Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.1-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on aesthetics, including changes to visual quality and character of the immediate project area, changes in scenic views or vistas, and increased lighting and nighttime illumination levels. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could generate changes in the future visual character within the surrounding community, obstruction of existing views, additional outdoor lighting, glare, and removal of existing vegetation. More specifically, the following discussions provide an overall summary of the types of aesthetic impacts identified in the three CEQA documents surveyed.

- a) **Scenic Vistas.** All three CEQA documents for past projects in the heavy industrial facility category that have disclosed either no impacts or less-than-significant impacts on scenic vistas. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on scenic vistas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to aesthetics could be significant. Therefore, impacts on scenic vistas from implementing the proposed project are determined to be significant.

- b) **Scenic Resources.** All three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts on scenic resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on scenic resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to aesthetics could be significant. Therefore, impacts on scenic resources from implementing the proposed project are determined to be significant.

- c) **Visual Character.** All three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts on the visual

character of an area. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the visual character or quality of an area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to aesthetics could be significant. Therefore, impacts on the visual character of a neighborhood from implementing the proposed project are determined to be significant.

- d) Light and Glare.** All three CEQA documents for past projects in the heavy industrial facility disclosed either no impacts or less-than-significant impacts related to light and glare. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts related to light and glare.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to aesthetics could be significant. Therefore, impacts related to light and glare from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to aesthetics and visual resources that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documentation found that some of the past projects have the potential to generate significant adverse impacts on scenic vistas, scenic resources, visual character, light and glare, and shade/shadow.

Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, aesthetic impacts and impacts to visual resources as an indirect result of implementing the proposed project are determined to be significant.

## **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects.” [14 Cal. Code Reg. 13355]

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD’s internal and accounts per SB 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed Senate Bill (SB) 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD’s internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Past development patterns within the district have resulted in a highly diverse visual environment from a cumulative, regional perspective. Overall, the region lacks a cohesive and consistent appearance. Rather, the aesthetic environment differs greatly from location to location with some areas consisting of a variety of land uses and architectural styles. Other areas appear very well-planned and have an orderly appearance. Thus, any future facilities obtaining offsets from the SCAQMD’s internal accounts would add to this cumulatively diverse aesthetic environment. As noted above, since the specific location and appearance of individual facilities cannot be predicted with certainty, the evaluation of cumulative aesthetic impacts is even more uncertain.

However, some of the past projects were determined to have significant adverse impacts on aesthetics and visual quality, including the potential to (1) result in the conversion of open space to urbanized uses that could contribute to a change in the visual character of the area, (2) result in the obstruction of the views of scenic vistas (e.g., mountains, hillsides, coastline, skyline) or resources (e.g., historic structures, scenic highways/corridors, rock outcroppings), or (3) result in the creation of new sources of light that could affect nighttime views.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD’s internal accounts. The three power plant projects, NRG’s El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which

were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC for both the Walnut Creek and Sentinel projects concluded that aesthetics impacts would be significant but could be mitigated to less than significant. The Walnut Creek project would require mitigation for light/glare and visual character. Construction lighting would be directed to the center of the facility and shielded to prevent light from straying offsite. The use of non-glare fixtures and control of lighting direction would be required of operational lighting. In addition, because of a moderately high visual sensitivity of the existing landscape and view characteristics, the CEC required the Walnut Creek facility to be painted in a neutral grey color to mitigate the adverse visual character impacts to less than significant. The CEC concluded that there are no scenic vistas or state scenic highway corridors in the Walnut Creek project vicinity, so impacts to scenic vistas and scenic resources were not concluded to be significant.

The CEC concluded in its FSA for the Sentinel project that adverse impacts to visual resources would be generated due to foreground views of the project by nearby residential viewers. The CEC further determined that the moderate overall visual sensitivity, combined with the moderate overall visual change could result in a potentially significant visual impact. The CEC concluded that the visual impact could be mitigated to less than significant by reducing the color contrast of all project structures and including perimeter landscape plantings that would further reduce project texture, color, and form contrast for nearby residential viewers and motorists. The CEC determined that night lighting associated with project construction would result in a potentially significant visual impact. The CEC concluded in its FSA that the lighting impact would be mitigated to less than significant by: 1) keeping minimal brightness consistent with safety; 2) shielding and directing lighting to eliminate all direct off-site illumination and all upward (backscatter) illumination; and 3) ensuring lighting for maintenance purposes would be kept off when not needed. The CEC determined that the project would also result in an adverse visual impact on the scenic corridor of SR 62, however, this impact would not be significant due to the poor existing visual condition. The CEC further determined that construction of the power plant, electric transmission line, underground water and gas pipelines and access road would cause temporary visual impacts due to the presence of equipment, materials, and workforce, but the visual quality and visual sensitivity is low to moderate, so the visual impacts during construction would be less than significant. The CEC concluded that no specific scenic vista points of notable importance were located in the project viewshed so scenic vista impacts were not concluded to be significant.

The CEC concluded in the FSA prepared for the El Segundo project that aesthetics impacts would not be significant. The CEC noted that existing nearby structures present visually chaotic views of fully exposed industrial machinery, piping, ductwork and scaffolding. They contrast strongly with their highly scenic coastal setting and with the

general visual character of other industrial and residential land uses in the surrounding viewshed. From some viewpoints the visual sensitivity is considered high, however, the proposed project would not substantially worsen the existing visual character. The CEC determined that unmitigated night lighting would have the potential to create significant adverse impacts to motorists and visitors to the nearby beach, but impacts to residents in this area would not be anticipated because it was expected that night lighting would be obscured by the intervening existing power units. The CEC noted that construction of new power generating units and a seawall in the area of existing landscaping, which would be removed, will result in a moderate to strong contrast with the previous landscaped setting, and a decline in visual quality of this portion of the setting. The impact would be minimized through landscape and seawall design enhancements resulting in beneficial overall aesthetic impacts.

Based upon the above considerations, impacts of the project, are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative aesthetics impacts.

### **Mitigation Measures for Future Aesthetics Impacts**

A number of mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant aesthetics impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse aesthetics impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for aesthetics impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of aesthetics impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant aesthetics impact, the potential exists for future indirect aesthetics impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.2**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - AGRICULTURAL AND FORESTRY RESOURCES**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified facilities obtaining emissions offsets from the SCAQMD's internal offset accounts has the potential to generate adverse indirect impacts to agricultural resources depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts on agricultural resources from the construction and operation of future new facilities.

The NOP/IS for the proposed project was circulated on March 17, 2009. At the time the NOP/IS was circulated, the environmental checklist did not include impacts to forest lands as topics to be evaluated as part of a CEQA document. However, as directed by SB97, the Natural Resources Agency adopted Amendments to the CEQA Guidelines for greenhouse gas emissions on December 30, 2009. On February 16, 2010, the Office of Administrative Law approved the Amendments and filed them with the Secretary of State for inclusion in the California Code of Regulations. The Amendments became effective on March 18, 2010. As part of the revisions to the CEQA Guidelines adopted by the Natural Resources Agency, the environmental checklist, Appendix G, was revised to include consideration of impacts to forestry lands. Specifically, the Agriculture Resources topic was revised and renamed Agriculture and Forestry Resources and questions were added to include consideration of impacts to forest resources. Although the NOP/IS did not include a preliminary analysis of indirect impacts from the proposed project that could conflict with, or cause rezoning of forest land, to provide a more comprehensive analysis of environmental impacts consistent with current CEQA analysis requirements, indirect impacts from the proposed project that have the potential to adversely affect forest resources, this topic is qualitatively addressed below.

### **Methodology**

The methodology for determining the significance of potential agricultural and forestry resources impacts is based on comparing the existing settings to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse indirect impacts include assessments of impacts related to the conversion of farmland to non-agricultural uses, potential conflict with agricultural zoning or Williamson Act contract, or other changes that could result in conversion of farmland or forest land.

Mitigation measures would be identified, as feasible and available, on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as “a substantial or potentially substantial, adverse change in the environment” (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is “significant,” generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant agricultural resource and forestry resource impacts if their implementation would result in any of the following:

- Would convert prime farmland, unique farmland or farmland of statewide importance as shown on the maps prepared pursuant to the farmland mapping and monitoring program of the California Resources Agency, to non-agricultural use.
- Would conflict with existing zoning or agricultural use or Williamson Act contracts.
- Would involve changes in the existing environment, which due to their location or nature, could result in conversion of farmland to non-agricultural uses.
- Would conflict with existing zoning or cause rezoning of forest land (defined in Public Resources Code §12220(g)) to other uses.
- Would result in the loss of or conversion of prime forest land, unique forest land or forest land of statewide importance, to non-forest uses.
- Would involve changes in the existing environment, which due to their location or nature, could result in conversion of forest land to non-forest uses.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential agricultural and forestry resource impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on agricultural resources. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of agricultural resource impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only. Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse indirect impacts to agricultural and forestry resources. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse agricultural and forestry resources impacts have been analyzed based on available information pertaining to each facility category.

## **Potential Impacts of Identified Facility Categories**

### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to change existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to agricultural and forestry resources as a result of constructing future new agricultural facilities may include conflict with zoning or the loss of farmland and forest land. Agricultural facilities would most likely be constructed in areas zoned for agricultural uses. Since the construction and operation of new agricultural facilities in areas previously designated for agricultural use would generally not constitute the conversion of farmland to non-agricultural use or forest land to non-forest use, it is unlikely that an adverse significant impact would occur.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.2-1). The two selected CEQA documents<sup>2</sup>, which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on agricultural resources. Based on a review of these documents, agricultural-related facilities are typically constructed and operated within areas zoned for agriculture. Accordingly, these projects were found to have less-than-significant impacts. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the two CEQA documents surveyed for this facility category.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

**a) Conversion of Farmland to Non-Agricultural Uses.** Both of the CEQA documents for past projects in the agricultural facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses. Since the construction and

operation of new agricultural facilities in areas previously designated for agricultural use would generally not constitute the conversion of farmland to non-agricultural use, it is unlikely that an adverse significant impact would occur.

However, based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts on agricultural resources. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** Both of the CEQA documents for past projects in the agricultural facility category found that neither document discussed impacts related to other changes that would convert farmland to non-agricultural uses. Since the construction and operation of new agricultural facilities in areas previously designated for agricultural use would generally not constitute the conversion of farmland to non-agricultural use, it is unlikely that an adverse significant impact would occur.

However, based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** Both of the CEQA documents for past projects in the agricultural facility category did not include an analysis of potential impacts related to conflict with or cause rezoning of forest land because this

requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) **Other changes that convert Forest Land to Other Uses.** Both of the CEQA documents for past projects in the agricultural facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for the conversion of farmland or forest land or conflict with agricultural or forestry zoning. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts to agricultural and forestry resources in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.2-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on agricultural resources, including conflicts with zoning. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings. Project-specific impacts were generally not considered significant as most retail and service establishments surveyed are located in developed urban areas and would not result in the loss of farmland or conflict with agricultural zoning designations. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the eight CEQA documents surveyed.

- a) Conversion of Farmland to Non-Agricultural Uses.** Six of the eight CEQA documents for past projects in the retail/service facility category disclosed either no impacts or a less-than-significant impact related to the conversion of farmland to non-agricultural uses; the other two CEQA documents did not discuss impacts related to the conversion of farmland. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** Six of the eight CEQA documents for past projects in the retail/service\_facility category disclosed either no impacts or a less-than-significant impact on agricultural resources; the other two CEQA documents did not discuss impacts related to the potential conflict with agricultural zoning. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different

environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) **Other Changes to Convert Farmland to Non-Agricultural Uses.** Six of the eight CEQA documents for past projects in the retail/service facility category disclosed either no impacts or a less-than-significant impact on agricultural resources; the other two CEQA documents did not discuss impacts related to other changes that could convert farmland to non-agricultural uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) **Conflict with or Cause Rezoning of Forest Land.** All eight CEQA documents for past projects in the retail/service facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) **Other changes that convert Forest Land to Other Uses.** All eight CEQA documents surveyed for past projects in the retail/service facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential for resulting in the loss of farmland or forest land conflicting with agricultural or forestry zoning. Therefore, these facilities would generally have a low likelihood of resulting in significant impacts to agricultural and forestry resources. However, the potential exists for one or more future large commercial projects to have significant impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.2-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on agricultural resources. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas. Project-specific impacts were generally not considered significant impacts since most of the commercial facilities are located in developed urban areas and would not result in the conversion of farmland to non-agricultural uses. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the nine CEQA documents surveyed.

- a) **Conversion of Farmland to Non-Agricultural Uses.** Seven of the nine CEQA documents for past projects in the large commercial facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses; the other two CEQA documents did not discuss impacts related to the conversion of farmland to non-agricultural resources. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** Seven of the nine CEQA documents for past projects in the large commercial facility category disclosed no impacts on agricultural resources; the other two CEQA documents did not discuss impacts related to conflicts with agricultural zoning or Williamson Act Contract. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** Seven of the nine CEQA documents for past projects in the large commercial facility category disclosed no impacts on agricultural resources; the other two CEQA documents did not discuss these impacts. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All nine CEQA documents for the past projects in the large commercial facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were

prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) **Other changes that convert Forest Land to Other Uses.** All nine CEQA documents for past projects in the large commercial facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

#### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter areas designated for agricultural uses and result in the conversion of agricultural land to non-agricultural uses. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts to agricultural resources. The potential also exists for future entertainment/recreational projects to generate significant adverse impacts to forestry resources.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.2-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on agricultural uses. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, and grading and landscaping of open space areas for outdoor recreational facilities. More specifically, the following discussion provides an overall summary of the types of impacts on agricultural and forestry resources identified in the four CEQA documents surveyed.

- a) Conversion of Farmland to Non-Agricultural Uses.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less-than-significant impacts related to the conversion of farmland to non-agricultural uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less-than-significant impacts on agricultural resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson

Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) **Other Changes to Convert Farmland to Non-Agricultural Uses.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less-than-significant impacts on agricultural resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) **Conflict with or Cause Rezoning of Forest Land.** All four CEQA documents for past projects in the entertainment/recreational facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) **Other changes that convert Forest Land to Other Uses.** All four CEQA documents for past projects in the entertainment/recreational facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, and parking structures. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would, therefore, would have a low potential for impacting agricultural and forestry lands. Therefore, these future facilities would have a low likelihood of resulting in significant impacts to agricultural and forestry resources. However, the potential exists for one or more future institutional projects to generate significant adverse impacts to agricultural and forestry resources.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.2-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on agricultural resources including the conversion of farmland to non-agricultural uses and potential conflicts with agriculture zoning. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities. However, these projects were generally found to have less-than-significant impacts to agricultural resources as most of these projects are located in developed urban areas. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the 15 CEQA documents surveyed.

- a) **Conversion of Farmland to Non-Agricultural Uses.** Eleven (11) of the 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts related to the conversion of farmland to non-agricultural uses; the other four documents did not discuss the conversion of farmland to non-agricultural uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in

Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** Eleven (11) of the 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts on agricultural resources; the other four documents did not discuss the conversion of farmland to non-agricultural uses. Based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** Eleven (11) if the 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts on agricultural resources; the other four documents did not discuss the conversion of farmland to non-agricultural uses. Based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All 15 CEQA documents for past projects in the institutional facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) Other changes that convert Forest Land to Other Uses.** All 15 CEQA documents for past projects in the institutional facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and

medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities). Any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would have a low potential for impacting agricultural and forestry lands and agricultural and forestry zoning. Therefore, transportation facilities would generally have a low likelihood of resulting in significant impacts to agricultural and forestry resources. However, the potential exists for one or more future projects to have significant impacts on agricultural and forestry resources.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.2-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on agricultural resources. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including shipping infrastructure and bus storage and maintenance facilities. However, the CEQA documents for the projects that were surveyed were found to have no impacts on agricultural resources as most of these projects were located in developed mixed-use, industrial, and commercial zoned areas and not agricultural areas. More specifically, the following discussions provide an overall summary of the types of impacts identified in the three CEQA documents surveyed.

**a) Conversion of Farmland to Non-Agricultural Uses.** One of the three CEQA documents for past projects in the transportation facility category disclosed no impact on agricultural resources; the other two documents did not discuss the conversion of farmland to non-agricultural uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

**b) Conflict with Agricultural Zoning or Williamson Act Contract.** One of the three CEQA documents for past projects in the transportation facility category disclosed no impact on agricultural resources; the other two documents did not discuss impacts on agricultural resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in

Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** One of the three CEQA documents for past projects in the transportation facility category disclosed no impact on agricultural resources; the other two documents did not discuss impacts on agricultural resources. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All three CEQA documents for past projects in the transportation facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) Other changes that convert Forest Land to Other Uses.** All three CEQA documents for past projects in the transportation facility category did not include an

analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to agricultural or forestry areas. Accordingly, it is likely that conflicts may occur regarding agricultural or forestry zoning. Therefore, it is possible future construction and operation of utility facilities could generate significant adverse impacts on agricultural and forestry resources.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.2-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on agricultural resources. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could affect agricultural resources, including the loss of farmland or result in a conflict with existing agricultural zoning. More specifically, the following

discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the four CEQA documents surveyed.

- a) Conversion of Farmland to Non-Agricultural Uses.** Three of the four CEQA documents for past projects in the utility facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** Three of the four CEQA documents for past projects in the utility facility category disclosed no impacts related to the agricultural zoning or the Williamson Act Contract; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** Three of the four CEQA documents for past projects in the utility facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual

projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All four CEQA documents for past projects in the utility facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) Other changes that convert Forest Land to Other Uses.** All four CEQA documents for past projects in the utility facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new

construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings. Depending on where these new facilities are located, significant impacts to agricultural and forestry resources could occur.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.2-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on agricultural resources. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in impacts to agricultural resources. However, adverse effects were not found to be significant since most of these facilities were located in developed urban industrial areas and not agricultural areas. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the four CEQA documents surveyed.

**a) Conversion of Farmland to Non-Agricultural Uses.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

**b) Conflict with Agricultural Zoning or Williamson Act Contract.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed no impacts on agricultural resources; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past

(Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed no impacts on agricultural resources; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All four CEQA documents for past projects in the light industrial/warehouse facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) **Other changes that convert Forest Land to Other Uses.** All four CEQA documents for past projects in the light industrial/warehouse facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. Siting these types of facilities could have the potential to affect agricultural and forestry lands and zoning designations. Accordingly, it is possible that these types of project would significantly impact agricultural and forestry areas. Therefore, these future heavy industrial facilities have the potential of generating significant adverse impacts to agricultural and forestry resources.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.2-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on agricultural resources including the loss of farmland and conflicts with agricultural zoning. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in the conversion of farmland to non-agricultural uses. More specifically, the following discussions provide an overall summary of the types of impacts on agricultural and forestry resources identified in the three CEQA documents surveyed.

- a) Conversion of Farmland to Non-Agricultural Uses.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts related to the conversion of farmland to non-agricultural uses. However, for one of the projects surveyed (Project # 51 SRG Chino South Industrial Park Project EIR), the lead agency concluded that the heavy industrial facility category project has the potential to generate significant adverse environmental impacts related to the conversion of farmland to non-agricultural uses. Furthermore, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in conversion of farmland to non-agricultural uses.

Based on information in the CEQA documents evaluated for the proposed project, and the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, impacts on related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- b) Conflict with Agricultural Zoning or Williamson Act Contract.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts on agricultural zoning and Williamson Act constricts. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural zones or in areas subject to the Williamson Act Contract that could result in conflict with zoning or violation of the contract.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts resulting in conflict with agricultural zoning or the Williamson Act Contract associated with the implementation of the proposed project are determined to be significant.

- c) Other Changes to Convert Farmland to Non-Agricultural Uses.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts on other changes to convert farmland. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in agricultural areas that could result in the conversion of farmland to non-agricultural uses.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to agricultural resources could be significant. Therefore, impacts related to the conversion of farmland to non-agricultural uses resulting from implementing the proposed project are determined to be significant.

- d) Conflict with or Cause Rezoning of Forest Land.** All three CEQA documents for past projects in the heavy industrial facility category did not include an analysis of potential indirect impacts related to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to conflict with or cause rezoning of forest land as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conflict with or cause rezoning of forest land resulting from implementing the proposed project are determined to be significant.

- e) Other changes that convert Forest Land to Other Uses.** All three CEQA documents for past projects in the heavy industrial facility category did not include an analysis of potential indirect impacts related to conversion of forest land to other uses because this requirement was not in effect at the time the CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. It is possible that future individual projects in this facility category could have the potential to convert forest land to other uses as a result of being sited in or near such locations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to forestry resources could be significant. Therefore, impacts related to the conversion of forest land to other uses resulting from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that almost all of the past projects had no impacts or less-than-significant impacts to agricultural resources. However, based on information in the CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff’s independent judgment, and the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was

prepared, agricultural and forestry resources impacts as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects.” [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per SB 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed Senate Bill (SB) 388 (Calderon) and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD’s internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. As discussed earlier in this section, there is an on-going trend of migration of dairy livestock operations from the district to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization. The direct loss of farmlands resulting from some of the past projects seems to reflect this on-going decline in agricultural operations in the district. Any future facilities obtaining offsets from the SCAQMD’s internal accounts that would result in the conversion of agricultural lands to non-agricultural uses would add to this cumulative decline in agricultural uses in the district. Since the specific location of individual facilities cannot be predicted with certainty, the evaluation of cumulative impacts on agricultural resources is even more uncertain. However, future conversion of agricultural lands to non-agricultural uses resulting from the approval of the project could result in a cumulatively significant contribution to the overall availability of agricultural resources within the district.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets from the SCAQMD’s internal accounts to three power plants. The three power plant projects, NRG’s El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California

Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC for all three power plant projects concluded that agricultural resources impacts would be not significant. A power plant may create a significant land use impact, for example, if it converts prime or unique farmland or farmland of statewide importance to nonagricultural uses.

According to the CEC, there is no agricultural land within or near the proposed Sentinel power plant site or project related features and facilities and that none of the lands affected by the Sentinel project are zoned for agricultural uses. In addition, the CEC determined that the Sentinel project and related facilities are located on land that is vacant and considered nonagricultural land by the California Department of Conservation who classified the areas surrounding the Sentinel site as “Urban Built-up Area.” Finally, the CEC concluded that the Sentinel proposed project and related facilities are not subject to an Agricultural Land Conservation (Williamson Act) contract and, thus, would generate no significant agricultural resources impacts.

The CEC concluded that the El Segundo project would also result in no significant agricultural resources impacts because there are no agricultural lands within the region of the El Segundo project and there are no agricultural uses or restrictions in the vicinity of the El Segundo facility.

The FSA prepared by the CEC for the Walnut Creek project determined that no areas used for agricultural production are located within a one-mile radius of the facility, the project does not convert agricultural land or resources to nonagricultural uses, and the site is developed industrial land that has no agricultural value. Thus, the CEC concluded that the Walnut Creek project would generate no significant adverse agricultural resources impacts.

Based upon the above considerations, impacts of the project, are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative agricultural resources impacts.

In addition, the project may result in a cumulatively considerable contribution to significant cumulative impacts on forestry resources.

### **Mitigation Measures for Future Agricultural Resources Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant agricultural resources impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing

air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse agricultural and forestry resources impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for agricultural and forestry resources impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of agricultural and forestry resources impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

#### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant agricultural or forestry resources impact, the potential exists for future indirect agricultural and forestry resources impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.3**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - AIR QUALITY**

**Introduction**

**Impact Analysis**

## INTRODUCTION

Chapter 4 addresses direct air quality and greenhouse gas impacts projected to result from sources receiving permits under Rules 1304 and 1309.1, pursuant to proposed Rule 1315. In addition, Chapter 4 qualitatively discusses the indirect emissions associated with constructing and operating such facilities and presents significance conclusions based upon the combined direct and indirect air quality and greenhouse gas impacts of the proposed project. This sub-chapter provides further information regarding the potential air quality and greenhouse gas impacts associated with the types of individual facilities that might be eligible for offsets under the proposed project based upon a review of CEQA documents for past projects.

## IMPACT ANALYSIS

The following discussion presents an evaluation of potential air quality and greenhouse gas impacts from future representative facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on the air quality conditions of a given area. Based on the information described in Subchapter 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of indirect air quality and greenhouse gas impacts is qualitative in nature, the determination of the types of impacts and the level of significance of potential facility-level impacts will not be affected by the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only. Future new projects could result in either new construction or modification of existing structures. As a result, construction of any new future facility or modification of any existing facility has the potential to create significant adverse air quality impacts. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse air quality impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit and

rezone existing land uses (e.g., agricultural, dairy) due to urbanization<sup>1</sup>. Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to air quality as a result of constructing future new agricultural facilities may include the generation of fugitive dust emissions that result from structure demolition and site work, as well as combustion exhaust emissions that result from on-site construction equipment, haul truck trips, and worker commute trips. Combustion exhaust emissions associated with on-site construction equipment, haul truck trips, and worker commute trips, as well as fugitive off-gassing emissions (VOCs) associated with the application of architectural coatings and asphalt paving may also result from building construction.

Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to sensitive residential and public recreation areas. The potential scale of farm structures, dairy processing plants, and other agricultural-related structures may result in significant localized air quality impacts to surrounding non-agricultural land uses.

Project-specific impacts were identified from the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.3-1). The two CEQA documents surveyed,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on air quality, including criteria pollutant emissions, odors, and consistency with the AQMP. Based on a review of these documents, agricultural-related facilities may be of substantial size and mass, which are likely to result in criteria pollutant emissions that exceed applicable significance thresholds and may create objectionable odors and, therefore, are likely to affect air quality. Accordingly, these projects were generally found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the two CEQA documents surveyed.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for agricultural projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. * Significance conclusion reflects different methodology than has been used in this PEA. Source: ICF Jones & Stokes, 2009.						

**a) Conflict with or obstruct implementation of applicable air quality plan**  
Both CEQA documents for the two past projects in the agricultural facility category disclosed less than significant impacts related to conflicts with the applicable air quality plan

**b) Violate any Air Quality Standard.** One of the two CEQA documents prepared for past projects in the agricultural facilities category indicated environmental impacts related to the violation of an air quality standard were less-than-significant (without or with mitigation). One of the CEQA documents (Project #2 – Kings County Dairy Element) concluded that this agricultural project has the potential to generate significant adverse environmental impacts related to the violation of an air quality standard.

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** One of the two CEQA documents prepared for past projects in the agricultural facilities category indicated environmental impacts related to the increase in criteria pollutants were less-than-cumulatively considerable. However, one of the CEQA documents (Project #2 – Kings County Dairy Element) concluded that the agricultural facility category project has the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** The two CEQA documents for past projects in the agricultural facilities category disclosed less than significant impacts related to sensitive receptors' exposure to substantial pollutant concentrations.

**e) Create Objectionable Odors.** The two CEQA documents prepared for past projects in the agricultural facilities category indicated that for one of the two projects, environmental impacts related to odors were less than significant. However, one of the CEQA documents (Project #2 – Kings County Dairy Element) concluded that the agricultural project has the potential to generate significant adverse environmental impacts related to odors associated with the operation of dairy farms.

**g, h) Greenhouse Gas Emissions.** In one of the two CEQA documents prepared for past projects in the agricultural facilities category, environmental impacts related to greenhouse gas emissions were not discussed. However, in the other CEQA document (Project #2 – Kings County Dairy Element), the lead agency concluded that the agricultural facility category project has the potential to generate significant adverse environmental impacts related to greenhouse gas emissions.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). However,

based on these historical data, only some of these facilities (an average of approximately 26 facilities per year) were anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of permitted stationary source equipment at retail/services facilities that may be constructed in the future include backup generators; service station gasoline storage and dispensing equipment; dry cleaning equipment; printing presses; boilers; paint spray booths; and food frying, charbroiling, and other cooking equipment. On a programmatic level, impacts to air quality as a result of constructing future new retail/service facilities may include the generation of fugitive dust emissions that result from structure demolition and site work, as well as combustion exhaust emissions that result from on-site construction equipment, haul truck trips, and worker commute trips. Combustion exhaust emissions associated with on-site construction equipment, haul truck trips, and worker commute trips, as well as fugitive off-gassing emissions (VOCs) associated with the application of architectural coatings and asphalt paving may also result from building erection.

Although retail/service facilities would most likely be constructed in areas zoned for such uses, these facilities may be near or directly adjacent to sensitive residential and public recreation areas. The potential scale of retail-related structures may result in significant localized air quality impacts to surrounding land uses.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.3-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on air quality, including local and regional construction emissions and regional operational emissions. These projects involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, which were found to result in criteria pollutant emissions that exceed applicable thresholds, create objectionable odors, expose sensitive receptors to substantial pollutant concentrations and, therefore, are likely to affect air quality. Accordingly, these projects were generally found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the CEQA documents surveyed.

- a) **Conflict with or obstruct implementation of applicable air quality plan.** Five of the eight CEQA documents for past projects in the retail service facilities category indicated that conflicts with the AQMP were either less than significant or no impact; two of the CEQA documents did not address this issue. However, for one of the projects surveyed (Project #6 – Archstone Hollywood), the lead agency concluded that this retail/service project has the potential to generate significant adverse environmental impacts related to conflicts with the AQMP. The EIR for the Archstone Hollywood project contains inconsistent statements regarding this impact. The EIR states that the project would result in construction emissions exceeding

SCAQMD significance thresholds, but recognizes that dust control measures and vehicle maintenance requirements would ensure consistency with the AQMP. This impact should have been classified as a potential to contribute to violations of air quality standards under criterion b, rather than as a conflict with the AQMP under criterion a. The EIR for the Archstone Hollywood project does not indicate that facilities with sources receiving permits under the proposed project would result in conflicts with the AQMP.

**b) Violate any Air Quality Standard.** Four of the eight CEQA documents prepared for past projects in the retail/service facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were less than significant. However, the other four CEQA documents concluded that the retail/service projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard (Projects #5 – Shops at Santa Anita Park Specific Plan, #6 – Archstone Hollywood, #9 – Westfield Fashion Square Expansion, and #10 – New Century Plan).

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** Five of the eight CEQA documents prepared for past projects in the retail/service facilities category indicated that environmental impacts related to the increase in criteria pollutants were less than cumulatively considerable. However, three of the CEQA documents concluded that the retail/service facility has the potential to generate a cumulatively considerable increase in criteria pollutants (Projects #5 – Shops at Santa Anita Park Specific Plan, #6 – Archstone Hollywood, and #10 – New Century Plan).

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** Three of the eight CEQA documents prepared for past projects in the retail/service facilities category indicated that environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations were less than significant. However, five of the CEQA documents concluded that the retail/service projects have the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations (Projects #4 – Wilshire La Brea, #5 – Shops at Santa Anita Park Specific Plan, #6 – Archstone Hollywood, #9 – Westfield Fashion Square Expansion, and #10 – New Century Plan).

**e) Create Objectionable Odors.** Five of the eight CEQA documents prepared for past projects in the retail/service facilities category disclosed less than significant impacts related to objectionable odors; the other three CEQA documents did not address impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** In seven of the eight CEQA documents prepared for past projects in the retail/service facilities category, environmental impacts related to greenhouse gas emissions were either not discussed or found to be less than significant. However, one of the CEQA documents (Project #4 – Wilshire La Brea

Project), concluded that the retail/service project has the potential to generate significant adverse environmental impacts related to greenhouse gas emissions.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). However, based on these historical data only some of these facilities were anticipated to involve new construction since most of them would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting. Based on historical trends, new large commercial facilities could be constructed within existing developed commercial, retail, mixed-use, residential, and transit-oriented areas and would, therefore, have a low potential for substantial construction-related emissions. Therefore, these facilities would generally have a low likelihood of resulting in significant construction-related impacts. However, the potential exists for one or more future large commercial projects to have significant air quality impacts.

Project-specific impacts are identified in the selected available environmental documents (see Table 5.3-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on air quality, including construction emissions and operational emissions. These projects involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in construction and operational period emissions. Based on a review of these documents, commercial facilities may result in criteria pollutant emissions that exceed applicable thresholds and may result in cumulatively considerable impacts and, therefore, are likely to affect air quality. Accordingly, these projects were generally found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the nine CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan .** All nine CEQA documents prepared for past projects in the large commercial facilities category disclosed less than significant impacts related to conflicts with the applicable air quality plan.

**b) Violate any Air Quality Standard.** Two of the nine CEQA documents prepared for past projects in the large commercial facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were less than significant (without or with mitigation). The other seven CEQA documents concluded that the large commercial projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard during construction and

operation (Projects #11-Sunset Doheny Hotel, #14 – Corbin and Nordhoff Redevelopment, #15 – Boulevard 6200, #16 – Panorama Palace, #17 – Metro Universal, #18 – Paseo Plaza Hollywood, and #19 – Plaza at the Glen).

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.**

One of the nine CEQA documents prepared for past projects in the large commercial facilities category indicated that environmental impacts related to the increase in criteria pollutants were considered to be less than cumulatively considerable. Another CEQA document did not address impacts related to this issue. However, seven of the CEQA documents concluded that the large commercial projects have the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants during construction and operation (Projects # 12 – 2000 Avenue of the Stars, # 13 – Travelodge Hotel, #14 – Corbin and Nordhoff Redevelopment, #16 – Panorama Place, #17, Metro Universal, #18 – Paseo Plaza Hollywood, and #19, Plaza at the Glen).

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.**

Four of the nine CEQA documents prepared for past projects in the large commercial facilities category indicated that environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations were less than significant. However, five of the CEQA documents concluded that the large commercial projects have the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations (Projects #11 – Sunset Doheny Hotel, #16 – Panorama Place, #17, Metro Universal, #18 – Paseo Plaza Hollywood, and #19, Plaza at the Glen).

**e) Create Objectionable Odors.**

Four of the nine CEQA documents prepared for past projects in the large commercial facilities category disclosed less than significant impacts related to odors; the other five CEQA documents did not address impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.**

Four of the nine CEQA documents prepared for past projects in the large commercial facilities category disclosed less than significant impacts related to greenhouse gas emissions; the other five documents did not address impacts related to greenhouse gas.

**Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, a small number of new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical trends, these types of projects would have

potential for increased construction and operational emissions. Therefore, the potential exists for one or more future entertainment/recreational projects to have significant air quality impacts.

Project-specific impacts are identified in the selected available environmental documents (see Table 5.3-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on air quality, including construction emissions and operational emissions. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities, which were determined to result in exceedances of applicable thresholds, cumulatively considerable increases of criteria pollutants, and substantial greenhouse gas emissions. Accordingly, these projects were found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the four CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan.** All four CEQA documents prepared for past projects in the entertainment/recreational facilities category disclosed less than significant impacts related to conflicts with the applicable air quality plan.

**b) Violate any Air Quality Standard.** All four of the CEQA documents prepared for past projects in the entertainment/recreational facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were considered to be significant (Projects #20 – City of Industry Business Center (NFL Stadium), #21 – LA Live – Sports and Entertainment District, #22 – Canyon Hills, and #23 – Wilmington Waterfront Development).

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** One of the four CEQA documents prepared for past projects in the entertainment/recreational facilities indicated that environmental impacts related to the increase in criteria pollutants were considered to be less than cumulatively considerable; one other CEQA document did not address impacts related to this issue. However, two of the CEQA documents (Projects #20 – City of Industry Business Center (NFL Stadium) and #23 – Wilmington Waterfront Development), concluded that the entertainment/recreational projects have the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** Two of the four CEQA documents prepared for past projects in the entertainment/recreational facilities category indicated that environmental impacts related to the exposure of

sensitive receptors to substantial pollutant concentrations were less than significant. However, the other CEQA documents (Projects #20 – City of Industry Business Center (NFL Stadium) and #23 – Wilmington Waterfront Development) concluded that the entertainment/recreational projects have the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations.

**e) Create Objectionable Odors.** Three of the four CEQA documents prepared for past projects in the entertainment/recreational facilities category disclosed less than significant impacts related to odors; the other CEQA document did not address impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** In two of the four CEQA documents prepared for past projects in the entertainment/recreational facilities category, environmental impacts related to greenhouse gas emissions were not discussed. However, two of CEQA documents (Projects #20 – City of Industry Business Center (NFL Stadium) and #23 – Wilmington Waterfront Development) concluded that the entertainment/recreational projects have the potential to generate significant adverse environmental impacts related to greenhouse gas emissions. More specifically, the CEQA documents for these projects indicated that project-related greenhouse gas emissions would significantly contribute to global climate change impacts in California on a cumulative basis.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities were anticipated to involve new construction since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temples. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting. Based on historical trends, these types of projects would have the potential for increased construction and operational emissions. Therefore, the potential exists for one or more future institutional projects to have significant air quality impacts.

Project-specific impacts are identified in the selected available environmental documents (see Table 5.3-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on air quality, including local and regional construction emissions and regional operational emissions. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools,

hospital buildings, and other public facilities, which were determined to result in exceedances of applicable thresholds, cumulatively considerable increases of criteria pollutants, and substantial greenhouse gas emissions. Accordingly, these projects were found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the 15 CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan.**

Thirteen of the 15 CEQA documents prepared for past projects in the institutional facilities category indicated that environmental impacts related to conflicts with the applicable air quality plan were less than significant; two of the 15 CEQA documents did not address impacts related to this issue.

**b) Violate any Air Quality Standard.** Six of the 15 CEQA documents prepared for past projects in the institutional facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were less than significant. However, the other nine CEQA documents concluded that the institutional projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard or exceedance of a threshold (Projects #24 – Caltrans District 7 Headquarters, #25 – Buckley School Enhancement, #26 – Cedars Sinai West Tower, #29 – New Paradise Church, #31 – Stephen Wise Middle School Relocation, #32 – Temple Israel of Hollywood, #33 – USC Health Sciences Campus, #35 – West LA College, and #37 – Harvard-Westlake School).

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.**

Nine of the 15 CEQA documents prepared for past projects in the institutional facilities category indicated that environmental impacts related to the increase in criteria pollutants were less than cumulatively considerable; two other CEQA documents did not address impacts related to this issue. However, four of the CEQA documents (Projects #31 – Stephen Wise Middle School Relocation, #32 – Temple Israel of Hollywood, #33 – USC Health Sciences Campus, and #35 – West LA College) concluded that the institutional projects have the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.**

Nine of the 15 CEQA documents prepared for past projects in the institutional facilities category indicated that environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations were less than significant (without or with mitigation); one CEQA document did not address impacts related to this issue. However, for five of the CEQA documents (#25 – Buckley School Enhancement, #26 – Cedars Sinai West Tower, #29 – New Paradise Church, #33 – USC Health Sciences Campus, and #37 – Harvard-Westlake School) concluded that the institutional projects have the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations.

e) **Create Objectionable Odors.** Twelve of the 15 CEQA documents prepared for past projects in the institutional facilities category disclosed less than significant impacts related to objectionable odors; the other three CEQA documents did not address impacts related to objectionable odors.

g, h) **Greenhouse Gas Emissions.** Four of the 15 CEQA documents prepared for past projects in the institutional facilities category disclosed less than significant impacts related to greenhouse gas emissions; the other 11 CEQA documents did not address impacts related to this issue.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future. Similarly, continuing improvements and expansion of public transportation infrastructure may increase the number of transportation projects in the future requiring permits and, potentially, offsets from the SCAQMD's internal offset account. However, since past transportation facility projects consisted primarily of highways and roads, which typically do not require stationary source permits, use of past permits and pending permits to predict future transportation facilities means that the number of transportation-related facilities that would require such permits in the future would not be expected to constitute a large number.

Examples of transportation facilities that may be constructed include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. Based on historical trends, these types of projects would have potential for increased construction and operational emissions. Therefore, the potential exists for one or more future transportation projects to have significant air quality impacts.

Project-specific impacts are identified in the available environmental documents (see Table 5.3-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on air quality, including construction emissions and operational emissions. These projects involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, some of which were found to result in violations of air quality standards or exceedances of thresholds, cumulatively considerable increases of criteria pollutants, and substantial greenhouse gas emissions. Accordingly, these projects were found to have significant air quality impacts. More specifically, the following

discussions provide an overall summary of the types of air quality impacts identified in the three CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan.** All three CEQA documents prepared for past projects in the transportation facilities category disclosed less than significant impacts related to conflicts with the applicable air quality plan.

**b) Violate any Air Quality Standard.** One of the three CEQA documents prepared for past projects in the transportation facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were considered to be less than significant. However, two CEQA documents (Projects # 39 – TraPac Terminal Expansion and #40 – Metro West Los Angeles Transportation Facility and Sunset Avenue Project) concluded that the transportation-related projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard or exceedance of a threshold.

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** One of the three CEQA documents prepared for past projects in the transportation facilities category indicated that environmental impacts related to the increase in criteria pollutants were less than cumulatively considerable. However, two of the CEQA documents (Projects # 39 – TraPac Terminal Expansion and #40 – Metro West Los Angeles Transportation Facility and Sunset Avenue Project) concluded that the transportation-related projects have the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** One of the three CEQA documents prepared for past projects in the transportation facilities category indicated that environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations were less than significant. However, two of the CEQA documents (Projects # 39 – TraPac Terminal Expansion and #41 – Canoga Park Orange Line Extension) concluded that the transportation-related projects have the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations.

**e) Create Objectionable Odors.** All three CEQA documents prepared for past projects in the transportation facilities category disclosed less than significant impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** One of the three CEQA documents prepared for past projects in the transportation facilities category indicated that environmental impacts related to greenhouse gas emissions were less than significant; one other CEQA document did not address impacts related to this issue. However, one of the CEQA documents (Project # 39 – TraPac Terminal Expansion) concluded

that the transportation-related project has the potential to generate significant adverse environmental impacts related to greenhouse gas emissions.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical trend, a large number of new utility-oriented facilities is not anticipated to be established in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., gas turbines, boilers, fuel-storage, exhaust structures), and low- to medium-scale buildings for landfill processing, transport, and storage facilities.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional demand for public infrastructure. Due to the necessity for many public infrastructure and utility services, these types of facilities have the potential to be constructed in a wide range of different areas. Based on the historical trend, these types of projects would have the potential for increased construction and operational emissions. Therefore, the potential exists for one or more future utility-related projects to have significant air quality impacts.

Project-specific impacts are identified in the selected available environmental documents (see Table 5.3-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on air quality, including construction emissions and operational emissions. These projects generally involve the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, some of which were found to result in violations of air quality standards and exceedances of thresholds, cumulatively considerable increases of criteria pollutants, and substantial greenhouse gas emissions. Accordingly, these projects were found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the four CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan.** Two of the four CEQA documents prepared for past projects in the utility project facilities category disclosed less than significant impacts related to conflicts with the applicable air quality plan; the other two CEQA documents did not address impacts related to this issue.

**b) Violate any Air Quality Standard.** Two of the four CEQA documents prepared for past projects in the utility project facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were considered to be less than significant. However,

two of the CEQA documents (Projects # 43 – LADWP Electrical Generating Stations Modifications and #44 – Bradley Landfill and Recycling Center) concluded that the utility projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard.

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** Two of the four CEQA documents prepared for past projects in the utility project facilities category indicated that environmental impacts related to the increase in criteria pollutants were less than cumulatively considerable; one CEQA document did not address impacts related to this issue. However, one of the CEQA documents (Project #44 – Bradley Landfill and Recycling Center) concluded that the utility project has the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** Three of the four CEQA documents prepared for past projects in the utility project facilities category indicated that environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations were less than significant. However, one of the CEQA documents (Project #43 – LADWP Electrical Generating Stations Modifications) concluded that the utility project has the potential to generate significant adverse environmental impacts related to the exposure of sensitive receptors to substantial pollutant concentrations.

**e) Create Objectionable Odors.** Two of the four CEQA documents prepared for past projects in the utility project facilities category disclosed less than significant impacts related to objectionable odors; the other two CEQA documents did not address impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** One of the four CEQA documents prepared for a past project in the utility project facilities category disclosed a less than significant impact related to greenhouse gas emissions; the other three CEQA documents did not address impacts related to this issue.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (Table 5.0-1). Based on these historical data, only some of these facilities were anticipated to involve new construction since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and warehouse/retail facilities. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings, which may require moderate amounts of construction activities, potentially resulting in significant adverse air quality impacts.

Project-specific impacts are identified in the available environmental documents (see Table 5.3-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on air quality, including construction emissions and operational emissions. These projects involved the construction of one- to three-story warehouse-type and office-type structures, some of which were found to result in violations of air quality standards and cumulatively considerable increases of criteria pollutants. Accordingly, these projects were found to have significant adverse air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the four CEQA documents surveyed.

- a) **Conflict with or obstruct implementation of applicable air quality plan.** All four CEQA documents prepared for past projects in the light industrial/warehouse facilities category disclosed less than significant impacts related to conflicts with the applicable air quality plan.
- b) **Violate any Air Quality Standard.** Two of the four CEQA documents prepared for past projects in the light industrial/warehouse facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were less than significant. However, two of the CEQA documents (Projects #47 – Alessandro Business Center and #48 – City of San Dimas Costco Development) concluded that the light industrial/warehouse projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard.
- c) **Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** Two of the four CEQA documents prepared for past projects in the light industrial/warehouse facilities category indicated that environmental impacts related to the increase in criteria pollutants were considered to be less than cumulatively considerable. However, two of the CEQA documents (Projects #47 – Alessandro Business Center and #48 – City of San Dimas Costco Development) concluded that the light industrial/warehouse projects have the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.
- d) **Expose Sensitive Receptors to Substantial Pollutant Concentrations.** Three of the four CEQA documents prepared for past projects in the light industrial/warehouse facilities category disclosed less than significant impacts (without or with mitigation) related to the exposure of sensitive receptors to substantial pollutant concentrations; the other CEQA document did not address impacts related to this issue.
- e) **Create Objectionable Odors.** All four CEQA documents prepared for past projects in the light industrial/warehouse facilities category disclosed less than significant impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** Two of the four CEQA documents prepared for past projects in the light industrial/warehouse facilities category disclosed less than significant impacts related to greenhouse gas emissions; the other two documents did not address impacts related to this issue.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities were anticipated to involve new construction since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas, which may require moderate amounts of construction activities, which may result in significant air quality impacts.

Project-specific impacts are identified in the available environmental documents (see Table 5.3-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on air quality, including construction emissions and operational emissions. These projects involved the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transport facilities, the construction and operation, some of which were found to result in violations of air quality standards or exceedances of significance thresholds, cumulatively considerable increases of criteria pollutants, and conflict with applicable plans and rules. Accordingly, these projects were found to have significant air quality impacts. More specifically, the following discussions provide an overall summary of the types of air quality impacts identified in the three CEQA documents surveyed.

**a) Conflict with or obstruct implementation of applicable air quality plan.** Two of the three CEQA documents prepared for past projects in the heavy industrial facilities category indicated that less than significant environmental impacts related to conflicts with the applicable air quality plan were anticipated to occur. However, the third CEQA document (Project #51 – SRG Chino South Industrial Park) concluded that the heavy industrial project has the potential to generate significant adverse environmental impacts related to conflicts with the applicable air quality plan. This conclusion was based upon an analysis demonstrating that emissions of criteria pollutants from project construction and operation would exceed the SCAQMD significance thresholds for mass emissions of criteria pollutants. Therefore, the impact should have been categorized under criterion b, rather than criterion a. The EIR does not indicate any potential for actual conflict with the AQMP.

**b) Violate any Air Quality Standard.** One of the three CEQA documents prepared for past projects in the heavy industrial facilities category indicated that environmental impacts related to the violation of an air quality standard or exceedance of an air quality significance threshold were considered to be less than significant. However, two of the CEQA documents (Projects #50 – Chevron Projects Company and #51 – SRG Chino South Industrial Park) concluded that the heavy industrial projects have the potential to generate significant adverse environmental impacts related to the violation of an air quality standard.

**c) Result in a Cumulatively Considerable Increase of any Criteria Pollutant.** One of the three CEQA documents prepared for past projects in the heavy industrial facilities indicated environmental impacts related to the increase in criteria pollutants were considered to be less than cumulatively considerable; one CEQA document did not address impacts related to this issue. However, the other CEQA document (Project #51 – SRG Chino South Industrial Park) concluded that the heavy industrial project had the potential to generate cumulatively considerable adverse environmental impacts related to the increase in criteria pollutants.

**d) Expose Sensitive Receptors to Substantial Pollutant Concentrations.** All three CEQA documents prepared for past projects in the heavy industrial facilities category disclosed less than significant impacts (without or with mitigation) related to the exposure of sensitive receptors to substantial pollutant concentrations.

**e) Create Objectionable Odors.** Two of the three CEQA documents prepared for past projects in the heavy industrial facilities category disclosed less than significant impacts related to objectionable odors; the other CEQA document did not address impacts related to objectionable odors.

**g, h) Greenhouse Gas Emissions.** Two of the three CEQA documents prepared for past projects in the heavy industrial facilities category did not address impacts related to greenhouse gas emissions. The remaining CEQA document (Project #50 – Chevron Products Company Product Reliability and Optimization Project) concluded that the heavy industrial project had the potential to generate significant adverse environmental impacts related to the increase in GHG emissions. GHG emission impacts were mitigated to less than significant levels.

### **Summary of Findings**

The review of 52 environmental documents found that many of the past projects had environmental impacts related to air quality that were either less than significant or less than significant with the implementation of mitigation measures. However, some of the CEQA documents found that the past projects have the potential to generate significant impacts related to the violations of air quality standards, cumulatively considerable increases of criteria pollutants, and substantial greenhouse gas emissions.

## **SUBCHAPTER 5.4**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - BIOLOGICAL RESOURCES**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary first step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts to biological resources depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts on biological resources from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts to biological resources is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse indirect impacts to biological resources include assessments of impacts to sensitive species, riparian habitat, wetlands, interference with movement of native species, and potential conflict with policies or ordinances. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant biological resource impacts if their implementation would result in any of the following:

- The project would result in a loss of plant communities or animal habitat considered to be rare, threatened or endangered by federal, state or local agencies.
- The project would interfere substantially with the movement of any resident or migratory wildlife species.
- The project would adversely affect aquatic communities through construction or operation of the project.
- The project would have a substantial adverse effect on federally protected wetlands.

- Conflict with biological policies or ordinances.
- Conflict with applicable conservation plan.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential impacts to biological resources from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on biological resources. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts on biological resources is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse biological resources impacts. Such future new or modified facilities could potentially result in development that is inconsistent with adjacent sensitive biological resources. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse biological resource impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to biological resources as a result of constructing future new agricultural facilities may include potentially altering undeveloped open space and natural areas and developing hillsides. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to areas known to support sensitive species and other biological

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

resources. The potential scale of farm structures, dairy processing plants, and other agricultural-related structures may result in significant impacts on biological resources.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.4-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on biological resources. Based on a review of these documents, agricultural-related facilities are typically constructed and operated within areas zoned for agriculture and are unlikely to significantly impact biological resources. Accordingly, these projects were found to have less-than-significant impacts or less-than-significant impacts with mitigation. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the two CEQA documents surveyed for this facility category.

**a) Sensitive Species.** One of the two CEQA documents for a past project in the agricultural facility category disclosed a less-than-significant impact with the implementation of mitigation measures on sensitive species; the other CEQA document did not address impacts on sensitive species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

**b) Riparian Habitat.** Both CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) on riparian habitat. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents were reviewed since they illustrate the types of impacts that may result from the development of such projects.

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. Source: ICF Jones & Stokes, 2009.						

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** Both CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts on protected wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) **Movement of Native Species.** One of the two CEQA documents a past project in the agricultural facility category disclosed a less-than-significant impact with the implementation of mitigation measures on movement of native species. The other document did not address impacts related to the potential interference of movement of native species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

- e, f) **Conflict with Policies, Ordinances, or Conservation Plans.** One of the CEQA documents for a past project in the agricultural facility category disclosed either a

less-than-significant impact or no impact related to conflicts with policies, ordinances, or conservation plans regarding biological resources; the other CEQA document did not disclose impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the last five years. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for alteration of undeveloped open space and natural areas resulting in impacts to biological resources. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse biological impacts in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts on biological resources.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.4-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on biological resources. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings. Project-specific impacts were generally not considered significant impacts as most retail and service establishments surveyed are located in developed urban

areas and are largely compatible with the surrounding areas. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the eight CEQA documents surveyed.

- a) **Sensitive Species.** Two of the eight CEQA documents for past projects in the retail/services facility category disclosed either a less-than-significant impact or no impact on sensitive species; the six other CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) **Riparian Habitat.** Two of the eight CEQA documents for past projects in the retail/services facility category disclosed either a less-than-significant impact with the implementation of mitigation or no impact on riparian habitat; the other six CEQA document did not address impacts related to riparian habitat. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** One of the eight CEQA documents for a past project in the retail/services facility category disclosed no impact on protected wetlands; the other seven CEQA documents did not address impacts to wetlands. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) Movement of Native Species.** One of the eight CEQA documents a past project in the retail/services facility category disclosed no impact on the movement of native species; the other seven CEQA documents did not address impacts related to potential interference of native species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

- e, f) Conflict with Policies, Ordinances, or Conservation Plans.** One of the eight CEQA documents for a past project in the retail/services facility category disclosed no impact related to conflicts with biological policies, ordinances, or conservation plans; the other seven CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on information in the CEQA documents evaluated for the proposed project, and the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding

biological resources resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential for alteration of undeveloped open space and natural areas that could support sensitive species or habitat. Therefore, these facilities would generally have a low likelihood of resulting in significant adverse impacts on biological resource. However, the potential exists for one or more future large commercial projects to have significant adverse impacts on biological resources.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.4-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on biological resources. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in changes to biological resources, including species and their habitat. However, project-specific impacts were generally not considered significant impacts since most of the commercial facilities are located in developed urban areas and are largely compatible with the surrounding areas. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the nine CEQA documents surveyed.

- a) **Sensitive Species.** Four of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on sensitive species; the other five CEQA documents did not address impacts on sensitive species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) Riparian Habitat.** Four of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on riparian habitat; the other five CEQA documents did not address impacts related to riparian habitat. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) Wetlands.** Three of the nine CEQA documents for past projects in the large commercial facility category disclosed either a less-than-significant impact or no impacts on protected wetlands; the other six CEQA documents did not address impacts to wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) Movement of Native Species.** Four of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on movement of native species; the other five CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this

facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

**e, f) Conflict with Policies, Ordinances, or Conservation Plans.** Four of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to conflicts with biological policies, ordinances, or conservation plans; the other five CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have

the potential to alter undeveloped open space and natural areas that may result in significant impacts on biological resources. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts on biological resources.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.4-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on biological resources. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities, which were determined to result in changes to areas potentially supporting biological resources. Accordingly, these projects were found to have significant biological impacts. More specifically, the following discussion provides an overall summary of the types of impacts identified in the four CEQA documents surveyed.

- a) Sensitive Species.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts or less-than-significant impacts with mitigation incorporation on sensitive species; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) Riparian Habitat.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts with mitigation incorporation on riparian habitat; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category

could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts with mitigation incorporation on protected wetlands; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) **Movement of Native Species.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts or less-than-significant impacts with mitigation incorporation on the movement of native species; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant.

Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

- e) **Conflict with Policies or Ordinances.** For one of the projects in the entertainment/recreational facility category, environmental impacts related to conflicts with policies and ordinances regarding biological resources were less-than-significant; two other CEQA documents did not address impacts related to these issues. However, for one of the projects surveyed (Project #22- Canyon Hills Project), the lead agency concluded that this entertainment/recreational category project had the potential to generate significant adverse environmental impacts related to conflicts with biological policies or ordinances resulting from the removal or potential impacts to over 200 coast live oak trees on the project site.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, and the additional consideration identified above, impacts related to conflicts with biological policies or ordinances resulting from implementing the proposed project are determined to be significant.

- f) **Conflict with Conservation Plan.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts related to conflict with a conservation plan; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts to conservation plans.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to conservation plans regarding biological resources from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale

buildings, parking structures, and outdoor lighting. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would have a low potential for alteration of undeveloped open space and natural areas. Therefore, these future facilities would have a low likelihood of resulting in significant impacts on biological resources. However, the potential exists for one or more future institutional projects to generate significant adverse biological impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.4-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on biological impacts. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, which were found to result in changes to the surrounding area. However, these projects were generally found to have less-than-significant biological impacts as most of these projects are located in developed urban areas and are largely compatible with the surrounding resources. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the 15 CEQA documents surveyed.

**a) Sensitive Species.** Eight of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on sensitive species; the other seven CEQA documents did not address impacts on sensitive species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

**b) Riparian Habitat.** Eight of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on riparian habitat; the other seven CEQA documents did not address impacts on riparian habitat. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category

could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) Wetlands.** Three of the 15 CEQA documents for past projects in the institutional facility category disclosed no impacts on protected wetlands; the other 12 CEQA documents did not address impacts related to protected wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) Movement of Native Species.** For five of the fifteen CEQA documents, environmental impacts related to the movement of native species were either less-than-significant (without or with mitigation) or no impact; nine other CEQA documents did not address impacts related to this issue. However, for one of the projects surveyed (Project #35- West Los Angeles College), the lead agency concluded that this institutional category project had the potential to generate significant adverse environmental impacts related to the movement of native species and wildlife corridors. More specifically, additional traffic generated by the proposed project, which could substantially increase noise levels, and increased nighttime lighting (particularly that of the new athletic field) were both determined to have a potential to “harass” bird species (particularly raptors) and result in nest abandonment.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, and the additional consideration identified above, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

**e, f) Conflict with Policies, Ordinances, or Conservation Plans.** Eight of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to conflicts with biological policies, ordinances, or conservation plans regarding biological resources; the other seven CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

#### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential for alteration of undeveloped open space and natural areas. Therefore, transportation facilities would generally have a low likelihood of resulting in significant biological impacts. However, the potential exists for one or more future projects to have significant impacts on biological resources.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.4-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on biological resources. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, some of which were found to result in changes to biological resources, including species and their habitat. However, the CEQA documents for the projects that were surveyed were found to generally have less-than-significant impacts on biological resources as most of these projects were located in developed mixed-use, industrial, and commercial zoned areas and are largely compatible with the surrounding resources. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the three CEQA documents surveyed.

- a) Sensitive Species.** For one of the projects in the institutional facility category, environmental impacts on sensitive species were found to be less-than-significant with the implementation of mitigation measures; one of the CEQA documents did not address impacts related to this issue. However, for one of the CEQA documents (Project #39 – TraPac Terminal Expansion at Berths 136-147), the lead agency concluded that this transportation-related project had the potential to generate significant adverse environmental impacts related to the potential disruption of local biological communities in the Los Angeles/Long Beach Harbors. More specifically, the operation of the proposed facilities at the TraPac Terminal was found to have the potential to introduce non-native species into the harbor via ballast water or vessel hulls, which could substantially disrupt local biological communities to result in a significant impact on biological resources.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, biological impacts related to sensitive species are determined to be significant.

- b) Riparian Habitat.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts with the implementation of mitigation measures on riparian habitat; the other CEQA document did not address impacts on riparian habitat. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) on protected wetland; the other CEQA document did not address impacts related to protected wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) **Movement of Native Species.** One of the three CEQA documents for a past project in the transportation facility category disclosed a less-than-significant impact on movement of native species; the other two CEQA documents did not address impacts related to potential interference of native species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

**e, f) Conflict with Policies, Ordinances, or Conservation Plans.** One of the three CEQA documents for a past project in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) related to conflicts with policies, ordinances, or conservation plans regarding biological resources; the other two CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades, and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to biologically sensitive areas. The potential scale and height of exhaust structures, flares, and other functional components of a typical large scale industrial utility may result in biological impacts to surrounding uses. Accordingly, it is likely that a number of conflicts may occur regarding biological policies and ordinances. Therefore, future construction and operation of utility facilities could likely generate significant adverse biological impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.4-1). The four CEQA documents surveyed, which were prepared for improvements to existing power

generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on biological resources. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, and power generating equipment, could generate changes to the surrounding area. More specifically, the following discussions provide an overall summary of the types of impacts on biological resources identified in the four CEQA documents surveyed.

- a) **Sensitive Species.** Three of the four CEQA documents for past projects in the utilities facility category disclosed less-than-significant impacts (without or with mitigation) on sensitive species; the other CEQA document did not address impacts on sensitive species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) **Riparian Habitat.** Three of the four CEQA documents for past projects in the utilities facility category disclosed less-than-significant impacts (without or with mitigation) on riparian habitat; the other CEQA document did not address impacts on riparian habitat. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** Two of the four CEQA documents for past projects in the utilities facility category disclosed less-than-significant impacts (without or with mitigation) on protected wetlands; the other two CEQA documents did not address impacts to wetlands. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the

SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) Movement of Native Species.** Two of the four CEQA documents for past projects in the utilities facility category disclosed less-than-significant impacts on the movement of native species; the other two CEQA documents did not address impacts related to wildlife corridors and the potential interference of native species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

- e, f) Conflict with Policies, Ordinances, or Conservation Plans.** Three of the four CEQA documents for past projects in the utilities facility category disclosed less-than-significant impacts (without or with mitigation) related to conflicts with policies, ordinances, or conservation plans regarding biological resources; the other CEQA document did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that could require outdoor lighting and moderate amounts of construction activities, which may result in significant adverse biological impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.4-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on biological resources. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in changes to habitat or could impact biological policies or ordinances. However, adverse effects were not found to be significant since most of these facilities were located in developed urban industrial areas and largely compatible with the surrounding resources. More specifically, the following discussions provide an overall summary of the types of impacts to biological resources identified in the four CEQA documents surveyed.

- a) **Sensitive Species.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts with the implementation of mitigation measures on sensitive species; the other two CEQA documents did not address impacts on sensitive species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) Riparian Habitat.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) on riparian habitat; the other two CEQA documents did not address impacts related to riparian habitat. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) Wetlands.** None of the CEQA documents surveyed for the proposed project addressed impacts on protected wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) Movement of Native Species.** One of the four CEQA documents for a past project in the light industrial/warehouse facility category disclosed a less-than-significant impact with the implementation of mitigation measures on the movement of native species; the other three CEQA documents did not address impacts related to wildlife corridors or the potential interference of native species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this

facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

**e, f) Conflict with Policies, Ordinances, or Conservation Plans.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts with the implementation of mitigation measures related to conflicts with biological policies or ordinances; the other two documents did not address impacts related to these issues, and none of the CEQA documents addressed impacts related to the consistency with relevant conservation plans. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would

involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. These facilities typically require outdoor lighting, smoke stacks, flares, and other industrial structures and could have the potential to affect biological resources located in the surrounding area. Therefore, these future heavy industrial facilities could have the potential of generating significant adverse impacts to biological resources.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.4-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on biological resources. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in changes to the habitat of protected species or impact biological policies and ordinances. More specifically, the following discussions provide an overall summary of the types of biological impacts identified in the three CEQA documents surveyed.

