safety Code, Section 40725; and

**WHEREAS**, the Governing Board finds and determines, taking into consideration the factors in §(d)(4)(D) of the Governing Board Procedures, that the modifications adopted which have been made to Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees since notice of public hearing was published do not significantly change the meaning of the proposed amended rule within the meaning of Health and Safety Code §40726 and would not constitute significant new information pursuant to CEQA Guidelines §15088.5; and

**WHEREAS**, the AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

**WHEREAS**, the adoption of PAR 317 also replaces Control Measure MCS-08 of the 2007 AQMP and its predecessor control measures including 2003 and 1997 AQMPs' Measure FSS-04 and 1984 AQMP Measure CTY-10; and

**WHEREAS**, the AQMD specifies the manager of Rule 317 as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of this proposed amended rule is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California.

**NOW, THEREFORE, BE IT RESOLVED**, that the South Coast Air Quality Management District Board does hereby certify that the Final Subsequent EA for Rule 317 – Clean Air Act Non-Attainment Fees was prepared in compliance with the California Environmental Quality Act statutes and CEQA Guidelines. This information was presented to the Governing Board, whose members reviewed, considered, and approved the information therein prior to acting on Proposed Amended Rule 317; and

**BE IT FURTHER RESOLVED**, that the AQMD Governing Board directs staff to prioritize the use of AB2766 funding for the Section 172(e) fee equivalency account funding and to itemize accounting of the Section 172(e) fee equivalency account showing the individual deposits into and withdrawals from the fund; and

**BE IT FURTHER RESOLVED**, that the AQMD Governing Board does hereby adopt, pursuant to the authority granted by law, Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees, as set forth in the attached, and incorporated herein by this reference.

CLERK OF THE BOARD

## PROPOSED AMENDED RULE 317 – RULE COVER PAGE

The ~~strikeout~~/underline language in the following rule adoption version, which is being released subsequent to the 30 day Set Hearing package previously released on 1/7/11, reflects changes due to comments received from US EPA on 12/17/10 and 1/12/11.

**ATTACHMENT E**

**PROPOSED AMENDED RULE 317. CLEAN AIR ACT NON-ATTAINMENT FEES**

(a) Purpose

The purpose of this rule is to satisfy requirements as specified in Sections 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the federal Clean Air Act (CAA) by utilizing a fee equivalency approach applying the principle in as provided by Section 172(e) of the CAA.

(b) Definitions

For the purposes of this rule, the following definitions shall apply:

- (1) ATTAINMENT YEAR is the calendar year that the Clean Air Act establishes for the Basin to reach attainment of the federal one-hour ozone standard pursuant to the CAA. Under the Severe 17 area designation, the attainment year is 2007. Under the Extreme area designation, the attainment year is 2010.
- (2) BASELINE EMISSIONS are emissions of VOC, NOx or both, (including major stationary source fugitive and unpermitted emissions), for which a source qualifies as a major stationary source, calculated using source information as reported to or amended by the District, through the District's Annual Emissions Report (AER) program, as follows:
  - (A) For an existing major stationary source prior to or during the attainment year, the baseline emissions shall be the average amount of the actual emissions, including fugitives and unpermitted emissions, during fiscal years 2005-06 and 2006-07 (emissions not to exceed allowables), and programmatically adjusted to account for regulatory effects between 2006 through 2010, for the South Coast Air Basin. For an existing major stationary source in the Salton Sea Air Basin prior to or during the attainment year the baseline emissions shall be AER emissions as reported to the District or amended by the District for the attainment year (emissions not to exceed allowables).

- (B) For sources that become subject to this rule ~~during~~ or after the attainment year:
- (i) For a non-RECLAIM major stationary source the baseline emissions shall be the amount of emissions allowed under the applicable implementation plan or the potential to emit (annual emissions including fugitives and emissions from unpermitted equipment).
  - (ii) For an existing RECLAIM source that subsequently qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of the RTC holdings at the beginning of the year available for use during the same calendar year or actual emissions during the calendar year the source becomes a major stationary source that do not exceed the RTC holdings at the end of the reconciliation period.
  - (iii) For a new RECLAIM source that qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of RTC holdings purchased at the beginning of the attainment year or the initial calendar year of operation, as applicable, or actual emissions during the calendar year, not to exceed RTC holdings at the end of the reconciliation period.

If a major stationary source is operational for a period of less than one calendar year in the attainment year or later, the allowable emissions or RTC credits or holdings based on subparagraph (b)(2)(B) (i through iii) as applicable, in the attainment year or initial year of operation, (including unpermitted and fugitives) shall be extrapolated over one full calendar year.

- (3) BASIN means either the Riverside county portion of the Salton Sea Air Basin (SSAB) or the South Coast Air Basin (SOCAB). The boundaries of each air basin shall be as defined by California Code of Regulations, Section 60104, Title 17.
- (4) CLEAN AIR ACT NON-ATTAINMENT FEE means the fee that would have been assessed to a major stationary source pursuant to Section 185 of

the 1990 amendments to the Clean Air Act (CAA). The annual VOC (CAA) Non-Attainment Fee (pursuant to Section 185) for a major stationary source of VOC and the Annual NO<sub>x</sub> CAA Non-Attainment Fee for, a major stationary source of NO<sub>x</sub> (a source may be a major stationary source for either VOC, NO<sub>x</sub> or both and subject to the applicable fee) for excess emissions of these air contaminants in accordance with Section 185 (b) of the CAA shall be calculated as follows:

$$\text{Annual CAA Non-Attainment Fee} = \$5,000 \times \text{CPIF} \times [ A - ( 0.8 \times B ) ]$$

Where:

A is the total amount of emissions actually emitted during the applicable fee assessment year for pollutants included in B, in tons. If A is less than or equal to 80% of B; then there shall be no annual CAA non-attainment fee assessed for the subject year.

B is Baseline Emissions, of VOC, NO<sub>x</sub> or both for which a source qualifies as a major stationary source as defined in this rule, in tons.

CPIF is the annual Consumer Price Index (CPI) adjustment factor as defined in this rule.

- (5) CPIF means the annual consumer price index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in the year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA. Section 185 cross-references the methodology in section 502(b)(3)(B)(v) of the CAA. This method has been interpreted for use in determining permit fees in a 1992 EPA memorandum. (See, Memorandum of October 15, 1992, from Frank Bunyard, "Calculating Fees for Operating Permits.") EPA has used this method to calculate the Part 70 permit fee rate since 1990, and will continue to update the rate every year in September, when the August values are available. The adjusted section 185 fee, then, would be prorated to that adjusted permit fee by multiplying the Part 70 permit fee rate by

200 (\$5000/\$25). Since Section 185 fees are assessed on a calendar year basis, and the inflation factor is applied in September the calendar year fee is determined as a weighted average (8/12 of the fee associated with January to August, and 4/12 of the fee associated with September to December).

(6) FEE ASSESSMENT YEAR means the year for which CAA fees are being calculated and assessed under the provisions of this rule.

(7) MAJOR STATIONARY SOURCE shall, for the purposes of this rule:

(A) For a non-RECLAIM source-have the same meaning as in Sections 181(b)(4)(B) and 182(d) of the CAA, or 182 (e) as applicable, or a Major Polluting Facility as defined in Rule 1302(s) – Definition of Terms.

(B) For a RECLAIM source-have the same meaning as in paragraph (b)(2) of Rule 3001 – Applicability where the potential to emit for a RECLAIM facility is the higher of:

(i) the starting allocation plus non-tradeable credits; or

(ii) RECLAIM Trading Credits (RTCs) held in the allocation account after trading.

RTC's held in the certificate account are not part of the allocation.

(8) NITROGEN OXIDES (NO<sub>x</sub>) means any compound that is an oxide of nitrogen.

(9) RECLAIM is the Regional Clean Air Incentives Market established by Regulation XX – Regional Clean Air Incentives Market (RECLAIM) which for the purposes of this rule comprises:

(A) Existing RECLAIM sources with a District issued facility identification number during or prior to the attainment date; or

(B) New RECLAIM sources with a District issued facility identification number issued after the attainment year; or

(C) An existing source with a District issued facility identification number prior to the attainment date that becomes a RECLAIM source during the attainment year which shall be treated as an existing RECLAIM source for the purposes of determining

baseline emissions for the attainment year or the initial year of operation as applicable.

- (10) VOLATILE ORGANIC COMPOUND (VOC) is as defined in Rule 102 – Definitions.

(c) Requirements

- (1) Section 172 (e) Fee Equivalency Account

(A) The Executive Officer shall establish and maintain a Section 172(e) fee equivalency account. The equivalency account shall be credited with expenditures from qualified programs that satisfy the following criteria:

(i) surplus to the State Implementation Program for the federal 1-hour ozone standard and are approved by the AQMD executive officer, Executive Officer of CARB, and the Administrator or Regional Administrator of US EPA Region IX as being surplus to the SIP;

(ii) designed to result in direct VOC or NO<sub>x</sub> reductions in the SCAQMD; or facilitate future VOC or NO<sub>x</sub> reductions in the SCAQMD through vehicle/engine fueling infrastructure or advanced technology development efforts for implementation within the next 10 years, or other uses approved by EPA;

(iii) expenditures occurring only in calendar years subsequent to 2008 from eligible projects;

(iv) only monies actually expended from qualified programs during a calendar year shall be credited.

(B) Expenditures eligible for the Section 172 (e) fee equivalency account need not actually be held nor disbursed directly by the AQMD provided the underlying programs have been approved by CARB and EPA and tracked pursuant to subdivision (c).

(C) Funds shall be accounted for on a dollar for dollar basis and shall not be discounted due to the passage of time. Funds may be accumulated in the accounts from year to year if a surplus exists in any given year, and used to offset the calculated Clean Air Act Non-attainment (Section 185) fees as needed.

(D) The Section 172 (e) fee equivalency account may be pre-funded according to the projects listed in Attachment A.

(2) Calculation of the CAA Non-Attainment (Section 185) Fee Obligation

By August 1, 2012, and continuing annually thereafter, the Executive Officer shall calculate the applicable prior calendar year CAA Non-Attainment (Section 185) fees for each major source in the South Coast AQMD pursuant to paragraph (b) and then aggregate such fees for the entire universe of major stationary sources in the District that would otherwise be subject to Section 185.

(3) Annual Demonstration of Equivalency

Beginning August 1, 2012, and continuing annually thereafter, the Executive Officer shall complete an equivalency demonstration to show that adequate funding was available in the equivalency account for the prior calendar year to meet the CAA Non-Attainment (Section 185) fee obligation calculated pursuant to paragraph (c)(2). Any surplus funding available in the fee equivalency account will be carried forward to the following assessment year. The annual determination of equivalency shall be made according to the following equation:

$$B_{i-1} + D_{i-1} - F_{i-1} = B_i \geq 0$$

Where,

$B_{i-1}$  is the Section 172 (e) fee equivalency account balance at the beginning of the prior calendar year  $i-1$

$D_{i-1}$  is the funds deposited (credited) into the Section 172 (e) fee equivalency account during the prior calendar year ( $i-1$ )

$F_{i-1}$  is the Section 185 fees calculated for all major stationary sources for prior calendar year calculated pursuant to paragraph (c) (2), and

$B_i$  is the Section 172 (e) fee equivalency account balance at the end of calendar year  $i-1$ , which is carried forward as the beginning balance for the following year  $i$ .

(4) Annual Preliminary Determination of Equivalency

Beginning July 1, 2012, and continuing annually thereafter, the Executive Officer shall complete a preliminary determination of equivalency to determine whether adequate funding is expected to be available in the Section 172 (e) fee equivalency account to meet the CAA Non-Attainment (Section 185) fee obligation for the current calendar year according to the following equation:

$$\underline{B_i + D_i > 110\% \times F_{i-1}}$$

Where,

B<sub>i</sub> is the Section 172 (e) Fee Equivalency Account balance at the beginning of the current calendar year i

D<sub>i</sub> is the funds expected to be deposited (credited) into Section 172 (e) Fee Equivalency Account in current calendar year i, and

F<sub>i-1</sub> is the Section 185 fees calculated pursuant to paragraph (c) (2) for the prior calendar year (i-1) being used as surrogate Section 185 fee estimate for the current year.

(5) Reporting Requirements

Beginning no later than September 3, 2012, and continuing annually thereafter, the EO shall file a report with CARB and US EPA that includes all of the following:

(A) A listing of all facilities subject to Section 185 and their calculated prior calendar year fee obligation,

(B) The aggregate amount of prior calendar year CAA Non-Attainment (Section 185) fees obligation calculated pursuant to paragraph (c)(2),

(C) The Section 172 (e) fee equivalency account beginning balance,

(D) The amount of any surplus funding carried over to the subsequent calendar year,

(E) A listing of all programs, program descriptions, description of funding, certification of eligibility for each program, and associated expenditures that were credited into the Section 172 (e) fee equivalency account during the prior calendar year and those expected to be credited during the current year,

(F) The results of the equivalency demonstration and preliminary determination of equivalency conducted pursuant to paragraph (c)(3) and (c)(4).

(6) Backstop Provision for Failure to Achieve Equivalency

In the event the annual determination of equivalency conducted for the prior year pursuant to paragraph (c)(3) shows a deficit ( $B_i < 0$ ) or the preliminary determination of equivalency conducted for the current year pursuant to paragraph (c)(4) shows that adequate funding to meet the estimated Section 185 fees for the current year may not be available, then the EO shall within 90 days submit to the Governing Board a back-stop rule for adoption that would require the Executive Officer to collect and/or track adequate fees for any shortfall. The Governing Board shall act on a backstop rule no later than 120 days from the funding inadequacy finding.

The backstop rule, to the extent applicable to major stationary sources of VOC and/or NO<sub>x</sub>, shall include the following baseline elements which owners or operators may request in writing:

(A) Alternative Baseline Period

Emissions from an ~~An~~ alternative baseline period reflecting the average of two consecutive years within the last ten (10) years prior to and including the attainment year may be substituted for baseline emissions from the attainment year subject to the following analysis:

- (i) Annual Emission data for the ten (10) years preceding and including the attainment year; and
- (ii) Analysis of adopted local, state, and federal rules or regulations that would have restricted the source's ability to either operate or emit a particular pollutant, had they been in effect during the consecutive two (2) years selected; and/or;
- (iii) Adjusted annual emissions considering the impact of subparagraphs (ii) above; and

(iv) Certification, in writing, by the highest-ranking executive on site that the source's emissions are irregular, cyclical, or otherwise vary significantly from year to year.

(B) Multi-Site Aggregation

Major stationary sources within a single non-attainment region, under common ownership and control, and that comport with the Federal definition of major stationary source for multi-site aggregation, may aggregate multi-site baseline and future year emissions.

(C) Regulation III – Fees credit

Each major stationary source paying Clean Air Act Non-attainment Section 185 fees pursuant to the backstop rule adopted pursuant to paragraph (c) (6) shall receive a credit for their fees paid for annual operating fees and annual operating emissions fees during the preceding calendar year. In no case, shall the credit exceed the Clean Air Act Non-attainment Section 185 fees due, or exceed the otherwise applicable annual operating fees and annual operating emissions fees.

(d) Severability

If any provision of this rule is held by a USEPA or CARB, finding or decision or a court decision to be invalid, such finding or decision will not affect the validity of the remainder of this rule and major stationary sources shall be subject to and must comply with the provisions contained in the remainder of this rule.

(e) Termination

This rule shall become inoperative and have no further effect or further operation upon a determination by the Administrator or Regional Administrator of the US EPA that in a given year the air basin is in attainment with the federal one-hour ozone standard, or upon approval by EPA of a replacement program, such as a state-wide program adopted by CARB.

**Proposed Amended Rule 317 (Cont.)**

~~(Adopted December 8, 2008)~~

**(Amended February 4, 2011)**

- (f) The Executive Officer shall submit Rule 317 for inclusion into the SIP by CARB and U.S. EPA within 14 days of adoption.

\*\* : Based reported expenditures by local governments and MSRC that were spent in VOC/NOx emission reduction related projects.

(Funding sources marked “continuous” indicate expected annual funding unless indicated otherwise).

**~~RULE 317. CLEAN AIR ACT NON-ATTAINMENT FEES~~**

~~(a) Purpose~~

~~— The purpose of this rule is to satisfy mandatory requirements as specified in Sections 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the federal Clean Air Act (CAA).~~

~~(b) Applicability~~

~~— This rule applies to major stationary sources of VOC or NO<sub>x</sub> as defined in this rule. As required by Section 182(f) of the CAA, major stationary sources of NO<sub>x</sub> are also subject to this rule in addition to major stationary sources of VOC. The fees required pursuant to this rule shall be in addition to any permit fees and any other fees required under other District Rules and Regulations. This rule shall become effective when the Administrator of the United States Environmental Protection Agency (U.S. EPA) or the Executive Officer, makes a finding that a Basin is not in attainment with the federal one-hour standard for ozone. This rule shall cease to be effective when the Administrator of the U.S. EPA designates a Basin to be in attainment of the federal one-hour standard for ozone.~~

~~(c) Definitions~~

~~(11) — ATTAINMENT YEAR is the calendar year that the Basin is mandated to reach attainment of the federal one-hour ozone standard pursuant to the CAA. Under the Severe 17 area designation, the attainment year is 2007. Under the Extreme area designation, the attainment year is 2010.~~

~~(12) — BASELINE EMISSIONS for a major stationary source, are calculated for each air contaminant, VOC and NO<sub>x</sub> (including major stationary source fugitive and unpermitted emissions) separately, as follows:~~

~~(A) — For existing major stationary sources prior to the attainment year, the baseline emissions shall be the amount of the actual emissions, including fugitives and unpermitted, during the attainment year (permitted emissions not to exceed permitted allowables).~~

~~(B) — For sources that become subject to this rule during or after the attainment year:~~

~~(i) — For a non-RECLAIM major stationary source the baseline emissions shall be the amount of emissions allowed under~~

~~the applicable implementation plan (annual emissions including fugitives and emissions from unpermitted equipment).~~

~~(ii) For an existing RECLAIM source that subsequently qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of the RTC holdings at the beginning of the year available for use during the same calendar year or actual emissions during the calendar year the source becomes a major stationary source that do not exceed the RTC holdings at the end of the reconciliation period.~~

~~(iii) For a new RECLAIM source that qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of RTC credits purchased at the beginning of the attainment year or the initial calendar year of operation, as applicable, or actual emissions during the calendar year, not to exceed RTC holdings at the end of the reconciliation period.~~

~~If a major stationary source is operational for a period of less than one calendar year in the attainment year or initial year of operation, as applicable, the emissions from the operational period shall be extrapolated over one full calendar year.~~

~~(13) BASIN means the Riverside county portion of the Salton Sea Air Basin (SSAB). The boundaries of each air basin shall be as defined by California Code of Regulations, Section 60104, Title 17, in which a major stationary source is located.~~

~~(14) FEE ASSESSMENT YEAR means the year for which CAA fees are being calculated and assessed under the provisions of this rule.~~

~~(15) MAJOR STATIONARY SOURCE shall, for the purposes of this rule:~~

~~(A) For a non-RECLAIM source have the same meaning as in Sections 181(b)(4)(B) and 182(d) of the CAA, if applicable, or a Major Polluting Facility as defined in Rule 1302(s) Definition of Terms.~~

~~(B) For a RECLAIM source have the same meaning as in paragraph (b)(2) of Rule 3001—Applicability where the potential to emit for a RECLAIM facility is the higher of:~~

~~(iii) the starting allocation plus nontradeable credits; or~~

~~(iv) RECLAIM Trading Credits (RTCs) held in the allocation account after trading.~~

~~RTC's held in the certificate account are not part of the allocation.~~

~~(16) NITROGEN OXIDES (NO<sub>x</sub>) means any compound that is an oxide of nitrogen.~~

~~(17) RECLAIM is the Regional Clean Air Incentives Market established by Regulation XX—Regional Clean Air Incentives Market (RECLAIM) which for the purposes of this rule is comprised of:~~

~~(A) Existing RECLAIM sources with a District issued facility identification number prior to the attainment date; or~~

~~(B) New RECLAIM sources with a District issued facility identification number issued during or after the attainment year; or~~

~~(C) An existing source with a District issued facility identification number prior to the attainment date that subsequently becomes a RECLAIM source shall be treated as an existing RECLAIM source for the purposes of determining baseline emissions for the attainment year or the initial year of operation as applicable.~~

~~(18) VOLATILE ORGANIC COMPOUND (VOC) is as defined in Rule 102—Definitions.~~

~~(d) Requirements~~

~~(7) An Annual VOC Clean Air Act Non Attainment Fee shall be assessed for a major stationary source of VOC and an Annual NO<sub>x</sub> CAA Non Attainment Fee shall be assessed for, a major stationary source of NO<sub>x</sub> payable to the District for excess emissions of these air contaminants in accordance with Section 185 (b) of the CAA as follows:~~

$$\text{Annual VOC CAA Non Attainment Fee} = \$5,000 \times \text{CPIF} \times [A - (0.8 \times B)],$$

and

$$\text{Annual NO}_x \text{ CAA Non Attainment Fee} = \$5,000 \times \text{CPIF} \times [D - (0.8 \times E)]$$

Where:

~~A = The total amount of VOC emissions actually emitted during the applicable fee assessment year, in tons per year. If A is less than or equal to 80% of B; then there shall be no annual VOC CAA non-attainment fee assessed for the subject year.~~

~~B = The VOC baseline emissions as defined in this rule in tons per year.~~

~~D = The total amount of NOx emissions actually emitted during the applicable fee assessment year, in tons per year. If D is less than or equal to 80% of E; then there shall be no annual NOx CAA non-attainment fee assessed for the subject year.~~

~~E = The NOx baseline emissions as defined in this rule in tons per year.~~

~~CPIF = The annual Consumer Price Index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA.~~

- ~~(8) Beginning with the second year after the attainment year and thereafter until the Administrator of the U.S. EPA designates the Basin to be in attainment of the federal one hour standard for ozone, both the VOC and NOx annual CAA fees shall be remitted in accordance with the annual emissions fee billing requirements as established in paragraphs (e)(2) and (e)(10) of Rule 301 Permit Fees. A major stationary source that does not pay any or all of the required CAA fees, by the specified due date, shall be subject to the late payment surcharge and permit revocation provisions of subdivision (e) of Rule 301 and is also in violation of this rule and subject to the civil and criminal penalties as provided for in Health and Safety Code 42400 et seq.~~

~~(e) Clean Air Act Non-Attainment Fee Programs~~

---

~~Clean Air Act non-attainment fees shall be used to fund stationary and/or mobile source VOC and NOx emission reduction programs based on criteria established by the South Coast Air Quality Management District Governing Board or its designee. Up to five percent of the program revenues can be used for administrative costs.~~

## **Executive Summary**

This staff report incorporates by reference and supplements the Final Staff Report on Proposed Rule 317 –Clean Air Act Non-Attainment Fees dated June 2009 and the Supplemental Staff Report Dated April 2010.

Staff has formulated an approach to satisfy Section 185 fee requirements through a fee equivalent structure that obviates the need for major stationary sources to pay a fee. Section 185 is not directly applicable to the case of a revoked air quality standard. However, the federal court of appeals has held that the Section 185 fee is a “control” which remains applicable after revocation of the standard pursuant to Section 172(e). Section 172 (e) allows for alternative programs that are no less stringent than the mandated program. Under EPA Guidance, such programs may be either “fee equivalent” or “emissions equivalent” or a combination. Staff’s proposal will recognize funding from fee programs that are surplus to the SIP and are used for air quality improvement projects in the SCAQMD. Staff is proposing a “fee equivalent” program. EPA’s guidance requires that fees collected under such a program be directed toward reducing NO<sub>x</sub> or VOC emissions. Such funds will be accumulated into a Fee Equivalency Account and used to offset the fee burden otherwise required under a Section 185 approach. PAR 317 also substitutes for Section 185 measures included in the current and previous AQMPs. These funds were not relied upon in the attainment demonstration for the applicable one-hour ozone SIP. Substituting Proposed Amended Rule 317 for the Section 185 measures in the 1994 and 1997 AQMPs does not change this, so these funds remain surplus to the one-hour ozone SIP.

More specifically, the staff proposal is focusing on funding from mobile source and infrastructure air quality improvement projects with air quality benefits that are surplus to the SIP and either result in direct ozone precursor emission reductions or facilitate future reductions from these source categories by investing in fleet engine modernization, vehicle fuel infrastructure and technology advancement projects. Since more than 80% of the ozone formation in the South Coast District is due to emissions from mobile sources and taking into account that a significant portion of the ozone precursor reductions needed (mostly NO<sub>x</sub> emissions originating from mobile sources) for the South Coast air basin’s attainment is in the so called “black box” (Section 182(e)(5) measures) with undefined control technologies, investing in reductions from such sources offers a much greater air quality improvement potential compared to the limited potential from major stationary sources, which contribute to less than 10% of the ozone precursors and are already subject to the nation’s most stringent regulations with cost effectiveness levels often well above the \$10,000 per ton mark. More specifically, while all existing major (and minor) stationary sources in the South Coast district operate, as required by state and federal law, subject to Best Available Retrofit Control Technology (BARCT) standards and new or modified sources operate subject to Best Available Control technology (BACT) standards, there are no analogous requirements applicable to mobile sources, and hence, there is the potential for greater reductions from mobile sources. It should

also be pointed out that CAA does not specify how Section 185 fee revenues should be used or direct their use towards pollution reduction efforts. Therefore, a Section 185 fee program may not reduce emissions, whereas the revenues from a fee-equivalent program must be used to reduce emissions, or facilitate those reductions. Therefore, this fee equivalent approach proposed by staff with a focus on reducing emissions from mobile and area sources has a much greater potential for an air quality benefit than a Section 185 fee approach focusing on stationary sources. If the backstop rule applies to stationary sources, it will allow sources to credit their Section 185 fees toward their Regulation III obligation.

The proposal also provides for a backstop mechanism should funds from the Fee Equivalency Account show a deficit below a conservative threshold. Should the backstop provisions be triggered, staff is required to develop and forward to the Governing Board within 90 days a substitute rule that would obtain sufficient fees, including fees from major NO<sub>x</sub> and VOC stationary sources if necessary. Sources would be required to pay a fee relative to their share of the fee burden and only on the amount of the shortfall between the Fee Equivalency Account and the Section 185 fees due from all major stationary sources.