- a) **Sensitive Species.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact with the implementation of mitigation measures or no impact on sensitive species; the other CEQA document did not address impacts on sensitive species. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on biological resources, including sensitive plant and animal species.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to sensitive species from implementing the proposed project are determined to be significant.

- b) **Riparian Habitat.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact with the implementation of mitigation measures or no impact on riparian habitat; the other CEQA document did not address impacts on riparian habitat. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited near sensitive riparian habitats to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to riparian habitat from implementing the proposed project are determined to be significant.

- c) **Wetlands.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts on protected wetlands; the other CEQA document did not address impacts on wetlands. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near sensitive wetlands to create significant adverse impacts on biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts to wetlands from implementing the proposed project are determined to be significant.

- d) **Movement of Native Species.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts on wildlife corridors or the movement of native species; the other CEQA document did not address impacts related to the potential interference of native species. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a wildlife corridor that could result in habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors or wildlife nursery sites. These impacts may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas to create significant adverse impacts on sensitive biological resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts on wildlife corridors and related to the movement of native species from implementing the proposed project are determined to be significant.

**e, f) Conflict with Policies, Ordinances, or Conservation Plans.** The three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts related to conflicts with policies, ordinances, or applicable conservation plans regarding biological resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could result in conflicts with applicable policies, ordinances, or conservation plans for a specific area to create significant adverse impacts on biological resources.

Based on the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to biological resources could be significant. Therefore, impacts related to policies, ordinances, or conservation plans regarding biological resources resulting from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents surveyed for the proposed project found that most of the past projects had environmental impacts related to biological resources that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents found that some of the past projects have the potential to generate significant adverse impacts to sensitive species and the movement of native species. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, impacts to biological resources as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per SB 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed Senate Bill (SB) 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Past development patterns within the district have resulted in a variety of environmental changes and development projects, many of which, as determined by the 52 CEQA documents described here, were found to have less-than-significant impacts on biological resources. Due to the wide distribution of wildlife, natural areas, and various biological resources within the district, the nature and scope of any potential biological impacts would typically be dependent on the specific location and physical nature of an individual project. As noted above, since the specific location and physical characteristics of individual facilities cannot be predicted with certainty, the evaluation of cumulative biological impacts is even more uncertain.

Some of the projects surveyed were found to have significant unavoidable impacts, particularly in relation to (1) adverse effects on sensitive species, (2) interference with movement of native species, and (3) conflicts with biological policies and ordinances.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The respective FSAs prepared by the CEC concluded significant (unmitigated) biological impacts from the El Segundo project, no significant biological impacts from the Walnut Creek project and significant biological impacts mitigated to less than significant from the Sentinel project. According to the FSA prepared by the CEC for the El Segundo project there are adverse biological impacts to marine organisms from the use of water from Santa Monica Bay for once-through cooling, which could entrain, impinge and thermally effect fish and invertebrates. CEC staff recommended that mitigation be applied to avoid or significantly reduce the adverse biological impacts. According the El

Segundo FSA, the project proponents did not supply the sound scientific information on entrainment impacts that would be needed to develop appropriate mitigation, so specific mitigation measures could not be recommended for this project that would reduce the biological impacts to less than significant levels.

The Walnut Creek project will be located on existing industrial land that is entirely paved and does not contain any vegetation or habitat to support sensitive species, so, the CEC staff concluded there will not be a significant impact to biological resources from the construction of the plant. According to FSA for the Walnut Creek project, parking and equipment staging areas required during the construction period and new transmission lines will be located on previously disturbed sites containing no natural vegetation and provides no habitat to sensitive species. With regard to operation of the Walnut Creek project, CEC staff concluded that the proposed transmission lines will not pose a significant collision or electrocution threat to bird populations and the site is not known to be an optimal flight path, nor a high bird use area or migration route so the proposed exhaust stacks would not pose a significant collision threat to bird populations.

The FSA for the Sentinel project described the preparation of the site to include permanent removal of disturbed Sonoran creosote bush scrub and annual grassland and temporarily disturb these same vegetation communities and existing dirt roads in the construction laydown area and gas transmission corridor. The FSA determined that the habitats permanently removed are already degraded and provide limited wildlife use for regionally common species. However, construction activities could potentially disturb migratory or nesting birds. The FSA listed several mitigation measures in an effort to reduce construction related impacts to biological resources to less than significant. The mitigation measures include monitoring by a biologist, a worker environmental awareness program, and impact avoidance for desert tortoise, rare plants, and burrowing owls during pre-construction surveys. According to the FSA for Sentinel, potential operation-related impacts include impacts to birds due to collision with and/or electrocution by the transmission line, disturbance to wildlife due to increased noise and lighting, and loss of sensitive habitat through long-term groundwater use. Proposed mitigation listed in the FSA includes incorporating construction design recommendations, such as separating phase conductors and requiring that bird perch diverters and/or specifically designed avian protection materials should be used to cover electrical equipment where adequate separation is not feasible. With implementation of this mitigation, the CEC concluded that significant avian mortality due to electrocution by transmission structures is not expected to occur. Also, the CEC also determined no sensitive species were found in the project area that would be impacted by operational lighting, and while operation of the plant would produce elevated noise levels, no sensitive species would be impacted by additional noise are known to occur in the immediate vicinity. Finally, according to the FSA, implementation of groundwater replenishment in advance of construction and operation of the Sentinel project will reduce the potential significant and irreversible impacts to mesquite hummocks and the special-status species they support to less than significant.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)), and the proposed project

has the potential to contribute to significant adverse cumulative biological resources impacts.

### **Mitigation Measures for Future Biological Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant biological resources impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse biological resources impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for biological resources impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of biological resources impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant biological resources impact, the potential exists for future indirect biological resources impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.5**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - CULTURAL RESOURCES**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts to cultural resources depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts of the proposed project on cultural resources from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts to cultural resources is based on comparing the existing setting to expected future conditions with the proposed project. The following analyses of potentially significant adverse cultural resource impacts include assessments of impacts to designated historic resources (e.g., buildings listed on the National Register of Historic Places and California Register of Historical Resources, locally landmarked buildings, paleontological resources, and human remains) and scenic viewsheds of historic resources that may be caused by future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in the siting, construction, and operation of future facilities, these future new projects have the potential to generate significant impacts to cultural resources if their implementation would result in any of the following:

- Cause a substantial adverse change in the significance of a historical resource.
- Disturb a significant prehistoric or historic archaeological site or a property of historic or cultural significance to a community or ethnic or social group.
- Disturb unique paleontological resources by construction of the proposed project.
- Disturb human remains.

## **IMPACT ANALYSIS**

The following is an evaluation of potential impacts to cultural resources from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on historic, archeological, and paleontological resources in a given area. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts to cultural resources is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

New or modified facilities could potentially result in removal of historic structures, alteration of historic structures and/or landscapes, built forms of a scale and with massing inconsistent with adjoining development, or destruction of archaeological and paleontological resources, including human remains. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse impacts to cultural resources have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to cultural resources as a result of constructing future new agricultural facilities may include altering or destroying historic structures and historic open space and disturbing or destroying archaeological or paleontological resources. Construction of buildings on agricultural land previously undisturbed or minimally disturbed by agricultural production could result in the exposure and/or destruction of buried archaeological or paleontological remains, or expose human remains that are not buried within a cemetery. Therefore, the potential development of farm structures, dairy processing plants, and other agricultural-related structures may result in significant impacts to historic, archaeological, and paleontological resources and human remains.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.5-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects could have on the various types of cultural resources, including adverse changes to historical resources, archaeological resources, paleontological resources, and human remains.

**TABLE 5.5-1  
Cultural Resources Impact Determination in Selected Environmental Documentation**

S – Significant	NE – Not Evaluated <sup>a</sup>

The specific checklist question was not discussed in the environmental document.</li> </ol> <p>Source: ICF Jones &amp; Stokes, 2009.</p>				

Based on a review of these documents, agricultural-related facilities are typically constructed and operated within areas zoned for agriculture. These projects were found to have less-than-significant impacts (without and with mitigation) to cultural resources. The following discussions provide an overall summary of the types of impacts on cultural resources identified in the two CEQA documents surveyed for this facility category.

**a) Historic Resources.** Both CEQA documents for past projects in the agricultural facilities category disclosed less-than-significant impacts (without or with mitigation) on historical resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are historic resources in the built environment that could be directly or indirectly affected by development.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to cultural resources could be significant. Therefore, impacts on historic resources from implementing the proposed project are determined to be significant.

**b) - d) Archaeological, Paleontological, Human Remains.** One of the two CEQA documents for past project in the agricultural facilities category disclosed less-than-significant impacts after implementation of mitigation measures on archaeological and paleontological resources and human remains. The other document found that impacts to archaeological resources would be less-than-significant but did not address impacts related to paleontological resources or human remains. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in

the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are many resources, particularly those that are undisturbed in the ground, that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the last five years identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and, as such, the potential for alteration of historical resources would be high. The potential for disturbing archaeological and paleontological resources and human remains could be slightly lower because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more future retail/service projects to have significant adverse impacts on cultural resources.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.5-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of human remains. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, which were found to result in changes to the character of the immediate project area, ground-disturbing activities, removal or alteration of existing structures, and potential to uncover archaeological and/or paleontological resources and human remains. Project-specific impacts could be significant when the retail and service establishments surveyed are located in developed

urban areas near historic resources or use of the resource is part of the project. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the eight CEQA documents surveyed.

- a) Historic Resources.** Three of the eight CEQA documents for past projects in the retail/services facilities category found less-than-significant impacts (without or with mitigation) or no impact on historical resources; one of the eight documents did not address impacts to historic resources. However, for some projects surveyed, the CEQA documents concluded that the retail/service projects have the potential to generate significant adverse environmental impacts on historic resources, such as those disclosed for Projects # 5 - Shops at Santa Anita Park Specific Plan, #6 – Archstone Hollywood, #8 – 1427 Fourth Street, and #10 – New Century Plan. These projects would involve either (1) the demolition of or result in a substantial change to contributors to locally-designated historic or potentially historic districts, or (2) the demolition of historic or potentially historic structures.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on cultural resources from implementing the proposed project are determined to be significant.

- b, c, d) Archaeological, Paleontological, Human Remains.** Four of the eight CEQA documents for past projects in the retail/services facilities category disclosed less-than-significant impacts with the implementation of mitigation measures or no impact on archaeological and paleontological resources and human remains; the other four CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are many resources, particularly those that are undisturbed in the ground, that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most future new or modified facilities would be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented and, as such, these projects have the potential to alter or destroy historical resources. The potential for disturbing archaeological and paleontological resources and human remains could be low because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more large commercial projects to have significant adverse impacts on cultural resources.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.5-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of human remains. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in changes to the character of the surrounding neighborhood, ground-disturbing activities, and potential to uncover archaeological and/or paleontological resources and human remains. However, project-specific impacts were generally not considered significant because no designated historic resources were located in the project area. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the nine CEQA documents surveyed.

- a) Historic Resources.** Eight of the nine CEQA documents for past projects in the large commercial facilities category found less-than-significant impacts (without or with mitigation or no impacts on historical resources; the other CEQA document did not address impacts on historic resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are historic resources in the built environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

- b, c, d) Archaeological, Paleontological, Human Remains.** Eight of the nine CEQA documents for past projects in the large commercial facilities category disclosed less-than-significant impacts (without or with mitigation) on archaeological and paleontological resources and human remains; the other CEQA document did not

address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are undisturbed resources in the ground that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter or destroy historical resources. The potential for disturbing archaeological and paleontological resources and human remains could be low because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts to cultural resources in the future.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.5-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of human remains. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, and grading and landscaping of open space areas for outdoor recreational facilities, which were not determined to destroy historic resources within the surrounding neighborhood. Accordingly, these projects were found to have less-than-significant impacts on cultural

resources. More specifically, the following discussion provides an overall summary of the types of impacts identified in the four CEQA documents surveyed.

**a) Historic Resources.** Three of the four CEQA documents for past projects in the entertainment/recreational facilities category disclosed less-than-significant impacts (without or with mitigation) or no impact on historical resources; the other CEQA document did not discuss impacts on historic resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are historic resources in the built environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on historic resources from implementing the proposed project are determined to be significant.

**b, c, d) Archaeological, Paleontological, Human Remains.** Three of the four CEQA documents for past projects in the entertainment/recreational facilities category disclosed less-than-significant impacts (without or with mitigation) on archaeological and paleontological resources and human remains. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are undisturbed resources in the ground that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the last five years identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temples. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings and parking structures. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and therefore, there is a

potential for alteration or destruction of historical resources. The potential for disturbing archaeological and paleontological resources and human remains could be low because ground cover has likely been previously disturbed. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more future institutional projects to generate significant adverse impacts on cultural resources.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.5-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of human remains. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities. However, these projects were generally found to have less-than-significant impacts on cultural resources as most of these projects are located in developed urban areas, where designated historic resources would not be affected and ground material has already been impacted by prior development. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the 15 CEQA documents surveyed.

**a) Historic Resources.** Eleven of the fifteen CEQA documents for past projects in the institutional facilities category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on historic resources; two CEQA documents did not address impacts on historic resources. However, for some projects surveyed, the CEQA documents concluded that the institutional projects have the potential to generate significant adverse environmental impacts on historic resources, such as those disclosed for Projects # 24 – Caltrans District 7 Headquarters and # 37 – Harvard-Westlake School. These projects would involve the demolition of historic or potentially historic structures that have been determined to be eligible for listing on the National Register or the California Register.

Therefore, based on information in the CEQA documents evaluated for the proposed project, and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on historic resources from implementing the proposed project are determined to be significant.

**b, c, d) Archaeological, Paleontological, Human Remains.** Fourteen of the fifteen CEQA documents for past projects in the institutional facilities category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on archaeological and paleontological resources and human remains; the other CEQA document did not address impacts related to these issues. However, based on

SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in the institutional facility category could be sited in areas where there are many resources, particularly those that are undisturbed in the ground, that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in the movement of goods, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas. Accordingly, the potential for alteration or destruction of historical resources is low. The potential for disturbing archaeological and paleontological resources and human remains could be slightly lower because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more transportation projects to have significant adverse impacts on cultural resources.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.5-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of

human remains. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, and bus storage and maintenance facilities, some of which were found to result in the removal of some existing buildings and ground disturbance. However, project-specific impacts were generally not considered significant because no designated historic resources were located in the project area. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the three CEQA documents surveyed.

- a) Historic Resources.** Three CEQA documents for past projects in the transportation facilities category disclosed less-than-significant impacts (without or with mitigation) or no impact on historical resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in the transportation facilities category could be sited in areas where there are historic resources in the built environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on historic resources from implementing the proposed project are determined to be significant.

- b, c, d) Archaeological, Paleontological, Human Remains.** The CEQA documents for past projects in the transportation facilities category disclosed less-than-significant impacts with mitigation for archeological and paleontological resources and human remains. However, for one project surveyed, the lead agency concluded that the transportation project has the potential to generate significant adverse environmental impacts on paleontological resources, such as those disclosed for Project #39 – TraPac Terminal Expansion. For this project, it was determined that any vertebrate fossils exposed by grading without appropriate professional, systematic recovery would be destroyed, resulting in significant impacts on paleontological resources.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities are not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks,

digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities are not anticipated to be constructed in the future, alteration, upgrades, and improvement to existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to sensitive cultural resources. Accordingly, there is a potential for alteration or destruction of historical resources. The potential for disturbing archaeological and paleontological resources and human remains could be low because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more utility projects to generate significant adverse cultural impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.5-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on cultural resources, including changes to historical, archaeological and paleontological resources, and human remains. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment. However, project-specific impacts were generally not considered significant impacts because no designated historic resources were located in the project area. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the four CEQA documents surveyed.

**a) Historic Resources.** Three of the four CEQA documents for past projects in the utility projects category disclosed either a less-than-significant impact with the implementation of mitigation measures or no impacts on historic resources; the other CEQA document did not discuss impacts on historic resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in the transportation facilities category could be sited in areas where there are historic resources in the built environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant.

Therefore, impacts on historic resources from implementing the proposed project are determined to be significant.

**b, c, d) Archaeological, Paleontological, Human Remains.** Three of the four CEQA documents for past projects in the utility projects category disclosed either less-than-significant impacts with the implementation of mitigation measures or no impact on archeological and paleontological resources and human remains; the other CEQA document did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are undisturbed resources in the ground that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities would likely involve the construction of one- to three-story warehouse-type buildings within existing light-industrial settings and would have the potential for alteration or destruction of historical resources. The potential for disturbing archaeological and paleontological resources and human remains could be low because ground cover has likely been disturbed for previous projects. However, the potential for disturbing those resources would be significantly higher for new development on previously undisturbed land. Therefore, the potential exists for one or more light industrial/warehouse projects to have significant adverse impacts on cultural resources.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.5-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on cultural resources, including changes to historical, archaeological and paleontological resources, and human remains. Based on the evaluation of these projects, the

construction of one- to three-story warehouse-type and office-type structures for the projects would not cause significant adverse effects on cultural resources because most of these facilities were located in developed urban industrial areas, where designated historic buildings were not located nearby and ground material has already been impacted by prior development. More specifically, the following discussions provide an overall summary of the types of impacts on cultural resources identified in the four CEQA documents surveyed.

**a) Historic Resources.** Two of the four CEQA documents for past projects in the light industrial/warehouse projects category disclosed less-than-significant impacts (without or with mitigation) on historic resources; the other two CEQA documents did not address impacts on historic resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in the light industrial/warehouse project category could be sited in areas where there are historic resources in the built environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on historic resources from implementing the proposed project are determined to be significant.

**b, c, d) Archaeological, Paleontological, Human Remains.** Two of the four CEQA documents for past projects in the light industrial/warehouse facilities category found that there would be less-than-significant impacts with the implementation of mitigation measures on archeological and paleontological resources and human remains; the other two CEQA documents did not address impacts on these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in the institutional facility category could be sited in areas where there are many resources, particularly those that are undisturbed in the ground, that could be disturbed by ground-breaking activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to

involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. The potential of disturbing existing historic structures could be high. The potential of disturbing archaeological and paleontological resources, and human remains, could be slightly lower, because ground cover has likely been disturbed for previous projects. However, the potential of disturbing those resources would be significantly higher for new construction starts on previously undisturbed land. Therefore, heavy industrial facilities would generally have a high likelihood of creating significant adverse impacts to cultural resources in the future.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.5-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on cultural resources, including adverse changes to historical resources, archaeological and paleontological resources, and the disturbance of human remains. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities would not result in significant changes to any historic resources. More specifically, the following discussions provide an overall summary of the types of cultural resource impacts identified in the three CEQA documents surveyed.

**a) Historic Resources.** The CEQA documents for past projects in the heavy industrial facilities category disclosed either a less-than-significant impact with the implementation of mitigation measures or no impacts on historical resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in the heavy industrial facilities category could be sited in areas where there are historic resources in the built environment.

Based on information in the CEQA documents evaluated and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on historic resources from implementing the proposed project are determined to be significant.

**b, c, d) Archaeological, Paleontological, Human Remains.** The CEQA documents for past projects in the heavy industrial facilities category disclosed either a less-than-significant impact with the implementation of mitigation measures or no impacts on

archeological and paleontological resources and human remains. Based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas where there are undisturbed resources in the ground that could be disturbed by ground-breaking activities.

Based on information in the CEQA documents evaluated and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources could be significant. Therefore, impacts on cultural resources from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to cultural resources that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documentation found that some of the past projects have the potential to generate significant adverse impacts on historic, archaeological, and paleontological resources.

Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to cultural resources as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill 827; and

- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), and potentially one other bill which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Cumulative development in the district could result in the substantial adverse modification or destruction of historic buildings, which could contribute to the degradation of the historic and architectural fabric of certain areas of the district. However, it is anticipated that development of future facilities obtaining offsets from the SCAQMD's internal accounts that could potentially affect historic resources or structures will be subject to the requirements of CEQA and other applicable legal requirements, and that the impacts of cumulative development on historic resources will be mitigated to the extent feasible, which could include compliance with the Secretary of the Interior's standards and guidelines and consultation with the State Historic Preservation Office. Nevertheless, it would be speculative to anticipate when, or if, such development would occur and whether any, or all, impacts to historic resources could be mitigated to a less-than-significant level.

Similarly, development of future facilities obtaining offsets from the SCAQMD's internal accounts may require grading and excavation that could potentially affect archaeological or paleontological resources or human remains. The cumulative effect of these projects would contribute to the continued loss of subsurface cultural resources if these resources are not protected upon discovery. If subsurface cultural resources are protected upon discovery as required by law, cumulative impacts to those resources would be less than significant. However, it would be speculative to anticipate when, or if, such development would occur and whether any, or all, impacts to cultural resources could be mitigated to a less-than-significant level. Given the decreasing number of historical and archaeological and paleontological resources present within the district due to on-going development and urbanization, cumulative impacts on cultural resources as a result of future development throughout the district is expected to be significant.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC for the El Segundo and Walnut Creek projects determined the cultural resources impacts are not significant, and the FSA for the Sentinel project concluded the potential significant cultural resources impacts could be

mitigated to less than significant. According to the FSA for the El Segundo project, project-related site development and construction would entail ground disturbance so the proposed project has the potential to adversely affect previously unknown cultural resources. However, the CEC concluded the proposed power plant location yielded no physical evidence of cultural resources. The CEC also concluded the use of secondary treated water would require pipeline construction and because archaeological sites are present in the vicinity, cultural resource surveys would need to be conducted and cultural resource monitoring recommended along the entire pipeline route until the end of pipeline ground disturbance. According to the CEC, no additional built environment or archaeological resources were identified as a result of the cultural resource survey of the parking lots adjacent to the proposed waterline route, and existing pipelines will be used to deliver natural gas.

CEC staff determined that the Walnut Creek project would have no impact on known significant archaeological resources, historic standing structures, or ethnographic resources. According to the FSA for the Walnut Creek project, the potential for newly discovered archaeological sites during ground disturbance would be mitigated by measures to impact levels below significance. Such measures include: designating a cultural resources specialist; conducting a construction worker training program; monitoring initial clearing and excavation; halting construction if there is a discovery of an archaeological site or human remains; recording and evaluating a discovery; and reporting the findings. CEC staff identified no indirect impacts to any known cultural resources in the impact area of the Walnut Creek project and, therefore, required no mitigation measures for indirect impacts for any class of cultural resources.

Archaeological surveys conducted in 2007 of the proposed Sentinel project area identified four archaeological sites and one isolate according to the FSA for the Sentinel project. The cultural resources were discovered along the proposed pipeline routes and the proposed plant site. The FSA stated the four sites are all historic-period and include refuse scatters and one collapsed/demolished concrete building, and the one isolate was composed of three brownware fragments. The CEC staff determined only one of these structures would have been directly impacted by the construction activities of the proposed project and provided measures in case any additional archaeological resources are discovered during construction on the main plant site, such as requiring identification, assessment, and mitigation sufficient to reduce the significance of the project's impacts to negligible, if such discovered resources are assessed as significant. Mitigation listed in the FSA included the following: the project be located at the greatest possible distance from any known cultural resources; fencing or some other type of physical demarcation be used if cultural resource is identified; a program of crew education; archaeological monitoring; and formal compliance with CEQA or National Environmental Policy Act if a cultural resource cannot be avoided. The FSA concluded no significant standing historic structures were identified in the area within one mile of the Sentinel project, so no impact to the integrity of setting, association, or feeling of any such resources in the surrounding area would result from the proposed project. Finally, the CEC concluded no ethnographic resources, either previously recorded or newly disclosed in the communications with Native Americans, were identified in the vicinity of the project, and

no indirect impacts to cultural resources in the impact area were identified so no mitigation of indirect impacts would be required for any class of cultural resources.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative cultural resources impacts.

### **Mitigation Measures for Future Cultural Resources Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant cultural resources impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse cultural resources impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for cultural resources impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of cultural resources impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant cultural resources impact, the potential exists for future indirect cultural resources impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.6**

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - ENERGY**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to result in adverse impacts on energy resources, depending upon the nature of the project. The following section summarizes the methodology used to evaluate the potential impacts on energy resources that may result from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts to energy resources is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse indirect impacts to energy resources include assessments of impacts related to conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies, effects on peak and base period energy demands, and conflicts with existing energy standards, that may be caused by future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts to energy resources if their implementation would result in any of the following:

- The project would conflict with adopted energy conservation plans or standards.
- The project would result in substantial depletion of existing energy resource supplies.

- An increase in demand for utilities would impact the current capacities of the electric and natural gas utilities.
- The project would use non-renewable resources in a wasteful and/or inefficient manner.

## IMPACT ANALYSIS

The following discussion presents an evaluation of potential energy resource impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on energy resources in the district. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of energy resource impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only. Construction and operation of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts on energy resources. Such future new or modified facilities could potentially result in energy resource impacts in the event that development projects or existing facility modifications occur in areas within the district, where additional supplies of electrical power and natural gas are in great demand. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse energy resource impacts have been analyzed based on available information pertaining to each facility category.

### Potential Energy Resource Impacts of Identified Facility Categories

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to reevaluate existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to energy resources as a result of constructing future new agricultural facilities may include increased energy use for agricultural operations, such as harvesting equipment, dairies, food processing, or related operations, such as

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

winery facilities. Agricultural operations typically have a low geographic density, and, therefore, any projected increase in energy demand would be relatively low. Nonetheless, due to the unknown nature of any specific future agricultural projects, significant impacts to energy resources may occur. Further, the combined effect of all the projects may potentially be significant.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.6-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. Based on a review of these documents, agricultural facilities typically have a low geographic density, and, therefore, any projected increase in energy demand would be relatively low. These projects were found to have less-than-significant energy resource impacts. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the two CEQA documents surveyed for this facility category.

**a, e) Energy Conservation Plans, Energy Standards.** The two CEQA documents did not reveal any conflicts with energy conservation plans, or energy standards for past projects in the agricultural facility category. Neither of the two CEQA documents addressed impacts related to conflicts with energy conservation plans. While all newly constructed facilities would be expected to comply with any existing energy conservation plans and standards, it is possible that future individual agricultural projects could conflict with established energy conservation standards, either inadvertently, or cumulatively.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, indirect impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents were reviewed since they illustrate the types of impacts that may result from the development of such projects.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Two CEQA documents for new or altered power utilities for past projects in the agricultural facility category. Neither of the two CEQA documents specifically addressed impacts related to the need for new or altered power utilities. The Clos de la Tech Winery project disclosed a less-than-significant impact related to requirements for new energy supplies, as well as a less-than-significant impact related to an increased demand for energy. However, it is possible that future individual agricultural projects could have a significant adverse effect or cumulatively impact the available capacity of existing power utilities, and due to increased demand, may require additional electrical and fuel energy sources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, indirect impacts related to requirements for new or altered power utilities, new energy supplies, or an overall increased demand for energy as a result of implementing the proposed project are determined to be significant.

#### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas with existing energy supply services.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the last five years. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for resulting in substantially increased energy use or increased pressure on energy supplies. Furthermore, it would be expected that all future development projects would generally conform to all established energy conservation plans and energy standards. Therefore, individual retail/service facilities would generally have a low likelihood of creating significant adverse impacts on energy resources in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts. In addition, the combined effect of all the projects may potentially be significant.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.6-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on energy

resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, which were found to result in projected increased operational energy consumption. However, project-specific impacts were generally not considered significant impacts as most retail and service establishments surveyed are located in developed urban areas with sufficient energy supply services, and would conform to established energy conservation plans and standards. Typically, these projects would either replace previous developments or would not require substantial new amounts of energy. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the eight CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Two of the eight CEQA documents disclosed less-than-significant impacts related to conflicts with energy conservation plans for past projects in the retail/service facility category that have or could have obtained offsets from the SCAQMD's internal accounts, while three of the eight CEQA documents disclosed less-than-significant impacts related to impacts on energy standards. While all newly constructed facilities would be expected to comply with any existing energy conservation plans and standards, to the extent that affected equipment are subject to energy conservation standard, it is possible that future individual retail/service projects could conflict with established energy conservation plans and standards, either individually or cumulatively.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Five of the eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) related to the need for new power utilities, new energy supplies, and increased demand for energy; the other three CEQA documents did not address impacts regarding these issues. However, future projects in the retail/service facility category may have characteristics that may require increased energy demands that are different from those reviewed for this PEA, that could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies,

and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas with existing energy supply services.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting, the construction and operation of all of which may result in the consumption of substantial amounts of energy. However, based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would likely have access to existing energy utility infrastructure, and would conform to all applicable energy conservation plans and standards. Furthermore, newly constructed or renovated facilities would be expected to have more efficient energy use technology than that which was previously installed and, therefore, may actually reduce overall energy use. Therefore, these facilities would generally have a low likelihood of resulting in significant impacts to energy resources. However, the potential exists for one or more future large commercial projects to have significant impacts. Moreover, the potential exists for the project as a whole to have significant energy impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.6-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in less-than-significant impacts to energy resources. However, project-specific impacts were generally not considered significant impacts since most of the commercial facilities are located in developed urban areas and would have access to existing energy utility infrastructure, would be in conformity with applicable energy plans, and would be expected to result in improvements to energy efficiency as compared to previous facilities. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the nine CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Two of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts or no impact related to conflicts with energy conservation plans and energy standards; the other seven CEQA documents did not address impacts related to these issues.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** The CEQA documents for past projects in the large commercial facility category disclosed impacts related to the need for new power utilities, new energy supplies, and increased demand for energy that were either less-than-significant (without or with mitigation), no impact, or impacts were not discussed in the CEQA documents.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, a some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities, the construction and operation of all of which may result in the consumption of substantial amounts of energy. However, all such facilities would be expected to conform to all applicable energy conservation plans and standards. Furthermore, newly constructed or renovated facilities would be expected to have more efficient energy use technology than that which was previously installed and, therefore, may actually reduce overall energy use. However, due the large scale of some such facilities (NFL stadiums, etc.), it is likely that a substantial new energy demand may occur. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse energy resource impacts. Moreover, the potential

exists for the project as a whole (including all categories of facilities) to have a significant energy impact.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.6-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities, which were generally determined to have a less-than-significant impact related to energy resources. More specifically, the following discussion provides an overall summary of the types of impacts on energy identified in the four CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Two of the four CEQA documents for past projects in the entertainment/recreation facility category disclosed less-than-significant impacts related to conflicts with energy conservation plans and energy standards; the other two CEQA documents did not address impacts related to these issues.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Two of the four CEQA documents for past projects in the entertainment/recreation facility category disclosed less-than-significant impacts related to the need for new power utilities, new energy supplies, and increased demand for energy; the other two CEQA documents did not address impacts related to these issues.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and

increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting, the construction and operation of all of which may result in the consumption of substantial amounts of energy. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would, therefore, be unlikely to require new energy utility or delivery infrastructure. All such facilities would be expected to conform to all applicable energy conservation plans and standards. Furthermore, newly constructed or renovated facilities would be expected to have more efficient energy use technology than that which was previously installed and, therefore, may actually reduce overall energy use. As such, these future facilities would have a low likelihood of resulting in significant impacts. However, the potential exists for one or more future institutional projects to generate significant adverse energy resource impacts. Moreover, the potential exists for the project as a whole (including all categories of facilities) to have a significant impact.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.6-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, which were generally determined to have a less-than-significant impact, or did not discuss impacts related to energy resources. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the 15 CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Five of the 15 CEQA documents for past projects in the institutional facility category disclosed less than significant impacts related to energy standards; the other 10 documents did not

address impacts related to such issue, and none of the CEQA documents discussed impacts related to energy conservation plans.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Five of the 15 CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts related to the need for new power utilities, new energy supplies, and increased demand for energy; the other 10 CEQA documents did not discuss these topics.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting, all of which may result in considerable amounts of new energy use. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have access to existing energy utility infrastructure. Furthermore, all such facilities would be expected to conform to all applicable energy conservation plans and standards.

Nevertheless, the potential exists for one or more future transportation projects to have significant impacts on energy resources. Moreover, the potential exists for the project as a whole (including all categories of facilities) to have a significant energy impact.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.6-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, which were found to have less-than-significant impacts or did not discuss impacts related to energy resources. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the three CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** One of the three CEQA documents for a past project in the transportation facility category disclosed a less-than-significant impact related to energy standards; the other two CEQA documents did not address impacts related to such issue, and none of the CEQA documents discussed impacts related to energy conservation plans.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** One of the three CEQA documents for a past project in the transportation facility category disclosed a less-than-significant impact related to the need for new power utilities, new energy supplies, and increased demand for energy; the other two documents did not address impacts related to such issue.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. These facilities would typically be constructed in industrial zoned areas with sufficient access to existing power utility infrastructure. Additionally, it is likely that operation of some of these utility projects (e.g., power plants) would increase the available amount of electricity for use in the electrical grid system. Other types of utility projects, such as water treatment, sewage, and solid waste treatment facilities may result in substantially increased energy demands. Accordingly, a number of conflicts may occur regarding energy resources. Therefore, future construction and operation of one or more utility facilities could generate significant adverse energy resource impacts. Moreover, the potential exists for the project as a whole (including all categories of facilities) to have a significant energy impact.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.6-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. However, based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, would have a low likelihood for impacts on energy resources. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the four CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** One of the four CEQA documents for a past project in the utility facility category disclosed no impacts related to energy conservation plans and standards; the other three CEQA documents did not address impacts related to such issues.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Three of the four CEQA documents for past projects in the transportation facility category disclosed either beneficial impacts, less-than-significant impacts, or no impacts related to the need for new power utilities, new energy supplies, and increased demand for energy; the other CEQA document did not discuss impacts related to such issues. Two projects (Projects #42 – El Segundo Power Redevelopment Project and #43 – LADWP Electric Generating Stations Modifications) were determined to have a beneficial impact on energy resources. Additionally, it is foreseeable that newly constructed public utilities, particularly power utilities, would require new energy (fuel) delivery systems in order to operate and, therefore, could potentially have a significant impact related to energy supplies.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas with adequate power utility infrastructure services.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility, for all of which construction and operation activities would potentially require substantial amounts of new energy. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that could require outdoor lighting and moderate amounts of construction activities, which may result in significant adverse energy resource impacts. Moreover, the potential exists for the project as a whole (including all categories of facilities) to have a significant energy impact.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table

5.6-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in increased energy demands. However, adverse effects were not found to be significant since these facilities are located in existing developed urban areas with adequate access to energy utility infrastructure, and would not result in substantial increases in energy demand. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the four CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Two of the four CEQA documents for past projects in the light industry/warehouse facility category disclosed less-than-significant impacts related to energy standards; the other two documents did not address impacts related to such issue, and none of the CEQA documents discussed impacts related to energy conservation plans.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Three of the four CEQA documents for past projects in the light industry/warehouse facility category disclosed less-than-significant impacts related to the need for new power utilities, new energy supplies, and increased demand for energy.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas, the construction and operation of all of which could potentially result in substantial new energy demands. Accordingly, it is likely that these types of project would have significant impact related to conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. Therefore, these future heavy industrial facilities have the potential of generating significant adverse energy resource impacts. Moreover, the potential exists for the project as a whole (including all categories of facilities) to have a significant energy impact.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.6-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on energy resources, including conflicts with energy conservation plans, the need for new or altered power or natural gas utility systems, effects on local or regional energy supplies or peak and base period energy demands, and conflicts with existing energy standards. Based on the evaluation of these projects, the construction and operation of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in increased demands on energy resources. Nonetheless, the surveyed projects generally found impacts to be less-than-significant or no impact to energy resources. More specifically, the following discussions provide an overall summary of the types of impacts on energy identified in the three CEQA documents surveyed.

**a, e) Energy Conservation Plans, Energy Standards.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impact related to energy conservation plans and standards; the other CEQA document did not discuss impacts related to such issues.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy conservation plans and standards as a result of implementing the proposed project are determined to be significant.

**b, c, d) Require New or Altered Power Utilities, Require New Energy Supplies, Increased Demand for Energy.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed either beneficial impacts or no impacts related to the need for new power utilities, new energy supplies, and

increased demand for energy; the other CEQA document did not discuss impacts related to such issues. One project (Project #50 – Chevron Products Company) would potentially result in a net benefit for energy supplies due to improvements at an oil refinery.

Based on information in the CEQA documents evaluated for the proposed project, the additional considerations identified in the preceding paragraph, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to energy could be significant. Therefore, impacts on energy resources related to the need for new power utilities, new energy supplies, and increased demand for energy resulting from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to energy resources that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, considering the potential impacts of the project as a whole, exercising SCAQMD staff’s independent judgment, and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts to energy resources as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects” [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD’s internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), which would require transfer of emission reduction credits for

certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. The construction and operation of many past development projects have resulted in new or different demands for energy resources. As compared to past and pending projects, future projects would likely include design features and equipment with higher levels of energy efficiency, in addition to distributed renewable and alternative energy generation capacities (solar, wind, co-generation technologies), which may result in beneficial cumulative impacts relative to the overall energy supply. While most projects would be expected to conform to existing adopted energy conservation plans and standards, incremental development of various types of new facilities, as discussed above, would likely result in net-positive demands for additional energy generation, transmission, and storage capacity. The current electrical generation and fuel supply infrastructure is limited, and in some regions at or near full capacity during peak periods. Therefore, any increase in demand would have the potential to result in significant cumulative impacts.

None of the past projects were specifically identified as having the potential to have significant adverse energy resource impacts. However, since the specific amount of new energy resources demands and the types of new future development projects cannot be predicted with certainty, the evaluation of energy resource impacts is even more uncertain.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC for both the El Segundo and Walnut Creek projects concluded that energy impacts would be not significant and the FSA determined the significant energy impacts from the Sentinel would be mitigated to less than significant. Energy impacts include conflict with adopted energy conservation plans; result in the need for new or altered power utility system; or create significant effects on local or regional energy supplies or require additional energy. For example, the CEC staff concludes that no significant additional new transmission facilities, other than those proposed by the El Segundo project, are required to meet the reliability criteria of North American Electric Reliability Corporation (NERC), Western Systems Coordinating Council (WSCC), and California Independent System Operator (Cal-ISO). CEC staff addressed the issue of inefficient and unnecessary consumption of energy to determine if

the project's consumption of energy creates a significant adverse impact. The FSA prepared by the CEC determined the project will burn natural gas from the existing Southern California Gas Company (SoCalGas) pipeline, whose infrastructure is extensive, so highly unlikely that the project could pose a substantial increase in demand for natural gas in California. In addition, the CEC concluded there is no real likelihood that the El Segundo project will require the development of additional energy supply capacity because SoCalGas claims that their pipeline should provide adequate access to natural gas fuel. According to the FSA, the El Segundo project would generate 630 MW of electric power at an overall project fuel efficiency around 55 percent. CEC staff concludes that while the project will consume substantial amounts of energy, it will do so in the most efficient manner practicable; it will not create significant adverse effects on energy supplies or resources; will not require additional sources of energy supply; will not consume energy in a wasteful or inefficient manner; and no energy standards would apply to the project. Thus, CEC staff concluded that the El Segundo project would present no significant adverse impacts upon energy resources.

According to the Walnut Creek FSA, power plants are high value gas consumers so should gas supplies or gas transport capacity fall short, power plants would not be curtailed until after most or all industrial and commercial users had been curtailed. The FSA claims that given SoCalGas's extensive system and its drive to continually improve its supply and delivery capabilities, CEC staff does not envision the project suffering significant risk of gas supply curtailment. The CEC concluded that the SoCalGas gas supply system should prove an adequate source for a project of Walnut Creek's size, so it highly unlikely that the project could pose a significant adverse impact on natural gas supplies in California. The Walnut Creek project would generate a nominal 500 MW of peaking electric power at an overall project fuel efficiency of 41.75 percent lower heating value (LHV) at maximum full load. While it will consume substantial amounts of energy, according to the FSA for Walnut Creek, there are no alternatives that could significantly reduce energy consumption. The CEC concluded the Walnut Creek project will consume energy in the most efficient manner practicable; will not create significant adverse effects on energy supplies or resources; will not require additional sources of energy supply; will not consume energy in a wasteful or inefficient manner; and no energy standards would apply to the project. Therefore CEC staff concluded that the Walnut Creek project would present no significant adverse impacts upon energy resources.

According to the CEC, the Sentinel project could be deemed to create significant adverse impacts on energy resources if alternatives existed that would reduce the project's use of fuel. However, CEC staff agreed with the applicant in choosing the General Electric LMS100 gas turbine generator as the most fuel efficient; employing evaporative inlet air cooling and evaporative compressor interstage cooling; and using natural gas burning technologies because they are most feasible. Similar to El Segundo and Walnut Creek, the Sentinel project will use the SoCalGas natural gas system, which has access to gas from the Rocky Mountains, Canada and the Southwest representing a resource of considerable capacity and an adequate source for the Sentinel project. Thus, the CEC concluded in the Sentinel FSA that it is highly unlikely that the project could pose a significant adverse impact on natural gas supplies in California. Further, according to the FSA, the existing SoCalGas natural gas transmission pipeline is a resource with adequate

delivery capacity so there is no real likelihood that the Sentinel project would require the development of additional energy supply capacity. If constructed and operated as proposed, the Sentinel project would generate a nominal 779 MW of peaking electric power at an overall project fuel efficiency of 42 percent LHV at maximum full load and average annual ambient conditions. The CEC concluded that while the Sentinel project would consume substantial amounts of energy, it would do so in the most efficient manner practicable; would not create significant adverse effects on energy supplies or resources; would not require additional sources of energy supply; would not consume energy in a wasteful or inefficient manner; and no energy standards would apply to the project. CEC staff, therefore, concluded that the project would present no significant adverse impacts upon energy resources.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative energy impacts.

### **Mitigation Measures for Future Energy Resource Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant energy impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts that are outside of its jurisdictional authority is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse energy impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for energy impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of energy impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant energy impact, the potential exists for future indirect energy impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.7**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - GEOLOGY AND SOILS**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts related to geology and soils depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts the proposed project would have related to geology and soils from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts related to geology and soils is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse geology and soils impacts include assessments of impacts due to exposure of people and structures to adverse geological effects, soil erosion or loss of top soil, location on a geologic unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. The analysis also includes identification of impacts due to the location of a facility on expansive soils or on soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems, where sewer service is not available.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant geology and soils impacts if their implementation would result in any of the following:

- Exposure of people or structures to major geologic hazards such as earthquake surface rupture, ground shaking, liquefaction or landslides.
- Result in substantial soil erosion or loss of topsoil.
- Be located on unstable or expansive soil.
- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential geology and soils impacts related to future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have related to the geology and soils of a given area. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts related to geology and soils is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse geology and soils impacts. Such future new or modified facilities could potentially result in geology and soil impacts if they occur along active faults, thus, being subject to seismic events like surface fault rupture, ground shaking, liquefaction, or landslides. The individual project could also result in impacts by causing soil erosion or loss of top soil, or being located on expansive or unstable soils that might lead to ground failure. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse geology and soils impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Geology and Soils Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to reevaluate existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup>

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts related to geology and soils as a result of constructing future new agricultural facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual agricultural facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.7-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, agricultural-related facilities may occur along active faults and would be subject to hazards posed by seismic activities, such as surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts identified in the two CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) due to the exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual agricultural facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading, or liquefaction.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. Source: ICF Jones & Stokes, 2009.					

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence, from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** Both of the CEQA documents for past projects in the agricultural facility category disclosed either less-than-significant impacts or no impacts due to expansive soils and soils incapable of supporting septic tanks and alternative waste disposal systems. For one of the documents, impacts related to the use of septic tanks and alternative waste disposal systems were not discussed. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or

alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

#### ***Primary Facility Category Impacts on a Programmatic Level***

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the last five years. On a programmatic level, impacts related to geology and soils as a result of constructing future new retail/service facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual retail/services facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.7-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, retail service facilities may occur along active faults and would be subject to hazards posed by seismic activities, such as surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the eight CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact due to exposure of people and structures to geological effects. However, based on SCAQMD staff's

review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual retail/services facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** The eight CEQA documents for past projects in the retail/services facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts due to expansive soils or soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features.

The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, impacts related to geology and soils as a result of constructing future new large commercial facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual large commercial facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.7-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, retail service facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the nine CEQA documents surveyed for this facility category.

- a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) due to exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual large commercial facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** The nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) due to expansive soils and no impacts due to soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3

in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.7-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, impacts related to geology and soils as a result of constructing future new entertainment/recreational facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual entertainment/recreational facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.7-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, large entertainment/recreational facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil

settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were generally found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the four CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that for most of the projects, environmental impacts due to the exposure of people and structures to geological effects were concluded to be less-than-significant (without or with mitigation). For one of the projects surveyed (Project #23- Wilmington Waterfront Development project), the CEQA document concluded that the entertainment/ recreational facility category project has the potential to have significant adverse impacts as the project site was located near a known fault line and had soils prone to liquefaction, thus, exposing people or structures to adverse seismic effects, such as liquefaction and strong ground shaking. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual entertainment/recreational facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction.

Therefore, based on information in the CEQA documents evaluated for the proposed project, the additional considerations identified in the preceding paragraph, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

**b) Soil erosion or loss of top soil.** The four CEQA documents for past projects in the entertainment/ recreational facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

**d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** Four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts or no impacts due to expansive soils or soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, impacts related to geology and soils as a result of constructing future new institutional facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual institutional facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.7-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, institutional facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the 15 CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact due to exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual institutional facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

**b) Soil erosion or loss of top soil.** The 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts

in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

**d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts due to expansive soils or soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, impacts related to geology and soils as a result of constructing future new transportation facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual transportation facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.7-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, transportation facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the three CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The three CEQA documents for past projects in the transportation facility category indicated that for most of the projects, environmental impacts due to the exposure of people and structures to geological effects were concluded to be less-than-significant (without or with mitigation). However for one of the projects surveyed (Project #39- TraPac Terminal Expansion at Berths 136-147), the lead agency concluded that the transportation-related project has the potential to have significant adverse impacts as the project site was located near a known fault line and had soils prone to liquefaction, thus, exposing people or structures to adverse seismic effects like liquefaction, strong ground shaking, tsunami, seiche, etc. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual transportation facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction.

Based on information in the CEQA documents evaluated for the proposed project, and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts due to expansive soils and either no impact or less-than-significant impacts due to soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. On a programmatic level, impacts related to geology and soils as a result of constructing future new utility facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual utility facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.7-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, utility projects may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the four CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The four CEQA documents for past projects in the utility facility category disclosed less-than-significant impacts (without or with mitigation) due to exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that

future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual utility facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading and liquefaction

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, subsidence and from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** The CEQA documents for past projects in the utility facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts or no impact due to expansive soils and no impacts due to soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, impacts related to geology and soils as a result of constructing future new light industrial/warehouse facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual light industrial/warehouse facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.7-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, light industrial/warehouse facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to geology and soils identified in the four CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The four CEQA documents

for past projects in the light industrial/warehouse facility category disclosed a less-than-significant impacts (without or with mitigation) due to exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual light industrial/warehouse facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading, and liquefaction.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

- b) Soil erosion or loss of top soil.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

- d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact due to expansive soils and no impacts due to soils incapable of supporting septic tanks and alternative waste disposal systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future

individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, impacts related to geology and soils as a result of constructing future new heavy industrial facilities may include potentially locating facilities in areas of known faults, such that people and structures are exposed to seismic effects, resulting in soil erosion or loss of top soil, exposing facilities to landslides and liquefaction, and locating project in areas with expansive soils, which could result in ground failure. Depending on the location of the individual facilities, the individual heavy industrial facilities may result in significant adverse impacts related to geology and soils.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.7-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have related to geology and soils, including seismic effects, effects from soil erosion or loss of top soil, and effects of unstable and expansive soils. Based on a review of these documents, heavy industrial facilities may occur along active faults and would be subject to hazards posed by seismic activities like surface fault rupture, relative displacement of the ground across the fault surface, liquefaction, and earthquake-induced landslides. Individual projects may also be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. However, these projects were found to have less-than-significant geology and soils impacts. More specifically, the following discussions provide an

overall summary of the types of impacts related to geology and soils identified in the three CEQA documents surveyed for this facility category.

**a, c) Expose people or structures to adverse seismic effects, unstable soil conditions, landslides, liquefactions, subsidence, etc.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts due to exposure of people and structures to geological effects. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited near or along active faults and would be subject to hazards posed by surface fault rupture due to seismic activity. During an earthquake on these active or potentially active faults within the district, potential surface rupture of the fault may result in relative displacement of the ground across the fault surface. Individual heavy industrial facilities could be located in areas subject to earthquake-induced landslides, unstable soil conditions causing subsidence, lateral spreading, and liquefaction.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to seismic effects, unstable soil conditions, landslides, liquefactions, and subsidence from implementing the proposed project are determined to be significant.

**b) Soil erosion or loss of top soil.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impact or less-than-significant impacts due to soil erosion or loss of top soil. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could result in soil erosion or loss of top soil due to wind and water erosion of areas with exposed soil and through surface run-off during irrigation and construction activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to soil erosion and loss of top soil from implementing the proposed project are determined to be significant.

**d, e) Expansive soils and soils incapable of supporting septic tanks and alternative waste water disposal.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impacts due to expansive soils or soils incapable of supporting septic tanks and alternative

waste disposal systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be subject to impacts resulting from subsidence, soil settlement, and expansive and corrosive soils, all of which have the potential to cause damage to building foundations, structures, pavements, and other landscape features. The facilities could also be located in areas with unstable soils or soils made up of highly plastic materials (e.g., sand or clay), such that they are unable to support septic tanks or alternative waste disposal system.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to geology and soils could be significant. Therefore, impacts related to expansive soil and soil incapable of supporting septic tanks or alternative waste disposal system from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to geology and soils that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the previous CEQA documents found that some of the past projects have the potential to generate significant adverse impacts related to the exposure of people and structures to adverse seismic conditions or conditions related to unstable soils generated by landslides, liquefaction, subsidence, etc. Therefore, based on information in the 52 CEQA documents surveyed for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to geology and soils as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects" [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);

- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) proposed SB 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. The construction and operation of past development projects have resulted in some impacts related to geology and soils by exposing people and structures to seismic and other geologic hazards or disturbance of unique geological features. While most projects typically conform to uniform building codes and other geotechnical construction/operation standards, the impacts related to geology and soils remain dependent on project location. Further, the entire district is susceptible to impacts from seismic activity. Thus, any future development within the district resulting from the project would cumulatively contribute to the exposure of people and structure to geologic risks. Since the specific location and type of future unknown facilities cannot be predicted with certainty, the evaluation of cumulative geology and soils impacts is even more uncertain. However, some of the past projects were determined to have significant adverse impacts related to geology and spoils, including impacts related to seismic activities.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared for all three power plant projects concluded that geology and soils impacts could be mitigated to less than significant. For example, the CEC determined that no known geological resources will be impacted by the construction and operation of the El Segundo project because there is to be little new grading and there is a minimal probability that significant paleontological resources will be encountered during the retooling of the power plant. According the FSA for the El Segundo project, the following mitigation measures will ensure the geological impacts will be less than significant: assign an engineering geologist and a geotechnical engineer to the project; conduct a liquefaction analysis and a slope stability analysis; conduct a shoreline monitoring program and assess erosion on the beach area; prepare an engineering geology report; design an additional seawall or perimeter wall; provide maps and

drawings showing the footprint of the power plant and all linear facilities to the paleontological resource specialist (PRS) and the compliance project manager (CPM) for approval; prepare a Paleontological Resources Monitoring and Mitigation Plan (PRMMP); prepare and conduct weekly CPM-approved training; monitor all construction-related grading, excavation, trenching, and augering; ensure the recovery, preparation for analysis, analysis, identification and inventory, the preparation for curation, and the delivery for curation of all significant paleontological resource materials; and prepare a Paleontological Resources Report (PRR).

The FSA for the Walnut Creek project states that with the exception of strong ground shaking and possible liquefaction potential during an earthquake, the Walnut Creek project site lies in an area that generally exhibits low geologic hazards. The effects of strong ground shaking and, possibly, liquefaction potential must be mitigated through structural design as required by the California Building Code. According to the CEC, paleontological resources have been documented in the general area of the project; however, no significant fossils were identified during initial site investigations due to the urbanized character of the area. The CEC concluded there is a possibility of encountering fossil remains with potentially high paleontologic sensitivity in Pleistocene sediments that are present at unknown depth below low sensitivity middle-Holocene sediments and fill materials, however, the potential impacts to paleontological resources due to construction activities would be mitigated to less than significant. Such mitigation listed in the FSA include: assigning an approved PRS to the project; providing maps and drawings showing the footprint of the power plant and all linear facilities to the PRS; prepare a PRMMP; prepare and conduct weekly CPM-approved training for all workers; monitor all construction-related grading, excavation, trenching, and augering; ensure the recovery, preparation for analysis, analysis, identification and inventory, the preparation for curation, and the delivery for curation of all significant paleontological resource materials; and prepare a Paleontological Resources Report (PRR).

According to the FSA prepared by the CEC for the Sentinel project, the site would be located in an active geologic area southeast of the San Bernardino Mountains in Southern California, and because of its geologic setting, the site could be subject to intense levels of earthquake related ground shaking. The CEC determined that while the potential for earthquake ground rupture is low, the site is 0.25 miles from the San Andreas (Banning) Fault and there are many other major active faults within 20 miles of the site. It was concluded in the FSA that the effects of strong ground shaking must be mitigated, to the extent practical, through structural designs required by the California Building Code, which requires that structures be designed to resist seismic stresses from ground acceleration and, to a lesser extent, liquefaction potential. The CEC proposed standard engineering design recommendations to mitigate the effects of strong ground shaking and dynamic compaction. In addition, the applicant has indicated that the potential effects of expansive clay soils, as well as excessive settlement due to compressible soils and hydro-compaction, will be addressed in an addendum to the project geotechnical report to be submitted prior to site grading. The CEC determined that there are no known viable geologic or mineralogical resources at the site; paleontological resources have been documented within six miles of the project; no significant fossils were found during cursory field evaluation of the plant site, near ancillary facilities or at the off-site lay

down area; and potential impacts to paleontological resources due to construction activities would be mitigated through worker training and monitoring by qualified paleontologists. Specific mitigation to reduce geology impacts to less than significant are listed as the following in the FSA: assigning an approved PRS to the project; providing maps and drawings showing the footprint of the power plant and all linear facilities to the PRS; preparing a PRMMP; preparing and conducting weekly CPM-approved training; monitoring all construction-related grading, excavation, trenching, and augering; ensuring the recovery, preparation for analysis, analysis, identification and inventory, the preparation for curation, and the delivery for curation of all significant paleontological resource materials; and preparing a Paleontological Resources Report (PRR).

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)), and the proposed project has the potential to contribute to significant adverse cumulative impacts to geology and soils.

### **Mitigation Measures for Future Geology and Soils Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant geology and soils impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts that are outside of its jurisdictional authority is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse geology and soils impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for geology and soils impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of geology and soils impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant geology and soils impact, the potential exists for future indirect geology and soils impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.8**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – HAZARDS AND HAZARDOUS MATERIALS**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Additionally, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse indirect impacts related to hazards and hazardous materials, depending on the nature of the project and its use, transport or disposal of hazardous materials. The following section summarizes the methodology used to evaluate the potential impacts on hazards and hazardous materials from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts related to hazards and hazardous materials is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse impacts related to hazards and hazardous materials include the emission or creation of hazards and hazardous materials involving upset or accident that may be caused by future new projects. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts related to hazards and hazardous materials if their implementation would result in any of the following:

- Create hazard through transport, use or disposal of hazardous materials.
- Create hazard through upset or accident involving the release of hazardous materials.
- Emit hazardous emissions within one quarter mile of a school.
- Located on a known hazardous materials site.
- Located within an airport land use plan or within vicinity of private airstrip.

- Impair implementation of physically interfere with adopted emergency response plan or emergency evacuation plan.
- Expose people or structures to risk of loss involving wildland fires.
- Increase fire hazards in area with flammable materials.
- Non-compliance with any applicable design code or regulation.
- Non-conformance to National Fire Protection Association standards.
- Non-conformance to regulations or generally accepted industry practices related to operating policy and procedures concerning the design, construction, security, leak detection, spill containment or fire protection.
- Exposure to hazardous chemicals in concentrations equal to or greater than the Emergency Response Planning Guideline (ERPG) 2 levels.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential impacts related to hazards and hazardous materials from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts related to hazards and hazardous materials. Based on the methodology described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts related to hazards and hazardous materials is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts related to hazards and hazardous materials. While the specific nature or degree of impacts is currently unknown, potentially significant adverse impacts related to hazards and hazardous have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit

existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that many more new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts due to hazards and hazardous materials as a result of constructing future new agricultural facilities may include the creation of hazards through the transport, use, or disposal of hazardous materials or the emission of hazards within a quarter mile of a school. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to sensitive uses, such as schools. Agricultural activities typically involve the use or transport of fertilizers and/or other chemicals and may result in significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.8-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts related to hazards and hazardous materials that could occur. Based on a review of these documents, agricultural-related facilities that involve the transport or use of chemicals and fertilizers could result in impacts related to hazards and hazardous materials. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the two CEQA documents surveyed for this facility category.

**a) Transport, Use, or Disposal of Hazardous Materials.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents were reviewed since they illustrate the types of impacts that may result from the development of such projects.

- b) Upset or Accident Involving Release of Hazardous Materials.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** The two CEQA documents for proposed projects in the agricultural facility category did not address impacts related to the emission of hazards within a quarter mile of a school. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** One of the two CEQA documents for past projects in the agricultural facility category disclosed a less-than-significant impact regarding the project's location on a known hazardous materials site; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project’s potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** Neither of the two CEQA documents proposed projects in the agricultural facility category addressed impacts related to the project sites’ location within an airport land use plan or within the vicinity of a private airstrip. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Neither of the two CEQA documents for the proposed projects in the agricultural facility category addressed impacts associated with the implementation of an evacuation plan. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have or could have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area’s evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** One of the two CEQA documents for past projects in the agricultural facility category disclosed a less-than-significant impact with the implementation of mitigation related to wildland fires; the other CEQA document did not address impacts related to wildland fires. However, based on SCAQMD staff’s

review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) related to the potential increase of fire hazards in areas with flammable materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the last five years. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for resulting in significant impacts related to hazards and

hazardous materials. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.8-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts related to hazards and hazardous materials that retail/services facilities would have, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings. However, project-specific impacts were generally considered less-than-significant. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the eight CEQA documents surveyed.

**a) Transport, Use or Disposal of Hazardous Materials.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

**b) Upset or Accident Involving Release of Hazardous Materials.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental

release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) **Emit Hazard Within ¼ Mile of Schools.** Five of the eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to the emission of hazards within a quarter mile of a school; the other three CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) **Located on Known Hazardous Materials Site.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts regarding the projects’ location on known hazardous materials sites. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project’s potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** Six of the eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts or no impacts related to the project sites' location within an airport land use plan or within the vicinity of a private airstrip; the other two CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, aviation impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Seven of the eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts associated with the implementation of an evacuation plan; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area's evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** Five of the eight CEQA documents for past projects in the retail/services facility category disclosed no impacts related to wildland fires; the other three CEQA documents did not address impacts related to wildland fires. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) **Increase Fire Hazards in Areas with Flammable Materials.** One of the eight CEQA documents for a past project in the retail/services facility category disclosed no impact related to the potential increase of fire hazards in areas with flammable materials; the other seven CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas. These facilities have a low potential for resulting in significant impacts related to the transport or use of hazardous materials. However, the potential exists for one or more future large commercial projects to have significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.8-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional

shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts related to hazards and hazardous materials that could occur, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas. Project-specific impacts were generally considered less-than-significant. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the nine CEQA documents surveyed.

- a) **Transport, Use, or Disposal of Hazardous Materials.** The nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

- b) **Upset or Accident Involving Release of Hazardous Materials.** The nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impact with the implementation of mitigation measures or no impact related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** Four of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to the emission of hazards within a quarter mile of a school; the other five CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** Six of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts or no impacts regarding the projects' location on known hazardous materials sites; the other three CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** Two the nine CEQA documents for past projects in the large commercial facility category disclosed either a less-than-significant impact or no impact related to the project sites' location within an airport land use plan or within the vicinity of a private airstrip; the other seven CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land

use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, aviation impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Three of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts or no impact associated with the implementation of an evacuation plan; the other six CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area’s evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** Two of the nine CEQA documents for past projects in the large commercial facility category disclosed either a less-than-significant impact or no impact related to wildland fires; the other seven CEQA documents did not address impacts related to wildland fires. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** One of the nine CEQA documents for past projects in the large commercial facility category disclosed no impact related to the potential increase of fire hazards in areas with flammable materials; the other eight CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

#### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to result in impacts related to hazards and hazardous materials, including the use or transport of hazardous materials. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.8-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on hazards and hazardous materials, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. These projects involved a variety of different structures,

including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities, which could involve the use and transport of various hazardous materials such as chemicals, fertilizers etc. Accordingly, these projects could have significant adverse impacts. More specifically, the following discussion provides an overall summary of the types of impacts related to hazards and hazardous materials identified in the four CEQA documents surveyed.

- a) Transport, Use, or Disposal of Hazardous Materials.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

- b) Upset or Accident Involving Release of Hazardous Materials.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed either a less-than-significant impact or no impact related to the emission of hazards within a quarter mile of a school; the other two CEQA documents did not address impacts

related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** Three of the four CEQA documents for past projects in the entertainment/recreational category disclosed less-than-significant impacts (without or with mitigation) regarding the projects' location on known hazardous materials sites; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** One of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed no impact related to the project sites' location within an airport land use plan or within the vicinity of a private airstrip; the other three CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared and in different environmental settings, hazards and

hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Two of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) associated with the implementation of an evacuation plan; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area's evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** One of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed no impact related to wildland fires; the other three CEQA documents did not address impacts related to wildland fires. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** One of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed no impact related to the potential increase of fire hazards in areas with flammable materials; the other three CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a

location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas. These future facilities could result in significant impacts related to hazards and hazardous materials. The potential exists for one or more future institutional projects to generate significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.8-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on hazards and hazardous materials, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities. However, these projects were generally found to have less-than-significant impacts related to hazards and hazardous materials. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the 15 CEQA documents surveyed.

- a) Transport, Use, or Disposal of Hazardous Materials.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to the transport, use, or disposal of hazardous materials; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

- b) Upset or Accident Involving Release of Hazardous Materials.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to the upset or accidental release of hazardous materials; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** Nine of the fifteen CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation) related to the emission of hazards within a quarter mile of a school; the other six CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** Thirteen of the fifteen CEQA documents for past projects in the institutional category disclosed either less-than-significant impacts (without or with mitigation) or no impact regarding the projects’ location on known hazardous materials sites; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project’s potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** Nine of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts related to the project sites’ location within an airport land use plan or within the vicinity of a private airstrip; the other six CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Ten of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-

significant impacts or no impact associated with the implementation of an evacuation plan; the other five CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area's evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** Nine of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts related to wildland fires; the other six CEQA documents did not address impacts related to wildland fires. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** Five of the fifteen CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impact related to the potential increase of fire hazards in areas with flammable materials; the other 10 CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. The potential exists for one or more future projects to have significant impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.8-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on hazards and hazardous materials, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities. However, the CEQA documents for the projects that were surveyed were found to have less-than-significant impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the three CEQA documents surveyed.

- a) **Transport, Use, or Disposal of Hazardous Materials.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) related to the transport, use, or disposal of

hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

- b) Upset or Accident Involving Release of Hazardous Materials.** Three CEQA documents for past projects in the transportation category disclosed less-than-significant impacts (without or with mitigation) related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to the emission of hazards within a quarter mile of a school; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant.

Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** Three CEQA documents for past projects in the transportation category disclosed less-than-significant impacts regarding the projects' location on known hazardous materials sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to the project sites' location within an airport land use plan or within the vicinity of a private airstrip; the other CEQA document did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) associated with the implementation of an evacuation plan; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that

future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area’s evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to wildland fires; the other CEQA document did not address impacts related to wildland fires. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to the potential increase of fire hazards in areas with flammable materials; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Impacts from the routine transport, use or disposal of hazardous materials could occur at these facilities. Therefore, future construction and operation of utility facilities could likely generate significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.8-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that could occur, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could result in impacts related to hazards and hazardous materials. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the four CEQA documents surveyed.

**a) Transport, Use or Disposal of Hazardous Materials.** For most of the projects in the utility facility category, environmental impacts related to the transport, use, or disposal of hazardous materials were less-than-significant (without or with mitigation). For one of the projects surveyed (Project #43 – LADWP Electrical Generating Stations Modifications), the CEQA document concluded that this project has the potential to generate significant adverse environmental impacts related to the transport, use, or disposal of hazardous materials. Currently, hazardous materials are transported throughout the district’s jurisdiction in great quantities via all modes of transportation including rail, highway, water, air and pipeline.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA

documents for the applicable facility categories available at the time the analysis was prepared, and the additional consideration identified above, impacts due to the transport, use, or disposal of hazardous materials resulting from implementing the proposed project are determined to be significant.

- b) Upset or Accident Involving Release of Hazardous Materials.** For most of the projects in the utility facility category, environmental impacts related to the upset or accidental release of hazardous materials were less-than-significant (without or with mitigation). However, for one of the projects surveyed (Project #43 – LADWP Electrical Generating Stations Modifications), the CEQA document concluded that this project has the potential to generate significant adverse environmental impacts related to the upset or accidental release of hazardous materials. More specifically, releases of hazardous materials, including aqueous ammonia, have the potential for harmful effects on workers and the public. Causes of these releases may include plant upsets; leaks in seals; pipeline failures; vehicular traffic accidents; and failures during ammonia delivery, such as hose leaks.

Based on information in the CEQA documents evaluated for the proposed project, and the fact that the CEQA documents evaluated provide only a “snapshot” of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** One of the four CEQA documents for past projects in the utility facility category disclosed a less-than-significant impacts with the implementation of mitigation measures related to the emission of hazards within a quarter mile of a school; the other three CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** Two of the four CEQA documents for past projects in the utility category disclosed less-than-significant impacts regarding the projects’ location on known hazardous materials sites; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this

facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** One of the four CEQA documents for past projects in the utility facility category disclosed no impact related to the project site's location within an airport land use plan or within the vicinity of a private airstrip; the other three CEQA documents did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** One of the four CEQA documents for past projects in the utility facility category disclosed a less-than-significant impact with the implementation of mitigation measures associated with the implementation of an evacuation plan; the other three CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different

environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area's evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** One of the four CEQA documents for past projects in the utility facility category disclosed a less-than-significant impact related to wildland fires; the other three CEQA documents did not address impacts related to wildland fires. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** Two of the four CEQA documents for past projects in the utility facility category disclosed less-than-significant impacts related to the potential increase of fire hazards in areas with flammable materials; the other two CEQA documents did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

#### ***Primary Facility Category Impacts on a Programmatic Level***

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new

construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that may result in significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.8-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on hazards and hazardous materials, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. Based on the evaluation of these projects, the light industrial uses may involve the use, transport or disposal of hazardous materials and may result in impacts related to hazards and hazardous materials. However, adverse effects were found to be less-than-significant. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the four CEQA documents surveyed.

**a) Transport, Use, or Disposal of Hazardous Materials.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

**b) Upset or Accident Involving Release of Hazardous Materials.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category

that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts related to the emission of hazards within a quarter mile of a school. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** The four CEQA documents for past projects in the light industrial/warehouse category disclosed less-than-significant impacts (without or with mitigation) regarding the projects' location on known hazardous materials sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to the project site's location within an airport land use plan or within the vicinity of a private airstrip. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impact associated with the implementation of an evacuation plan. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area's evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impact related to wildland fires. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) **Increase Fire Hazards in Areas with Flammable Materials.** Three of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impact related to the potential increase of fire hazards in areas with flammable materials; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. These types of project could significantly impact hazards and hazardous materials through transporting or disposing of hazardous materials. Therefore, these future heavy industrial facilities have the potential of generating significant adverse impacts related to hazards and hazardous materials.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.8-1). The three CEQA documents surveyed, which were prepared for improvements to two existing

refineries and an industrial park project, illustrate the types of impacts related to hazards and hazardous materials that could occur, including impacts associated with the transport, use, or disposal of hazardous materials; accidental release of hazardous materials; emissions of hazardous materials; and safety risks associated with hazardous materials sites, aviation activities, wildland fires, and flammable materials. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in impacts. More specifically, the following discussions provide an overall summary of the types of impacts related to hazards and hazardous materials identified in the three CEQA documents surveyed.

- a) Transport, Use, or Disposal of Hazardous Materials.** The three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts related to the transport, use, or disposal of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location (e.g., schools, residential areas, etc.) that could create significant adverse impacts related to hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the transport, use, or disposal of hazardous materials as a result of implementing the proposed project are determined to be significant.

- b) Upset or Accident Involving Release of Hazardous Materials.** The three CEQA documents for past projects in the heavy industrial category disclosed less-than-significant impacts (without or with mitigation) related to the upset or accidental release of hazardous materials. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create upset conditions or accidental release of hazardous materials that could significantly impact adjacent land uses, including schools and residential areas

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts due to the upset or accidental release of hazardous materials as a result of implementing the proposed project are determined to be significant.

- c) Emit Hazard Within ¼ Mile of Schools.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts related to the emission of hazards within a quarter mile of a school. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited within a quarter mile of a school that could create significant adverse impacts resulting from potential hazardous emissions that may affect the health and safety of the school occupants.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to hazardous emissions within a quarter mile of schools as a result of implementing the proposed project are determined to be significant.

- d) Located on Known Hazardous Materials Site.** The three CEQA documents for past projects in the heavy industrial category disclosed less-than-significant impacts regarding the projects' location on known hazardous materials sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be located on a known hazardous materials site that could create significant adverse impacts related to exposure to potential hazards and hazardous materials.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts associated with a project's potential location on a known hazardous materials site as a result of implementing the proposed project are determined to be significant.

- e, f) Located Within Airport Land Use Plan or Within the Vicinity of a Private Airstrip.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impacts related to the project site's location within an airport land use plan or within the vicinity of a private airstrip. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited within an airport land use plan or near a private airstrip, which could create significant adverse impacts related to hazards associated with aviation activities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related hazards associated with aviation activities resulting from implementing the proposed project are determined to be significant.

- g) Impair implementation of Evacuation Plan.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impact associated with the implementation of an evacuation plan. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could impair or interfere with the implementation of an evacuation plan for a particularly area and potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts to a particular area’s evacuation plan resulting from implementing the proposed project are determined to be significant.

- h) Exposure to Wildland Fires.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impact related to wildland fires. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near high fire hazard areas, including, but not limited to, mountain and wildland areas, which could potentially result in significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to exposure to wildland fires resulting from implementing the proposed project are determined to be significant.

- i) Increase Fire Hazards in Areas with Flammable Materials.** Two of the three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts related to the potential increase of fire hazards in areas with flammable materials; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is considered a high fire hazard area due to the use or manufacture of flammable materials, which could potentially create significant adverse safety impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, hazards and hazardous materials impacts could be significant. Therefore, impacts related to fire hazards associated with the use or manufacture of flammable materials resulting from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to hazards and hazardous materials that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents found that some of the past projects have the potential to generate significant adverse impacts related to hazards and hazardous materials, specifically impacts associated with the transport, use, or disposal of hazardous materials and the accidental release of hazardous materials. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, impacts related to hazards and hazardous materials as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Some of the past projects were determined to have significant adverse impacts on hazards and hazardous materials, including the potential to (1) create a hazard through the transport, use, or disposal of hazardous materials, or (2) create a hazard through the upset or accidental release of hazardous materials.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared for all three power plant projects concluded that hazard and hazardous materials impacts could be mitigated to less than significant. For example, according to the CEC, the El Segundo project uses a variety of hazardous materials for storage, use during the construction phase of the project, and for routine plant operation and maintenance (O&M) following construction. Gasoline, diesel, fuel oil, lubricants, solvents, adhesives, paint materials and welding gases are listed in the FSA for use during construction, and O&M materials include but are not limited to aqueous ammonia, lubricating oils, sodium hypochlorite, hydrazine, hydrochloric acid, various gases and piped-in natural gas. The CEC concluded that the transportation and delivery of hazardous materials is routinely regulated and controlled by various federal and state laws, ordinances, regulations and standards. CEC concluded that the following mitigation measures will reduce impacts to less than significant: approval of the compliance project manager (CPM) if the facility intends to store, handle, use or move (or combination of these activities) material above certain quantities; update existing Business Plan; revise the existing Risk Management Plan (RMP); and undertake a feasibility study for the substitution of the 35 percent hydrazine with a less hazardous chemical.

According to the FSA for the Walnut Creek project, there is potential for the transportation, handling, and use of hazardous materials to impact the surrounding community, so all chemicals and natural gas used in the proposed project were evaluated recognizing that some hazardous materials must be used at power plants. Therefore, CEC staff conducted its analysis by examining the choice and amount of chemicals to be used, the manner in which the applicant will use the chemicals, the manner it will be transported to the facility and transferred to facility storage tanks, and the way the applicant plans to store the materials on-site. CEC staff's evaluation of the Walnut Creek project concluded that that hazardous materials use from the proposed project would not present a significant impact to the public as long as the proposed mitigation measures are implemented. The FSA also addressed the issue of the transportation, storage, and use of aqueous ammonia. The proposed project is expected to comply with all applicable laws, ordinances, regulations and standards and the project proponent would be required to develop a Risk Management Plan. The CEC concluded the potential for accidents resulting in the release of hazardous materials is greatly reduced by the implementation of a safety management program, which includes the use of both engineering and administrative controls. Examples of engineering control include secondary containment areas, physical separation of stored chemicals, installation of automatic sprinkler systems and an exhaust system, monitoring systems, and ammonia sensors. Examples of administrative controls include worker training, use of personal protective equipment, safety operating procedures, fire safety and prevention, and emergency response actions. CEC staff believed the risk of exposure to significant concentrations of aqueous ammonia during transportation to the facility are insignificant because of the remote possibility of accidental release of a sufficient quantity to present a danger to the public combined with the already diluted concentration of the aqueous ammonia being transported. The CEC determined that the transportation of similar volumes of hazardous materials on the nation's highways is not unique nor an infrequent occurrence and, thus, concludes that the transportation of aqueous ammonia to the proposed facility and the risk of accident and exposure is less than significant. In addition, according to the CEC, based on the environmental mobility, toxicity, quantities present at the site and frequency of delivery, aqueous ammonia poses the predominate risk associated with hazardous materials transportation and use at the proposed facility. CEC staff concluded, however, that the risk associated with transportation of other hazardous materials to the proposed facility does not significantly increase the risk of impact beyond that associated with ammonia transportation.

The FSA for the Sentinel project stated that aqueous ammonia (29 percent ammonia in aqueous solution) is the only acutely hazardous material proposed to be either used or stored at the site in quantities exceeding the reportable amounts defined in the California Health and Safety Code. The FSA also stated that other hazardous materials, such as mineral and lubricating oils, cleaning detergents, and welding gases, would be present at the Sentinel site, and hazardous materials used during construction would include gasoline, diesel fuel, motor oil, hydraulic fluid, welding gases, lubricants, solvents, paint, and paint thinner. No acutely toxic hazardous materials would be used on site during construction. According to the CEC, none of these materials pose significant potential for off-site impacts as a result of the quantities on site, their relative toxicity, their physical state, and/or their environmental mobility. The CEC staff reviewed and assessed

the potential for the transportation, handling, and use of hazardous materials to impact the surrounding community, and concluded that that hazardous materials use from the proposed project would not present a significant impact to the public as long as the proposed mitigation measures are implemented, and a risk management plan developed prior to delivery of aqueous ammonia to the facility. Similar to the Walnut Creek project, the CEC recommended the Sentinel project to implement a safety management program, which includes the use of both engineering and administrative controls. Examples of engineering control include secondary containment areas, physical separation of stored chemicals, installation of automatic sprinkler systems and an exhaust system, monitoring systems, and ammonia sensors. Examples of administrative controls include worker training, use of personal protective equipment, safety operating procedures, fire safety and prevention, and emergency response actions. To address the issue of spill response, the CEC determined the facility would prepare and implement an emergency response plan that includes information on hazardous materials contingency and emergency response procedures, spill containment and prevention systems, personnel training, spill notification, on-site spill containment, and prevention equipment and capabilities, as well as other elements. Emergency procedures would be established, which include evacuation, spill cleanup, hazard prevention, and emergency response. The FSA for the Sentinel project determined the hazardous materials including aqueous ammonia, which is used for air pollution control, would be transported to the facility by tanker truck, and while many types of hazardous materials would be transported to the site, CEC staff believed that transport of aqueous ammonia poses the predominant risk associated with hazardous materials transport. CEC staff reviewed the technical and scientific literature on hazardous materials transportation accident rates and concluded that the risk of exposure to significant concentrations of aqueous ammonia during transportation to the facility is insignificant because of the remote possibility that an accidental release of a sufficient quantity could be dangerous to the public.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)), and the proposed project has the potential to contribute to significant adverse cumulative hazard and hazardous materials impacts.

### **Mitigation Measures for Future Impacts related to Hazards and Hazardous Materials**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant hazards and hazardous materials impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." Because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not

feasible to identify appropriate facility-specific mitigation measures for hazards and hazardous materials impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of hazards and hazardous materials impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant hazards and hazardous materials impact, the potential exists for future indirect hazards and hazardous materials impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.9**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - HYDROLOGY AND WATER QUALITY**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Additionally, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse hydrology and water quality impacts depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts of the proposed project on water resources and water quality from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential hydrology and water quality impacts is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse impacts on hydrology and water quality include assessments of impacts to the region's watersheds, rivers, lakes, reservoirs, and groundwater. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts on water resources and water quality if their implementation would result in any of the following:

#### **Water Quality:**

- The project would result in a violation of National Pollutant Discharge Elimination System (NPDES) permit requirements or any water quality standards.
- The project would cause degradation or depletion of ground water resources substantially affecting current or future uses.

- The project would result in substantial increases in the area of impervious surfaces, such that interference with groundwater recharge efforts occurs.
- The project would result in alterations to the course or flow of floodwaters.
- Create or contribute runoff water which would exceed stormwater drainage systems.
- The project would cause the degradation of surface water quality substantially affecting current or future uses.
- Place housing or structures within a 100-year flood hazard area that would impede or redirect flood flow.
- Expose people or structures to risk of loss involving flooding or inundation by seiche, tsunami, or mudflow.
- The capacities of existing or proposed wastewater treatment facilities and the sanitary sewer system would not be sufficient to meet the needs of the project.

Water Demand:

- The existing water supply would not have the capacity to meet the increased demands of the project, or the project would use a substantial amount of potable water.
- The project would increase demand for water by more than five million gallons per day.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential impacts on water resources and water quality from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on water resources and water quality. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of hydrology and water quality impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts on existing water resources and water quality. Such future new or modified facilities could potentially result in development adjacent to sensitive resources that could affect the water quality. While the specific nature or degree of such impacts is currently unknown, potentially significant

adverse impacts on hydrology and water quality have been analyzed based on available information pertaining to each facility category.

## **Potential Impacts of Identified Facility Categories**

### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future. On a programmatic level, impacts to water resources and water quality as a result of constructing future new agricultural facilities may include impacts to water quality, drainage, erosion and siltation, groundwater, and potential impacts related to flooding. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to water resources that provide the main water supply for a particular area. Activities related to the operation of agricultural facilities may result in significant impacts to water supply and water quality.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.9-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on hydrology and water quality, including potential adverse effects to existing groundwater and water supplies, particularly the water quality of drinking water supplies, and the conversion of open space areas to agricultural uses that could potentially degrade water quality, on-site and within downstream of receiving water bodies, by significantly increasing the suspended sediment load and/or contributing other pollutant to the natural waterways. Based on a review of these documents, agricultural-related facilities may result in the following impacts to hydrology and water quality:

- Increased runoff and erosion, which could increase turbidity and decrease water quality in downstream receiving waters;

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents were reviewed since they illustrate the types of impacts that may result from the development of such projects.

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. Source: ICF Jones & Stokes, 2009.																

- Increased groundwater pumping necessary to supply water for facility operations, which could lower groundwater levels in the groundwater-bearing materials underlying the site and could interfere with local flow and recharge of existing surface water sources;
- Convert native grassland areas, or other natural habitats, to agricultural uses, which could (1) increase the rate and volume of runoff from the project site and lead to increased bed and accounts erosion within channels draining the project site; (2) potentially degrade water quality, on-site and within downstream receiving water bodies by significantly increasing the suspended sediment load and/or contributing other pollutant to the natural waterways; and (3) potentially increase the rate and volume of runoff from the project site and lead to increased flooding downstream.

However, these projects were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on hydrology and water quality. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the two CEQA documents surveyed for this facility category.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** Both of the CEQA documents for past projects in the agricultural facility category disclosed a less-than-significant impact (without or with mitigation) on groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

- c, d, e) Drainage Patterns and Capacity.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts on the existing drainage patterns and capacities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant erosion within the channels draining a project area, increased siltation or flooding, and increased storm water runoff beyond the existing capacities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without and with mitigation) on water quality. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., high salinity and nitrate levels), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to flooding. More specifically, both of the CEQA documents identified less-than-significant impacts related to the projects’ location within a 100-year flood zone; the CEQA documents did not address flooding impacts related to levee/dam failure, seiche, tsunami, or

mudflow. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** One of the two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. The other CEQA document only disclosed less-than-significant impacts (without and with mitigation) related to water supplies and facilities and wastewater treatment facilities; this document did not address impacts to storm drain facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas. Examples of projects that may be constructed in the future include dry cleaning and laundry

businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for alteration of existing hydrological conditions, water resources, and water quality. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts to hydrology and water quality in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.9-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. Based on a review of these documents, retail service facilities may result in the following impacts to hydrology and water quality:

- Adverse impacts may result from the release of contaminants into the stormwater drainage channels during the routine operation of retail/service development projects. Potential water quality issues are associated with stormwater runoff across existing paved areas and streets that have accumulated fuel, oil, grease, and trash deposits.
- During construction, grading activities could potentially result in a temporary increase in the amount of suspended solids running off the site. In the event of rainfall, construction site runoff originating from the project site could result in sheet erosion of exposed soil, which could affect surface water quality in the vicinity of the project site, as well as water resources located downstream from the project site. Therefore, construction-related erosion could result in a potentially significant impact to surface water quality.
- The construction of foundations for retail service buildings and subterranean parking structures could have the potential to interfere with groundwater by intercepting the aquifer during excavation. Therefore, project construction could result in a significant impact to groundwater or groundwater quality.
- All of the projects surveyed for the retail/service facility category were identified to be located in impervious areas (i.e., areas that are currently developed with structures or pavement). Due to the existing impervious nature of the project sites, the retail service projects were found to not substantially alter existing drainage patterns on the project sites or surrounding areas or substantially increase the amount of water flowing from the site. Based on the existing and proposed impervious conditions, the amount and quality of stormwater were found to not change substantially.

- All of the projects surveyed for the retail/service facility category were located in urban areas where adequate water, wastewater, and stormwater infrastructure exists. Therefore, implementation of these retail service projects were found to not have the potential to result in significant impacts associated with existing infrastructure and capacity.

These projects were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on hydrology and water quality. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the two CEQA documents surveyed for this facility category.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited on contaminated parcels or in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the retail/service facility category disclosed a less-than-significant impact or no impact on groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

**c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on information in the CEQA documents evaluated for the proposed project, the additional considerations identified in the preceding paragraph, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

**f) Water Quality Degradation.** All of the CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts or no impact on water quality. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

**g, h, i, j) Flooding.** Seven of the eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts or no impacts related to flooding; one CEQA document did not address any impacts related to flooding. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas. Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings and parking structures/lots. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential for alteration of existing hydrological conditions, water resources, and water quality. Therefore, these facilities would generally have a low likelihood of resulting in

significant adverse impacts to hydrology and water quality in the future. However, the potential exists for one or more future large commercial projects to have significant impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.9-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in the release of contaminants into the stormwater drainage channels during the routine operation of large commercial development projects, temporary increases in the amount of suspended solids running off the site during construction, potential to interfere with groundwater by intercepting the aquifer during excavation, alteration of existing drainage patterns on the project sites and surrounding areas, and relocation of utility lines, including water lines, sewer lines, and storm water drainage. However, project-specific impacts were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on hydrology and water quality. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the nine CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) or no impact related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited on contaminated parcels or in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

- b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the large commercial facility category disclosed a less-than-significant impact or no impact on groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

- c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** All of the CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) or no impact on water quality. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** All of the CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts or no impacts related to flooding. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

- l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future. Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter undeveloped open space and natural areas that may result in the alteration of existing hydrological conditions, water resources, and water quality. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts on water resources and water quality.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.9-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, parking lots, and grading and landscaping of open space areas for outdoor recreational facilities, which were found to result in the release of contaminants into the stormwater drainage channels during the routine operation of entertainment/recreational development projects, temporary increases in the amount of suspended solids running off the site during construction, alteration of existing drainage patterns on the project sites and surrounding areas, and relocation of utility lines, including water lines, sewer lines, and storm water drainage. However, these projects were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on hydrology and water quality. More specifically, the following discussion provides an overall summary of the types of hydrology and water quality impacts identified in the four CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) or no impact related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained

offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

- b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed a less-than-significant impact or no impact on groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

- c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts on water quality. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater or near water resources), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts or no impacts related to flooding. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

- l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas. Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and parking lots. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would, therefore, would have a low potential alteration of existing hydrological conditions, water resources, and water quality. Therefore, these facilities would generally have a low likelihood of resulting in significant adverse impacts to hydrology and water quality in the future. However, the potential exists for one or more future institutional projects to have significant impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.9-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, which were found to result in the release of contaminants into the stormwater drainage channels during the routine operation of institutional projects, temporary increases in the amount of suspended solids running off the site during construction, potential to interfere with groundwater by penetrating the water table during excavation, alteration of existing drainage patterns on the project sites and surrounding areas, and relocation of utility lines, including water lines, sewer lines, and storm water drainage. However, project-specific impacts were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures

on hydrology and water quality. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the 15 CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation) related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed a less-than-significant impact or no impact on groundwater resources; the other CEQA document did not address impacts to groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

**c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that

could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation) or no impact on water quality; the other CEQA document did not address impacts on water quality. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts or no impacts related to flooding; the other CEQA document did not address impacts to flooding. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

#### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, the number of transportation facilities that would require stationary-source permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities. Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities). Any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential for alteration of existing hydrological conditions, water resources, and water quality. However, the potential exists for one or more future projects to have significant impacts on hydrology and water quality.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.9-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, and bus storage and maintenance facilities, some of which were found to result in the release of contaminants into the stormwater drainage channels during the routine operation of transportation projects, temporary increases in the amount of suspended solids running off the site during construction, alteration of existing drainage patterns on the project sites and surrounding areas, and relocation of utility lines, including water lines, sewer lines, and storm water drainage. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the three CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** For some of the projects in the transportation facility category, environmental impacts related to compliance with applicable water standards and wastewater treatment requirements were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, for other projects, the lead agencies concluded that the transportation facility category project has the potential to violate applicable water quality standards, such as those disclosed for the Project # 39, TraPac Terminal Expansion Project, which was found to have a potential to increase incidental spills and illegal discharges due to increased vessel calls at the port terminal; leaching of contaminants, such as copper from anti-fouling paint, could also cause increased loading in the harbor, which was listed as impaired with respect to copper.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the transportation facility category disclosed a less-than-significant impact or no impact on groundwater resources. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

- c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) on the existing drainage patterns and capacities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** For some of the projects in the transportation facility category, environmental impacts related to water quality degradation were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, for other projects, the lead agencies concluded that the transportation facility category project has the potential to degrade water quality, such as those disclosed for the Project # 39, TraPac Terminal Expansion Project, which was found to have a potential to increase incidental spills and illegal discharges due to increased vessel calls at the port terminal; leaching of contaminants, such as copper from anti-fouling paint, could also cause increased loading in the harbor, which was listed as impaired with respect to copper.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** For some of the projects in the transportation facility category, environmental impacts related to flooding and inundation were either less-than-significant or no impact. However, for other projects, the lead agencies concluded that the transportation facility category project has the potential to degrade water quality, such as those disclosed for the Project # 39, TraPac Terminal Expansion

Project, which determined that project construction within the Port area would expose people and structures to substantial risk involving tsunamis or seiches.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** Two of the three CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems; the other CEQA document did not address impacts to the existing infrastructure. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on the historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to

the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Any new utility project would most likely be constructed within an already developed area and would, therefore, have a low potential for alteration of existing hydrological conditions, water resources, and water quality. However, the potential exists for one or more future projects to have significant impacts on hydrology and water quality.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.9-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could result in the release of contaminants into the stormwater drainage channels during the routine operation, temporary increases in the amount of suspended solids running off the site during construction, alteration of existing drainage patterns on the project sites and surrounding areas, and relocation of utility lines, including water lines, sewer lines, and storm water drainage. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the four CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts (without or with mitigation) related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** Three of the four CEQA documents for past projects in the utility-oriented facility category disclosed a less-than-significant

impact or no impact on groundwater resources; the other CEQA document did not address impacts to groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

**c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts (without or with mitigation) on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

**f) Water Quality Degradation.** Three of the four CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts on water quality; the other CEQA document did not address impacts on water quality. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

**g, h, i, j) Flooding.** Two of the four CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts related to flooding; the other two CEQA documents did not address impacts to flooding. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** Two of the four CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems; the other two CEQA documents did not address impacts regarding the adequacy of the existing infrastructure within the district. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas. Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings. Any new light industrial/warehouse facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential for alteration of existing hydrological conditions, water resources, and water quality. However, the potential exists for one or more future projects to have significant impacts on hydrology and water quality.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.9-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, effects on water supplies, and wastewater conveyance and treatment capacities. Based on the evaluation of these projects, the construction of warehouse-type and office-type structures may result in (1) increases in the amount of impervious surfaces within a development area, (2) increase in the potential for stormwater to come into contact with sediment, debris, and urban pollutants and discharge to adjacent surface waters during both the construction and operations period, (3) and changes in the amount of impervious surface area on-site to alter the existing drainage patterns, and (4) relocation of utility lines, including water lines, sewer lines, and storm water drainage. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the four CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts with the implementation of mitigation measures or no impact related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on

existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

- b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed a less-than-significant impact or no impact on groundwater resources. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

- c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) or no impact on the existing drainage patterns and capacities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant

impacts (without and with mitigation) or no impact on water quality. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

**g, h, i, j) Flooding.** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts related to flooding. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

**l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas. Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. Any new heavy industrial facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential for alteration of existing hydrological conditions, water resources, and water quality. However, the potential exists for one or more future projects to have significant impacts on hydrology and water quality.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.9-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could generate (1) increases in the amount of impervious surfaces within a development area, (2) an increase in the potential for stormwater to come into contact with sediment, debris, and urban pollutants and discharge to adjacent surface waters during both the construction and operations period, (3) changes in the amount of impervious surface area on-site to alter the existing drainage patterns, and (4) relocation of utility lines, including water lines, sewer lines, and storm water drainage. More specifically, the following discussions provide an overall summary of the types of hydrology and water quality impacts identified in the three CEQA documents surveyed.

**a, k) Violation of Standards or Exceedance of Applicable Requirements.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impact related to compliance with applicable water quality standards and wastewater treatment requirements. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on existing water resources, including surface water bodies and groundwater, resulting in the violation or exceedance of applicable standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on hydrology and water quality from implementing the proposed project are determined to be significant.

**b) Depletion of Groundwater Supplies.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impact on groundwater resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing groundwater supply issues or shallow groundwater areas, which could exacerbate the rate of depletion and create significant adverse impacts on groundwater resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on groundwater resources from implementing the proposed project are determined to be significant.

**c, d, e) Drainage Patterns and Capacity.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impacts on the existing drainage patterns and capacities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts on the existing drainage patterns and capacities to result in significant increases in flooding and storm water runoff beyond the capacities of existing drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on the existing drainage patterns and capacities from implementing the proposed project are determined to be significant.

- f) Water Quality Degradation.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impact on water quality. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing major water quality issues (e.g., sites with contaminated soils and/or groundwater), which could exacerbate existing conditions and create significant adverse impacts on water quality.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts on water quality from implementing the proposed project are determined to be significant.

- g, h, i, j) Flooding.** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impacts related to flooding. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location within a 100-year or 500-year flood zone or areas subject to inundation and create significant adverse impacts related to flooding.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to flooding and inundation from implementing the proposed project are determined to be significant.

- l, m, n, o) Adequacy of Existing Infrastructure (Water, Wastewater, and Storm Drainage).** All of the CEQA documents for past projects in the heavy industrial facility category disclosed either less-than-significant impacts or no impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts

in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is already experiencing deficiencies in its infrastructure services, which could exacerbate the need for facility upgrades, and create significant adverse impacts on the existing water supply, wastewater treatment facilities, and storm drainage systems.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to hydrology and water quality could be significant. Therefore, impacts related to the adequacy of the existing infrastructure within the district, including water supplies and facilities, wastewater treatment facilities, and storm drain systems from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to hydrology and water quality that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documentation found that some of the past projects have the potential to generate significant adverse impacts on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff’s independent judgment, and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, hydrology and water quality impacts as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects.” [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);

- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Past development patterns within the district have resulted in a variety of altered or new man-made hydrological conditions. The region consists of many different hydrological basins, catchment areas, and countless man-made drainage systems along streets, residential areas, and developed urban centers. While there is a large amount of impervious, paved, and developed land within the district, there are also large areas of undeveloped natural drainage in the mountainous and less developed regions in the eastern portion of the district. Thus, the hydrological environment differs greatly from location to location. Therefore, any future facilities obtaining offsets from the SCAQMD's internal accounts would potentially result in new or altered hydrological conditions, that may affect local or regional water quality in various parts of the district. As noted above, since the specific location of individual facilities cannot be predicted with certainty, the evaluation of cumulative hydrological and water quality impacts is even more uncertain.

However, some of the past projects were determined to have significant adverse impacts on hydrology and water quality, including potential adverse effects related to the violation of applicable water quality and wastewater treatment standards, alteration of existing drainage patterns, increased surface water runoff, water quality degradation, water supplies, and wastewater conveyance and treatment capacities.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC for all three power plant projects determined the significant impacts to hydrology and water quality could be mitigated to less than significant. For example, according to the CEC, water demand for the El Segundo project is estimated at 207 million gallons per day (gpd) at full operation and are proposed to be supplied from a combination of sources, including the City of El Segundo

through Metropolitan Water District of Southern California. The proposed once-through cooling system for the ESPR project would use large quantities of water, pulling cool water from the Santa Monica Bay and returning almost all of the water, warmed, to the Bay. According to the CEC, the discharge of the cooling water through the Hyperion outfall would result in an average temperature rise of seven degrees, but under worst case conditions could be as much as 19.5 degrees above the existing discharge temperature at the discharge point. The FSA states the El Segundo project will be using approximately 180,000 gpd potable water for the makeup water for the evaporative coolers, heat recovery steam generator blowdown, quench water, and miscellaneous plant uses. Various options to mitigate the adverse impacts on water quality and demand, such as using reclaimed water instead of seawater or potable water, were discussed in the FSA. According to the FSA for the El Segundo project, the West Basin Municipal Water District will supply approximately 86,000 gpd of reclaimed water for both irrigation and for pumps and bearings seal water augmentation mitigating the need for treated (potable) water. Sanitary wastewater discharges, according to the FSA, will be directed to the existing City of Manhattan Beach Municipal Sanitary Sewer System and existing policies in the California Coastal Act of 1976 prevent depletion of groundwater supplies and substantial interference with surface water flow. Since the site lies at approximately 19 feet above sea level, and might be afforded some protection by the existing sea wall, the CEC concluded no significant impacts from a tsunami are anticipated at the El Segundo facility. In light of the historical performance of California power plants and the electrical system in seismic events, CEC staff believes there is no special concern with power plant functional reliability affecting the electric system's reliability due to seismic events.

The FSA prepared by the CEC for the Walnut Creek project would comply with all applicable water resource laws, ordinances, regulations, and standards and that potential significant impacts would be mitigated through the preparation of construction and operation plans and the use of Best Management Practices (BMPs) that would mitigate problems related to contamination to surface and groundwater, use of potable water supplies, or non-compliance with wastewater treatment and discharge requirements. The CEC reports the Walnut Creek project would use less than 12,000 gallons per day of reclaimed water, primarily for dust control during construction. The FSA states the project would provide chlorine treatment of the reclaimed water, utilizing a 180,000 gallon tank to provide a minimum of 90 minutes contact time for disinfection with an additional 180,000 gallon tank to store the treated reclaimed water for process uses, and provide approximately 1.5 hours of onsite operational storage if reclaimed water supply were disrupted. In the event of a disruption in reclaimed water supply, the Walnut Creek project would benefit from storage of five to nine million gallons, so there is no adverse impact to water supply. Potentially significant construction wastewater and stormwater runoff will be managed to maintain compliance with the required Drainage, Erosion and Sediment Control Plan (DESCP) that ensures protection of water quality. Other mitigation includes: developing and implementing a Storm Water Pollution Prevention Plan (SWPPP) during construction and operation; obtaining a Flood Permit and Water Quality Agreement for commercial connection to the Los Angeles County's flood control system; submitting a Dual Plumbing Plan to local health services department for use of reclaimed and potable water; using reclaimed water as its primary water supply for

construction and operations, including cooling, process, and other approved non-potable use; monitoring the use of emergency backup water; securing a Water Supply Service Agreement from local water districts for reclaimed and potable water service; obtaining a Permit for Industrial Wastewater Discharge; and complying with the wastewater discharge limitations, pretreatment requirements, peak flow restrictions, dewatering discharges, payment of fees, and monitoring and reporting requirements of Los Angeles County Sanitation District. Finally, according to the FSA, the Walnut Creek project would not alter the existing drainage patterns, not result in increased runoff volumes, and is not near any large body of water where a potential tsunami or seiche could affect the site.

According to the FSA for the Sentinel project, groundwater from onsite wells or that serves local municipal needs would be used to meet the potable water demands for the project's operation workforce and plant processes (cooling, fire protection, and landscape irrigation) at a maximum of 1,100 acre-foot per year (AFY) and, during construction, an average of 25,000 gallons per day of groundwater would be used primarily for dust suppression and vehicle washing with a portion of this water use returning to the groundwater basin. The FSA states that during hydrotesting of the natural gas pipeline, a maximum of 250,000 gallons per day of groundwater could be used and, after the hydrotesting event, this wastewater would either be trucked to a treatment and disposal facility or percolated onsite depending on the results of water analysis. With respect to the potential for significant impacts associated with the project's extraction of groundwater, CEC staff believes the applicant's proposal to import new water for recharge at 108 percent of the project's use would mitigate the depletion of groundwater. The estimated annual potable water demand for operation is two AFY and during construction, potable water use would be limited to drinking water provided in bottles, and waterless portable facilities would be used for sanitary needs. According to the CEC, water quality could be impacted by discharge of eroded sediments from the site, discharge of hazardous materials released during construction, or migration of existing hazardous materials present in the subsurface soil and groundwater. During operation, the FSA states that water quality could be impacted by discharge of eroded sediments from the Sentinel site, discharge of hazardous materials released during operation, or migration of existing hazardous materials present in the subsurface soils and groundwater. The CEC determined that the project's DESCP and SWPPP has included BMPs for wind and water erosion control and storm water management during project construction and operation that would maintain water quality to an impact that is less than significant. The FSA reports that the sanitary wastewater system would collect wastewater from sinks, toilets, and other sanitary facilities for discharge to an onsite septic system as permitted and in accordance with the Riverside County ordinances and standards. The CEC concluded that the Sentinel site is not located within the 100-year floodplain, is too far inland to be affected by tsunami and too far from a large water body to be affected by seiche.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)), and the proposed project has the potential to contribute to significant adverse cumulative hydrology and water quality impacts.

## **Mitigation Measures for Future Hydrology and Water Quality Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant hydrology and water quality impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse hydrology and water quality impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for hydrology and water quality impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of hydrology and water quality impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant hydrology and water quality impact, the potential exists for future indirect hydrology and water quality impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.10**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - LAND USE AND PLANNING**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse land use and planning impacts depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential indirect impacts the proposed project on land use and planning from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential land use impacts is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse land use impacts include assessments of impacts to established communities, land use plans, and conservation plans, which may be caused by future new projects. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant land use and planning impacts if their implementation would result in the following:

- Physically divide an established community.
- Land use and planning impacts would be considered significant if the project conflicts with the land use and zoning designations established by local jurisdictions.
- Conflict with any applicable Habitat Conservation Plans or Natural Community Conservation Plans

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential land use impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on land use and planning for a given area. Based on the methodology described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts related to land use and planning is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse land use impacts. Such future new or modified facilities could potentially result in facilities and developments that could divide an existing community; conflict with adopted land use designations, zoning requirements, or ordinances; or conflict with adopted habitat or natural community conservation plans. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse land use and planning impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.10-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to land use and planning as a result of constructing future new agricultural facilities may include division of established communities (e.g., agricultural facilities which prevent access for community residents), conflicts with adopted land use plans (e.g., conversion of residential, commercial, industrial, or public

lands to agricultural use), and/or conflict with adopted conservation plans (e.g., affecting natural habitats or migratory corridors due to agricultural land uses).

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.0-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on land use and planning. Based on a review of these documents, agricultural-related facilities are typically constructed and operated within areas zoned for agriculture and are likely to be consistent with adopted plans and policies.

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

Therefore, these facilities are unlikely to conflict with land use and conservation plans. Accordingly, these projects in the identified CEQA documents were found to have less-than-significant land use and planning impacts. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the two CEQA documents surveyed for this facility category.

- a) **Division of Existing Communities.** The two CEQA documents for past projects in the agricultural facility category disclosed either no impact or a less-than-significant impact on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from the division of existing communities from implementing the proposed project are determined to be significant.

- b) **Conflict with Adopted Land Use Plans.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) **Conflict with Adopted Conservation Plans.** The two CEQA documents for past projects in the agricultural facility category disclosed either no impact or less-than-significant impact on existing conservation plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects’ consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the last five years. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential of creating divisions within an existing community or conflicts with adopted land use and conservation plans. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse land use and planning impacts in the future. However, the potential exists for one or more future retail/service projects to have significant adverse land use impacts.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.10-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on land use and planning, which involve conflict or inconsistency with adopted plans or policies of agencies with jurisdiction over the projects analyzed. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, some of which were found to result in conflicts with existing plans and policies. However, project-specific impacts were generally not considered significant impacts in the identified CEQA documents as most retail and service establishments surveyed are located in developed urban areas and are largely compatible with regional and local plans, conservation plans, and generally do not result in divisions of existing communities. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the eight CEQA documents surveyed.

- a) Division of Existing Communities.** The eight CEQA documents for past projects in the retail/service facility category disclosed either no impacts or less-than-significant

impacts on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from the division of existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** For most of the projects in the retail/service facility category, environmental impacts resulting from conflicts with adopted plans or policies were concluded to be either less-than-significant or no impact. However, for one project surveyed (Project # 6 – Archstone Hollywood), the lead agency concluded that this retail/service facility category project has the potential to generate significant adverse land use impacts resulting from the need to change the zoning designation for the project site (industrial to commercial retail). In addition, future individual projects in this facility category could be sited in or near a location that could create conflicts with adopted local and regional plans and policies, resulting in potentially significant adverse impacts to land use plans.

Based on information in the CEQA documents evaluated for the proposed project, the additional considerations identified in the preceding paragraph, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** Seven of the eight CEQA documents for past projects in the retail/service facility category disclosed either less-than-significant impacts or no impacts on the conservation plans of the affected areas; the other CEQA document did not discuss the project's conservation plan consistency. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant.

Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential of creating divisions within an existing community or conflicts with adopted land use and conservation plans. Therefore, these facilities would generally have a low likelihood of creating significant adverse land use and planning impacts in the future. However, the potential exists for one or more future large commercial projects to have significant adverse land use impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.10-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on land use and planning, including the creation of divisions within existing communities and conflicts with the land use and conservation plans of the immediate project area. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, some of which were found to result in changes to the zoning code of the surrounding community, conflict with historic resource conservation ordinances, and other general land use plan conflicts. However, project-specific impacts were generally not considered significant in the identified CEQA documents since most of the commercial facilities are located in developed urban areas and are largely compatible with the surrounding land uses, plans, and conservation policies. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the nine CEQA documents surveyed.

- a) **Division of Existing Communities.** Eight of the nine CEQA documents for past projects in the large commercial facility category disclosed either no impacts or less-than-significant impacts on existing communities; the other CEQA document did not discuss impacts regarding division of existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this

facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from the division of existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Land Use Plans.** For most of the projects in the large commercial facility category, environmental impacts resulting from conflicts with adopted plans or policies were concluded to be less-than-significant (without or with mitigation). However, for one project surveyed (Project # 17 – Metro Universal), the lead agency concluded that this large commercial facility category project has the potential to generate significant adverse land use impacts resulting from conflicts with adopted land use plans due to inconsistencies with building height and zoning requirements. In addition, future individual projects in this facility category could be sited in or near a location that could create conflicts with adopted local and regional plans and policies, resulting in potentially significant adverse impacts to land use plans.

Based on information in the CEQA documents evaluated for the proposed project, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plan.** Six of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts or no impacts on the conservation plans of the affected areas; the other three CEQA documents did not discuss the projects' conservation plan consistencies. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Based on these historical data, some of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to create structures or developments that could physically divide an existing community or conflict with adopted land use and/or conservation plans of an area. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse land use and planning impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.10-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on land use and planning, including changes that would result in physical division of an existing community; conflict with adopted land use plans, ordinances, and policies; or conflict with adopted conservation plans. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting and signage, and grading and landscaping of open space areas for outdoor recreational facilities, which were determined to result in conflicts with adopted land use plans and zoning requirements. Accordingly, these projects in the identified CEQA documents were found to have no significant land use and planning impacts. More specifically, the following discussion provides an overall summary of the types of land use impacts identified in the four CEQA documents surveyed.

**a) Division of Existing Communities.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less-than-significant impacts on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from the division of existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or a less-than-significant impact on existing conservation plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and, therefore, would have a low potential to create new divisions within an existing community or to conflict with adopted land use and conservation plans. Therefore, these future facilities would have a low likelihood of resulting in significant land use and planning impacts. However, the potential exists for one or more future institutional projects to generate significant adverse land use and planning impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.10-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on land use and planning, including the creation of physical divisions of the surround communities, conflict with adopted local and regional land use plans, and conflict with adopted local and regional conservation plans. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, some of which were found to result in incompatible land uses with the surrounding community possibly leading to a reduction or degradation of the existing community's character. However, these projects were generally found to have less-than-significant land use and planning impacts in the identified CEQA documents as most of these projects are located in developed urban areas and are largely compatible with the surrounding resources and land uses. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the 15 CEQA documents surveyed.

**a) Division of Existing Communities.** Fourteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts (without or with mitigation) on existing communities; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant.

Therefore, impacts due to physical divisions of existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** The fifteen CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** Thirteen of the fifteen CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts on existing conservation plans; the other two CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not

constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential to divide and existing community or to conflict with adopted land use and/or conservation plans. Therefore, transportation facilities would generally have a low likelihood of resulting in significant land use and planning impacts. However, the potential exists for one or more future projects to have significant impacts on land use and planning.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.10-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on land use and planning, including creating divisions within an existing community, and conflicts with adopted land use and conservation plans of an area. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, some of which were found to result in divisions of existing communities and conflicts with land use and conservation plans. However, the CEQA documents for the projects that were surveyed were found to have less-than-significant land use and planning impacts as most of these projects were located in developed mixed-use, industrial, and commercial zoned areas and are largely compatible with the surrounding land uses. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the three CEQA documents surveyed.

**a) Division of Existing Communities.** The three CEQA documents for past projects in the transportation facility category disclosed either less-than-significant impacts with implementation of mitigation measures or no impacts on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from divisions created within existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** Two of the three CEQA documents for past projects in the transportation facility category disclosed either no impact or less-than-significant impacts with the implementation of mitigation measures on existing conservation plans; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on the historical data, a large number of new utility-oriented facilities are not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage

facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to sensitive residential neighborhoods and publicly accessible scenic areas. The potential scale and height of exhaust structures, flares, and other functional components of a typical large scale utility project may result in land use and planning impacts to surrounding non-industrial land uses. Accordingly, it is likely that a number of conflicts may occur regarding the surrounding communities and land uses of an area. Therefore, future construction and operation of utility facilities would likely generate significant adverse land use and planning impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.10-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on land use and planning, including divisions of existing communities and conflicts with adopted land use and conservation plans. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could generate conflicts with the surrounding land uses that could result in significant adverse impacts. More specifically, the following discussions provide an overall summary of the types of land use impacts identified in the four CEQA documents surveyed.

**a) Division of Existing Communities.** Three of the four CEQA documents for past projects in the transportation facility category disclosed either no impacts or a less-than-significant impact on existing communities; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant.

Therefore, impacts resulting from divisions created within existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** The four CEQA documents for past projects in the utility facility category disclosed less-than-significant impacts or no impact related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** The four CEQA documents for past projects in the transportation facility category disclosed either no impacts or a less-than-significant impact on existing conservation plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would

likely involve the construction of one- to three-story warehouse-type buildings that could require outdoor lighting and moderate amounts of construction activities, which may result in significant adverse land use and planning impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.10-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on land use and planning, including creation of divisions within existing communities and conflicts with adopted land use and conservation plans. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in conflicts with adopted land use plans. However, adverse effects were not found to be significant in the identified CEQA documents since most of these facilities were located in developed urban industrial areas and largely compatible with the surrounding land uses. More specifically, the following discussions provide an overall summary of the types of land use and planning impacts identified in the four CEQA documents surveyed.

**a) Division of Existing Communities.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts with implementation of mitigation measures or no impacts on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from divisions created within existing communities from implementing the proposed project are determined to be significant.

**b) Conflict with Adopted Land Use Plans.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) **Conflict with Adopted Conservation Plans.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either no impacts or less-than-significant impacts (without or with mitigation) on existing conservation plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. These facilities typically require outdoor lighting, smoke stacks, flares, and other industrial structures which have the potential to conflict with the land use and conservation plans of adjacent non-industrial areas. Accordingly, it is likely that these types of project would have an adverse impact on the surrounding land uses and communities. Therefore, these future heavy industrial facilities have the potential of generating significant adverse land use and planning impacts.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.10-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on land use and planning, including divisions to existing communities and conflicts with adopted land use and conservation plans. Based on the

evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could create divisions within the surrounding community and conflicts with land use and conservation plans despite the conclusions in the surveyed CEQA documents. More specifically, the following discussions provide an overall summary of the types of land use and planning impacts identified in the three CEQA documents surveyed.

- a) Division of Existing Communities.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts on existing communities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create physical barriers or divisions in an established community such that significant adverse impacts on existing communities could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts resulting from divisions created within existing communities from implementing the proposed project are determined to be significant.

- b) Conflict with Adopted Land Use Plans.** The three CEQA documents for past projects in the heavy industrial facility category disclosed a less-than-significant impact or no impacts related to the projects' consistency with land use plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create conflicts with applicable land use plans and policies.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects' consistency with applicable land use plans from implementing the proposed project are determined to be significant.

- c) Conflict with Adopted Conservation Plans.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or a less-than-significant impact on existing conservation plans. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this

facility category could be sited in or near a location that could create conflicts with applicable conservation plans for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to land use and planning could be significant. Therefore, impacts related to the projects’ consistency with applicable adopted conservation plans and regulations from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to land use and planning that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents found that some of the past projects have the potential to generate significant adverse impacts resulting from conflicts with adopted land use plans and zoning designations. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff’s independent judgment, and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, land use and planning impacts as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects.” [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal credit accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed SB 388 (Calderon), and potentially one other bill which would require transfer of

emission reduction credits for certain pollutants from SCAQMD's internal credit accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827 or by obtaining offsets on the open market. Past development patterns within the district have resulted in a variety of different land use and planning changes, some of which have resulted in significant land use impacts. Development projects typically conform to existing land use and planning standards and zoning designations. Therefore, any future development within the district resulting from the project would have a low potential for resulting in cumulatively significant impacts related to land use and planning. Nevertheless, since the specific location of individual facilities cannot be predicted with certainty, the evaluation of cumulative planning and land use impacts is even more uncertain. Some of the past projects were determined to have significant adverse impacts related to planning and land use, specifically due to the conflict with adopted land use plans and zoning designations.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSAs prepared by the CEC concluded that the El Segundo project would have no significant adverse land use and planning impacts and both Walnut Creek and Sentinel would be able to mitigate significant land use and planning impacts to less than significant. The FSA for the El Segundo project determined that the project is consistent with land use plans, ordinances, regulations and standards (LORS) and policies applicable to the project site and compatible with existing and planned land uses. Such regulations include the Federal Aviation, California Coastal Act, Warren-Alquist Act, California State Lands Commission Lease, State Subdivision Map Act, City of El Segundo General Plan, City of Los Angeles General Plan, and City of Manhattan Beach General Plan. Finally, the CEC concluded the El Segundo project is compatible with the heavy industrial character of the site and does not disrupt or divide the physical arrangement of an established community.

The Walnut Creek project complies with the LORS of the City of Industry where the project is located according to the FSA. The City of Industry would require a conditional use permit and zone exception for the project and the FSA has determined the Walnut Creek project will comply with these requirements from the City of Industry. The Walnut Creek project, the FSA states, is not located on federally administered lands or state land so is not subject to federal or state land use regulations. The FSA states that a project may have a significant impact on land use if it would create unmitigated noise,

dust, public health hazard or nuisance, traffic, or visual impacts, or when it precludes or unduly restricts existing or planned future uses. As noted in other parts of the FSA for the Walnut Creek projects, these other environmental impacts are mitigated to less than significant so impact to land use has been mitigated to less than significant. In addition, the CEC staff believes the proposed Walnut Creek project is consistent with the goals of the City of Industry General Plan and as conditioned, the project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project; disrupt or divide the physical arrangement of the established community; contribute to a cumulative adverse effect on land use; or preclude or unduly restrict existing or planned future uses. One land use mitigation measure was proposed by the CEC to ensure the design and construction of the project follow the Development Plan Standards of the City of Industry's Development Guidelines.

The Sentinel project, according to the FSA, would not disrupt or divide the physical arrangement of an established community and is consistent with the current development pattern for the area established by the Riverside County General Plan and Zoning Code, and the City of Palm Springs General Plan and Zoning Code with certain project components subject to Riverside County and the City of Palm Springs Public Use Permit or Conditional Use Permit. Further, the CEC determined that the Sentinel project would not be incompatible with existing on-site or nearby uses, as it is consistent with the general character of these permitted uses and the planned development pattern for the area. Finally, the CEC imposed a mitigation measure on the project to comply with the Subdivision Map Act by either adjusting the boundaries of all parcels or portions of parcels that constitute the Sentinel site (as necessary) to merge all properties into a single legal parcel, within the County of Riverside jurisdiction, in accordance with provisions and procedures set forth in the County of Riverside Ordinance 460 (Regulating the Division of Land of the County of Riverside), Section 18.7 (Merging of Contiguous Parcels), or by obtaining the County of Riverside's written approval that its proposal to record a lot-tie agreement is acceptable.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)), and the proposed project has the potential to contribute to significant adverse cumulative land use and planning impacts.

### **Mitigation Measures for Future Land Use and Planning Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant land use and planning impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation

of potentially significant adverse land use and planning impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for land use and planning impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of land use and planning impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant land use and planning impact, the potential exists for future indirect land use and planning impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.11**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - MINERAL RESOURCES**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts to mineral resources depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts on mineral resources from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential impacts to mineral resources is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse indirect impacts to mineral resources include assessments of impacts related to the loss of mineral resources or the loss of mineral resource recovery sites.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts to mineral resources if their implementation would result in any of the following:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.
- Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

## IMPACT ANALYSIS

The following discussion presents an evaluation of potential indirect impacts to mineral resources from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential indirect impacts they may have on mineral resources of a given area. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of mineral resource impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse indirect impacts to mineral resources. Such future new or modified facilities could potentially result in the loss of mineral resources. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse impacts have been analyzed based on available information pertaining to each facility category.

### Potential Impacts of Identified Facility Categories

#### Agricultural Facilities

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to mineral resources as a result of constructing future new agricultural facilities may include the loss of mineral resources due to siting of future facilities. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to areas known to contain important mineral resources. The potential scale and geographic distribution of farm structures, dairy processing plants, and other agricultural-related structures may result in significant impacts to mineral resources.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.11-1) which summarizes the

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. Source: ICF Jones & Stokes, 2009.		

determination of impacts on mineral resources in all the reviewed CEQA documents. The two selected CEQA documents<sup>2</sup>, which were prepared for a winery and a county

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on mineral resources. Based on a review of these documents, agricultural-related facilities are typically constructed and operated within areas zoned for agriculture and were consistent with the existing land use of the surrounding area. Accordingly, these projects were found to have less-than-significant mineral resource impacts. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the two CEQA documents surveyed for this facility category.

- a) **Loss of Mineral Resources.** One of the two CEQA documents for a past project in the agricultural facility category disclosed a less than significant impact related to the loss of mineral resources; the other CEQA document did not discuss loss of mineral resources impacts. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) **Loss of Mineral Resource Recovery Site.** One of the two CEQA documents for a past project in the agricultural facility category disclosed a less than significant impact related to the loss of mineral resource recovery sites; the other CEQA document did not discuss impacts from the loss of mineral resources recovery site. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in an area designated as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new

construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for affecting areas known to contain mineral resources or areas designated as mineral resource recovery sites. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts to mineral resources in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.11-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on mineral resources. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings. Project-specific impacts were not considered significant impacts as most retail and service establishments surveyed are located in developed urban areas and not areas designated as mineral resource recovery sites. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the eight CEQA documents surveyed.

- a) **Loss of Mineral Resources.** Seven of the eight CEQA documents for past projects in the retail/service facility category disclosed either less than significant or no impacts related to the loss of mineral resources; the other CEQA document did not discuss impacts related such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) **Loss of Mineral Resource Recovery Site.** Seven of the eight CEQA documents for past projects in the retail/service facility category disclosed either less than significant

or no impacts related to the loss of mineral resource recovery sites; the other CEQA document did not discuss impacts related such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting and be located in developed areas. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential for being located in areas known to contain mineral resources or areas known to contain mining activities. Therefore, these facilities would generally have a low likelihood of resulting in significant impacts to mineral resources. However, the potential exists for one or more future large commercial projects to have significant impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.11-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on mineral resources. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas. Project-specific impacts were generally not considered significant impacts since most of the commercial facilities are located in developed urban areas and not areas known to support mining operations or areas known to contain mineral resources. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the nine CEQA documents surveyed.

- a) **Loss of Mineral Resources.** Eight of the nine CEQA documents for past projects in the large commercial facility category disclosed no impacts related to the loss of mineral resources; the other CEQA document did not discuss impacts related to such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) **Loss of Mineral Resource Recovery Site.** Eight of the nine CEQA documents for past projects in the large commercial facility category disclosed no impacts related to the loss of mineral resource recovery sites; the other CEQA document did not discuss impacts related to such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter undeveloped open space and natural areas, areas that may contain mineral resources or mining activities. Therefore, the potential exists for one or more

future entertainment/recreational projects to generate significant adverse mineral resources impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.11-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on mineral resources. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities. Depending on location, these projects could impact areas known to contain mineral resources. More specifically, the following discussion provides an overall summary of the types of impacts on mineral resources identified in the four CEQA documents surveyed.

**a) Loss of Mineral Resources.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

**b) Loss of Mineral Resource Recovery Site.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore,

impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would, therefore, have a low potential for alteration of areas known to contain mineral resources or mining activities. Accordingly, these future facilities would have a low likelihood of resulting in significant impacts to mineral resources. However, the potential exists for one or more future institutional projects to generate significant adverse impacts on mineral resources.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 11.2-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on mineral resources. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, which were found to result in less-than-significant impacts to mineral resources. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the 15 CEQA documents surveyed.

- a) **Loss of Mineral Resources.** 14 of the 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources; the other CEQA document did not address loss of mineral resources impacts. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) Loss of Mineral Resource Recovery Site.** 14 of the 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites; the other CEQA document did not address impacts related to such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential for significantly impacting areas known to contain mineral resources. Therefore, transportation facilities would generally have a low likelihood of resulting in significant mineral resources impacts according to the CEQA documents reviewed. However, the potential exists for one or more future transportation-related projects to have significant impacts on mineral resources.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.11-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on mineral resources. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, some of which were found to result in changes to areas known to contain mineral resources. However, the CEQA documents for the projects that were surveyed were found to have less-than-significant mineral resource impacts as most of these projects were located in developed mixed-use, industrial, and commercial zoned areas. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the three CEQA documents surveyed.

- a) Loss of Mineral Resources.** The three CEQA documents for past projects in the transportation facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) Loss of Mineral Resource Recovery Site.** The three CEQA documents for past projects in the transportation facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to areas known to contain mineral resources or areas that support mining activities. Therefore, future construction and operation of utility facilities could generate significant adverse mineral resources impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.11-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on mineral resources. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could generate changes to areas that support mining activities. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the four CEQA documents surveyed.

- a) **Loss of Mineral Resources.** The four CEQA documents for past projects in the utility facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore,

impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) Loss of Mineral Resource Recovery Site.** The four CEQA documents for past projects in the utility facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in an adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that could result in significant adverse impacts to mineral resources.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.11-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on mineral resources. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in changes to areas known to support mining activities or areas that contain mineral resources. However, adverse effects were not found to be significant since most of these facilities were located in developed urban industrial areas. More specifically, the following discussions provide an overall summary of the types of mineral impacts on mineral resources identified in the four CEQA documents surveyed.

- a) **Loss of Mineral Resources.** The four CEQA documents for past projects in the light industrial warehouse facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) **Loss of Mineral Resource Recovery Site.** The four CEQA documents for past projects in the light industrial warehouse facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a potentially significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. These facilities typically are located in industrial areas. Accordingly, though it is unlikely that these types of project, based on the surveyed CEQA documents, would significantly impact designated mineral resource recovery site

areas, future heavy industrial facilities have the potential of generating significant adverse impacts to mineral resources.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.11-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on mineral resources. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could generate changes in areas that contain mineral resources or designated recovery site areas. More specifically, the following discussions provide an overall summary of the types of impacts on mineral resources identified in the three CEQA documents surveyed.

- a) **Loss of Mineral Resources.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resources. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas known to contain mineral resources that could result in the loss of mineral resources.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resources resulting from implementing the proposed project are determined to be significant.

- b) **Loss of Mineral Resource Recovery Site.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less than significant impacts related to the loss of mineral resource recovery sites. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in area designated to as a recovery site, resulting in a significant adverse impact.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to mineral resources could be significant. Therefore, impacts related to the loss of mineral resource recovery site resulting from implementing the proposed project are determined to be significant.

## **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to mineral resources that were either less-than-significant or no impacts. However, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the CEQA documents evaluated provide only a "snapshot" of the CEQA documents for the applicable facility categories available at the time the analysis was prepared, impacts to mineral resources as an indirect result of implementing the proposed project are determined to be significant.

## **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed SB 388 (Calderon), and potentially one other bill which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315 or SB 827, or by obtaining offsets on the open market. None of the 52 projects surveyed were found to contribute to the cumulative loss of known mineral resources that would be of value to the region and the residents of the state or contribute to the cumulative loss of availability of locally-important mineral resource recovery sites delineated on local general plans, specific plans or other land use plans. However, any future facilities obtaining offsets from the SCAQMD's internal accounts that would result in the loss of known mineral resources or the availability of locally-important mineral resource recovery sites would add to this cumulative reduction in the amount of mineral resources available within the district. Since the specific location of individual facilities cannot be predicted with certainty, the evaluation of cumulative impacts on mineral resources is even more uncertain.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The El Segundo and Walnut Creek projects were determined to have no significant adverse mineral resource impacts according to their respective FSAs. The potential significant impact to mineral resources from the Sentinel project, according to the FSA, could be mitigated to less than significant. For example, the CEC determined for the El Segundo project that the project location is designated as Mineral Resources Zone-3, an area of undetermined mineral resources potential and no mineral resources are known to have been identified at the present site and there are no significant sand or gravel mines in the area. Therefore, the CEC concluded no significant adverse mineral resources impacts will result from the El Segundo project. Similarly, the Walnut Creek project, according to the FSA, there are no known viable mineral resources on the property and no significant mineral deposits (aggregates) present, although mineralogical resources (sand, gravel, oil and gas) do exist in the vicinity of the project, such as the Walnut oil field approximately one mile to the east-northeast. So, it was CEC staff's opinion that the potential for significant adverse impacts to the project from mineral resources from the construction, operation, and closure of the proposed project, is low. However, in order to ensure the impacts remain low and less than significant, the project is subject to the following mitigation measure: adopting a compliance monitoring program that will ensure compliance with the laws, ordinances and regulations applicable to mineral resources.