## **Background**

Section 185 was included in the 1990 amendments to the CAA as a backstop provision for those severe and extreme areas that did not attain the one hour standard for ozone by the attainment date. Section 185 requires that major stationary sources for VOC or NO<sub>x</sub> in those non-attainment areas to either reduce their emissions by 20% from a baseline amount or pay a fee. The South Coast air basin and the Salton Sea air basin both failed to attain the one hour ozone standard by the attainment date and are subject to Section 185 fees (although the one-hour ozone standard was superseded by the eight-hour standard, Section 185 has been held by court decision to remain in effect through Section 172(e)).

Staff began working on Proposed Rule 317 during the summer of 2008 to implement the requirements of Section 185. Although a rule was adopted in December 2008 for the Salton Sea Air Basin, no rule has yet been adopted for the South Coast Air Basin even though several different approaches were developed, workshopped, and proposed. Staff's most recent proposal was considered by the Board in June 2010. There is substantial opposition to this fee rule by the regulated community as the fee burden is significant while the relative contribution by major stationary sources to ground level ozone is small relative to area and mobile sources. Further, the applicability of the fee solely to major stationary sources is seen as unfair given the fact that major stationary sources in the South Coast air basin are subject to the nation's most stringent regulations and have reduced their emissions significantly over the years. The timing of the fee proposal is problematic given the nation-wide recession and the collateral effects on the California economy.

The only ozone non-attainment area to have an adopted and federally approved rule is Sacramento Metropolitan APCD. Their rule 307 was adopted in September 2002 and was modeled on a strict construction of Section 185. Rule 307 has a fixed baseline for the attainment year and there was no provision for alternative or equivalent programs. As discussed below, other agencies that have proposed or adopted rules incorporating additional flexibility including clean unit exemptions or alternative baselines have either had those portions disapproved or have been notified by US EPA of deficiencies regarding those provisions. Staff has heeded the precedent established by these agencies in the development of Rule 317.

To help states develop programs to implement the Section 185 requirements, US EPA issued guidance in March 2008 on determining baseline emissions. That memo provided that an alternative baseline could be used if a “source’s emissions are irregular, cyclical, or vary significantly from year to year”. Any 24 consecutive month period within the last 10 years could be used as the alternative baseline subject to adjusting the emissions for regulatory effects. Unfortunately, US EPA did not provide guidance on how to determine if a source’s emissions are irregular, cyclical, or vary significantly. Staff developed a metric (the Student’s t-test) to be used to determine if a source was cyclical. A draft rule incorporating that concept was crafted, workshopped, and proposed for adoption. That rule was considered at the April 2009 Board Meeting and was criticized by many stakeholders as overly complex. The hearing on Rule 317 was subsequently continued and that Student’s t-test metric was dropped.

On December 11, 2009 US EPA mailed a letter to Governor Schwarzenegger effectively giving California notice that a sanctions clock would be started by the failure to adopt a rule for Section 185 fees. The 18 month sanctions clock officially started with the publication of the January 5 Federal Register notice regarding the South Coast Air Basin (FR Vol. 175 No.2 Tuesday 1/5/10 p. 232). Should the District fail to timely adopt a Section 185 rule, sanctions including higher offset ratios and loss of highway funding would occur. The rule must be submitted to EPA and found complete by EPA by July 5, 2011 to avoid sanctions. Moreover, US EPA would be required to adopt a federal plan to implement Section 185 and would collect the fee money directly if a Section 185 program is not approved by EPA by January 5, 2012.

US EPA provided further guidance on Section 185 fees in its memo of January 5, 2010. US EPA’s March 2008 guidance noted that other alternative baselines may be included in a Section 185 program. Those other baselines include the aggregation of NO<sub>x</sub> and VOC at a single site and the aggregation of multi-facility operations providing the operations comport with the federal definition of major stationary source. The January 2010 memo noted that fee equivalent alternative programs may also be approvable.

The January 2010 memo also noted that Section 172 (e) of the act allows for programs that are “not less stringent” than the Section 185 program. Fee equivalent and emissions equivalent programs were identified as possible approaches under a Section 172 (e) construct. Fee

equivalency may be approvable under the 172 (e) concept if the program “clearly raises at least as much revenue as otherwise required Section 185 fee program if the proceeds are spent to pay for emissions reductions that will further improve ozone air quality.”

To utilize the Section 172 (e) provisions, staff researched what state programs are available and could be used for Section 185 fees. One highly promising program is AB 118. AB 118, Nunez, California Alternative and Renewable Fuel, Vehicle Technology, Clean Air, and Carbon Reduction Act of 2007 was adopted in October 2007. This bill imposes a fee on certain mobile sources with the monies to be used for projects that improve environmental quality, increase efficiency, develop and deploy innovative technologies, and support energy conservation and activities. Staff’s opinion is that the AB 118 program is surplus to the one-hour ozone SIP and can be included as a fee equivalent program under the Section 172 (e) rubric for Section 185 fees. Staff’s preliminary estimate is that approximately 10 million dollars in funding may be available under this program and can be used on a dollar for dollar basis to reduce the fee requirement. Staff has also identified other programs that may be used for emissions equivalency purposes and has listed those in Appendix A. One such program is AB 2766, under which fees imposed on motor vehicles are used by local governments and the MSRC to reduce motor vehicle emissions. The aggregate funding from these programs is in excess of \$100 million at present, with some of the funding programs being ongoing. Proposed Amended Rule 317 also serves to replace the Section 185 control measure contained in the most recent and earlier AQMPs. In the 2007 AQMP, Control Measure MCS-08 provided that the District would implement a fee on major stationary sources of VOC and NO<sub>x</sub> if the Basin did not attain the revoked one-hour ozone standard by 2010. Similar measures were contained in the 1997 AQMP, FSS-04 (same as in the 2003 AQMP) and the 1994 AQMP, CTY-10. PAR 317 replaces these measures.

### **Proposed amendments**

PAR 317 is based on a fee equivalency approach as provided by Section 172 (e) of the Clean Air Act and outlined in the US EPA memo of January 5, 2010. Section 172 (e) is an anti-backsliding provision of the CAA that requires US EPA to develop regulations to ensure that controls are “not less stringent” than those of the Section 185 program. The proposed amended rule will generate at least as much revenue as otherwise required under a Section 185 fee program. The Executive Officer of the SCAQMD will annually calculate fee obligations that would otherwise occur under a Section 185 fee program and use equivalent funding from alternative federal, state and local air quality improvement programs that are surplus to the one-hour ozone SIP to offset the Section 185 fee obligations.

Major stationary sources in the SCAQMD are already at BARCT or BACT. The SCAQMD has the most aggressive environmental regulations in the nation. With emission levels from major stationary sources already at such low levels, it is speculative what amount of further emission

reductions could be achieved under a fee regulation. Many sources such as refineries, utilities, and water and sewage agencies are likely to have an inelastic response to fees. These sources are more likely to pass through any increased fee dollars to the consumer rather than reduce or curtail emissions. Moreover, Section 185 does not direct how the fee revenue from a Section 185 rule should be used. There is no requirement that the fee money be directed toward emission control projects. The Section 172 (e) approach is designed to direct fee money toward programs most likely to yield reductions in ozone precursors.

More specifically, the staff proposal is focusing on funding from mobile source and infrastructure air quality improvement projects with air quality benefits that are surplus to the SIP and either result in direct ozone precursor emission reductions or facilitate future reductions from these source categories by investing in fleet engine modernization, vehicle fuel infrastructure and technology advancement projects. Since more than 80% of the ozone formation in the South Coast District is due to emissions from mobile sources and taking into account that a significant portion of the ozone precursor reductions needed for the South Coast air basin's 8 hour ozone attainment is in the so called "black box", investing in reductions from such sources offers a much greater air quality improvement potential compared to the limited potential from stationary sources, which contribute to less than 20% of the ozone precursors and are already subject to the nation's most stringent regulations. Indeed, major sources, which would be subject to a Section 185 fee, contribute less than 10% of ozone precursor emissions in the Basin. Therefore, this fee equivalent approach proposed by staff has a much greater air quality benefit potential than a Section 185 fee approach.

The proposed rule requires the EO to establish a fee equivalent program fund. Credits and debits will be reconciled on an annual basis. Should the fund balance in the fee equivalent program show a deficit for the prior year or the preliminary analysis of the fund balance for the current year drop below 110% of the prior year's Section 185 fee calculation, staff is required to develop and forward for adoption an alternative rule that will provide equivalent fees, including if needed, assessing each major stationary source individually for its proportional share of the fees required if any deficit should occur in the future. The proposed amended rule has the following elements:

**Establish Section 172(e) Fee Equivalent Account**

The staff proposal would establish a Section 172(e) fee equivalent account. Programs with funding mechanisms that provide for ozone-related air quality improvement projects in the SCAQMD and that are surplus to the one-hour ozone SIP will be used to fund a fee equivalent program. Only those programs that have been approved for use as part of Rule 317 by the Executive Officer of the SCAQMD, the Executive Officer of CARB, and the Regional Administrator of US EPA Region IX shall be included. Staff will follow a similar approach to that currently being employed for seeking and obtaining approval for source specific rules or for approving alternative source testing methods with both CARB

and EPA. Furthermore, the fee equivalent account shall be credited only from expenditures that are:

1. designed to result in direct VOC and NOx reductions in the SCAQMD or to facilitate future VOC or NOx reductions in the SCAQMD through vehicle/engine fueling infrastructure or advanced technology development efforts for implementation within the next 10 years;
2. expenditures occurring only in calendar years subsequent to 2008 from eligible projects; and
3. monies actually expended from qualified programs during a calendar year.

Funding from all approved programs will be credited into the account beginning with the 2010 calendar year (including funds expended subsequent to 2008) and shall be continued to be credited as long as funding from any approved program is available. In addition, funds credited into the fee equivalent account:

1. need not actually be held nor disbursed directly by the AQMD provided the underlying programs have been approved by CARB and EPA for use in this rule and tracked pursuant to the tracking provisions established in the rule; and
2. shall be accounted for on a dollar for dollar basis and shall not be discounted due to the passage of time. Funds may be accumulated in the accounts from year to year and used to offset the calculated Clean Air Act Non-attainment (Section 185) fees as needed.

Furthermore, the proposed amended rule identifies a list of programs (Attachment A) that are likely to be surplus to the one-hour ozone SIP that will be used to prefund the equivalent account. Attachment A is also attached to this staff report. Staff has also identified additional funding programs that likely meet the program selection criteria of the rule that can provide on-going funding credit to the fee equivalent account and are listed in Attachment B of this staff report. Attachment C shows a list of possible programs that might be also be used in the future to potentially fund the fee equivalent account, provided they are surplus to the SIP and approved by CARB and EPA.

### **Calculation and Tracking of Section 185 Fee Obligation**

District staff will calculate the fees required under a Section 185 program by comparing emissions in years subsequent to the baseline with the sources' actual emissions. Subsequent year emissions that are greater than 80% of the baseline are calculated as if they were assessed a fee as follows

$$\text{Annual CAA Non-Attainment Fee} = \$5,000 \times \text{CPIF} \times [ A - ( 0.8 \times B ) ]$$

Where:

A = Total amount of emissions actually emitted during the applicable fee assessment year for pollutants included in B, in tons. If A is less than or equal to 80% of B; then there shall be no annual CAA non-attainment fee assessed for the subject year.

B = Baseline emissions, of VOC, NO<sub>x</sub> or both for which a source qualifies as a major stationary source as defined in this rule, in tons.

CPIF = The annual Consumer Price Index (CPI) adjustment factor as defined in this rule.

#### Consumer Price Index Factor (CPIF)

CPIF means the annual consumer price index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in the year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA. Section 185 cross-references the methodology in section 502(b)(3)(B)(v3) of the CAA. This method has been interpreted for use in determining permit fees in a 1992 EPA memorandum. (See, Memorandum of October 15, 1992, from Frank Bunyard, "Calculating Fees for Operating Permits.") EPA has used this method to calculate the Part 70 permit fee rate since 1990, and will continue to update the rate every year in September, when the August values are available. The adjusted section 185 fee, then, would be prorated to that adjusted permit fee by multiplying the Part 70 permit fee rate by 200 (\$5000/\$25). Since section 185 fees are assessed on a calendar year basis, and the inflation factor is applied in September, the calendar year fee is determined as a weighted average (8/12 of the fee associated with January to August, and 4/12 of the fee associated with September to December). These will be updated by EPA each year in the fall.

#### Baseline

For an existing major stationary source prior to or during calendar year 2010, the baseline shall be the average of the source's emissions during fiscal years 2005-06 and 2006-07 adjusted for regulatory effects. Existing RECLAIM sources are RECLAIM sources that have been issued a District identification number prior to or during calendar year 2010. Calendar year 2006 and 2007 are pre-recession years and are more representative of typical emissions. Staff will adjust the sources' emissions proportionally to account for regulatory effects between 2006 and 2010. Existing sources that are not major stationary sources prior to the attainment year

but become major stationary sources due to the emissions levels during the attainment year shall be regarded for the purposes of this rule as an existing major stationary source, with their baseline established based on their pro-rated attainment year emissions and not their permitted emissions or RECLAIM holdings. Sources that become major stationary sources subsequent to the attainment year will have their baseline developed from their permitted emissions or RECLAIM holdings, as appropriate. Baselines are established individually for each pollutant (VOC and NOx) for which a source is a major stationary source. Baselines are also established for each individual facility.

Fees are calculated for each major stationary source for each pollutant (VOC/NOx) for which the source is a major stationary source. Calculated fees from all sources are then aggregated to determine the total Section 185 fee obligation. Fees are calculated for the Section 185 universe for each calendar year subsequent to the attainment year as long as the basins are non-attainment for the one-hour ozone standard.

Using an alternate baseline is consistent with US EPA's guidance memo of March 2008. Staff is calculating the fees for the universe of sources subject to Section 185 on an aggregate basis. When viewed globally, the variation in emissions from this universe is irregular and varies substantially from year to year. This is due primarily to the recession which began in 2008. Staff is using programmatic rule adjustment factors for VOC and NOx with effective dates of 2007 through 2010. These factors will be weighted for the Section 185 universe and applied uniformly.

The Executive Officer shall debit the Section 185 fees calculated for the universe of all major stationary sources that would otherwise be subject to Section 185 against the funding available from the Fee Equivalent Program on an annual basis.

Staffs justification for using more than one year actual emissions to determine Section 185 baseline emissions is based on the following analysis. The U.S. EPA Guidance Document allows the use of "2 out of 10" to establish the baseline emissions in estimating the Section 185 fees, "where a source's emissions are irregular, cyclical or otherwise vary significantly from year to year". AQMD staff is proposing a programmatic use of the average of FY 2005-2006 and FY 2006-2007 emissions as the baseline to calculate the Section 185 fee obligations. It is based on the fact that R317 facilities are part of the regional economy that is subject to periodic national recessions and therefore experience cyclical fluctuation in manufacturing activities or services provided. Using the 2010 baseline will lock facilities in a low production year in the wake of the most recent recession. Since World War II, US economy has gone through several recessions in 1973, 1981, 1990, and 2001 prior to the great recession. According to the recession dating

procedure by the National Bureau of Economic Research (NBER), the great recession began in December 2007 and ended in June 2009. A wide range of economic indicators were considered in this process, such as real gross domestic product (GDP), gross domestic income (GDI), employment, industrial production index (IPI), and others. Figures 1 shows the quarterly trend in GDP and IPI from the 4th quarter in 2007 to the 3rd quarter in 2010. Figure 2 shows the U.S. monthly employment trend from January 2007 to October 2010. As with other recessions, employment is a lagging indicator.

Figure 1  
Percent Change in Real GDP and Industrial Production

Figure 2  
Monthly US Employment

The 2007-2009 recession has hit the California economy especially hard given its relatively large share of real estate and construction related activities. Figures 3 and 4 show monthly employment trends in California and the four counties (Los Angeles, Orange, Riverside, and San Bernardino) in Southern California, respectively, from January 2007 to October 2010. Both figures display cyclical behavior similar to the U.S. economy. Figure 5 compares unemployment rates in the U.S., California, and the four counties in Southern California.

Figure 3  
California Employment

Figure 4  
Four-county Employment

Figure 5  
U.S., California and County Unemployment Rate

Table 1 shows GDP for California and the four counties in Southern California from 2006 to 2009.

Table 1  
Real GDP by Region by Year (millions of dollars)\*

Region	2006	2007	2008	2009
CA	\$1,747,816	\$1,778,722	\$1,778,185	\$1,739,674
LA-OR	\$600,623	\$605,948	\$607,773	N/A
RV-SB	\$94,313	\$93,535	\$92,318	N/A

\* millions of 2001 dollars for CA and millions of 2005 dollars for LA-OR-RV-SB.

<http://www.bea.gov/regional/gsp/action.cfm>

<http://www.bea.gov/regional/gdpmetro/>

In order to determine the appropriate period for baseline determination, AQMD staff analyzed the overall activity trends for the R317 facilities in the last decade. Gaseous fuel consumption and solvent and coating usage were selected as two parameters to represent activities associated with VOC and NOx emissions. Figure 6 shows the changes in gaseous fuel and solvent/coating usage for the last 10 years relative to the 2000 level. Activities reported by facilities between 2000 and 2006 were in fiscal year (i.e., 2000= FY2000-2001) and beginning in 2008 they were in

calendar year. As it can be seen, the selection of the average of FY05 and FY06 as the baseline is a conservative approach that they do not represent the highest two years out the last 10 years, on a facility-by-facility basis, allowed under the U.S.EPA Guidance Document. Therefore, it would result in higher fee obligations than it would otherwise be required. AQMD staff believes this level of conservatism is appropriate to ensure that this programmatic approach is not less stringent than the straight Section 185 requirements.

Gaseous Fuel & Coating/Solvent Usage Trends  
for PR317 Facilities

**Annual Determination of Equivalency**

Beginning in the initial year July 1, 2012, and continuing annually thereafter, the Executive Officer shall complete an equivalency demonstration to verify that adequate funding was available in the equivalency account for the prior calendar year to meet the calculated CAA Non-Attainment (Section 185) fee obligation. Any surplus funding available in the fee equivalency account will be carried forward to the following assessment year. The annual determination of equivalency shall be made according to the following equation:

$$B_{i-1} + D_{i-1} - F_{i-1} = B_i \geq 0$$

Where,

$B_{i-1}$  is the Section 172 (e) fee equivalency account balance at the beginning of the prior calendar year  $i-1$ ;

$D_{i-1}$  is the funds deposited (credited) into the Section 172 (e) fee equivalency account during the prior calendar year ( $i-1$ );

$F_{i-1}$  is the Section 185 fees calculated for all major stationary sources for the prior calendar year, and

$B_i$  is the Section 172 (e) fee equivalency account balance at the end of calendar year  $i-1$ , which is carried forward as the beginning balance for the following year  $i$ . The backstop provision (discussed below in this report) is triggered if  $B_i < 0$ .

### **Initial Annual Preliminary Determination of Equivalency**

Also an initial Annual Preliminary Determination of Equivalency shall be conducted, beginning July 1, 2012, and continuing annually thereafter, the Executive Officer shall complete a preliminary determination of equivalency to determine whether adequate funding is expected to be available in the Section 172 (e) fee equivalency account to meet the CAA Non-Attainment (Section 185) fee obligation for the current calendar year according to the following equation:

$$B_i + D_i > 110\% \times F_{i-1}$$

Where,

$B_{i-1}$  is the Section 172 (e) fee equivalent account balance at the beginning of the current calendar year  $i$ ; (prefunding in the 2012 initial calendar year);

$D_{i-1}$  is the funds expected to be deposited (credited) into Section 172 (e) fee equivalent account in current calendar year  $i$ , and

$F_{i-1}$  is the Section 185 calculated fees obligation for the prior calendar year ( $i-1$ ) being used as a surrogate Section 185 fee estimate for the current year.

### **Reporting Requirements**

Beginning no later than September 3, 2012, and continuing annually thereafter, the EO shall file a report with CARB and US EPA that includes all of the following:

- (A) A listing of all facilities subject to Section 185 and their calculated prior calendar year fee obligation,
- (B) The aggregate calculated amount of prior calendar year CAA Non-Attainment (Section 185) fees obligation;
- (C) The Section 172 (e) fee equivalency account beginning balance,
- (D) The amount of any surplus funding carried over to the subsequent calendar year,
- (E) A listing of all programs, program descriptions, description of funding, certification of eligibility for each program, and associated expenditures that were credited into the Section 172 (e) fee equivalency account during the prior calendar year and those expected to be credited during the current year,
- (F) The results of the equivalency demonstration and preliminary determination of equivalency conducted.

### **Backstop Provision**

In the event the annual equivalency demonstration shows a deficit or a preliminary equivalency demonstration shows potential inadequate funding, this backstop provision requires the EO within 90 days to develop and bring to the Governing Board a backstop rule for adoption that would allow the Executive Officer to collect and/or track adequate fees for any shortfall. The backstop rule which may be constructed to reflect a Section 185 or Section 172(e) framework shall include the following elements to the extent the program applies to stationary sources:

- (A) **Alternative Baseline Period**  
An alternative baseline period reflecting the average of two consecutive years within the last ten (10) years prior to and including the attainment year may be substituted for emissions from the attainment year subject to the following analysis:
  - (i) Emission data for the ten (10) years preceding and including the attainment year; and

- (ii) Analysis of adopted local, state, and federal rules or regulations that would have restricted the source's ability to either operate or emit a particular pollutant, had they been in effect during the consecutive two (2) years selected; and/or;
  - (iii) Adjusted annual emissions considering the impact of subparagraphs (B) above; and
  - (iv) Certification, in writing, by the highest-ranking executive on site that the source's emissions are irregular, cyclical, or otherwise vary significantly from year to year.
- (B) Multi-Site Aggregation
- Major stationary sources within a single non-attainment region, under common ownership and control, and that comport with the Federal definition of major stationary source for multi-site aggregation, may aggregate multi-site baseline and future year emissions.
- (C) Regulation III – Fees credit
- Each major stationary source paying Clean Air Act Non-attainment fees shall receive a credit for their fees paid for annual operating fees and annual operating emissions fees during the preceding calendar year. In no case, shall the credit exceed the Clean Air Act Non-attainment fees due.

Development of this backstop rule, should the backstop provision of PAR 317 be triggered, will adhere to the traditional and legally required stakeholder and public participation process of the SCAQMD rule development process.

## **Preliminary Equivalency Determination**

Staff has reviewed the programs (Attachment A & B) likely to fund the fee equivalency account and conducted a preliminary evaluation of the fee equivalency. Funding prior to program initiation is about \$110.2 million. Funding available subsequent to program initialization is a onetime amount of over \$45.4 million and on-going funding of \$34 million per year. Estimated funding is more than sufficient for the first several years of the program. Additions to the fee equivalency account are shown as positive values and credits from the account (the Section 185 fee obligation) are shown as a negative (in parentheses). A preliminary accounting of the funds is given in Table 1. MSRC and AB2766 funds will be credited towards Rule 317 fee obligations after the expenditure has occurred and local government has the discretion to allocate monies within CARB's AB2766 guidelines.

The projection of fees required from the Section 185 universe is given in Attachment D. Attachment D identifies all sources subject to Section 185 fees and estimates the individual and aggregate fees based on conservative assumptions. The fee is listed as a constant demand in Table 1 as these competing factors are expected to offset each other. Although the CPIR will increase annually, actual emissions from the universe are expected to decline by almost the same amount due to the regulatory program.

As can be seen from Table 1, the fund balance in the fee equivalency account assumed is at all times projected to be greater than 110% of the projected demand for the subsequent year. The conservative projection does not consider any of the programs identified in Attachment C , which may also be eligible to deposit funds into the fee equivalency account up to \$46.2 million for the fee equivalency account.

**Table 1**  
**Estimated Fee Equivalency Account Funding**

<u>Fee Equivalent Account Activity</u>	<u>Credit/(Debit) @</u>
Pre-funding available at beginning of program (including ongoing funding from CY 2010)	\$110.2M
Funding available during CY 2011	\$34.0M
Estimated Section 185 Fee Obligation for CY 2011	<u>(\$30.0M)</u>
Funds available at end of initial year (2011) / beginning of subsequent year (2012)	\$114.2M
Funds deposited during CY 2012 (on-going and one-time)	\$34.0M
Estimated Section 185 Fee Obligation for CY 2012	<u>(\$30.0M)</u>
Funds available at end of year (2012) /beginning of subsequent year (2013)	\$118.2.1M
Funding available during CY 2013	\$79.4M
Estimated Section 185 Fee Obligation for CY 2013	<u>(\$30.0M)</u>
Funds available at end of year (2013) /beginning of subsequent year (2014)	\$167.6M
Funding available during 2014	\$34.0M
Estimated Section 185 fee Obligation for 2014	<u>(\$30.0M)</u>
Funds available at end of year (2014) / beginning of subsequent year (2015)	\$171.6M

@ If the estimated funding continues and Section 185 fees do not significantly deviate from the estimates, there should be sufficient funding till 2020 and beyond, when the federal 1-hour ozone standard is expected to be met.

## **Rule Sunset and Other Provisions**

PAR 317 includes a provision such that if any provision of the rule is held by USEPA or CARB finding or decision to be invalid, such finding or decision (including any court decision) will not affect the validity of the remainder of the rule.

Furthermore, this rule shall become inoperative and have no effect or operation upon a determination by the Administrator or Regional Administrator of the US EPA that in a given year the air basin is in attainment with the federal one-hour ozone standard, or is subsumed by a statewide program adopted by CARB as a SIP revision. Also, PAR 317 requires the Executive Officer to submit Rule 317 for inclusion into the SIP by CARB and U.S. EPA within 14 days of adoption.

## **California Environmental Quality Act**

Pursuant to the California Environmental Quality Act (CEQA) and the AQMD's Certified Regulatory Program (Rule 110), the AQMD has prepared a final subsequent environmental assessment for the proposed adoption of Rule 317.

## **Socio-Economic Analysis**

There are no anticipated adverse socio-economic impacts from the adoption of the present rule, since staff anticipates the aggregate Section 185 fee obligation for all major sources to be fully offset by the fee equivalency account. In the event that the fee obligation is not fully offset and a backstop provision is triggered staff will analyze any future potential socio-economic impact as part of the new rule adoption process.

The Socio-Economic Analysis prepared in May 2009, for the rule as proposed at the time is incorporated by reference.