The entire Sentinel site is mapped as Mineral Resource Zone 3, which refers to "areas containing mineral deposits the significance of which cannot be evaluated from available data." The CEC determined that the Sentinel project has no known viable mineralogical resources within three miles of the site and no productive oil or gas fields will be affected by project development, therefore, the potential for significant adverse impacts to the project from mineral resources from the construction, operation, and closure of the proposed project, is low. Similar to the Walnut Creek, the Sentinel project imposes monitoring and mitigation measures for mineral resources to ensure compliance with applicable laws, ordinances, regulations, and standards (LORS) to mitigate potential mineral resources impacts to less than significant.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative mineral resources impacts.

### **Mitigation Measures for Future Mineral Resources Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant mineral resources impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse mineral resources impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for mineral resources impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of mineral resources impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant mineral resources impact, the potential exists for future indirect mineral resources impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES - NOISE**

**Introduction**

**Impact Analysis**

## INTRODUCTION

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse noise impacts depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts of the proposed project on noise from the construction and operation of future new facilities.

### Methodology

The methodology for determining the significance of potential noise impacts is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses address the potential noise impacts that could result from the construction and operation of a project within a primary facility category in the district. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### Significance Criteria

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant noise impacts if their implementation would result in either one of the following:

- Construction noise levels would exceed local noise ordinances or, if the noise threshold is currently exceeded, project noise sources would increase ambient noise levels by more than three decibels (dBA) at the site boundary. Construction noise levels would be considered significant if they would exceed federal Occupational Safety and Health Administration (OSHA) noise standards for workers.
- The proposed project operational noise levels would exceed any of the local noise ordinances at the site boundary or, if the noise threshold is currently exceeded, project noise sources would increase ambient noise levels by more than three dBA at the site boundary.

- A substantial permanent increase in ambient noise level above levels existing without the project.
- A substantial temporary or periodic increase in ambient noise levels existing without the project.
- Exposure of persons to noise near public airport.
- Exposure of persons to noise near private airstrip.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential noise impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on the noise environment. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of noise impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts on the noise environment. Such future new or modified facilities could potentially result in development adjacent to noise-sensitive receptors. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse noise impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

On a programmatic level, noise impacts as a result of constructing future new agricultural facilities may include impacts related to the generation of noise levels in excess of established noise standards or thresholds, the generation of groundborne vibration, permanent increases in ambient noise levels, temporary or periodic increases in ambient noise levels, and potential impacts related to noise exposure near airports or private airstrips. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to noise-sensitive receptors, such as residential uses and schools. Activities related to the operation of agricultural facilities may result in significant noise impacts.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.12-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. Based on a review of these documents, agricultural-related facilities may result in noise impacts, specifically increased ambient noise during construction activities due to various excavating, grading, and construction equipment. Such increases would exceed established local standards on acceptable noise within the vicinity of noise-sensitive land uses. However, these projects were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the two CEQA documents surveyed for this facility category.

**a) Violation of Applicable Noise Standards.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts (without or with mitigation) related to the violation of established noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** Both of the CEQA documents for past projects in the agricultural facility category disclosed a less-than-significant impact related to excessive groundborne noise or vibration. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts on ambient noise levels. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent increases in the ambient noise beyond generally acceptable levels.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts on the existing ambient noise levels from implementing the proposed project are determined to be significant.

- e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** Both of the CEQA documents for past projects in the agricultural facility category disclosed either no impact or a less-than-significant impact related to noise exposure near airports or private airstrips. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, noise impacts as a result of constructing future new retail facilities may include impacts related to the generation of noise levels in excess of established noise standards or thresholds, the generation of groundborne vibration, permanent increases in ambient noise levels, temporary or periodic increases in ambient noise levels, and potential impacts related to noise exposure within two miles of a public airport or private airstrip. In addition, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas, where a potential to create new noise impacts on existing sensitive receptors exists. Therefore, the potential exists for one or more future retail/service projects to have significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.12-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on noise, including potential adverse effects related to construction noise in excess of established noise standards, as well as temporary increases to ambient noise levels due to various types of noise-producing construction equipment. Based on a review of these documents, retail/service facilities may result in the temporary or periodic increases in ambient noise due to the operation of on-site facilities (e.g., noise associated with loading docks and delivery vehicles) or permanent increases in ambient noise due to the corresponding increases in traffic in an area. Most of these projects were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the eight CEQA documents surveyed for this facility category.

- a) Violation of Applicable Noise Standards.** The eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) related to the violation of established noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) related to excessive groundborne noise or vibration. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The eight CEQA documents for past projects in the retail/service facility category indicated that for most of the projects, environmental impacts on the ambient noise levels were concluded to be less-than-significant (without or with mitigation). However, for some projects surveyed, the lead agencies concluded that the retail/service facility projects have the potential to generate significant adverse permanent or periodic increases in ambient noise levels, such as those disclosed for Project #4 (Wilshire La Brea Project) and Project #5 (Shops at Santa Anita Park Specific Plan Project), which were found to have a potential to increase ambient noise due to the addition of vehicular traffic during operations and due to the use of noise-producing on-site activities, such as the loading docks. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have

obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on the existing ambient noise levels from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** Five of the eight CEQA documents for past projects in the retail/service facility category disclosed either no impacts or less-than-significant noise impacts related to airports or private airstrips; the other three CEQA documents did not address noise impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings and parking structures/lots. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas. However, the potential exists for one or more future large commercial project to generate significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.12-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to potentially result increased ambient noise during construction and demolition activities that would exceed established local standards on acceptable noise levels, operational traffic noise that would produce permanent increases to ambient noise levels in excess of established standards, or construction activities that would produce groundborne noise and vibrations in excess of acceptable vibration levels. However, most project-specific impacts were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the nine CEQA documents surveyed.

**a) Violation of Applicable Noise Standards.** The nine CEQA documents for past projects in the large commercial facility category indicated that for most of the projects, environmental impacts on the ambient noise levels were concluded to be less-than-significant (without or with mitigation). However, for some projects, the lead agencies concluded that large commercial projects have the potential to generate significant adverse noise impacts, such as those disclosed for the Project #15 (Boulevard 6200 Project) and Project #19 (Plaza at the Glen Project), which were found to have a potential to expose people to noise levels in excess of established standards due to construction noise generated by these projects. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

**b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The nine CEQA documents for past projects in the large commercial facility category indicated that for most of the projects, environmental impacts pertaining to groundborne noise and vibration were concluded to be less-than-significant. However, for some

projects, the lead agencies concluded that the large commercial projects have the potential to generate significant adverse groundborne noise and vibration impacts, such as those disclosed for the Project #16 (Panorama Palace Project) and Project #19 (Plaza at the Glen Project), which were both found to have a potential to expose people to excessive groundborne noise or vibration levels during construction activities, particularly during activities such as pile driving. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

**c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The nine CEQA documents for past projects in the large commercial facility category indicated that for most of the projects, environmental impacts pertaining to the temporary, periodic, or permanent increases in ambient noise levels were concluded to be less-than-significant (without or with mitigation). However, for some projects, the lead agencies concluded that the large commercial projects have the potential to generate significant increases in the ambient noise levels, such as those disclosed for the Projects #12 (2000 Avenue of the Stars), #15 (Boulevard 6100), #16 (Panorama Palace), #17 (Metro Universal), and #19 (Plaza at the Glen), which were found to have a potential to permanently increase ambient noise levels due to increased vehicular traffic during project operations and on-site activities, such as loading dock operation, and to periodically increase ambient noise levels due to construction-related noise. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts on the existing

ambient noise levels from implementing the proposed project are determined to be significant.

- e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** Five of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts or no impact on noise related to airports or private airstrips. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

#### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter undeveloped open space and natural areas that may result in changes to the existing noise conditions or lead to new sources of ambient noise. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.12-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on noise, including potential adverse effects related to generation of noise in excess of established standards,

generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, parking lots, and grading and landscaping of open space areas for outdoor recreational facilities, which were found to result in both periodic and permanent increases in ambient noise levels due to construction-related noise, event-related traffic noise, noise from the operation of stationary sources, and noise from vehicular traffic, some of which were in excess of established applicable noise standards. Based on a review of these documents, entertainment/recreational-related facilities may result in noise impacts, including the periodic increases in ambient noise during construction activities due to various excavating, grading, and construction equipment; periodic increases in ambient noise during special events resulting from increases in traffic and some event-related equipment or vehicles, such as helicopters; or permanent increases in ambient noise during facility operation resulting from noise-producing activities, such as loading dock operations. Such increases in ambient noise levels would exceed standards related to sensitive land uses, such as residences and recreational facilities (e.g., parks). More specifically, the following discussion provides an overall summary of the types of noise impacts identified in the four CEQA documents surveyed.

- a) Violation of Applicable Noise Standards.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that for most of the projects, environmental impacts on the ambient noise levels were concluded to be less-than-significant (without or with mitigation). However, for one of the projects, the lead agency concluded that an entertainment/recreational facility category project has the potential to result in significant adverse noise impacts, such as those disclosed for the Project #20 (City of Industry Business Center - NFL Stadium), which was found to have a potential to expose people to noise levels in excess of established standards due to traffic noise generated by the events during the operation of the project. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** Three of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts related to groundborne noise or vibration; the other CEQA document did not address impacts related to groundborne noise or vibration. However, based on SCAQMD staff's review of the distribution of

similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

**c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that all of these projects would have significant impacts on the existing ambient noise levels. For each of the four projects surveyed, the lead agencies concluded that the entertainment/recreation projects have the potential to result in a significant permanent, periodic, or permanent and periodic increase in ambient noise levels due to construction related noise; operational stationary source noise, such as parking structures or helicopters; and increased traffic noise during operation and special events, such as professional sports games. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on the existing ambient noise level from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** Three of the four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts or no noise impacts related to airports or private airstrips; the other CEQA document did not address noise impacts related to this issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). However, based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and parking lots. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and would, therefore, have a low potential to measurably increase the existing noise levels. However, the potential exists for one or more future institutional projects to have significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.12-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities. Based on review of these documents, institutional facilities may result in noise impacts, including both permanent and periodic increases in ambient noise levels during construction and demolition activities, some of which were found to be in excess of established standards regarding acceptable noise levels, or the generation of groundborne vibrations related to construction and demolition activities. However, most project-specific impacts were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the 15 CEQA documents surveyed.

- a) Violation of Applicable Noise Standards.** The 15 CEQA documents for past projects in the institutional facility category indicated that for most of the projects, environmental impacts on the ambient noise levels were concluded to be less-than-significant (without or with mitigation or no impact related to violation of established noise standards. However, for one of the projects (Project # 33 – USC Health Sciences Campus), the lead agency concluded that this institutional project had the potential to result in a significant adverse noise impact due to the exposure of people to noise levels in excess of established standards during project construction. Similarly, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people or incompatible land uses to noise levels in excess of established noise standards.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The 15 CEQA documents for past projects in the institutional facility category indicated that for most of the projects, environmental impacts pertaining to groundborne noise and vibration were concluded to be less-than-significant (without or with mitigation). However, for some projects, the lead agencies concluded that large commercial projects have the potential to result in significant adverse noise impacts, such as those disclosed for the Projects #27 (La Cienega Eldercare Facility) and #28 (Museum of Tolerance), which were found to have a potential to expose people to excessive groundborne noise or vibration levels due to construction activities, such as pile driving. Similarly, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The 15 CEQA documents for past projects in the institutional facility category indicated that for some of the projects, environmental impacts pertaining to the temporary, periodic, or

permanent increases in ambient noise levels were concluded to be less than significant (without or with mitigation). However, for the other projects, the lead agencies concluded that large commercial projects have the potential to result in significant permanent and/or periodic increases in ambient noise levels, such as those disclosed for Projects #25 (Buckley School Enhancement), #26 (Cedars Sinai West Tower), #27 (La Cienega Eldercare Facility), #28 (Museum of Tolerance), #29 (New Paradise Church), #31 (Stephen Wise Middle School Relocation), #32 (Temple Israel of Hollywood), #33 (USC Health Sciences Campus), and #37 (Harvard-Westlake School). These projects were found to have a potential to permanently increase ambient noise due to increased vehicular traffic during operations; permanently increase ambient noise due to noise from a proposed land use, such as a children's playground; and periodically increase ambient noise due to construction-related activities. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on the existing ambient noise levels from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** 11 of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impact on noise related to airports or private airstrips; the other four CEQA documents did not address noise impacts related to airports or private airstrips. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to

continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities). Any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential to create noise impacts near sensitive receptors or incompatible land uses. However, the potential exists for one or more future transportation-related projects to have significant adverse noise impacts.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.12-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, and bus storage and maintenance facilities. Based on a review of these documents, transportation-related facilities may result in noise impacts due to periodic construction-related increases in the ambient noise levels. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the three CEQA documents surveyed.

- a) **Violation of Applicable Noise Standards.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to violation of established noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts related to groundborne noise or vibration; the other CEQA document did not address impacts related to such issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The three CEQA documents for past projects in the transportation facility category indicated that for most of the projects, environmental impacts pertaining to the temporary, periodic, or permanent increases in ambient noise levels were concluded to be less-than-significant (without or with mitigation). However, for one of the projects (Project #39 – TraPac Terminal Expansion), the lead agency concluded that this transportation project had the potential to result in significant periodic increases in ambient noise levels due to construction activities in several locations near sensitive receptors. Similarly, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create periodic significant adverse impacts on the ambient noise beyond a generally acceptable level.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on the existing ambient noise levels from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** One of the three CEQA documents for past projects in the transportation facility category disclosed no impact related to airports or private airstrips; the other two CEQA documents did not address impacts related to such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities are not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Any new utility project would most likely be constructed within an already developed area and would, therefore, have a low potential to create new sources of ambient noise or alter the existing noise conditions of an area. However, the potential exists for one or more future utility projects to have significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.12-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near

airports or private airstrips. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, may result in the periodic increases in ambient noise levels due to construction and demolition activities, permanent increases in ambient noise levels due to increased traffic noise and operation of noise-producing stationary equipment, and noise levels in excess of established applicable noise standards. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the four CEQA documents surveyed.

- a) Violation of Applicable Noise Standards.** The four CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts (without or with mitigation) related to violation of established noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The four CEQA documents for past projects in the utility-oriented facility category disclosed less-than-significant impacts related to groundborne noise or vibration. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The four CEQA documents for past projects in the utility-oriented facility category disclosed less-

than-significant impacts (without or with mitigation) on the existing ambient noise levels of an area. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either temporary or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts on the existing ambient noise level from implementing the proposed project are determined to be significant.

- e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** The four CEQA documents for past projects in the utility-oriented facility category disclosed either a less-than-significant impact or no noise impacts related to airports or private airstrips. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings. Any new light industrial/warehouse facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential to

measurably change the existing noise conditions or lead to new sources of ambient noise. However, the potential exists for one or more future light industrial projects to have significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.12-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. Based on the evaluation of these projects, the construction of warehouse-type and office-type structures may result in noise impacts, including the periodic increases in ambient noise levels due to construction and demolition activities, permanent increases in ambient noise levels due to increased traffic noise and operation of stationary noise producing equipment, and noise levels in excess of established applicable noise standards. However, most project-specific impacts were found to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the four CEQA documents surveyed.

- a) Violation of Applicable Noise Standards.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to violation of established noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create significant adverse impacts by exposing people to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impact on groundborne noise or vibration. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location

that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

**c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The four CEQA documents for past projects in the light industrial/warehouse facility category indicated that for most of the projects, environmental impacts pertaining to the temporary, periodic, or permanent increases in ambient noise levels were concluded to be less-than-significant. However, for one of the projects (Project #49 – 959 Seward Street), the lead agency concluded that this light industrial/warehouse project had the potential to result in significant impacts from periodic increases in ambient noise levels due to construction period noise. Similarly, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create periodic adverse impacts on the ambient noise beyond generally acceptable levels.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on the existing ambient noise levels from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** Three of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either a less-than-significant impact or no impacts related to noise caused by airports or private airstrips; the other CEQA document did not discuss noise impacts related to airports or private airstrips. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related

to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. Any new heavy industrial facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential for measurably changing the existing noise conditions or lead to new sources of ambient noise. However, the potential exists for one or more future heavy industrial projects to have significant adverse noise impacts.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.12-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on noise, including potential adverse effects related to generation of noise in excess of established standards, generation of groundborne noise or vibrations, permanent increases in ambient noise levels, periodic increases in ambient noise levels, and exposure to excessive noise near airports or private airstrips. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could generate noise impacts, including the periodic increases in ambient noise levels due to construction and demolition activities, permanent increases in ambient noise levels due to increased traffic noise and operation of stationary noise producing equipment, or noise levels in excess of established applicable noise standards. However, project-specific impacts were found in the CEQA document surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on noise. More specifically, the following discussions provide an overall summary of the types of noise impacts identified in the three CEQA documents surveyed.

- a) **Violation of Applicable Noise Standards.** The three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts related to compliance with applicable noise standards. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this

facility category could be sited in or near a location that could create significant adverse impacts by exposing people or incompatible land uses to noise levels in excess of established noise standards.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to noise levels in excess of established noise standards from implementing the proposed project are determined to be significant.

- b) Exposure to Excessive Groundborne Noise or Groundborne Vibration.** The three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts on groundborne noise or vibration. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that is sensitive to groundborne vibrations or already exposed to groundborne vibrations, which could exacerbate these conditions or create significant adverse impacts to persons residing in and around an particular area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts from groundborne noise or vibration from implementing the proposed project are determined to be significant.

- c, d) Permanent or Periodic Increase in Ambient Noise Levels.** The three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts (without or with mitigation) on the existing ambient noise levels. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that could create either periodic or permanent significant adverse impacts on the ambient noise beyond generally acceptable levels.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts on existing ambient noise levels from implementing the proposed project are determined to be significant.

**e, f) Exposure of Persons to Noise Near a Public Airport or Private Airstrip.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts on noise related to airports or private airstrips. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near an area already experiencing exposure to noise from a nearby airport or private airstrip, which could exacerbate existing conditions and create significant adverse impacts related to noise.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, noise impacts could be significant. Therefore, impacts related to exposure of persons to noise from nearby airports or private airstrips from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to noise that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents found that some of the past projects have the potential to generate significant adverse noise impacts, including potential adverse effects related to the violation of applicable noise level standards, generation of groundborne noise or vibration, and periodic or permanent increases in ambient noise levels. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, noise impacts as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed SB 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Development within a project area could cumulatively affect noise by creating additional sources of ambient noise or through siting of noise-producing land uses immediately adjacent to sensitive receptors. Since some of the past projects have the potential to generate significant adverse noise impacts, including potential adverse effects related to the generation of noise levels in excess of established noise standards or thresholds, the generation of groundborne vibration, permanent increases in ambient noise levels, temporary or periodic increases in ambient noise levels, and potential impacts related to noise exposure near airports or private airstrips, cumulative impacts resulting from any future projects to be constructed within the district are determined to be potentially considerable.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

Potentially significant adverse noise impacts from the construction and operation of the three power plants were determined by the CEC to be significant but could be mitigated to less than significant. As written in the FSA for the El Segundo project, the construction and operation of any power plant creates noise or unwanted sound, and the character and loudness of this noise, the times of day or night that it is produced, and the proximity of the facility to sensitive receptors determine whether the facility would meet applicable noise control laws and ordinances, and whether it would cause significant adverse noise impacts. The FSA continues to state that vibration may be produced as a result of power plant operation or of construction practices, such as pile driving, and that ground-borne energy of vibration has the potential to cause structural damage and annoyance.

Specifically, the El Segundo FSA determined that the project will generate noise from the construction and demolition louder than permissible under local noise ordinances, so noise mitigation measures are recommended to monitor and mitigate potential construction and demolition noise impacts. These mitigation measures include notifying all residents, property owners, and business owners within one-half mile of the site, and the City of Manhattan Beach, the City of El Segundo, and L.A. County Lifeguard Headquarters of the commencement of project construction; documenting, investigating, evaluating, and attempting to resolve all project-related noise complaints; establishing a “hotline” for noise complaints; designating a noise monitoring officer; taking all feasible measures to reduce the noise at its source as soon as possible; requiring haul trucks and other engine-powered equipment to be equipped with adequate mufflers; operating haul trucks in accordance with posted speed limits; and limiting truck engine exhaust brake use to emergencies. The implementation of these mitigation measures during construction, the CEC concluded, will reduce the significant adverse noise impacts to less than significant. The operation of the El Segundo project, according to the FSA, will result in a steady, continuous noise source day and night from the operation of the steam turbine generator, gas turbine generators, heat recovery steam generators, transformers, boiler feed pumps, circulating water pumps, fin fan coolers, and gas compressors. Occasional short-term increases in noise levels would occur as steam relief valves open to vent pressure, or during startup or shutdown as the plant transitions to and from steady-state operation. The FSA determined that at other times, such as when the plant is shut down for lack of dispatch or for maintenance, noise levels would decrease. Operational noise mitigation measures include the following: enclosure around the gas turbine compartments; noise barriers around the gas turbine generators, boilers, and transformers; acoustic shroud around the gas turbine exhaust ducts and transition ductwork; silencers at the boiler exit stack; enclosures around the steam turbine package and the generator package; enclosures for major pumps; and noise barriers for fin fan coolers. In addition, the CEC requires the project design and implementation to include appropriate noise mitigation measures adequate to ensure that the project will not cause resultant noise levels to exceed the ambient median noise level ( $L_{50}$ ) at residential receivers by two decibels or more, so that the noise due to plant operations will comply with the noise standards of the El Segundo and Manhattan Beach Municipal Codes and the operation of the El Segundo project will not produce significant adverse noise impacts.

The construction activities at the Walnut Creek project will be temporary and will occur between the hours of 7:00 a.m. and 8:00 p.m., which would be in compliance with the applicable noise laws, ordinances, regulations and standards (LORS). In the event that actual construction noise should annoy nearby workers or residents, CEC staff proposes conditions which would establish a Noise Complaint Process that requires the project proponent to resolve any problems caused by construction noise. Further, the CEC determined that the adverse noise impacts from construction activities would be mitigated by notifying all residents within one-half mile of the site and the linear facilities of the commencement of project construction; documenting, investigating, evaluating, and attempting to resolve all project-related noise complaints; limiting hours of operation of heavy construction equipment; requiring haul trucks and other engine-powered equipment to be equipped with adequate mufflers; operating haul trucks in accordance with posted speed limits; and limiting truck engine exhaust brake use to emergencies.

The only construction activity likely to produce vibration that could be perceived offsite would be pile driving, however, because vibration studies concluded pile driving would be less than the vibration threshold to induce structural damage, CEC staff believes pile driving would not result in significant vibration impacts at the nearby commercial buildings or the nearest sensitive receptors. The primary noise sources from the operation of the Walnut Creek project would include the gas turbine generators, gas turbine air inlets, exhaust stacks, wet cooling tower, natural gas fuel compressor, electrical transformers, and various pumps and fans. The FSA listed the following noise mitigation measures: additional noise barriers around gas turbine enclosures; inlet air filter/ventilation silencing; increased stack silencing; increased thickness of the selective catalytic reduction (SCR) plate steel; additional noise barriers around SCR inlet and expansion joint; low noise, slow speed cooling tower fans and motors; cooling tower noise barriers and/or splash noise attenuators; additional cooling tower noise barriers; and silencers and/or enclosures on auxiliary equipment. Additional mitigation found in the FSA to ensure the adverse operational noise impacts are less than significant include: designing and implementing the project to include appropriate noise mitigation measures adequate to ensure that operation of the project will not cause noise levels attributable to plant operation, during the four quietest consecutive hours of the nighttime, to exceed an average of 52 decibels (dBA); and conduct an occupational noise survey to identify the noise hazardous areas in the facility. According to the FSA, the City of Industry General Plan contains noise goals, standards, and policy statements to encourage compatibility with surrounding communities and to maintain a low profile of noise sources in the surrounding communities. CEC staff concludes that the Walnut Creek project operational noise will create less than significant adverse impacts at the most sensitive receptors and will thus comply with the applicable local noise LORS.

For the Sentinel project, CEC staff concludes that the project can be built and operated in compliance with all applicable noise and vibration LORS and, if built in accordance with the mitigation measures proposed, would produce no significant adverse noise impacts on sensitive receptors, either direct or indirect. Adverse noise impacts would result from the operation of construction equipment (e.g., bulldozers, haul trucks) and operational plant equipment (e.g., turbines, pumps). Operational noise mitigation measures in the Sentinel FSA included locating natural gas compressors in two sound-attenuated buildings; installing silencers on the gas turbine exhaust stack; and evacuating and/or removing the two residences nearest the project site. The FSA for the Sentinel project listed the following mitigation measures to mitigate significant noise impacts from both construction and operation to less than significant: notify all residents within three-quarter mile of the site of the commencement of project construction; establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project; documenting, investigating, evaluating, and attempting to resolve all project-related noise complaints; approve a noise control program and implement; design and implement the project to include appropriate noise mitigation measures adequate to ensure that operation of the project will not cause noise levels due solely to plant operation to exceed an average of 48 dBA Leq; conduct an occupational noise survey to identify the noise hazardous areas in the facility; restrict noisy construction work relating to any project features to specific times of day; requiring haul trucks and other engine-powered equipment to be equipped with adequate

mufflers; operating haul trucks in accordance with posted speed limits; and limiting truck engine exhaust brake use to emergencies.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative noise impacts.

### **Mitigation Measures for Future Noise Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant noise impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse noise impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for noise impacts in this EA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. As a result, those measures identified in the survey of CEQA documents to mitigate noise impacts are not listed in this Program PEA. Identification and adoption of mitigation of noise impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant noise impact, the potential exists for future indirect noise impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.13**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – POPULATION AND HOUSING**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts on population, housing, and employment depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts of the proposed project on population, housing, and employment from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential population, housing, and employment impacts is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of population, housing, and employment impacts include assessments of growth inducing effects of future new projects for population, housing, and employment in comparison with growth forecasted in adopted plans, and assessment of displacement of housing and people or need for replacement housing elsewhere as a result of future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as “a substantial or potentially substantial, adverse change in the environment” (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is “significant,” generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant population, housing, and employment impacts if their implementation would result in any of the following:

- Induce substantial growth either directly or indirectly.
- Displace substantial number of existing housing.

- Displace substantial number of people necessitating construction of replacement housing.
- The proposed project would produce additional population, housing or employment inconsistent with adopted plans either in terms of overall amount or location.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential population, housing, and employment impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on population, housing, and employment. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts to population, housing, and employment is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse population, housing, and employment impacts. Such future new or modified facilities could potentially result in impacts to population and housing by inducing growth, such that it exceeds adopted population or housing projections for the planning area or sub-region in which the development site is located, potentially creating or removing jobs, displacing existing housing and people, or creating new housing. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse population, housing, and employment impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup>

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to population, housing, and employment as a result of constructing future new agricultural facilities may include potential increases in population, housing, and jobs in the area. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may result in displacement of housing and population.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.13-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on population, housing, and employment. Based on a review of these documents, agricultural-related facilities may result in an increase in population, housing, or jobs in the area; however, the growth is likely to be consistent with the adopted plans and policies. In addition, the agricultural projects are likely to be constructed in areas zoned for agricultural uses, and thus, the resulting displacement of people and housing as a result of construction of the facility would not be significant. Accordingly, these projects were found in the CEQA documents surveyed to have less-than-significant impact or no impact on population, housing, and employment in the document. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the two CEQA documents surveyed for this facility category.

**a) Substantial Growth.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

**b, c) Displacements of Housing and People Necessitating Replacement Housing.**

One of the two CEQA documents for a past project in the agricultural facility category disclosed a less-than-significant impact for displacement of housing and people or necessitating the need for replacement housing, while the other CEQA document did not address impacts related to such issue. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

**Retail/Service Facilities**

Review of approved and pending permit applications over the last five years identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area which are not consistent with the projections of adopted plans and policies. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse population, housing, and employment impacts in the future. However, the potential exists for one or more future retail/service projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.13-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area. The CEQA documents for the retail and service projects surveyed involved

the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, which were found in the CEQA document surveyed to result in less-than-significant impacts on population, housing, and employment as most retail and service establishments surveyed are located in developed urban areas and are largely consistent with adopted plans and policies for a specific area. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the eight CEQA documents surveyed.

- a) Substantial Growth.** All eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

- b, c) Displacements of Housing and People Necessitating Replacement Housing.** The eight CEQA documents for past projects in the retail/service facility category disclosed either no impacts or less-than-significant impacts for displacement of housing and people or necessitating the need for replacement housing. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-years period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data only some of these facilities are anticipated to involve new

construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, and parking structures. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential for displacement of people and housing or increases in population, housing, and jobs in the area. Therefore, these facilities would generally have a low likelihood of resulting in significant adverse population, housing, and employment impacts. However, the potential exists for one or more future large commercial projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.13-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found in the CEQA documents surveyed to result in less-than-significant impacts on population, housing, and employment as most of the commercial facilities are located in developed urban areas and are largely consistent with adopted plans and policies for a specific area. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the nine CEQA documents surveyed.

**a) Substantial Growth.** The nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

**b, c) Displacements of Housing and People Necessitating Replacement Housing.**

The nine CEQA documents for past projects in the large commercial facility category disclosed either no impacts or less-than-significant impacts for displacement of housing and people or need for replacement housing. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

**Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities are anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area which are not consistent with the projections of adopted plans and policies. Therefore, entertainment/recreational projects would generally have a low likelihood of creating significant adverse population, housing, and employment impacts in the future. However, the potential exists for one or more future entertainment/recreational projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.13-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area. These projects were determined in the CEQA documents surveyed to result in less-than-

significant impacts on population, housing, and employment as most entertainment/recreational facilities surveyed are located in developed urban areas and are largely consistent with adopted plans and policies for a specific area. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the four CEQA documents surveyed.

**a) Substantial Growth.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

**b, c) Displacements of Housing and People Necessitating Replacement Housing.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either no impacts or less-than-significant impacts for the displacement of housing and people or need for replacement housing. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area. Therefore, these future facilities would have a low likelihood of resulting in significant adverse population, housing, and employment impacts. However, the potential exists for one or more future institutional projects to generate significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.13-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area. These projects were determined in the CEQA documents surveyed to result in less-than-significant impacts on population, housing, and employment as most institutional facilities surveyed are located in developed urban areas and are largely consistent with adopted plans and policies for a specific area. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the 15 CEQA documents surveyed.

**a) Substantial Growth.** The 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

**b, c) Displacements of Housing and People Necessitating Replacement Housing.** The 15 CEQA documents for past projects in the institutional facility category disclosed either no impacts or less-than-significant impacts for the displacement of housing and people or need for replacement housing. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5

in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area. Therefore, transportation facilities would generally have a low likelihood of resulting in significant population, housing, and employment impacts. However, the potential exists for one or more future transportation-related projects to have significant population, housing, and employment impacts.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.13-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area which are not consistent with the projections of adopted plans and policies. These projects were determined in the CEQA documents surveyed to result in less-than-significant impacts on population, housing, and employment as most of these projects were located in developed mixed-use,

industrial, and commercial zoned areas and are largely consistent with the adopted plans and policies for a specific area. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the three CEQA documents surveyed.

- a) Substantial Growth.** The three CEQA documents for past projects in the transportation facility category disclosed either no impact or less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

- b, c) Displacements of Housing and People Necessitating Replacement Housing.** The three CEQA documents for past projects in the transportation facility category disclosed no impacts or less-than-significant impacts for the displacement of housing and people or need for replacement housing. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g.,

boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. On a programmatic level, most future new or modified facilities would be constructed in industrial zoned areas and would have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area. Therefore, utility projects would generally have a low likelihood of creating significant adverse population, housing, and employment impacts in the future. However, the potential exists for one or more future utility projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.13-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects illustrate the type of impacts on population, housing, and employment, including potential increase in population, housing, and jobs in the area. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, were determined in the CEQA documents surveyed to result in less-than-significant impacts on population, housing, and employment as most of the facilities are located on industrial zones lands or lands zoned for utilities. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the four CEQA documents surveyed.

**a) Substantial Growth.** The four CEQA documents for past projects in the utility facility category disclosed either no impacts or a less-than-significant impact for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

**b, c) Displacements of Housing and People Necessitating Replacement Housing.**

The four CEQA documents surveyed for past projects in the utility facility category disclosed no impacts for displacement of housing and people or necessitating the need for replacement housing. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

**Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that would have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area. Therefore, light industrial/warehouse facilities would generally have a low likelihood of creating significant adverse population, housing, and employment impacts in the future. However, the potential exists for one or more future light industrial/warehouse projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 4.2-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on population, housing, and employment, including potential increases in population, housing, and jobs in the area. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures were determined in the CEQA documents surveyed to result in less-than-significant impacts on population, housing, and employment as most of the facilities are located on industrial zones lands or lands zoned for utilities. More specifically, the following discussions provide an overall

summary of the types of population, housing, and employment impacts identified in the four CEQA documents surveyed.

- a) Substantial Growth.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts for inducing substantial growth directly or indirectly. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

- b, c) Displacements of Housing and People Necessitating Replacement Housing.**

The four CEQA documents for the proposed project indicated that these past projects in the light industrial/warehouse facility category disclosed either no impacts or less-than-significant impacts for displacement of housing and people or necessitating the need for replacement housing. Based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that

would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. These facilities have a low potential for displacement of people and housing or increase in population, housing, and jobs in the area. Therefore, heavy industrial facilities would generally have a low likelihood of creating significant adverse population, housing, and employment impacts in the future. However, the potential exists for one or more future heavy industrial projects to have significant adverse population, housing, and employment impacts.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 4.2-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the type of impacts on population, housing, and employment, including potential increase in population, housing, and jobs in the area which are not consistent with the projections of adopted plans and policies. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities were found in the CEQA documents surveyed to result in no significant adverse impacts on population, housing, and employment as most of the facilities are located on industrial zones lands. More specifically, the following discussions provide an overall summary of the types of impacts on population, housing, and employment identified in the three CEQA documents surveyed.

- a) **Substantial Growth.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or a less-than-significant impact for inducing substantial growth directly or indirectly. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that construction and operation of future individual projects in this facility category could result in significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts on substantial growth from implementing the proposed project are determined to be significant.

- b, c) **Displacements of Housing and People Necessitating Replacement Housing.** The three CEQA documents surveyed for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts for displacement of housing and people or necessitating the need for replacement housing. However,

based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could displace a large number of housing and people necessitating the construction of replacement housing elsewhere.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to population and housing could be significant. Therefore, impacts regarding displacements from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to population, housing, and employment that were either no impacts or less-than-significant. However, there remains a potential for significant adverse impacts generated by future projects approved under the project by inducing significant population, housing, or employment growth directly or indirectly over existing conditions or growth that it is not consistent with the adopted plans and policies for a specific area, or displace large number of housing, and people necessitating construction of replacement housing elsewhere. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, population, housing, and employment impacts as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects" [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;

- Facilities that will obtain offsets from the SCAQMD’s internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD’s internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, or SB 827 or by obtaining offsets on the open market. The construction and operation of past development projects have resulted in certain increases in population, housing and jobs within the district. However, the population increases from the past projects were within current projections for the region (see Environmental Setting section for future population and employment projections in the study areas). Based on the past trends, it is likely that any future facilities obtaining offsets from the SCAQMD’s internal accounts would be consistent with existing zoning and general plan land use designations and, thus, would be consistent with projections for the region. Nonetheless, improvements to infrastructure are likely as a result of construction of these future facilities, and new housing to accommodate anticipated growth would be required, the construction of which could cause significant environmental impacts. The growth that could indirectly occur due to the proposed project could contribute to those significant environmental impacts. In addition, it is possible that existing housing units and residents could be displaced as a result of construction of future facilities, though the exact number or nature of such displacement cannot be predicted absent information on specific future projects.

While none of the past projects were specifically identified as having the potential to have significant adverse population, housing, and employment impacts, and it is not currently known when, where, or how much development or new construction would occur, the evaluation of population, housing, and employment impacts is even more uncertain.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD’s internal accounts. The three power plant projects, NRG’s El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

Both the El Segundo and Walnut Creek projects were determined by the CEC to have no significant adverse impacts on population and housing and the Sentinel project will mitigate potential population and housing impacts to less than significant. The construction of the El Segundo project is not expected to result in workers moving to the area for construction or permanent jobs according to the FSA prepared by the CEC. The

FSA determined that if for some reason a few workers did temporarily relocate, there was a housing vacancy rate of four to six percent in El Segundo, Hawthorne, and other nearby cities, so CEC staff does not expect any significant impact on housing from the construction of the El Segundo project. The CEC determined that the operation of the project could result in a possible shortage of workers in some trades, creating an influx of new population, having impacts on housing. However, The CEC concluded the population and housing impact would be less than significant because of the size of Los Angeles County and available labor force.

The CEC determined that the Walnut Creek project would largely use local labor and, thus, not create any significant adverse impacts on the area's population and housing. An analysis by the project proponent shows 88 construction workers may be non-local (from outside of Los Angeles County), which constitutes 40 percent of the average construction workforce or 22 percent of the peak construction workforce as the maximum potential population increase. CEC staff does not expect any housing to be displaced (moved) as a result of this project and sufficient vacant housing (e.g., hotels/motels and RV parks) exists and is available to accommodate any workers that elect to temporarily relocate to the study area.

The FSA for the Sentinel project states the project would use local and regional labor and would not create any significant adverse impacts on the area's housing. According to the FSA, the number of construction workers (total onsite staff) would range from 27 in the first month of construction to 371 in the sixth month of construction, the peak period with an average number of workers onsite over the course of the 18-month construction period would be 212. However, as stated in the FSA, construction laborers are not expected to relocate for the 18-month construction period. If they did, the CEC determined the local area has adequate and available owner-occupied and rental housing, as well as motel/hotel accommodations and recreational vehicle sites. Given the availability of housing, motel and hotel rooms, and mobile home parks and the fact that most workers would be commuting on a daily basis, staff does not expect this project to adversely impact local housing during construction. The CEC determined approximately 28 percent of the entire millwright labor force in the metropolitan area would be working at the proposed project placing a potential significant impact on population and housing as millwrights could travel from the Los Angeles area in order to meet the demand of construction projects in Riverside County, although the project job would be for a relatively short period of time and millwrights typically travel from job site to job site during the construction season in order to make a living. According to the FSA, the operation of the project would have 10 skilled full-time employees and four part-time employees. Even if the employees relocated to the local area, based on the housing availability discussed earlier, CEC staff does not expect that the 14 full- and part-time employees would have difficulty finding housing within Riverside County and relocation of 14 full- and part-time employees and their families would not create a substantial increase in population. To mitigate, the project proponent stated that it is committed to give local preference in hiring and procurements so impacts to population and housing will be less than significant.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative population and housing impacts.

### **Mitigation Measures for Future Population and Housing Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant population and housing impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse population and housing impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for population and housing impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of population and housing impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant population and housing impact, the potential exists for future indirect population and housing impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.14**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – PUBLIC SERVICES**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse physical impacts which may require expanded government facilities or services depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts the proposed project would have on public services from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of public services impacts is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse indirect impacts on public services include assessments of impacts on fire protection, police protection, schools, parks and recreational facilities, and other public facilities which may be caused by future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts on public services if their implementation would result in any of the following:

- Impacts on public services would be considered significant if the project would result in substantial physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response time

or other performance objectives for fire protection, police protection, schools, parks and other public facilities.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential impacts on public services from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on public services for a given area. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts to public services is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts on public services. Such future new or modified facilities could potentially result in facilities and developments that could create a need for new or expanded public facilities and/or services in order to maintain acceptable service ratios, response times, or other performance objectives. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse impacts on public services have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future. On a programmatic level, impacts to public services as a result of constructing future new agricultural facilities may create a need for new or expanded fire protection, police protection, schools, parks and recreational facilities, and other public facilities.

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.14-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on public services. Based on a review of these documents, agricultural-related facilities may be of substantial size, which may result in construction-related impacts associated with reduced response time for fire and police protection services. However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures for public services. More specifically, the following discussions provide an overall summary of the types of impacts identified in the two CEQA documents surveyed for this facility category.

**a, b) Fire and/or Police Protection (Emergency Services).** Both of the CEQA documents for the proposed project indicated that these past projects in the agricultural facility category (without or with mitigation) resulted in less-than-significant impacts on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts to schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

#### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential to create impacts on fire protection, police protection, schools, parks and recreational facilities, and other public facilities. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts on public services in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.14-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on public services, which involve physical impacts associated with the provision of, or need for, new or expanded fire, police, school, parks and recreation, and library facilities or services. The CEQA documents for the retail and service projects surveyed involved the construction

or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures in similar settings, some of which were found to result in potential impacts on public services, including the following:

- Conflicts with local fire code pertaining to commercial and residential land uses, which may require the addition or expansion of fire protection facilities and services.
- Increased demand for public services resulting from indirect growth, impacts, which may require the addition or expansion public services facilities.
- Construction period traffic delays and congestion, which may impact fire and police services to a point where acceptable response times are no longer feasible.

However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on public services. More specifically, the following discussions provide an overall summary of the types of impacts identified in the eight CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) to emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d) School Services and Parks and Recreational Facilities.** The eight CEQA documents for past projects in the retail/service facility category disclosed less-than-significant impacts (without or with mitigation) or no impacts to schools and parks and recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools or parks and

recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools or parks and recreational facilities from implementing the proposed project are determined to be significant.

- e) **Other Public Facilities.** Review of seven of the eight CEQA documents surveyed past projects in the retail/service facility category mostly disclosed either no impacts or less-than-significant impacts on libraries and other public facilities; one CEQA document did not discuss impacts on other public services. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on other public facilities from implementing the proposed project are determined to be significant.

#### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential to create impacts on public services in the future. Therefore, these facilities would generally have a low likelihood of resulting in significant impacts on public services. However, the potential

exists for one or more future large commercial projects to have significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.14-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on public services, including potential adverse effects on fire protection, police protection, schools, parks and recreational facilities, and other public facilities. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, some of which were found to result in the following types of impacts:

- Increases in population, use of land, and intensity of usage, which resulted in an increased demand for fire protection, police protection, and schools. Such increases in demand could require expansion of emergency services staff or facilities and new or expanded school facilities in order to maintain acceptable service ratios (student capacity or police officer-to-population ratios) and response times.
- Construction-related impacts to school access including detours, lane closures, and general traffic delays.
- Indirect population growth and increases in demand for parks, recreational facilities, libraries, and other public facilities such that new or expanded public service facilities would be required.

However, project-specific impacts were not considered significant impacts in the CEQA documents surveyed since most of the commercial facilities are located in developed urban areas and are largely accessible to surrounding public services, and those impacts considered potentially significant could be mitigated to less-than-significant levels. More specifically, the following discussions provide an overall summary of the types of impacts identified in the nine CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** Review of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts to schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

#### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to create structures or developments that could create a need for new or expanded public services and facilities of an area. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.14-1). The four CEQA documents surveyed, which were prepared for the

development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on public services, including physical impacts associated with the provision of, or need for, new or expanded fire, police, school, parks and recreation, and library facilities or services. These projects involved a variety of different structures, including mid- to high-rise buildings, parking structures, outdoor lighting and signage, and grading and landscaping of open space areas for outdoor recreational facilities, which were determined to result in potential impacts on public services, such that the following would occur:

- Increases in population, use of land, and intensity of usage would result in an increased demand for fire protection, police protection, and schools. Such increases in demand could require expansion of emergency services staff or facilities and new or expanded school facilities in order to maintain acceptable service ratios (student capacity or police officer-to-population ratios) and response times.
- Conflict with parkland requirements/standard (i.e., park space per 1,000 residents ratio).

Accordingly, one of these projects was found to have significant impacts on public services. More specifically, the following discussion provides an overall summary of the types of impacts identified in the four CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts (without or with mitigation) on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

- c) **School Services.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on schools. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools or where there are already deficiencies in school enrollment capacities, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools from implementing the proposed project are determined to be significant.

- d) **Parks and Recreational Facilities.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that for three of the four projects, environmental impacts on parks and recreational facilities were less than significant or no impact. However, for one of the projects surveyed (Project #21 – LA Live-Sports & Entertainment District), the lead agency concluded that this project has the potential to generate significant adverse environmental impacts on parks and recreational facilities due to conflicts with the City of Los Angeles Department of Recreation and Parks' standards on park/recreational space to residents ratio (4 acres/1,000 residents), resulting from the construction of the project. In addition, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on parks and recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on parks and recreational facilities from implementing the proposed project are determined to be significant.

- e) **Other Public Facilities.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on other public facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could

create significant adverse impacts on other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on other public facilities from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and, therefore, would have a low potential to create a need for new or expanded public services or facilities. Therefore, these future facilities would have a low likelihood of resulting in significant impacts on public services. However, the potential exists for one or more future institutional projects to generate significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.14-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on public services, including physical impacts to fire protection, police protection, schools, parks and recreational facilities, and other public facilities which would result in a need for new or expanded public services. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, some of which were found to result in potential impacts on public services such that one or more of the following would occur:

- Construction period traffic delays and congestion, which may impact fire and police services to a point where acceptable response times are no longer feasible.

- Increased demand for public services resulting from indirect growth, which may require the addition or expansion public services facilities.
- Project proximity to schools, which may result in adverse impacts to schools resulting from construction-related noise, traffic delays, and general nuisance-like impacts associated with the construction and operation of certain institutional projects, such as churches.

However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on public services. More specifically, the following discussions provide an overall summary of the types of impacts identified in the 15 CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation or no impacts on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** Review of 14 of the 15 CEQA documents for past projects in the institutional facility category disclosed less-than-significant impacts (without or with mitigation or no impacts on schools, parks and recreational facilities, and other public facilities; the other CEQA document did not address impacts related to these issues. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, and impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting. However, any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would, therefore, have a low potential to create a need for new or expanded fire protection, police protection, schools, parks and recreational facilities, or other public facilities. Therefore, transportation facilities would generally have a low likelihood of resulting in significant impacts on public services. However, the potential exists for one or more future projects to have significant adverse impacts on public services.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.14-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on public services, which involve physical impacts associated with the provision of, or need for, new or expanded fire, police, school, parks and recreation, and library facilities or services of an area. The CEQA documents for the transportation projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, bus storage and maintenance facilities, and mixed-use residential and commercial facilities, some of which were found to result in potential impacts on public services such that construction period traffic delays and congestion may impact fire and police services, schools, parks and recreational facilities, and other public facilities to a point where acceptable service ratios

and response times are no longer feasible. However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on public services. More specifically, the following discussions provide an overall summary of the types of impacts identified in the three CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** Three CEQA documents for past projects in the transportation facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities are not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Although these facilities would typically be constructed in industrial zoned areas, these facilities may be sited near or directly adjacent to sensitive residential neighborhoods and publicly accessible open spaces. The potential scale and scope of operations at a typical large scale industrial utility may result in conditions, such as industrial emergencies, additional criminal activity (in unsupervised industrial areas surrounding the utility structure), and increased worker populations, that may necessitate increased use of public services. Adverse impacts to emergency services, schools, parks and recreational facilities, as well as other public facilities may occur. Therefore, the potential exists for future construction and operation of utility facilities to generate significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.14-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on provisions of public services. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could create a need for new or expanded public services and facilities resulting in significant adverse impacts. More specifically, the following discussions provide an overall summary of the types of impacts identified in the four CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future

individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts with the implementation of mitigation measures or no impacts on schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data and the assumption that the annual percentage of newly constructed physical activities would be five percent, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings that could

require moderate amounts of construction activities, which may result in significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.14-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on public services, including potential adverse effects on fire protection, police protection, schools, parks and recreational facilities, and other public facilities. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may result in potential impacts on public services such that one or both of the following may occur:

- Increased demand for schools resulting from indirect growth, which could create impacts that may require the addition or expansion public services facilities.
- Construction period traffic delays and congestion, which may impact fire and police services to a point where acceptable response times are no longer feasible.

However, adverse effects were not found to be significant in the CEQA documents surveyed since most of these facilities were located in developed urban industrial areas and largely compatible with the surrounding public services. More specifically, the following discussions provide an overall summary of the types of impacts on public services identified in the four CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impact on schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

#### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. The potential scale and scope of operations at a typical large heavy industrial facility may result in conditions, such as industrial emergencies, additional criminal activity (in unsupervised industrial areas surrounding the utility structure), and/or increased worker populations, that may necessitate increased use of public services. Adverse impacts to emergency services, schools, parks and recreational facilities, as well as other public facilities may occur. Therefore, these future heavy industrial facilities have the potential of generating significant adverse impacts on public services.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.14-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on public services, including potential adverse effects on fire protection, police protection, schools, parks and recreational facilities, and other

public facilities. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities generally were found in the CEQA documents surveyed to not result in significant impacts to public services. More specifically, the following discussions provide an overall summary of the types of impacts identified in the three CEQA documents surveyed.

**a, b) Fire and/or Police Protection (Emergency Services).** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impact or less-than-significant impacts on emergency services. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that would create a need for new or expanded fire or police facilities and services to maintain acceptable response times or where there are already deficiencies in public services (e.g., fire and police staffing and equipment issues), which could exacerbate existing conditions such that significant adverse impacts on emergency services could occur.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on emergency services resulting from implementing the proposed project are determined to be significant.

**c, d, e) School Services, Parks and Recreational Facilities, and Other Public Facilities.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either no impacts or less-than-significant impacts to schools, parks and recreational facilities, and other public facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on schools, parks and recreational facilities, and other public facilities such that acceptable service ratios would not be met or where there are already deficiencies in school enrollment capacities and existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to public services could be significant. Therefore, impacts on schools, parks and recreational facilities, and other public facilities from implementing the proposed project are determined to be significant.

## Summary of Findings

The review of the 52 CEQA documents found that most of the past projects had environmental impacts related to public services that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents also found that some of the past projects have the potential to generate significant adverse impacts related to standards on park and recreational land service ratios. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on public services as an indirect result of implementing the proposed project are determined to be significant.

## Cumulative Impacts

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Past development patterns within the district have resulted in a variety of different impacts to public services, some of which would be cumulatively significant. Development projects, while individually responsible for less-than-significant impacts, would potentially result in cumulative impacts due to growth in population and subsequent increased demand for police, fire, school, recreational and other public services. Thus, any future development within the district, resulting from the project, would potentially add to this cumulatively considerable increase in demand for public services. As noted above, since the specific location of individual facilities cannot

be predicted with certainty, the evaluation of cumulative public service impacts is even more uncertain.

However, some of the past projects were determined to have significant adverse impacts on public services, including the potential to impact standards on park and recreational land service ratios.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The FSA prepared for the El Segundo and Walnut Creek projects concluded that there will be no significant adverse impacts on public services and the FSA for the Sentinel project determined impacts on public services could be mitigated to less than significant. The FSA for the El Segundo project concluded that since temporary workers are not expected to move to and/or bring families to El Segundo or nearby communities during the construction period, there is not expected to be any impact on the need for school facilities. Fire protection is provided by the El Segundo Fire Department, which has 54 firefighters and paramedics operating from two fire stations with the closest station staffing ten employees per shift, and, according to the FSA, the response time to the site is approximately three to five minutes. Police protection is provided by the El Segundo Police Department, with 69 authorized sworn officers plus a support staff. The FSA states that on-duty patrol staff ranges from three to eight officers and response time to the project site is under four minutes. The closest hospital with full emergency services is the Robert F. Kennedy Medical Center in Hawthorne, approximately four miles northeast of the site, and there are industrial medical clinics in El Segundo and several other medical centers five to 10 miles from the project site. Finally, according to the FSA, the City of El Segundo imposes development impact fees based on the gross square foot of building area to finance fire, police, and library services, a fee that will be required by the El Segundo project. Thus, CEC staff believes that the El Segundo project would not cause a significant adverse direct or cumulative impact on schools or public services such as fire and police.

If 88 non-local (outside of Los Angeles County) construction workers were to relocate as a result of the Walnut Creek project, approximately 97 school-aged children would be added to Los Angeles County school enrollment, which CEC staff concluded would be a very small impact (less than one percent of Los Angeles County school enrollment for the entire county). During the operations phase, a workforce of nine would result in a worst-case scenario of 22 school children, if the workers were to relocate to the City of Industry. If these children were to go to school districts close to the project, it would be

less than one percent, which, CEC concludes, is a small impact on schooling. Law enforcement of the City of Industry is provided by a station of the Los Angeles County Sheriff's Department which has 200 sworn and 34 civilian personnel and for an emergency, the response time is five minutes or less and for a non-emergency it is five to thirty minutes. According to the FSA, the Walnut Creek project would be located within an industrial area that is currently served by the local fire department and fire risks at the proposed project do not pose significant added demands on local fire protection services. CEC staff concludes that the Los Angeles County Fire Department Hazmat Team is adequately equipped and staffed to respond to more serious hazardous materials incidents at the Walnut Creek facility with an adequate response time. The nearby hospital is 5.9 miles from the project site and emergency medical services are provided by the County of Los Angeles Fire Department with a response time for emergency medical service of slightly over three minutes. The CEC determined there should be no significant adverse impacts on parks within Los Angeles County due to the small construction and operational workforce that could be relocating from outside the county. CEC staff concluded that construction and operation of the Walnut Creek project would not cause a significant direct or cumulative adverse impact on the area's schools, law enforcement, fire protection, emergency services, and hospitals.

During construction of the Sentinel project, the CEC anticipates most of the labor force would commute daily from within Riverside County and that the addition of project-related children to schools at or over capacity may increase costs in terms of supplies, equipment, and/or teachers but the impact would be small. The CEC concludes this worst-case scenario is unlikely to occur since any nonlocal construction workers would not likely relocate family members for the relatively short duration of construction. For operation of the Sentinel project, CEC estimates 14 full- and part-time operation workers are expected to be hired from the local labor force of Riverside County, which would result in the addition of 14 school children to the Palm Springs Unified School District, an increase of less than one percent that is considered a small impact. The Palm Desert Police Department (PDPD), consisting of 78 sworn deputy sheriff positions, provides police protection services to the unincorporated areas of Riverside County in the north Palm Springs area where the Sentinel project is located. The FSA reports the response time to the project area would be less than five minutes and the city of Palm Springs Police Department (PSPD) would provide law enforcement services to the project site and vicinity in the event that the PDPD needs assistance. According to the FSA, the PSPD has 89 fulltime officers, 60.5 civilian officers, 32 non-sworn volunteers, and 26 reserve officers. According to the FSA, the Sentinel project would be located in the city of Palm Springs within an industrial area whose fire support is currently served by the Palm Springs Fire Department (PSFD) with the response time of about 10 minutes from the closest station to the project site. The FSA determined that Palm Springs has one general hospital, Desert Regional Medical Center, with a 393-bed capacity, located 6.2 miles to the south of the project site and is the closest hospital to the proposed project site, with an estimated seven to 10 minutes' driving time to the site. CEC staff does not expect the construction or operation workforces to have a significant adverse impact on parks because of the number and variety of parks within the regional project area. In addition, the CEC anticipates that construction workers are unlikely to bring their families to a work site, and therefore, impact existing park services. Thus, the CEC

concludes the Sentinel project would not create any significant adverse impacts on the area's schools, law enforcement, fire protection, emergency services, hospitals, or parks.

Based upon the above considerations, impacts of the project, are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative public services impacts.

### **Mitigation Measures for Future Impacts on Public Services**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant public services impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse public services impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for public services impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of public services impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant public services impact, the potential exists for future indirect public services impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.15**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – RECREATION**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse impacts on recreation depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts of the proposed project on recreation from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential recreation impacts is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse impacts on recreation include assessments of impacts to the region's demand for parks and recreational facilities, as well as other recreational opportunities. Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts on recreation if their implementation would result in any of the following:

- The project would result in an increased demand for neighborhood or regional parks or other recreational facilities.
- The project would adversely affect existing recreational opportunities.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential impacts on recreation from future facilities that would be eligible for offsets under the proposed project. The

analysis is organized according to the primary facility categories and the potential impacts they may have on recreation. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of recreation impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts on existing recreational facilities and resources. Such future new or modified facilities could potentially result in development adjacent to sensitive resources that could affect the recreational opportunities of a site and its surroundings. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse impacts on recreation have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to revisit existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to recreation as a result of constructing future new agricultural facilities may include impacts to local and regional parks or other recreational facilities resulting from increased demand for recreational facilities. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses and would not include recreational elements, these facilities may be near or directly adjacent to parks or other recreational facilities that provide the primary source of recreation for a particular area. Activities related to the operation of agricultural facilities may result in significant adverse impacts to recreation.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.15-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern

Element, illustrate the types of impacts that agricultural-related projects would have on recreation, including potential increases in demand for parks and other recreational facilities, physical impacts to existing recreational facilities or locations, and construction or expansion of recreational facilities that may have adverse effects on the environment. However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts on recreation. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the two CEQA documents surveyed for this facility category.

- a) Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to the increased demand for parks or other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts on existing local and regional parks or other recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** Both of the CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts resulting from construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could lead to the construction or expansion of recreational facilities, thereby resulting in adverse impacts to the environment.

---

and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

<sup>a</sup> An “NE” designation could mean one of the following: 1. The issue area was not discussed in the environmental document. 2. The specific checklist question was not discussed in the environmental document. Source: ICF Jones & Stokes, 2009.		

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts

related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential to increase demand for parks and other recreational facilities or to result in the construction or expansion of recreational facilities such that adverse impacts to the environment would occur. Therefore, retail/service facilities would generally have a low likelihood of creating significant adverse impacts to recreation in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for retail/service facilities at the time the survey was conducted (see Table 5.15-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities and the construction or expansion of recreational facilities. Based on a review of these documents, retail service facilities may result in adverse impacts from the increase in residents and employees within the area surrounding a project site, such that demand for parks and recreational facilities would increase leading to accelerated deterioration of recreational facilities and facilities. However, these projects were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the eight CEQA documents surveyed for this facility category.

- a) **Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The eight CEQA documents for past projects in the retail/service facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to increases in demand for parks and other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in a

location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** The eight CEQA documents for past projects in the retail/service facility category disclosed either less-than-significant impacts (without or with mitigation or no impact related to the construction or expansion of recreational facilities. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings and parking structures/lots. Based on historical data, new large commercial facilities would likely be constructed within existing developed commercial, retail, mixed-use residential, and transit-oriented areas and would, therefore, have a low potential to increase demand for parks and other recreational facilities or to result in the construction or expansion of recreational facilities such that adverse impacts to the environment would occur. Therefore, these facilities would generally have a low likelihood of resulting in significant adverse impacts to

recreation in the future. However, the potential exists for one or more future large commercial projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.15-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities and the construction or expansion of recreational facilities. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in adverse impacts related to increases in residents and employees within the area surrounding a project site, such that the demand for parks and recreational facilities would increase and the construction or expansion of recreational facilities may be required. However, project-specific impacts were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on recreation. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the nine CEQA documents surveyed.

- a) Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to increases in demand for parks and other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** The nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to the construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3

in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data and a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities. Based on historical data, entertainment/recreational projects have the potential to alter undeveloped open space and natural areas that may result in the alteration of existing parks or recreational facilities, or require construction of new or expanded recreational facilities. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.15-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities, the construction or expansion of recreational facilities, and conflicts with applicable standards on service ratios. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, parking lots, and grading and landscaping of open space areas for outdoor recreational facilities, which were found to result in conflicts with local standards on service ratios and increases in demand for existing parks and recreational facilities. However, most of these projects were found in the CEQA documents surveyed to have less-than-significant impacts on recreation. More specifically, the following discussion provides an overall summary of the types of recreation impacts identified in the four CEQA documents surveyed.

- a) **Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that for three of the four projects, environmental impacts related to increases in demand for parks and other recreational facilities were less than significant. However, for one of the projects surveyed (Project #21 – LA Live-Sports & Entertainment District), the lead agency concluded that this project has the potential to generate significant adverse environmental impacts on parks and recreational facilities due to conflicts with the City of Los Angeles Department of Recreation and Parks’ standards on park/recreational space to residents ratio (4 acres/1,000 residents), resulting from the construction of the project. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on parks and recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on existing local and regional parks or other recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) **Construction or Expansion of Recreational Facilities.** The four CEQA documents for past projects in the entertainment/recreational facility category indicated that for three of the four projects, environmental impacts related to the construction or expansion of recreational facilities were less than significant. However, for one of the projects surveyed (Project #21 – LA Live-Sports & Entertainment District), the lead agency concluded that this project has the potential to generate significant adverse environmental impacts on parks and recreational facilities due to conflicts with the City of Los Angeles Department of Recreation and Parks’ standards on park/recreational space to residents ratio (4 acres/1,000 residents), resulting from the construction of the project, which is entertainment and recreational in nature. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities which could result in significant adverse impacts to the environment.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to the construction or expansion of

recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and parking lots. Most of these facilities would be constructed within existing commercial, residential, and institutional zoned areas and therefore, would have a low potential to alter existing recreational facilities. Therefore, these facilities would generally have a low likelihood of resulting in significant adverse impacts to recreation in the future. However, some of the future institutional facilities would involve an increased use of existing parks, or construction/expansion of recreational facilities, and, as such, the potential exists for one or more future institutional projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.15-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on recreation, including potential adverse effects related to the construction or expansion of new recreational facilities or an increase in demand for existing parks or other recreational facilities. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities, which have the potential to result in significant impacts resulting from increases in demand for existing parks or other recreational facilities or from the construction of new or expanded recreational facilities. However, project-specific impacts were found in the CEQA documents surveyed to have less-than-significant impacts or no impacts on recreation. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the 15 CEQA documents surveyed.

- a) **Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts related to increases in demand for existing local and regional parks or other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained

offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts on existing local and regional parks or other recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts resulting from the construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category near a location that would require alteration, expansion, or construction of recreational facilities which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail,

shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities). Any new transportation-oriented facility would most likely be constructed within existing industrial, commercial, mixed-use, and transportation-zoned areas and would not include the construction or expansion of new recreational facilities. Therefore, transportation-oriented facilities would have a low potential to create impacts on existing parks or recreational facilities. However, the potential exists for one or more future transportation-related projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.15-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities, the construction or expansion of recreational facilities, and conflicts with applicable standards on service ratios. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, and bus storage and maintenance facilities, some of which were found to result in temporary construction impacts that would disrupt existing park and recreational facility operations in the area, but were determined to be not significant in the CEQA documents surveyed. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the three CEQA documents surveyed.

**a) Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The three CEQA documents for past projects in the transportation facility category disclosed either a less-than-significant impact or no impacts related to demand for existing parks and recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

**b) Construction or Expansion of Recreational Facilities.** The three CEQA documents for past projects in the transportation facility category disclosed either a less-than-significant impact or no impacts resulting from the construction or

expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities, which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity and the distributed nature of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. Any new utility project would most likely be constructed within an already developed area and would, therefore, have a low potential for alteration of existing recreational facilities. Nonetheless, the potential exists for one or more future utility-related projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.15-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities and the construction or expansion of recreational facilities. Based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, could result in visual impacts to existing recreational facilities, as well as potential increases in

demand for parks and recreational facilities. However, project-specific impacts were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with implementation of mitigation measures on recreation. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the four CEQA documents surveyed.

- a) **Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The four CEQA documents for past projects in the utility-oriented facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to demand for existing parks or other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) **Construction or Expansion of Recreational Facilities.** The four CEQA documents for past projects in the utility-oriented facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities, which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts resulting from the construction or expansion of recreational facilities from implementing the proposed project are determined to be significant.

#### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1).

However, based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, new light industrial/warehouse facilities that would be constructed in the future would likely involve the construction of one- to three-story warehouse-type buildings. Any new light industrial/warehouse facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential for alteration of existing recreational facilities. However, the potential exists for one or more future projects to have significant impacts on recreation.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.15-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities and the construction or expansion of recreational facilities. Based on the evaluation of these projects, the construction of warehouse-type and office-type structures may result in increased demand for existing parks or recreational facilities, physical impacts to existing parks or recreational facilities, and/or new or expanded recreational facilities, the construction of which could create significant adverse impacts to the environment. However, project-specific impacts were found in the CEQA documents surveyed to have less-than-significant impacts or less-than-significant impacts with the implementation of mitigation measures on recreation. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the four CEQA documents surveyed.

**a) Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to increases in demand for parks or other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time

the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to the construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities, which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). However, based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas. Because the analysis of recreation impacts is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be affected by the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas. Any new heavy industrial facility would most likely be constructed within existing industrial and commercial-zoned areas and would, therefore, have a low potential for alteration of existing recreational facilities. However, the potential exists for one or more future projects to have significant adverse impacts on recreation.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.15-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on recreation, including potential adverse effects related to increased demand for parks and recreational facilities and the construction or expansion of recreational facilities. Based on the evaluation of these projects, the demolition and construction of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in an increase of demand for existing parks or other recreational facilities, but were determined to be not significant in the CEQA documents surveyed. More specifically, the following discussions provide an overall summary of the types of recreation impacts identified in the three CEQA documents surveyed.

- a) Increase in the Demand for Existing Local and Regional Parks or Other Recreational Facilities.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts related to demand for existing parks or other recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in a location that could create significant adverse impacts on existing local and regional parks and other recreational facilities such that acceptable service ratios would not be met or where there are already deficiencies in the existing levels of service, which could exacerbate these existing conditions.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, impacts to recreation could be significant. Therefore, impacts related to the increased demand for parks and recreational facilities resulting from implementing the proposed project are determined to be significant.

- b) Construction or Expansion of Recreational Facilities.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts related to the construction or expansion of recreational facilities. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a location that would require alteration, expansion, or construction of recreational facilities, which could result in significant adverse impacts to the environment.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different

environmental settings, impacts to recreation could be significant. Therefore, impacts related to the construction or expansion of recreational facilities resulting from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to recreation that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents also found that some of the past projects have the potential to generate significant adverse impacts on recreation, including potential adverse effects related to the construction or expansion of new recreational facilities, conflicts with applicable standards on acceptable park facility service ratios, and increased demand for existing parks or other recreational facilities, but were determined to be not significant. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on recreation as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects." [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed SB 388 (Calderon), and potentially one other bill which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. Past development patterns within the district have resulted in a variety of different impacts to recreational services and facilities, some of which would

be cumulatively significant. Development projects, while individually responsible for less-than-significant impacts, would potentially result in cumulative impacts due to growth in population and subsequent increased demand for recreational services and facilities. Thus, any future development within the district resulting from the project would potentially add to this cumulatively considerable increase in demand for recreational services. As noted above, since the specific location of individual facilities cannot be predicted with certainty, the evaluation of cumulative recreational impacts is even more uncertain.

However, some of the past projects were determined to have significant adverse impacts on recreation, including the potential to impact standards on park and recreational land service ratios.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The El Segundo and Walnut Creek project were determined by the CEC to have no significant recreation impacts and the Sentinel project will mitigate recreational impacts to less than significant. According to the CEC, parks and recreational open space are located along the coast west of the El Segundo project. One landscape mitigation measure would involve the installation of public park type benches along the west property line, which would benefit the existing recreational space. Thus, the CEC concludes no adverse impacts to recreation from the El Segundo project.

The FSA prepared by the CEC for the Walnut Creek project concluded that because the project would use largely local labor, this would not create any significant adverse impacts on the area's parks and recreation. CEC staff used a conservative estimate provided by the applicant that 22 percent (88 workers) of peak construction workforce would be non-local (outside of Los Angeles County) and their dependents would not likely follow them, so many non-local workers would still be within commuting distance from neighboring counties. The CEC describes this is a small number of construction workers for a short term activity. Also, the CEC estimates up to nine operations workers would be needed and would commute from Los Angeles County, so overall, most of the construction and operation labor force would be from Los Angeles County. Therefore, the CEC concludes that there should be no significant adverse impacts on parks and recreation resources within Los Angeles County as a result of the Walnut Creek project.

Similar to the Walnut Creek project, the CEC anticipated that the Sentinel project would use local and regional labor so would not create any significant adverse impacts on the area's parks and recreation. The FSA discussed the nearby 794,000-acre Joshua Tree

National Park managed by the U.S. Department of the Interior National Parks Service is located just a few miles east of Desert Hot Springs where recreational activities are available at the park including backpacking, camping, mountain biking, rock climbing, geologic tours, birding, horseback riding, and star gazing. Also, according to the FSA, within Riverside County, the Riverside County Regional Park and Open-Space District is an independent agency governed by a board of supervisors that manages and operates more than 44,000 acres, which includes 40 parks, reserves, historic, or archaeological sites and 90 miles of regional trails. Finally, the FSA describes Desert Hot Springs itself has six parks within its city limits: Arroyo Park, Constitution Park, Eastside Park, Hot Springs Park, Mission Springs Park, and Wardman Park. CEC staff does not expect the construction or operation workforces to have a significant adverse impact on parks and recreation because of the number and variety of parks within the regional project area. In addition, the CEC concludes that construction workers are unlikely to bring their families to a work site, and therefore, impact existing parks and recreation.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative recreation impacts.

### **Mitigation Measures for Future Recreation Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant recreation impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts that are limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse recreation impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for recreation impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of recreation impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant recreation impact, the potential exists for future indirect recreation

impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.16**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – SOLID/HAZARDOUS WASTE**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction and operation of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to result in adverse impacts related to solid/hazardous waste, depending upon the nature of the project. The following section summarizes the methodology used to evaluate the potential impacts related to solid/hazardous waste that may result from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential solid/hazardous waste impacts is based on comparing the existing setting to expected future conditions with the proposed project in place. The following analyses of potentially significant adverse indirect impacts related to solid/hazardous waste include assessments of impacts regarding sufficient capacity of existing landfills for solid waste needs and compliance with local, state, and federal regulations regarding solid and hazardous waste disposal that may be caused by future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as "a substantial or potentially substantial, adverse change in the environment" (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is "significant," generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant impacts related to solid/hazardous waste if their implementation would result in any of the following:

- The generation and disposal of hazardous and non-hazardous waste would exceed the capacity of designated landfills.
- Failure to comply with federal, state, and local statutes and regulations related to solid and hazardous waste.

## IMPACT ANALYSIS

The following discussion presents an evaluation of potential solid/hazardous waste impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have related to solid/hazardous waste in the district. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts related to solid/hazardous waste is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction and operation of any new future facility or modification of any existing facility in the future has the potential to create significant adverse impacts related to solid/hazardous waste. Such future new or modified facilities could potentially result in solid/hazardous waste impacts in the event that development projects or existing facility modifications occur on a scale great enough to exceed capacities of local or regional waste disposal sites or produce quantities or types of hazardous waste that would not conform with existing disposal regulations. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse solid/hazardous waste impacts have been analyzed based on available information pertaining to each facility category.

### Potential Solid/Hazardous Waste Impacts of Identified Facility Categories

#### Agricultural Facilities

Review of approved and pending permit applications over the last five years identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g., San Joaquin Valley) or to areas outside the state due to economic pressures to reevaluate existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

Examples of agricultural facilities that may be constructed in the future include dairy farms, crop farms, wineries, livestock and poultry farms, and potentially different types of food processing facilities. On a programmatic level, impacts related to solid/hazardous waste as a result of constructing future new agricultural facilities may include increased solid waste resulting from agricultural operations, such as harvesting, livestock

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

management, dairy operations, food processing, or other agricultural operations, such as winery facilities. While agricultural facilities typically operate on a large scale, much of the solid waste would consist of biodegradable crop wastes, or in the case of a cattle ranch or dairy operation, in the form of cattle manure. Due to the unknown nature of any specific future agricultural projects, significant adverse impacts related to solid/hazardous wastes may occur.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.16-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. For the CEQA documents analyzed, as discussed above, much of the solid wastes that result from these types of agricultural facilities consist of biodegradable crop wastes and cattle manure. Manure is typically used on-site as fertilizer for cropland or is collected and trucked off the site for sale and use on nearby fields as fertilizer. This aspect of manure management for a typical dairy facility would be regulated according to local agricultural policies. Therefore, there is a low likelihood of significant impact as a result of agricultural facilities. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the two CEQA documents surveyed for this facility category.

**a) Sufficient Landfill Capacity.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to landfill capacities.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, indirect impacts related to insufficient landfill capacities as a result of implementing the proposed project are determined to be significant.

---

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

**b) Compliance with Federal, State, and Local Regulations.** One of the two CEQA documents for a past project in the agricultural facility category disclosed a less-than-significant impact related to compliance with applicable waste disposal regulations; the other CEQA document did not discuss this topic. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in

the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result in significant adverse effect related to compliance with applicable federal, state, and local solid/hazardous waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, indirect impacts related to conflicts with federal, state and local solid/hazardous waste regulations as a result of implementing the proposed project are determined to be significant.

### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). However, based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, most future new or modified facilities would be constructed within existing developed retail and mixed-use residential areas based on historical data and would have a low potential for resulting in substantially increased amounts or new types of solid/hazardous wastes. Furthermore, it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations. Therefore, individual retail/service facilities would generally have a low likelihood of creating significant adverse impacts related to solid/hazardous waste in the future. However, the potential exists for one or more future retail/service projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.16-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal, that may be caused by future new projects. The CEQA documents for the retail and service projects surveyed involved the construction or remodeling and reconfiguration of low- and medium-scale offices, retail stores, and shopping centers or the construction of new high-rise structures, the construction and operation of which would result in solid/hazardous waste disposal. However, project-specific impacts were generally not considered significant impacts in the CEQA

documents surveyed as most retail and service establishments surveyed are located in developed urban areas with sufficient landfill disposal capacity and would conform to all applicable waste disposal regulations. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the eight CEQA documents surveyed.

- a) **Sufficient Landfill Capacity.** Six of the eight CEQA documents for past projects in the retail/service facility category indicated that for most of the projects, environmental impacts related to sufficient landfill capacity were concluded to be less-than-significant or no impact; one CEQA document did not discuss impacts related to this issue. However, for one project (Project #5 – Shops at Santa Anita Park), the lead agency concluded that the retail/service facility category has the potential to generate significant unavoidable impacts due to the projected substantial increase in waste expected to be generated by 1,300 new employees at the larger facility and the fact that local landfill facilities would have insufficient capacity or would close after 2029.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

- b) **Compliance with Federal, State, and Local Regulations.** Seven of the eight CEQA documents for past projects in the retail/service facility category disclosed either less-than-significant impact or no impacts related to compliance with applicable waste disposal regulations; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to compliance with waste disposal regulation resulting from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas with existing energy supply services.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, most of the new commercial facilities that are constructed in the future would involve medium and high-rise buildings, parking structures, and outdoor lighting, the construction and operation of all of which may result in substantially increased amounts or new types of solid/hazardous wastes. However, it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations. Therefore, these facilities would have a low likelihood of resulting in significant adverse impacts related to solid/hazardous waste in the future. However, the potential exists for one or more future large commercial projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.16-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. The CEQA documents for the large commercial projects surveyed involved the construction of medium- and large-scale buildings within existing urban areas, which were found to result in less-than-significant impacts related to solid/hazardous waste. However, while project-specific impacts were generally less-than-significant in the CEQA documents surveyed, some significant adverse impacts were disclosed related to landfill capacity. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the nine CEQA documents surveyed.

**a) Sufficient Landfill Capacity.** Seven of the nine CEQA documents for past projects in the large commercial facility category indicated that for most of the projects, environmental impacts related to sufficient landfill capacity were concluded to be less-than-significant (without or with mitigation) or no impact. However, for two projects (Projects #11 – Sunset Doheny Hotel and #17 – Metro Universal), the lead agencies concluded that the large commercial projects have the potential to generate significant unavoidable impacts due to the projected near-term closure of contracted landfill facilities.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

**b) Compliance with Federal, State, and Local Regulations.** The nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to compliance with applicable waste disposal regulations. However, based on

SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to compliance with waste disposal regulation resulting from implementing the proposed project are determined to be significant.

### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table 5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, those new facilities that would be constructed in the future may involve the construction of medium and large scale buildings, landscaping, parks, and other public facilities, the construction and operation of all of which may result in substantially increased amounts or new types of solid/hazardous wastes. While it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations, due the large scale, public use and patronage of some such facilities (NFL stadiums, etc.), it is likely that a substantial impact related to solid/hazardous waste may occur. Therefore, the potential exists for one or more future entertainment/recreational projects to generate significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.16-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. These projects involved a variety of different structures, including medium to high-rise buildings, parking structures, outdoor lighting, and grading and landscaping of open space areas for outdoor recreational facilities, which were determined in the CEQA documents surveyed to have a less-than-significant impact related to solid/hazardous

waste. More specifically, the following discussion provides an overall summary of the types of impacts related to solid/hazardous waste identified in the four CEQA documents surveyed.

- a) Sufficient Landfill Capacity.** The four CEQA documents for past projects in the entertainment/recreation facility category disclosed either less-than-significant or no impacts related to sufficient landfill capacity.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to land fill capacity as a result of implementing the proposed project are determined to be significant.

- b) Compliance with Federal, State, and Local Regulations.** The four CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant or no impacts related to compliance with applicable waste disposal regulations. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to waste disposal regulations resulting from implementing the proposed project are determined to be significant.

### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). However, based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, new institutional facilities that would be constructed in the future would involve low-, medium-, or large-scale buildings, parking structures, and outdoor lighting, the construction and operation of all of which may result in substantially increased amounts or new types of solid/hazardous wastes. However, it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations. These future facilities would have a moderate likelihood of resulting in significant

solid/hazardous waste impacts. Accordingly, the potential exists for one or more future institutional projects to generate significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.16-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs, and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. Some of these projects involved the demolition of existing buildings and the construction of low-, medium-, and large-scale buildings, landscaping, parks, playfields and gymnasiums associated with schools, hospital buildings, and other public facilities in developed urban areas with sufficient landfill disposal capacity and would conform to all applicable waste disposal regulations. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the 15 CEQA documents surveyed.

**a) Sufficient Landfill Capacity.** 12 of the 15 CEQA for past projects in the institutional facility category indicated that for most of the projects, environmental impacts related to sufficient landfill capacity were concluded to be either less-than-significant impacts (without or with mitigation) or no impacts; two of the CEQA documents did not discuss impacts related to this issue. However, for one project (Project #33 – USC Health Sciences Campus), the lead agency concluded that this institutional project has the potential to generate significant unavoidable impacts due to the concerns of exceeding the capacity of landfill service providers.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to solid/hazardous waste as a result of implementing the proposed project are determined to be significant.

**b) Compliance with Federal, State, and Local Regulations.** 13 of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to compliance with applicable waste disposal regulations; the other two CEQA documents did not discuss impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to waste disposal regulations resulting from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, these types of facilities may involve low- and medium-scale buildings, transportation equipment storage yards, parking structures, rail, shipping, airport facilities, and transportation-related uses (e.g., rail yards, transit centers, shipping depots, docks, cranes, runways, terminals, support facilities), and outdoor lighting, all of which may result in substantially increased amounts or new types of solid/hazardous wastes. While it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations, the potential exists for one or more future projects to have significant adverse impacts related to solid/hazardous wastes.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.16-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. These projects typically involved the demolition of existing structures and the construction of a variety of new structures, including low- and medium-scale buildings, the use of large-scale cranes, and shipping infrastructure, and bus storage and maintenance facilities, which were generally found in the CEQA documents surveyed to have less-than-significant impacts related to solid/hazardous waste. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the three CEQA documents surveyed.

- a) **Sufficient Landfill Capacity.** Two of the three CEQA documents for past projects in the transportation facility category disclosed either a less-than-significant impact or no impact related to sufficient landfill capacity; the other CEQA document did not address impacts related to this issue.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

- b) **Compliance with Federal, State, and Local Regulations.** Two of the three CEQA documents for past projects in the transportation facility category disclosed no impacts related to compliance with applicable waste disposal regulations; the other CEQA document did not address impacts related to this issue. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to compliance with waste disposal regulations resulting from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the last five years identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some type of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. These facilities would typically be constructed in industrial zoned areas with sufficient access to waste disposal services. However, due to the scale and nature of these facilities and their operations, the construction and operation of utility projects would have a high likelihood to result in substantially increased amounts or new types of solid/hazardous wastes.

While it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations, power generation, water treatment, sewage, and solid waste treatment facilities may generate large amounts of new solid and hazardous waste, which would either need to be (re)processed, disposed of on-site, or transported to other waste disposal facilities. Therefore, future construction and operation of utility facilities could generate significant adverse impacts related to solid/hazardous waste.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.16-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. However, based on the evaluation of these projects, the construction, modification, or renovation of a variety of structures, including underground pipelines, water storage tanks, groundwater recharge equipment, landfills, smoke stacks, flares, and power generating equipment, would have a low likelihood for impacts related to solid/hazardous waste. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the four CEQA documents surveyed.

- a) Sufficient Landfill Capacity.** The four CEQA documents for the past projects in the utility facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to sufficient landfill capacity.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

- b) Compliance with Federal, State, and Local Regulations.** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to compliance with applicable waste disposal regulations. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations. Additionally, while it is expected that future utilities, including waste disposal facilities, would comply with all established federal, state, and local regulation regarding waste disposal, the facilities could include unique or unusual design characteristics that could require increased waste disposal requirements that are

different from those reviewed for this PEA, which could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to compliance with waste disposal regulations resulting from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas with adequate power utility infrastructure services.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility, for all of which construction and operation activities would potentially result in substantially increased amounts or new types of solid/hazardous wastes. On a programmatic level, it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations. Therefore, individual light industrial/warehouse facilities would generally have a low likelihood of creating significant adverse impacts related to solid/hazardous waste in the future. However, the potential exists for one or more future light industrial/warehouse projects to have significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.16-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. Based on the evaluation of these projects, the construction of one- to three-story warehouse-type and office-type structures may in result in increased waste disposal demands. However, adverse effects were not found to be significant in the CEQA documents surveyed since these facilities are located in existing developed urban areas with adequate access to waste disposal services and landfill capacity, and would not result in conflicts with waste disposal regulations. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the four CEQA documents surveyed.

- a) Sufficient Landfill Capacity.** The four CEQA documents for past projects in the light industry/warehouse facility category disclosed either less-than-significant impacts or no impact related to sufficient landfill capacity.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

- b) Compliance with Federal, State, and Local Regulations.** The four CEQA documents for past projects in the light industry/warehouse facility category disclosed either less-than-significant impacts or no impact related to compliance with applicable waste disposal regulations. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to compliance with waste disposal regulations resulting from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, those new heavy industrial facilities that would be developed in the future as a result of implementing the proposed project would involve the construction of medium- to large-scale industrial buildings, with machinery, boilers, pumps, fuel storage tanks, refinery equipment, mining and extraction equipment, and raw material storage areas, the construction and operation of all of which could potentially result in substantially increased amounts or new types of solid/hazardous wastes. Furthermore, while it would be expected that all future development projects would generally conform to all established solid/hazardous waste disposal regulations, it is likely that these types of projects could have significant adverse impacts related to landfill capacity and solid/hazardous waste disposal regulations. Therefore, these future heavy industrial facilities have the potential of generating significant adverse impacts.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.16-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have related to solid/hazardous waste, including impacts regarding capacity of existing landfills for solid waste needs and conflicts with local, state, and federal regulations regarding solid and hazardous waste disposal. Based on the evaluation of these projects, the construction and operation of fuel storage tanks, refinery equipment, and associated support facilities, and concrete warehouse type buildings, raw material storage, and associated shipping and transportation facilities could result in the generation of increased amounts or different kinds of solid/hazardous wastes, or potential impacts related to conflicts with waste disposal regulations. Nonetheless, the surveyed projects generally determined in the CEQA documents surveyed to have a less-than-significant impact related to solid/hazardous waste. More specifically, the following discussions provide an overall summary of the types of impacts related to solid/hazardous waste identified in the three CEQA documents surveyed.

- a) Sufficient Landfill Capacity.** The three CEQA documents for past projects in the heavy industrial facility category disclosed less-than-significant impacts related to sufficient landfill capacity.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts related to landfill capacity as a result of implementing the proposed project are determined to be significant.

- b) Compliance with Federal, State, and Local Regulations.** The three CEQA documents for past projects in the heavy industrial facility category that have or could have obtained offsets from the SCAQMD’s internal accounts disclosed less-than-significant impacts related to compliance with applicable waste disposal regulations. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in areas that would result conflict with waste disposal regulations.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, solid/hazardous waste impacts could be significant. Therefore, impacts on energy resources related to compliance with waste disposal regulations resulting from implementing the proposed project are determined to be significant.

## **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to solid/hazardous wastes that were either less-than-significant (without or with mitigation) or no impacts. However, four different projects disclosed significant unavoidable impacts related to landfill capacity. Based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff's independent judgment, and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to solid/hazardous waste as an indirect result of implementing the proposed project are determined to be significant.

## **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other "past, present and reasonably foreseeable future projects" [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD's internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD's internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez) and proposed SB 388 (Calderon), which would require transfer of emission reduction credits for certain pollutants from SCAQMD's internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining offsets on the open market. The construction and operation of virtually every past development project has resulted in some quantity of solid and/or hazardous waste. While most projects typically conform to federal, state, and local waste disposal regulation, the capacity of the various local and regional waste disposal facilities, including processing and recycling centers, landfills, and hazardous waste disposal facilities is finite. Generally over time, existing landfills and disposal sites will gradually reach capacity, eventually necessitating the construction and use of new disposal facilities. Any future development within the district resulting from the project would cumulatively contribute to the reduction in the available remaining capacity at existing landfills and disposal sites. Since the specific amount and type of wastes that would be

potentially produced by future unknown facilities cannot be predicted with certainty, the evaluation of cumulative solid/hazardous waste impacts is even more uncertain.

However, some of the past projects were determined to have significant adverse impacts related to solid/hazardous wastes, including impacts regarding capacity of existing landfills for solid waste needs.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

All three of the power plant projects, according to their respective FSAs, generated significant adverse solid waste impacts that could be mitigated to less than significant. The El Segundo FSA determined the waste will be generated during construction, including demolition of existing structures, site preparation, and construction of the generating plant; and during operation of the project associated with handling, storing, and disposing of project-related hazardous and nonhazardous wastes. According to the FSA, nonhazardous wastes generated during operation are expected to be similar to those generated by the present facility and include trash, paper, wood, plastic, cardboard, broken and rusted metal and machine parts, defective electrical materials, empty containers, and other typical worker-generated solid wastes. Hazardous wastes, the CEC determined, are likely to be generated during routine project operation include oily water, combustion turbine generator (CTG) wash water, heat recovery steam generator wash water, spent selective catalytic reduction catalysts, and minimal amounts of used cleaning solvents. CEC staff also determined that much of the hazardous waste generated during facility construction and operation will be recycled, such as used oil and spent catalysts. The mitigation measures proposed in the FSA include obtaining a hazardous waste generator identification number; notifying when any impending waste management-related enforcement action is taking place; preparing and submitting to the Los Angeles County Department of Hazardous Materials for review and approval; employing a Registered Professional Engineer or Geologist, with experience in remedial investigation and feasibility studies for consultation during soil excavation and grading activities; suspending construction activity at that location if potentially contaminated soil is unearthed for the protection of workers or the public; preparing a Remedial Investigation Workplan; and surrounding the entire site by a berm or other solid structures capable of containing any runoff from the site and preventing this runoff from leaving the site. Finally, CEC staff concluded the management of the wastes for the El Segundo project will be in compliance with all applicable laws, ordinances, regulations, and standards (LORS), which ensures that wastes generated during constructing and operating the proposed project will be managed in an environmentally safe manner.

The Walnut Creek FSA prepared by the CEC determined waste generated during construction and operation of the Walnut Creek project or waste associated with remediation of existing on-site contamination would not result in any significant adverse environmental impacts if the mitigation measures are implemented. According to the Walnut Creek FSA, site preparation and construction of the proposed generating plant and associated facilities would generate both nonhazardous and hazardous wastes in liquid and solid forms including metal debris from welding/cutting activities, packing materials, electrical wiring, and empty non-hazardous chemical containers. The CEC determined that hazardous wastes anticipated to be generated during construction include welding materials, paint, flushing and cleaning fluids, solvents, asbestos containing materials, and lead-based paint for a total of approximately 3,000 pounds of hazardous waste generated from the construction phase of the project. The FSA states that nonhazardous solid wastes anticipated to be generated during the operation of the project include up to 37 tons of waste annually, comprised of maintenance wastes and office wastes, with non-recyclable wastes regularly transported offsite to a solid waste disposal facility. The FSA further states that area drains will be located by mechanical equipment where oil could mix with rainwater or other water sources and then sent to an oil-water separator, which separates out any oil before the effluent goes to the collection tank via an underground drain line with the oil-contaminated fluid pumped out by a vacuum truck on an as-needed basis and disposed of at a facility specifically qualified to handle each waste. The CEC staff determined that hazardous wastes anticipated to be generated during routine project operation include waste lubricating oil, lubrication oil filters from the combustion turbines, spent Selective Catalytic Reduction catalyst, oily rags, cooling tower sludge, laboratory analysis waste, oil sorbents, and chemical feed area drainage. Mitigation measures to reduce potential significant solid waste impacts to less than significant outlined in the Walnut Creek FSA include the following: employ a Registered Professional Engineer or Geologist, who shall be available for consultation during soil excavation and grading activities; suspend construction activity at that location if potentially contaminated soil is unearthed for the protection of workers or the public; obtain a hazardous waste generator identification number from the Department of Toxic Substances Control (DTSC); notify the construction project manager (CPM) upon becoming aware of any impending waste management-related enforcement action; prepare a Construction Waste Management Plan and an Operation Waste Management Plan for all wastes generated during construction and operation of the facility, respectively; submit both plans to the CPM for review and approval; ensure that the site is properly characterized and remediated if necessary through an approved workplan; and ensure that the cooling tower sludge is tested and report the findings to the CPM. The project proponent states that handling and management of operational waste would follow the hierarchical approach of source reduction, recycling, treatment, and disposal; and CEC staff concludes the quantities of hazardous waste generated during operation would not significantly impact the treatment and disposal resources available in California. Finally, CEC staff concludes that the Walnut Creek project would comply with all applicable LORS regulating the management of hazardous and non-hazardous wastes during facility construction and operation.

Site preparation and construction of the Sentinel power plant project and associated facilities, according to the FSA, would generate both nonhazardous and hazardous wastes

in solid and liquid forms and all wastes would be recycled to the extent possible. The FSA states that non-hazardous solid wastes generated during construction would include wood, concrete, metal, paper, glass, and plastic and all non-hazardous solid wastes would be recycled to the extent possible and non-recyclable wastes would be collected by a licensed hauler and disposed in a solid waste disposal facility. Also according to the FSA, non-hazardous liquid wastes would also be generated during construction including sanitary wastes, storm water runoff, pipe hydrotesting, and equipment wash water. Hazardous wastes anticipated to be generated during construction, according to the FSA, include empty hazardous material containers, solvents, waste paint, welding materials, oil absorbents. The CEC concluded that during construction, 3,816 cubic yards of non-hazardous solid waste, 306 cubic yards of hazardous solid waste, 858,000 gallons of non-hazardous liquid waste, and 1,584 gallons of hazardous liquid waste would be generated. During operation, the FSA states that non-recyclable non-hazardous solid waste would be primarily from the zero liquid discharge (ZLD) system solids produced by that process and spent CTG air filters with wastes disposed of at an appropriately licensed landfill. Potentially hazardous liquid waste from the CTG wash water could result from the operation of the Sentinel according to the FSA. The CEC determined that hazardous wastes expected to be generated during routine project operation include used hydraulic fluids, oils, greases, oily filters and rags, spent selective catalytic reduction catalyst, cleaning solutions and solvents, and batteries. The CEC concluded that during operation, 33,870 cubic yards of non-hazardous solid waste, 360 cubic yards of hazardous solid waste, 300,000 gallons of non-hazardous liquid waste, and no gallons of hazardous liquid waste would be generated. In order to mitigate the significant adverse solid and hazardous waste impacts to less than significant the following measures are listed in the Sentinel FSA: employ a Registered Professional Engineer or Geologist, who shall be available for consultation during soil excavation and grading activities; suspend construction activity at that location if potentially contaminated soil is unearthed for the protection of workers or the public; comply with Division of Oil, Gas, and Geothermal Resources (DOGGR) procedures for abandonment of an orphaned oil or gas wells; conduct a Phase I Environmental Site Assessment along the proposed natural gas and water pipeline corridors before construction begins; develop and implement a Construction Waste Management Plan; ensure that spills or releases of hazardous substances, hazardous materials, or hazardous wastes associated with the construction or operation of the project are reported, delineated, cleaned-up, and remediated; notify the CPM upon becoming aware of any impending waste management-related enforcement action; obtain a hazardous waste generator identification number from the U.S. EPA; prepare an Operation Waste Management Plan for all wastes generated during operation of the facility, and shall submit the plan to the CPM, DTSC, and the Regional Water Quality Control Board for review and approval; conduct annual analyses of the solids residue from the ZLD process to determine if the solids are hazardous or non-hazardous and ensure appropriate disposal of the solids residue; and submit annual compliance reports to the CPM documenting the annual volumes of wastes generated and the method used to manage the waste generated, such as recycling or disposal. Finally, CEC staff concludes that the Sentinel project would comply with all applicable LORS regulating the management of hazardous and nonhazardous wastes during both facility construction and operation.

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative solid/hazardous waste impacts.

### **Mitigation Measures for Future Solid/Hazardous Waste Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant solid and hazardous waste impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse solid and hazardous waste impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for solid and hazardous waste impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of solid and hazardous waste impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant solid and hazardous waste impact, the potential exists for future indirect solid and hazardous waste impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.17**

---

# **INDIRECT ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES – TRANSPORTATION/TRAFFIC**

**Introduction**

**Impact Analysis**

## **INTRODUCTION**

The proposed project would provide offsets, which can be a necessary step in obtaining approval for a facility. Therefore, the proposed Rule 1315 project has the potential to create indirect adverse impacts in the future from siting, constructing, and operating individual facilities containing stationary pollutant sources that qualify to receive emissions offsets available from the SCAQMD's internal offset accounts. Construction of new or modified structures in future new facilities obtaining emissions offsets from the SCAQMD's internal offset accounts have the potential to generate adverse traffic and transportation impacts depending upon the nature of the project, its location, and its setting. The following section summarizes the methodology used to evaluate the potential impacts the proposed project would have on traffic and transportation from the construction and operation of future new facilities.

### **Methodology**

The methodology for determining the significance of potential traffic and transportation impacts is based on comparing the existing setting to expected future conditions with the proposed projects in place. The following analyses of potentially significant adverse traffic and transportation impacts include assessments of impacts due to increased traffic, inadequate parking, hazardous design features, inadequate emergency access, and effects on alternative mode of transportation that may be caused by future new projects.

Mitigation measures would be identified on a project-by-project basis and would be the responsibility of the lead agencies based on their underlying legal authority to mitigate project impacts.

### **Significance Criteria**

A significant impact is defined as “a substantial or potentially substantial, adverse change in the environment” (Public Resource Code § 21068). Although there is no ironclad rule as to when an impact is “significant,” generally, the questions presented in Appendix G of the CEQA Guidelines can serve as significance criteria, unless a particular agency has developed its own, more specific criteria. To the extent that the proposed project results in siting, constructing, and operating future facilities, these future new projects have the potential to generate significant traffic and transportation impacts if their implementation would result in any of the following:

- Peak period levels on major arterials would be disrupted to a point where level of service (LOS) is reduced to D, E, or F for more than one month or the amount of unacceptable reduction specified in any applicable local plan or ordinance.
- An intersection's volume to capacity ratio increase by 0.02 (two percent) or more when the LOS is already D, E, or F or the amount of unacceptable reduction specified in any applicable local plan or ordinance.

- A major roadway is closed to all through traffic, and no alternate route is available.
- There is an increase in traffic (e.g., 350 heavy-duty truck round-trips per day) that is substantial in relation to the existing traffic load and capacity of the street system.
- The demand for parking facilities is substantially increased.
- Water borne, rail car, or air traffic is substantially altered.
- Traffic hazards to motor vehicles, bicyclists, or pedestrians are substantially increased.
- Result in inadequate emergency access.
- Conflict with adopted policies, plans or programs supporting alternative transportation.

## **IMPACT ANALYSIS**

The following discussion presents an evaluation of potential traffic impacts from future facilities that would be eligible for offsets under the proposed project. The analysis is organized according to the primary facility categories and the potential impacts they may have on traffic and circulation of a given area. Based on the information described in Subsection 5.0, a large majority of stationary source equipment permits would be for the installation of new or replacement equipment at existing facilities. Because the analysis of impacts to traffic and transportation is qualitative in nature as explained in Subchapter 5.0, the determination of the types of impacts and the level of significance of potential facility-level project impacts will not be based on the number of newly constructed or pre-existing facilities. Therefore, information on the number of new facilities is intended for informational purposes only.

Construction of any new future facility or modification of any existing facility in the future has the potential to create significant adverse traffic and transportation impacts. Such future new or modified facilities could potentially result in increase in daily or peak hour traffic, exceed the established level of service standards for a street segment or an intersection, increase hazards due to design features or incompatible uses, result in inadequate parking, and interfere with the implementation of alternative transportation system plans and policies. While the specific nature or degree of such impacts is currently unknown, potentially significant adverse traffic and transportation impacts have been analyzed based on available information pertaining to each facility category.

### **Potential Impacts of Identified Facility Categories**

#### **Agricultural Facilities**

Review of approved and pending permit applications over the five-year period identified 14 agricultural facilities or less than one percent of the total permit applications (see Table 5.0-1). In addition, there is an estimated annual two percent migration of dairy livestock operations from the Chino-Ontario-Norco area to other parts of California (e.g.,

San Joaquin Valley) or to areas outside the state due to economic pressures to reevaluate existing land uses (e.g., agricultural, dairy) due to encroaching urbanization.<sup>1</sup> Accordingly, it is unlikely that a large number of new agricultural facilities would be constructed in the district in the future.

On a programmatic level, impacts to traffic and transportation as a result of constructing future new agricultural facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although agricultural facilities would most likely be constructed in areas zoned for agricultural uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for agricultural projects available at the time the survey was conducted (see Table 5.17-1). The two selected CEQA documents,<sup>2</sup> which were prepared for a winery and a county General Plan Dairy Element, illustrate the types of impacts that agricultural-related projects would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found to have less-than-significant traffic and transportation impacts. More specifically, the following discussions provide an overall summary of the types of impacts traffic and transportation identified in the two CEQA documents surveyed for this facility category.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts with the implementation of mitigation measures related to the substantial increase in traffic over existing traffic loads and capacity and exceedance

---

<sup>1</sup> Final Environmental Assessment for Proposed Rule 1127 – Emission Reductions from Livestock Waste (SCAQMD, August 2004).

<sup>2</sup> It should be noted that no available documents were found for projects within the district; the two selected documents for agricultural facilities were for projects in San Mateo County and Kings County in northern and central California, respectively. Although these projects are not located within the district, their environmental documents illustrate the types of impacts that may result from the development of such projects.

of levels of service established for streets and highways. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) Change Air Traffic Patterns.** One of the two CEQA documents for a past project in the agricultural facility category disclosed no impacts on air traffic patterns; the other CEQA document did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) Increased Hazards due to Design Feature or Incompatible Uses.** The two CEQA documents for past projects in the agricultural facility category indicated that for one of the projects, the environmental impacts related to increased hazards from design features or incompatible uses were less-than-significant. However, for the other project surveyed (Project #1 – Clos de la Tech Winery), the lead agency concluded that this agricultural project has the potential to generate significant adverse environmental impacts on safety risk associated with conflicts between vehicles on area roads. More specifically, although the increase in traffic attributed to this project was not considered substantial, the potential for conflict between vehicles exiting the site access road and turning left and vehicles traveling north on the main highway would increase to significant adverse levels, particularly during periods of poor visibility, such as fog or rain. In addition, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could be sited in or

near a land use or incorporate design features that could create significant adverse impacts, including vehicular/bicycle or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site.

Therefore, based on information in the CEQA documents evaluated for the proposed project, the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, and the additional considerations identified in the preceding paragraph, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** The two CEQA documents for past projects in the agricultural facility category disclosed less-than-significant impacts related to emergency access. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) **Parking Capacity.** One of the two CEQA documents for a past project in the agricultural facility category disclosed a less-than-significant impact on parking capacity; the other CEQA document did not address impacts on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands onto nearby on-street or off-street parking facilities and could also result in project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore,

impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** One of the two CEQA documents for a past project in the agricultural facility category disclosed no impact on programs and policies supporting alternative transportation system; the other CEQA document did not address impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 1 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

#### **Retail/Service Facilities**

Review of approved and pending permit applications over the five-year period identified 2,621 retail/service facilities, or 42.1 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction since most of them would be established and operated within existing retail-oriented buildings in urban, commercial, and mixed-use residential areas.

Examples of projects that may be constructed in the future include dry cleaning and laundry businesses, restaurants, gas stations, and auto repair facilities, as evidenced by the currently pending permits and permits issued by the SCAQMD in the five-year period. On a programmatic level, impacts to traffic and transportation as a result of constructing future new retail/services facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although retail/services facilities would most likely be constructed in areas zoned for commercial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for retail service facilities at the time the survey was conducted (see Table 5.17-1). The eight CEQA documents surveyed, which were prepared for a medical office project, five mixed-use projects (all involving residential and retail developments), and two commercial/retail projects, illustrate the types of impacts that retail/services facilities would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have some significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the eight CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The eight CEQA documents for past projects in the retail/services facility category indicated that for some of the projects, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacity and exceedance of levels of service established for streets and highways were less-than-significant impacts (without or with mitigation). However, for the other projects surveyed (Projects #5 – Shops at Santa Anita Specific Plan, #7 – 2001 Main Street Mixed Use Development, #8 – 1427 Fourth Street, and #10 – New Century Plan), the lead agencies concluded that these retail/service projects have the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels and exceedance of levels of service. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. In situations where a project involves street vacations or other substantial street system changes, traffic impacts were also determined to result from diverted or shifted traffic caused by the project. In addition, the increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios, and exceedance of established level of service. Similarly, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

**c) Change Air Traffic Patterns.** Four of the eight CEQA documents for past projects in the retail/services facility category disclosed no impacts on air traffic patterns; the

other four CEQA documents did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) Increased Hazards due to Design Feature or Incompatible Uses.** Six of the eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts or no impact related to increased hazards from design features or incompatible uses; the other two documents did not discuss impacts related to hazards due to design features or incompatible land uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) Emergency Access.** The eight CEQA documents for past projects in the retail/services facility category disclosed less-than-significant impacts (without or with mitigation) related to emergency access. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes,

walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) Parking Capacity.** The eight CEQA documents for past projects in the retail/services facility category disclosed less-than-significant impacts (without or with mitigation) on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities or project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** The eight CEQA documents for past projects in the retail/services facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 2 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Large Commercial Facilities**

Review of approved and pending permit applications over the five-year period identified 649 large commercial facilities, or 10.4 percent of the total (see Table 5.0-1). However, based on these historical data and the assumption that the annual percentage of newly constructed physical activities would be five percent, only some of these facilities are anticipated to involve new construction since most of the projects would be established and operated within existing buildings and facilities in developed urban areas.

Examples of large commercial facilities that may be constructed in the future include hotels/motels, regional shopping centers, and office and media production facilities. On a programmatic level, impacts to traffic and transportation as a result of constructing future new large commercial facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although large commercial facilities would most likely be constructed in areas zoned for commercial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for large commercial facilities available at the time the survey was conducted (see Table 5.17-1). The nine CEQA documents surveyed, which were prepared for two hotel/motel projects, a regional shopping center, and six mixed-use projects (all involving commercial and residential developments), illustrate the types of impacts that large commercial facilities would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have some significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the nine CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The nine CEQA documents for past projects in the large commercial facility category indicated that for some of these projects, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacities were less-than-significant (without

or with mitigation). However, for the other projects surveyed (Projects #11 – Sunset Doheny Hotel, #13 – Travelodge Hotel, #16 – Panorama Palace, #17 – Metro Universal, #18 – Paseo Plaza Hollywood, and #19 – Plaza at the Glen), the lead agencies concluded that these large commercial projects have the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. In situations where a project involves street vacations or other substantial street system changes, traffic impacts can also result from diverted or shifted traffic caused by the project. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios and exceedance of established level of service. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) **Change Air Traffic Patterns.** Four of the nine CEQA documents for past project in the large commercial facility category disclosed no impacts on air traffic patterns; the other five CEQA documents did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) **Increased Hazards due to Design Feature or Incompatible Uses.** The nine CEQA documents prepared for past projects in the large commercial facility category indicated that for most of the projects, environmental impacts related to increased hazards from design features or incompatible uses were either less-than-significant or no impact; four of the CEQA documents did not discuss impacts related to hazards

due to design features or incompatible land uses). However, for one of the projects surveyed (Project #17 – Metro Universal), the lead agency concluded that this large commercial project has the potential to generate significant adverse environmental impacts related to increased hazards from design features or incompatible uses. More specifically, sidewalk closures were proposed for this project throughout the construction phase, requiring some pedestrians in the area to cross over streets in order to access a sidewalk, potentially causing an increase in vehicle/pedestrian interaction to create a significant adverse impact on pedestrian safety. Similarly, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** Seven of the nine CEQA documents for past projects in the large commercial facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact related to emergency access; the other two CEQA documents did not address impacts related to emergency access. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) **Parking Capacity.** The nine CEQA documents for past projects in the large commercial facility category indicated that for most of the projects, environmental

impacts on parking capacity were concluded to be less-than-significant. However, for one project surveyed (Project #17 – Metro Universal), the lead agency concluded that this large commercial project has the potential to generate significant adverse impacts due to insufficient parking capacity as a result of that project. Furthermore, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities or project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** Eight of the nine CEQA documents for past projects in the large commercial facility category disclosed less-than-significant impacts (without or with mitigation) on programs and policies supporting alternative transportation system; the other CEQA document did not include discussion on impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 3 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD's internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

#### **Entertainment/Recreational Facilities**

Review of approved and pending permit applications over the five-year period identified 24 entertainment/recreational facilities, or less than one percent of the total (see Table

5.0-1). Accordingly, based on these historical data, a small number of these new entertainment and recreation-oriented facilities is anticipated to be developed in the future.

Examples of projects that may be constructed in the future include sports venues, concert halls, parks, golf courses, equestrian centers, and other outdoor recreational facilities. On a programmatic level, impacts to traffic and transportation as a result of constructing future new entertainment/recreational facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although entertainment/recreational facilities would most likely be constructed in areas zoned for commercial and recreational uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for entertainment/recreational facilities available at the time the survey was conducted (see Table 5.17-1). The four CEQA documents surveyed, which were prepared for the development of a professional football stadium in the City of Industry, a sports and entertainment district in downtown Los Angeles, a residential project with an equestrian center and a large open space component in the San Fernando Valley, and a waterfront project in the Community of Wilmington in the South Bay, illustrate the types of impacts that entertainment and recreational facilities would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the four CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The four CEQA documents prepared for past projects in the entertainment/recreational facility category indicated that for some of the project surveyed, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacity or exceedance of established levels of service were considered to be less-than-significant (without or with mitigation). However, for two of the projects surveyed (Projects #20 – City of Industry Business Center (NFL Stadium) and #21 – LA Live-Sports and Entertainment District), the lead agencies concluded that these entertainment/recreational projects have the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels or exceedance of established levels of service. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections during events at these venues. In situations where a project involves street vacations or other substantial

street system changes, traffic impacts can also result from diverted or shifted traffic caused by the project. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios and exceedance of established level of service. In addition, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) **Change Air Traffic Patterns.** Three of the four CEQA documents for past project in the entertainment/recreational facility category disclosed either a less-than-significant impact or no impacts on air traffic patterns; the other CEQA document did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) **Increased Hazards due to Design Feature or Incompatible Uses.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts related to increased hazards from design features or incompatible uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through

the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts related to emergency access. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) **Parking Capacity.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed less-than-significant impacts on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

**g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** The four CEQA documents for past projects in the entertainment/recreational facility category disclosed either less-than-significant impacts or no impact on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 4 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

#### **Institutional Facilities**

Review of approved and pending permit applications over the five-year period identified 421 institutional facilities, or 6.8 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most would be located within existing buildings in commercial, residential, and institutional land use areas.

Examples of institutional facilities include schools, colleges, universities, hospitals, museums, and churches/temple. On a programmatic level, impacts to traffic and transportation as a result of constructing future new institutional facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although institutional facilities would most likely be constructed in areas zoned for commercial, residential, and institutional uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for schools, hospitals, senior care facilities, etc., available at the time the survey was conducted (see Table 5.17-1). The 15 CEQA documents surveyed, which were prepared for a state agency headquarters, a county courthouse facility, four schools, two colleges, an addition to an existing university campus, an addition to an existing hospital, an eldercare facility, a

museum, two religious facilities, and a fire station, illustrate the types of impacts that institutional facilities would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have some significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the 15 CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The 15 CEQA documents for past projects in the institutional facility category indicated that for some projects, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacity were concluded to be less-than-significant (without or with mitigation). However, for six of the projects surveyed (Projects #25 – Buckley School Enhancement, #26 – Cedars Sinai West Tower, #28 – Museum of Tolerance, #34 – Sierra Canyon Senior Secondary School, #35 – West LA College, and #37 – Harvard – Westlake School), the lead agencies concluded that these institutional projects have the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. In situations where a project involves street vacations or other substantial street system changes, traffic impacts can also result from diverted or shifted traffic caused by the project. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios, and exceedance of established level of service. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

**c) Change Air Traffic Patterns.** 11 of the 15 CEQA documents for past project in the institutional facility category disclosed either a less-than-significant impact or no impacts on air traffic patterns; the other four CEQA documents did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5

in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) Increased Hazards due to Design Feature or Incompatible Uses.** 14 of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts related to increased hazards from design features or incompatible uses; the other CEQA document did not discuss impacts related to hazards due to design features or incompatible land uses. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) Emergency Access.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts related to emergency access. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) Parking Capacity.** The 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** 13 of the 15 CEQA documents for past projects in the institutional facility category disclosed either less-than-significant impacts or no impacts on programs and policies supporting alternative transportation system; the other two CEQA documents did not address impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 5 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different

environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Transportation Facilities**

Review of approved and pending permit applications over the five-year period identified 100 transportation facilities, or 1.6 percent of the total (see Table 5.0-1). Due to continuing improvements in transportation facilities across the district to accommodate expected increases in goods movement, it is possible that a larger number of transportation-related facilities would be constructed in the future due to continuing improvements and expansion of public transportation infrastructure. However, since highways and roads typically do not require stationary source permits, the number of transportation-related facilities that would require such permits in the future does not constitute a large number (based on historical data, as shown in Table 5.0-1) in comparison to the overall SCAQMD permitting activities.

Examples of transportation facilities that may be constructed in the future include port terminal expansions, transit/bus maintenance facilities, and transit lines and transit line extensions. On a programmatic level, impacts to traffic and transportation as a result of constructing future new transportation facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although transportation facilities would most likely be constructed in areas zoned for mixed use, commercial and industrial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the selected CEQA documents for transportation facilities available at the time the survey was conducted (see Table 5.17-1). The three CEQA documents surveyed, which were prepared for a port terminal expansion, a bus maintenance facility, and a transit line extension, illustrate the types of impacts that transportation projects would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have some significant adverse impacts (prior to mitigation) related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the three CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) related to the substantial increase in traffic over existing traffic loads and capacity and exceedance of levels of service

established for streets and highways. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. In situations where a project involves street vacations or other substantial street system changes, traffic impacts can also result from diverted or shifted traffic caused by the project. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios and exceedance of established level of service. In addition, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) **Change Air Traffic Patterns.** Two of the three CEQA documents for past projects in the transportation facility category disclosed no impacts on air traffic patterns; the other CEQA document did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) **Increased Hazards due to Design Feature or Incompatible Uses.** One of the three CEQA documents for a past project in the transportation facility category disclosed a less-than-significant impact with implementation of mitigation measures related to increased hazards from design features or incompatible uses; the other two CEQA documents did not discuss impacts related to increased hazards from design features or incompatible uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land

use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** The three CEQA documents for past projects in the transportation facility category disclosed either less-than-significant impacts or no impact related to emergency access. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) **Parking Capacity.** Two of the three CEQA documents for past projects in the transportation facility category disclosed less-than-significant impacts (without or with mitigation) on parking capacity; the other CEQA document did not address impacts on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** The three CEQA documents for past projects in the transportation facility category disclosed either less-than-significant impacts or no impact on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 6 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Utility Projects**

Review of approved and pending permit applications over the five-year period identified 150 utility facilities, or 2.4 percent of the total (see Table 5.0-1). Based on this historical data, a large number of new utility-oriented facilities is not anticipated to be constructed and operated in the future. On a programmatic level, those new utility-oriented facilities that may be constructed in the future could involve water treatment plants (e.g., tanks, digesters, ponds), above- and underground pipelines, power generating equipment (e.g., boilers, fuel-storage, exhaust structures), and landfill processing, transport, and storage facilities. Some types of future utility projects may require demolition of existing structures and construction of low- to medium-scale buildings.

While a large number of new utility-oriented facilities is not anticipated to be constructed in the future, alteration, upgrades and improvement of existing facilities are likely to occur in order to meet additional future demand for public utility infrastructure. Due to the necessity of many public infrastructure and utility services, these facilities have the potential to be constructed in a wide range of different areas. On a programmatic level, impacts to traffic and transportation as a result of constructing future new utility facilities may include potentially increasing traffic substantially over existing traffic load and

capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although utility facilities would most likely be constructed in areas zoned for industrial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for utility projects available at the time the survey was conducted (see Table 5.17-1). The four CEQA documents surveyed, which were prepared for improvements to an existing power generating facilities, a landfill and recycling center, and a recharge basin and pipeline project, illustrate the types of impacts that utility projects would have traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have some significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the four CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The four CEQA documents for past projects in the utility facility category disclosed less-than-significant impacts (without or with mitigation) related to the substantial increase in traffic over existing traffic loads and capacity and exceedance of levels of service established for streets and highways. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

**c) Change Air Traffic Patterns.** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impact with implementation of mitigation measures or no impacts on air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 7 in Appendix F), it is possible that future

individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) Increased Hazards due to Design Feature or Incompatible Uses.** The four CEQA documents for past projects in the utility facility category indicated that for most of the projects, environmental impacts were concluded to be less than significant with implementation of mitigation measures or no impacts related to increased hazards from design features or incompatible uses. However, for one project surveyed (Project #43 – LADWP Electrical Generating Stations Modification), the lead agency concluded that this utility project has the potential to generate significant adverse environmental impacts related to the possibility of an accidental spill of chemicals resulting from truck accidents. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) Emergency Access.** Three of the four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts or no impact related to emergency access; the other CEQA document did not discuss impacts related emergency access. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other

barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) Parking Capacity.** The four CEQA documents for past projects in the utility facility category disclosed either less-than-significant impacts (without or with mitigation) or no impact on parking capacity. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** Three of the four CEQA documents for past projects in the utility facility category disclosed no impact on programs and policies supporting alternative transportation system; the other CEQA document did not discuss impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 7 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Light Industrial/Warehouse Facilities**

Review of approved and pending permit applications over the five-year period identified 1,133 light industrial/warehouse facilities, or 18.2 percent of the total (see Table 5.0-1). Based on these historical data, only some of these facilities are anticipated to involve new construction in the future since most of them would be located within existing buildings, structures, and warehouses in industrial or other compatibly zoned areas.

Examples of light industrial/warehouse facilities that may be constructed include production/post-production studios/facilities, business parks housing light industrial and warehouse distribution uses, and a warehouse/retail facility. On a programmatic level, impacts to traffic and transportation as a result of constructing future new light industrial/warehouse facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency access, or conflict with adopted plans and policies for alternative transportation systems. Although light industrial/warehouse facilities would most likely be constructed in areas zoned for commercial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for light industry/warehouse facilities available at the time the survey was conducted (see Table 5.17-1). The four CEQA documents surveyed, which were prepared for two production/post-production studios/facilities, a business park, and a warehouse/retail facility, illustrate the types of impacts that light industrial/warehouse projects would have traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the four CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The four CEQA documents for past projects in the light industrial/warehouse facility category indicated that for some of the projects, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacity were concluded

to be less-than-significant (without or with mitigation). However, for most of the projects surveyed, the lead agencies concluded that the light industrial/warehouse projects have the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels, such as those disclosed for Projects #46 – Lantana Studio Development, #48 – City of San Dimas Costco Development, and #49 – 959 Seward Street. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. In situations where a project involves street vacations or other substantial street system changes, traffic impacts can also result from diverted or shifted traffic caused by the project. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios and exceedance of established level of service. In addition, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) **Change Air Traffic Patterns.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed no impacts on air traffic patterns; the other two CEQA documents did not address impacts related to changes in air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) **Increased Hazards due to Design Feature or Incompatible Uses.** Three of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed less-than-significant impacts (without or with mitigation) related to increased hazards from design features or incompatible uses; the other CEQA

document did not discuss impacts related to increased hazards from design features or incompatible uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts or no impacts related to emergency access. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) **Parking Capacity.** The four CEQA documents for past projects in the light industrial/warehouse facility category disclosed either less-than-significant impacts (without or with mitigation) or no impacts on parking capacity. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking

demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** Two of the four CEQA documents for past projects in the light industrial/warehouse facility category disclosed no impacts on programs and policies supporting alternative transportation system; the other two CEQA documents did not discuss impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 8 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Heavy Industrial Facilities**

Review of approved and pending permit applications over the five-year period identified 1,118 heavy industrial facilities, or 17.9 percent of the total (see Table 5.0-1). Based on these historical data, only some of these heavy industrial facilities are anticipated to involve new construction in the future since most of them would be located within existing structures in industrial zoned areas.

Examples of heavy industrial facilities that may be constructed include refineries and industrial parks. On a programmatic level, impacts to traffic and transportation as a result of constructing future new heavy industrial facilities may include potentially increasing traffic substantially over existing traffic load and capacity of the street system, exceed level of service standards for designated roads and highways, cause hazards due to design feature or through incompatible uses, result in inadequate parking capacity or emergency

access, or conflict with adopted plans and policies for alternative transportation systems. Although heavy industrial facilities would most likely be constructed in areas zoned for commercial uses, these facilities may be near or directly adjacent to incompatible uses. These above-mentioned factors may result in significant adverse traffic and transportation impacts.

Project-specific impacts are identified in the CEQA documents for heavy industrial facilities available at the time the survey was conducted (see Table 5.17-1). The three CEQA documents surveyed, which were prepared for improvements to two existing refineries and an industrial park project, illustrate the types of impacts that heavy industrial projects would have on traffic and transportation, including substantial increase in daily and peak hour over existing traffic loads and capacity, exceedance of established level of service standards, inadequate parking capacity and access, and conflict with adopted plans and policies for alternative transportation system. Accordingly, these projects were found in the CEQA documents surveyed to have significant adverse impacts related to traffic and transportation. More specifically, the following discussions provide an overall summary of the types of traffic and transportation impacts identified in the three CEQA documents surveyed.

**a, b) Substantial Increase in Traffic over Existing Traffic Loads and Capacity and resulting in Exceedance of Established Levels of Service.** The three CEQA documents for past projects in the heavy industrial facility category indicated that for most of the projects, environmental impacts related to the substantial increase in traffic over existing traffic loads and capacity were concluded to be less-than-significant impact (without or with mitigation). However, for one of the projects surveyed (Project #50 – Chevron Products Company El Segundo Refinery Product Reliability and Optimization), the lead agency concluded that this heavy industrial project has the potential to generate significant adverse environmental impacts related to the substantial increase in traffic over existing levels. More specifically, the impacts would result from the addition of new project-generated traffic to local intersections. The increase in daily and peak hour traffic could result in the congestion of intersections and roads leading to excessive delays and queuing, increasing volume-to-capacity ratios and exceedance of established level of service. In addition, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts resulting in substantial increase in traffic and exceedance of level of service anywhere within the district.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts from substantial increase in traffic over existing conditions and exceedance of level of service established for streets and highways from implementing the proposed project are determined to be significant.

- c) **Change Air Traffic Patterns.** The three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts on air traffic patterns. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts related to changes in air traffic patterns. The individual project could be located within two miles of any airport or included in an airport land use plan.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to changes in air traffic patterns from implementing the proposed project are determined to be significant.

- d) **Increased Hazards due to Design Feature or Incompatible Uses.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact or no impacts related to increased hazards from design features or incompatible uses. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could be sited in or near a land use or incorporate design features that could create significant adverse impacts, including vehicular/vehicular, vehicular/bicycle, or vehicle/pedestrian conflicts, as well as operational delays caused by slowing and/or queuing to access a project site. These conflicts may be created by the driveway configuration or through the placement of project driveways in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or in close proximity to busy or congested intersections.

Based on the fact that the prior CEQA documents evaluated provide only a "snapshot" of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts related to increased hazards due to design features or incompatible land uses from implementing the proposed project are determined to be significant.

- e) **Emergency Access.** The three CEQA documents for past projects in the heavy industrial facility category disclosed no impacts related to emergency access. However, based on SCAQMD staff's review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD's offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could have a project driveway on a sidewalk with high pedestrian activity, or access risks or deficiencies associated with the adjoining street system due to curves, slopes, walls or other barriers to provide adequate lines-of-sight, or construction activities impeding access to the site.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on emergency access from implementing the proposed project are determined to be significant.

- f) Parking Capacity.** The three CEQA documents for past projects in the heavy industrial facility category indicated that for most of the projects, no impacts related to the parking capacity would occur. However, for one of the projects surveyed (Project #50 – Chevron Products Company El Segundo Refinery Product Reliability and Optimization), the lead agency concluded that this heavy industrial project has the potential to generate significant adverse environmental impacts related to the deficiency in parking capacity at the project site during project construction. Based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on parking capacity of an area. Parking impacts can result from the provision of an insufficient parking supply to serve a project. Such impacts can be manifested by spillover of project parking demands to nearby on-street or off-street parking facilities and project parking demand intrusion into nearby residential neighborhoods. This could potentially result in significant adverse environmental impacts.

Therefore, based on information in the CEQA documents evaluated for the proposed project and the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts on parking capacity from implementing the proposed project are determined to be significant.

- g) Conflict with Adopted Plans and Policies Supporting Alternative Transportation Systems.** The three CEQA documents for past projects in the heavy industrial facility category disclosed either a less-than-significant impact with implementation of mitigation measures or no impacts on programs and policies supporting alternative transportation system. However, based on SCAQMD staff’s review of the distribution of similar types of projects for this facility category that have obtained offsets from the SCAQMD’s offset accounts in the past (Figure 9 in Appendix F), it is possible that future individual projects in this facility category could create significant adverse impacts on programs and policies supporting alternative transportation system by increasing demand for transit ridership. Similarly, future facilities obtaining offsets from the SCAQMD’s internal accounts could include design characteristics that could affect the visibility of pedestrians and bicyclists to drivers entering and exiting the site and the visibility of cars to pedestrians and bicyclists or result in removal of sidewalks and bike routes. This could potentially result in significant adverse environmental impacts.

Based on the fact that the prior CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, with different types of future projects and in different environmental settings, transportation/traffic impacts could be significant. Therefore, impacts on programs and policies supporting alternative transportation system from implementing the proposed project are determined to be significant.

### **Summary of Findings**

The review of 52 CEQA documents found that most of the past projects had environmental impacts related to traffic and transportation that were either less-than-significant or less-than-significant with the implementation of mitigation measures. However, review of the CEQA documents also found that some of the past projects have the potential to generate significant adverse impacts related to increased traffic (regionally and locally), increased hazards due to design features, or parking capacity. Therefore, based on information in the 52 CEQA documents evaluated for the proposed project that cover the nine primary facility categories, exercising SCAQMD staff’s independent judgment, and the fact that the CEQA documents evaluated provide only a “snapshot” of the documents for the applicable facility categories available at the time the analysis was prepared, impacts related to traffic and transportation as an indirect result of implementing the proposed project are determined to be significant.

### **Cumulative Impacts**

CEQA requires the evaluation of cumulative impacts in addition to direct and indirect impacts. According to the State CEQA Guidelines, cumulative impacts refer to the change in the environment which results from the incremental impact of a proposed project when added to other “past, present and reasonably foreseeable future projects.” [14 Cal. Code Reg. 13355].

For the purposes of the proposed project, the assessment of cumulative impacts provided below includes the reasonably foreseeable impacts from the following types of facilities:

- Facilities that will obtain offsets from the SCAQMD’s internal offset accounts per Proposed Rule 1315 (i.e., Rules 1304 and 1309.1);
- Facilities that will obtain offsets on the open credit market;
- Facilities that will obtain offsets from the SCAQMD’s internal accounts per Senate Bill (SB) 827; and
- Power plant facilities per Assembly Bill (AB) No. 1318 (Perez), proposed SB 388 (Calderon), and potentially one other bill, which would require transfer of emission reduction credits for certain pollutants from SCAQMD’s internal offset accounts to eligible electrical generating facilities.

Facilities obtaining an SCAQMD air quality permit will be required to offset any increase in emissions either by obtaining offsets per Proposed Rule 1315, SB 827, or by obtaining

offsets on the open market. As noted in the discussion of the traffic and transportation settings (see Section 3.17), the regional transportation system in the district is currently operating at or above capacity during peak periods. The roadway system shows substantial freeway congestion in the morning and evening peak periods. The transit system is experiencing substantial overcrowding on a number of core urban bus routes with significant excess capacity on most off-peak and peripheral routes. While not all future development projects would result in significant traffic or transportation related impacts, as noted above, the evaluation of cumulative traffic and transportation impacts is uncertain since the specific location and impacts of individual facilities cannot be identified at this time.