## **Findings**

Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the hearing. The draft findings are as follows:

Necessity - The AQMD Governing Board has determined that a need exists to adopt Rule 317 – Clean Air Act Non-Attainment Fees to comply with the requirements of the 1990 amendments to the Federal Clean Air Act and the federal court decision applying Section 185 requirements through Section 172(e) to cases where the one-hour ozone standard has been revoked and replaced by the more stringent eight-hour standard, and to avoid imposing unreasonable costs on major stationary sources of VOC/NOx.

Authority - The AQMD Governing Board obtains its authority to adopt, amend, or repeal rules and regulations from Health and Safety Code Sections 39002, 40000, 40001, 40440, 40702, and

41508 and Sections 172(e), 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the Federal Clean Air Act.

Clarity - The AQMD Governing Board has determined that Rule 317 – Clean Air Act Non-Attainment Fees is written and displayed so that the meaning can be easily understood by persons directly affected.

Consistency - The AQMD Governing Board has determined that the adoption of Rule 317 – Clean Air Act Non-Attainment Fees is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, federal or state regulations.

Non-Duplication - The AQMD Governing Board has determined that the adoption of Rule 317 – Clean Air Act Non-Attainment Fees does not impose the same requirement as any existing state or federal regulation, and the proposed amendments are necessary and proper to execute the powers and duties granted to, and imposed upon, the AQMD.

Reference - In adopting the Rule, the AQMD Governing Board references the following statutes which the AQMD hereby implements, interprets or makes specific: Health and Safety Code Sections 40001 (rules to achieve ambient air quality standards), 40440(a) (rules to carry out the Air Quality Management Plan), and Sections 172(e), 181, 182 and 185 of the 1990 amendments to the Federal Clean Air Act.

### **Conclusions and Recommendations**

The proposed amendments to Rule 317 were developed to comport with federal requirements and guidance while obviating the need for fee payments from the impacted industry. The fee equivalent approach crafted by staff eliminates the fee burden across the universe of sources subject to Rule 317 fees through the application of the AB 118 funds and funds from other federal, state and local programs that are surplus to the SIP, providing benefits in the SCAQMD, and approved by CARB and US EPA.

The rule provides for a backstop provision should the fee equivalent fund show a deficit or its balance drop below a conservative threshold. If the fund balance is less than 110% of the prior year's calculated Section 185 fee obligation, the Executive Officer is required to develop and forward to the Governing Board a substitute rule that may require sources to pay their proportionate share of any shortfall from the fee equivalent fund.

Staff is recommending the adoption of this proposal.

### **Comments and Response to Comments**

Comment: EPA has expressed concern that crediting sources subject to the PAR 317 fees with their Regulation III emissions fees already paid will compromise implementation of Title V and that no credit be given against Title V fees.

Response: Staff will implement the Regulation III fee credit such that it will not impact funding or operation of the Title V program. Furthermore, should the backstop rule be triggered staff commits to working with US EPA to factor in any concerns

relative to safeguarding the Title V fees during the course of the rule development process.

Comment: EPA has suggested the following revisions be made to the rule language: [Since the entire current proposed rule text is in underline format, suggested US EPA language that was added to the rule in the set hearing package and was reflected in simple underline format, is presented in *italicized underline* format in this comment and response section of the staff report for clarification purposes. In contrast, suggested rule additions that were made in this attached final proposed rule version and subsequent to the set package are shown in double underline format. All deletions are shown as strikethrough regardless of the time of deletion.

(a) Purpose

“The purpose of this rule is to satisfy requirements as specified in Sections 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the federal Clean Air Act (CAA) by utilizing a fee equivalency approach applying the principle in as ~~provided by~~ Section 172(e) of the CAA.”

(b)(2)(A) Baseline Emissions

“For an existing major stationary source prior to or during the attainment year, the baseline emissions shall be the average amount of the actual emissions, including fugitives and unpermitted emissions, during fiscal years 2005-06 and 2006-07 (emissions not to exceed allowables), and programmatically adjusted to account for regulatory effects between 2006 through 2010, for the South Coast Air Basin.”

(b)(2)(B) Baseline Emissions

“For sources that become subject to this rule ~~during or~~ after the attainment year:”

(b)(5) CPIF

“CPIF means the annual consumer price index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in the year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA. *Section 185 cross-references the methodology in section 502(b)(3)(B)(v) of the CAA. This method has been*

*interpreted for use in determining permit fees in a 1992 EPA memorandum. (See, Memorandum of October 15, 1992, from Frank Bunyard, "Calculating Fees for Operating Permits.") EPA has used this method to calculate the Part 70 permit fee rate since 1990, and will continue to update the rate every year in September, when the August values are available. The adjusted section 185 fee, then, would be prorated to that adjusted permit fee by multiplying the Part 70 permit fee rate by 200 (\$5000/\$25). Since Section 185 fees are assessed on a calendar year basis, and the inflation factor is applied in September the calendar year fee is determined as a weighted average (8/12 of the fee associated with January to August, and 4/12 of the fee associated with September to December)."*

(c)(1)(A)(i) Section 172(e) Fee Equivalency Account  
"surplus to the State Implementation Program"

(c)(6)(A) Alternative Baseline Period  
"Emissions from an A~~n~~ alternative baseline period reflecting the average of two consecutive years within the last ten (10) years prior to and including the attainment year may be substituted for baseline emissions from the attainment year subject to the following analysis:

(i) Annual Emission data for the ten (10) years preceding and including the attainment year; and"

(c)(6)(C) Regulation III Fees credit  
"Each major stationary source paying Clean Air Act Non-attainment Section 185 fees pursuant to the backstop rule adopted pursuant to paragraph (c) (6) shall receive a credit for their fees paid for annual operating fees and annual operating emissions fees during the preceding calendar year. In no case, shall the credit exceed the Clean Air Act Non-attainment Section 185 fees due, or exceed the otherwise applicable annual operating fees and annual operating emissions fees"

(b)(9) RECLAIM  
"(A) Existing RECLAIM sources with a District issued facility identification number during or prior to the attainment date; or  
(B) New RECLAIM sources with a District issued facility identification number issued ~~during or~~ after the attainment year; or  
(C) An existing source with a District issued facility identification number prior to the attainment date that subsequently becomes a RECLAIM source during the attainment year which shall be treated as an existing RECLAIM source for the purposes of determining baseline emissions for the attainment year or the initial year of operation as applicable."

Response: The final proposed rule has been edited to incorporate these comments.

Comment: What is the likelihood, with the current state budget shortfall and the poor state of the economy that funding for the Section 172(e) fee equivalency account will be insufficient and trigger the backstop provision?

Response: Unlikely. The Section 172(e) fee equivalency account is being pre-funded with more than an estimated \$100 million. Funds for these programs have already been approved and/or are currently being utilized for emissions reductions project where the reductions are surplus to the SIP. The aggregate fee obligation to be offset is conservatively estimated to be about \$30 million annually. Also, it is anticipated that credits to the Section 172(e) fee equivalency account will be about \$34 million annually with an estimated \$171 million surplus in 2020 and beyond in the Section 172(e) fee equivalency account, since a surplus in any given year is carried forward into the beginning balance for the following year. Furthermore, in the unlikely event that the backstop provision is triggered, sources would only pay for the pro-rata shortfall for their own source(s), after all credits had first been applied from the Section 172(e) fee equivalency account (including applying Regulation III emissions fees credits).

Comment: Should the backstop provision be triggered, why must sources provide a request in writing if they wish to have an alternative baseline?

Response: If the backstop provision is triggered, based on staff analysis, not all facilities would automatically benefit from an alternative baseline. In some cases a source may actually wish to use emissions in the baseline year to calculate their Section 185 fee obligation. The proposed backstop rule therefore does not impose the alternative baseline on all sources arbitrarily.

Comment: Subsequent to the January 5, 2011 Public Workshop and the January 6, 2011 release of the Set Hearing package SCAQMD during the open comment period ending January 25, 2011, two letters of support, submitted by sources that might potentially be impacted by the rule, were received by SCAQMD staff supporting staffs current rule proposal.

Response: Staff has worked diligently over the last two years to craft an equitable compliance strategy for Section 185 CAA requirements. Staff appreciates the endorsement by potentially affected sources of its rule proposal.

## **PREFACE**

This document constitutes the Final Subsequent Environmental Assessment (SEA) for Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees and Replacement of 2007 AQMP Control Measure #2007 MCS-08 (Clean air Act Emission Fees for Major Stationary Sources), 1997 AQMP Control Measure FSS-04, and 1994 Control Measure CTY-10. The Draft SEA was released for an expedited 20-day public review and comment period from January 6, 2011 to January 25, 2011. No comment letters were received from the public relative to the Draft SEA. The environmental analysis in the Draft SEA concluded that Proposed Amended Rule 317 would not generate any significant adverse environmental impacts.

Minor modifications were made to the proposed amended rule subsequent to release of the Draft SEA for public review. To facilitate identifying modifications to the document, added and/or modified text is underlined. Staff has reviewed these minor modifications and concluded that they do not make any impacts substantially worse or change any conclusions reached in the Draft SEA. As a result, these minor revisions do not require recirculation of the document pursuant to CEQA Guidelines §15088.5. Therefore, this document now constitutes the Final SEA for Proposed Amended Rule 317.

## **CHAPTER 1 - PROJECT DESCRIPTION**

---

**Introduction**

**California Environmental Quality Act**

**Project Location**

**Project Objective**

**Project Background**

**Project Description**

**Universe of Affected Sources**

## **INTRODUCTION**

The California Legislature created the South Coast Air Quality Management District (SCAQMD) in 1977<sup>1</sup> as the agency responsible for developing and enforcing air pollution control rules and regulations in the South Coast Air Basin (Basin) and portions of the Salton Sea Air Basin and Mojave Desert Air Basin referred to herein as the district. By statute, the SCAQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the district<sup>2</sup>. Furthermore, the SCAQMD must adopt rules and regulations that carry out the AQMP<sup>3</sup>. The 2007 AQMP concluded that major reductions in emissions of volatile organic compounds (VOCs), oxides of sulfur (SOx), PM2.5 and oxides of nitrogen (NOx) are necessary to attain the air quality standards for ozone and particulate matter. Ozone, a criteria pollutant, is formed when VOCs react with NOx in the atmosphere and has been shown to adversely affect human health. NOx also contributes to the formation of PM10 and PM2.5.

The proposed project consist of amending Rule 317 to delete §185 fees applicable to the Salton Sea Air Basin (SSAB) and incorporate §172(e) fees applicable to the entire district, modifying the 2007 AQMP to revise: control measure #2007 MSC-08 – Clean Air Act Emission Fees for Major Stationary Sources, 1997 AQMP control measures FSS-04 (same as the control measure in the 2003 AQMP), and 1994 AQMP control measure CTY-10 by replacing them with PAR 317<sup>4</sup>. Proposed amended Rule (PAR) 317 would replace 2007 AQMP control measure #2007 MSC-08 as modified and the related earlier measures listed above.

Existing control measure #2007 MCS-08 and similar control measures in the 1997 and 1994 AQMPs (control measures FSS-04, and CTY-10, respectively<sup>5</sup>) state that if the former federal one-hour ozone ambient air quality standard is not met by the year 2010, the SCAQMD shall impose an emissions fee of \$5,000 (1990 dollars) per ton of VOC and NOx, emitted by each major source in excess of 80 percent of the source's 2010 emissions beginning in 2011. The fee rate would be adjusted to reflect annual increases in the Consumer Price Index (CPI) since 1990. The fee shall be paid for each calendar year after the year 2010 and until the area meets the one-hour ozone standard.

<sup>1</sup> The Lewis-Presley Air Quality Management Act, 1976 Cal. Stats., ch 324 (codified at Health & Safety Code, §§40400-40540).

<sup>2</sup> Health & Safety Code, §40460 (a).

<sup>3</sup> Health & Safety Code, §40440 (a).

<sup>4</sup> All AQMPs can be obtained by submitting a Public Records Act request: by fax to 909.396.3330, by e-mail to [PublicRecordsRequests@aqmd.gov](mailto:PublicRecordsRequests@aqmd.gov), or by mail to SCAQMD, Public Records Coordinator/Public Records Unit, 21865 Copley Drive, Diamond Bar, CA. 91765. In addition, the 1997 AQMP is available online at: <http://www.aqmd.gov/aqmp/97aqmp/index.html> and the 2007 AQMP is available online at: <http://www.aqmd.gov/aqmp/07aqmp/index.html>.

<sup>5</sup> The proposed project includes replacing control measures FSS-04 and CTY-10, from the 1997 and 1994 AQMPs, respectively because these control measures are included in plans approved by U.S. EPA and, remain approved unless explicitly replaced. Although a similar control measure is included in the 2003 AQMP (control measure FSS-04), the 2003 AQMP has not been approved by U.S. EPA and, therefore, control measure #FSS-04 does not need to be modified.

U.S. EPA has established guidance that would allow adoption of an alternative program to the §185 fees as long as the program is consistent with the principles of §172(e) of the Clean Air Act (CAA), which is an “anti-backsliding” provision that allows U.S. EPA, through rulemaking, to accept alternative programs that are “not less stringent.” Although in this case, U.S. EPA revoked the one-hour ozone standard and replaced it with the more stringent eight-hour standard, the federal court of appeals held that the §185 fee remains applicable through §172(e). Under U.S. EPA’s guidance, an alternative program could consist of a program that pays an equivalent fee as would otherwise be required from §185(e) program and the proceeds are spent for emissions reductions of ozone-forming pollutants, i.e., NO<sub>x</sub> and/or VOC. PAR 317 would implement an alternative program to the §185(e) fee program.

SCAQMD staff has formulated an approach to satisfy §185 fee requirements through a fee equivalent structure that obviates the need for major stationary sources to pay a fee. Section 172 (e) allows for alternative programs that are no less stringent than the mandated program. Staff’s proposal will recognize funding from fee programs that are surplus to the one-hour State Implementation Plan (SIP) for the one-hour ozone standard and are used for air quality improvement projects for ozone precursors in the district. Such funds will be accumulated into a Fee Equivalency Account and used to offset the fee burden otherwise required under a §185 approach.

Specifically, the staff proposal is focusing on funding from mobile source air quality improvement projects with air quality benefits that are surplus to the SIP one-hour ozone precursors and either result in direct and indirect ozone precursor emission reductions or facilitate future reductions from these source categories by investing in fleet engine modernization, vehicle fuel infrastructure and technology advancement projects. Since more than 80 percent of the ozone formation in the district is due to emissions from mobile sources, and taking into account that a significant portion of the ozone precursor reductions needed (mostly NO<sub>x</sub> emissions originating from mobile sources) for the Basin’s attainment is in the so called “black box” (§182(e)(5) measures) with undefined control technologies, investing in reductions from such sources offers a greater air quality improvement potential compared to the limited potential from major stationary sources as would occur under a §185 fee program, which contribute than 10 percent of the ozone precursors and are already subject to the nation’s most stringent regulations with cost effectiveness levels often well above the \$10,000 per ton mark. More specifically, while all existing major (and minor) stationary sources in the district operate, as required by state and federal law, subject to Best Available Retrofit Control Technology (BARCT) standards and new or modified sources operate subject to Best Available Control technology (BACT) standards, there are no analogous requirements applicable to mobile sources, and hence, there is the potential for greater reductions from mobile sources. It should also be pointed out that CAA does not specify how §185 fee revenues should be used or direct their use towards pollution reduction efforts. Therefore, this fee equivalent approach proposed by staff with a focus on reducing emissions from mobile sources and address... has a much greater potential for an air quality benefit than a §185 fee approach focusing on stationary sources.

The proposal also provides for a backstop mechanism should funds from the Fee Equivalency Account show a deficit below a conservative threshold. Should the backstop provisions be triggered, staff is required to develop and forward to the Governing Board within 90 days for a Board action within 120 days a substitute rule that would obtain sufficient fees, including fees

from major NO<sub>x</sub> and VOC stationary sources if necessary. Sources would be required to pay a fee relative to their share of the fee burden and only on the amount of the shortfall between the Fee Equivalency Account and the §185 fees otherwise due from all major stationary sources.

## **CALIFORNIA ENVIRONMENTAL QUALITY ACT**

Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is considered to be a discretionary approval by a public agency and, therefore, is considered to be a “project” as defined by the California Environmental Quality Act (CEQA) (CEQA Guidelines §15387). Further, the 2007 AQMP included control measure #2007 MSC-08 – Clean Air Act Emission Fees for Major Stationary Sources is included as part of the control Measures evaluated in the 2007 AQMP Final Program Environmental Impact Report (Sch. #2006111064) and similar measures were evaluated in the 1997 AQMP Final Program Environmental Impact Report (Sch. #96011062) and the 1994 AQMP Final Program Environmental Impact Report (Sch. #94021021). Because the proposed amendments to Rule 317 would implement an alternative program to the §185 fees, which was the focus of control measure #2007 MSC-08, FSS-04, and CTY-10, as long as the program is consistent with the principles of §172(e) of the Clean Air Act (CAA), it is considered to be a modification to the previously approved 1994, 1997, and 2007 AQMPs and their associated CEQA documents. Therefore, a subsequent environmental assessment (SEA) has been prepared pursuant to CEQA Guidelines §15162 because changes are proposed in the project which may require revisions of the previous EIR. To facilitate the analysis of environmental impacts from PAR 317, the environmental analysis is streamlined primarily off of the most recent applicable AQMP, i.e., the 2007 AQMP.

SCAQMD is the lead agency for the proposed project and has prepared this final SEA with no significant adverse impacts pursuant to its Certified Regulatory Program. California Public Resources Code §21080.5 allows public agencies with regulatory programs to prepare a plan or other written document in lieu of an environmental impact report once the Secretary of the Resources Agency has certified the regulatory program. SCAQMD's regulatory program was certified by the Secretary of the Resources Agency on March 1, 1989, and is codified as SCAQMD Rule 110. Pursuant to Rule 110, SCAQMD has prepared this final SEA.

CEQA and Rule 110 require that potential adverse environmental impacts of proposed projects be evaluated and that feasible methods to reduce or avoid significant adverse environmental impacts of these projects be identified. To fulfill the purpose and intent of CEQA, the SCAQMD has prepared this final SEA to address the potential adverse environmental impacts associated with the proposed project. The final SEA is a public disclosure document intended to: (a) provide the lead agency, responsible agencies, decision makers and the general public with information on the environmental effects of the proposed project; and, (b) be used as a tool by decision makers to facilitate decision making on the proposed project.

SCAQMD staff's review of the proposed project shows that the project would not have any significant adverse effects on the environment. Therefore, pursuant to CEQA Guidelines §15252(a)(2)(B), no alternatives or mitigation measures are required to be included in this final

SEA. The analysis in Chapter 2 supports the conclusion of no significant adverse environmental impacts.

## **PROJECT LOCATION**

The SCAQMD has jurisdiction over an area of 10,473 square miles, consisting of the four-county South Coast Air Basin (Basin) and the Riverside County portions of the Salton Sea Air Basin (SSAB) and the Mojave Desert Air Basin (MDAB). The Basin, which is a subarea of the district, is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The 6,745 square-mile Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. The Riverside County portion of the SSAB and MDAB is bounded by the San Jacinto Mountains in the west and spans eastward up to the Palo Verde Valley. The federal non-attainment area (known as the Coachella Valley Planning Area) is a subregion of both Riverside County and the SSAB and is bounded by the San Jacinto Mountains to the west and the eastern boundary of the Coachella Valley to the east (Figure 1-1).

When originally adopted in December 2008, Rule 317 implemented §185(e) fee requirements only in the SSAB, which are currently in effect in that air basin. The proposed amendments to Rule 317 delete the §185 fee requirements in the SSAB and implement a program consistent with §172(e), which would apply to the entire district. No major sources were identified in the SSAB at the time of adoption.

## **PROJECT OBJECTIVES**

The general project objectives of PAR 317 are summarized in the following bullet points:

- Modify control measure #2007 MSC-08 in the 2007 AQMP, control measure FSS-04 in the 1997 AQMP, and control measure CTY-10 in the 1994 AQMP to substitute an alternative equivalent program to the §185 fees that is consistent with the principles of §172(e) within the district.
- Implement 2007 AQMP control measures #2007 MSC-08 – Clean Air Act Emission Fees for Major Stationary Sources, 1997 control measure FSS-04, and 1994 control measure CTY-10, as modified.
- Amend Rule 317 to delete §185 fee requirements in the SSAB and include an alternative program to the §185 fees that is consistent with the principles of §172(e) within the entire district.
- Adopt and implement an alternative equivalent program consisting of a program that identifies at least as much revenue as would otherwise be required from a §185(e) program where the proceeds are spent to pay for emissions reductions and facilitate emission reductions of ozone-forming pollutants, i.e., NO<sub>x</sub> and/or VOC

**Figure 1-1**  
**Boundaries of the South Coast Air Quality Management District**

## **PROJECT BACKGROUND**

Clean Air Act (CAA) §185 requires states with ozone nonattainment areas classified as Severe or Extreme to develop, as a revision to their SIP, a fee collection rule to be implemented in the event that an area fails to attain the ozone standards by the required attainment date. The \$5,000 (1990 dollars) per ton fee applies to every "major stationary source" of VOC and NO<sub>x</sub> emissions. The following describes the basic §185 fee program to provide background for understanding the §172(e) equivalent program that is included in PAR 317. The definition of major stationary source is any source with a "potential to emit" (PTE) 10 tons per year, not just sources with actual emissions of ten tons per year. However, the fee is based on total actual emissions, not potential to emit. It should be noted that, fugitive emissions are not included in determining PTE unless the sources is one of the types of facilities listed in 40 CFR Part 70, section 70.2. If the facility is already a major source, then fugitive emissions would be included in its total emissions for fee calculation. If the facility has taken a synthetic minor permit limiting it to less than 10 tpy, then the facility would not be subject to PAR 317.

Pursuant to section 182(f) of the federal Clean Air Act, the plan provisions required under this subpart, which includes the fee, which are applicable to major stationary sources of VOC are also applicable to major stationary sources of NO<sub>x</sub>. That is, unless U.S. EPA finds that additional reductions of NO<sub>x</sub> would not contribute to attainment. On this basis, it is assumed that the fee applies to major NO<sub>x</sub> sources as well.

The CAA provides that the computation of a source's "baseline amount" must be the lower of the amount of actual or allowable emissions under the permit applicable to the source (or if no permit has been issued for the attainment year, the amount of VOC and NO<sub>x</sub> emissions allowed under the applicable implementation plan) during the attainment year. The CAA also provides that U.S. EPA may issue guidance on calculating the "baseline amount" as the lower of the average actual emissions or average allowable emissions over a period of more than one year in cases where a source's emissions are irregular, cyclical or otherwise vary significantly from year to year." Accordingly, on March 21, 2008, U.S. EPA issued a memorandum entitled "Guidance on Establishing Emissions Baselines under Section 185 of the CAA for Severe and Extreme Ozone Nonattainment Areas that Fail to Attain the 1-hour Ozone NAAQS by their Attainment Date."

The CAA does not specify how states may spend or allocate the fees collected under a §185 fee program. Therefore, states have discretion on how to use the fees. U.S. EPA has stated that one beneficial approach would be to channel the fees into innovative programs to provide incentives for additional ozone precursor emissions reductions from stationary or mobile sources or for other purposes aimed at reducing ambient ozone concentrations in the affected area<sup>6</sup>.

The U.S. EPA had previously waived the §185 fee program requirements applicable under the revoked one-hour ozone NAAQS in rules issued to address the transition from the one-hour standard to the 1997 eight-hour standard. Following legal challenge on December 22, 2006, the federal Court of Appeals in Washington, D.C., ruled that U.S. EPA did have the authority to revoke the one-hour ozone standard. Therefore, the 2007 AQMP was not required to demonstrate attainment of the one-hour standard. However, the court also ruled that U.S. EPA must require areas that had not yet attained the one-hour standard to continue to implement control requirements at least as stringent as those in effect under the one-hour standard. In particular, one-hour ozone New Source Review and conformity provisions must continue to be implemented. In addition, if a severe or extreme area fails to attain the one hour standard by the statutory date, the area must implement a measure requiring major stationary sources to either reduce their emissions to 80 percent of what they were in the attainment year or pay an annual fee of \$5,000 (adjusted for inflation) for each ton in excess of 80 percent of the baseline (referred to hereinafter as the §185 fee). The Basin would currently be classified as extreme nonattainment for the one-hour ozone standard while the Riverside County portion of the SSAB is classified as severe and, therefore, these areas would be subject to the §185 fee requirements or an equivalent measure as described below.

U.S. EPA has established guidance that would allow adoption of an alternative program to the §185 fees as long as the program is consistent with the principles of §172(e) of the Clean Air Act (CAA), which is an "anti-backsliding provision that allows U.S. EPA, through rulemaking, to accept alternative programs that are "not less stringent" where U.S. EPA has revised the standard to make it less stringent. U.S. EPA interpreted this section to apply to areas where U.S. EPA made the standard more stringent, as in the replacement of the one-hour ozone standard with the more stringent eight-hour ozone standard. Alternative programs may be fee-equivalent, emissions equivalent, or some combination of these two. Under the guidance document, an

---

<sup>6</sup> U.S. EPA. 2010. Guidance on Developing Fee Programs Required by Clean Air Act Section 185 for the 1-hour Ozone NAAQS. January. <http://www.epa.gov/groundlevelozone/pdfs/20100105185guidance.pdf>

example of a fee equivalent alternative program would be for states to develop programs that shift the fee burden from the specific set of major stationary sources that are otherwise required to pay fees according to §185 to other non-major sources of emissions, including owners and/or operators of mobile sources. This alternative approach would allow states to recognize through reduced or eliminated fees those major sources of emission that have already installed the latest air pollution control technologies and assess the total required fees on other sources that are not already as well controlled. Such an alternative program recognizes that already well controlled major sources would have few, if any, options for avoiding fees by achieving additional reductions.

Another example of alternative programs could include the following. An alternative program could combine features of an emissions-equivalent program and a fee-equivalent program. For example, some portion of the emissions reductions necessary to demonstrate equivalence, as explained above, could be offset by fees collected on each ton of emissions that is offset.