However, future projects are likely to result in traffic impacts, which are similar to those from past development projects. Some of the past projects were determined to have significant adverse impacts on traffic and transportation, including the potential to (1) increase traffic substantially from existing conditions, (2) result in exceedance of levels of service for freeway segments and intersections established by congestion management agency, (3) result in increased hazards from design features or incompatible land uses, or (4) result in inadequate parking capacity.

It is reasonably foreseeable that the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. The three power plant projects, NRG's El Segundo Power Redevelopment (El Segundo), Walnut Creek Energy Park (Walnut Creek), and CPV Sentinel Energy (Sentinel), were evaluated by the California Energy Commission (CEC) in separate Final Staff Assessments (FSAs), which were reviewed to obtain the environmental impact analysis and determination of significance made by the lead agency (CEC). The analysis and conclusions regarding significance are summarized and incorporated by reference herein. The El Segundo and Walnut Creek projects are located in Los Angeles County and the Sentinel project is located in Riverside County.

The CEC concluded in the FSAs for all three power plant projects that the projects would generate significant adverse transportation and traffic impacts but the impacts could be mitigated to less than significant. The FSA for the El Segundo projects notes the influx of large numbers of construction workers and the transportation of large pieces of equipment can, over the course of the construction phase, increase roadway congestion and also affect traffic flow. The FSA continues to state that the construction of other facilities such as pipelines for water service can temporarily disrupt traffic flows when trenching is required in or across roadways. The project proponent expected to add two new full-time employees above the current operations employee levels, which is an increase, the CEC concludes, that is insignificant in traffic levels. The FSA discloses that deliveries to the project site are expected for on-going maintenance of the plant and the incremental change in the number of delivery trips to the plant site is expected to be nominal and will generally occur during non-commute periods. Overall, the CEC staff determined that the intersections and roadways that are operating at acceptable level of service (LOS) (LOS of D or better) will not see a decline in their LOS to an unacceptable LOS but since some of the area intersections and roadways are operating at a LOS of "E" or "F" the potential exists for the project to cause an impact in the traffic and

transportation area. However, the CEC concluded that any identified transportation/traffic impacts can be mitigated to a level of insignificance by implementing the following mitigation measures: comply with Caltrans and other relevant jurisdictions limitations on vehicle sizes and weights; comply with Caltrans and other relevant jurisdictions limitations for encroachment into public rights-of-way and shall obtain necessary encroachment permits from Caltrans and all relevant jurisdictions; ensure that permits and/or licenses are secured from the California Highway Patrol and Caltrans for the transport of hazardous materials; develop a parking and staging plan for all phases of project construction to enforce a policy that all project-related parking occurs on-site or in designated off-site parking areas; consult with the Cities of El Segundo, Manhattan Beach and Los Angeles, and prepare and submit a construction traffic control plan to the construction project manager (CPM) for approval; have all the lighting and marking required by the Federal Aviation Authority (FAA) so that the stacks do not create a hazard to air navigation; and repair any damage to the segment of Vista Del Mar and other roadways affected by construction activity along with the primary roadways.

CEC staff analyzed the traffic related information for the Walnut Creek Project and concluded the traffic and transportation impacts would be significant but that the availability of mitigation measures could reduce or eliminate the significance of these impacts. In addition, the CEC determined the mitigation measures would ensure that the project complies with applicable laws, ordinances, regulations, and standards (LORS) pertaining to traffic and transportation. According to the FSA for Walnut Creek, traffic and transportation impacts during construction will result from the vehicle trips of the construction workforce (e.g., boilermakers, electricians, ironworkers, carpenters); truck traffic generated by the demolition and removal of the existing warehouse on the proposed project site; and truck deliveries supplying construction materials and equipment. Operation of the Walnut Creek project will result in traffic and transportation impacts from employee trips, which, according to the FSA, will result in a tenfold reduction in total trip generation when compared to employee trips generated by the current warehouse operation and, therefore, result in a significant adverse impact to traffic and transportation. In addition, the CEC determined that truck trips during operation, including delivery of hazardous materials and removal of wastes, will be a maximum of three truck trips per day with an average of two or fewer trips per day, and concluded this number of truck trips would not significantly impact the existing LOS for area roads. According to the FSA, aircraft approaching or departing the El Monte Airport do not fly over the proposed power plant, and the proposed facility is not located within 20,000 feet of a runway at the El Monte Airport, or other general aviation facility. Significant traffic and transportation impacts during construction are mitigated to less than significant with the following measures listed in the FSA: secure an encroachment permit demonstrating compliance with the applicable requirements of the City of Industry, the County of Los Angeles, and Caltrans; comply with the applicable parking standards of the City of Industry, and the County of Los Angeles; prepare a parking plan(s) for the construction and operation phases of the project and submit to the CPM for approval a parking plan(s) for the construction and operation phases of the project; prepare a construction traffic control and implementation plan for the project and its associated facilities; repair to original or near original condition affected public rights-of-way; and submit written notification to the Los Angeles County Sheriff's Department

Aero Bureau informing them of the start of commercial operation date for the power plant and advising them that potential turbulence caused by thermal plumes emitted from the power plant's cooling towers and combustion turbine generator stacks may adversely affect aircraft flying directly over the power plant below an elevation of 500 feet above ground level.

The FSA prepared by the CEC for the Sentinel project employee trips from construction workforce and truck delivery for construction material and equipment have the potential to generate significant transportation/traffic impacts as the LOS is degraded in both intersections and freeway ramps resulting in motorists experiencing an increased delay. The operation of the Sentinel project would employ ten full-time and four part-time workers spread over a 24-hour period in addition to an estimated one to two nonrecurring service/delivery trips per month to and from the project site. Further, the FSA states that tanker trucks delivering aqueous ammonia to replenish aqueous ammonia stored on site for plant operation will occur up to 56 times per year from a supplier in Southern California. The FSA determined the project site is not located within 20,000 feet of an airport runway triggering a notification to the FAA and does not have any structure exceeding 200 feet in height which would also trigger an FAA notification. The CEC concluded that the construction and operation of the Sentinel project with the effective implementation of the following mitigation measures would ensure that the project's direct adverse traffic and transportation impacts are less than significant and, ensure that the Sentinel project complies with applicable LORS regarding traffic and transportation: secure an encroachment permit in accordance with the applicable requirements of the county of Riverside, the city of Palm Springs, and Caltrans; comply with the applicable parking standards of the county of Riverside; prepare a parking plan for the operation phase of the project and submit to the CPM for approval; prepare a construction traffic control and implementation plan, including timing of heavy equipment and building materials deliveries, signing, lighting, and traffic control device placement, and redirecting construction traffic for the project and its associated facilities; repair affected public rights-of-way (e.g., highway, road, bicycle path, pedestrian path) to original or near original condition that has been damaged due to construction activities conducted for the project and its associated facilities; dedicate, and complete improvement of Melissa Lane from Dillon Road to the north boundary of the Sentinel site to the county of Riverside standard for a collector rural road; and pay a Transportation Uniform Mitigation Fee to the county of Riverside;

Based upon the above considerations, impacts of the project are considered to be cumulatively considerable (CEQA Guidelines §15064(h)(1)) and the proposed project has the potential to contribute to significant adverse cumulative transportation/traffic impacts.

### **Mitigation Measures for Future Traffic and Transportation Impacts**

Mitigation measures were described in the CEQA documents that were surveyed relating to any potentially significant traffic and transportation impacts identified in those documents. As a single purpose public agency responsible for adopting and enforcing

air quality rules and regulations, the SCAQMD's authority to implement mitigation measures for such indirect impacts is limited. CEQA is intended to be implemented in conjunction with discretionary powers granted to public agencies by other laws (CEQA Guidelines §14040(a)). Further, the CEQA Guidelines (§15040(b)) specifically state, "CEQA does not grant an agency new powers independent of the powers granted to the agency by other laws." With respect to measures identified in the survey for mitigation of potentially significant adverse traffic and transportation impacts, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. In addition, because the survey related to representative facilities, rather than to specific future facilities that will actually receive permits from SCAQMD, it is not feasible to identify appropriate facility-specific mitigation measures for traffic and transportation impacts in this PEA. Instead, appropriate facility-specific mitigation measures will necessarily have to be identified in the CEQA document prepared for each such facility that is proposed. Identification and adoption of mitigation of traffic and transportation impacts would primarily be the responsibility of the local general purpose public agency (e.g., city or county) or other agency that would typically serve as the lead agency on any given future facility.

#### **Level of Significance after Mitigation**

Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant traffic and transportation impact, the potential exists for future indirect traffic and transportation impacts to be significant and unavoidable (i.e., significant even after imposition of feasible mitigation measures).

## **SUBCHAPTER 5.18**

---

### **CONSISTENCY**

#### **Introduction**

## **INTRODUCTION**

The Southern California Association of Governments (SCAG) and the SCAQMD have developed, with input from representatives of local government, the industry community, public health agencies, the USEPA - Region IX and the California ARB, guidance on how to assess consistency within the existing general development planning process in the Basin. Pursuant to the development and adoption of its Regional Comprehensive Plan Guide (RCPG), SCAG has developed an Intergovernmental Review Procedures Handbook (June 1, 1995). The SCAQMD also adopted criteria for assessing consistency with regional plans and the AQMP in its CEQA Air Quality Handbook. The following sections address consistency between the proposed project (i.e., proposed Rule 1315) and relevant regional plans pursuant to the SCAG Handbook and SCAQMD Handbook.

### **Consistency with Regional Comprehensive Plan and Guide (RCPG) Policies**

The RCPG provides the primary reference for SCAG's project review activity. The RCPG serves as a regional framework for decision making for the growth and change that is anticipated during the next 20 years and beyond. The Growth Management Chapter (GMC) of the RCPG contains population, housing, and jobs forecasts, which are adopted by SCAG's Regional Council and that reflect local plans and policies, shall be used by SCAG in all phases of implementation and review. It states that the overall goals for the region are to (1) re-invigorate the region's economy, (2) avoid social and economic inequities and the geographical isolation of communities, and (3) maintain the region's quality of life. Growth in industry categories potentially eligible to receive permits for new or modified sources in reliance on Rules 1304 and 1309.1 are included in the projection of growth in the RCPG.

### **Consistency with Growth Management Chapter (GMC) to Improve the Regional Standard of Living**

The Growth Management goals are to develop urban forms that enable individuals to spend less income on housing cost, that minimize public and private development costs, and that enable firms to be more competitive, strengthen the regional strategic goal to stimulate the regional economy. The proposed project in relation to the GMC would neither interfere with the achievement of such goals nor with any powers exercised by local land use agencies. The proposed project would contribute to the GMC's goal of improving the regional standard of living by allowing various permitted-facility improvements, including modernization measures that would increase energy efficiency and reduce air pollution, as well as the installation of emergency equipment, and equipment necessary for essential public services. The proposed project would further efforts to minimize red tape and expedite the permitting process to maintain economic vitality and competitiveness.

### **Consistency with Growth Management Chapter (GMC) to Provide Social, Political and Cultural Equity**

The Growth Management goals to develop urban forms that avoid economic and social polarization promotes the regional strategic goals of minimizing social and geographic disparities and of reaching equity among all segments of society. Consistent with the Growth Management goals, local jurisdictions, employers and service agencies should provide adequate training and retraining of workers, and prepare the labor force to meet the challenges of the regional economy. Growth Management goals also include encouraging employment development in job-poor localities through support of labor force retraining programs and other economic development measures. Local jurisdictions and other service providers are responsible for developing sustainable communities and for providing, equally to all members of society, accessible and effective services such as: public education, housing, health care, social services, recreational facilities, law enforcement, and fire protection. Implementing the proposed project is not expected to interfere with the goals of providing social, political and cultural equity. To the extent that the proposed project enables provision of essential public services, the proposed project furthers the Growth Management goals pertaining to social, political and cultural equity.

### **Consistency with Growth Management Chapter (GMC) to Improve the Regional Quality of Life**

The Growth Management goals also include attaining mobility and clean air goals and developing urban forms that enhance quality of life, accommodate a diversity of life styles, preserve open space and natural resources, are aesthetically pleasing, preserve the character of communities, and enhance the regional strategic goal of maintaining the regional quality of life. The RCPG encourages planned development in locations least likely to cause environmental impacts, as well as supports the protection of vital resources such as wetlands, groundwater recharge areas, woodlands, production lands, and land containing unique and endangered plants and animals. While encouraging the implementation of measures aimed at the preservation and protection of recorded and unrecorded cultural resources and archaeological sites, the plan discourages development in areas with steep slopes, high fire, flood and seismic hazards, unless complying with special design requirements. Finally, the RCPG encourages mitigation measures that reduce noise in certain locations, measures aimed at preservation of biological and ecological resources, measures that would reduce exposure to seismic hazards, minimize earthquake damage, and develop emergency response and recovery plans. The proposed project in relation to the GMC is not expected to interfere with attaining these goals. The proposed rule would contribute to the regional quality of life because it would allow the modernization of equipment that would increase energy efficiency, and help support the operation of essential public services, including emergency service providers.

**Consistency with Regional Mobility Element (RMP) and Congestion Management Plan (CMP)**

The proposed project is consistent with the RMP and CMP in allowing access to the PM<sub>10</sub>, SO<sub>x</sub>, NO<sub>x</sub> and VOC Priority Reserve accounts. The proposed project would provide greater options for facilities that require credits to comply with NSR requirements. The proposed project does not cause direct transportation impacts, but rather, the eligible facilities may implement projects that could increase traffic, worker commute trips, raw material or finished product transport trips or result in inadequate parking capacity.

Mayor, City of Chino  
Cities Representative, San Bernardino County

**MEMBERS:**

MICHAEL D. ANTONOVICH  
Supervisor, Fifth District  
Los Angeles County Representative

JOHN BENOIT  
Supervisor, Fifth District  
Riverside County Representative

MICHAEL A. CACCIOTTI  
Councilmember, City of South Pasadena  
Cities of Los Angeles County, Eastern Region

BILL CAMPBELL  
Supervisor, Third District  
Orange County Representative

JANE CARNEY  
Senate Rules Committee Appointee

JOSIE GONZALES  
Supervisor, Fifth District  
San Bernardino County Representative

RONALD O. LOVERIDGE  
Mayor, City of Riverside  
Cities Representative, Riverside County

JOSEPH K. LYOU, Ph.D.  
Governor's Appointee

JUDY MITCHELL  
Councilmember, Rolling Hills Estates  
Cities of Los Angeles County, Western Region

JAN PERRY  
Councilwoman, 9<sup>th</sup> District  
City of Los Angeles Representative

MIGUEL A. PULIDO  
Mayor, City of Santa Ana  
Cities Representative, Orange County

**EXECUTIVE OFFICER:**  
BARRY R. WALLERSTEIN, D.Env.

## **CHAPTER 6**

---

# **ALTERNATIVES -- DIRECT AND INDIRECT AIR QUALITY, VISIBILITY, AND GREENHOUSE GAS IMPACTS**

### **Introduction**

### **Alternatives Rejected as Infeasible**

### **Description of Alternatives**

### **Evaluation of the Comparative Effects of the Project Alternatives**

### **Least Toxic Alternative**

### **Conclusion and Environmentally Superior Alternative**

## INTRODUCTION

This ~~Draft-Final~~ PEA provides a discussion of alternatives to the proposed project as required by CEQA. An EIR must describe a range of reasonable alternatives to the proposed project that would feasibly attain most of the project objectives and provide a means for evaluating the comparative merits of each alternative. A "No Project" alternative must also be evaluated. The range of alternatives must be sufficient to permit a reasoned choice, but need not include every conceivable project alternative. State CEQA Guidelines §15126.6(a) states that there is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason. The key issue is whether the selection and discussion of alternatives fosters informed decision making and meaningful public participation.

SCAQMD Rule 110 (the rule that implements the SCAQMD's certified regulatory program) does not impose any greater requirements for a discussion of project alternatives in an environmental assessment than is required for an EIR under CEQA. To provide an analysis of impacts from the alternatives consistent with the analysis of impacts from the proposed project, the analysis of air quality, health, visibility, and greenhouse gas emission impacts from the project alternatives is included in this chapter (see Subchapter 4.1 of this PEA for the analysis of these same impacts from the proposed project). The analysis of most indirect impacts from the project alternatives can be found in Chapter 7 of this PEA (see subchapters in Chapter 5 of this PEA for the analysis of indirect impacts from the proposed project). This format approach makes it easier for the reader to compare all environmental effects of the project alternatives with all environmental effects of the proposed project.

## ALTERNATIVES REJECTED AS INFEASIBLE

A CEQA document should identify any alternatives that were considered by the lead agency, but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination (CEQA Guidelines §15126.6(c)). While the scope and goals of proposed projects may be relatively specific, a variety of options can be considered as alternatives to the proposed project. Because of the variety of alternative options to the proposed project, there is a wide range of alternatives that have been considered and evaluated in this chapter. The following alternatives have been eliminated from further detailed consideration in the PEA for the following reasons: 1) they fail to meet most of the basic project objectives, 2) they are infeasible as defined by CEQA (CEQA Guidelines §15364), or 3) they are unable to avoid significant impacts (CEQA Guidelines §15126.6(c)).

**Prohibit the Use of Offsets from Shutdowns or Reductions at Minor Sources to Demonstrate Equivalency with Federal Offset Requirements**

One theoretically possible alternative would be to prohibit the use of newly tracked minor source credits for demonstrating equivalency with federal offset requirements. Under such an alternative, newly tracked minor source credits could not be used as offsets for emissions from sources eligible for the offset exemptions in Rule 1309.1 or Rule 1304. This alternative is not consistent with the project objectives identified in Chapter 2 to: 1) maintain the ability of the SCAQMD to continue to administer its new source review program for major and minor sources for facility modernization and to accommodate population growth; and 2) recognize sufficient previously-unused emission reductions beyond those required by applicable regulatory requirements in order to demonstrate federal equivalency for major sources that are exempt under Rule 1304 or that obtain credits from the Priority Reserve under Rule 1309.1. Removing all credits from shutdowns or reductions at minor sources would cause the internal offset accounts for CO and PM10 to start with negative balances and would change the 2006 balances as shown in Table 6-1.

**TABLE 6-1  
Year 2006 Running Balance Without Minor Source Credits (Tons/Day)**

	Pollutant				
	VOC	NOx	SOx	CO	PM10
2006 Running Balance with Minor Source Credits	68.80	26.65	2.46	13.35	11.41
2006 Running Balance without Minor Source Credits	19.72	11.26	0.43	<b>-3.39</b>	<b>-3.27</b>
Net Change in 2006 Running Balance if Minor Source Credits Removed	-49.08	-15.39	-2.03	-16.74	-14.68

Under this alternative, no permits could be issued under Rules 1304 or 1309.1 for a source that would have an increase in PM10 emissions, which typically covers most types of combustion sources and many non-combustion sources. This would result in a permit moratorium for projects resulting in a PM10 emission increase until enough existing sources shut down or have other surplus PM10 emission reductions to restore a positive PM10 SCAQMD internal offset account balance for use in the following year. It is expected that it would take several years to obtain sufficient emission reductions to provide a positive balance of PM10 offsets.

**Prohibit the Use of Any Credits Not Previously Recognized Prior to Adoption of Rule**

This potential alternative would re-establish the internal offset tracking system that was in place prior to adopting the 2006 or 2007 versions of proposed Rule 1315. Under this

alternative, only the sources of credits accounted for under the prior offset tracking system would be recognized for purposes of demonstrating equivalency with federal offset requirements.

Prior to these earlier adoptions of proposed Rule 1315, in connection with review of a separate rule adopted in 2002, USEPA questioned whether the SCAQMD had retained adequate documentation of certain emissions reductions that arose from shutdowns occurring before 1990. As a result, SCAQMD agreed to remove those pre-1990 credits for which the District no longer possessed complete documentation.

Absent either the pre-1990 credits or the new sources of credits that would be recognized under proposed Rule 1315, SCAQMD's internal accounts would have negative balances for some pollutants. As a result, SCAQMD would not be able to demonstrate equivalency with federal offset requirements.

Table 6-2 summarizes the 2006 balances for this alternative excluding the pre-1990 credits without sufficient records and excluding BACT discount of ERCs.

**TABLE 6-2  
Year 2006 Running Balance with Pre-September 2006  
Tracking System (Tons/Day)**

	Pollutant				
	VOC	NOx	SOx	CO	PM10
2006 Running Balance with Proposed Tracking System	68.8	26.65	2.46	13.35	11.41
2006 Running Balance with pre-September 2006 Tracking System (approvable version)	18.37	10.77	0.36	<b>-5.09</b>	<b>-4.45</b>
Net Change in 2006 Running Balance if Reinstate Pre-September 2006 Tracking System	<b>-50.43</b>	<b>-15.88</b>	<b>-2.1</b>	<b>-18.44</b>	<b>-15.86</b>

Under this alternative, no permits could be issued under Rules 1304 or 1309.1 for a source that would have an increase in PM10 emissions, which typically covers most types of combustion sources and many non-combustion sources. This would result in a permit moratorium for projects resulting in a PM10 emission increase until enough existing sources shut down or have other surplus PM10 emission reductions to restore a positive PM10 SCAQMD internal offset account balance for use in the following year. It is expected that it would take several years to obtain sufficient emission reductions to provide a positive balance of PM10 offsets.

### **Fossil Fueled Power Plant Project Alternative**

Environmental groups and power plant representatives suggested at the April 8, 2009, Public Consultation and Scoping Meeting for the proposed project that the SCAQMD

consider an alternative of evaluating the impacts from allowing fossil fueled power plant projects access to the SCAQMD's internal offset accounts. Such an alternative would be similar to the 2007 amendments to Rule 1309.1 vacated by the Superior Court. This alternative would allow fossil fueled power plants access to the SCAQMD's offset accounts for applications deemed complete during a specified period of time (e.g., a period of three years) and require payment of mitigation fees to fund future clean air projects.

In part, the rationale expressed by environmental groups and power plant representatives for this alternative was the concern that the Governing Board may adopt Rule 1315, but may not adopt the proposed amendments then contemplated for Rule 1309.2. At the time the NOP/IS was circulated for public review, the proposed project included amending Rule 1309.2 to exclude larger fossil fuel-fired thermal power plants from accessing the SCAQMD's internal offset accounts. Subsequent to the release of the NOP/IS, the SCAQMD decided to remove the amendment to Rule 1309.2 from the project description and rescind Rule 1309.2 in its entirety. Rule 1309.2 was rescinded by the SCAQMD Governing Board on February 5, 2010. This means that power plant projects that do not currently qualify for exemption under Rule 1304 as involving source modifications or as less-than four-ton facilities are not eligible under SCAQMD rules for credits from SCAQMD's internal offset accounts. An alternative that would allow power plants access to the SCAQMD internal accounts would not lessen any significant environmental impacts resulting from the proposed project and, therefore, does not meet CEQA's requirement to avoid or lessen any of the significant effects of the project (CEQA Guidelines §15126.6(a)).

Power plants, however, are not ignored in the analysis. In October 2009, Governor Schwarzenegger signed into law AB 1318, which requires that qualified electrical generating facilities be provided with offsets from the SCAQMD's internal accounts (Health & Safety Code § 40440.14). The CPV Sentinel Energy project meets these requirements. Also, there is proposed legislation that could provide access to the SCAQMD's internal accounts for one additional power plant, the Walnut Creek Mission Energy project. A third power plant – NRG's El Segundo Power Redevelopment project – was anticipated to be the subject of legislation mirroring the Walnut Creek Energy Park and CPV Sentinel Energy projects. More recently, the El Segundo plant has received an exemption from the offset requirements under Rule 1304(a)(2). Therefore, the El Segundo power plant received its permit pursuant to SB 827, which authorizes the District to issue permits under Rules 1304 and 1309.1 through May 1, 2012. To the extent the three power plants obtain permits pursuant to State Legislation, including SB 827, rather than by proposed Rule 1315, these three power plants are not permitted pursuant to the proposed project; however, they are considered reasonably foreseeable projects contributing to cumulative impacts. Therefore, impacts from the three proposed power plants are discussed as part of the cumulative scenario.

## **Other Project Alternatives Suggested by the Superior Court**

In its decision in *Natural Resources Defense Council v. South Coast Air Quality Management District* (Los Angeles County Superior Court Case No. BS 105728), the Superior Court suggested several alternatives based upon potential SCAQMD energy-related objectives identified for the previously proposed amendments to Rule 1309.1, which would have provided power plants with access to the Priority Reserve for a specified period. The Court stated, “If the District’s environmental objective is to eliminate reliance on diesel-powered back-up generators, then one possible mitigation measure would be to limit access to the Priority Reserve to those power companies wanting to replace dirty power generators with newer, cleaner generating plants. . . . Or, if the problem is a statewide shortage of electricity, . . . then the alternative of siting that capacity in areas with cleaner air and transporting it into the basin via additional transmission capacity is an alternative that should be considered. Or, if the problem is with peak power, the question remains whether that limited, incremental power can be provided using solar, wind, or other renewable facilities.”

The proposed project no longer includes provisions that would make power plants eligible for offsets from the SCAQMD’s internal accounts, except for the source modifications and less than four-ton facilities that have been eligible for exemptions from offsets pursuant to Rule 1304, or landfill gas control systems eligible under Rule 1309.1, since 1996. Because the proposed project does not attempt to address the needs for additional or cleaner power, an alternative that would only make credits available to cleaner plants, renewable power, or power plants outside the district would not address the project objectives for the currently proposed project.

## **Issue Offsets to Priority Projects First**

This alternative would require establishing a list of stationary source projects from the highest to lowest priority according to whether or not they are environmentally and/or economically beneficial. Examples of high priority projects may include projects using clean or alternative fuels or projects using super compliant solvent products. Once the priority list is established, projects with the highest priority ratings would be awarded offsets first; projects with a lower priority rating would be awarded offsets only after offsets have been awarded to higher priority projects.

There are a number of hurdles to implementing this alternative. First, applications for new or modified sources are considered and addressed on a “first in, first out” basis. As a result, it would be difficult, if not impossible, to administer a priority projects alternative effectively. An application for a low priority project may be processed and approved before a permit application for a higher priority project is received. To award offsets on a priority basis would likely necessitate a lengthy delay period so that proposed projects could first be collected and ranked before applications could be granted. This would result in delays in processing both higher and lower priority projects.

Ultimately, this alternative would be expected to generate direct and indirect environmental impacts equivalent to the proposed project because similar assumptions regarding the amount and rate of use of offsets in the internal accounts would apply to this alternative as would apply to the proposed project. As a result, this alternative is not carried forward because it would not be expected to avoid or substantially lessen significant impacts from the proposed project (CEQA Guidelines §15126.6(a)).

## **DESCRIPTION OF PROJECT ALTERNATIVES**

The following project alternatives were generally developed by modifying specific components of the Proposed Rule 1315. In addition, Alternative C addresses comments stating concerns that credits should be limited to small businesses and Alternative D addresses comments stating concerns that previous minor source shutdown credits should not be used for future permitted projects. The rationale for selecting and modifying specific components of the proposed project to generate feasible alternatives for the analysis is based on CEQA's requirement to present "potentially feasible" alternatives. When considering approval of the proposed project, the SCAQMD's Governing Board may choose all of or portions of any of the alternatives analyzed, as well as variations on the alternatives, since the comparative merits of the project alternatives have been analyzed and circulated for public review and comment along with the analysis of the proposed project. The main components of the proposed project and each project alternative are summarized in Table 6-3.

### **Summary of the Proposed Project**

Before describing each of the five project alternatives, this section provides a brief summary of the proposed project. As described in Chapter 2 (Project Description), proposed Rule 1315 would ensure that emissions increases from exempt sources under Rule 1304 and sources accessing the SCAQMD's Priority Reserve account under Rule 1309.1 are fully offset to the extent required by federal law by valid emission reductions from the SCAQMD's internal offset accounts. The proposed rule would achieve equivalency with federal requirements by establishing what types of reductions are eligible to be used to offset emissions from major sources and how those reductions are tracked. The proposed rule would also provide for the use of offsets from certain newly tracked sources. For example, under proposed Rule 1315 SCAQMD would recognize emission reductions generated from federal minor source shutdowns and reductions that were not previously accounted for in the SCAQMD's federal equivalency demonstrations.

**TABLE 6-3**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> (Key Components)	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limit Offset Availability
<b>Project Description Summaries</b>					
PR 1315 would specify the tracking system used to demonstrate equivalency with federal offset requirements. It would track offset use and establish caps on net emissions increases from issuance of permits under Rules 1304 and 1309.1 based on 2007 AQMP growth projections for applicable industry categories.	Neither the proposed project nor Alternatives B through D adopted. SB827 would allow issuance of permits under Rules 1309.1 and 1304 from January 1, 2010 until May 1, 2012, at which time permits would not be issued under Rules 1309.1 or 1304. AB 1318 and pending SB 388 could allow credits transferred to qualifying power plants until 5/1/12 and 1/1/13, respectively.	Would specify the tracking system to demonstrate equivalency with federal offset requirements. Offsets subject to fees for large businesses that qualify for permits under Rule 1304. Fees would be used for emission reduction projects. Otherwise, includes same components including caps on net emission increases. Mitigation projects could not create new offsets.	Would establish a tracking system to demonstrate equivalency with federal offset requirements. Large businesses would be prohibited from accessing the SCAQMD's internal offset accounts. Otherwise, includes same components as proposed project, including caps on net emission increases.	Would establish a tracking system to demonstrate equivalency with federal offset requirements. Would eliminate the SCAQMD's existing internal account balances. SCAQMD's internal accounts would only be funded by credits generated starting in 2009. Otherwise, includes same components as proposed project, including caps on net emission increases.	Would specify the tracking system to demonstrate equivalency with federal offset requirements. Caps on net emission increases established at 50% of the 2007 AQMP growth projections for the applicable industry categories. Otherwise, includes same components as proposed project.
<b>Purpose (Subdivision a)</b>					
Maintain ability to continue to issue permits to major and minor sources for facility modernization and to accommodate population growth (implement Rules 1304 and 1309.1), memorialize procedures for demonstrating equivalency; & demonstrate sufficient credits available to demonstrate equivalency.	Rule 1315 not adopted, so sources could not obtain offsets from Rules 1309.1 or 1304 after May 1, 2012. SCAQMD would not maintain internal accounts.	Same as proposed project.	Same as proposed project. However, large businesses would no longer qualify for offset exemptions pursuant to Rule 1304.	Same as proposed project. However, only offsets generated from the year 2009 on could be used.	Same as proposed project.

**TABLE 6-3 (Continued)**  
 Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b>Definitions Subdivision b)</b>					
Community Bank Net Emission Increase Offset Ratio Orphan Reduction Orphan Shutdown Priority Reserve Shortfall	Rule 1315 not adopted so no definitions	Same as proposed project, plus: Large Business	Same as proposed project, plus: Large Business	Same as proposed project.	Same as proposed project.
<b>Federal NSR Equivalency (Subdivision c)</b>					
Maintain a separate District offset account for each federal nonattainment air contaminant	Rule 1315 not adopted so no tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Annually track all emissions offsets provided to major sources from internal offset accounts.	Rule 1315 not adopted so no tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Annually track all eligible credits deposited in SCAQMD's internal accounts	No annual tracking because equivalency demonstration with federal offset requirements not necessary as SCAQMD would not provide offsets pursuant to Rules 1304 and 1309.1 and would not maintain internal accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 6-3 (Continued)**

Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
Deposit appropriate emission reductions in SCAQMD's internal offset accounts.	Emission reductions no longer deposited into SCAQMD's internal offset accounts	Same as proposed project.	Same as proposed project.	Eliminate credits in existing internal offset accounts. Only deposit credits from major and minor sources generated after 2009.	Same as proposed project.
All unused credits in the federal offset accounts shall be discounted annually.	No tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b>Net Emission Increases (Subdivision d)</b>					
All increases in potential to emit (PTE) that occur at minor sources pursuant to Rule 1304 and Rule 1309.1 shall be tracked and not constitute debits	Tracking increases in PTE not necessary.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Cumulative net emission increases shall be included in the Executive Officer's report to the Governing Board	No Report to the Governing Board required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 6-3 (Continued)**

Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b><i>Federal NSR Equivalency Reports (Subdivision e)</i></b>					
The Executive Officer shall aggregate and track offsets debited from and offsets provided to the SCAQMD offset accounts into specific reporting periods	No offsets from or credits to SCAQMD offset accounts and no reporting periods.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Complete Preliminary Determination of Equivalency (PDE) with federal non-attainment NSR offset requirements 12 months after reporting period.	PDE is not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Complete Final Determination of Equivalency (FDE) with federal non-attainment NSR offset requirements for any account(s) for which the PDE did not demonstrate equivalence with 18 months after reporting period.	FDE is not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 6-3 (Continued)**

Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b><i>Projections of Federal Offset Balances (Subdivision f)</i></b>					
PDEs & FDEs shall also include projections of the federal offset account balances at the end of each of the two subsequent reporting periods.	PDE and FDE are not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b><i>Equivalency Backstop Provisions (subdivision g)</i></b>					
Discontinue funding the Priority Reserve if the most recent actual District offset account balances (from FDE) demonstrate a shortfall for any air contaminant.	Internal accounts no longer used so no shortfalls will occur.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Resume funding upon completion of FDE demonstrating no more shortfalls.	Internal accounts no longer used so no FDE required to demonstrate no shortfall.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Discontinue issuing permits that rely on 1304 or 1309.1 for the air pollutants that have a shortfall.	Internal accounts no longer used so no more shortfalls.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 6-3 (Continued)**

Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
If an FDE demonstrates that a shortfall exists in any of the SCAQMD offset accounts or a subdivision (f) projection predicts a shortfall, the Executive Officer shall prepare a report to the Governing Board recommending implementation of one or more backstop provisions as needed to correct the shortfall	No FDE required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b>CEQA Backstop Provisions (subdivision h)</b>					
If the cumulative net emission increase of a nonattainment air contaminant exceeds the cap for that air contaminant, the Executive Officer shall discontinue issuing permits to construct and permits to operate that rely on new offsets from SCAQMD's internal accounts.	No internal accounts, therefore, no cumulative net increases from affected facilities.	Same as proposed project	Same as proposed project	Same as proposed project.	Same as proposed project.

**TABLE 6-3 (Continued)**  
 Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
Pollutant-specific cumulative net emission increase thresholds are established based on the 2007 AQMP-forecasted growth in emissions from industry categories potentially eligible to receive permits under Rules 1304 and 1309.1	No air contaminant-specific cumulative net emission increase thresholds established	Same as proposed project.	Same as proposed project.	Same as proposed project.	Pollutant-specific cumulative net emission increase thresholds are established based on 50% of the 2007 AQMP-forecasted growth in emissions from industry categories potentially eligible to receive permits under Rules 1304 and 1309.1
<b>State Implementation Plan Submittals (subdivision i)</b>					
Net emission increase definition, cumulative net emission increases & projected cumulative net emission increases, as well as, Rule 1315 requirements for net emissions increases and CEQA backstop provisions shall not be submitted for inclusion in the SIP.	No backstop provisions.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b>Alternatives Components</b>					
Cumulative net emissions increases capped at 2007 AQMP growth projections for industry categories potentially eligible to receive permits under Rules 1304 and 1309.1.	No debits available.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project except caps at 50 % of 2007 AQMP growth projections for industry categories potentially eligible to receive permits under Rules 1304 and 1309.1.

**TABLE 6-3 (Concluded)**  
 Comparison of Key Components of the Proposed Project to the Alternatives

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
All credits generated each year available as offsets in the future	No credits available.	Same as proposed project.	Same as proposed project.	Existing balances in offset accounts eliminated. Only credits generated from 2009 on could be used as offsets in the future.	Same as proposed project.
Large businesses have access to offsets in the SCAQMD's offset accounts (no change from pre-Rule 1315 situation).	No offset accounts available to any businesses.	Large businesses must pay a fee to access the SCAQMD's offset accounts to qualify for Rule 1304 exemptions.	Large businesses prohibited from access to Rule 1304 exemption from offsets, therefore, offsets unavailable for these sources.	Same as proposed project.	Same as proposed project.
No Fees for large businesses.	No fees.	Includes large business user fee for access to Rule 1304 exemptions; fees to be used for emission reduction projects.	No large business user fees as large businesses would not qualify for exemptions under Rule 1304.	Same as proposed project.	Same as proposed project.
<b><i>Proposed Amended Rule 1309.2 – No Longer Part of the Proposed Project, Rescinded February 5, 2010</i></b>					

Proposed Rule 1315 would specify procedures to be followed by the Executive Officer to make annual demonstrations that the SCAQMD's NSR program, in the aggregate, satisfies federal offset requirements for major sources under Clean Air Act §173. SCAQMD Rule 1304 exempts certain types of new or modified sources from NSR offset requirements. Emission increases over applicable thresholds from these exempt new or modified sources are still subject to federal offset requirements pursuant to the Clean Air Act (CAA). Additionally, specific essential public services may obtain offsets from the SCAQMD's Priority Reserve pursuant to SCAQMD Rule 1309.1. Proposed Rule 1315 would continue to ensure that the SCAQMD's NSR program is equivalent in the aggregate to the federal nonattainment NSR offset requirements under the CAA, even after the removal from the SCAQMD's offset accounts of certain pre-1990 credits pursuant to a 2006 agreement with the USEPA.

### **Alternative A - No Project Alternative**

CEQA Guidelines §15126.6 requires evaluation of a no project alternative to allow decisionmakers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project.

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted. However, without the proposed project SB 827 would remain in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. Further, AB 1318, which requires the SCAQMD to provide offsets for power plants that meet specific criteria, would also remain in effect. There is currently pending legislation, SB 388 that would require, upon making specific findings, the SCAQMD to transfer offsets to a second eligible power plant. Emissions from facilities permitted under SB 827, AB 1318 and SB 388 are not due to the proposed project, nor are they the result of a No Project Alternative.

While SB 827 would continue to be in effect through May 1, 2012, the quantitative analysis of the No Project Alternative's air quality, visibility, and greenhouse gas impacts is based upon the assumption that no permits are issued pursuant to the proposed project (proposed rule 1315) after July 1, 2010. This is because, to analyze the project impacts, all emissions resulting from issuance of permits under Rules 1304 and 1309.1 commencing on the earliest potential date of project approval have been attributed to the proposed project.

It was originally assumed that proposed Rule 1315 could be adopted as soon as July, 2010. Because the analysis of environmental impacts from the proposed project has taken longer than anticipated, Proposed Rule 1315 was not adopted in July 2010. In spite of the delay in the anticipated adoption of Proposed Rule 1315, SCAQMD has continued to use the same assumptions regarding emission impacts from affected facilities, i.e., all permits issued after July 1, 2010, are a result of the proposed project

(or alternatives). It is impossible to predict the exact date upon which Proposed Rule 1315 will be considered for adoption. If the time period analyzed in the PEA were modified to reflect approval of Proposed Rule 1315 at a later date, emissions attributed to the project would decrease slightly.

### **General Effects of Alternative A**

As a result of selecting Alternative A, for purposes of analyzing quality, health, visibility and greenhouse gas impacts, it is assumed that no permits would be issued under Rules 1304 and 1309.1 pursuant to proposed Rule 1315. It is possible that existing facilities could increase operations to slightly less than their maximum Potential to Emit (PTE) to help accommodate future population and economic growth. Currently facilities operate, on average, at approximately 80 percent PTEs, depending on market conditions. To accommodate future population growth, existing facilities might increase operations slightly. Therefore, emissions in the district could increase to a certain extent, but would not increase appreciably compared to the proposed project. Such potential emissions increases have not been quantified.

Adoption of Alternative A, the No Project Alternative, would mean that offsets from the district's internal accounts would not be available to facilities providing essential public services. These essential public services include prisons, police facilities, fire fighting facilities, schools, hospitals, water delivery operations, public transit, publicly owned or operated sewage treatment facilities, and landfill gas control or processing facilities. It is expected that few, if any, such facilities would be able to purchase credits on the open market. As a result, development of new and expanded facilities needed to improve essential public services and to serve population growth would be significantly hampered.

In addition, commercial and industrial manufacturing capacity in the district would be limited because the types of facilities that could obtain offsets pursuant to Rules 1304 or 1309.1 under the proposed project would no longer have access to these sources of offsets. As a result, such facilities would have to purchase credits, if available, on the open market. Because credits may be unavailable or too expensive to afford, future affected facilities would likely not be built or could not be modified. This would limit the number of future new jobs because fewer new or modified facilities could be built compared to a scenario where offsets from the SCAQMD's offset accounts are available. Under this scenario, as facilities shut down, consumers may have to drive longer distances to obtain goods and services from facilities that are able to continue operating. In addition, in-district manufacturing capacity may not be able to accommodate future population growth in the district as old facilities would no longer be able to upgrade or replace existing equipment. Under this scenario, a greater proportion of commercial and industrial goods may have to be imported into the district resulting in higher mobile source (e.g., trucks, planes, marine vessels, etc.) emissions than would otherwise be the case. Just as mobile source emissions from the proposed project cannot be quantified,

such potential emissions increases from the No Project Alternative also cannot be quantified.

### **Alternative B – Offset User Fees for Large Businesses**

Alternative B is similar to the proposed project in all aspects except that Alternative B includes “offset user fees” for large businesses that seek an exemption from offset requirements pursuant to Rule 1304. Large businesses that would have to pay an offset user fee are those businesses that do not qualify as small businesses pursuant to the definition of small business in SCAQMD Rule 102 – Definition of Terms (Small Business Assistance Office definition). A small business is defined in Rule 102 as:

For the purpose of qualifying for assistance offered by the SCAQMD’s Small Business Assistance Office only, a small business means a business with total gross annual receipts of \$5,000,000 or less, or a business with a total number of employees of 100 or less.

The intent of this Alternative would be to charge fees for large businesses using the “small facility” exemption (Rule 1304(d), but not for equipment replacement or air pollution control projects. In addition, offset user fees would not be applicable to facilities, including large businesses, seeking offsets through the Priority Reserve pursuant to Rule 1309.1, since these are essential public services and other high-priority sources. Access to Rule 1309.1 would continue to be limited to essential public services, which are defined in Rule 1302 – Definitions, and other Specific Priority Sources. Table 6-4 shows potential offset user fees that could be charged under Alternative B. CO is not included in the list of pollutants for which fees would be paid as the district has been reclassified as attainment for the national ambient air quality standards and, therefore, offsets are not required. Offset user fees would be in effect upon the date of adoption of Alternative B.

**TABLE 6-4**  
**Alternative B – Large Business User Fees per Pound of Pollutant**

Pollutant <sup>a</sup>	Weighted Average Purchase Price <sup>b</sup>	Weighted Average Purchase Price Plus 25% Premium <sup>c</sup>
NOx	\$61,762.71	\$77,203
PM10	\$116,449.82	\$145,562
VOC	\$9,735.79	\$12,170
SOx	\$48,838.60	\$61,048

<sup>a</sup> The district is in attainment with state and federal CO standards, so CO emission increases are no longer subject to offset requirements.

<sup>b</sup> Based on weighted average of 2007 and 2008 ERC purchase prices.

<sup>c</sup> Premium based on administrative cost and to ensure last resort option.

Large business user fees were derived as follows. SCAQMD staff tracked the number of ERC purchases by pollutant from 2007 through 2008, as well as the purchase price per ERC purchase transaction. Dividing the total dollar amounts of all pollutants purchased by the total number of ERCs purchased by pollutant, produces a weighted average purchase price (middle column of Table 6-4). SCAQMD staff then added a premium of 25 percent of the weighted average purchase price. The 25 percent premium is intended to cover costs to administer the fee program under Alternative B plus an additional cost to dissuade large businesses from obtaining offsets from the SCAQMD's internal offset accounts, except as a last resort. In all other respects, Alternative B would include the same provisions as the proposed project.

### **General Effects of Alternative B**

Under Alternative B, it is assumed that offsets would be debited from the SCAQMD's offset accounts to demonstrate equivalency with federal offset requirements for large businesses. Further, it is conservatively assumed that, regardless of the cost, large businesses would continue to seek exemptions pursuant to Rule 1304 and the SCAQMD would continue to debit its offset accounts in the same amount, on average, as it has in the past, except if limited by the growth caps based on 2007 AQMP growth projections for industry categories potentially eligible to receive permits under Rules 1304 and 1309.1. In general, Alternative B would generate similar air quality, health, visibility, and greenhouse gas impacts compared to the proposed project. However, those impacts would be reduced by implementation of emissions reductions projects funded through the offset fees charged to large businesses.

Under Alternative B, large business would have to pay the large business user fees (Table 6-4) for all emissions offsets obtained from the SCAQMD offset accounts pursuant to the offset exemption provisions of Rule 1304. Table 6-5 provides data on average emissions from large businesses based on historical permitting data between 2001 through 2006. Future emissions from large businesses were calculated for the

future milestone years using 2007 AQMP growth projections. Using the historical emissions data to project future emissions from large businesses for each milestone year and applying the large business user fees per pollutant (Table 6-4), total fees that would be collected for each milestone year in the future as a result of implementing Alternative B are calculated (Table 6-6).

**TABLE 6-5**  
**Future Projected Large Business Emissions (tons per day)**

Milestone Years	Pollutant			
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM10
2014	1.39	0.12	0.03	0.09
2023	4.55	0.31	0.09	0.31
2030	6.97	0.52	0.15	0.48
Percent Contribution <sup>a</sup>	24%	23%	21%	11%

<sup>a</sup> The average percentage of credits issued to large businesses out of the total average requested credits by R1304 & R 1309.1 facilities over the last five years.

The user fees shown in Table 6-6 represent total fees for each milestone period. The total user fees are the sums of the fees collected each year from future new or modified large businesses for each milestone year period.

**TABLE 6-6**  
**Potential Large Business User Fees Collected per Pollutant<sup>a</sup>**

Milestone Year	Fees Collected by Pollutant				
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM10	TOTAL
2014	\$33,832,600	\$18,528,720	\$3,662,880	\$26,201,160	\$82,225,360
2023	\$110,747,000	\$47,865,860	\$10,988,640	\$90,248,440	\$259,849,940
2030	\$169,649,800	\$80,291,120	\$18,314,400	\$139,739,520	\$407,994,840

<sup>a</sup> Total fee = large business emissions (ton/day) x 2000 (pounds/ton) x user fee (dollars/pound). Sums may not be exact due to rounding.

The large business user fees would allow large business operators to continue to qualify for exemptions from offset requirements pursuant to Rule 1304. The SCAQMD would continue to use offsets from its offset accounts to demonstrate equivalency with federal offset requirements for these large businesses. The total user fees collected during each milestone year represent the sums of user fees collected each year during the milestone year periods. This means that user fees would be collected each year in amounts represented by historical permitting data between 2001 through 2006 for large businesses that have qualified for exemptions from offsets pursuant to Rule 1304.

Emission reductions obtained from projects funded by the user fees under Alternative B are based on BACT incremental cost effectiveness and are adjusted to 2010 dollars for the purposes of this analysis. BACT incremental cost effectiveness is intended to determine potential emission reductions from stationary source equipment. BACT cost effectiveness often changes over time based on the introduction of new technologies, or remaining availability of cost-effective reduction opportunities. As a result, it is possible that future cost effectiveness could change over time for the reasons given in the preceding sentence or based on the types of emission reduction projects funded, e.g., mobile source projects rather than stationary source projects. However, it is not known and cannot be known at this time the precise nature of any future emission reduction projects and how the cost effectiveness of these future projects may change, i.e., increase or decrease. It should be noted that if the future emission reduction projects have higher costs than the current BACT increment cost, they will yield less emissions reduction benefits than analyzed. Recent mobile source reduction projects for PM10 have shown to have higher costs than the BACT incremental cost.

Once collected, user fees could be applied to both stationary and mobile source emission reduction projects (such as those identified in Table 6-7, see also Table 7-6 in Chapter 7 of this PEA). In some cases emission reduction projects would likely provide co-benefits by reducing multiple criteria pollutants that would not be subject to the user fee, such as reductions in air toxics and greenhouse gases. Examples of emission reduction projects that could be funded by offset user fees and the incremental cost between existing equipment and new cleaner technologies are shown in Table 6-7 and are based on an evaluation of potentially available projects by SCAQMD's Technology Advancement Office.

**TABLE 6-7**  
**Sample Super Clean Air Action Technologies and Incremental Costs**

<b>Incremental Cost between Existing Equipment and New Cleaner Technology</b>	<b>Existing Equipment</b>	<b>New Cleaner Technology</b>	<b>Resource</b>
\$2,250 / kW	30 kW – 250 kW Microturbines	1 kW – 250 kW Fuel Cell	Northern Power Systems, 2003
\$4,000 / kW	50 kW – 2 MW Natural Gas ICE	1 kW – 250 kW Fuel Cell	Northern Power Systems, 2003
\$6,000	Perc Dry Cleaning Machine (low end)	Wet Cleaning Machine (high end)	PAR 1421 Staff Report, SCAQMD, Nov. 2002
\$8,450	195 HP Diesel Yard Spotter	LPG Yard Spotter	Carl Moyer Program (FY 2001-2002)
\$9,000	Heavy-Duty Diesel Vehicles (School Buses, Transit Buses, Trash Trucks, etc.) with no control	Heavy-Duty Diesel Vehicle with Particulate Trap (\$6,500) and Catalytic Oxidizer (\$2,500)	Technology Advancement Office,

**TABLE 6-7 (CONCLUDED)**  
**Sample Super Clean Air Action Technologies and Incremental Costs**

<b>Incremental Cost between Existing Equipment and New Cleaner Technology</b>	<b>Existing Equipment</b>	<b>New Cleaner Technology</b>	<b>Resource</b>
\$10,000	Perc Dry Cleaning Machine (low end)	HC Dry Cleaning Machine (low end)	PAR 1421 Staff Report, SCAQMD, Nov. 2002
\$10,010	250 HP Diesel Paratransit Bus	CNG Paratransit Bus	Carl Moyer Program (FY 2001-2002)
\$15,000	175 HP Diesel Shuttle Bus	CNG Shuttle Bus	Carl Moyer Program (FY 2001-2002)
\$18,140	275 HP Diesel Shuttle Bus	LPG Shuttle Bus	Carl Moyer Program (FY 2001-2002)
\$18,467	80 HP Diesel Sweeper (aux)	CNG Sweeper (aux)	Carl Moyer Program (FY 2001-2002)
\$18,500	235 HP Diesel Maintenance Truck	CNG Maintenance Truck	Carl Moyer Program (FY 2001-2002)
\$20,316	80 HP Diesel Sweeper (aux)	CNG Sweeper (aux)	Carl Moyer Program (FY 2001-2002)
\$33,000	315 HP Diesel Refuse Hauler Stop and Go (automated)	LNG Refuse Hauler Stop and Go (automated)	Carl Moyer Program (FY 2001-2002)

\$36,933	195 HP Diesel Sweeper (main)	CNG Sweeper (main)	Carl Moyer Program (FY 2001-2002)
\$37,000	225 HP Diesel Refuse Hauler Stop and Go (roll-off)	CNG Refuse Hauler Stop and Go (roll-off)	Carl Moyer Program (FY 2001-2002)

It is expected that any emission reductions resulting from emission reduction projects may benefit both the local area in which the emission reduction project is located and the region depending on the type and amount of air pollutants reduced. Emission reductions obtained from offset user fees, however, would be prohibited from generating future emission offsets, but would be retired for the benefit of the environment.

Based on the likely high costs of emission reduction projects, it is not anticipated that the emission reduction fees would produce the same quantity of emission reductions compared to the quantity of offsets obtained from the SCAQMD's internal offset accounts. Moreover, the emission reduction projects may not be located in the exact same place as the sources permitted in reliance upon offsets from the SCAQMD's internal offset accounts. Therefore, it is not likely that these emission reduction projects would reduce regional or localized air quality impacts to insignificance. The air quality, health, visibility and greenhouse gas effects of Alternative B and potential emission reduction projects are analyzed later in this chapter.

As noted above, Alternative B assumes that large businesses would continue to seek exemptions under Rule 1304 despite the requirement that they pay an offset user fee to benefit from the exemption. It therefore provides an impact analysis based on the emissions associated with continued development of new and modified sources by large businesses under Rule 1304. As explained below, Alternative C would prohibit access by large businesses to the Rule 1304 exemption altogether. The impact analysis in Alternative C assumes that without access to the Rule 1304 exemption, large businesses would not be able to undertake projects involving new or modified sources due to the high cost of obtaining offsets on the open market. Accordingly, these two alternatives reflect two possible scenarios: one in which development of new and modified sources under Rule 1304 by large businesses continues at levels equal to the project condition and a second in which there is no development of new and modified sources under Rule 1304 by large businesses. These two scenarios bracket a range of possible outcomes, depending upon the reaction of large businesses to payment of an offset user fee to qualify for exemption under Rule 1304 or to the cost of acquiring offsets in the open market if the Rule 1304 exemption is not available to them. There is no question that increasing the cost of developing a new or modified source under either scenario would restrain the rate of growth in commercial and industrial sources that would otherwise qualify for the Rule 1304 exemption. However, the extent to which projects involving new or modified sources of the type that are exempt under Rule 1304 would be undertaken by large businesses under either scenario would depend upon their ability to pay those costs. That ability would in turn vary significantly depending on factors such as the type of business involved, competition from smaller businesses and businesses outside of the district, growth in the region and general economic conditions.

### **Alternative C – Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

SCAQMD staff has received comments that large businesses should not have access to the SCAQMD's offset accounts because such facilities have the financial resources to purchase offsets on the open market. To address this comment relative to the proposed project, Alternative C would prohibit access by large businesses to the Rule 1304 Exemption. In all other aspects Alternative C would be identical to the proposed project.

#### **General Effects of Alternative C**

By prohibiting large businesses from qualifying for an exemption from offset requirements through Rule 1304, the SCAQMD would have to demonstrate equivalency with federal offset requirements for fewer facilities per year compared to the proposed project. Table 6-5 shows the future anticipated emissions from large businesses based on historical permitting data between 2001 through 2006 and projected for each future milestone year using 2007 AQMP growth projections for the relevant industry categories. Under Alternative C, the offsets previously available to large businesses qualifying for an exemption from offsets pursuant to Rule 1304, would no longer be

accessible by them. Table 6-5 shows emissions that would occur under the proposed project, but would not occur for each milestone year in the future under Alternative C. These data are used to quantify future emission impacts from Alternative C later in this chapter.

For the purposes of the analysis of Alternative C, it is assumed that average offset use by small businesses would not increase. This assumption is reasonable because it is unlikely that small business would substantially increase demand for offsets beyond average offset use on a year-to-year basis. Review of the historical data from 2001 through 2006 indicates that excess offsets were available that were not used. This historical information suggests that all small businesses needing offsets during the 2001 through 2006 timeframe were able to obtain them, i.e., there was no pent up demand for offsets from small businesses that was not provided by the SCAQMD.

Under Alternative C, large businesses would have to obtain credits on the open market. However, credits on the open market are in short supply; accordingly fewer facilities would be able to obtain permits for new or modified sources. Therefore, the analysis of Alternative C assumes that these facilities would not be built. Consequently, future air quality, health, visibility and greenhouse gas impacts and other indirect impacts as a result of implementing Alternative C would be less than for the proposed project.

#### **Alternative D – Use of Credits Generated in 2009 and Beyond Only**

Alternative D would only allow the use of credits generated in 2009 and beyond to be used to offset emissions from facilities that qualify for permits under Rules 1304 and 1309.1 in order to demonstrate equivalency with federal offset requirements. Specifically, under Alternative D, offsets in the SCAQMD's existing offset accounts would be eliminated. Instead, only new credits generated starting in 2009 and succeeding years could be used as offsets for demonstrating equivalency with federal offset requirements. Any unused credits in a given year would rollover to the next year. Because SCAQMD's previous offset accounts would be eliminated under Alternative D, use of offsets could not exceed the number of credits generated each year plus any credits rolled over from previous years, thus, effectively capping the number of offsets that can be used per year. In all other respects Alternative D is similar to the proposed project.

#### **General Effects of Alternative D**

Like the proposed project, the intent of Alternative D is to ensure that exempt sources under Rule 1304 and essential public services accessing the SCAQMD's Priority Reserve under Rule 1309.1 are fully offset to the extent required by federal law by valid emission reductions from the SCAQMD's internal offset accounts. Alternative D would achieve equivalency with federal requirements by establishing what types of reductions are eligible to be used to offset emissions and how those reductions are tracked.

Alternative D would allow the SCAQMD to recognize emission reductions generated from minor sources, such as shutdowns and minor source over-control that were not previously accounted for in the SCAQMD's federal equivalency demonstrations.

Under Alternative D, the SCAQMD's existing offset accounts would be eliminated. Only new credits generated in 2009 and after could be used to offset emission increases from sources that qualify for exemptions from offset requirements pursuant to Rules 1304 and 1309.1. For purposes of evaluating the potential effects of this alternative, it is assumed that none of the growth in emissions forecasted in the 2007 AQMP for the industries potentially eligible to receive permits under Rules 1304 and 1309.1 would occur. However, unlike conditions without the proposed project, emissions from shutdowns or reductions at facilities that previously received permits under Rules 1304 and 1309.1 could be replaced with emissions from new or modified sources receiving new permits under Rules 1304 and 1309.1. Table 6-7.1 shows projected emission reductions from shutdowns that would be available for use by stationary sources in the future under Alternative D. Compared to the proposed project, offset use under Alternative D would likely be substantially less, which would result in lower air quality, health, visibility and greenhouse gas impacts.

**TABLE 6-7.1**  
**Emission Reductions from Shutdowns of Currently Permitted Sources Obtaining**  
**Offsets from SCAQMD Internal Offset Accounts**

Years	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>	CO
<b>Tons per Day</b>						
2014	11.21	0.77	0.03	0.03	0.02	0.87
2023	15.57	1.05	0.04	0.04	0.03	1.37
2030	15.57	1.05	0.04	0.04	0.03	1.37
<b>Pounds per Day</b>						
2014	22,420	1,540	60	60	40	1,740
2023	31,140	2,100	80	80	60	2,740
2030	31,140	2,100	80	80	60	2,740

### **Alternative E – Limited Offset Availability**

Like the proposed project, the intent of Alternative E is to ensure that exempt sources under Rule 1304 and essential public services accessing the SCAQMD's Priority Reserve under Rule 1309.1 are fully offset to the extent required by federal law by valid emission reductions from the SCAQMD's internal offset accounts. Alternative E would achieve equivalency with federal requirements by establishing what types of reductions are eligible to be used to offset emissions and how those reductions are tracked.

Alternative E would allow the SCAQMD to recognize emission reductions generated from minor sources, such as shutdowns and minor source over-control that were not previously accounted for in the SCAQMD's federal equivalency demonstrations.

The proposed project would limit the cumulative net emissions increases by all sources (major and minor) obtaining offsets from the Priority Reserve or exempt from offsets pursuant to Rule 1304 to levels based upon the growth assumptions in the 2007 AQMP for the relevant industry categories. Alternative E would limit the cumulative net emissions increases from those sources to levels set at 50 percent of the AQMP-based levels in the proposed project ("50 percent cap"). That is, staff would track the total net increases of each nonattainment air contaminant offset from the offset accounts from the start of implementation through the end of each reporting period and compare the results with the 50 percent caps included in the adopted rule for the corresponding period. If the cumulative net emission increase of any contaminant exceeded the cap, no further offsets of that contaminant would be available from the offset accounts until sufficient additional credits are tracked to bring the cumulative net emission increase to a level at least 10 percent below the applicable 50 percent cap. In other respects, Alternative E would be the same as the proposed project.

#### **General Effects of Alternative E**

Net offset use from Alternative E would be less than the net offset use from the proposed project. Under Alternative E, the analysis is based on the assumption that only half of the emissions attributed to growth in the industries potentially eligible to receive permits under Rules 1304 and 1309.1 would occur. The other category of emissions attributed to the proposed project, emissions from replacement of sources that shut down, would occur in an amount equal to the emissions projected for the proposed project. Because fewer offsets would be available under Alternative E, the SCAQMD would be able to demonstrate equivalency with federal offset requirements for fewer facilities. As a result, fewer facilities would likely be constructed and operated in the future, thus, reducing potential quality, health, visibility and greenhouse gas effects, as well as other indirect environmental impacts, compared to the proposed project (see also Chapter 7). Facilities that would no longer qualify for exemptions from offset requirements under Rules 1304 or 1309.1, would have to obtain offsets on the open market. However, offsets on the open market are in short supply.

### **EVALUATION OF THE COMPARATIVE EFFECTS OF THE PROJECT ALTERNATIVES**

The following sections describe potential direct and indirect adverse environmental impacts, including air quality, visibility, and greenhouse gas impacts, that may be generated by each project alternative. Evaluations of the comparative merits of the

direct effects of the project alternatives compared to the proposed project are evaluated in this chapter.

Indirect impacts of the future new and modified facilities enabled by the proposed project, such as water impacts, etc., are referred to as indirect impacts. Potential adverse indirect impacts from the proposed project are discussed in the subchapters in Chapter 5 and for the project alternatives are evaluated in Chapter 7 and summarized in Table 7-2.

The analysis of the air quality, health, visibility and greenhouse gas impacts for the project alternatives uses the same methodology as was used for the proposed project. For information on the methodologies and assumptions used for the analysis, the reader is referred to Subchapter 4.0. Finally, determining significance is based on the same significance criteria described in Chapter 4.1, see in particular Tables 4.1-1 and 4.1-2.

## **Air Quality**

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted. Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's offset accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment.

#### ***1. AQMP Consistency – Would Alternative A conflict with or obstruct the implementation of an Applicable Air Quality Plan?***

The 2007 AQMP incorporates future growth projections for the entire region, based on data provided by the Southern California Association of Governments (SCAG). The SCAQMD is required to use SCAG's growth projections in its AQMP (Health & Safety Code §40460(b)). The AQMP includes the projected emissions resulting from this regional growth and sets forth measures and strategies for attaining air quality standards in spite of this growth. The AQMP takes into account future emissions from both stationary and mobile sources, as well as emissions from construction activities.

The analysis assumes that if the proposed project is not approved, a portion of the projected regional growth would not occur. Thus, from an air quality perspective, future emissions without the proposed project would be less than they would be under the project. The conditions without the project are potential improvements to air quality and associated health, visual and climate change effects beyond those improvements forecasted to occur under the AQMP. Therefore, Alternative A, like the proposed project, would not conflict with or obstruct the implementation of the AQMP.

**2. Criteria Pollutant Emission Standards – Would Alternative A violate any air quality standard or contribute to an existing or projected air quality violation**

**Regional Mass Criteria Pollutant Emissions – Project Effects**

The best approach for understanding the project-specific emission effects of the No Project Alternative is to compare its emissions with the proposed project, which are shown in Table 6-8. The emissions attributed to the project would not occur under the No Project Alternative. Thus, Table 6-8 can also be seen as the effects of the No Project Alternative i.e., the emission increases that would not occur, or looked at another way, emission reduction benefits compared to the proposed project impacts. For example, it is expected that the proposed project would generate approximately 16.99 tpd of VOC by 2014 compared to Alternative A, as shown in Table 6-8. Conversely, under Alternative A the 16.99 tpd of VOC would not be emitted.

**TABLE 6-8  
Reductions in Stationary Source Emissions – No Project Alternative  
Compared to the AQMP**

Milestone Years	Pollutant					
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	CO	PM10	PM2.5
<b>Tons per Day</b>						
2014	16.99	1.29	0.16	1.14	0.85	0.54
2023	34.52	2.38	0.49	4.16	2.84	1.8
2030	44.59	3.31	0.74	6.26	4.44	2.82
<b>Pounds per Day</b>						
2014	33,980	2,580	320	2,280	1,700	1,080
2023	69,040	4,760	980	8,320	5,680	3,600
2030	89,180	6,620	1,480	12,520	8,880	5,640

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD’s offset accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment. Although these facilities could potentially obtain credits on the open market, these offsets, if available, would likely be unaffordable to most facilities.

As indicated in Subchapter 4.1, SCAQMD staff determined that total lead emissions in the district are approximately 18 lbs/day (6,517 lbs/yr) based on fiscal year (FY) 2006-

2007 data comprised of 566 facilities in the Basin that reported lead emissions. Lead emission impacts from the proposed project were calculated for the same milestone years evaluated for other emission impacts. Using AQMP growth projections, all the net increases from the 566 facilities reporting lead emissions were added together to determine the overall total net increase in lead emissions by 2030 in the Basin. As shown in Table 6-9, the maximum net increase in lead emissions by 2030 in the Basin from the proposed project would not exceed the SCAQMD's mass daily significance threshold for lead of three pounds per day. From the perspective of Alternative A, the lead emissions shown in Table 6-9 would not occur.

**TABLE 6-9**  
**Reductions in Lead Emissions - - No Project Alternative**  
**Compared to the AQMP**

<b>Milestone Years</b>	<b>Lead (lbs/day)</b>
2014	0.13
2023	0.45
2030	0.70

### **Cumulative Effects**

The No Project Alternative would not result in direct adverse impacts that would combine with effects of other past, present and future projects. It is important to note, however, under the No Project Alternative, it is reasonably foreseeable that permits would be issued under SB 827 through May 1, 2012 and the SCAQMD would be required to provide offsets to three power plants from the SCAQMD's internal accounts. These actions would not result from the proposed project or the No Project Alternative.

### ***Modeled Concentrations of Criteria Pollutants***

#### **Regional Criteria Pollutant Concentrations – Proposed Project Effects**

##### **a. Ozone Concentrations**

In addition to analyzing mass criteria pollutant emissions from project alternatives, this PEA supplements the analysis by also providing each alternative's contribution to regional concentrations of criteria pollutants. The 2007 AQMP concludes that ozone and PM2.5 air quality will improve substantially in the future, even assuming the growth represented by the proposed project. The No Project Alternative reflects additional air pollutant concentration benefits that would be foregone if the proposed project is approved. Table 6-10 summarizes the predicted proposed project's contribution to average and maximum ozone concentrations in the Basin and Coachella Valley for the

milestone years of 2014, 2023 and 2030. The ozone concentrations in Table 6-10 reflect the ozone concentration improvements under Alternative A that would be foregone if the proposed project is adopted.

**TABLE 6-10**  
**Reductions in Regional Ozone Concentrations – No Project Alternative**  
**Compared to the AQMP**

Year	Basin Average Ozone (ppb )	Basin Maximum Station Ozone ( ppb )	Coachella Valley Average Ozone ( ppb )	Coachella Valley Maximum Station Ozone ( ppb )
2014	0.9	1.4	0.5	0.6
2023	1.5	1.9	0.8	1.1
2030	2.6	2.9	1.1	1.3

**b. Particulate Matter Concentrations**

Table 6-11 summarizes predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentration improvements foregone as a result of implementing the proposed project estimated for the milestone years of 2014, 2023 and 2030. Looked at from the perspective of Alternative A, the PM2.5 and PM10 concentrations in Table 6-11 represent the PM2.5 and PM10 concentration improvements compared to the proposed project.

**TABLE 6-11**  
**Reductions in Regional PM2.5 and PM10 Concentrations – No Project Alternative**  
**Compared to the AQMP**

Milestone Year	Annual PM2.5 (µg/m <sup>3</sup> )	Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> ) Basin Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )
2014	0.06	0.12	0.6	0.7	0.01	0.01	0.1	0.1
2023	0.15	0.32	1.2	1.8	0.03	0.03	0.1	0.1
2030	0.21	0.47	1.6	2.5	0.05	0.05	0.2	0.2

The pollutant concentrations identified on Tables 6-10 and 6-11 are the incremental decreases in concentrations of pollutants that would occur if the No Project Alternative is selected, i.e., concentration reduction benefits compared to the proposed project. Chapter 4.1 discusses the extent to which attainment of applicable air quality standards

could occur more quickly under No Project conditions compared to conditions under the proposed project.

**c. NO2 Concentrations**

Regional modeling for NO2 was performed and the results are described in the following paragraphs. Table 6-12 shows the concentration improvements of Alternative A compared to the proposed project. See subchapter 4.1 for additional information comparing NO2 concentrations under the proposed project and conditions without the project.

**TABLE 6-12  
Reductions in Regional NO2 Concentrations – No Project Alternative  
Compared to the AQMP**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> (ppb)
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0

**d. SO2 Concentrations**

From the perspective of Alternative A, Table 6-13 shows the SO2 concentration improvements of the No Project Alternative compared to the proposed project. See subchapter 4.1 for additional information comparing SO2 concentrations under the proposed project and conditions without the project.

**TABLE 6-13  
Reductions in Regional SO2 Concentrations- No Project Alternative**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
2014	1	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO2 is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SOx emissions from all point and areas sources are less than 0.04 tons per day.

**e. Carbon Monoxide (CO) Concentrations**

The Basin is currently in attainment of both the California and federal 1-hour and 8-hour CO standards. Current maximum ambient concentrations are less than 50 percent of the 8-hour standard in the most heavily affected portions of the Basin. The 2008 winter planning emissions inventory (2007 AQMP, Appendix III) estimated total Basin emissions at 3,180 tons per day. Mobile sources account for more than 91 percent of the emissions inventory. The stationary and area source inventory comprises less than nine percent (281 tons per day) of the total inventory.

Ambient concentrations of carbon monoxide respond linearly to changes in the emissions inventory. Table 6-14 shows the effects of the proposed project on ambient CO concentrations in the Basin. Under Alternative A, the CO concentration effects shown in the table would not occur. See subchapter 4.1 for additional information comparing CO concentrations under the proposed project and conditions without the project.

**TABLE 6-14  
Reductions in Regional CO Concentrations – No Project Alternative  
Compared to the AQMP**

<b>Milestone Year</b>	<b>Change in Concentration (ppm)</b>
2014	0.00
2023	0.01
2030	0.01

**Regional Criteria Pollutant Concentrations-- Cumulative Effects**

The No Project Alternative would not contribute to concentrations of pollutants that would combine with effects of other past, present and future projects.

**Localized Criteria Pollutant Concentrations**

Tables 4.1-21 and 4.1-22 in Chapter 4 show that the proposed project has the potential to increase local PM2.5 concentrations at sensitive receptors that may be located near future representative facilities. Similarly, Tables 4.1-23 through 4.1-25 show that the proposed project has the potential to increase local NO2 concentrations at sensitive receptors that may be located near future representative facilities. These impacts would be avoided under the No Project Alternative because the No Project Alternative assumes no new permits for new or modified sources are issued under Rules 1304 and 1309.1 in reliance upon proposed Rule 1315.

### 3. *Health Effects – Would Alternative A Expose Sensitive Receptors to Substantial Pollutant Concentrations*

#### a. *Region-wide emissions of criteria pollutants*

The analysis of the project impacts includes a comparison of the health impacts of the proposed project and Alternative A, based on the projected Basin ozone, PM<sub>2.5</sub>, and PM<sub>10</sub>. Increases in criteria pollutant emissions may result in potential adverse health effects including the following: cardiovascular, neurological, reproductive and respiratory diseases. Health effects have been evaluated by modeling criteria pollutant concentrations, which can provide information on mortality, hospital admissions, emergency room visits, minor restricted activity days, school absence days, loss of work days, and cases of acute/chronic bronchitis, nonfatal heart attacks and adverse upper/lower respiratory conditions.

Table 6-15 shows the estimated health effects from the No Project Alternative as a result of exposures to ozone for the milestone years of the analysis. These impacts represent additional benefits, beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report that could occur if the proposed project were not implemented, nor replaced by other growth.

**TABLE 6-15**  
**Reductions in Estimated Ozone Health Impacts – No Project Alternative Compared to the AQMP**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days (Days)</b>	<b>School Absences (Days)</b>
2014	7	42	29,575	31,172
2023	12	71	49,513	52,186
2030	20	122	85,339	89,947

Table 6-16 provides the same analysis with respect to PM<sub>2.5</sub> and PM<sub>10</sub> emissions. PM<sub>2.5</sub> and PM<sub>10</sub> for the milestone years of the analysis. As explained in Subchapter 4.1, the health effects shown in Tables 4.1-27 and 4.1-28 and Table 6-16 below represent additional health benefits beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report that could occur if the proposed project were not implemented, nor replaced by other growth.

**TABLE 6-16**  
**Reductions in Estimated Annual PM2.5 and PM10 Health Impacts – No Project**  
**Alternative Compared to the AQMP**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
2014	33	59	18	29	1,262	11	13	23,374	4,074
2023	86	155	46	74	3,283	29	34	60,814	10,601
2030	125	224	66	108	4,763	42	50	88,214	15,377

**Region-wide Emissions of Criteria Pollutants-- Cumulative Effects**

The No Project alternative would not result in adverse health effects that would combine with effects of other past, present and future projects.

***b. Region-wide emissions of TACs***

Basin toxic risks (measured in cancer risk per million person population over a lifetime (70 years) of exposure) were estimated using the MATES-III modeling platform for 2014, 2023 and 2030 model year simulations. According to the MATES-III study completed by SCAQMD in 2008, total Basin population-weighted cancer risk from air pollution is 853 in one million ( $853 \times 10^{-6}$ ), which is based on the modeling exposures over the entire Basin. Approximately 94 percent of this risk is caused by mobile source emissions, primarily diesel particulates (84 percent). Total risk from industrial sources, which include industries, and businesses such as dry cleaners and chrome plating operations, is approximately 50 in one million ( $51 \times 10^{-6}$ ).

Table 6-17 summarizes the region-wide cancer risk reduction foregone as a result of implementing the proposed project. Alternative A would result in benefits equivalent to the amounts shown in Table 6-17.

The cancer risk reductions not achieved if the proposed project were implemented would not exceed the SCAQMD's cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ). However, the proposed project would result in a cancer burden risk that exceeds the SCAQMD's cancer burden significance threshold of 0.5. Alternative A would avoid this significant impact.

**TABLE 6-17**  
**Reductions in Cancer Risk and Cancer Burden Impacts – No Project Alternative**  
**Compared to the AQMP**

<b>Milestone Years</b>	<b>Cancer Risk Reduction<sup>a</sup></b>	<b>Cancer Burden Reduction</b>
2014	0.91	16
2023	2.86	54
2030	4.4	86

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

Table 6-18 provides the change in chronic HI in overall population-weighted values between the conditions with and without the proposed project. Acute HIs were calculated for each hour in each population area and the highest value is identified. Similar to the chronic HIs, the change in acute HIs reflect overall population-weighted values between the conditions with and without the proposed project is provided in Table 6-18. Under Alternative A, the non-cancer health risks identified in Table 6-14 would not occur.

**Table 6-18**  
**Reductions in Chronic and Acute Health Risk – No Project Alternative**  
**Compared to the AQMP**

<b>Year</b>	<b>Chronic Health Index Not Achieved</b>	<b>Acute Health Index Not Achieved</b>
2014	0.0	0.02
2023	0.02	0.05
2030	0.02	0.08

### **Cumulative Effects.**

The No Project alternative would not contribute to cancer and non-cancer health risks from past, present and future projects.

#### ***c. Localized Emissions of TACs***

Under Alternative A, it is assumed that no permits would be approved under Rule 1304 or Rule 1309.1 pursuant to proposed Rule 1315. As such, the localized toxic air contaminant impacts under the No Project Alternative would be zero.

**4. Odors – Would Alternative A Create Objectionable Odors Affecting a Substantial Number of People**

Some of the stationary source equipment permitted under Rules 1304 and 1309.1 could create objectionable odors. Under Alternative A potential odor impacts that could occur under the proposed project would be eliminated.

**Visibility Impacts**

**5. Visibility. Would the Alternative A create significant aesthetic impacts by resulting in air emissions that substantially degrade the existing visual character or quality of the project surroundings?**

**Project Effects**

Visual character or visibility is a manifestation of air quality, i.e., the worse the air quality the more visual character or visibility is adversely affected. In general, perception of visibility beyond eight to 10 miles is very subjective and subtle changes in range are not easily detected by the eye. (Until recent upgrades in automated monitoring, many military airports would not report range more than eight miles). California continues to maintain a state standard for visibility structured to reduce aerosol particles (8-hour average) that contribute to an extinction coefficient value of 0.23 per kilometer (or 10 miles of visual range) when relative humidity is less than 70 percent. The previous form of the standard assessed the number of days when visual range was less than 10 miles for the same humidity consideration.

The project values for the extinction coefficient predicted for the eastern Basin represented by Riverside-Rubidoux (the worst case), are from 0.063 to 0.067 from 2014 to 2030, or one-third of the California standard (Table 6-19). The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the proposed project would not cause or contribute to a violation of the state standard, and is not significant. The No Project Alternative would avoid these effects.

**Table 6-19  
Reductions in Visibility Impacts at Riverside-Rubidoux  
Measured in Extinction Coefficient and Visual Range (miles) - No Project Alternative**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Project Impact on Extinction Coefficient	Visual Range Without Project (miles)	Project Difference in Miles
2014	0.0672	0.0002	35.512	-0.091
2023	0.0629	0.0005	39.290	-0.274
2030	0.0656	0.0008	37.633	-0.469

In Class I areas that could potentially be affected by the proposed project, the deciview is directly used as the metric for visibility assessment in the federal Regional Haze visibility standard. A 0.5 deciview change is used to assess significance in Class I wilderness areas. The 0.5 deciview metric is equivalent to a five percent change in the local extinction coefficient. While California continues to maintain a threshold-based state standard for visibility as defined above, the downwind impacts to Class I areas that typically have greater base visual range and a lower base extinction coefficient are better characterized by the more responsive deciview index. Table 6-20 summarizes the project’s predicted visibility impacts with respect to the federal standard for Class I areas. Under the federal standard, a 0.5 deciview change would be considered a significant project impact and a cumulatively considerable contribution to a significant cumulative impact. The maximum project impact measured in deciviews would be less than 0.06 in all cases, which is not significant. The visibility changes presented on Table 6-20 are the incremental degradations in visibility that would not occur if the No Project Alternative were selected. Alternative A would eliminate the proposed project’s less-than-significant effect on visibility.

**Table 6-20  
Reductions in Impacts to Visibility at Class-I Wilderness Areas Measured in Deciview and Visual Range – No Project Alternative Compared to the AQMP**

Area Impacted	Predicted Deciview Value Without Project	Total Project Impact (Difference in Deciviews)	Predicted Visual Range Without Project (miles)	Project Impact (miles)

Joshua Tree	11.378	0.017	89.893	-0.108

### Cumulative Effects

The No Project alternative would not contribute to cumulative impacts on visibility.

### Climate Change Impacts Analysis

**6. Greenhouse Gas Emissions – Would Alternative A result in greenhouse gas emissions that may have a significant impact on the environment, based on any applicable threshold of significance?**

*Project Effects*

The analysis of GHGs takes two approaches in order to capture all six GHG pollutants identified in AB 32. First, SOx emissions were selected as a surrogate to prorate the GHG emissions because SOx emissions result primarily from sulfur contained in fossil fuels. Using a ratio of GHG emissions to SOx emissions from the AQMP inventory, the GHG emissions from the proposed project and project alternatives are calculated using the estimated SOx emissions from the proposed project and multiplying by the ratio factor (see subchapter 4.0 and Appendix D-1).

Second, an analysis of the statewide inventory was conducted to determine the impact from the remaining GHG pollutants, including HFCs, PFCs and SF6. Combustion GHG emissions are proportional to SOx emissions, while emissions of HFCs, PFCs and SF6 are analyzed as proportional to emissions of CO2, CH4 and N2O, based on the statewide inventory (see Subchapter 4.0 and Appendix D-1).

Table 6-21 shows the total GHG emissions from all six GHG pollutants attributed to the proposed project. Under Alternative A, the GHG emissions in Table 6-21 would not occur.

**TABLE 6-21**  
**Reductions in SO<sub>x</sub> and Greenhouse Gas Emissions – No Project Alternative**  
**Compared to the AQMP**

<b>Milestone Years</b>	<b>SO<sub>x</sub> Emissions (tons/day)</b>	<b>SO<sub>x</sub> Emissions (tons/year)</b>	<b>CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions (million MT CO<sub>2</sub> eq /year)</b>	<b>HFCs, PFCs and SF<sub>6</sub> Emissions<sup>1</sup> (million MT CO<sub>2</sub> eq /year)</b>	<b>TOTAL GHG Emissions<sup>2</sup> (million MT CO<sub>2</sub> eq /year)</b>
2014	0.16	58.4	4.52	0.29	4.81
2023	0.49	178.85	13.83	0.89	14.74
2030	0.74	270.1	20.89	1.36	22.26

1. Calculated based on ratio of 0.065 of high GWP/total GHGs. Thus, CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions x 0.065 = HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 million MT CO<sub>2</sub> eq /year x 0.065 = 0.29 million MT CO<sub>2</sub> eq /year)

2. Total GHG emissions = CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions + HFCs, PFCs and SF<sub>6</sub> emissions

SCAQMD's currently adopted Tier 3 GHG significance threshold for SCAQMD lead agency projects is 10,000 MT CO<sub>2</sub>eq per year. Projects with incremental increases below this threshold are not considered to be cumulatively considerable. As shown in Table 6-17, potential GHG emissions from the proposed project exceed 10,000 MT CO<sub>2</sub>eq per year and are concluded to be significant. Therefore, GHG emissions from are considered to be cumulatively considerable (CEQA Guidelines §15065(a)(3)), so are expected to contribute to significant adverse climate change impacts. Under Alternative A, the GHG impacts shown in Table 6-17 would not occur.

### Cumulative Effects

Alternative A, the No Project Alternative, would not contribute to cumulative climate change impacts.

### Alternative B –User Fees for Large Businesses

#### *1. AQMP Consistency – Would Alternative B Conflict with or Obstruct the Implementation of an Applicable Air Quality Plan?*

Like the proposed project, Alternative B would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. Therefore, the intent of Alternative B is to maintain consistency with Regulation XIII, i.e., to ensure that there are no net increases in emissions from new or modified permitted sources. Although the AQMP provides strategies for attaining and maintaining the NAAQSs and CAAQSs, it is considered to be a growth accommodating document. Alternative B would allow the use of offsets up to the 2007 AQMP growth projection cap.

Emissions from Alternative B are not expected to conflict with or obstruct the implementation of the AQMP because offsets cannot be issued above the emissions

caps, which are based on growth projections of the 2007 AQMP for the relevant industry categories. Because regional criteria pollutant emissions from Alternative B are expected to be less than the regional criteria pollutant emissions from the project, the potential for conflict with the 2007 AQMP would be even less likely.

**2. Criteria Pollutant Emission Standards – Would Alternative B Violate any Air Quality Standard or Contribute to an Existing or Projected Air Quality Violation**

**a. Alternative B – Region-wide emissions of criteria pollutants**

Emissions from sources with permits issued in reliance on offsets in the SCAQMD’s internal accounts under Alternative B would be the same as the emissions from the proposed project because Alternative B would be subject to the same cap. However, under Alternative B, a reduction in those emissions would occur due to use of a large business user fee to fund emissions-reducing projects.

The primary difference between the proposed project and Alternative B is that under Alternative B large businesses would be subject to a large business user fee based on the quantity of emissions to be offset. Based on historical permit data, Table 6-22 shows emissions from large businesses and the potential large business user fees that could be charged per pound of pollutant under Alternative B. It should be noted that the emissions shown in Table 6-22 constitute a subset of the total proposed project emissions. By multiplying the emissions from large businesses by the emission fee per pollutant (Table 6-22), potential emission fees collected for each timeframe can be calculated (Table 6-23).

**TABLE 6-22  
Emissions from Large Businesses and Large Business User Fees**

Milestone Years	Pollutant					
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	CO	PM10	PM2.5
Tons per Day						
2014	1.39	0.12	0.03	0.04	0.09	0.06
2023	4.55	0.31	0.09	0.39	0.31	0.20
2030	6.97	0.52	0.15	0.68	0.48	0.31

**TABLE 6-22 (Concluded)**

<sup>a</sup> Based on weighted average of 2007 and 2008 ERC purchase prices and 25% premium. Sums may not be exact due to rounding.

**TABLE 6-23**  
**Potential Large Business User Fees Collected per Pollutant<sup>a</sup>**

Milestone Years	Fees Collected by Pollutant				
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM <sub>10</sub>	TOTAL
2014	\$52,820,000	\$18,528,720	\$3,662,880	\$26,201,160	\$101,212,460
2023	\$172,900,000	\$47,865,860	\$10,988,640	\$90,248,440	\$322,002,940
2030	\$264,860,000	\$80,291,120	\$18,314,400	\$139,739,520	\$503,205,040

<sup>a</sup> Total fee = large business emissions (ton/day) x 2000 (pounds/ton) x mitigation fee (dollars/pound).

The analysis assumes that once collected, under Alternative B large business user fees would fund emission reduction projects similar to those shown in Table 6-4 (see also Table 7-6 in Chapter 7), which would offset some of the emissions associated with implementing Alternative B. However, because it is unknown at this time and cannot be known what specific types of emission reduction projects would be implemented in the future, it is not possible to quantify the emissions reduction associated with each potentially funded project. Instead, to determine the effects of the large business user fees, SCAQMD staff used the following approach. First, staff identified the BACT incremental cost effectiveness, i.e., the cost per ton of pollutant reduced by pollutant based on the typical cost effectiveness of BACT equipment adjusted for 2010 dollars (Table 6-24). Once the BACT equipment adjustment factor is determined, the total amount of fees collected for each pollutant (Table 6-24) is then divided by the BACT adjustment factor for that pollutant (Table 6-25). Because BACT cost effectiveness includes a capital recovery factor amortized over 10 years (the assumed life of the

project), the result is then multiplied by the amortized capital recovery factor to obtain anticipated emission reductions by pollutant, based on the fees collected. Applying this methodology produces the emission reductions from Alternative B, which are shown in Table 6-25.

**TABLE 6-24  
BACT Incremental Cost Effectiveness by Pollutant (Dollars per Ton)**

	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM10

<b>Pounds per Day</b>						
2014	2,780	240	60	80	180	120
2023	9,100	620	180	780	620	400
2030	13,940	1,040	300	1,360	960	620

Assumes facilities operate 50 weeks/year, five days/week.

Emission reduction = total fee (dollars)/incremental BACT cost effectiveness (dollars/ton reduced).

Once emissions reductions from use of the large business user fees have been quantified (Table 6-25), they are subtracted from the Alternative B emissions. Remaining emissions compared to the proposed project emissions and are shown in Table 6-26. As can be seen in Table 6-26, emissions of criteria pollutants from Alternative B would be significant, but would be less than the emissions from the proposed project.

**TABLE 6-26  
Proposed Project and Alternative B Stationary Source Emissions**

<b>Regional Significance Thresholds (Pounds per Day)</b>						
Significance Threshold	55	55	150	550	150	55
Significant?	Yes	Yes	Yes	Yes	Yes	Yes

As indicated in Subchapter 4.1, SCAQMD staff determined that total lead emissions in the district are approximately 18 lbs/day (6,517 lbs/yr) based on fiscal year (FY) 2006-2007 data comprised of 566 facilities in the Basin that reported lead emissions. Lead emission impacts were calculated for the same milestone years evaluated for other emission impacts. As shown in Table 6-27, the maximum net increase in lead emissions by 2030 in the Basin from the proposed project and the cumulative scenario with the proposed project would not exceed the SCAQMD's mass daily significance threshold for lead of three pounds per day. Similarly, Table 6-27 shows that lead emission impacts from Alternative B and the cumulative scenario with Alternative B would be less-than-significant.

**TABLE 6-27**  
**Proposed Project and Alternative B –**  
**Project-Specific and Cumulative Lead Emissions**

Milestone Years	Lead (lbs/day)			
	Proposed Project	Cumulative with Proposed Project	Alternative B	Cumulative with Alternative B
2014	0.13	0.33	0.02	0.26
2023	0.45	0.50	0.04	0.25
2030	0.70	0.63 <sup>1</sup>	0.08	0.25

**Cumulative Effects**

As explained in Chapters 4.0 and 4.1, the cumulative impact analysis includes emissions from sources permitted under Rules 1304 and 1309.1 under the prior version of Rule 1315 and SB 827. In addition, the cumulative impacts analysis includes emissions from three power plants.

Table 6-28 shows the total mass emissions from stationary sources under Alternative B plus the other sources included in the cumulative scenario. Based on the data shown in Table 6-28, cumulative impacts from Alternative B would be significant, but less significant than the proposed project. Further, based on the emissions shown in Table 6-28, Alternative B's contribution to cumulative impacts is considered to be cumulatively considerable.

**TABLE 6-28**  
**Proposed Project and Alternative B Cumulative Stationary Source Mass Emissions**

Milestone Years	Pollutant					
	VOC	NOx	SOx	CO	PM10	PM2.5
<b>Cumulative With Proposed Project – Tons per Day</b>						
2014	23.71	4.7	0.47	10.82	3.47	2.87
2023	40.76	5.64	0.79	14.36	5.29	4.02
2030	50.74	6.61	1.04	16.55	6.79	4.97

<sup>1</sup> For lead emitting facilities, in the early years of the analysis there were some SIC facility categories with negative growth factors, resulting in lower overall lead emissions. Based on this factor, the cumulative net increase in lead emissions was determined to be lower than the proposed project because it included more years of negative growth.

### *Modeled Concentrations of Criteria Pollutants*

#### **Regional Criteria Pollutant Concentrations – Alternative B**

##### **a. Ozone Concentrations**

In addition to analyzing project-specific effects of Alternative B in terms of mass emissions of criteria pollutants, this PEA includes a supplemental analysis of the contribution of Alternative B to regional concentrations of these same criteria pollutants.

Air quality is expected to improve under future conditions, with or without the proposed project or alternatives. Table 6-29 presents the contributions from Alternative B to the Basin and Coachella Valley ozone concentrations for the milestone years of 2014, 2023, and 2030 in terms of the difference in ozone concentrations under Alternative B compared to conditions without the proposed project. As explained in subchapter 4.1, no new significance criteria are applied to this analysis. Rather, this section is intended

to further describe the degree to which emissions of criteria pollutants would affect regional air quality.

As shown in the table, for most milestone years in the Basin, Alternative B would contribute less to ozone concentrations than the proposed project. Alternative B would also contribute equal or less to maximum ozone concentrations in the Coachella Valley. Due to the non-linearity of ozone formation, the average ozone impact to the Coachella Valley, which includes the far downwind impacts to Indio (greater than 125 miles east of Los Angeles), is nominally higher (1.0 ppb) for Alternative B than the proposed project for the milestone years 2014 and 2023. Another way of looking at the results in Table 6-29 is that for most years, Basin and Coachella Valley ozone concentration improvements foregone from Alternative B are equal to or less than the proposed project.

**TABLE 6-29  
Proposed Project and Alternative B - Contribution to Regional Ozone Concentrations  
(Peak 8-hour concentrations)**

Milestone Years	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Proposed Project</b>				
2014	0.9	1.4	0.5	0.6
2023	1.5	1.9	0.8	1.1
2030	2.6	2.9	1.1	1.3
<b>Alternative B</b>				
2014	0.9	1.3	0.6	0.6
2023	1.4	1.8	0.9	1.0
2030	2.5	2.8	1.1	1.2

**b. Particulate Matter Concentrations**

Table 6-30 shows the contribution of emissions from Alternative B to the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations estimated for the milestone years of 2014, 2023 and 2030 compared to the proposed project. As shown in the table, for most milestone years, Alternative B contributes less to regional concentrations of particulate matter than the proposed project. Another way of looking at the results in Table 6-30 is that for most years Basin and Coachella Valley predicted annual average and 24-hour average Basin and Coachella Valley PM2.5 and PM10 concentration improvements foregone from Alternative B are equal to less than the proposed project.

**TABLE 6-30**  
**Proposed Project and Alternative B – Contributions to Regional PM2.5 and PM10 Concentrations**

Milestone Year	Annual PM2.5 (µg/m <sup>3</sup> )	Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> ) Basin Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )
<b>Proposed Project</b>								
2014	0.06	0.12	0.6	0.7	0.01	0.01	0.1	0.1
2023	0.15	0.32	1.2	1.8	0.03	0.03	0.1	0.1
2030	0.21	0.47	1.6	2.5	0.05	0.05	0.2	0.2
<b>Alternative B</b>								
2014	0.04	0.08	0.5	0.6	0.01	0.01	0.1	0.1
2023	0.08	0.18	1.1	1.2	0.02	0.02	0.1	0.1
2030	0.11	0.24	1.5	1.5	0.02	0.02	0.2	0.2

**c. NO2 Concentrations**

Table 6-31 shows the contributions to regional NO2 concentrations from Alternative B compared to the proposed project. The regional NO2 concentration analysis is based on an emissions-weighted approach to estimate the incremental contributions of NO2 from Alternative B compared to the without project conditions. As Table 6-31 shows, Alternative B and the proposed project would result in NO2 concentrations of 1.0 ppb or less for all milestone years, regardless of the averaging time.

**TABLE 6-31**  
**Alternative B and the Proposed Project – Contributions to Regional NO2 Concentrations**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>				
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0

**TABLE 6-31 (Concluded)**  
**Alternative B and the Proposed Project – Contributions to Regional NO<sub>2</sub> Concentrations**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> <sup>b</sup> (ppb)
<b>Alternative B</b>				
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0

**d. SO<sub>2</sub> Concentrations**

Table 6-32 shows the contributions to regional SO<sub>2</sub> concentrations from Alternative B compared to the proposed project. The regional SO<sub>2</sub> concentration analysis is also based on an emissions-weighted approach to estimate the incremental increased contributions of SO<sub>2</sub> from Alternative B compared to the without project conditions. Both Alternative B and the proposed project would result in contributions to SO<sub>2</sub> concentrations in the Basin of 0.04 ton per day, which is less than 0.1 percent of the Basin SO<sub>x</sub> emissions, and less than 1.0 ppb for all milestone years, regardless of the averaging time. SO<sub>2</sub> is not measured in the Coachella Valley because there are so few SO<sub>2</sub> emissions sources.

**TABLE 6-32**  
**Alternative B and the Proposed Project – Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative B</b>			
2014	0	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. CO Concentrations**

Ambient concentrations of carbon monoxide respond linearly to changes in the emissions inventory. Table 6-33 shows contributions to ambient CO concentrations in the Basin from Alternative B compared to the proposed project. Table 6-33 shows that contributions to CO concentrations from Alternative B are equal to contributions to CO concentrations from the proposed project.

**TABLE 6-33  
Alternative B and the Proposed Project –  
Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Proposed Project	Alternative B
2014	0.00	0.00
2023	0.01	0.01
2030	0.01	0.01

**Regional Criteria Pollutant Concentrations-- Cumulative Effects**

**a. Cumulative Ozone Concentrations**

In addition to analyzing project-specific contributions of Alternative B to regional pollutant concentrations, this PEA includes an analysis of the combined contributions to regional pollutant concentrations from Alternative B plus other sources receiving permits in reliance upon the SCAQMD’s internal offset accounts. Table 6-34 presents the contribution to regional ozone concentrations from such sources in the Basin and Coachella Valley for the milestone years of 2014, 2023, and 2030 in terms of the ozone concentrations for the cumulative scenario with Alternative B compared to the cumulative scenario with the proposed project. As shown in the table, the cumulative scenario with Alternative B results in the same or less contributions to regional ozone concentrations than the proposed project.

**TABLE 6-34**  
**Proposed Project and Alternative B Cumulative Scenarios – Contributions to Regional Ozone Concentrations (Peak 8-hour concentrations)**

Year	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Cumulative With Proposed Project</b>				
2014	1.1	1.8	0.8	0.8
2023	2.0	2.5	1.0	1.3
2030	3.0	3.5	1.3	1.6
<b>Cumulative With Alternative B</b>				
2014	1.1	1.8	0.7	0.8
2023	1.5	1.6	0.6	0.7
2030	2.8	3.0	0.9	1.1

**b. Cumulative Particulate Matter Concentrations**

Table 6-35 shows the predicted contribution of regional particulate matter concentrations from Alternative B with the cumulative scenario compared to the proposed project with the cumulative scenario in terms of the contributions to predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations estimated for the milestone years of 2014, 2023 and 2030. As shown in the table, for most milestone years, the cumulative scenario with Alternative B would contribute less to regional particulate matter concentrations than the cumulative scenario with the proposed project.

**TABLE 6-35**  
**Proposed Project and Alternative B Cumulative Scenarios –Contributions to Regional PM2.5 and PM10 Concentrations**

Milestone Year	Annual PM2.5 (µg/m <sup>3</sup> )	Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> ) Basin Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )
<b>Cumulative With Proposed Project</b>								
2014	0.18	0.38	1.1	1.8	0.04	0.04	0.1	0.1
2023	0.26	0.57	1.8	2.8	0.06	0.06	0.2	0.2
2030	0.32	0.71	2.2	3.5	0.07	0.07	0.2	0.2

2030	0.22	0.49	2.0	2.5	0.05	0.05	0.2	0.2

**c. Cumulative NO2 Concentrations**

Table 6-36 shows the contributions to cumulative regional NO2 concentrations from the cumulative scenario with Alternative B compared to the cumulative scenario with the proposed project. As Table 6-36 shows, the cumulative scenario with Alternative B would contribute the same amount or less to regional NO2 concentrations than the cumulative scenario with the proposed project.

**TABLE 6-36**  
**Alternative B and the Proposed Project Cumulative Scenarios – Contributions to Regional NO2 Concentrations**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> <sup>b</sup> (ppb)
<b>Cumulative with Proposed Project</b>				
2014	1	0	1	0
2023	2	0	1	0
2030	2	0	1	0
<b>Cumulative with Alternative B</b>				
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0

**d. Cumulative SO<sub>2</sub> Concentrations**

Table 6-37 shows the contributions to cumulative regional SO<sub>2</sub> concentrations from the cumulative scenario with Alternative B compared to the cumulative scenario with the proposed project. As shown in the table, for most milestone years, the cumulative scenario with Alternative B would contribute roughly the same amount to regional SO<sub>2</sub> concentrations as the cumulative scenario with the proposed project.

**TABLE 6-37  
Alternative B and the Proposed Project Cumulative Scenarios – Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative B</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. Cumulative CO Concentrations**

Table 6-38 shows the contributions to regional CO concentrations in the Basin from the cumulative scenario with Alternative B compared to the cumulative scenario with the proposed project. Table 6-38 shows that the contribution to CO concentrations from the cumulative scenario with Alternative B are equal to the contribution to CO concentrations from the cumulative scenario with the proposed project.

**TABLE 6-38**  
**Alternative B and the Proposed Project – Cumulative Scenarios**  
**Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Cumulative With Proposed Project	Cumulative With Alternative B
2014	0.01	0.01
2023	0.02	0.02
2030	0.02	0.02

### Localized Criteria Pollutant Concentrations

Tables 4.1-21 and 4.1-22 in Chapter 4 show that the proposed project has the potential to increase localized PM<sub>2.5</sub> concentrations at sensitive receptors that may be located near future representative facilities. Similarly, Tables 4.1-23 through 4.1-25 show that the proposed project has the potential to increase local NO<sub>2</sub> concentrations at sensitive receptors that may be located near future representative facilities. The analysis of localized criteria pollutant impacts prepared for the proposed project applies to Alternative B for the following reasons. Because most components of Alternative B are identical to the proposed project, the same future representative facilities that would qualify for permits pursuant to Rules 1304 or 1309.1 under the proposed project would qualify for these permits under Alternative B. The same five-year database (2003 through 2008) of permits and pending permits in the SCAQMD's overall permit database that was used to analyze future localized impacts of the proposed project would be applicable to Alternative B. The same Source Classification Codes (SCCs) would be applicable: (1) to assigning stack parameters to emission sources for modeling on the basis of source type; and (2) to estimate chemical speciation of permitted emissions reported as PM and organic gases with respect to particle size composition of PM emissions.

The main difference between Alternative B and the proposed project is that under Alternative B, large businesses would be required to pay fees per pound of pollutant (Table 6-2) that would be offset by the SCAQMD. The fees would then be used to fund emission reduction projects (Table 6-4). Although the emission reduction projects have the potential to reduce the regional effects of Alternative B, such projects would not reduce emissions at the future affected facilities and, therefore, would not be likely to reduce localized criteria pollutant effects from Alternative B to nearby receptors.

### 3. Health Effects – Would Alternative B Expose Sensitive Receptors to Substantial Pollutant Concentrations

#### Region-wide Emissions of Criteria Pollutants—Alternative B

The analysis of Alternative B includes a comparison of the health impacts resulting from Alternative B to the health impacts of the proposed project. Increases in criteria pollutant emissions may result in potential adverse health effects including the following: cardiovascular, neurological, reproductive and respiratory diseases. Health effects have been evaluated by modeling criteria pollutant concentrations, which can provide information on mortality, hospital admissions, emergency room visits, minors restricted activity days, school absence days, loss of work days, and cases of acute/chronic bronchitis, nonfatal heart attacks and adverse upper/lower respiratory conditions. Table 6-39 shows the estimated health effects from the proposed project and Alternative B as a result of exposures to ozone for the milestone years of the analysis. Similarly, Table 6-40 shows the estimated health effects from Alternative B compared to the proposed project as a result of exposure to PM2.5 and PM10 during the milestone years analyzed. The impacts shown in Tables 6-39 and 6-40 represent health benefits foregone beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report (SCAQMD, 2007) that could occur if the project and Alternative B were not implemented, nor replaced by other growth.

**TABLE 6-39**  
**Proposed Project and Alternative B – Estimated Ozone Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Hospital Admissions (People)	Minor Restricted Activity Days (Days)	School Absences (Days)
<b>Proposed Project</b>				
2014	7	42	29,575	31,172
2023	12	71	49,513	52,186
2030	20	122	85,339	89,947
<b>Alternative B</b>				
2014	7	42	29,612	31,211
2023	11	68	47,715	50,292
2030	20	119	83,331	87,830

**TABLE 6-40  
Proposed Project and Alternative B – Estimated PM2.5 and  
PM10 Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
<b>Proposed Project</b>									
2014	33	59	18	29	1,262	11	13	23,374	4,074
2023	86	155	46	74	3,283	29	34	60,814	10,601
2030	125	224	66	108	4,763	42	50	88,214	15,377
<b>Alternative B</b>									
2014	21	39	11	19	819	7	9	15,176	2,645
2023	48	86	25	41	1,819	16	19	33,692	5,873
2030	65	117	35	56	2,478	22	26	45,900	8,001

The SCAQMD has not developed significance thresholds for the specific health effects identified in Tables 6-39 and 6-40. However, given the magnitude of the health effects foregone compared to health effect conditions in the absence of Alternative B, SCAQMD staff concludes that Alternative B has the potential to generate significant adverse health effects from increased exposures to ozone and particulate matter. Because of the beneficial effects of the emission reduction projects assumed to be implemented using the large business user fees, health effects generated by Alternative B are expected to be significant, but less significant than health effects generated by the proposed project.

**Region-wide Emissions of Criteria Pollutants-- Cumulative Effects**

The cumulative health impacts analysis includes health effects of Alternative B, plus health effects of the reasonably foreseeable power plant projects and the effects of the additional three years of past sources permitted in reliance on the SCAQMD’s internal offset account (2007 through 2009). Table 6-41 shows the estimated health effects from the cumulative scenario with the proposed project compared to the cumulative scenario with Alternative B as a result of exposure to ozone for the milestone years of the analysis. Table 6-42 shows the estimated health effects from the cumulative scenarios with the proposed project compared to the cumulative scenario with Alternative B as a result of exposures to PM2.5 and PM10 for the milestone years of the analysis.

**TABLE 6-41**  
**Proposed Project and Alternative B –**  
**Estimated Cumulative Ozone Health Impacts**

The SCAQMD has not developed specific significance thresholds for cumulative health impacts. Given the magnitude of the cumulative health benefits foregone that would occur if Alternative B were implemented, the contribution to cumulative impacts from Alternative B is concluded to be cumulatively considerable, but less than the proposed project.

### Region-wide Emissions of TACs

Basin toxic risks (measured in cancer risk per million person population over a lifetime of exposure) were estimated using the MATES-III modeling platform for 2014, 2023 and 2030 model year simulations. For reference, the MATES-III study for 2008 attributed the cancer risk from stationary sources, which include industries, and businesses such as dry cleaners and chrome plating operations at approximately 51 additional cancers in a population of one million individuals, whereas total regional cancer risk from toxic air contaminants was 853 in one million. Under conditions with or without the project, toxic risks are expected to decrease in future years. Table 6-43 shows the region-wide project-specific cancer risk and cancer burden reductions foregone beyond those anticipated in the 2007 AQMP, if Alternative B or the proposed project were implemented, as compared to conditions without the project. Table 6-43 also shows the contribution to cancer risk and cancer burden from the cumulative scenario with Alternative B and from the cumulative scenario with the proposed project.

**TABLE 6-43**  
**Proposed Project and Alternative B – Cancer Risk and Cancer**  
**Burden Impacts (Project-specific and Cumulative)**

Year	Cancer Risk Reduction Not Achieved <sup>a</sup>	Cumulative Cancer Risk Reduction Not Achieved <sup>a</sup>	Cancer Burden Reductions Not Achieved	Cumulative Cancer Burden Reductions Not Achieved
<b>Proposed Project</b>				
2014	0.91	3.35	16	59
2023	2.86	5.15	54	96
2030	4.4	6.59	86	129
<b>Alternative B</b>				
2014	0.22	2.68	4	47
2023	0.52	2.80	10	52
2030	0.78	2.97	15	58

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

As shown in Table 6-43, neither the proposed project nor Alternative B would generate project-specific or cumulative cancer risk impacts that exceed the SCAQMD's cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ).

The proposed project and Alternative B would result in a cancer burden impacts that exceed the SCAQMD's significance threshold of 0.5. Compared to the without project

scenario, the proposed project would create an increased project-specific cancer burden impact in the year 2030 of 87. Alternative B would create an increased project-specific cancer burden impact in the year 2030 of 16. In addition, the cumulative scenarios with both the proposed project and with Alternative B result in significant cancer burdens compared to the without project scenarios. The contributions to cumulative cancer burden impacts from Alternative B are considered to be cumulatively considerable but less than the proposed project.

A hazard index (HI) is a summation of the hazard (non-cancer) quotients for all chemicals to which an individual is exposed. A hazard index can be measured as a result of chronic (long-term) exposure or acute (short-term) exposure. SCAQMD's significance threshold for non-cancer chronic or acute HI value is 1.0 because if the HI is less than 1.0, it is presumed that no significant adverse human health effects (non-cancer) are expected to occur. Table 6-44 shows the population-weighted project-specific change in chronic HI between conditions without the project and the proposed project and between conditions without the project and Alternative B. Table 6-44 also shows the changes between conditions without the project and cumulative scenarios with the proposed project and with Alternative B.

**Table 6-44  
Proposed Project and Alternative B – Chronic and Acute Health  
Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Chronic Health Index Not Achieved</b>	<b>Cumulative Chronic Health Index Not Achieved</b>	<b>Acute Health Index Not Achieved</b>	<b>Cumulative Acute Health Index Not Achieved</b>
<b>Proposed Project</b>				
2014	0.0	0.02	0.02	0.06
2023	0.02	0.03	0.05	0.09
2030	0.02	0.03	0.08	0.11
<b>Alternative B</b>				
2014	0	0.01	0.01	0.05
2023	0	0.01	0.01	0.05
2030	0	0.02	0.02	0.05

As shown in Table 6-44, neither the proposed project nor Alternative B would exceed the SCAQMD's acute or chronic HI significance threshold of 1.0. Similarly, Table 6-44 shows that cumulative acute and chronic HI impacts from the proposed project with the cumulative scenario and Alternative B with the cumulative scenario would not exceed

the HI significance threshold. Therefore, neither the proposed project nor Alternative B would generate project-specific or cumulative non-cancer health risk impacts, while impacts from Alternative B would be equivalent to or less than the proposed project.

### **Localized Emissions of TACs**

Under Alternative B, sources permitted under Rules 1304 and 1309.1 would be subject to the requirements in Rules 1401 and 1402 that limit the cancer risk and non-cancer hazard level, which would limit any potential significant toxic impact from each source. The thresholds in Rule 1401 are the same as the SCAQMD's CEQA significance thresholds for toxics. As a result of these regulatory prohibitions, the issuance of a permit by the SCAQMD to a stationary source of TACs would not result in stationary source emissions that exceed the CEQA significance thresholds for localized health impacts. However, the thresholds contained in Rule 1401 are applied on a permit-unit basis; as a result, a facility with multiple permitted sources could still exceed the Hazard Index limits in Rule 1401. Such facilities would instead be subject to Rule 1402; under that rule, the allowable cancer burden is the same as under Rule 1401, but the Hazard Index limits for acute and chronic non-cancer toxic impacts are higher (3.0) than the limits under Rule 1401 and thus higher than the applicable CEQA significance thresholds. Therefore, the localized air toxic impacts of the proposed project are considered significant.

The main difference between Alternative B and the proposed project is that under Alternative B, large businesses would be required to pay fees per pound of pollutant (Table 6-4) that would be offset by the SCAQMD. The fees would then be used to fund emission reduction projects (Table 6-7). Although the emission reduction projects have the potential to reduce the regional effects of Alternative B (Table 6-25), such projects would not reduce TAC emissions at the future affected facilities and, therefore, would not be likely to reduce localized effects from TACs. Therefore, Alternative B has the potential to generate adverse localized impacts from emissions of TACs equivalent to the significant impacts of the proposed project.

#### ***4 Odors – Would Alternative B Create Objectionable Odors Affecting a Substantial Number of People***

Some equipment permitted under Rules 1304 and 1309.1 could create objectionable odors, as explained in subchapter 4.1. Evaluation of permit applications includes the imposition of conditions to minimize such odors. In addition, installing BACT equipment would typically contribute to a reduction in potential odor impacts. Further, SCAQMD Rule 402 prohibits operation of a facility that creates an odor nuisance. Nevertheless, as explained in subchapter 4.1, facilities containing sources receiving permits under the proposed project could result in significant odor impacts. Alternative B could result in the same types of facilities as the proposed project; and therefore would have the same potential to result in significant odor impacts. Emission reduction projects funded by offset user fees under Alternative B could reduce odors (e.g.,

replacing diesel engines with alternative technology), but such reductions would not be expected to occur at the same facilities as those with sources receiving permits under proposed Rule 1315.

### **Visibility Impacts**

- 5. Visibility. Would the Alternative B create significant aesthetic impacts by resulting in air emissions that substantially degrade the existing visual character or quality of the project surroundings?**

#### **Alternative B Effects**

Table 6-45 shows predicted visibility and visual range impacts from Alternative B and the proposed project with respect to the state standard. The state standard is a light extinction coefficient of 0.23 per kilometer when relative humidity is less than 70 percent (roughly equivalent to a 10-mile visual range), over an 8-hour averaging period (10 am – 6 pm, PST). Visual range (measured in miles) is provided for informational purposes. The range of without project values for the extinction coefficient predicted for the eastern Basin represented by Riverside-Rubidoux (the worst case) is from 0.063 to 0.067 from 2014 to 2030 over the project timeframe, or one-third of the California standard. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the proposed project would not cause or contribute to a violation of the state standard and is not significant. As shown in Table 6-45, visual range impacts for Alternative B are less than or equal to the proposed project and, therefore, are also concluded to be less than significant.

**TABLE 6-45  
Proposed Project and Alternative B – Visibility Impacts at Riverside-Rubidoux  
Measured in Extinction Coefficient and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Proposed Project	Alternative B		Proposed Project	Alternative B
2014	0.0672	0.0002	0.0001	36.512	-0.091	-0.059
2023	0.0629	0.0005	0.0003	39.290	-0.274	-0.152
2030	0.0656	0.0008	0.0004	37.633	-0.469	-0.244

The deciview – an index which incorporates incremental changes in people’s perception of visibility is directly used as the metric for visibility assessment in the federal Regional

Haze visibility standard. A 0.5 deciview change is used to assess significance in Class I wilderness areas. Table 6-46 summarizes the visibility effects of Alternative B and the visibility effects of the proposed project in terms of deciview changes.

**TABLE 6-46**  
**Proposed Project and Alternative B – Visibility Impacts at Class-I Wilderness Areas**

Cucamonga	15.865	0.049	0.025	51.224	-0.243	-0.126
San Gorgonio	13.124	0.023	0.012	67.006	-0.138	-0.072
San Jacinto	14.056	0.020	0.01	60.075	-0.119	-0.062
Joshua Tree	11.378	0.017	0.009	89.893	-0.108	-0.056

As shown in Table 6-46, the maximum impact projected for the proposed project measured in deciviews would be less than 0.06 for all locations and milestone years, which is not significant. Similarly, implementing Alternative B would also generate a

maximum impact measured in deciviews that would be less than 0.03 for all locations and milestone years, which is not significant. Further, visibility impacts from Alternative B would be less than visibility impacts from the proposed project.

### Cumulative Effects

The cumulative visibility impacts analysis includes effects of Alternative B, plus effects of the reasonably foreseeable power plant projects and the additional three years of past sources receiving permits in reliance upon the SCAQMD's offset accounts (2007 through 2009). Table 6-47 presents the visibility effects of the cumulative scenario with Alternative B and the visibility effects of the cumulative scenario with the proposed project. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the cumulative scenario with the proposed project would not cause or contribute to a violation of the state standard and would not be significant. Neither Alternative B nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact. Visibility impacts from Alternative B would be less for all years and locations than for the proposed project.

**TABLE 6-47  
Proposed Project and Alternative B – Cumulative Visibility Impacts at Riverside-  
Rubidoux Measured in Deciview and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Cumulative with Proposed Project	Cumulative with Alternative B		Cumulative with Proposed Project	Cumulative with Alternative B
2014	0.0672	0.0003	0.0003	36.512	-0.170	-0.130
2023	0.0629	0.0008	0.0006	39.290	-0.456	-0.328
2030	0.0656	0.0008	0.0005	37.633	-0.469	-0.306

The cumulative visibility impacts analysis for class I wilderness areas includes effects of Alternative B, plus effects of the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the SCAQMD's offset accounts (2007 through 2009). Table 6-48 shows the visibility effects for class I wilderness areas of the cumulative scenario with Alternative B and the visibility effects of the cumulative scenario with the proposed project in terms of deciview changes. Under the federal standard, a 0.5 deciview change would be considered a significant adverse impact and a cumulatively considerable contribution to a significant cumulative

impact. Neither Alternative B nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact.

**Climate Change****6. Greenhouse Gas Emissions – Would Alternative B result in greenhouse gas emissions that may have a significant impact on the environment, based on any applicable threshold of significance?**

The methodology for deriving GHG emission impacts for the project alternatives is the same methodology used for the proposed project, which makes two assumptions. First, SOx emissions were selected as a surrogate to prorate the GHG emissions because SOx emissions result primarily from sulfur contained in fossil fuels. Using a ratio of GHG emissions to SOx emissions from the AQMP inventory, the GHG emissions from the proposed project and project alternatives are calculated using the estimated SOx emissions from the proposed project and multiplying by the ratio factor (see subchapter 4.0 and Appendix D).

Second, an analysis of the statewide inventory was conducted to determine the impact from the remaining GHG pollutants, including HFCs, PFCs and SF6. Combustion GHG emissions are proportional to SOx emissions, while emissions of HFCs, PFCs and SF6 are analyzed as proportional to emissions of CO2, CH4 and N2O, based on the statewide inventory. (See Subchapter 4.0 for additional discussion of the methodology for calculating GHG emissions.). Table 6-49 lists the total GHG emissions from all six GHG pollutants attributed to Alternative B, as well as the GHG emissions attributed to the proposed project.

**TABLE 6-49  
Proposed Project and Alternative B – SOx and Greenhouse Gas Emissions**

Milestone Year	SOx Emissions (tons/day)	SOx Emissions (tons/year)	CO2, CH4 & N2O Emissions (million MT CO <sub>2</sub> eq/year)	HFCs, PFCs and SF6 Emissions <sup>a</sup> (million MT CO <sub>2</sub> eq/year)	TOTAL GHG Emissions <sup>b</sup> (million MT CO <sub>2</sub> eq/year)
<b>Proposed Project</b>					
2014	0.16	58.4	4.52	0.29	4.81
2023	0.49	178.85	13.83	0.90	14.74
2030	0.74	270.1	20.89	1.36	22.26
<b>Alternative B</b>					
2014	0.11	40.15	3.11	0.20	3.31
2023	0.35	127.75	9.88	0.64	10.52
2030	0.51	186.15	14.40	0.94	15.33

<sup>a</sup> Calculated based on ratio of 0.065 of high GWP/total GHGs. Thus, CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions x 0.065 = HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 million MT CO<sub>2</sub> eq /year x 0.065 = 0.29 million MT CO<sub>2</sub> eq /year)

<sup>b</sup> Total GHG emissions = CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions + HFCs, PFCs and SF<sub>6</sub> emissions. Total GHG emissions may not be exact due to rounding.

SCAQMD’s adopted Tier 3 GHG significance threshold for SCAQMD lead agency projects is 10,000 MT CO<sub>2</sub>eq per year. Projects with incremental increases below this threshold are not considered to be cumulatively considerable. As shown in Table 6-41, potential GHG emissions from Alternative B exceed 10,000 MT CO<sub>2</sub>eq per year for the milestone years of 2023 and 2030 and are concluded to be significant, but less than the GHG emissions from the proposed project. Therefore, GHG emissions from Alternative B are considered to be cumulatively considerable (CEQA Guidelines §15065(a)(3)) and, would contribute to significant adverse climate change impacts.

**Cumulative Effects**

The cumulative analysis includes GHG emissions from Alternative B, plus GHG emissions from the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the district’s offset accounts (2007 through 2009). Table 6-50 presents the GHG emissions from the cumulative scenario with Alternative B and the GHG emissions from the cumulative scenario with the proposed project.

**TABLE 6-50  
Proposed Project and Alternative B – Cumulative Greenhouse Gas Emissions**

<b>Attainment Year Periods</b>	<b>TOTAL GHG Emissions (million MT CO<sub>2</sub> eq /year)</b>
<b>Cumulative With Proposed Project</b>	
2007-2014	11.98
2007-2023	21.61
2007-2030	29.13
<b>Cumulative With Alternative B</b>	
2007-2014	10.55
2007-2023	17.70
2007-2030	22.21

As explained above, cumulative GHG emissions from Alternative B are considered to be cumulatively considerable and, therefore, would contribute to significant adverse climate change impacts.

**Alternative C- Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

1. ***AQMP Consistency – Would Alternative C Conflict with or Obstruct the Implementation of an Applicable Air Quality Plan?***

Like the proposed project, Alternative C would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. Although the AQMP provides strategies for attaining and maintaining the NAAQSs and CAAQSs, it is considered to be a growth accommodating document. Alternative C would allow the use of offsets up to the cap that is based on 2007 AQMP growth projections cap for the relevant industry categories. However, Alternative C would not allow large businesses (those that do not qualify as small businesses under SCAQMD Rule 102) to access the SCAQMD’s internal offset accounts.

Emissions from Alternative C are not expected to conflict with or obstruct the implementation of the AQMP because offsets cannot be issued above emissions caps, which are based on growth projections of the 2007 AQMP for the relevant industry categories. Because regional criteria pollutant emissions from Alternative C are expected to be less than the regional criteria pollutant emissions from the proposed project, the potential for conflicts with the 2007 AQMP would be even less likely.

2. ***Criteria Pollutant Emission Standards – Would Alternative C Violate any Air Quality Standard or Contribute to an Existing or Projected Air Quality Violation***

a. ***Alternative C Effects – Regional Mass Criteria Pollutant Emissions***

The primary difference between the proposed project and Alternative C is that under Alternative C large businesses would be prohibited from obtaining exemptions from offset requirements pursuant to Rules 1304 and 1309.1. The following analysis of impacts from Alternative C, identifies emissions from large businesses based upon historical permit data. To calculate the emission effects from Alternative C, the anticipated future increase in emissions from large businesses are subtracted from the emissions projected for the proposed project. Table 6-51 shows the relative magnitude of potentially significant adverse impacts from Alternative C compared to the proposed project. Table 6-51 shows emissions from the proposed project, the subset of emissions attributed to large businesses, and the resulting emissions from Alternative C. Under Alternative C, mass emissions of criteria pollutants would be significant, but would be less than the significant emissions projected for the proposed project.

**TABLE 6-51

Sums may not be exact due to rounding.

As indicated in Subchapter 4.1, SCAQMD staff determined that total lead emissions in the district are approximately 18 lbs/day (6,517 lbs/yr) based on fiscal year (FY) 2006-2007 data comprised of 566 facilities in the Basin that reported lead emissions. Lead emission impacts were calculated for the same milestone years evaluated for other emission impacts. As shown in Table 6-52, the maximum net increase in lead emissions by 2030 in the Basin from the proposed project and the cumulative scenario with the proposed project would not exceed the SCAQMD’s mass daily significance threshold for lead of three pounds per day. Similarly, Table 6-52 shows that lead emission impacts from Alternative C and from the cumulative scenario with Alternative C would be less-than-significant.

**TABLE 6-52  
Proposed Project and Alternative C –  
Project-Specific and Cumulative Lead Emissions**

Milestone Years	Lead (lbs/day)			
	Proposed Project	Cumulative With Proposed Project	Alternative C	Cumulative With Alternative C

2023	0.45	0.50	0.40	0.47
2030	0.70	0.63 <sup>2</sup>	0.62	0.58

**Cumulative Effects**

As explained in Chapters 4.0 and 4.1, the cumulative impact analysis includes emissions from sources permitted under Rules 1304 and 1309.1 pursuant to prior version of Rule 1315 and SB 827. In addition, the cumulative impacts analysis includes emissions from three power plants.

Table 6-53 shows the total mass emissions from stationary sources under Alternative C, plus the other sources included in the cumulative scenario. Based on the data shown in Table 6-53, cumulative impacts from Alternative C would be significant, but less significant than the proposed project. Further, based on the emissions shown in Table 6-53, Alternative C’s contribution to cumulative impacts is considered to be cumulatively considerable.

<sup>2</sup> For lead emitting facilities, in the early years of the analysis there were some SIC facility categories with negative growth factors, resulting in lower overall lead emissions. Based on this factor, the cumulative net increase in lead emissions was determined to be lower than the proposed project because it included more years of negative growth.

### *Modeled Concentrations of Criteria Pollutants*

#### **Regional Criteria Pollutant Concentrations – Alternative C**

##### **a. Ozone Concentrations**

In addition to analyzing project-specific effects of Alternative C in terms of mass emissions of criteria pollutants, this PEA includes a supplemental analysis of the contribution of Alternative C to regional pollutant concentrations.

Air quality is expected to improve under future conditions, with or without the proposed project or alternatives. As shown in the Table 6-54, for most milestone years, Alternative C would contribute less to ozone concentrations than the proposed project. Another way of looking at the results in Table 6-54 is that for most years, Basin and Coachella Valley ozone concentration improvements foregone from Alternative C are equal to or less than the proposed project.

**TABLE 6-54**  
**Proposed Project and Alternative C – Contribution to Regional Ozone Concentrations**  
**(Peak 8-hour concentrations)**

Year	Basin Average Ozone (ppb )	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Proposed Project</b>				
2014	0.9	1.4	0.5	0.6
2023	1.5	1.9	0.8	1.1
2030	2.6	2.9	1.1	1.3
<b>Alternative C</b>				
2014	0.8	1.3	0.5	0.5
2023	1.3	1.6	0.8	0.9
2030	2.3	2.5	1.0	1.1

**b. Particulate Matter Concentrations**

Table 6-55 shows the contribution of emissions from Alternative C to the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations estimated for the milestone years of 2014, 2023 and 2030 compared to the proposed project. As shown in the table, for most milestone years, Alternative C contributes less to regional concentrations of particulate matter than the proposed project. Another way of looking at the results in Table 6-55 is that for most years Basin and Coachella Valley predicted annual average and 24-hour average Basin and Coachella Valley PM2.5 and PM10 concentration improvements foregone from Alternative C are equal to or slightly less than the proposed project.

**TABLE 6-55**  
**Proposed Project and Alternative C – Contributions to Regional PM2.5 and PM10 Concentrations**

Year	Basin Annual PM2.5 (µg/m <sup>3</sup> )	Basin Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )

<b>Alternative C</b>								
2014	0.05	0.11	0.5	0.7	0.01	0.01	0.1	0.1
2023	0.13	0.28	1.1	1.6	0.03	0.03	0.1	0.1
2030	0.18	0.4	1.4	2.2	0.04	0.04	0.1	0.1

**c. NO2 Concentrations**

Table 6-56 shows the contribution to regional NO2 concentrations from Alternative C compared to the proposed project. The regional NO2 concentration analysis is based on an emissions-weighted approach to estimate the incremental contributions of NO2 from Alternative C. As Table 6-56 shows, Alternative C and the proposed project would result in NO2 concentrations of 1.0 ppb or less for all milestone years, regardless of the averaging time.

**TABLE 6-56**  
**Alternative C and the Proposed Project – Contributions to Regional NO2 Concentrations**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>

<b>Alternative C</b>				
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0

**d. SO<sub>2</sub> Concentrations**

Table 6-57 shows the contributions to regional SO<sub>2</sub> concentrations from Alternative C compared to the proposed project. The regional SO<sub>2</sub> concentration analysis is also based on an emissions-weighted approach to estimate the incremental increased contributions of SO<sub>2</sub> from Alternative C. Both Alternative C and the proposed project would result in contributions to SO<sub>2</sub> concentrations in the Basin of 0.04 ton per day or less, which is less than 0.1 percent of the Basin SO<sub>x</sub> emissions, and less than 1.0 ppb for all milestone years, regardless of the averaging time. SO<sub>2</sub> is not measured in the Coachella Valley because there are so few SO<sub>2</sub> emissions sources.

**TABLE 6-57**  
**Alternative C and the Proposed Project – Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative C</b>			
2014	0	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. CO Concentrations**

Ambient concentrations of carbon monoxide respond linearly to changes in the emissions inventory. Table 6-58 shows contributions to ambient CO concentrations in the Basin from Alternative C compared to the proposed project. Table 6-58 shows that contributions to CO concentrations from Alternative C are not noticeably lower than concentrations from the proposed project.