### **SCAQMD Rule 317**

SCAQMD staff began working on proposed Rule 317 during the summer of 2008 to implement the requirements of §185. Although a rule was adopted in December 2008 for the Salton Sea Air Basin, no rule has yet been adopted for the Basin even though staff has developed several different approaches that have been presented at several workshops. As originally adopted, Rule 317 implemented control measure #2007 MSC -08 of the 2007 AQMP only for the SSAB. Pursuant to the CAA, Rule 317 required major stationary sources for VOC or NO<sub>x</sub> to pay a fee of \$5,000 (1990 dollars to be adjusted for inflation) for every ton of emissions in excess of 80 percent of the baseline emissions. Baseline emissions are the total emissions from the facility in the year that attainment of the one-hour ozone standard was required (2007 for the SSAB and 2010 for the SOCAB). Fees are required to be paid annually until the basin attains the standard. Special rule language was included for RECLAIM sources and new major stationary sources that become subject to the rule during or subsequent to the attainment year.

A later proposal for a fee applicable in the Basin was considered by the Governing Board in June 2010. There was widespread opposition to this fee rule by the regulated community as the fee burden is substantial, while the relative VOC and NO<sub>x</sub> contributions by major stationary sources to ground level ozone is small relative to area and mobile sources. Further, as indicated by the regulated community, applying a fee solely to major stationary sources is considered to be problematic given that major stationary sources in the Basin are subject to the nation's most stringent regulations and have reduced their emissions significantly over the years. As a consequence, major stationary sources would have few, if any, options for avoiding fees by achieving additional reductions.

As a result, and in accordance with §172(e) and U.S. EPA guidance, SCAQMD staff has developed a new proposal to amend Rule 317 to implement an alternative program consistent with §172(e) of the CAA that would apply to the entire district. The proposed project is described in the next section.

## **PROJECT DESCRIPTION**

The proposed rule requires the Executive Officer to establish a fee equivalent program fund. Credits and debits will be reconciled on an annual basis. Should the fund balance in the fee equivalent program show a deficit for the prior year or the preliminary analysis of the fund balance for the current year drop below 110 percent of the prior year's §185 fee calculation, staff would be required to develop and forward for adoption an alternative rule that will provide equivalent fees, including if needed, assessing each major stationary source individually for its proportional share of the fees required if any deficit should occur in the future. The proposed amended rule has the elements summarized below. A copy of PAR 317 is included in Appendix A of this EA.

### **Purpose [subdivision (a)]**

This subdivision would be modified to allow the use of a fee equivalency approach as provided by §172(e) of the CAA, to satisfy mandatory non-attainment pursuant to the CAA.

### **Applicability [subdivision (b)] – Deleted**

**Definitions [subdivision (c)]** – would be reorganized as subdivision (b). The following definitions would be modified or added to PAR 317. Definitions not listed here have not been modified.

- Attainment year [paragraph (b)(1)] – has been modified to improve clarity.
- Baseline [paragraph (b)(2)] – has been modified to specify that major source VOC and NOx emissions would be calculated using reported emissions pursuant to the Annual Emissions Report (AER) program or as modified by the Executive Officer.
  - [subparagraph (b)(2)(A)] – has been modified to specify that VOC and NOx emissions from major sources in the SSAB would be calculate using reported emissions pursuant to the AER program or as modified by the Executive Officer.
  - [subparagraph (b)(2)(B)] – has been modified to improve clarity.
- Clean Air Act Non-attainment Fee [paragraph (b)(4)] – This definition has been added because this term is used throughout the rule and means the fee that would have been assessed to a major stationary source pursuant to §185 of the 1990 amendments to the CAA. This paragraph also provides the methodology for calculating §185 fees.
- CPIF [paragraph (b)(5)] – has been added and means the annual consumer price index (CPI) adjustment factor in accordance with §§502(b)(3)(B)(v) and 185(b)(3) of the CAA.
- Major stationary source for non-RECLAIM source [subparagraph (b)(7)(A)] – deleted the reference to §182(e).

**Requirements [subdivision (d)]** – would be reorganized as **subdivision (c)**, previous subdivision (d) would be deleted, and new requirements would be added. The staff proposal would establish a §172(e) fee equivalent account. Programs with funding mechanisms that provide for air quality improvement projects or facilitate reductions of ozone precursors in the district and that are surplus to the one-hour ozone SIP will be used to fund a fee equivalent program. Only those programs that have been approved for use as part of Rule 317 by the

Executive Officer of the SCAQMD, the Executive Officer of CARB, and the Regional Administrator of U.S. EPA Region IX shall be included.

- Section 172(e) fee equivalency account [subparagraph (c)(1)] – new paragraph.
  - [subparagraph (c)(1)(A)] – new subparagraph (c)(1)(A) would establish and maintain a §172(e) fee equivalency account. The equivalency account would be credited with expenditures from qualified programs that satisfy specified criteria.
  - [subparagraph (c)(1)(B)] – new subparagraph (c)(1)(B) states that expenditures eligible for the §172 (e) fee equivalency account need not actually be held nor disbursed directly by the SCAQMD under specified provisions.
  - [subparagraph (c)(1)(C)] – new subparagraph (c)(1)(C) would require funds to be accounted for on a dollar for dollar basis and shall not be discounted due to the passage of time.
  - [subparagraph (c)(1)(D)] – new subparagraph (c)(1)(D) would require the §172 (e) fee equivalency account to be pre-funded according to the projects listed in Attachment A of PAR 317.
- Calculation of the CAA non-attainment (§185) Fee Obligation [subparagraph (c)(2)] – new paragraph that would require by August 1, 2012, and continuing annually thereafter, the Executive Officer to calculate the applicable prior calendar year CAA Non-Attainment (§185) fees and then aggregate such fees for the entire universe of major stationary sources in the district that would otherwise be subject to §185.
- Annual demonstration of equivalency [subparagraph (c)(3)] – new paragraph that would require, beginning August 1, 2012, and continuing annually thereafter, the Executive Officer to complete an equivalency demonstration to show that adequate funding was available in the equivalency account for the prior calendar year. Surplus funding would be carried forward to the following assessment year.
- Annual preliminary determination of equivalency [subparagraph (c)(4)] – new paragraph that would require, beginning July 1, 2012, and continuing annually thereafter, the Executive Officer to complete a preliminary determination of equivalency to determine whether adequate funding is expected to be available in the §172 (e) fee equivalency account to meet the CAA Non-Attainment (§185) fee obligation according to the specified formula.
- Reporting requirements [subparagraph (c)(5)] – new paragraph that would require beginning no later than September 2, 2012, and continuing annually thereafter, the Executive Officer to file a report with CARB and U.S. EPA that includes all of the following:
  - [subparagraph (c)(5)(A)] – new subparagraph (c)(5)(A) would include a listing of all facilities subject to §185 and their calculated prior calendar year fee obligation,
  - [subparagraph (c)(5)(B)] – new subparagraph (c)(5)(B) would include the aggregate calculated amount of prior calendar year CAA Non-Attainment (§185) fees obligation;
  - [subparagraph (c)(5)(C)] – new subparagraph (c)(5)(C) would include the §172 (e) fee equivalency account beginning balance,

- [subparagraph (c)(5)(D)] – new subparagraph (c)(5)(D) would include the amount of any surplus funding carried over to the subsequent calendar year,
  - [subparagraph (c)(5)(E)] – new subparagraph (c)(5)(E) would include a listing of all programs, program descriptions, description of funding, certification of eligibility for each program, and associated expenditures that were credited into the Section 172 (e) fee equivalency account during the prior calendar year and those expected to be credited during the current year,
  - [subparagraph (c)(5)(F)] – new subparagraph (c)(5)(F) would include the results of the equivalency demonstration and preliminary determination of equivalency conducted.
- Backstop provision [subparagraph (c)(6)] – new paragraph; in the event the annual equivalency demonstration shows a deficit or a preliminary equivalency demonstration shows inadequate funding, this backstop provision requires the Executive Officer within 90 days to develop and bring to the Governing Board a backstop rule for adoption that would allow the Executive Officer to collect and/or track adequate fees for any shortfall. The Governing Board should act on the backstop rule proposal within 120 days from the funding inadequacy finding. The backstop rule should include the following elements to the extent the backstop rule applies to stationary sources:
    - [subparagraph (c)(6)(A)] – new subparagraph (c)(6)(A) would include an alternative baseline period reflecting the average of two consecutive years within the last ten (10) years prior to and including the attainment year may be substituted for emissions from the attainment year.
    - [subparagraph (c)(6)(B)] – new subparagraph (c)(6)(B) would include a provision that major stationary sources within a single non-attainment region, under common ownership and control, and that comport with the Federal definition of major stationary source for multi-site aggregation, may aggregate multi-site baseline and future year emissions.
    - [subparagraph (c)(6)(C)] – new subparagraph (c)(6)(C) would include the provision that each major stationary source paying Clean Air Act Non-attainment fees shall receive a credit for their fees paid for annual operating fees and annual operating emissions fees during the preceding calendar year. In no case, shall the credit exceed the Clean Air Act Non-attainment fees due.

**Severability [subdivision (d)]** – previous subdivision (d) would be deleted and the following new requirement would be added. If any provision of this rule is held by USEPA or CARB, finding or decision or a court decision to be invalid, such finding or decision will not affect the validity of the remainder of this rule and major stationary sources shall be subject to and must comply with the provisions contained in the remainder of this rule

**Termination [subdivision (e)]** – previous subdivision (e) would be deleted and the following new requirement would be added. This rule shall become inoperative and have no effect or operation upon a determination by the Administrator or Regional Administrator of the US EPA that in a given year the air basin is in attainment with the federal one-hour ozone standard, or

upon approval by EPA of a replacement program, such as a state-wide program adopted by CARB.

**Submittal to U.S. EPA and CARB [subdivision (f)]** – new subdivision (f) would add the following new requirement. The Executive Officer shall submit Rule 317 for inclusion into the SIP by CARB and U.S. EPA within 14 days of adoption.

**Attachment A** – a new attachment to Rule 317 that identifies a list of programs that are surplus to the one-hour ozone SIP that will be used to prefund the equivalent account.

## **POLLUTION CONTROL LEVELS FOR LARGE-EMITTING SOURCES IN THE DISTRICT**

As previously noted, U.S. EPA has established guidance that would allow adoption of an alternative program to the §185 fees as long as the program is consistent with the principles of §172(e) of the Clean Air Act (CAA). An example of a fee equivalent alternative program would be for states to develop programs that shift the fee burden from the specific set of major stationary sources that are otherwise required to pay fees according §185 to other non-major sources of emissions, including owners and/or operators of mobile sources. This alternative approach would allow states to recognize through reduced or eliminated fees those major sources of emission that have already installed the latest air pollution control technologies and assess the remainder of the total required fees on other sources that are not already as well controlled. Such an alternative program recognizes that already well controlled major sources would have few, if any, options for avoiding fees by achieving additional reductions. It would be necessary for the U.S. EPA to find the alternative program to be equivalent to a §185 fee. The proposed amendments to Rule 317 would be consistent with the principles of §172(e) and is appropriate for large-emitting sources in the district as they are already at Reasonably Available Control Technology (RACT) or BARCT emission levels as explained in the following paragraphs.

Large-emitting sources in the district already meet RACT/BARCT emission limits because of current federal, state, and local regulatory requirements. The following describes applicable federal, state, and local regulatory requirements that have resulted in large-emitting sources in the district achieving RACT/BARCT emission limits.

- 1) Emission Limitation Requirements for New and Modified Sources
  - For major sources, federal New Source Review (NSR) regulations require new sources, relocations, and modifications of existing sources that increase emissions to comply with BACT for attainment pollutants and Lowest Achievable Emission Rate (LAER) for nonattainment pollutants and their precursors. In the Basin, ozone and particulates and their precursors (including VOC, NO<sub>x</sub> and SO<sub>x</sub>) are nonattainment pollutants. Thus, LAER is required for all criteria pollutants except CO because it is an attainment pollutant.
  - The most stringent emissions limitation contained in a SIP for a class or category of source in a nonattainment area must be considered LAER, unless (a) a more stringent emissions limitation has been achieved in practice, or (b) the SIP limitation is demonstrated by the owner or operator of the proposed source to be unachievable [CAA,

§171(3)]. Federal LAER applies to a significant emissions increase at a major stationary source, but the SCAQMD has implemented this as a 1.0 lb/day increase in emissions from all sources subject to nonattainment NSR, including minor sources. SCAQMD also requires LAER for Prevention of Significant Deterioration (PSD) sources although federal law only requires BACT.

- Health and Safety Code (H&SC) §40440 requires the use of BACT as defined in state law (H&SC §40405) to include an emission limit defined the same way as federal LAER, except state law allows consideration of costs in establishing the class or category. State law requires BACT (similar to LAER) for all new and modified permitted sources (H&SC §40440(b)(1)).
- State BACT requirements cannot be less stringent than Federal LAER for major polluting facilities.
- The Federal CAA requirement for LAER is implemented through BACT by the SCAQMD. SCAQMD regulations require meeting emissions limits more stringent than LAER if they are technologically feasible and cost effective.
- SCAQMD NSR regulations require the following:

Section (f) of Rule 1302 – Definitions, includes the following definition of BACT: BACT means the most stringent emission limitation or control technique which:

- (1) has been achieved in practice for such category or class of source; or
- (2) is contained in any state implementation plan (SIP) approved by the U.S. EPA for such category or class of source. A specific limitation or control technique shall not apply if the owner or operator of the proposed source demonstrates to the satisfaction of the Executive Officer or designee that such limitation or control technique is not presently achievable; or
- (3) is any other emission limitation or control technique, found by the Executive Officer or designee to be technologically feasible for such class or category of sources or for a specific source, and cost-effective as compared to measures as listed in the AQMP or rules adopted by the SCAQMD Governing Board.

## 2) Emission Limitation Requirements for Existing Sources

- At the Federal level, the designation of an area as a non-attainment area requires a state to develop and submit to the U.S. EPA a SIP under the CAA (Title 1, Part D). This submittal must include a demonstration of how the NAAQS will be achieved as expeditiously as possible, including the application of RACT (CAA §172(c)(1)).
- The CAA requires SIPs for nonattainment areas to include at least emission controls that are economically and technologically feasible. RACT is defined as the lowest emission limit that a particular source is capable of meeting through the application of control technology that is reasonably achievable considering technological and economic feasibility (44 Fed. Reg. 53762, September 17, 1979).
- For each nonattainment area required to submit an attainment demonstration, §§172(c)(1) and (c)(2) of the CAA requires the region to demonstrate that it has adopted all control

measures necessary to show that it will attain the 8-hour ozone standard as expeditiously as practicable and to meet any reasonable further progress (RFP) requirements. In order to comply with these provisions, the SCAQMD must identify and evaluate all measures it has implemented or plans to implement in the future and compare them with measures implemented by other agencies within and outside of California (i.e., reasonably available control measure (RACM)/RACT analysis). The SCAQMD has performed a RACM/RACT analysis as part of the 2007 AQMP submittal.

- H&SC § 40440 requires the use of BARCT for existing sources and BARCT is defined as follows:

*BARCT (California Health and Safety Code § 40406): "...best available retrofit control technology means an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source."*

The above definition of BARCT corresponds closely to the federal definition of BACT, except that BARCT is based on class or category of sources where BACT is based on the individual sources (CAA § 169(3)). Thus, state law requires existing sources to meet standards equivalent to those required for new sources under federal law.

- The California Clean Air Act (CCAA) requires that an ozone non-attainment area not meeting the emission reduction target of five percent per year needs to demonstrate the implementation of "All Feasible Measures" (H&SC, §§40913, 40914 and 40920.5), which is defined in the California Code of Regulations (CCR), Title 17, §70600 as:

*"...air pollution control measures, including but not limited to emissions standards and limitations, applicable to all air pollution source categories under a district's authority that are based on the maximum degree of reductions achievable for emissions of ozone precursors, taking into account technological, social, environmental, energy and economic factors, including cost-effectiveness."*

The CEQA Guidelines (CCR Title 14, §15364) define feasible as:

*"...capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors."*

Thus, SCAQMD requires all feasible control measures for existing sources, even if they are more stringent than RACT.

- The CCAA requires that districts develop SIPs that would work towards attainment of the California Ambient Air Quality Standard for ozone. Further, the CCAA requires adopting and implementing all feasible measures as expeditiously as practicable. Feasible measures include the use of BARCT and RACT on existing stationary sources.
- California H&SC § 40920 requires that severe non-attainment areas include the use of RACT and BARCT on all permitted stationary sources as part of the implementation plan in order to meet the State ozone standard.

The above discussion of federal, state, and local regulatory requirements pertaining to new, modified, or relocated sources clearly demonstrate that large-emitting sources in the district are currently at RACT or BARCT levels. Many stationary sources are actually at BACT due to New Source Review program requirements. Consequently, it would be difficult for large emitting sources to reduce emissions in order to avoid fees if a strict §185 fee program were to be adopted.

## **FUNDING SOURCES**

PAR 317 would focus on funding from mobile source air quality improvement projects with air quality benefits that are surplus to the one-hour ozone SIP and either result in direct and indirect ozone precursor emission reductions or facilitate future reductions from these source categories by investing in fleet engine modernization, vehicle fuel infrastructure and technology advancement projects. More than 80 percent of the ozone formation in the district is due to emissions from mobile and area sources, while stationary sources contribute to less than 20 percent of the ozone precursors and are already subject to the nation's most stringent regulations. Of the stationary source emissions, major sources contribute approximately 10 percent of the total emissions. Staff has reviewed the programs (Table 1-1, see also PAR 317 Attachment A) likely to fund the fee equivalency account and conducted a preliminary evaluation of the fee equivalency. As shown in Table 1-1, Funding prior to program initiation is about \$110.15 million. Estimated funding is expected to be sufficient for the first several years of the program.

## **UNIVERSE OF AFFECTED SOURCES**

To analyze impacts from implementing PAR 317, it is necessary to establish a baseline for the purposes of CEQA, against which the proposed project is compared and a determination of significance is made. For the purposes of establishing a baseline for PAR 317, it was assumed that the baseline would consist of implementing a straight §185 fee program. A straight §185 fee program would apply to major stationary sources within the jurisdiction of the SCAQMD. PAR 317 defines a major stationary source as:

- (A) For a non-RECLAIM source-have the same meaning as in Sections 181(b)(4)(B) and 182(d) of the CAA, or 182 (e) as applicable, or a Major Polluting Facility as defined in Rule 1302(s) – Definition of Terms.
- (B) For a RECLAIM source-have the same meaning as in paragraph (b)(2) of Rule 3001 – Applicability where the potential to emit for a RECLAIM facility is the higher of:
  - (i) the starting allocation plus non-tradeable credits; or
  - (ii) RECLAIM Trading Credits (RTCs) held in the allocation account after trading. (RTC's held in the certificate account are not part of the allocation.)

\* Pending CARB and U.S. EPA approval .

\*\* Based reported expenditures by local governments and MSRCs that funded VOC/NOx emission reduction-related projects. (Funding sources marked “continuous” indicate expected annual funding unless indicated otherwise).

To identify the types of facilities used to establish the CEQA baseline and develop an inventory establish for the purposes of analyzing impacts from the proposed project, staff used SCAQMD’s Annual Emissions Reporting (AER) inventory data, cross-referenced it with the SCAQMD’s Title V database and included the following additional assumptions:

1. All sources with a potential (or permitted) to emit 25 or more tons per year of either VOC or NOx emissions annually and located in the portion of the SSAB that is within the jurisdiction of the SCAQMD, are major stationary sources and included in this estimate;
2. All other sources with a potential (or permitted) to emit 10 or more tons per year of either VOC or NOx emissions annually and located in the Basin (within the jurisdiction of the SCAQMD), are also major stationary sources and included in this estimate;
3. Sources are classified as major stationary sources based on their potential to emit or permitted level of emissions. However, fee amounts are based on actual emissions in the applicable fee assessment year; etc.

Evaluation of the SCAQMD databases identified certain industry groups (by two digit Standard Industrial Classification (SIC) code) that were used to establish the baseline (Table 1-2).

**TABLE 1-2  
Industry Categories by SIC Code**

<b>SIC Code</b>	<b>Grouping</b>
29	Petroleum Refining & Related Industries
32	Stone, Clay, Glass & Concrete Products
27	Printing, Publishing & Allied Industries
42	Motor Freight & Warehousing
33	Primary Metal Industries
37	Transportation Equipment
25	Furniture & Fixtures
23	Apparel & Other Finished Products of Fabrics & Similar Materials
46	Pipelines, Except Natural Gas
24	Lumber & Wood Products, Except Furniture
79	Amusement & Recreation Services
39	Miscellaneous Manufacturing Goods
36	Electronic & Other Electrical Equipment & Components
26	Paper & Allied Products
47	Transportation Services
45	Transportation by Air
75	Automotive Repair, Services & Parking
50	Wholesale-Durable Goods
82	Educational Services
30	Rubber & Miscellaneous Plastics Products
20	Food & Kindred Products

**TABLE 1-2 (Concluded)  
Industry Categories**

<b>SIC Code</b>	<b>Grouping</b>
76 & 78	Miscellaneous Repair Services
28	Chemicals & Allied Products
38	Measuring, Analyzing & Controlling Instruments; Photographic Goods; Watches & Clocks
94, 96 & 97	Public Administration
34	Fabricated Metal Products, Except Machinery and Transportation Equipment
91	Executive, Legislative & General Government, Except Finance
13	Oil & Gas Extraction
80	Health Services
51	Wholesale Trade - Non-Durable Goods
49	Electric, Gas & Sanitary Services (EGFs)

The analysis of major sources identified 417 facilities. For the assumptions used to determine how a facility would comply under a §185 fee program see the “Analysis Methodology” discussion under III. Air Quality and Greenhouse Gas Emissions. With regard to quantifying the air quality baseline see Appendix B.

## **CHAPTER 2 - ENVIRONMENTAL CHECKLIST**

---

**Introduction**

**General Information**

**Environmental Factors Potentially Affected**

**Determination**

**Environmental Checklist and Discussion**

## **INTRODUCTION**

The environmental checklist provides a standard evaluation tool to identify a project's adverse environmental impacts. This checklist identifies and evaluates potential adverse environmental impacts that may be created by the proposed project.

## **GENERAL INFORMATION**

Project Title: Final Subsequent Environmental Assessment for Proposed Amended Rule 317 – Clean Air Act Non-Attainment Fees and Replacement of 2007 AQMP Control Measure #2007 MCS-08 (Clean Air Act Emission Fees for Major Stationary Sources), 1997 AQMP Control Measure FSS-04, AND 1994 Control Measure CTY-10

Lead Agency Name: South Coast Air Quality Management District

Lead Agency Address: 21865 Copley Drive  
Diamond Bar, CA 91765

CEQA Contact Person: Jeff Inabinet, (909) 396-2453

PAR 317 Contact Person: Robert Pease, (909) 396-3118

Project Sponsor's Name: South Coast Air Quality Management District

Project Sponsor's Address: 21865 Copley Drive  
Diamond Bar, CA 91765

General Plan Designation: Not applicable

Zoning: Not applicable

Description of Project: PAR 317 would replace existing AQMP measures regarding CAA §185 with a fee equivalent rule, Rule 317. PAR 317 would satisfy §185 fee requirements through a fee equivalent structure that obviates the need for major stationary sources to pay a fee and would modify AQMP control measures calling for imposing a §185 fee. Section 172 (e) of the CAA allows for alternative programs that are no less stringent than the mandated program. Staff's proposal will recognize funding from fee programs that are surplus to the one-hour ozone SIP and are used for air quality improvement projects in the district or to facilitate reductions of ozone precursors. Such funds will be accumulated into a Fee Equivalency Account and used to offset the fee burden otherwise required under a §185 approach.

Surrounding Land Uses and Setting: Commercial and industrial facilities

Other Public Agencies Whose Approval is Required: Not applicable

**ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED**

The following environmental impact areas have been assessed to determine their potential to be affected by the proposed project. As indicated by the checklist on the following pages, environmental topics marked with a "✓" may be adversely affected by the proposed project. An explanation relative to the determination of impacts can be found following the checklist for each area.

- |  |  |  |
|--|--|--|
| <input type="checkbox"/> Aesthetics  | <input type="checkbox"/> Geology and Soils               | <input type="checkbox"/> Population and Housing        |
| <input type="checkbox"/> Agriculture and Forestry Resources                  | <input type="checkbox"/> Hazards and Hazardous Materials | <input type="checkbox"/> Public Services               |
| <input checked="" type="checkbox"/> Air Quality and Greenhouse Gas Emissions | <input type="checkbox"/> Hydrology and Water Quality     | <input type="checkbox"/> Recreation                    |
| <input type="checkbox"/> Biological Resources                                | <input type="checkbox"/> Land Use and Planning           | <input type="checkbox"/> Solid/Hazardous Waste         |
| <input type="checkbox"/> Cultural Resources                                  | <input type="checkbox"/> Mineral Resources               | <input type="checkbox"/> Transportation/Traffic        |
| <input type="checkbox"/> Energy  | <input type="checkbox"/> Noise                           | <input checked="" type="checkbox"/> Mandatory Findings |

**DETERMINATION**

On the basis of this initial evaluation:

- I find the proposed project, in accordance with those findings made pursuant to CEQA Guideline §15252, COULD NOT have a significant effect on the environment, and that an ENVIRONMENTAL ASSESSMENT with no significant impacts has been prepared.
- I find that although the proposed project could have a significant effect on the environment, there will NOT be significant effects in this case because revisions in the project have been made by or agreed to by the project proponent. An ENVIRONMENTAL ASSESSMENT with no significant impacts will be prepared.
- I find that the proposed project MAY have a significant effect(s) on the environment, and an ENVIRONMENTAL ASSESSMENT will be prepared.
- I find that the proposed project MAY have a "potentially significant impact" on the environment, but at least one effect 1)has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL ASSESSMENT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier ENVIRONMENTAL ASSESSMENT pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier ENVIRONMENTAL ASSESSMENT, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Date: January 5, 2011

Steve Smith, Ph.D.  
Program Supervisor

## **ENVIRONMENTAL CHECKLIST AND DISCUSSION**

PAR 317 would satisfy §185 fee requirements as applicable to the one-hour ozone standard through a fee equivalent structure that obviates the need for major stationary sources to pay a fee. Section 172 (e) allows for alternative programs that are no less stringent than the mandated program. Staff's proposal will recognize funding from fee programs that are surplus to the SIP and are used for air quality improvement projects in the SCAQMD. Such funds will be accumulated into a Fee Equivalency Account and used to offset the fee burden otherwise required under a §185 approach.

As indicated in Chapter 1, this CEQA document for the proposed project is a subsequent CEQA document to the 2007 AQMP Final Program Environmental Impact Report (PEIR) and the Final PEIRs for the 1997 and 1994 AQMPs and, as a result, the analysis tiers off of these documents (although this Subsequent EA for PAR 317 tiers primarily off of the 2007 AQMP) pursuant to CEQA Guidelines §15152. Further, it relies to the extent applicable on the analysis of environmental impacts evaluated in the 2007 AQMP Final PEIR.

As noted in Chapter one of this Subsequent EA, PAR 317 would eliminate the §185 fee requirement for the SSAB and instead implement a §172(e) equivalency program that would apply throughout the entire district. Because §172(e) equivalency fees would be drawn from existing revenue sources (see PAR 317 Attachment A) and because fees would be used to satisfy fee obligations in existing programs, as explained in the following sections, PAR 317 is not expected to generate any new direct or indirect environmental impacts compared to baseline conditions or compared to the analysis in the 2007 AQMP Final Environmental Impact Report. As currently proposed, should §185 fees be required, they would be required to satisfy SCAQMD Regulation III – Fees, obligations. Since CAA §185 does not require collected fees to be invested in emission reduction projects, no additional emission reductions are anticipated and, therefore, none were expected from any §185 fees collected by the SCAQMD.

The analysis in this SEA demonstrates that, although a straight §185 fee program may result in emission reductions that would be foregone under a §172(e) under specific circumstances, these emission reductions foregone would not exceed the SCAQMD's air quality significance thresholds. The analysis contained herein is considered to be a conservative analysis because it compares conditions with the proposed project (PAR 317) to conditions assuming the SCAQMD instead adopted a §185 fee rather than simply comparing conditions under the proposed project (PAR 317) with conditions in the environment today.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
<b>I. AESTHETICS.</b> Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

The proposed project impacts on aesthetics will be considered significant if:

- The project will block views from a scenic highway or corridor.
- The project will adversely affect the visual continuity of the surrounding area.
- The impacts on light and glare will be considered significant if the project adds lighting which would add glare to residential areas or sensitive receptors.

**Discussion**

**I. a) – c):** Overall, it was concluded in the Initial Study (IS) for the 2007 AQMP that AQMP control measures are not expected to adversely affect scenic vistas in the district; damage scenic resources, including but not limited to trees, rock outcroppings, or historic buildings within a scenic highway; or substantially degrade the visual character of a site or its surroundings. The reason for this conclusion is that most of the AQMP control measures that would be implemented by the SCAQMD typically affect industrial, institutional, or commercial facilities located in appropriately zoned areas (e.g., industrial and commercial areas) that are not usually associated with scenic resources. Construction activities are expected to be limited to industrial and commercial areas. Further, modifications typically occur inside the buildings at the affected facilities, or because of the nature of the business (e.g., commercial or industrial) can easily blend with the facilities with little or no noticeable effect on adjacent areas. Some control measures that are under the jurisdiction of CARB or the U.S. EPA would establish exhaust emission standards. Establishing exhaust emission standards for mobile sources would also not be expected to adversely affect scenic resources.

Further, emission growth management control measures may require emission reductions from new or redevelopment land use projects. These control measures, however, do not initiate or promote land use projects, they may simply require emission reductions after the decision has already been made to pursue new or redevelopment projects. As a result, emission growth management control measures are not expected to adversely affect local land use policies or create aesthetic impacts.

The 2007 AQMP may have a beneficial effect on scenic resources by improving visibility as well as improving air quality, preventing smoke (BCM-03 and BCM-04, limit opening burning and wood burning), and minimizing dust (BCM-02 and EGM-01, dust control).

**I. d):** The 2007 AQMP is not expected to create additional demand for new lighting or exposed combustion sources (e.g., flares) that could create glare that could adversely affect day or nighttime views in any areas. As noted in item I. a) – c) above, facilities affected by AQMP control measures typically make modifications in the interior of an affected facility so any new light sources would typically be inside a building or not noticeable because of the presence of existing outdoor light sources. Further, operators of commercial or industrial facilities who would make physical modifications to facilities and may require additional lighting would be located in appropriately zoned areas that are not usually located next to residential areas, so new light sources, if any, would not be noticeable to residents.

### **Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific aesthetic impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. PAR 317 would eliminate the §185 fee requirement for the SSAB and instead implement a §172(e) equivalency program that would apply throughout the entire district. Because §172(e) equivalency fees would be drawn from existing revenue sources (see PAR 317 Attachment A) and because fees would be used to satisfy fee obligations in existing programs, as explained in the following sections, PAR 317 is not expected to generate any new direct or indirect environmental impacts compared to baseline conditions or compared to the analysis in the 2007 AQMP Final Environmental Impact Report. As currently proposed, should §185 fees be required, they would be required to satisfy SCAQMD Regulation III – Fees, obligations. Since CAA §185 does not require collected fees to be invested in emission reduction projects, no additional emission reductions are anticipated and, therefore, none were expected from any §185 fees collected by the SCAQMD. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees would not change any conclusions in the IS for the 2007 AQMP. Since 317 PAR is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential aesthetics impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>II. AGRICULTURE AND FOREST RESOURCES.</b> Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland mapping and Monitoring Program of the California Resources Agency, to non- agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code §12220(g)), timberland (as defined by Public Resources Code §4526), or timberland zoned Timberland Production (as defined by Government Code §51104 (g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Project-related impacts on agriculture and forest resources will be considered significant if any of the following conditions are met:

- The proposed project conflicts with existing zoning or agricultural use or Williamson Act contracts.
- The proposed project will convert prime farmland, unique farmland or farmland of statewide importance as shown on the maps prepared pursuant to the farmland mapping and monitoring program of the California Resources Agency, to non-agricultural use.
- The proposed project conflicts with existing zoning for, or causes rezoning of, forest land (as defined in Public Resources Code §12220(g)), timberland (as defined in Public Resources Code §4526), or timberland zoned Timberland Production (as defined by Government Code § 51104 (g)).
- The proposed project would involve changes in the existing environment, which due to their location or nature, could result in conversion of farmland to non-agricultural use or conversion of forest land to non-forest use.

## **Discussion**

**II. a) - c):** It was concluded in the 2007 AQMP IS that control measures, which typically affect existing commercial or industrial facilities or establish specifications for fuels or mobile source exhaust emissions, are not expected to generate any new construction of buildings or other structures that would require conversion of farmland to non-agricultural use or conflict with zoning for agricultural uses or a Williamson Act contract. There are no provisions in the 2007 AQMP that would affect or conflict with existing land use plans, policies, or regulations or require conversion of farmland to non-agricultural uses. Some control measures could affect agricultural facilities and farmers (e.g., BCM-04, prohibit agricultural burning, and on-road and off-road mobile source control measures and MCS-05, reduce emissions from livestock wastes), however, these control measures are not expected to convert agricultural land uses to non-agricultural land uses. Land use, including agriculture-related uses, and other planning considerations are determined by local governments and no agricultural land use or planning requirements will be altered by the proposed project. AQMP control measures, including control measures related to mobile sources, would have no direct or indirect effects on agricultural resources. The 2007 AQMP could provide benefits to agricultural resources by reducing ozone emissions and, thus, reducing the adverse impacts of ozone on plants and animals.

Emission growth management control measures may require emission reductions from new or redevelopment land use projects. These control measures, however, do not initiate or promote land use projects, they may simply require emission reductions after the decision has already been made to pursue new or redevelopment projects. As a result, emission growth management control measures are not expected to adversely affect local land use policies or result in the conversion of agricultural lands to non-agricultural land uses.

**II. d):** In March 2010, amendments to the CEQA Guidelines were finalized that added forest resources as a new topic in the environmental checklist to be evaluated along with agricultural resources. Because the 2007 AQMP Program EIR was certified in June 2007, there was no explicit evaluation of potential forestry resources impacts. It is expected that the 2007 AQMP would not generated significant adverse forestry resources impacts for the same reasons it would not adversely affect agricultural resources, i.e., control measures would typically affect existing commercial or industrial facilities or establish specifications for fuels or mobile source exhaust emissions, so are not expected to generate any new construction of buildings or other structures that would require conversion of forest resources to non-forest use or conflict with zoning for forestry uses. Further, there are no provisions in the proposed 2007 AQMP that would affect or conflict with existing land use plans, policies, or regulations or require conversion of forests to non-forest uses.

## **Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific agricultural and forestry resources impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the \$185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see

PAR 317 Attachment A). Stationary source fees applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline agricultural or forest conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential agricultural and forestry resources impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>III. AIR QUALITY AND GREENHOUSE GAS EMISSIONS</b>				
Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Violate any air quality standard or contribute to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Diminish an existing air quality rule or future compliance requirement resulting in a significant increase in air pollutant(s)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
g) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
h) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

**Air Quality Significance Criteria**

To determine whether or not air quality impacts from adopting and implementing PAR 317 are significant, impacts will be evaluated and compared to the criteria in Table 2-1. The project will be considered to have significant adverse air quality impacts if any one of the thresholds in Table 2-1 are equaled or exceeded.

**Table 2-1  
SCAQMD Air Quality Significance Thresholds**

<b>Mass Daily Thresholds <sup>a</sup></b>		
<b>Pollutant</b>	<b>Construction <sup>b</sup></b>	<b>Operation <sup>c</sup></b>
NOx	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM10	150 lbs/day	150 lbs/day
PM2.5	55 lbs/day	55 lbs/day
SOx	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Lead	3 lbs/day	3 lbs/day
<b>Toxic Air Contaminants (TACs), Odor and GHG Thresholds</b>		
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk $\geq$ 10 in 1 million Hazard Index $\geq$ 1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
GHG	10,000 metric tons per year for industrial facilities	
<b>Ambient Air Quality for Criteria Pollutants <sup>d</sup></b>		
NO2  1-hour average annual average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.25 ppm (state – peak hour); 0.10 ppm (federal – 98 <sup>th</sup> percentile) 0.053 ppm (federal)	
PM10 24-hour average annual geometric average annual arithmetic mean	10.4 $\mu\text{g}/\text{m}^3$ (construction) <sup>e</sup> & 2.5 $\mu\text{g}/\text{m}^3$ (operation) 1.0 $\mu\text{g}/\text{m}^3$ 20 $\mu\text{g}/\text{m}^3$

## **Discussion**

**III.a)** The IS for the 2007 AQMP concluded that implementing AQMP control measures is, in effect, an update of the SCAQMD's 2003 AQMP, which is required pursuant to state law. By revising and updating emission inventories and control strategies, the SCAQMD is complying with state law, and furthering development and implementation of AQMP control measures, which are expected to reduce emissions and make progress towards attaining and maintaining all state and federal ambient air quality standards in the district. Control measure #2007 MCS-08 in the 2007 AQMP would require implementing \$185 fees throughout the district. Rule 317 was adopted in December 2008, but imposed \$185 fees only in the SSAB. Rule 317 is being amended to delete the \$185 fee requirement in the SSAB and impose an equivalent program consistent with CAA §172(e) throughout the entire district. To avoid inconsistency with the 2007 AQMP, control measure #2007 MCS-08 is being modified to substitute provisions for implementing a §172(e) program. This modification to control measure #2007 MCS-08 would eliminate any inconsistency between the proposed project and the 2007 AQMP.

**III.b)** The analysis of air quality impacts in the PEIR for the 2007 AQMP concluded that for most air quality impact areas, e.g., operational secondary impacts from increased electricity demand, mobile sources, etc., would be less than applicable significance thresholds and, therefore, would not contribute to significant adverse cumulative impacts. Construction air quality impacts (PM10) were concluded to be significant. Nine mitigation measures were identified to reduce construction air quality impacts. However, the analysis concluded that implementing the nine mitigation measures would not reduce construction air quality impacts to less than significant. It is, however, possible that implementing the proposed project in lieu of implementing a \$185 fee program throughout the district could adversely affect air quality. Potential adverse air quality impacts from the proposed project are discussed in the following subsections.

### **Analysis Methodology**

The analysis of PAR 317 primarily focuses on air quality impacts because this environmental topic area was identified as the area most affected by the proposed project. The following information provides detail on the methodology used to establish the baseline against which potential adverse air quality impacts from the proposed project are evaluated.

### **Proposed Project: §172 Alternative Fee Equivalency Program**

The PAR 317 relies on the fee equivalency approach provided by the CAA §172. Specifically, it uses funds available between FY08-09 and 2010 to prefund the \$185 Fee Accounts established by PAR 317 to meet the fee obligations beginning in 2011 and payable in 2012. These funds are surplus to the 1-hour ozone SIP and are used to directly and indirectly reduce air emissions, or to advance clean air technologies that will lead to emission reductions in the near future. Future funding meeting similar criteria can be creditable to the Accounts and used to meet the \$185 fee obligations until the former 1-hour ozone standard is met, which is anticipated to be around 2020 based on the 2007 AQMP modeling analysis (Chapter 5 of the AQMP). Under the proposed project, since facilities will not be charged for the \$185 fees, they are not expected to make further emission reductions beyond the existing SCAQMD's BARCT or BACT requirements. Emission reductions from the funded projects were already occurring and reductions from future projects cannot be quantified due to unknown funding amount or project selection. Therefore, it is assumed that there is no change to the current emission levels.

### **Existing Setting: §185 Fee Program**

Existing Rule 317 requires paying §185 fees, but currently only applies to the Salton Sea Air Basin (SSAB). The existing setting for the CEQA analysis is considered to be what would occur if SCAQMD were to adopt a straight §185 fee program to the existing Rule 317 for the South Coast Air Basin (SCAB). Under CAA, the collected fees do not have to be invested in emission reduction projects. The PAR 317 also stated that if a straight 185 fee program is adopted as a backstop measure, SCAQMD would credit the fees for a facility's Reg III annual emission fees and annual operating fees. It should also be noted that if SCAQMD does not adopt any §185 fee or an equivalent program, the U.S. EPA shall adopt the program for SCAQMD and the fees collected will go to the U.S. Treasury. Therefore, no emission reductions are expected from the collected fees. However, facilities may take certain actions to reduce their fee obligations, resulting in emission reductions that would otherwise not occur in comparison with PAR 317. These potential emission reductions foregone are the focus of this CEQA analysis. The following sections describe each of the potential actions facilities may take and assess the associated emission impacts.

#### *Option 1- Reduce emissions through controls beyond SCAQMD rules and regulations*

This option is unlikely because all facilities in the district are either at BARCT or BACT levels. As a result, opportunities for future emission reductions are limited (see discussion entitled "Pollution Control levels for Large-emitting Sources in the District" in Chapter 1).

#### *Option 2- Pay fees*

Likely participants of this option include those types of facility sectors that can pass on such costs, are required to operate for safety reasons, or are unable to scale back the demand for services or products. These likely sectors are listed in the bullet points.

- Power Plants (including cogeneration);
- Energy-related facilities (i.e., refineries, oil and gas extraction, bulk terminals, tank farms, sulfur plants);
- Public Agencies, including landfills;
- Universities; and
- Hospitals.

#### *Option 3- Take a temporary emission cap until the one-hour ozone standard<sup>1</sup> is attained (i.e., 2020)*

It is assumed that facilities with 2009 emissions that are less than or equal to eight tpy are likely to accept a temporary permit condition, i.e., a facility-wide emissions cap of less than 10 tpy as long as it does not unnecessarily constrain their operations. By taking the facility-wide emissions cap, the facility would not be subject to PAR 317 and, therefore, would not be required to pay §185 fees. This assumption is based on the 2007 AQMP growth forecast for this district, which is estimated to be 1.0 percent per year, on average, between 2010 and 2020. Facilities emitting eight tpy in 2010 can grow up to 25 percent by 2020 without exceeding the 10

---

<sup>1</sup> The U.S. EPA revoked the one-hour ozone standard in 2005. However, to prevent backsliding, §185 would continue to apply until 2020, which is when it is anticipated that the district would attain the federal one-hour standard and PAR 317 would no longer be applicable.

typy threshold. A growth rate of 25 percent over 10 years substantially exceeds the 2007 AQMP growth projections for all facilities, including affected PAR 317 facilities.

*Option 4- Reduce throughput to avoid fees*

An analysis was conducted to determine how likely this option is for any facilities that would not be expected to choose Options 1 through 3. The analysis is designed to assess, on a facility-by-facility, how much activity curtailment would be needed to avoid paying \$185 fees. The milestone year 2020 is selected for this analysis, because it represents a conservative scenario that if a facility does not need to curtail growth by 2020 when the highest growth is expected for the study period (2010-2020), it should not have to do so during any interim year. On the other hand, if a facility needs to curtail its production to avoid the fees, year 2020 should represent the highest curtailment, resulting in the greatest reductions foregone. The CAA allows the U.S. EPA to provide guidance on calculating the baseline as the average allowable emissions over a period of more than one year in cases where a “source’s emissions are irregular, cyclical or otherwise vary significantly from year to year.” Due to the recent severe economic recession, most facilities experienced significant variation (i.e., decline) in their emissions and were cyclical in response to national recessions such as early 1990’s and early 2000’s. Therefore, for the purposes of this CEQA analysis, the baseline to estimate the potential \$185 fees is the average of two out of 10 consecutive years with the highest emissions, adjusted for adopted rules between the selected years and 2010. The emission targets are 80% of the baseline emissions.

Since the U.S. EPA’s guidance for establishing baseline emissions other than 2010 requires adjustment for adopted rules by 2010, this analysis uses throughput/activity data, instead of emissions, and normalizes all the data to the 2009 (used as 2010) throughput/activity level to ensure the adopted rules by 2010 were considered (i.e., the 2009/2010 emissions reflected the rules implemented by 2010). The following equations were followed to determine if a facility would curtail its operation to reduce or avoid \$185 fees.

*Equation (A)*

The ratio of \$185 Targeted Throughput to the 2009(2010) Level<sub>x</sub> = [(average of highest throughput for two consecutive years) x 0.8]/ 2009(2010) Throughput<sub>x</sub>;

Where:

The 2009(2010) Level<sub>x</sub>, is the year 2009 throughput reported by facility x. It is used as the 2010 level for this analysis.

Natural gas consumption or solvent/coating usage is used as a surrogate to represent a facility’s overall production activity. Natural gas consumption is used primarily for facilities largely associated with fuel combustion activity while solvent/coating use is used for facilities associated with industrial coating or printing operations.

*Equation (B)*

Projected Throughput with Unconstrained Growth Relative to the 2009(2010) Level<sub>x</sub> = GF<sub>x2020</sub> CF<sub>x2020</sub>

Where

GF<sub>x2020</sub> is the basin-wide growth factor for the industry sector for facility x by 2020 based on the 2007 AQMP growth projections and 2010 equals to 1; and

$CF_{x2020}$  is the aggregated control factor for facility x for all applicable SCAQMD rules with compliance dates by year 2020 and 2010 equals to 1.

No further NOx reductions beyond 2010 were assumed for the NOx RECLAIM facilities, even though the program includes a programmatic 3.4 percent reduction in allocations through the year 2011. The reason for this assumption is that facilities can purchase RECALIM Trading Credits (RTCs) that available in the market in lieu of on-site reductions. This assumption is considered to be a conservative assumption for the purpose of this analysis.

If the result of equation (A) is greater than or equal to equation (B), no throughput curtailment is necessary, since projected growth from a depressed 2010 level is less than 80 percent of two more representative years and there would be no §185 fee obligations.

If the result of equation (A) is less than equation (B), a facility may choose to reduce throughput in order to avoid paying the fees with one exception. It is assumed that large businesses (i.e., facilities with their 2009 revenues greater than or equal to \$5 million and estimated §185 fees are less than one percent of total revenues) are unlikely to curtail their future growth to avoid the fees. \$5 million represent 10 times of SCAQMD's Rule 102 small business revenue definition of \$0.5 million. During the rule development process small business representatives, not large companies, raised repeatedly about affordability concern. Based on this assumption, these facilities would likely pay the §185 fees.

The curtailed throughput would translate into potential emission reductions foregone compared to the proposed project:

Equation (C)

Emission Reductions Foregone = 2009(2010) Reported Emissions \* (B-A)

### **Construction Impacts**

Implementing a §185 fee program throughout the district is considered the baseline from which to determine impacts from the proposed project. Under a §185 fee program, no construction and associated construction air quality impacts would occur for the following reasons. As noted in Chapter 1 of this SEA, large-emitting sources in the district already meet RACT/BARCT emission limits because of current federal, state, and local regulatory requirements. As a result, instead of installing additional emission control equipment, which is considered to be infeasible, affected facilities would have four options for comply with §185 fee requirements as explained in the "Analysis Methodology" discussion above: pay fees, take a temporary emissions cap until the one-hour ozone standard is achieved (anticipated in 2020), or reduce throughput.

Implementing the proposed project would also not result in construction and associated construction air quality impacts because the proposed project must achieve fee equivalency with a §185 fee program. Under the proposed project, fees would be derived from existing funding sources, so affected sources would not be required to make any physical changes at their facilities, even if they could. Consequently, the proposed project would not create significant adverse construction air quality impacts or substantially contribute to significant adverse project-specific or cumulative construction air quality impacts identified in the PEIR for the 2007 AQMP.

**Operational Impacts**

Using the air quality analysis methodology described above, PAR 317 would not result in any NOx emission reductions foregone compared to implementing a §185 fee program because all affected large NOx-emitting facilities would likely pay fees because they consist of: power plants (including cogeneration); energy-related facilities (i.e., refineries, oil and gas extraction, bulk terminals, tank farms, sulfur plants); public agencies, including landfills; universities; hospitals; facilities that can take a temporary emissions cap; facilities then can grow when the economy recovers but stay below 80% of their §185 baseline emissions; or facilities that are large businesses where their 2009 revenues are greater than or equal to \$5 million and estimated PAR 317 fees are less than one percent of total revenues.

Using the air quality analysis methodology described above, the analysis of operational VOC emission impacts as a result of implementing the proposed project showed that, although implementing PAR 317 would result in almost 47 pounds per day of VOC emissions foregone, VOC reductions foregone would not exceed the applicable VOC significance threshold of 55 pounds per day. This conclusion is based on the fact that only four large VOC-emitting facilities do not fit the description of facilities that would likely pay fees. Instead it was assumed that these facilities could potentially reduce throughput and, therefore, emissions to avoid paying the §185 fee.

**Table 2-2  
VOC Emission Reductions Foregone from Implementing PAR 317**

Ref ID	VOC TPY CY 2009 (a)	CHK IF VOC > 8 TPY CY 2009	Average of 2 consecutive Year peak Activity Ratio (b)	0.8*Activity Ratio (c) = 0.8*(b)	2020_GF*CF Where CF=1 (d)	0.8 ratio >= 2020_GF*CF (c) >= (d)	% curtailment (e) = (d) - (c)	Potential VOC Emission Red Foregone (TPY) (f) = (e)*(a)

4	8.65	y	1.18	0.95	1.13	N	0.18	1.54
Sum – Tons per Year								8.53
Sum – Tons per Day								0.02
Sum – Pounds per Day								46.74

TPY = tons per year

X = the fuel throughput reported by facility x for calendar year 2009.

2020\_GF<sub>i</sub> = the basin-wide growth factor for the industry sector for facility x between 2010 and 2020 based on the 2007 AQMP growth projections.

2020\_CF<sub>i</sub> = the control factor for any applicable SCAQMD rules with post 2010 compliance dates through the year 2020.

**III.c)** As noted in the discussions of construction and operations air quality impacts in item III. b) above, PAR 317 would not result in any construction air quality impacts and potential

operational air quality impacts would be less than the applicable significance thresholds. Specifically, no construction to install control equipment to comply with PAR 317 would occur for two reasons. First, large-emitting sources in the district are already at RACT/BARCT levels, so installation of further control is not considered to be feasible. Second, PAR 317 would implement an equivalent program to §185 fees, consistent with §172(e). Under this program, fees would be obtained from existing SCAQMD funding sources, which also would not require affected sources to install control equipment, even if they could. As a result, construction air quality impacts from the proposed project are not considered to be cumulatively considerable and, therefore, are concluded to be cumulatively insignificant.

As noted in the discussion of operational NO<sub>x</sub> air quality impacts in item III. B), implementing PAR 317 would not adversely affect NO<sub>x</sub> emissions from affected sources in any way. Since PAR 317 would not result in any NO<sub>x</sub> emission reductions foregone, NO<sub>x</sub> emission impacts are not considered to be cumulatively considerable and, therefore, are not considered to significant adverse cumulative impacts.

Analysis of operational VOC emission impacts as a result of implementing the proposed project concluded that VOC reductions foregone would not exceed the applicable VOC significance threshold of 55 pounds per day. This conclusion is based on the fact that only four large VOC-emitting facilities do not fit the description of facilities that would likely pay fees. Instead it was assumed that these facilities would reduce throughput and, therefore, emissions to avoid paying a fee. Since VOC emission reductions foregone do not exceed the applicable VOC significance threshold of 55 pounds per day VOC emission impacts are not considered to be cumulatively considerable and, therefore, are not considered to significant adverse cumulative impacts.

The analysis of air quality impacts in the PEIR for the 2007 AQMP concluded that for most air quality impact areas, e.g., operational secondary impacts from increased electricity demand, mobile sources, etc., would be less than applicable significance thresholds and, therefore, would not contribute to significant adverse cumulative impacts. Implementing the currently proposed project is not expected to create significant adverse cumulative NO<sub>x</sub> or VOC impacts or to change the conclusion regarding cumulative impacts in the PEIR for the 2007 AQMP in any way.

**III.d)** Potential air quality impacts from exposing sensitive receptors to substantial criteria pollutant concentrations were evaluated in the Program EIR for the 2007 AQMP. In general, the modeling performed for the 2007 AQMP showed improvements, i.e., declining concentrations, from the baseline year (2005) compared to future milestone years (2015 and 2024) for all criteria pollutants and VOC emissions. PAR 317 only applies to ozone precursors – NO<sub>x</sub> and VOC emissions. The analysis of potential criteria pollutant emissions foregone as a result of implementing PAR 317 compared to the baseline showed that there would be no NO<sub>x</sub> emission reductions foregone, while there would be almost 47 pounds per day of VOC emission reductions foregone. Consequently, PAR 317 would not create any localized NO<sub>x</sub> impacts to sensitive receptors. VOC emissions do not contribute to localized air quality impacts, but instead, contribute to regional ozone concentrations. However, it is unlikely that 47 pounds of VOC emissions per day would have a measurable effect on regional ozone concentrations. Therefore, it is concluded that VOC emissions from the proposed project would not create significant adverse localized air quality impacts to sensitive receptors.

In addition to the analysis of criteria pollutant exposures to sensitive receptors above, each of the four facilities that was identified as potentially having emission reductions foregone as a result of implementing PAR 317 compared to the baseline was also evaluated with regard to each facility's toxic air contaminant (TAC) emissions in connection with the AB 2588 Air Toxics Hot Spots Act program. AB 2588 requires districts to prioritize and then categorize facilities for the purposes of determining whether or not a health risk assessment (HRA) is necessary. The categorization process is based on an examination of the emissions inventory data, in consultation with the California Air Resources Board and the State Department of Health Services. Further, individual air districts are required to designate high, intermediate, and low priority categories and include each facility within the appropriate category based on its individual priority score.

Under the SCAQMD's AB 2588 program, a facility with a priority score of less than 1.0 is exempt from the AB 2588 program. A facility with a priority score of greater than 1.0, but less than 10 is required to update its TAC emissions inventory every four years. A facility with a priority score greater than 10 must prepare an HRA. As can be seen in Table 2-3, one facility had a priority score of 9.22, which does not require preparation of an HRA. A priority score of 9.22 for facility #1 means that the facility-wide cancer risk is less than the cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ) and the non-cancer hazard index threshold of 1.0 (see Table 2-1). VOC emission reductions foregone from facility #1 of approximate 5.5 pounds per day (see Table 2-3) would also not cause an exceedance of the cancer risk or hazard index significance thresholds.

**TABLE 2-3  
Priority Scores for Facilities with Emission Reductions Foregone**

<b>Reference ID</b>	<b>Facility Category</b>	<b>Priority Score</b>	<b>VOC Emission Reductions Foregone (#/D)</b>
1	Food & Kindred Products	9.22	5.5
2	Exterminating and Pest Control Services	Less than 1.0	19.3
3	Exterminating and Pest Control Services	Less than 1.0	13.5
4	Agricultural Fumigation	Less than 1.0	8.5
<b>Total</b>			<b>46.7</b>

Table 2-3 also shows that all three remaining facilities that have the potential to create TAC emission reductions foregone have priority scores less than 1.0 and, therefore, are not in the AB 2588 data base. Because facility-wide emissions from the three remaining facilities are less than 1.0, VOC emission reductions foregone shown in Table 2-3 would not exceed the cancer risk or hazard index significance thresholds shown in Table 2-1.

**III.e)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse odor impacts for the following reasons. Promulgation of AQMP control measures into rules or regulations may involve reformulated coatings or solvents, which may have noticeable odors. It is typically the case, however, that reformulated products have less noticeable odors than the products they are replacing. Reformulated products tend to

have reduced VOC content and reduced emissions and, therefore, fewer potential odors. As a result, significant adverse odor impacts have not been associated with reformulated products compared to conventional high VOC products. However, owners/operators of industries affected by control measures in the proposed 2007 AQMP would still be subject to existing air quality rules and regulations, including SCAQMD's Rule 402 - Nuisance, which prohibits creating odor nuisances. For these reasons, implementing the 2007 AQMP is not expected to create significant adverse odor impacts and, therefore, will not be further addressed in the Draft PEIR. Although the proposed project may result in VOC emission reductions foregone at facilities that use solvents and/or coatings, it is expected that any solvents and coatings would comply with applicable rules and regulations and, therefore, would have a low VOC content. As a result, such coatings and solvents would not be expected to create significant adverse odor impacts. Consequently, implementing the currently proposed project is not expected to change the conclusions regarding odor impacts in the IS for the 2007 AQMP in any way.

**II. f)** CAA fee requirements only apply to large-emitting sources of NO<sub>x</sub> and VOC emissions. As indicated in item II. B) above, PAR 317 is not expected to have any effect on NO<sub>x</sub> emissions from affected large sources. The proposed project, however, has the potential to result in almost 47 pounds per day of VOC emission reductions foregone, which does not exceed the applicable significance threshold of 55 pounds per day. Since the proposed project would not affect NO<sub>x</sub> emissions in any way and VOC emission reductions foregone would be less than significant, PAR 317 is not expected to significantly adversely affect an existing rule or future compliance requirement.

**III. g) & h)** Global warming is the observed increase in average temperature of the earth's surface and atmosphere. The primary cause of global warming is an increase of GHG emissions in the atmosphere. The six major types of GHG emissions identified in the Kyoto Protocol and in CARB's RMP regulation are carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), sulfur hexafluoride (SF<sub>6</sub>), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs). The GHG emissions absorb longwave radiant energy emitted by the earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the earth. The downward part of this longwave radiation emitted by the atmosphere is known as the "greenhouse effect."

The current scientific consensus is that the majority of the observed warming over the last 50 years can be attributable to increased concentration of GHG emissions in the atmosphere due to human activities. Events and activities, such as the industrial revolution and the increased consumption of fossil fuels (e.g., combustion of gasoline, diesel, coal, etc.), have heavily contributed to the increase in atmospheric levels of GHG emissions. As reported by the California Energy Commission (CEC), California contributes 1.4 percent of the global and 6.2 percent of the national GHG emissions (CEC, 2004). Further, approximately 80 percent of GHG emissions in California are from fossil fuel combustion (e.g., gasoline, diesel, coal, etc.).

As noted earlier in this discussion, CAA fee requirements only apply to large-emitting sources of NO<sub>x</sub> and VOC emissions. NO<sub>x</sub> emissions are typically generated from combustion. Similarly, CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O are the primary GHG emissions associated with combustion. Since the analysis of the proposed project concluded that implementing PAR 317 would not affect large NO<sub>x</sub> emitting sources, it is also expected that the proposed project would not affect CO<sub>2</sub>, CH<sub>4</sub>, or N<sub>2</sub>O emissions from affected facilities in any way. VOC emissions from affected facilities

are generated by VOC-containing solvents and coatings. In general, solvents and coatings do not typically emit GHGs and are not typically associated with combustion or other sources of GHGs such as refrigerants and niche applications in the electronics industry. Therefore, even though the proposed project may result in VOC emission reductions foregone, no similar GHG emission reductions foregone are anticipated.

### **Conclusion**

It was concluded in the PEIR for 2007 AQMP that implementing AQMP control measures could result in significant adverse construction air quality impacts (PM10), while operational air quality impacts were concluded to be less than significant. Paying fees such as the \$185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not affect NOx emissions from affected sources in any way, but would result in less than significant VOC emission reductions foregone (approximately 47 pounds per day). Since implementing PAR 317 would not generate significant adverse construction or operational air quality impacts, it would not make substantially worse significant adverse construction impacts identified in the PEIR for the 2007 AQMP, nor would it change any conclusions regarding operational impacts. Further, the CAA does not require \$185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Consequently, no changes from baseline NOx emissions would occur and a small, but less than significant change in VOC emissions compared to the baseline are anticipated. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential air resources impacts will not be further evaluated in this final SEA.

Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require \$185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with \$185 cannot be demonstrated and backstop measures need to be adopted.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>IV. BIOLOGICAL RESOURCES.</b>				
Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by §404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflicting with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

## **Significance Criteria**

Impacts on biological resources will be considered significant if any of the following criteria apply:

- The project results in a loss of plant communities or animal habitat considered to be rare, threatened or endangered by federal, state or local agencies.
- The project interferes substantially with the movement of any resident or migratory wildlife species.
- The project adversely affects aquatic communities through construction or operation of the project.

## **Discussion**

**IV. a), b), & d)** In the 2007 AQMP IS, no direct or indirect impacts from implementing AQMP control measures were identified that could adversely affect plant and/or animal species in the district. The effects of implementing AQMP control measures would typically result in reducing mobile source exhaust emissions, modifying fuel specifications, or modifications at existing commercial or industrial facilities to control or further control emissions. Such existing commercial or industrial facilities are generally located in appropriately zoned commercial or industrial areas, which typically do not support candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service. Similarly, modifications at existing facilities would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with native or resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Further, since the proposed 2007 AQMP primarily regulates stationary emission sources at existing commercial or industrial facilities, it does not directly or indirectly affect land use policy that may adversely affect riparian habitat or other sensitive natural communities identified in local or regional plans, policies, or regulations, or identified by the California Department of Fish and Game or U.S. Fish and Wildlife Service. Improving air quality is expected to provide health benefits to plant and animal species in the district. There are no control measures contained in the 2007 AQMP or PAR 317 that would alter this determination.

**IV. c)** As noted in the previous item, promulgating control measures in the 2007 AQMP may require modifications at existing industrial or commercial facilities to control or further control emissions at these affected facilities. Similarly, the 2007 AQMP contains control measures that establish emission standards for mobile sources, result in additional control of emissions from mobile sources, or revise fuel specifications. As a result, the proposed project will not affect land use policies or designations. Some control measures could result in the installation of additional controls at port facilities, which are located on the coast. However, the port facilities are considered to be heavy industrial facilities and the installation of additional controls would be consistent with this land use. For these reasons the proposed project will not adversely affect protected wetlands as defined by §404 of the Clean Water Act, including, but not limited to marshes, vernal pools, coastal wetlands, etc., through direct removal, filling, hydrological interruption or other means.

**IV. e) & f)** Implementing the 2007 AQMP is not expected to affect land use plans, local policies or ordinances, or regulations protecting biological resources such as a tree preservation policy or

ordinance for the reasons already given, i.e. control measures promulgated as rules or regulations primarily affect existing facilities located in appropriately zoned areas or establish emission standards for mobile sources or fuel specifications. Land use and other planning considerations are determined by local governments and no land use or planning requirements will be altered by the proposed project. Similarly, the proposed 2007 AQMP is not expected to affect in any way habitat conservation or natural community conservation plans, agricultural resources or operations, and would not create divisions in any existing communities.

**Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific biological resources impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline biological resources conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential biological resources impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>V. CULTURAL RESOURCES.</b> Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource, site, or feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

## **Significance Criteria**

Impacts to cultural resources will be considered significant if:

- The project results in the disturbance of a significant prehistoric or historic archaeological site or a property of historic or cultural significance to a community or ethnic or social group.
- Unique paleontological resources are present that could be disturbed by construction of the proposed project.
- The project would disturb human remains.

## **Discussion**

**V. a), b), c), & d)** As noted in the IS for the 2007 AQMP, implementing the 2007 AQMP control measures is primarily expected to result in controlling stationary source emissions at existing commercial or industrial facilities, establish emission standards for mobile sources, or establish fuel standards. Affected facilities where physical modifications may occur are typically located in appropriately zoned commercial or industrial areas that have previously been disturbed. Because potentially affected facilities are existing facilities and controlling stationary source emissions does not typically require extensive cut-and-fill activities or excavation, it is unlikely that implementing control measures in the proposed 2007 AQMP will: adversely affect historical or archaeological resources as defined in CEQA Guidelines §15064.5, destroy unique paleontological resources or unique geologic features, or disturb human remains interred outside formal cemeteries.

Further, emission growth management control measures may require emission reductions from new or redevelopment land use projects. These control measures, however, do not initiate or promote land use projects, they may simply require emission reductions after the decision has already been made to pursue new or redevelopment projects. As a result, emission growth management control measures are not expected to adversely affect local land use policies or create additional development that would impact cultural resources.

## **Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific cultural resources impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline cultural resources conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential cultural resources impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>VI. ENERGY.</b> Would the project:				
a) Conflict with adopted energy conservation plans?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the need for new or substantially altered power or natural gas utility systems?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Create any significant effects on local or regional energy supplies and on requirements for additional energy?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create any significant effects on peak and base period demands for electricity and other forms of energy?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Comply with existing energy standards?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts to energy and mineral resources will be considered significant if any of the following criteria are met:

- The project conflicts with adopted energy conservation plans or standards.
- The project results in substantial depletion of existing energy resource supplies.
- An increase in demand for utilities impacts the current capacities of the electric and natural gas utilities.
- The project uses non-renewable resources in a wasteful and/or inefficient manner.

**Discussion**

**VI. a) & e)** It was concluded in the 2007 AQMP IS that AQMP control measures are not anticipated to result in any conflicts with adopted energy conservation plans or violations of any energy conservation standards by affected facilities. In some cases facilities complying with 2007 AQMP control measures may need to install various types of control equipment, which could potentially increase energy demand in the district. It is expected, however, that owners/operators of affected facilities would comply with any applicable energy conservation standards in effect at the time of installation. Alternatively, implementing the proposed 2007 AQMP may result in owners/operators of affected facilities replacing old inefficient equipment with newer more energy efficient equipment (e.g., MCS-01, Facility Modernization and MCS-03, Energy Efficiency and Conservation), thus providing beneficial impacts on energy demand. Based upon these considerations, however, the net effect of implementing the 2007 AQMP is that it is not expected to conflict with any adopted energy conservation plans or energy efficiency standards. These topics, therefore, will not be further evaluated in this final SEA.

**VI. b), c), & d)** The IS for the 2007 AQMP indicated that 2007 AQMP control measures may interfere with energy conservation efforts in the district. Further, implementing some AQMP control measures could increase energy demand in the region at affected facilities. As a result, these topics were further analyzed in the PEIR. The analysis concluded that energy impacts as a result of implementing control measures in the 2007 AQMP would not be significant for the following reasons. Although implementing AQMP control measures may increase demand for electricity, natural gas, and alternative fuels, it is expected that local utilities have the capacity to supply future demand. Further, installing new less polluting and more efficient equipment as a result of complying with AQMP control measures may provide beneficial reductions in future demand. Finally, greater reliance on electricity, natural gas, and alternative fuels would reduce demand for other fossil fuels.

Based on the analysis of the currently proposed project, paying fees such as the §185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to contribute to adverse environmental impacts in any way. Therefore, the proposed project would not result in the need for new or substantially altered power or natural gas utility systems; create significant effects on peak and base period demands for electricity and other forms of energy; or create significant effects on peak and base period demands for electricity and other forms of energy.

### **Conclusion**

It was concluded in the 2007 AQMP IS that significant adverse project-specific energy impacts may occur due to implementation of the 2007 AQMP control measures. However, paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline energy conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential energy impacts will not be further evaluated in this final SEA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
<b>VII. GEOLOGY AND SOILS.</b> Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
• Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
• Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
• Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts on the geological environment will be considered significant if any of the following criteria apply:

- Topographic alterations would result in significant changes, disruptions, displacement, excavation, compaction or over covering of large amounts of soil.

- Unique geological resources (paleontological resources or unique outcrops) are present that could be disturbed by the construction of the proposed project.
- Exposure of people or structures to major geologic hazards such as earthquake surface rupture, ground shaking, liquefaction or landslides.
- Secondary seismic effects could occur which could damage facility structures, e.g., liquefaction.
- Other geological hazards exist which could adversely affect the facility, e.g., landslides, mudslides.

### **Discussion**

**VII. a), c) & d)** It was concluded in the 2007 AQMP IS that the control measures will not directly or indirectly expose people or structures to earthquake faults, seismic shaking, seismic-related ground failure including liquefaction, landslides, mudslides or substantial soil erosion for the following reasons. When implemented as rules or regulations, AQMP control measures do not directly or indirectly result in construction of new structures. Some structural modifications, however, at existing affected facilities may occur as a result of installing control equipment or making process modifications. In any event, existing affected facilities or modifications to existing facilities would be required to comply with relevant Uniform Building Code requirements in effect at the time of initial construction or modification of a structure.

New structures must be designed to comply with the Uniform Building Code Zone 4 requirements since the district is located in a seismically active area. The local cities or counties are responsible for assuring that projects comply with the Uniform Building Code as part of the issuance of the building permits and can conduct inspections to ensure compliance. The Uniform Building Code is considered to be a standard safeguard against major structural failures and loss of life. The goal of the Code is to provide structures that will: (1) resist minor earthquakes without damage; (2) resist moderate earthquakes without structural damage but with some non-structural damage; and (3) resist major earthquakes without collapse but with some structural and non-structural damage.

The Uniform Building Code bases seismic design on minimum lateral seismic forces ("ground shaking"). The Uniform Building Code requirements operate on the principle that providing appropriate foundations, among other aspects, helps to protect buildings from failure during earthquakes. The basic formulas used for the Uniform Building Code seismic design require determination of the seismic zone and site coefficient, which represents the foundation conditions at the site.

Any potentially affected facilities that are located in areas where there has been historic occurrence of liquefaction, e.g., coastal zones, or existing conditions indicate a potential for liquefaction, including expansive or unconsolidated granular soils and a high water table, may have the potential for liquefaction-induced impacts at the project sites. The Uniform Building Code requirements consider liquefaction potential and establish more stringent requirements for building foundations in areas potentially subject to liquefaction. Therefore, compliance with the Uniform Building Code requirements is expected to minimize the potential impacts associated with liquefaction. The issuance of building permits from the local cities or counties will assure compliance with the Uniform Building Code requirements. Therefore, no significant impacts from liquefaction are expected and this potential impact will not be considered further.

Because facilities affected by any AQMP control measures are typically located in industrial or commercial areas, which are not typically located near known geological hazards (e.g., landslide, mudflow, seiche, tsunami or volcanic hazards), no significant adverse geological impacts are expected. Tsunamis at the ports, i.e., Port of Los Angeles and Port of Long Beach, are not expected because the ports are surrounded by breakwaters that protect the area from wave action. In any event, AQMP control measures will not increase potential exposures to tsunamis. As a result, these topics will not be further evaluated in this final SEA.

**VII. b)** Although the 2007 AQMP control measures may require modifications at existing industrial or commercial facilities, it was concluded in the IS for the 2007 AQMP that such modifications are not expected to require substantial grading or construction activities. Soil stabilization methods and paving of unpaved areas could be required under control measure BCM-02 which would further reduce PM10 emissions from paved and unpaved roads. Soil compaction or over covering with a hard-ground cover such as asphalt or concrete pavement could contribute to surface water erosion of soils in areas adjacent to paved or other impervious surface areas. However, these potential impacts from paving of unpaved roads are not anticipated from the 2007 AQMP. Further, the control measure (BCM-02) is expected to reduce wind erosion of soil. The proposed project does not have the potential to substantially increase the area subject to compaction or overcovering since the subject areas would be limited in size and, typically, have already been graded or displaced in some way (e.g., shoulders of roadways). Therefore, significant adverse soil erosion impacts are not anticipated from implementing the 2007 AQMP and will not be further evaluated in this final SEA.

**VII. e)** Septic tanks or other similar alternative waste water disposal systems are typically associated with small residential projects in remote areas. As noted in the IS for the 2007 AQMP, the 2007 AQMP does not contain any control measures that generate construction of residential projects in remote areas. AQMP control measures typically affect existing industrial or commercial facilities that are already hooked up to appropriate sewerage facilities. Based on these considerations, the use of septic tanks or other alternative waste water disposal systems will not be further evaluated in this final SEA.

### **Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific geology and soils impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline geological and soil conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential geology and soils impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>VIII. HAZARDS AND HAZARDOUS MATERIALS.</b> Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, and disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions, or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code §65962.5 and, as a result, would create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport or a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Significantly increased fire hazard in areas with flammable materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts associated with hazards will be considered significant if any of the following occur:

- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.
- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

**Discussion**

**VIII. a), b) & c)** The 2007 AQMP PEIR indicated that the 2007 AQMP control measures have the potential to create direct or indirect hazard impacts in several ways, including potential hazardous impacts that may result from the reformulation of products with materials that are low or exempt VOC materials, ammonia use in selective catalytic reduction equipment, use of fuel additives, etc., could generate significant offsite hazard impacts. The analysis of hazard impacts concluded that only potential impacts from modifications at refineries to produce a modified CARB Phase 3 gasoline (ONRD-03) and/or reformulated diesel fuel (ONRD-07) that could require equipment modifications or new equipment could generate significant offsite hazard impacts. One mitigation measure was identified to reduce this significant hazard impact, but hazard impacts remained significant.

Based on the analysis of the currently proposed project, paying fees such as the \$185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to contribute to adverse environmental impacts in any way.

**VIII. d)** Government Code §65962.5 typically refers to a list of facilities that may be subject to Resource Conservation and Recovery Act (RCRA) permits or site cleanup activities. For any facilities affected by control measures that are on the list, it is anticipated that they would be required to manage any and all hazardous materials in accordance with federal, state and local regulations. According to the IS for the 2007 AQMP, implementing AQMP control measures is not expected to interfere with site cleanup activities or create additional site contamination. Therefore, this topic will not be further evaluated in this final SEA.

**VIII. e)** According to the IS for the 2007 AQMP, implementing AQMP control measures is not expected to adversely affect any airport land use plan or result in any safety hazard for people residing or working in the district. U.S. Department of Transportation – Federal Aviation Administration Advisory Circular AC 70/7460-2K provides information regarding the types of projects that may affect navigable airspace. Projects that involve construction or alteration of structures greater than 200 feet above ground level within a specified distance from the nearest runway; objects within 20,000 feet of an airport or seaplane base with at least one runway more than 3,200 feet in length and the object would exceed a slope of 100:1 horizontally (100 feet horizontally for each one foot vertically from the nearest point of the runway); etc., may adversely affect navigable airspace. Control measures in the 2007 AQMP are not expected to require construction of tall structures near airports so potential impacts to airport land use plans or safety hazards to people residing or working in the vicinity of local airports are not anticipated. These controls are expected to establish emission standards or increase the use of electrical equipment, but are not expected to interfere with airport activities. Implementing the currently proposed project is not expected to change this conclusion in any way. This potential impact will not be further addressed in this final SEA.

**VIII. f)** According to the IS for the 2007 AQMP, implementing AQMP control measures is not expected to interfere with any emergency response procedures or evacuation plans. Operators of any existing commercial or industrial facilities affected by the AQMP control measures will typically have their own emergency response plans for their facilities already in place. Emergency response plans are typically prepared in coordination with the local city or county emergency plans to ensure the safety of not only the public, but the facility employees as well. The implementation of certain control measures could result in the need for additional storage of hazardous materials (e.g., ammonia). Such modifications may require revisions to emergency response plans if new hazardous are introduced to a facility. However, these modifications would not be expected to interfere with emergency response procedures and would not impair implementation of, or physically interfere with any adopted emergency response plan or emergency evacuation plan. Implementing the currently proposed project is not expected to change this conclusion in any way, so this topic will not be further evaluated in this final SEA.

**VIII. g)** The 2007 AQMP would typically affect existing commercial or industrial facilities in appropriately zoned areas. Since commercial and industrial areas are not typically located near wildland or forested areas, according to the IS prepared for the 2007 AQMP, implementing AQMP control measures has no potential to increase the risk of wildland fires. Implementing the currently proposed project is not expected to change this conclusion in any way. Therefore, this topic will not be further evaluated in this final SEA.

**VIII. h)** The 2007 AQMP IS concluded that some control measures in the 2007 AQMP that require add-on control equipment or reformulated products may increase potential fire hazards in

areas with flammable materials and may be a potentially significant impact. The PEIR, however, concluded that potential fire hazard impacts would be less than significant through complying with applicable laws and regulations regarding storage, handling and transport of flammable materials. Further, increased use of some types of flammable substances, e.g., alternative fuels, would result in a commensurate reduction in other types of flammable substances e.g., fossil fuels.

Based on the analysis of the currently proposed project, paying fees such as the §185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to contribute to adverse environmental impacts in any way. Therefore, implementing the currently proposed project is not expected to change the above conclusion in any way.

### **Conclusion**

Based upon the above considerations, with the exception of accidental releases of hazardous materials it was concluded in the 2007 AQMP IS that significant adverse project-specific hazards and hazardous materials impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. One mitigation measure was identified to reduce significant hazardous materials impacts, but impacts remained significant. To the extent applicable, the mitigation measure would continue to be required. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline hazards or hazardous materials conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential hazards and hazardous materials impacts will not be further evaluated in this final SEA.

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
<b>IX. HYDROLOGY AND WATER QUALITY.</b> Would the project:				
a) Violate any water quality standards, waste discharge requirements, exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board, or otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in substantial erosion or siltation on- or off-site or flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Place housing or other structures within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map, which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
f) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam, or inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Require or result in the construction of new water or wastewater treatment facilities or new storm water drainage facilities, or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Potential impacts on water resources will be considered significant if any of the following criteria apply:

Water Demand:

- The existing water supply does not have the capacity to meet the increased demands of the project, or the project would use more than 262,820 gallons per day of potable water.
- The project increases demand for total water by more than five million gallons per day.

Water Quality:

- The project will cause degradation or depletion of ground water resources substantially affecting current or future uses.
- The project will cause the degradation of surface water substantially affecting current or future uses.
- The project will result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements.

- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system are not sufficient to meet the needs of the project.
- The project results in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project results in alterations to the course or flow of floodwaters.

### **Discussion**

**IX. a) & i)** The 2007 AQMP IS concluded that some control measures in the 2007 AQMP that would control particulate and/or SO<sub>x</sub> emissions could require additional wastewater discharge from devices like wet gas scrubbers (e.g., BCM-01, PM Control Devices, and CMB-02, SO<sub>x</sub> Controls). Facilities, such as refineries, could also require modifications to supply reformulated gasoline (ONRD-03), reformulated diesel fuels (ONRD-07), and cleaner marine fuels (ONRD-06), and these modifications could generate additional wastewater discharge. Further, affected facilities that generate waste water and are subject to waste discharge or pretreatment requirements currently comply with and will continue to comply with all relevant waste water requirements, waste discharge regulations and standards for stormwater runoff, and any other relevant requirements for direct discharges into sewer systems. These standards and permits require water quality monitoring and reporting for onsite water-related activities. The analysis in the PEIR for the 2007 AQMP concluded that implementing five mitigation measures would reduce water quality impacts to less than significant.

Based on the analysis of the currently proposed project, paying fees such as the §185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to contribute to adverse environmental impacts in any way.

**IX. b), g) & h)** As discussed above, the 2007 AQMP IS concluded that some control measures in the 2007 AQMP that would control particulate (fugitive dust) and/or SO<sub>x</sub> emissions could require additional water use from affected facilities (e.g., BCM-01, CMB-02, ONRD-03, ONRD-06, MCS-07, EGM-01, EGM-02, and MOB-01). The analysis in the PEIR concluded, however, that potential water demand impacts from implementing AQMP control measures would not exceed applicable significance thresholds.

Based on the analysis of the currently proposed project, paying fees such as the §185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to increase demand for water so the proposed project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge, affect available water supplies or require a determination by a wastewater treatment provider. Similarly, the proposed project is not expected to result in the construction of new water or wastewater treatment facilities and would not cause an increase in storm water discharge, since no major construction activities are required or expected.

**IX. c), & d)** The 2007 AQMP IS concluded that soil stabilization methods and paving of unpaved areas could be required under control measure BCM-02 which would further reduce PM10 emissions from paved and unpaved roads, and soil compaction or over covering with a hard-ground cover such as asphalt or concrete pavement could contribute to surface water runoff since additional impervious surface areas would be created. The reason for this conclusion is that control measures in the 2007 AQMP are generally expected to impose control requirements on stationary sources at existing commercial or institutional facilities and establish emission exhaust specifications for mobile sources.

The currently proposed project is not expected to generate new structures that could alter existing drainage patterns by altering the course of a river or stream that would result in substantial erosion, siltation, or flooding on or offsite, increase the rate or amount of surface runoff that would exceed the capacity of existing or planned stormwater drainage systems, etc. As indicated in the 2007 AQMP IS, although minor modifications might occur at commercial or industrial facilities affected by the proposed 2007 AQMP control measures, these facilities have, typically, already been graded and the areas surrounding them have likely already been paved over or landscaped. Based on the analysis of the currently proposed project, paying fees such as the §185 fees, is not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to contribute to adverse environmental impacts in any way. Since this potential adverse impact is not considered to be significant, it will not be further evaluated in this final SEA.

**IX. e), & f)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would did not include the construction of new or relocation of existing housing or other types of facilities and, as such, would not require the construction or the placement of housing or other structures within a 100-year flood area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood delineation map (See also XIII “Population and Housing”). As a result, the proposed project would not be expected to create or substantially increase risks from flooding; expose people or structures to significant risk of loss, injury or death involving flooding; or increase existing risks, if any, of inundation by seiche, tsunami, or mudflow. Consequently, potential flooding impacts from implementing AQMP control measures were concluded to be significant. Therefore, this topic will not be evaluated further in this final SEA.

### **Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific hydrology and water quality impacts may occur due to implementation of the 2007 AQMP control measures. Five mitigation measures were identified that would reduce significant hydrology/water quality impacts to less than significant. To the extent applicable, mitigation measures would continue to be required for future projects. However, paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees

would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline hydrology or water quality conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential hydrology and water quality impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>X. LAND USE AND PLANNING.</b>				
Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Land use and planning impacts will be considered significant if the project conflicts with the land use and zoning designations established by local jurisdictions.

**Discussion**

**X. a)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts that could physically divide a community because, generally, control measures would be expected to impose control requirements on stationary sources at existing commercial or institutional facilities or establish emission exhaust specifications for mobile sources. As a result, the 2007 AQMP does not require construction of structures for new land uses in any areas of the district and, therefore, is not expected to create divisions in any existing communities or conflict with any applicable habitat conservation or natural community conservation plans. Implementing the currently proposed project is not expected to change this conclusion in any way.

**X. b)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts that could interfere with complying with any applicable land use plans, zoning ordinances, habitat conservation or natural community conservation plans for the following reasons. No control measures were identified that would directly affect these plans, policies, or regulations. The SCAQMD is specifically excluded from infringing on existing city or county land use authority (California Health & Safety Code §40414). Land use and other planning considerations are determined by local governments and no present or

planned land uses in the region or planning requirements will be altered by the proposed project in any way. There are existing links between population growth, land development, housing, traffic and air quality. SCAG's Regional Comprehensive Plan accounts for these links when designing ways to improve air quality, transportation systems, land use, compatibility and housing opportunities in the region. Land use planning is handled at the local level and contributes to development of the AQMP growth projections, for example, but the AQMP does not affect local government land use planning decisions. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusion**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific land use and planning impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline land use and planning conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential land use and planning impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XI. MINERAL RESOURCES.</b> Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Project-related impacts on mineral resources will be considered significant if any of the following conditions are met:

- The project would result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
- The proposed project results in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

**Discussion**

**XI. a) & b)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts that would directly result in the loss of availability of a known mineral resource of value to the region and the residents of the state, or of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan. Further, implementing AQMP control measures is not expected to deplete non-renewable mineral resources, such as aggregate materials, metal ores, etc., at an accelerated rate or in a wasteful manner because AQMP control measures are typically not mineral resource intensive measures. Therefore, significant adverse impacts to mineral resources from implementing AQMP control measures are not anticipated. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific mineral resources impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline land conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential mineral resources impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XII. NOISE.</b> Would the project result in:				
a) Exposure of persons to or generation of permanent noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
c) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport or private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts on noise will be considered significant if:

- Construction noise levels exceed the local noise ordinances or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels will be considered significant if they exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project noise sources increase ambient noise levels by more than three dBA at the site boundary.

**Discussion**

**XII. a), b) & c)** It was concluded in the AQMP IS that certain control measures may require existing commercial or industrial owners/operators of affected facilities to install air pollution control equipment or modify their operations to reduce stationary source emissions. Potential modifications will occur at facilities typically located in appropriately zoned industrial or commercial areas. The 2007 AQMP could require additional control equipment that could generate noise impacts, but virtually all of the control equipment would be installed at industrial and commercial facilities.

The IS for the 2007 AQMP noted that ambient noise levels in commercial and industrial areas are typically driven primarily by freeway and/or highway traffic in the area and any heavy-duty equipment used for materials manufacturing or processing at nearby facilities. It is not expected that any modifications to install air pollution control equipment would substantially increase ambient [operational] noise levels in the area, either permanently or intermittently, or expose people to excessive noise levels that would be noticeable above and beyond existing ambient levels. It is not expected that affected facilities would exceed noise standards established in local general plans, noise elements, or noise ordinances currently in effect. Affected facilities would be required to comply with local noise ordinances and elements, which may require construction of noise barriers or other noise control devices.

In addition to the above, the IS noted that some control measures would provide an incentive for the early retirement of older equipment, replacing it with newer technologies. In most cases, newer equipment and newer engines are more efficient and generate less noise than older equipment. For example, electric and hybrid vehicles generate less noise than standard gasoline fueled vehicles. Therefore, some control measures could result in noise reductions at industrial/commercial facilities or along freeways/highways/streets as a result of quieter engines (e.g., MCS-01, Facility Modernization, and ONRD-06, Accelerated Penetration of Partial Zero-Emission and Zero Emission Vehicles).

It was concluded in the IS for the 2007 AQMP that implementing AQMP control measures would not cause an increase in groundborne vibration levels because air pollution control equipment is not typically vibration intensive equipment. Consequently, the 2007 AQMP would not directly or indirectly cause substantial noise or excessive groundborne vibration impacts. Implementing the currently proposed project is not expected to change this conclusion in any way. These topics, therefore, will not be further evaluated in this final SEA.

**XII. d)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts at affected facilities because they would still be expected to comply, and not interfere, with any applicable airport land use plans and disclose any excessive noise levels to affected residences and workers pursuant to existing rules, regulations and requirements, such as CEQA. It is assumed that operations in these areas near airports are subject to and in compliance with existing community noise ordinances and applicable OSHA or Cal/OSHA workplace noise reduction requirements. In addition to noise generated by current operations, noise sources in each area may include nearby freeways, truck traffic to adjacent businesses, and operational noise from adjacent businesses. It was concluded that none of the control measures in the 2007 AQMP would locate residents or commercial buildings or other sensitive noise source closer to airport operations. Consequently, there are no components of the 2007 AQMP that would substantially increase ambient noise levels, either intermittently or permanently. Implementing the currently proposed project is not expected to change this conclusion in any way.

### **Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific noise impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline noise conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential noise impacts will not be further evaluated in this final SEA.

---

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XIII. POPULATION AND HOUSING.</b>				
Would the project:				
a) Induce substantial growth in an area either directly (for example, by proposing new homes and businesses) or indirectly (e.g. through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of people or existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts of the proposed project on population and housing will be considered significant if the following criteria are exceeded:

- The demand for temporary or permanent housing exceeds the existing supply.
- The proposed project produces additional population, housing or employment inconsistent with adopted plans either in terms of overall amount or location.

**Discussion**

**XIII. a)** The IS for the 2007 AQMP noted that, according to SCAG (2004), population growth in the SCAG region (which includes all of the district) is expected to grow to 22.9 million due to births within the region and migration. Consistent with SCAG’s population growth projections, the proposed project is not anticipated to generate any significant effects, either directly or indirectly, on the district’s population or population distribution. The 2007 AQMP generally affects existing commercial or industrial facilities located in predominantly industrial or commercial urbanized areas throughout the district. It is expected that the existing labor pool within the areas surrounding any affected facilities would accommodate the labor requirements for any modifications at affected facilities. In addition, it is not expected that affected facilities would be required to hire additional personnel to operate and maintain new control equipment on site because air pollution control equipment is typically not labor intensive equipment. In the event that new employees are hired, it is expected that the existing local labor pool in the district can accommodate any increase in demand for workers that might occur as a result of the 2007 AQMP. As a result, implementing AQMP control measures is not expected to result in significant adverse changes in population densities or induce significant growth in population. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XIII. b)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts that would increase demand for new workers in the district. Any demand for new employees is expected to be accommodated from the existing labor pool so no substantial population displacement is expected. Construction activities generated by the 2007 AQMP are expected to be limited to stationary sources within industrial and

commercial areas for the installation of new technology or equipment. The 2007 AQMP is not expected to require construction activities that would displace people or existing housing. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific population and housing impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the \$185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require \$185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline population and housing conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential population and housing impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XIV. PUBLIC SERVICES.</b> Would the proposal result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:				
a) Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

### **Significance Criteria**

Impacts on public services will be considered significant if the project results in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response time or other performance objectives.

### **Discussion**

**XIV. a), b), & d)** It was concluded in the 2007 AQMP IS that there is no potential for significant adverse public service impacts to fire departments, police departments, or other public services as a result of implementing AQMP control measures. Similarly, the proposed project would not result in the need for new or physically altered government facilities in order to maintain acceptable service ratios, response times or other performance objectives. Similarly, most industrial facilities have on-site security that controls public access to facilities so no increase in the need for police services are expected. Most industrial facilities have on-site fire protection personnel and/or have agreements for fire protection services with local fire departments. For these reasons, implementing the 2007 AQMP is not expected to require additional fire or police protection services. As a result, the analysis in the IS for the 2007 AQMP concluded that existing resources at services such as fire departments, police departments and local governments would not be significantly adversely affected as a result of implementing AQMP control measures. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XIV. c)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts to schools because implementing AQMP control measures is not expected to induce population growth and, therefore, would not increase or otherwise alter the demand for schools in the district. Implementing the currently proposed project is not expected to change this conclusion in any way.

### **Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific public service impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline public services conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential public service impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XV. RECREATION.</b>				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment or recreational services?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts to recreation will be considered significant if:

- The project results in an increased demand for neighborhood or regional parks or other recreational facilities.
- The project adversely affects existing recreational opportunities.

**Discussion**

**XV. a) & b)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts to recreational resources for the following reasons. As discussed under “Land Use and Planning” and “Population and Housing” in the IS for the 2007 AQMP, there are no provisions that would affect land use plans, policies, ordinances, or regulations. Land use and other planning considerations are determined by local governments. No land use or planning requirements, including those related to recreational facilities, will be altered by the proposal. The IS for the 2007 AQMP concluded that implementing AQMP control measures would not have the potential to directly or indirectly induce population growth or redistribution. As a result, implementing AQMP control measures would not increase the use of, or demand for existing neighborhood and/or regional parks or other recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific recreational impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP.

Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline recreation resources conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential recreational impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XVI. SOLID/HAZARDOUS WASTE.</b>				
Would the project:				
a) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Comply with federal, state, and local statutes and regulations related to solid and hazardous waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

The proposed project impacts on solid/hazardous waste will be considered significant if the following occurs:

- The generation and disposal of hazardous and non-hazardous waste exceeds the capacity of designated landfills.

**Discussion**

**XVI. a)** The 2007 AQMP IS concluded that implementing control measures in the 2007 AQMP could create significant adverse solid waste impacts for the following reasons. Implementing AQMP control measures could require facilities to install air pollution control equipment, such as carbon adsorption devices, particulate filters, catalytic incineration, selective catalytic reduction or other types of control equipment that could increase the amount of solid/hazardous wastes generated in the district due to the disposal of spent catalyst, filters or other mechanisms used in the control equipment. Solid waste impacts were further analyzed in the PEIR for the 2007 AQMP. The analysis in the PEIR concluded that most solid waste impacts resulting from implementing AQMP control would not exceed applicable significance thresholds. The analysis also concluded that potentially significant adverse solid waste impacts from disposal of spent batteries from increasing penetration of electric vehicles into the district fleet and disposal of spent carbon from carbon adsorption control equipment could result in significant adverse solid waste impacts. However, three mitigation measures were identified that could reduce potentially significant adverse impacts to less than significant. To the extent applicable, mitigation measures would continue to be required for future projects. Therefore, it was concluded in the PEIR for the 2007 AQMP that solid waste impacts from implementing AQMP control measures,

along with implementing mitigation measures as applicable, would not create significant adverse solid waste impacts. Implementing the control measure #2007 MCS-08., which would require paying \$185 fees, is not expected to change this conclusion in any way. Similarly, amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district is also not expected to change the conclusion regarding solid waste impacts in any way.

**XVI. b)** The 2007 AQMP IS concluded that the 2007 AQMP control measures are not expected to interfere with affected facilities’ abilities to comply with federal, state, or local statutes and regulations related to solid and hazardous waste handling or disposal. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific solid/hazardous waste impacts may occur due to implementation of the 2007 AQMP control measures. However, paying fees such as the \$185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete \$185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require \$185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential solid/hazardous waste impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
<b>XVII. TRANSPORTATION/TRAFFIC.</b>				
Would the project:				
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Potentially Significant Impact	Less Than Significant With Mitigation	Less Than Significant Impact	No Impact
b) Conflict with an applicable congestion management program, including but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g. sharp curves or dangerous intersections) or incompatible uses (e.g. farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Significance Criteria**

Impacts on transportation/traffic will be considered significant if any of the following criteria apply:

- Peak period levels on major arterials are disrupted to a point where level of service (LOS) is reduced to D, E or F for more than one month.
- An intersection's volume to capacity ratio increase by 0.02 (two percent) or more when the LOS is already D, E or F.
- A major roadway is closed to all through traffic, and no alternate route is available.
- The project conflicts with applicable policies, plans or programs establishing measures of effectiveness, thereby decreasing the performance or safety of any mode of transportation.
- There is an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system.
- The demand for parking facilities is substantially increased.
- Water borne, rail car or air traffic is substantially altered.
- Traffic hazards to motor vehicles, bicyclists or pedestrians are substantially increased.
- The need for more than 350 employees

- An increase in heavy-duty transport truck traffic to and/or from the facility by more than 350 truck round trips per day
- Increase customer traffic by more than 700 visits per day.

### **Discussion**

**XVII. a) & b)** It was concluded in the IS for the 2007 AQMP that implementing AQMP control measures would not be expected to adversely affect transportation and traffic in the district. The IS for the 2007 AQMP noted that implementing AQMP control measures is not expected to substantially increase vehicle trips or vehicle miles traveled in the district. The 2007 AQMP relies on transportation and related control measures developed by SCAG (SCAG, 2004). These transportation control measures include strategies to enhance mobility by reducing congestion through transportation infrastructure improvements, mass transit improvements, increasing telecommunications products and services, enhanced bicycle and pedestrian facilities, etc. Specific strategies that serve to reduce vehicle trips and vehicle miles traveled, such as strategies resulting in greater reliance on mass transit, ridesharing, telecommunications, etc., are expected to result in reducing traffic congestion. Although population in the district will continue to increase, implementing the transportation control measures (in conjunction with the Regional Transportation Plan) will ultimately result in greater percentages of the population using transportation modes other than single occupant vehicles. As a result, relative to population growth, existing traffic loads and the level of service designation for intersections district-wide would not be expected to decline at current rates, but could possibly improve to a certain extent. Therefore, implementing AQMP control measures could ultimately provide transportation improvements and congestion reduction benefits. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XVII. c)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant adverse impacts to air traffic or air traffic patterns because control measures typically do not require transporting materials by air. Further, controlling emissions at existing commercial or industrial facilities and establishing mobile source exhaust and fuel specifications do not require constructing any structures that could impede air traffic patterns in any way. Therefore, implementing AQMP control measures is not expected to generate significant adverse air traffic impacts. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XVII. d)** It was concluded in the 2007 AQMP IS that the 2007 AQMP will not directly or indirectly increase roadway design hazards or incompatible risks. To the extent that implementing components of the transportation control measure and related measures further develop roadway infrastructure, it is expected that there would ultimately be a reduction in roadway hazards or incompatible risks as part of any roadway infrastructure improvements and reduced congestion. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XVII. e)** The IS for the 2007 AQMP concluded that implementing AQMP control measures would not create significant impacts that could adversely affect affected facilities' emergency access routes or plans. Controlling emissions at existing commercial or industrial facilities and establishing mobile source exhaust and fuel specifications are not expected to affect in any way emergency access routes at any affected commercial or industrial facilities. The reason for this conclusion is that controlling emissions (from stationary sources in particular) is not expected to

require construction of any structures that might obstruct emergency access routes at any affected facilities. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XVII.f)** The 2007 AQMP IS concluded that adopting the proposed 2007 AQMP will not conflict with adopted policies, plans or programs supporting alternative transportation programs. In fact, the transportation and related control measures would specifically encourage and provide incentives for implementing alternative transportation programs and strategies. Therefore, implementing AQMP control measures will not significantly adversely affect alternative transportation programs. Implementing the currently proposed project is not expected to change this conclusion in any way.

**Conclusions**

Based upon the above considerations, it was concluded in the 2007 AQMP IS that significant adverse project-specific transportation/traffic impacts would not be expected to occur due to implementation of the 2007 AQMP control measures. Paying fees such as the §185 fees, was not expected to contribute to adverse environmental impacts in any way. Amending the 2007 AQMP to modify control measure #2007 MSC-08 and the similar control measures in the 1997 and 1994 AQMPs and amending Rule 317 to delete §185 fees applicable to the SSAB and incorporate §172(e) fees applicable to the entire district would not change any conclusions in the IS for the 2007 AQMP. Further, the CAA does not require §185 fees to be used for emission reduction programs. Section 172(e) fees would be drawn from existing revenue sources (see PAR 317 Attachment A). Stationary source fees would be applied to existing Regulation III fee obligations if equivalency with §185 cannot be demonstrated and backstop measures need to be adopted. Consequently, no changes from baseline transportation/traffic conditions are anticipated from adopting PAR 317. Since PAR 317 is not expected to create significant adverse impacts, mitigation measures are not required. Therefore, potential transportation/traffic impacts will not be further evaluated in this final SEA.

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
--	---	--	---	------------------

**XVIII. MANDATORY FINDINGS OF SIGNIFICANCE.**

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
--	--------------------------	--------------------------	-------------------------------------	--------------------------

	<b>Potentially Significant Impact</b>	<b>Less Than Significant With Mitigation</b>	<b>Less Than Significant Impact</b>	<b>No Impact</b>
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

**XVIII.a)** In the 2007 AQMP IS, no direct or indirect impacts from implementing the 2007 AQMP control measures were identified that could potentially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory. The effects of implementing AQMP control measures are typically reducing mobile source exhaust emissions, modifying fuel specifications, or modifications at existing commercial or industrial facilities to control or further control emissions. Such existing commercial or industrial facilities are generally located in appropriately zoned commercial or industrial areas, which typically do not support candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service. Similarly, modifications at existing facilities would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with native or resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Further, since the proposed 2007 AQMP primarily regulates stationary emission sources at existing commercial or industrial facilities, it does not directly or indirectly affect land use policy that may adversely affect riparian habitat or other sensitive natural communities identified in local or regional plans, policies, or regulations, or identified by the California Department of Fish and Game or U.S. Fish and Wildlife Service. Improving air quality is expected to provide health benefits to plant and animal species in the district. There are no control measures contained in the 2007 AQMP that would significantly adversely affect biological resources. Implementing the currently proposed project is not expected to change this conclusion in any way.

**XVIII.b)** As noted in the PEIR, with the exception of the environmental topic areas discussed below, implementing AQMP control measures would not generate project-specific adverse impacts for the environmental topics on the environmental checklist (CEQA Guidelines, Appendix G). Cumulative impacts are not considered to be "cumulatively considerable" as

defined by CEQA guidelines §15065(a)(3) for these environmental topics. For example, the environmental topics checked ‘No Impact’ in the IS for the 2007 AQMP (e.g., agriculture, biological resources, land use and planning, mineral resources, population and housing, public services, recreation, and transportation and traffic) would not be expected to make any contribution to potential cumulative impacts whatsoever. Implementing the currently proposed project is not expected to change this conclusion in any way.

For the environmental topics checked ‘Less than Significant Impact’ (e.g., aesthetics, geology and soils, and noise), the analysis indicated that proposed project impacts would not exceed any project-specific significance thresholds. This conclusion is based on the fact that the analyses for each of these environmental areas concluded that the incremental effects of the proposed project would be minor and, therefore, not considered to be cumulatively considerable and would not contribute significantly to cumulative impacts. Implementing the currently proposed project is not expected to change this conclusion in any way.

The following topics were checked potentially significant on the IS for the 2007 AQMP and were further analyzed in the PEIR: air quality, energy, hazards and hazardous materials, hydrology and water quality, and solid/hazardous waste. The analysis of energy impacts in the PEIR for the 2007 AQMP concluded that project-specific impacts would not be significant and were not considered to be cumulative considerable. Therefore, cumulative energy impacts were concluded to be less than significant. Implementing the currently proposed project is not expected to change this conclusion in any way.

The analysis of hydrology and water quality and solid/hazardous waste impacts in the PEIR for the 2007 AQMP concluded that impacts to these environmental topic areas would be significant. Five mitigation measures were identified to that could reduce project-specific hydrology and water quality impacts to less than significant and three mitigation measures were identified that could reduce project-specific solid/hazardous waste impacts to less than significant. Based on these conclusions, implementing AQMP control measures was not expected to contribute to significant adverse cumulative hydrology and water quality or solid/hazardous waste impacts. Implementing the currently proposed project is not expected to change this conclusion in any way.

The analysis of air quality impacts in the PEIR for the 2007 AQMP concluded that for most air quality impact areas, e.g., operational secondary impacts from increased electricity demand, mobile sources, etc., would be less than applicable significance thresholds and, therefore, would not contribute to significant adverse cumulative impacts. Construction air quality impacts (PM10) were concluded to be significant. Nine mitigation measures were identified to reduce construction air quality impacts. However, the analysis concluded that implementing the nine mitigation measures would not reduce construction air quality impacts to less than significant. As a result, construction air quality impacts were considered to be cumulatively considerable. Therefore, it was concluded that implementing the 2007 AQMP contributed to significant adverse cumulative construction air quality impacts.

The 2007 AQMP included an analysis of GHG impacts from implementing AQMP control measures. An analysis of GHG impacts is considered to be a cumulative impact analysis because it cannot be demonstrated that project-specific GHG emissions contribute to global climate change. The analysis concluded that implementing AQMP control measures to reduce criteria

pollutants would also produce GHG emission reduction co-benefits. Therefore, cumulative GHG emission impacts were concluded to be less than significant. Implementing the currently proposed project is not expected to change any of these conclusions in any way or make substantially worse significant adverse construction air quality impacts.

The analysis of hazards and hazardous materials impacts in the PEIR for the 2007 AQMP concluded that for most hazards and hazardous materials impact areas, e.g., use of alternative fuels, use of ammonia in air pollution control equipment, etc., would be less than applicable significance thresholds and, therefore, would not contribute to significant adverse cumulative impacts. Impacts to modifications at refineries to produce alternative fuels could result in significant exposures to flammable materials and, therefore, were concluded to be significant. Five mitigation measures were identified to reduce the severity of hazards and hazardous materials impacts. However, the analysis concluded that implementing the five mitigation measures would not reduce hazards and hazardous materials impacts to less than significant. As a result, hazards and hazardous materials impacts were considered to be cumulatively considerable. Therefore, it was concluded that implementing the 2007 AQMP contributed to significant adverse cumulative hazards and hazardous materials impacts. Implementing the currently proposed project is not expected to change any of these conclusions in any way or make substantially worse significant adverse hazards and hazardous materials impacts.

**XVIII.c)** Based on the foregoing analyses, implementing AQMP control measures may cause significant adverse effects on human beings. However, implementing the currently proposed project is not expected to increase the severity in any way of impacts to human beings that might result from implementing other AQMP control measures.

Based on the preceding analyses in items I through XVIII above, the proposed project is not expected to contribute to or make substantially worse project-specific or cumulative impacts to the following environmental topic areas: aesthetics, agriculture and forest resources, air quality and greenhouse gas emissions, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, solid/hazardous waste and transportation.

---

**APPENDIX A**

---

**PROPOSED AMENDED RULE 317**

**ATTACHMENT E**

**PROPOSED AMENDED RULE 317. CLEAN AIR ACT NON-ATTAINMENT FEES**

(a) Purpose

The purpose of this rule is to satisfy requirements as specified in Sections 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the federal Clean Air Act (CAA) by utilizing a fee equivalency approach applying the principle in as provided by Section 172(e) of the CAA.

(b) Definitions

For the purposes of this rule, the following definitions shall apply:

- (1) ATTAINMENT YEAR is the calendar year that the Clean Air Act establishes for the Basin to reach attainment of the federal one-hour ozone standard pursuant to the CAA. Under the Severe 17 area designation, the attainment year is 2007. Under the Extreme area designation, the attainment year is 2010.
- (2) BASELINE EMISSIONS are emissions of VOC, NO<sub>x</sub> or both, (including major stationary source fugitive and unpermitted emissions), for which a source qualifies as a major stationary source, calculated using source information as reported to or amended by the District, through the District's Annual Emissions Report (AER) program, as follows:
  - (A) For an existing major stationary source prior to or during the attainment year, the baseline emissions shall be the average amount of the actual emissions, including fugitives and unpermitted emissions, during fiscal years 2005-06 and 2006-07 (emissions not to exceed allowables), and programmatically adjusted to account for regulatory effects between 2006 through 2010, for the South Coast Air Basin. For an existing major stationary source in the Salton Sea Air Basin prior to or during the attainment year the baseline emissions shall be AER emissions as reported to the District or amended by the District for the attainment year (emissions not to exceed allowables).

- (B) For sources that become subject to this rule during or after the attainment year:
- (i) For a non-RECLAIM major stationary source the baseline emissions shall be the amount of emissions allowed under the applicable implementation plan or the potential to emit (annual emissions including fugitives and emissions from unpermitted equipment).
  - (ii) For an existing RECLAIM source that subsequently qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of the RTC holdings at the beginning of the year available for use during the same calendar year or actual emissions during the calendar year the source becomes a major stationary source that do not exceed the RTC holdings at the end of the reconciliation period.
  - (iii) For a new RECLAIM source that qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of RTC holdings purchased at the beginning of the attainment year or the initial calendar year of operation, as applicable, or actual emissions during the calendar year, not to exceed RTC holdings at the end of the reconciliation period.

If a major stationary source is operational for a period of less than one calendar year in the attainment year or later, the allowable emissions or RTC credits or holdings based on subparagraph (b)(2)(B) (i through iii) as applicable, in the attainment year or initial year of operation, (including unpermitted and fugitives) shall be extrapolated over one full calendar year.

- (3) BASIN means either the Riverside county portion of the Salton Sea Air Basin (SSAB) or the South Coast Air Basin (SOCAB). The boundaries of each air basin shall be as defined by California Code of Regulations, Section 60104, Title 17.
- (4) CLEAN AIR ACT NON-ATTAINMENT FEE means the fee that would have been assessed to a major stationary source pursuant to Section 185 of

the 1990 amendments to the Clean Air Act (CAA). The annual VOC (CAA) Non-Attainment Fee (pursuant to Section 185) for a major stationary source of VOC and the Annual NOx CAA Non-Attainment Fee for, a major stationary source of NOx (a source may be a major stationary source for either VOC, NOx or both and subject to the applicable fee) for excess emissions of these air contaminants in accordance with Section 185 (b) of the CAA shall be calculated as follows:

$$\text{Annual CAA Non-Attainment Fee} = \$5,000 \times \text{CPIF} \times [ A - ( 0.8 \times B ) ]$$

Where:

A is the total amount of emissions actually emitted during the applicable fee assessment year for pollutants included in B, in tons. If A is less than or equal to 80% of B; then there shall be no annual CAA non-attainment fee assessed for the subject year.

B is Baseline Emissions, of VOC, NOx or both for which a source qualifies as a major stationary source as defined in this rule, in tons.

CPIF is the annual Consumer Price Index (CPI) adjustment factor as defined in this rule.

- (5) CPIF means the annual consumer price index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in the year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all-urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA. Section 185 cross-references the methodology in section 502(b)(3)(B)(v) of the CAA. This method has been interpreted for use in determining permit fees in a 1992 EPA memorandum. (See, Memorandum of October 15, 1992, from Frank Bunyard, "Calculating Fees for Operating Permits.") EPA has used this method to calculate the Part 70 permit fee rate since 1990, and will continue to update the rate every year in September, when the August values are available. The adjusted section 185 fee, then, would be prorated to that adjusted permit fee by multiplying the Part 70 permit fee rate by

200 (\$5000/\$25). Since Section 185 fees are assessed on a calendar year basis, and the inflation factor is applied in September the calendar year fee is determined as a weighted average (8/12 of the fee associated with January to August, and 4/12 of the fee associated with September to December).

(6) FEE ASSESSMENT YEAR means the year for which CAA fees are being calculated and assessed under the provisions of this rule.

(7) MAJOR STATIONARY SOURCE shall, for the purposes of this rule:

(A) For a non-RECLAIM source-have the same meaning as in Sections 181(b)(4)(B) and 182(d) of the CAA, or 182 (e) as applicable, or a Major Polluting Facility as defined in Rule 1302(s) – Definition of Terms.

(B) For a RECLAIM source-have the same meaning as in paragraph (b)(2) of Rule 3001 – Applicability where the potential to emit for a RECLAIM facility is the higher of:

(i) the starting allocation plus non-tradeable credits; or

(ii) RECLAIM Trading Credits (RTCs) held in the allocation account after trading.

RTC's held in the certificate account are not part of the allocation.

(8) NITROGEN OXIDES (NOx) means any compound that is an oxide of nitrogen.

(9) RECLAIM is the Regional Clean Air Incentives Market established by Regulation XX – Regional Clean Air Incentives Market (RECLAIM) which for the purposes of this rule comprises:

(A) Existing RECLAIM sources with a District issued facility identification number during or prior to the attainment date; or

(B) New RECLAIM sources with a District issued facility identification number issued after the attainment year; or

(C) An existing source with a District issued facility identification number prior to the attainment date that becomes a RECLAIM source during the attainment year which shall be treated as an existing RECLAIM source for the purposes of determining

baseline emissions for the attainment year or the initial year of operation as applicable.

- (10) VOLATILE ORGANIC COMPOUND (VOC) is as defined in Rule 102 – Definitions.

(c) Requirements

- (1) Section 172 (e) Fee Equivalency Account

(A) The Executive Officer shall establish and maintain a Section 172(e) fee equivalency account. The equivalency account shall be credited with expenditures from qualified programs that satisfy the following criteria:

(i) surplus to the State Implementation Program for the federal 1-hour ozone standard and are approved by the AQMD executive officer, Executive Officer of CARB, and the Administrator or Regional Administrator of US EPA Region IX as being surplus to the SIP;

(ii) designed to result in direct VOC or NO<sub>x</sub> reductions in the SCAQMD; or facilitate future VOC or NO<sub>x</sub> reductions in the SCAQMD through vehicle/engine fueling infrastructure or advanced technology development efforts for implementation within the next 10 years, or other uses approved by EPA;

(iii) expenditures occurring only in calendar years subsequent to 2008 from eligible projects;

(iv) only monies actually expended from qualified programs during a calendar year shall be credited.

(B) Expenditures eligible for the Section 172 (e) fee equivalency account need not actually be held nor disbursed directly by the AQMD provided the underlying programs have been approved by CARB and EPA and tracked pursuant to subdivision (c).

(C) Funds shall be accounted for on a dollar for dollar basis and shall not be discounted due to the passage of time. Funds may be accumulated in the accounts from year to year if a surplus exists in any given year, and used to offset the calculated Clean Air Act Non-attainment (Section 185) fees as needed.

(D) The Section 172 (e) fee equivalency account may be pre-funded according to the projects listed in Attachment A.

(2) Calculation of the CAA Non-Attainment (Section 185) Fee Obligation

By August 1, 2012, and continuing annually thereafter, the Executive Officer shall calculate the applicable prior calendar year CAA Non-Attainment (Section 185) fees for each major source in the South Coast AQMD pursuant to paragraph (b) and then aggregate such fees for the entire universe of major stationary sources in the District that would otherwise be subject to Section 185.

(3) Annual Demonstration of Equivalency

Beginning August 1, 2012, and continuing annually thereafter, the Executive Officer shall complete an equivalency demonstration to show that adequate funding was available in the equivalency account for the prior calendar year to meet the CAA Non-Attainment (Section 185) fee obligation calculated pursuant to paragraph (c)(2). Any surplus funding available in the fee equivalency account will be carried forward to the following assessment year. The annual determination of equivalency shall be made according to the following equation:

$$B_{i-1} + D_{i-1} - F_{i-1} = B_i > 0$$

Where,

$B_{i-1}$  is the Section 172 (e) fee equivalency account balance at the beginning of the prior calendar year  $i-1$

$D_{i-1}$  is the funds deposited (credited) into the Section 172 (e) fee equivalency account during the prior calendar year ( $i-1$ )

$F_{i-1}$  is the Section 185 fees calculated for all major stationary sources for prior calendar year calculated pursuant to paragraph (c) (2), and

$B_i$  is the Section 172 (e) fee equivalency account balance at the end of calendar year  $i-1$ , which is carried forward as the beginning balance for the following year  $i$ .

(4) Annual Preliminary Determination of Equivalency

Beginning July 1, 2012, and continuing annually thereafter, the Executive Officer shall complete a preliminary determination of equivalency to determine whether adequate funding is expected to be available in the Section 172 (e) fee equivalency account to meet the CAA Non-Attainment (Section 185) fee obligation for the current calendar year according to the following equation:

$$B_i + D_i > 110\% \times F_{i-1}$$

Where,

B<sub>i</sub> is the Section 172 (e) Fee Equivalency Account balance at the beginning of the current calendar year i

D<sub>i</sub> is the funds expected to be deposited (credited) into Section 172 (e) Fee Equivalency Account in current calendar year i, and

F<sub>i-1</sub> is the Section 185 fees calculated pursuant to paragraph (c) (2) for the prior calendar year (i-1) being used as surrogate Section 185 fee estimate for the current year.

(5) Reporting Requirements

Beginning no later than September 3, 2012, and continuing annually thereafter, the EO shall file a report with CARB and US EPA that includes all of the following:

(A) A listing of all facilities subject to Section 185 and their calculated prior calendar year fee obligation,

(B) The aggregate amount of prior calendar year CAA Non-Attainment (Section 185) fees obligation calculated pursuant to paragraph (c)(2),

(C) The Section 172 (e) fee equivalency account beginning balance,

(D) The amount of any surplus funding carried over to the subsequent calendar year,

(E) A listing of all programs, program descriptions, description of funding, certification of eligibility for each program, and associated expenditures that were credited into the Section 172 (e) fee equivalency account during the prior calendar year and those expected to be credited during the current year,

(F) The results of the equivalency demonstration and preliminary determination of equivalency conducted pursuant to paragraph (c)(3) and (c)(4).

(6) Backstop Provision for Failure to Achieve Equivalency

In the event the annual determination of equivalency conducted for the prior year pursuant to paragraph (c)(3) shows a deficit ( $B_i < 0$ ) or the preliminary determination of equivalency conducted for the current year pursuant to paragraph (c)(4) shows that adequate funding to meet the estimated Section 185 fees for the current year may not be available, then the EO shall within 90 days submit to the Governing Board a back-stop rule for adoption that would require the Executive Officer to collect and/or track adequate fees for any shortfall. The Governing Board shall act on a backstop rule no later than 120 days from the funding inadequacy finding.

The backstop rule, to the extent applicable to major stationary sources of VOC and/or NO<sub>x</sub>, shall include the following baseline elements which owners or operators may request in writing:

(A) Alternative Baseline Period

Emissions from an ~~An~~ alternative baseline period reflecting the average of two consecutive years within the last ten (10) years prior to and including the attainment year may be substituted for baseline emissions from the attainment year subject to the following analysis:

- (i) Annual Emission data for the ten (10) years preceding and including the attainment year; and
- (ii) Analysis of adopted local, state, and federal rules or regulations that would have restricted the source's ability to either operate or emit a particular pollutant, had they been in effect during the consecutive two (2) years selected; and/or;
- (iii) Adjusted annual emissions considering the impact of subparagraphs (ii) above; and

(iv) Certification, in writing, by the highest-ranking executive on site that the source's emissions are irregular, cyclical, or otherwise vary significantly from year to year.

(B) Multi-Site Aggregation

Major stationary sources within a single non-attainment region, under common ownership and control, and that comport with the Federal definition of major stationary source for multi-site aggregation, may aggregate multi-site baseline and future year emissions.

(C) Regulation III – Fees credit

Each major stationary source paying Clean Air Act Non-attainment Section 185 fees pursuant to the backstop rule adopted pursuant to paragraph (c) (6) shall receive a credit for their fees paid for annual operating fees and annual operating emissions fees during the preceding calendar year. In no case, shall the credit exceed the Clean Air Act Non-attainment Section 185 fees due, or exceed the otherwise applicable annual operating fees and annual operating emissions fees.

(d) Severability

If any provision of this rule is held by a USEPA or CARB, finding or decision or a court decision to be invalid, such finding or decision will not affect the validity of the remainder of this rule and major stationary sources shall be subject to and must comply with the provisions contained in the remainder of this rule.

(e) Termination

This rule shall become inoperative and have no further effect or further operation upon a determination by the Administrator or Regional Administrator of the US EPA that in a given year the air basin is in attainment with the federal one-hour ozone standard, or upon approval by EPA of a replacement program, such as a state-wide program adopted by CARB.

**Proposed Amended Rule 317 (Cont.)**

~~(Adopted December 8, 2008)~~

**(Amended February 4, 2011)**

- (f) The Executive Officer shall submit Rule 317 for inclusion into the SIP by CARB and U.S. EPA within 14 days of adoption.

**RULE 317. ~~CLEAN AIR ACT NON-ATTAINMENT FEES~~**

~~(a) Purpose~~

~~— The purpose of this rule is to satisfy mandatory requirements as specified in Sections 182(d), 182(e), 182(f) and 185 of the 1990 amendments to the federal Clean Air Act (CAA).~~

~~(b) Applicability~~

~~— This rule applies to major stationary sources of VOC or NO<sub>x</sub> as defined in this rule. As required by Section 182(f) of the CAA, major stationary sources of NO<sub>x</sub> are also subject to this rule in addition to major stationary sources of VOC. The fees required pursuant to this rule shall be in addition to any permit fees and any other fees required under other District Rules and Regulations. This rule shall become effective when the Administrator of the United States Environmental Protection Agency (U.S. EPA) or the Executive Officer, makes a finding that a Basin is not in attainment with the federal one-hour standard for ozone. This rule shall cease to be effective when the Administrator of the U.S. EPA designates a Basin to be in attainment of the federal one-hour standard for ozone.~~

~~(c) Definitions~~

~~(11) — ATTAINMENT YEAR is the calendar year that the Basin is mandated to reach attainment of the federal one-hour ozone standard pursuant to the CAA. Under the Severe 17 area designation, the attainment year is 2007. Under the Extreme area designation, the attainment year is 2010.~~

~~(12) — BASELINE EMISSIONS for a major stationary source, are calculated for each air contaminant, VOC and NO<sub>x</sub> (including major stationary source fugitive and unpermitted emissions) separately, as follows:~~

~~(A) — For existing major stationary sources prior to the attainment year, the baseline emissions shall be the amount of the actual emissions, including fugitives and unpermitted, during the attainment year (permitted emissions not to exceed permitted allowables).~~

~~(B) — For sources that become subject to this rule during or after the attainment year:~~

~~(i) — For a non-RECLAIM major stationary source the baseline emissions shall be the amount of emissions allowed under~~

~~the applicable implementation plan (annual emissions including fugitives and emissions from unpermitted equipment):~~

- ~~(ii) For an existing RECLAIM source that subsequently qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of the RTC holdings at the beginning of the year available for use during the same calendar year or actual emissions during the calendar year the source becomes a major stationary source that do not exceed the RTC holdings at the end of the reconciliation period.~~
- ~~(iii) For a new RECLAIM source that qualifies as a major stationary source for the purposes of this rule the baseline emissions shall be the higher of RTC credits purchased at the beginning of the attainment year or the initial calendar year of operation, as applicable, or actual emissions during the calendar year, not to exceed RTC holdings at the end of the reconciliation period.~~

~~If a major stationary source is operational for a period of less than one calendar year in the attainment year or initial year of operation, as applicable, the emissions from the operational period shall be extrapolated over one full calendar year.~~

- ~~(13) BASIN means the Riverside county portion of the Salton Sea Air Basin (SSAB). The boundaries of each air basin shall be as defined by California Code of Regulations, Section 60104, Title 17, in which a major stationary source is located.~~
- ~~(14) FEE ASSESSMENT YEAR means the year for which CAA fees are being calculated and assessed under the provisions of this rule.~~
- ~~(15) MAJOR STATIONARY SOURCE shall, for the purposes of this rule:
  - ~~(A) For a non-RECLAIM source have the same meaning as in Sections 181(b)(4)(B) and 182(d) of the CAA, if applicable, or a Major Polluting Facility as defined in Rule 1302(s) Definition of Terms.~~~~

~~(B) For a RECLAIM source have the same meaning as in paragraph (b)(2) of Rule 3001—Applicability where the potential to emit for a RECLAIM facility is the higher of:~~

~~(iii) the starting allocation plus nontradeable credits; or~~

~~(iv) RECLAIM Trading Credits (RTCs) held in the allocation account after trading.~~

~~RTC's held in the certificate account are not part of the allocation.~~

~~(16) NITROGEN OXIDES (NO<sub>x</sub>) means any compound that is an oxide of nitrogen.~~

~~(17) RECLAIM is the Regional Clean Air Incentives Market established by Regulation XX—Regional Clean Air Incentives Market (RECLAIM) which for the purposes of this rule is comprised of:~~

~~(A) Existing RECLAIM sources with a District issued facility identification number prior to the attainment date; or~~

~~(B) New RECLAIM sources with a District issued facility identification number issued during or after the attainment year; or~~

~~(C) An existing source with a District issued facility identification number prior to the attainment date that subsequently becomes a RECLAIM source shall be treated as an existing RECLAIM source for the purposes of determining baseline emissions for the attainment year or the initial year of operation as applicable.~~

~~(18) VOLATILE ORGANIC COMPOUND (VOC) is as defined in Rule 102—Definitions.~~

~~(d) Requirements~~

~~(7) An Annual VOC Clean Air Act Non-Attainment Fee shall be assessed for a major stationary source of VOC and an Annual NO<sub>x</sub> CAA Non-Attainment Fee shall be assessed for, a major stationary source of NO<sub>x</sub> payable to the District for excess emissions of these air contaminants in accordance with Section 185 (b) of the CAA as follows:~~

$$\text{Annual VOC CAA Non-Attainment Fee} = \$5,000 \times \text{CPIF} \times [A - (0.8 \times B)],$$

and

$$\text{Annual NO}_x \text{ CAA Non-Attainment Fee} = \$5,000 \times \text{CPIF} \times [D - (0.8 \times E)]$$

Where:

~~A = The total amount of VOC emissions actually emitted during the applicable fee assessment year, in tons per year. If A is less than or equal to 80% of B; then there shall be no annual VOC CAA non-attainment fee assessed for the subject year.~~

~~B = The VOC baseline emissions as defined in this rule in tons per year.~~

~~D = The total amount of NOx emissions actually emitted during the applicable fee assessment year, in tons per year. If D is less than or equal to 80% of E; then there shall be no annual NOx CAA non-attainment fee assessed for the subject year.~~

~~E = The NOx baseline emissions as defined in this rule in tons per year.~~

~~CPIF = The annual Consumer Price Index (CPI) adjustment factor which is equivalent to the cumulative increase in the CPI beginning with the 1989 change in the index up to and including the change in year prior to the year for which the fees are due. For any calendar year the CPI is the average of the CPI for all urban consumers published by the Department of Labor, as of the close of the 12-month period ending on August 31 of each calendar year or the revision of the CPI which is most consistent with the CPI for calendar year 1989 in accordance with Sections 502(b)(3)(B)(v) and 185(b)(3) of the CAA.~~

- ~~(8) Beginning with the second year after the attainment year and thereafter until the Administrator of the U.S. EPA designates the Basin to be in attainment of the federal one-hour standard for ozone, both the VOC and NOx annual CAA fees shall be remitted in accordance with the annual emissions fee billing requirements as established in paragraphs (e)(2) and (e)(10) of Rule 301 – Permit Fees. A major stationary source that does not pay any or all of the required CAA fees, by the specified due date, shall be subject to the late payment surcharge and permit revocation provisions of subdivision (e) of Rule 301 and is also in violation of this rule and subject to the civil and criminal penalties as provided for in Health and Safety Code 42400 et seq.~~

~~(e) Clean Air Act Non-Attainment Fee Programs~~

~~Clean Air Act non-attainment fees shall be used to fund stationary and/or mobile source VOC and NOx emission reduction programs based on criteria established by the South Coast Air Quality Management District Governing Board or its designee. Up to five percent of the program revenues can be used for administrative costs.~~

\*

1. Annual Emissions < 8 tpy
2. Power Plants, Refineries, Oil & Gas Production Facilities, Sulfur Plants, Tank Farms, Hospitals, Institutions, Bulk Terminal, Public Agencies, Landfills,
3. No activity curtailment is necessary
4. Companies with 2009 revenues more than \$5MM and estimated PR317 fees to be less than 1% of the revenues

Note: Some facilities on this list also emit VOC emissions, therefore, the number of facilities in Tables B-1 and B-2 are not additive.

Total											8.53

\*

1. Annual Emissions < 8 tpy

2. Power Plants, Refineries, Oil & Gas Production Facilities, Sulfur Plants, Tank Farms, Hospitals, Institutions, Bulk Terminal, Public Agencies, Landfills,

3. No activity curtailment is necessary

4. Companies with 2009 revenues more than \$5MM and estimated PR317 fees to be less than 1% of the revenues

Note: Some facilities on this list also emit NOx emissions, therefore, the number of facilities in Tables B-1 and B-2 are not additive.

BOARD MEETING DATE: February 4, 2011

AGENDA NO. 30

PROPOSAL: Consider Appointment of Board Assistant/Consultant for Board Member Nelson

SYNOPSIS: This action is for the Board to consider appointment of Denis R. Bilodeau as a Board Consultant for incoming Governing Board Member Shawn Nelson

COMMITTEE: Not Applicable

**RECOMMENDED ACTION:**

Appoint Denis R. Bilodeau as Board Consultant and Independent Contractor for incoming Governing Board Member Shawn Nelson.

Barry R. Wallerstein, D.Env.  
Executive Officer

tc

---

**Background**

By Board policy established February 10, 1995, the Administrative Committee reviews proposed contracts for Board Member Assistants and/or Consultants and is charged with the responsibility to:

“...determine if the proposed compensation rate is consistent with the required qualifications...and, with advice of General Counsel, make a case-by-case determination of whether a person proposed to provide assistance is a Board Member Assistant or a Board Member Consultant. If the determination is made that the person is a Board Member Consultant, the Administrative Committee also shall determine whether the Board Member Consultant is an employee not eligible for District benefits or an independent contract” (Feb. 10, 1995, paragraph 4).

Incoming Governing Board Member Shawn Nelson has presented a proposal to engage Denis R. Bilodeau as his Board Consultant. This matter is being taken to the full Board so as not to delay the appointment.

The proposed scope of duties for the Board Consultant includes: “performs for Board Member a variety of professional-level assignments in the development and formulation of policy, data analysis, reports, plans, assessments, and strategies for AQMD programs; provides advice and recommendations to the Board Member regarding matters subject to the Board Member’s decision-making authority; may provide liaison with the public on behalf of the Board Member. Typical functions may include planning, organizing, and developing a wide variety of programs on the Board Member’s behalf and evaluating the effectiveness of various approaches.”

The Governing Board policy specifies the requirements for a Board Consultant. Those requirements are: “evidence of the required training and experience shall be demonstrated by graduation from an accredited college or university preferably with a major in an academic discipline related to the assignment and/or sufficient experience involving technical or analytical work at a professional level which would demonstrate the required knowledge, skills, and abilities related to the assignment.”

General Counsel has reviewed Mr. Bilodeau’s qualifications and has determined that they well exceed the minimum requirements in the Board’s policy. Mr. Bilodeau has a Bachelor of Science degree in Civil Engineering and is a licensed Professional Engineer. He has two years of legal study at Chapman University School of Law. Mr. Bilodeau has extensive experience in both the public and private sectors, in both policy and technical areas. He is well-qualified for the Board Consultant position.

**Recommendation**

Appoint Denis R. Bilodeau as Board Consultant for Governing Board Member Shawn Nelson on the terms described in the attached proposal.

**Attachment**

Proposal for SCAQMD Board Member Assistant/Consultant

Proposal for SCAQMD Board Member Assistant/Consultant

To: Administrative Cmte For board meeting on 2/4/11 From: Board Member Nelson

In accordance with the policy adopted by the Governing Board February 10, 1995, and amended May 8, 1998, I submit this proposal to hire the individual named below, in the capacity indicated, to assist me in my duties as a member of the Governing Board of the SCAQMD beginning 1/26/11 and ending June 30, 2011.

Candidate Information

Name: DENIS BILODEAU, PE

Qualifications (education, professional experience, etc.): B.S. CIVIL ENGINEERING.  
LICENSED CIVIL AND TRAFFIC ENGINEER.

Proposed Capacity (check one)

- Board Member Assistant (employee) - the work to be performed primarily will entail the duties indicated below for an Assistant.
- Board Member Consultant (employee) - the work to be performed primarily will entail the duties indicated below for a Consultant.
- Board Member Consultant (independent contractor) - the work to be performed primarily will entail the duties indicated below for a Board Member Consultant and in performing such duties the independent contractor will be responsible for selecting the appropriate method and means of achieving the required results. My proposed Board Member Consultant does   /does not    have a business license. If so, the type of business is   , and the business license number is    issued by the   .

Proposed Scope of Duties (check one)

- Assistant (up to \$27.72/hour) - Performs for Board Member a variety of tasks ranging from liaison with constituent public entities, other Board Members, the public, and District staff related to clerical functions. Typical functions may include preparing narrative and statistical reports, preparing correspondence, filing and maintaining records, arranging meetings and other group functions; monitoring various programs and projects; responding to inquiries from constituent public entities, District Board Members, the public and District staff.  
   Examples of duties are set forth in the attachment (OPTIONAL)
- Consultant (up to \$54.80/hour) - Performs for Board Member a variety of professional-level assignments in the development and formulation of policy, data analysis, reports, plans, assessments, and strategies for District programs; provides advice and recommendations to the Board Member regarding matters subject to the Board Member's decision-making authority; may provide liaison with the public on behalf of the Board Member. Typical functions may include planning, organizing, and developing a wide variety of programs on the Board Member's behalf and evaluating the effectiveness of various approaches.  
   Examples of duties are set forth in the attachment (OPTIONAL)

Proposed Rate of Compensation (fill in all blanks)

\$54.80 per hour up to a maximum payable during the contract period not to exceed \$ 25,000  
(FY 2010-11 maximum is \$37,707 per Board Member, except Chairman's Assistant receives \$113,121.)

For Administrative Committee Use:

Reviewed by Administrative Committee with advice of District Counsel. Based on the scope of duties, the individual is a:  
 Assistant (employee)                       Consultant (employee)                       Consultant (independent contractor)

By \_\_\_\_\_ for the Administrative Committee