**TABLE 6-58  
Alternative C and the Proposed Project –  
Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Proposed Project	Alternative C
2014	0.00	0.00
2023	0.01	0.01
2030	0.01	0.01

**Regional Criteria Pollutant Concentrations-- Cumulative Effects**

**a. Cumulative Ozone Concentrations**

In addition to analyzing project-specific contributions of Alternative C to regional pollutant concentrations, this PEA includes an analysis of the combined contributions to regional pollutant concentrations from Alternative C plus other sources receiving permits in reliance upon the SCAQMD’s internal offset accounts. Table 6-59 shows the contribution to regional ozone concentrations from such sources in the Basin and Coachella Valley in terms of the ozone concentrations for the cumulative scenario with Alternative C compared to the cumulative scenario with the proposed project. As shown in the table, for most milestone years, the cumulative scenario with Alternative C results in less contribution to regional ozone concentrations than the cumulative scenario with proposed project.

**TABLE 6-59  
Proposed Project and Alternative C Cumulative Scenarios -  
Contributions to Regional Ozone Concentrations  
(Peak 8-hour Concentrations)**

Year	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb )
<b>Cumulative With Proposed Project</b>				
2014	1.1	1.8	0.8	0.8
2023	2.0	2.5	1.0	1.3
2030	3.0	3.5	1.3	1.6
<b>Cumulative With Alternative C</b>				
2014	1.1	1.7	0.7	0.7
2023	1.6	1.7	0.7	0.8
2030	2.6	2.6	0.8	0.9

**b. Cumulative Particulate Matter Concentrations**

Table 6-60 shows the predicted contribution of regional particulate matter concentrations from Alternative C with the cumulative scenario compared to the proposed project with the cumulative scenario in terms of the contributions to the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations estimated for the milestone years of 2014, 2023 and 2030. As shown in the table, the cumulative scenario with Alternative C would contribute less to regional particulate matter concentrations than the cumulative scenario with proposed project.

**c. Cumulative NO2 Concentrations**

Table 6-61 shows the contributions to cumulative regional NO2 concentrations from the cumulative scenario with Alternative C compared to the cumulative scenario with the proposed project. As Table 6-61 shows, the cumulative scenario with Alternative C would contribute the same amount or less to regional NO2 concentrations than the cumulative scenario with proposed project.

**TABLE 6-60**

**d. Cumulative SO2 Concentrations**

Table 6-62 shows the contributions to cumulative regional SO2 concentrations foregone from the cumulative scenario with Alternative C compared to the cumulative scenario with the proposed project. As shown in the table, for most milestone years, the

cumulative scenario with Alternative C would contribute roughly the same amount to regional SO<sub>2</sub> concentrations as the cumulative scenario with the proposed project.

**TABLE 6-62**  
**Alternative C and the Proposed Project Cumulative Scenarios –**  
**Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative C</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. Cumulative CO Concentrations**

Table 6-63 shows the contributions to CO concentrations in the Basin from the cumulative scenario with Alternative C compared to the proposed project. Table 6-63 shows that the contribution to CO concentrations from Alternative C are not noticeably lower than the contribution to CO concentrations from the cumulative scenario with the proposed project.

**TABLE 6-63**  
**Alternative C and the Proposed Project – Cumulative Scenarios**

Milestone Year	Change in Concentration (ppm)	
	Cumulative With Proposed Project	Cumulative With Alternative C
2014	0.01	0.01
2023	0.02	0.02
2030	0.02	0.02

### **Localized Criteria Pollutant Concentrations**

Tables 4.1-21 and 4.1-22 in Chapter 4 show that the proposed project has the potential to increase localized PM<sub>2.5</sub> concentrations at sensitive receptors that may be located near future representative facilities. Similarly, Tables 4.1-23 through 4.1-25 show that the proposed project has the potential to increase local NO<sub>2</sub> concentrations at sensitive receptors that may be located near future representative facilities. The analysis of project-specific localized criteria pollutant impacts prepared for the proposed project applies to Alternative C for the following reasons. Because most components of Alternative C are identical to the proposed project, the same future representative facilities that would qualify for these permits pursuant to Rules 1304 or 1309.1 under the proposed project would qualify for permits under Alternative C. The same five-year database (2003 through 2008) of permits and pending permits in the SCAQMD's overall permit database that was used to analyze future localized impacts of the proposed project would be applicable to Alternative C. The same Source Classification Codes (SCCs) would be applicable: (1) to assigning stack parameters to emission sources for modeling on the basis of source type; and (2) to estimate chemical speciation of permitted emissions reported as PM and organic gases with respect to particle size composition of PM emissions.

The main difference between Alternative C and the proposed project is that under Alternative C, large businesses would be prohibited from obtaining offsets through the SCAQMD's internal offset accounts. Evaluation of permit data indicates that large businesses are not necessarily large emitters. As a result, since it is likely that the localized criteria pollutant analysis would apply to small businesses to the same or extent as it would apply to large businesses, the analysis is still applicable to Alternative C. However, because large businesses would no longer qualify for the offset exemptions in Rule 1304, fewer facilities would be built that could have localized air quality impacts.

#### **3. *Health Effects – Would Alternative C Expose Sensitive Receptors to Substantial Pollutant Concentrations***

##### **Region-wide Emissions of Criteria Pollutants—Alternative C**

The analysis of the Alternative C includes a comparison of the health impacts of Alternative C to the health impacts of the proposed project. Increases in criteria pollutant emissions may result in potential adverse health effects including the following: cardiovascular, neurological, reproductive and respiratory diseases. Health effects have been evaluated by modeling criteria pollutant concentrations, which can provide information on mortality, hospital admissions, emergency room visits, minor restricted activity days, school absence days, loss of work days, and cases of acute/chronic bronchitis, nonfatal heart attacks and adverse upper/lower respiratory conditions. Table 6-64 shows the estimated health effects from the proposed project and

Alternative C as a result of exposures to ozone for the milestone years of the analysis. Similarly, Table 6-65 shows the estimated health effects from Alternative C compared to the proposed project as a result of exposure to PM2.5 and PM10 during the milestone years analyzed. The impacts shown in Tables 6-64 and 6-65 represent additional benefits foregone beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report (SCAQMD, 2007) that could occur if the proposed project and Alternative C were not implemented or replaced by growth.

**TABLE 6-64**  
**Proposed Project and Alternative C – Estimated Ozone Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Hospital Admissions (People)	Minor Restricted Activity Days (Days)	School Absences (Days)
<b>Proposed Project</b>				
2014	7	42	29,575	31,172
2023	12	71	49,513	52,186
2030	20	122	85,339	89,947
<b>Alternative C</b>				
2014	7	40	28,074	29,589
2023	10	61	42,958	45,278
2030	18	109	76,309	80,430

**TABLE 6-65**  
**Proposed Project and Alternative C – Estimated PM2.5 and PM10 Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
<b>Proposed Project</b>									
2014	33	59	18	29	1,262	11	13	23,374	4,074
2023	86	155	46	74	3,283	29	34	60,814	10,601
2030	125	224	66	108	4,763	42	50	88,214	15,377
<b>Alternative C</b>									
2014	30	53	16	26	1,128	10	12	20,894	3,642
2023	75	134	40	65	2,853	25	30	52,840	9,211
2030	107	192	57	93	4,083	36	43	75,620	13,182

The SCAQMD has not developed significance thresholds for the specific health effects identified in Tables 6-64 and 6-65. However, given the magnitude of the health effects foregone compared to health effect conditions in the absence of Alternative C, SCAQMD staff concludes that Alternative C has the potential to generate significant adverse health effects. Because Alternative C prohibits large businesses from accessing offsets from the SCAQMD’s internal offset accounts, fewer new or modified sources are expected to be built in the future. As a result, health effects generated by Alternative C are expected to be significant, but less significant than health effects generated by the proposed project.

**Region-wide Emissions of Criteria Pollutants-- Cumulative Effects**

The cumulative health impacts analysis includes health effects of Alternative C, plus health effects of the reasonably foreseeable power plant projects and the effects of the additional three years of past sources permitted in reliance on the SCAQMD’s internal offset account (2007 through 2009). Table 6-66 shows the estimated health effects from the cumulative scenarios with the proposed project and with Alternative C as a result of exposures to ozone for the milestone years of the analysis. Table 6-67 shows the estimated health effects from the cumulative scenarios with the proposed project and with Alternative C as a result of exposures to PM2.5 and PM10 for the milestone years of the analysis.

**TABLE 6-66  
Proposed Project and Alternative C –  
Estimated Cumulative Ozone Health Impacts**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days (Days)</b>	<b>School Absences (Days)</b>
<b>Cumulative With Proposed Project</b>				
2014	9	54	37,662	39,696
2023	15	92	64,780	68,278
2030	24	143	100,213	105,624
<b>Cumulative With Alternative C</b>				
2014	9	52	36,532	38,505
2023	12	73	51,561	54,345
2030	20	121	84,733	89,308

**TABLE 6-67**  
**Proposed Project and Alternative C -**  
**Estimated Cumulative Annual PM2.5 and PM10 Health Impacts**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Acute Bronchitis (People)</b>	<b>Chronic Bronchitis (People)</b>	<b>Non-fatal Heart Attacks (People)</b>	<b>Upper/Lower Respiratory (People)</b>	<b>Emergency Room Visits</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days</b>	<b>Work Loss (Days)</b>
<b>Cumulative With Proposed Project</b>									
2014	102	184	55	89	3,908	34	41	72,384	12,618
2023	152	273	81	132	5,803	51	61	107,476	18,735
2030	189	341	101	164	7,231	63	76	133,938	23,347
<b>Cumulative With Alternative C</b>									
2014	99	178	53	86	3,772	33	39	69,857	12,177
2023	141	253	75	122	5,370	47	56	99,471	17,339
2030	172	309	92	149	6,555	57	69	121,406	21,163

The SCAQMD has not developed specific significance thresholds for cumulative health impacts. Given the magnitude of the health benefits foregone that would occur if Alternative C were implemented, the contribution to cumulative impacts from Alternative C is concluded to be cumulatively considerable.

### **Region-wide Emissions of TACs**

Basin toxic risks (measured in cancer risk per million person population over a lifetime of exposure) were estimated using the MATES-III modeling platform for 2014, 2023 and 2030 model year simulations. For reference, the MATES-III study for 2008 attributed the cancer risk from stationary sources, which include industries, and businesses such as dry cleaners and chrome plating operations at approximately 51 additional cancers in a population of one million individuals whereas the total regional cancer risk from all toxic air contaminants was 853 in one million. Table 6-68 shows the additional region-wide cancer risk and cancer burden reductions foregone beyond those anticipated in the 2007 AQMP, if Alternative C or to the proposed project were implemented as compared to conditions without the Project. Table 6-68 also shows the contribution to cancer risk and cancer burden from the cumulative scenario with Alternative C and the cumulative scenario with the proposed project.

**TABLE 6-68**  
**Proposed Project and Alternative C –Cancer Risk and Cancer**  
**Burden Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cumulative Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cancer Burden Reductions Not Achieved</b>	<b>Cumulative Cancer Burden Reductions Not Achieved</b>
<b>Proposed Project</b>				
2014	0.91	3.35	16	59
2023	2.86	5.15	54	96
2030	4.4	6.59	86	129
<b>Alternative C</b>				
2014	0.82	3.26	14	57
2023	2.54	4.83	48	90
2030	3.96	6.09	77	119

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

As shown in Table 6-68, neither the proposed project nor Alternative C would generate project-specific or cumulative cancer risk impacts that exceed the SCAQMD's cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ).

The proposed project and Alternative C would result in project-specific or cumulative cancer burden impacts that exceed the SCAQMD's significance threshold of 0.5. Compared to the without project scenario, the proposed project would create an increased project-specific cancer burden impact in the year 2030 of 87. Alternative C would create an increased project-specific cancer burden impact of 74 in the year 2030. In addition, the cumulative scenarios with both the proposed project and with Alternative C result in significant cancer burdens compared to the without project scenarios. The contributions to cumulative cancer burden impacts are considered to be cumulatively considerable but less than the proposed project.

A hazard index (HI) is a summation of the hazard (non-cancer) quotients for all chemicals to which an individual is exposed. A hazard index can be measured as a result of chronic (long-term) exposure or acute (short-term) exposure. SCAQMD's significance threshold for non-cancer chronic or acute HI value is 1.0 because if the HI is less than 1.0, it is presumed that no significant adverse human health effects (non-cancer) are expected to occur. Table 6-69 shows the population-weighted project-specific change in chronic HI between the conditions without the project the proposed project and between the conditions without the project and Alternative C. Table 6-69

also shows the changes between the conditions without the project and the cumulative scenarios with the proposed project and with Alternative C.

**TABLE 6-69  
Proposed Project and Alternative C – Chronic and Acute Health  
Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Chronic Health Index Not Achieved</b>	<b>Cumulative Chronic Health Index Not Achieved</b>	<b>Acute Health Index Not Achieved</b>	<b>Cumulative Acute Health Index Not Achieved</b>
<b>Proposed Project</b>				
2014	0	0.02	0.02	0.06
2023	0.02	0.03	0.05	0.09
2030	0.02	0.03	0.08	0.11
<b>Alternative C</b>				
2014	0	0.02	0.02	0.05
2023	0.01	0.03	0.04	0.08
2030	0.02	0.03	0.07	0.10

As shown in Table 6-69, neither the proposed project nor Alternative C would exceed the SCAQMD’s acute or chronic HI significance threshold of 1.0. Similarly, Table 6-69 shows that acute and chronic HI impacts from the proposed project with the cumulative scenario and Alternative C with the cumulative scenario would not exceed the HI significance threshold. Therefore, neither the proposed project nor Alternative C would generate project-specific or cumulative non-cancer health risk impacts, while impacts from Alternative C would be equivalent to or less or than the proposed project.

**Localized Emissions of TACs**

Under Alternative C, sources permitted under Rules 1304 and 1309.1 would be subject to the requirements in Rules 1401 and 1402 that limit the cancer risk and non-cancer hazard level, which would limit any potential significant toxic impact from each source. The thresholds in Rule 1401 are the same as the SCAQMD’s CEQA significance thresholds for toxics. As a result of these regulatory prohibitions, the issuance of a permit by the SCAQMD to a stationary source of TACs would not result in stationary source emissions that exceed the CEQA significance thresholds for localized health impacts. However, the thresholds contained in Rule 1401 are applied on a permit-unit basis; as a result, a facility with multiple permitted sources could still exceed the Hazard Index limits in Rule 1401. Such facilities

would instead be subject to Rule 1402; under that rule, the allowable cancer burden is the same as under Rule 1401, but the Hazard Index limits for acute and chronic non-cancer toxic impacts are higher (3.0) than the limits under Rule 1401 and thus higher than the applicable CEQA significance thresholds. Therefore, the localized air toxic impacts of the proposed project are considered significant.

The main difference between Alternative C and the proposed project is that under Alternative C, large businesses would be prohibited from obtaining offsets through the SCAQMD's internal offset accounts. Evaluation of permit data indicates that large businesses are not necessarily large emitters. As a result, since it is likely that the localized TACs analysis would apply to small businesses to the same or greater extent as it would apply to large businesses, the analysis is still applicable to Alternative C. Therefore, Alternative C has the potential to generate adverse localized impacts from emissions of TACs equivalent to the significant impacts of the proposed project.

**4. *Odors – Would Alternative C Create Objectionable Odors Affecting a Substantial Number of People***

Some equipment permitted under Rules 1304 and 1309.1 could create objectionable odors, as explained in subchapter 4.1. Evaluation of permits includes the imposition of conditions to minimize such odors. In addition, installing BACT equipment would typically contribute to a reduction in potential odor impacts. Further, SCAQMD Rule 402 prohibits operation of a facility that creates an odor nuisance. Nevertheless, as explained in subchapter 4.1, facilities containing sources receiving permits under the proposed project could result in significant odor impacts. Alternative C could result in the same types of facilities as the proposed project; and therefore would have the same potential to result in significant odor impacts.

## **Visibility Impacts**

**5. *Visibility. Would the Alternative C create significant aesthetic impacts by resulting in air emissions that substantially degrade the existing visual character or quality of the project surroundings?***

**Alternative C Effects**

Table 6-70 shows predicted visibility and visual range impacts from Alternative C and the proposed project with respect to the state standard. The state standard is a light extinction coefficient of 0.23 per kilometer when relative humidity is less than 70 percent (roughly equivalent to a 10-mile visual range), over an 8-hour averaging period (10 am – 6 pm, PST). Visual range (measured in miles) is provided for informational purposes. The range of without project values for the extinction coefficient predicted for the eastern Basin represented by Riverside-Rubidoux (the worst case) is from 0.063 to

0.067 from 2014 to 2030 over the project timeframe, or one-third of the California standard. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the proposed project would not cause or contribute to a violation of the state standard and would not be significant. As shown in Table 6-70, visual range impacts for Alternative C are less than or equal to the proposed project and, therefore, are also concluded to be less than significant.

**TABLE 6-70**  
**Proposed Project and Alternative C – Visibility Impacts at Riverside-Rubidoux**  
**Measured in Extinction Coefficient and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles

2023	0.0629	0.0005	0.0004	39.290	-0.274	-0.238
2030	0.0656	0.0008	0.0007	37.633	-0.469	-0.402

The deciview – an index which incorporates incremental changes in people’s perception of visibility is directly used as the metric for visibility assessment in the federal Regional Haze visibility standard. A 0.5 deciview change is used to assess significance in Class I wilderness areas. Table 6-71 shows the visibility effects of Alternative C and the visibility effects of the proposed project in terms of deciview changes.

**TABLE 6-71**

Joshua Tree	11.378	0.017	0.015	89.893	-0.108	-0.093

As shown in Table 6-71, the maximum project impact measured in deciviews would be less than 0.06 for all locations and milestone years, which is not significant. Similarly, implementing Alternative C would also generate a maximum impact measured in deciviews that would be less than 0.05 for all locations and milestone years, which is not significant. Further, visibility impacts from Alternative C would be less than visibility impacts from the proposed project.

### Cumulative Effects

The cumulative visibility analysis includes effects of Alternative C, plus effects of the reasonably foreseeable power plant projects, and the additional three years of past sources receiving permits in reliance upon the SCAQMD's offset accounts (2007 through 2009). Table 6-72 presents the visibility effects of the cumulative scenario with Alternative C and the cumulative scenario with the proposed project. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the cumulative scenario with the proposed project would not cause or contribute to a

violation of the state standard and would not be significant. Neither Alternative C nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact.

**TABLE 6-72  
Proposed Project and Alternative C – Cumulative Visibility Impacts at Riverside-  
Rubidoux Measured in Extinction Coefficient and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project (km <sup>-1</sup> )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Cumulative with Proposed Project	Cumulative with Alternative C		Cumulative with Proposed Project	Cumulative with Alternative C
2014	0.0672	0.0003	0.0003	36,512	-0.170	-0.163
2023	0.0629	0.0008	0.0007	39,290	-0.456	-0.419
2030	0.0656	0.0008	0.0007	37,633	-0.469	-0.421

The cumulative visibility impacts analysis for class I wilderness areas includes effects of Alternative C, plus effects of the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the SCAQMD's offset accounts (2007 through 2009). Table 6-73 presents the visibility effects for class I wilderness areas of the cumulative scenario with Alternative C and the visibility effects of the cumulative scenario with the proposed project in terms of deciview changes. Under the federal standard, a 0.5 deciview change would be considered a significant adverse impact and a cumulatively considerable contribution to a significant cumulative impact. Neither Alternative C nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact and, therefore, it is concluded that cumulative visibility impacts are not significant. Visibility impacts from Alternative C would be less for all years and locations than for the proposed project.

**Climate Change****6. Greenhouse Gas Emissions – Would Alternative C result in greenhouse gas emissions that may have a significant impact on the environment, based on any applicable threshold of significance?**

The methodology for deriving GHG emission impacts for the project alternatives is the same methodology used for the proposed project, which makes two assumptions. First, SOx emissions were selected as a surrogate to prorate the GHG emissions because SOx emissions result primarily from sulfur contained in fossil fuels. Using a ratio of GHG emissions to SOx emissions from the AQMP inventory, the GHG emissions from the proposed project and project alternatives are calculated using the estimated SOx emissions from the proposed project and multiplying by the ratio factor (see subchapter 4.0 and Appendix D).

Second, an analysis of the statewide inventory was conducted to determine the impact from the remaining GHG pollutants, including HFCs, PFCs and SF6. Combustion GHG emissions are proportional to SOx emissions, while emissions of HFCs, PFCs and SF6 are analyzed as proportional to emissions of CO2, CH4 and N2O, based on the statewide inventory. (See Subchapter 4.0 for additional discussion of the methodology for calculating GHG emissions.). Table 6-74 lists the total GHG emissions from all six GHG pollutants attributed to Alternative C, as well as the GHG emissions attributed to the proposed project.

SCAQMD's adopted Tier 3 GHG significance threshold for SCAQMD lead agency projects is 10,000 MT CO2eq per year. Projects with incremental increases below this threshold are not considered to be cumulatively considerable. As shown in Table 6-74, potential GHG emissions from Alternative C exceed 10,000 MT CO2eq per year and are concluded to be significant, but less than the GHG emissions from the proposed project. Therefore, GHG emissions from Alternative C are considered to be cumulatively considerable (CEQA Guidelines §15065(a)(3)), and, would contribute to significant adverse climate change impacts.

**Table 6-74  
Proposed Project and Alternative C – SOx Emissions  
and Greenhouse Gas Emissions**

<b>Attainment Year Periods</b>	<b>SOx Emissions (tons/day)</b>	<b>SOx Emissions (tons/year)</b>	<b>CO2, CH4 and N2O Emissions (million MT CO2 eq /year)</b>	<b>HFCs, PFCs and SF6 Emissions<sup>a</sup> (million MT CO2 eq /year)</b>	<b>TOTAL GHG Emissions<sup>b</sup> (million MT CO2 eq /year)</b>
<b>Proposed Project</b>					
2014	0.16	58.4	4.52	0.29	4.81
2023	0.49	178.85	13.83	0.90	14.74
2030	0.74	270.1	20.89	1.36	22.26

**Table 6-74 (Concluded)  
Proposed Project and Alternative C – SOx Emissions  
and Greenhouse Gas Emissions**

Attainment Year Periods	SOx Emissions (tons/day)	SOx Emissions (tons/year)	CO2, CH4 and N2O Emissions (million MT CO <sub>2</sub> eq /year)	HFCs, PFCs and SF6 Emissions <sup>a</sup> (million MT CO <sub>2</sub> eq /year)	TOTAL GHG Emissions <sup>b</sup> (million MT CO <sub>2</sub> eq /year)
<b>Alternative C</b>					
2014	0.13	47.45	3.67	0.24	3.91
2023	0.4	146	11.29	0.73	12.03
2030	0.59	215.35	16.65	1.08	17.74

<sup>a</sup> Calculated based on ratio of 0.065 of high GWP/total GHGs. Thus, CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions x 0.065 = HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 million MT CO<sub>2</sub> eq /year x 0.065 = 0.29 million MT CO<sub>2</sub> eq /year)

<sup>b</sup> Total GHG emissions = CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions + HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 + 0.29 = 4.81 million MT CO<sub>2</sub> eq /year). Total GHG emissions may not be exact due to rounding.

### Cumulative Effects

The cumulative analysis includes GHG emissions from Alternative C, plus GHG emissions from the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the district’s offset accounts (2007 through 2009). Table 6-75 presents the GHG emissions from the cumulative scenario with Alternative C and the GHG emissions from the cumulative scenario with the proposed project.

As explained above, GHG emissions from Alternative C are considered to be cumulatively considerable and, therefore, would contribute to significant adverse climate change impacts.

**TABLE 6-75  
Proposed Project and Alternative C – Cumulative Greenhouse Gas Emissions**

Attainment Year Periods	TOTAL GHG Emissions (million MT CO <sub>2</sub> eq /year)
<b>Cumulative With Proposed Project</b>	
2014	11.98
2023	21.61
2030	29.13
<b>Cumulative With Alternative C</b>	
2014	11.10
2023	18.75
2030	24.62

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

#### ***1. AQMP Consistency – Would Alternative D Conflict with or Obstruct the Implementation of an Applicable Air Quality Plan?***

Like the proposed project, Alternative D would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. Although the AQMP provides strategies for attaining and maintaining the NAAQSs and CAAQSs, it is considered to be a growth accommodating document. The main difference between Alternative D and the proposed project is that Alternative D restricts the availability of offsets through the following mechanisms. First, Alternative D would not allow access to the SCAQMD's existing offset accounts as these accounts would be eliminated under this alternative. Second, only new credits generated each year starting in 2009 could be used to offset emission increases from affected facilities.

Emissions from Alternative D are not expected to conflict with or obstruct the implementation of the AQMP because offsets cannot be issued above the emissions caps, which are based on growth projections of the 2007 AQMP for the relevant industry categories. Because regional criteria pollutant emissions from Alternative D are expected to be less than the regional criteria pollutant emissions from the project, the potential for conflicts with the 2007 AQMP would be even less likely.

#### ***2. Criteria Pollutant Emission Standards – Would Alternative D Violate any Air Quality Standard or Contribute to an Existing or Projected Air Quality Violation***

##### ***a. Regional Mass Criteria Pollutant Emissions – Alternative D Effects***

The primary effect of implementing Alternative D is that a fewer number of credits would be available each year after adoption of this alternative compared to the proposed project. The reason fewer offsets would be available is as follows. Alternative D would eliminate all pre-existing offsets in the SCAQMD's internal offset accounts. The SCAQMD would start accruing offsets each year starting in 2009 and issuing only those offsets available that have accrued starting in 2009. Table 6-76 shows the emissions from Alternative D in comparison to the emissions from the proposed project. As can be seen from Table 6-76, the emissions of VOCs, NO<sub>x</sub>, CO and PM<sub>2.5</sub> from Alternative D would be significant, but would be less than the emissions from the proposed project. Unlike the proposed project, Alternative D would result in less than significant emissions of SO<sub>x</sub> and PM<sub>10</sub>.

<b>Regional Significance Thresholds (Pounds per Day)</b>						
Significance Threshold	55	55	150	550	150	55
Significant?	Yes	Yes	No	Yes	No	Yes

As indicated in Subchapter 4.1, SCAQMD staff determined that total lead emissions in the district are approximately 18 lbs/day (6,517 lbs/yr) based on fiscal year (FY) 2006-2007 data comprised of 566 facilities in the Basin that reported lead emissions. Lead emission impacts were calculated for the same milestone years evaluated for other emission impacts. As shown in Table 6-77, the maximum net increase in lead emissions by 2030 in the Basin from the proposed project and the cumulative scenario with the proposed project would not exceed the SCAQMD's mass daily significance threshold for lead of three pounds per day. Similarly, Table 6-77 shows that lead emission impacts

from Alternative D and from the cumulative scenario with Alternative D would be less-than-significant.

### Cumulative Effects

As explained in Chapters 4.0 and 4.1, the cumulative impact analysis includes emissions from sources permitted under Rules 1304 and 1309.1 pursuant to prior version of Rule 1315 and SB 827. In addition, the cumulative impacts analysis includes emissions from three power plants.

**TABLE 6-77  
Proposed Project and Alternative D –

2023	0.45	0.50	0.01	0.22
2030	0.70	0.63 <sup>3</sup>	0.01	0.21

Table 6-78 presents the total mass emissions from stationary sources under Alternative D plus the other sources included in the cumulative scenario. As shown in Table 6-78, cumulative impacts from Alternative D are considered to be cumulatively considerable.

**TABLE 6-78  
Proposed Project and Alternative D Cumulative Stationary Source Mass Emissions**

Milestone Years	Pollutant					
	VOC	NOx	SOx	CO	PM10	PM2.5
	Cumulative With Proposed Project – Tons per Day					
2014	23.71	4.7	0.47	10.82	3.47	2.87
2023	40.76	5.64	0.79	14.36	5.29	4.02
2030	50.74	6.61	1.04	16.55	6.79	4.97

<sup>3</sup> For lead emitting facilities, in the early years of the analysis there were some SIC facility categories with negative growth factors, resulting in lower overall lead emissions. Based on this factor, the cumulative net increase in lead emissions was determined to be lower than the proposed project because it included more years of negative growth.

**TABLE 6-78 (Concluded)**

### *Modeled Concentrations of Criteria Pollutants*

#### **Regional Criteria Pollutant Concentrations**

##### **a. Ozone Concentrations**

In addition to analyzing project-specific effects of Alternative D in terms of mass emissions of criteria pollutants, this PEA includes a supplemental analysis of the contribution of Alternative D to regional concentrations of these same criteria pollutants.

Air quality is expected to improve under future conditions, with or without the proposed project or alternatives. Table 6-79 shows the contributions from Alternative D and the proposed project to the Basin and Coachella Valley ozone concentrations for the

milestone years of 2014, 2023, and 2030. As shown in Table 6-79, for most milestone years, Alternative D would contribute less to ozone concentrations than the proposed project.

**TABLE 6-79**  
**Project and Alternative D – Contribution to Regional Ozone Concentration Concentrations (Peak 8-hour concentrations)**

Year	Basin Average Ozone (ppb )	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Proposed Project</b>				
2014	0.9	1.4	0.5	0.6
2023	1.5	1.9	0.8	1.1
2030	2.6	2.9	1.1	1.3
<b>Alternative D</b>				
2014	0.7	1.0	0.4	0.4
2023	0.7	0.8	0.5	0.5
2030	1.5	1.2	0.6	0.5

**b. Particulate Matter Concentrations**

Table 6-80 shows the contribution of emissions from Alternative D compared to the proposed project for the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations estimated for the milestone years of 2014, 2023 and 2030. As shown in the table, for most milestone years, Alternative D contributes less to regional concentrations of particulate matter than the proposed project. Another way of looking at the results in Table 6-80 is that for most years Basin and Coachella Valley predicted annual average and 24-hour average PM2.5 and PM10 concentration improvements foregone from Alternative D are equal to or less than the proposed project.

**Table 6-80**  
**Proposed Project and Alternative D – Contributions to Regional PM2.5 and PM10 Concentrations**

Year	Basin Annual PM2.5 (µg/m <sup>3</sup> )	Basin Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )

2030	0.21	0.47	1.6	2.5	0.05	0.05	0.2	0.2
<b>Alternative D</b>								
2014	0.02	0.05	0.3	0.4	0	0	0	0
2023	0.03	0.06	0.5	0.5	0.01	0.01	0.1	0.1
2030	0.03	0.06	0.5	0.5	0.01	0.01	0.1	0.1

**c. NO2 Concentrations**

Table 6-81 shows the contributions to regional NO2 concentrations from Alternative D compared to the proposed project. The regional NO2 concentration analysis is based on an emissions-weighted approach to estimate the incremental contributions of NO2 from Alternative D. As Table 6-81 shows, Alternative D and the proposed project would result in NO2 concentrations of 1.0 ppb or less for all milestone years, regardless of the averaging time.

**TABLE 6-81**  
**Alternative D and the Proposed Project – Contributions to Regional NO<sub>2</sub> Concentrations**

Milestone Year	Basin 1-Hour Average NO <sub>2</sub> (ppb)	Basin Annual Average NO <sub>2</sub> (ppb)	Coachella 1-Hour Average NO <sub>2</sub> (ppb)	Coachella 24-Hour Average NO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>				
2014	0	0	0	0

<b>Alternative D</b>				
2014	0	0	0	0
2023	0	0	0	0
2030	0	0	0	0

**d. SO<sub>2</sub> Concentrations**

Table 6-82 shows the contributions to regional SO<sub>2</sub> concentrations from Alternative D compared to the proposed project. The regional SO<sub>2</sub> concentration analysis is also based on an emissions-weighted approach to estimate the incremental increased contributions of SO<sub>2</sub> from Alternative D. Both Alternative D and the proposed project would result in contributions to SO<sub>2</sub> concentrations in the Basin of 0.04 ton per day or less, which is less than 0.1 percent of the Basin SO<sub>x</sub> emissions, and less than 1.0 ppb for all milestone years, regardless of the averaging time. SO<sub>2</sub> is not measured in the Coachella Valley because there are so few SO<sub>2</sub> emissions sources.

**TABLE 6-82**  
**Alternative D and the Proposed Project –**  
**Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

<b>Milestone Year</b>	<b>Basin 1-Hour Average SO<sub>2</sub> (ppb)</b>	<b>Basin 24-Hour Average SO<sub>2</sub> (ppb)</b>	<b>Basin Annual Average SO<sub>2</sub><sup>b</sup> (ppb)</b>
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative D</b>			
2014	0	0	0
2023	0	0	0
2030	0	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. CO Concentrations**

Ambient concentrations of carbon monoxide respond linearly to changes in the emissions inventory. Table 6-83 shows the contributions to ambient CO concentrations in the Basin from Alternative D compared to the proposed project. Table 6-83 shows that CO concentrations from Alternative D are less than or equal to the project-specific concentrations from the proposed project.

**TABLE 6-83  
Alternative D and the Proposed Project –  
Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Proposed Project	Alternative D
2014	0.00	0.00
2023	0.01	0.00
2030	0.01	0.00

***Modeled Concentrations of Criteria Pollutants***

**Regional Criteria Pollutant Concentrations – Alternative D**

**a. Cumulative Ozone Concentrations**

In addition to analyzing project-specific contributions of Alternative D to regional pollutant concentrations, this PEA includes an analysis of the combined contributions to regional pollutant concentrations from Alternative D plus other sources receiving permits in reliance upon the SCAQMD’s internal offset accounts. Table 6-84 shows the contribution to regional ozone concentrations from such sources in terms of the 8-hour ozone concentrations as between the cumulative scenario with Alternative D compared to the cumulative scenario with the proposed project. As shown in the table, the cumulative scenario with Alternative D results in the same or less contributions to regional ozone concentrations than the proposed project.

**TABLE 6-84**  
**Proposed Project and Alternative D Cumulative Scenarios – Contributions to Regional Ozone Concentrations (Peak 8-hour Concentrations)**

Year	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Cumulative With Proposed Project</b>				
2014	1.1	1.8	0.8	0.8
2023	2.0	2.5	1.0	1.3
2030	3.0	3.5	1.3	1.6
<b>Cumulative With Alternative D</b>				
2014	0.9	1.4	0.6	0.6
2023	1.0	0.9	0.4	0.4
2030	1.7	1.3	0.4	0.4

**b. Cumulative Particulate Matter Concentrations**

Table 6-84.1 presents the contribution of regional particulate matter concentrations from Alternative D with the cumulative scenario compared to the proposed project with the cumulative scenario in terms of the contributions to the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations. As shown in the table, for most milestone years, the cumulative scenario with Alternative D would contribute less to regional particulate matter concentrations than the cumulative scenario with the proposed project.

**Table 6-84.1**  
**Proposed Project and Alternative D Cumulative Scenarios –Contributions to Regional PM2.5 and PM10 Concentrations**

Year	Basin Annual PM2.5 (µg/m <sup>3</sup> )	Basin Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )
<b>Cumulative With Proposed Project</b>								
2014	0.18	0.38	1.1	1.8	0.04	0.04	0.1	0.1
2023	0.26	0.57	1.8	2.8	0.06	0.06	0.2	0.2
2030	0.32	0.71	2.2	3.5	0.07	0.07	0.2	0.2
<b>Cumulative With Alternative D</b>								
2014	0.14	0.31	0.9	1.4	0.03	0.03	0.1	0.1

2030	0.14	0.31	1.0	1.5	0.03	0.03	0.1	0.1

**c. Cumulative NO2 Concentrations**

Table 6-85 shows the contributions to cumulative regional NO2 concentrations from the cumulative scenario with Alternative D compared to the cumulative scenario with the proposed project. As Table 6-85 shows, the cumulative scenario with Alternative D would contribute the same amount or less to regional NO2 concentrations than the cumulative scenario with the proposed project.

**TABLE 6-85  
Alternative D and the Proposed Project Cumulative Scenarios –  
Contributions to Regional NO2 Concentrations**

<b>Milestone Year</b>	<b>Basin 1-Hour Average NO<sub>2</sub> (ppb)</b>	<b>Basin Annual Average NO<sub>2</sub> (ppb)</b>	<b>Coachella 1-Hour Average NO<sub>2</sub> (ppb)</b>	<b>Coachella 24-Hour Average NO<sub>2</sub> (ppb)</b>

2014	1	0	0	0
2023	1	0	1	0
2030	1	0	1	0

**d. Cumulative SO2 Concentrations**

Table 6-86 also shows the contributions to cumulative regional SO2 concentrations from the cumulative scenario with Alternative D compared to the cumulative scenario with the proposed project. As shown in the table, for most milestone years, the cumulative scenario with Alternative D would contribute roughly the same amount to regional SO2 concentrations as the cumulative scenario with the proposed project.

**TABLE 6-86**  
**Alternative D and the Proposed Project Cumulative Scenarios –**  
**Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Cumulative With Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Cumulative With Alternative D</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. Cumulative CO Concentrations**

Table 6-87 shows the contributions to CO concentrations in the Basin from the cumulative scenario with Alternative D compared to the cumulative scenario with the proposed project. Table 6-87 shows that CO concentrations from the cumulative scenario with Alternative D are not noticeably less than concentrations from the cumulative scenario with the proposed project.

**TABLE 6-87**  
**Alternative D and the Proposed Project – Cumulative Scenarios**  
**Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Cumulative With Proposed Project	Cumulative With Alternative D
2014	0.01	0.01
2023	0.02	0.02
2030	0.02	0.02

### **Localized Criteria Pollutant Concentrations**

Tables 4.1-21 and 4.1-22 in Chapter 4 show that the proposed project has the potential to increase localized PM<sub>2.5</sub> concentrations at sensitive receptors that may be located near future representative facilities. Similarly, Tables 4.1-23 through 4.1-25 show that the proposed project has the potential to increase local NO<sub>2</sub> concentrations at sensitive receptors that may be located near future representative facilities. The analysis of project-specific localized criteria pollutant impacts prepared for the proposed project applies to Alternative D for the following reasons. Because most components of Alternative D are identical to the proposed project, the same future representative facilities that would qualify for permits pursuant to Rules 1304 or 1309.1 under the proposed project would qualify for permits under Alternative D. The same five-year database (2003 through 2008) of permits and pending permits in the SCAQMD's overall permit database that was used to analyze future localized impacts of the proposed project would be applicable to Alternative D. The same Source Classification Codes (SCCs) would be applicable: (1) to assigning stack parameters to emission sources for modeling on the basis of source type; and (2) to estimate chemical speciation of permitted emissions reported as PM and organic gases with respect to particle size composition of PM emissions.

The main difference between Alternative D and the proposed project is that under Alternative D, the SCAQMD's pre-existing offset accounts would be eliminated and only credits generated in the year 2009 and after could be used to offset future emission increases from affected facilities receiving permits under Rules 1304 and 1309.1. Although fewer sources would be permitted under Alternative D compared to the proposed project, future affected facilities receiving permits under Alternative D could have the same characteristics as the facilities used to analyze project-specific localized criteria pollutant impacts under the proposed project.

### ***3. Health Effects – Would Alternative D Expose Sensitive Receptors to Substantial Pollutant Concentrations***

#### **Region-wide Emissions of Criteria Pollutants—Alternative D**

The analysis of Alternative D includes a comparison of the health impacts of Alternative D to the health impacts of the proposed project. Increases in criteria pollutant emissions may result in potential adverse health effects including the following: cardiovascular, neurological, reproductive and respiratory diseases. Health effects have been evaluated by modeling criteria pollutant concentrations, which can provide information on mortality, hospital admissions, emergency room visits, minor restricted activity days, school absence days, loss of work days, and cases of acute/chronic bronchitis, nonfatal heart attacks and adverse upper/lower respiratory conditions. Table 6-88 shows the estimated health effects from the proposed project and Alternative D as a result of exposures to ozone for the milestone years of the analysis. Similarly, Table 6-89 shows

the estimated health effects from Alternative D compared to the proposed project as a result of exposure to PM2.5 and PM10 during the milestone years analyzed. The impacts shown in Tables 6-88 and 6-89 represent additional health benefits, beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report that could occur if the proposed project and Alternative D were not implemented or replaced by other growth.

**TABLE 6-88**  
**Proposed Project and Alternative D – Estimated Ozone Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Hospital Admissions (People)	Minor Restricted Activity Days (Days)	School Absences (Days)
<b>Proposed Project</b>				
2014	7	42	29,575	31,172
2023	12	71	49,513	52,186
2030	20	122	85,339	89,947
<b>Alternative D</b>				
2014	5	32	22,219	23,419
2023	6	35	24,658	25,989
2030	12	71	49,579	52,255

**TABLE 6-89**  
**Proposed Project and Alternative D – Estimated PM2.5 and PM10 Health Impacts – Health Benefits Foregone**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
<b>Proposed Project</b>									
2014	33	59	18	29	1,262	11	13	23,374	4,074
2023	86	155	46	74	3,283	29	34	60,814	10,601
2030	125	224	66	108	4,763	42	50	88,214	15,377
<b>Alternative D</b>									
2014	13	23	7	11	478	4	5	8,852	1,543
2023	17	31	9	15	659	6	7	12,209	2,128
2030	17	31	9	15	659	6	7	12,209	2,128

The SCAQMD has not developed significance thresholds for the specific health effects identified in Tables 6-88 and 6-89. However, given the magnitude of the health effects foregone compared to health effect conditions in the absence of Alternative D, SCAQMD staff concludes that Alternative D has the potential to generate significant adverse health effects. Because Alternative D would eliminate the SCAQMD’s existing offset accounts and only allow the use of credits generated in 2009 and after to offset emission increases from affected facilities, substantially fewer new or modified sources are expected to be built in the future. As a result, health effects generated by Alternative D are expected to be significant, but less significant than health effects generated by the proposed project.

**Region-wide Emissions of Criteria Pollutants-- Cumulative Effects**

The cumulative health impacts analysis includes health effects of Alternative D, plus health effects of the reasonably foreseeable power plant projects, and the effects of the additional three years of past sources permitted in reliance on the SCAQMD’s internal offset account (2007 through 2009). Table 6-90 shows the estimated health effects from the cumulative scenarios with the proposed project and with Alternative D as a result of exposures to ozone for the milestone years of the analysis. Table 6-91 shows the estimated health effects as a result of cumulative scenario with the proposed project compared to the cumulative scenario with Alternative D as a result of exposures to PM2.5 and PM10 for the milestone years of the analysis.

**TABLE 6-90  
Proposed Project and Alternative D -  
Estimated Cumulative Ozone Health Impacts**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days (Days)</b>	<b>School Absences (Days)</b>
<b>Cumulative With Proposed Project</b>				
2014	9	54	37,662	39,696
2023	15	92	64,780	68,278
2030	24	143	100,213	105,624
<b>Cumulative With Alternative D</b>				
2014	7	40	28,358	29,889
2023	8	48	33,473	35,280
2030	13	80	56,034	59,060

**TABLE 6-91**  
**Proposed Project and Alternative D -**  
**Estimated Cumulative Annual PM2.5 and PM10 Health Impacts**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
<b>Cumulative With Proposed Project</b>									
2014	102	184	55	89	3,908	34	41	72,384	12,618
2023	152	273	81	132	5,803	51	61	107,476	18,735
2030	189	341	101	164	7,231	63	76	133,938	23,347
<b>Cumulative With Alternative D</b>									
2014	82	147	44	71	3,125	27	33	57,872	10,088
2023	83	150	44	72	3,178	28	33	58,857	10,260
2030	82	148	44	71	3,131	27	33	57,990	10,108

The SCAQMD has not developed specific significance thresholds for cumulative health impacts. Given the magnitude of health benefits foregone that would occur if Alternative D were implemented, SCAQMD staff concludes that Alternative D would make a cumulatively considerable contribution to this significant impact.

### Region-wide Emissions of TACs

Basin toxic risks (measured in cancer risk per million person population over a lifetime of exposure) were estimated using the MATES-III modeling platform for 2014, 2023 and 2030 model year simulations D. For reference, the MATES-III study for 2008 attributed the cancer risk from stationary sources, which include industries, and businesses such as dry cleaners and chrome plating operations at approximately 51 additional cancers in a population of one million individuals while the total regional cancer risk from toxic air contaminants was 853 in one million. Table 6-92 shows the additional region-wide cancer risk and cancer burden reductions foregone beyond those anticipated in the 2007 AQMP, if Alternative D or the proposed project were implemented as compared to conditions without the project. Table 6-92 also shows the contribution to cancer risk and cancer burden from the cumulative scenario with Alternative D and the cumulative scenario with the proposed project.

**TABLE 6-92**  
**Proposed Project and Alternative D –Cancer Risk and Cancer**  
**Burden Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cumulative Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cancer Burden Reductions Not Achieved</b>	<b>Cumulative Cancer Burden Reductions Not Achieved</b>
<b>Proposed Project</b>				
2014	0.91	3.35	16	59
2023	2.86	5.15	54	96
2030	4.4	6.59	86	129
<b>Alternative D</b>				
2014	0.12	2.56	2	45
2023	0.16	2.44	3	46
2030	0.16	2.34	3	46

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

As shown in Table 6-92, neither the proposed project nor Alternative D would generate project-specific or cumulative cancer risk impacts that exceed the SCAQMD's cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ).

The proposed project and Alternative D would result in cancer burden impacts that exceed the SCAQMD's significance threshold of 0.5. Compared to the without project scenario, the proposed project would create an increased cancer burden impact in the year 2030 of 87. Alternative D would create an increased cancer burden impact of 20 in the year 2030. Similarly, the cumulative scenarios with both the proposed project and with Alternative D result in significant cancer burdens compared to the without project scenarios. The contributions to cumulative cancer burden impacts from Alternative D are considered to be cumulatively considerable, but less than the proposed project.

A hazard index (HI) is a summation of the hazard (non-cancer) quotients for all chemicals to which an individual is exposed. A hazard index can be measured as a result of chronic (long-term) exposure or acute (short-term) exposure. SCAQMD's significance threshold for non-cancer chronic or acute HI value is 1.0 because if the HI is less than 1.0, it is presumed that no significant adverse human health effects (non-cancer) are expected to occur. Table 6-93 shows the population-weighted project-specific change in chronic HI between the conditions without the project and the proposed project and the conditions without the project and Alternative D. Table 6-93

also shows the changes between the conditions without the project and the cumulative scenarios with the proposed project and with Alternative D.

**TABLE 6-93  
Proposed Project and Alternative D – Chronic and Acute Health  
Impacts (Project-specific and Cumulative)**

<b>Alternative D</b>				
2014	0.0	0.01	0.00	0.04
2023	0.00	0.01	0.00	0.04
2030	0.00	0.01	0.00	0.04

As shown in Table 6-93, neither the proposed project nor Alternative D would exceed the SCAQMD’s acute or chronic HI significance threshold of 1.0. Similarly Table 6-93 shows that acute and chronic health risks from the proposed project with the cumulative scenario and Alternative D with the cumulative scenario would not exceed the HI significance threshold. Therefore neither the proposed project nor Alternative D would generate project-specific or cumulatively considerable non-cancer health risk impacts, while impacts from Alternative D would be equivalent to or less than the proposed project.

### **Localized Emissions of TACs**

Under Alternative D, sources permitted under Rules 1304 and 1309.1 would be subject to the requirements in Rules 1401 and 1402 that limit the cancer risk and non-cancer hazard level, which would limit any potential significant toxic impact from each source. The thresholds in Rule 1401 are the same as the SCAQMD’s CEQA significance thresholds for toxics. As a result of these regulatory prohibitions, the issuance of a permit by the SCAQMD to a stationary source of TACs would not result in stationary source emissions that exceed the CEQA significance thresholds for localized health impacts. However, the thresholds contained in Rule 1401 are

applied on a permit-unit basis; as a result, a facility with multiple permitted sources could still exceed the Hazard Index limits in Rule 1401. Such facilities would instead be subject to Rule 1402; under that rule, the allowable cancer burden is the same as under Rule 1401, but the Hazard Index limits for acute and chronic non-cancer toxic impacts are higher (3.0) than the limits under Rule 1401 and thus higher than the applicable CEQA significance thresholds. Therefore, the localized air toxic impacts of the proposed project are considered significant.

The main difference between Alternative D and the proposed project is that under Alternative D, the SCAQMD's pre-existing offset accounts would be eliminated and only credits generated in the year 2009 and after could be used to offset future emission increases from affected facilities receiving permits under Rules 1304 and 1309.1. Although fewer new sources would be permitted under Alternative D compared to the proposed project, facilities receiving permits under Alternative D could have the same characteristics as the facilities receiving permits under the proposed project. Therefore, Alternative D has the potential to generate adverse localized impacts from emissions of TACs equivalent to significant impacts of the proposed project.

#### ***4. Odors – Would Alternative D Create Objectionable Odors Affecting a Substantial Number of People***

Some equipment permitted under Rules 1304 and 1309.1 could create objectionable odors, as explained in subchapter 4.1. However, SCAQMD permits must prevent odor nuisances so the SCAQMD evaluation of permit applications includes the imposition of conditions to minimize such odors. In addition, installing BACT equipment would typically contribute to a reduction in potential odor impacts. Further, SCAQMD Rule 402 prohibits operation of a facility that creates an odor nuisance. Nevertheless, as explained in subchapter 4.1, facilities containing sources receiving permits under the proposed project could result in significant odor impacts. Alternative D could result in the same types of facilities as the proposed project; and therefore would have the same potential to result in significant odor impacts.

### **Visibility Impacts**

#### **5. Visibility. Would the Alternative D create significant aesthetic impacts by resulting in air emissions that substantially degrade the existing visual character or quality of the project surroundings?**

##### **Alternative D Effects**

Table 6-94 shows predicted visibility and visual range impacts from Alternative D and the proposed project with respect to the state standard. The state standard is a light extinction coefficient of 0.23 per kilometer when relative humidity is less than 70

percent (roughly equivalent to a 10-mile visual range), over an 8-hour averaging period (10 am – 6 pm, PST). Visual range (measured in miles) is provided for informational purposes. The range of without project values for the extinction coefficient predicted for the eastern Basin represented by Riverside-Rubidoux (the worst case) is from 0.063 to 0.067 from 2014 to 2030 over the project timeframe, or one-third of the California standard. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the proposed project would not cause or contribute to a violation of the state standard and would not be significant. As shown in Table 6-94, visual range impacts for Alternative D are less than or equal to the proposed project.

**TABLE 6-94**

The deciview – an index which incorporates incremental changes in people’s perception of visibility is directly used as the metric for visibility assessment in the federal Regional Haze visibility standard. A 0.5 deciview change is used to assess significance in Class I wilderness areas. Table 6-95 shows the visibility effects of Alternative D and the visibility effects of the proposed project in terms of deciview changes.

Joshua Tree	11.378	0.017	0.002	89.893	-0.108	-0.015

As shown in Table 6-95, the maximum project impact measured in deciviews would be less than 0.06 for all locations and milestone years, which is not significant. Similarly, implementing Alternative D would also generate a maximum impact measured in deciviews that would be less than 0.05 for all locations and milestone years, which is not significant. Further, visibility impacts from Alternative D would be less than visibility impacts from the proposed project.

### Cumulative Effects

The cumulative visibility analysis includes effects of Alternative D, plus effects of the reasonably foreseeable power plant projects, and the additional three years of past sources receiving permits in reliance upon the SCAQMD's offset accounts (2007 through 2009). Table 6-96 presents the visibility effects of the cumulative scenario with Alternative D and the cumulative scenario with the proposed project. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the cumulative scenario with the proposed project would not cause or contribute to a violation of the state standard and would not be significant. Neither Alternative D nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact. Visibility impacts from Alternative D would be less for all years and locations than for the proposed project.

**TABLE 6-96**  
**Proposed Project and Alternative D – Cumulative Visibility Impacts at Riverside-  
 Rubidoux Measured in Extinction Coefficient and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Cumulative with Proposed Project	Cumulative with Alternative D		Cumulative with Proposed Project	Cumulative with Alternative D
2014	0.0672	0.0003	0.0002	36.512	-0.017	-0.130
2023	0.0629	0.0008	0.0004	39.290	-0.456	-0.227
2030	0.0656	0.0008	0.0003	37.633	-0.469	-0.177

The cumulative visibility impacts analysis for class I wilderness areas includes effects of Alternative D, plus effects of the reasonably foreseeable power plant projects, and the additional three years of past stationary source permit application project impacts (2007 through 2009). Table 6-97 presents the visibility effects for class I wilderness areas of the cumulative scenario with Alternative D and the visibility effects of the cumulative scenario with the proposed project in terms of deciview changes. Under the federal standard, a 0.5 deciview change would be considered a significant adverse impact and a cumulatively considerable contribution to a significant cumulative impact. Neither Alternative D nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact and, therefore, it is concluded that cumulative visibility impacts are not significant. Visibility impacts from Alternative D would be less for all years and locations than for the proposed project.

**TABLE 6-97**

## **Climate Change**

### **6. Greenhouse Gas Emissions – Would Alternative D result in greenhouse gas emissions that may have a significant impact on the environment, based on any applicable threshold of significance?**

The methodology for deriving GHG emission impacts for the project alternatives is the same methodology used for the proposed project, which makes two assumptions. First, SO<sub>x</sub> emissions were selected as a surrogate to prorate the GHG emissions because SO<sub>x</sub> emissions result primarily from sulfur contained in fossil fuels. Using a ratio of GHG emissions to SO<sub>x</sub> emissions from the AQMP inventory, the GHG emissions from the proposed project and project alternatives are calculated using the estimated SO<sub>x</sub> emissions from the proposed project and multiplying by the ratio factor (see subchapter 4.0 and Appendix D).

Second, an analysis of the statewide inventory was conducted to determine the impact from the remaining GHG pollutants, including HFCs, PFCs and SF<sub>6</sub>. Combustion GHG emissions are proportional to SO<sub>x</sub> emissions, while emissions of HFCs, PFCs and SF<sub>6</sub> are analyzed as proportional to emissions of CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O, based on the statewide inventory. (See Subchapter 4.0 for additional discussion of the methodology for calculating GHG emissions.). Table 6-98 lists the total GHG emissions from all six GHG pollutants attributed to Alternative D, as well the GHG emissions attributed to the proposed project.

SCAQMD's adopted Tier 3 GHG significance threshold for SCAQMD lead agency projects is 10,000 MT CO<sub>2</sub>eq per year. Projects with incremental increases below this threshold are not considered to be cumulatively considerable. As shown in Table 6-98, potential GHG emissions from Alternative D exceed 10,000 MT CO<sub>2</sub>eq per year and are concluded to be significant, but less than the GHG emissions from the proposed project. Therefore, GHG emissions from Alternative D are considered to be cumulatively considerable (CEQA Guidelines §15065(a)(3)).

**Table 6-98  
Proposed Project and Alternative D – SOx Emissions  
and Greenhouse Gas Emissions**

<b>Attainment Year Periods</b>	<b>SOx Emissions (tons/day)</b>	<b>SOx Emissions (tons/year)</b>	<b>CO2, CH4 and N2O Emissions (million MT CO<sub>2</sub> eq /year)</b>	<b>HFCs, PFCs and SF6 Emissions<sup>a</sup> (million MT CO<sub>2</sub> eq /year)</b>	<b>TOTAL GHG Emissions<sup>b</sup> (million MT CO<sub>2</sub> eq /year)</b>
<b>Proposed Project</b>					
2014	0.16	58.4	4.52	0.29	4.81
2023	0.49	178.85	13.83	0.90	14.74
2030	0.74	270.1	20.89	1.36	22.26
<b>Alternative D</b>					
2014	0.03	10.95	0.85	0.06	0.90
2023	0.04	14.6	1.13	0.07	1.20
2030	0.04	14.6	1.13	0.07	1.20

<sup>a</sup> Calculated based on ratio of 0.065 of high GWP/total GHGs. Thus, CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions x 0.065 = HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 million MT CO<sub>2</sub> eq /year x 0.065 = 0.29 million MT CO<sub>2</sub> eq /year)

<sup>b</sup> Total GHG emissions = CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions + HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 + 0.29 = 4.81 million MT CO<sub>2</sub> eq /year). Total GHG emissions may not be exact due to rounding.

### Cumulative Effects

The cumulative analysis includes GHG emissions from Alternative D, plus GHG emissions from the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the district’s offset accounts (2007 through 2009). Table 6-99 presents the GHG emissions from the cumulative scenario with Alternative D and the GHG emissions from the cumulative scenario with the proposed project.

As explained above, GHG emissions from Alternative D are considered to be cumulatively considerable and, therefore, would contribute to significant adverse climate change impacts.

**TABLE 6-99  
Proposed Project and Alternative D – Cumulative  
Greenhouse Gas Emissions**

<b>Attainment Year Periods</b>	<b>TOTAL GHG Emissions (million MT CO<sub>2</sub> eq /year)</b>
<b>Cumulative With Proposed Project</b>	
2014	11.98
2023	21.61
2030	29.13
<b>Cumulative With Alternative D</b>	
2014	7.99
2023	8.01
2030	8.07

1.

**Alternative E – Limited Offset Availability**

***1. AQMP Consistency – Would Alternative E Conflict with or Obstruct the Implementation of an Applicable Air Quality Plan?***

Like the proposed project, Alternative E would specify regulatory procedures for making annual demonstrations of equivalency with federal offset requirements. Although the AQMP provides strategies for attaining and maintaining the NAAQSs and CAAQSs, it is considered to be a growth accommodating document. The major difference between Alternative E and the proposed project is that Alternative E would only allow the use of offsets in an amount up to 50 percent of the 2007 AQMP growth projections for the relevant industry categories.

Emissions from Alternative E are not expected to conflict with or obstruct the implementation of the AQMP because offsets cannot be issued above the 50 percent emissions caps, which are based on growth projections of the 2007 AQMP for the relevant industry categories. Because regional criteria pollutant emissions from Alternative E are expected to be less than the regional criteria pollutant emissions from the proposed project, the potential for conflicts with the 2007 AQMP would be even less likely.

**2. Criteria Pollutant Emission Standards – Would Alternative E Violate any Air Quality Standard or Contribute to an Existing or Projected Air Quality Violation**

**a. Alternative C – Region-wide emissions of criteria pollutants**

Chapter 4.0 explains that two components make up the emissions attributed to the proposed project. The first component is the amount of net growth in emissions forecasted in the 2007 AQMP for the industry categories that are potentially eligible for permits issued under Rules 1309.1 and Rule 1304. Under the proposed project, growth in stationary source emissions for the industry categories that are potentially eligible for permits issued under Rules 1309.1 and Rule 1304 would be the same as AQMP growth in stationary source emissions for these same categories (Table 6-100). Under Alternative E, growth in stationary source emissions for the industry categories that are potentially eligible for permits issued under Rules 1309.1 and Rule 1304 would be 50 percent of the growth in stationary source emissions from those sources anticipated by the AQMP. The second component includes the emissions from existing sources that relied on offsets from the SCAQMD internal accounts for permits issued prior to July 2010 and that would shut down during the twenty year analysis timeframe. This second component, i.e., shutdown emissions from stationary sources returned to the SCAQMD, would be the same under the proposed project and under Alternative E (Tables 6-100 and 6-101). For the above reasons, emissions impacts from Alternative E would not be a simple 50 percent of the emissions from the proposed project

Table 6-100 shows mass emissions of criteria pollutants from the proposed project, while Table 6-101 shows direct regional emissions from Alternative E. As can be seen comparing the total emissions projected for the proposed project ( Table 6-100) to the total emissions projected for Alternative E, criteria pollutant emissions from Alternative E would be significant, but would be less than the emissions from the proposed project.

**Alternative E Stationary Source Emissions**

Milestone Years	Pollutants					
	VOC	NO <sub>x</sub>	SO <sub>x</sub>	CO	PM10	PM2.5
<b>Total - Pounds per Day</b>						
2014	28,200	2,060	200	2,000	880	560
2023	50,100	3,420	540	5,540	2,880	1,820
2030	60,160	4,360	780	7,620	4,480	2,840
<b>Regional Significance Thresholds (Pounds per Day)</b>						
Significance Threshold	55	55	150	550	150	55
Significant?	Yes	Yes	Yes	Yes	Yes	Yes

Total emissions may not be exact due to rounding.

As indicated in Subchapter 4.1, SCAQMD staff determined that total lead emissions in the district are approximately 18 lbs/day (6,517 lbs/yr) based on fiscal year (FY) 2006-2007 data comprised of 566 facilities in the Basin that reported lead emissions. Lead emission impacts were calculated for the same milestone years evaluated for other emission impacts. As shown in Table 6-102, the maximum net increase in lead emissions by 2030 in the Basin from the proposed project and the cumulative scenario with the proposed project would not exceed the SCAQMD's mass daily significance threshold for lead of three pounds per day. Similarly, Table 6-102 shows that lead emission impacts from Alternative E and from the cumulative scenario with Alternative E would be less-than-significant.

**TABLE 6-102**  
**Proposed Project and Alternative E –**  
**Project-Specific and Cumulative Lead Emissions**

Milestone Years	Lead (lbs/day)			
	Proposed Project	Cumulative With Proposed Project	Alternative E	Cumulative With Alternative E
2014	0.13	0.33	0.07	0.29
2023	0.45	0.50	0.23	0.36
2030	0.70	0.63	0.35	0.42

### Cumulative Effects

As explained in Chapters 4.0 and 4.1, the cumulative impact analysis includes emissions from sources permitted under Rules 1304 and 1309.1 pursuant to the prior version of Rule 1315 and SB 827. In addition, the cumulative impacts analysis includes emissions from three power plants.

Table 6-102 presents the total mass emissions from stationary sources under Alternative E plus the other sources included in the cumulative scenario. As shown in Table 6-102, impacts from Alternative E are cumulatively considerable and, therefore, significant.

**TABLE 6-103  
Proposed Project and Alternative E Cumulative Stationary Source Mass Emissions**

Milestone Years	Pollutant					
	VOC	NOx	SOx	CO	PM10	PM2.5
	Cumulative With Proposed Project – Tons per Day					
2014	23.71	4.7	0.47	10.82	3.47	2.87
2023	40.76	5.64	0.79	14.36	5.29	4.02
2030	50.74	6.61	1.04	16.55	6.79	4.97
Cumulative With Proposed Project Pounds per Day						
2014	47,420	9,400	940	21,640	6,940	5,740
2023	81,520	11,280	1,580	28,720	10,580	8,040
2030	101,480	13,220	2,080	33,100	13,580	9,940

### *Modeled Concentrations of Criteria Pollutants*

#### **Regional Criteria Pollutant Concentrations – Alternative E**

##### **a. Ozone Concentrations**

In addition to analyzing project-specific effects of Alternative E in terms of mass regional emissions of criteria pollutants, this PEA includes a supplemental analysis of the contribution of Alternative E to regional concentrations of these same criteria pollutants.

Air quality is expected to improve under future conditions, with or without the proposed project or alternatives. Table 6-104 shows the contributions from Alternative E and the proposed project to the ozone concentrations in the Basin and provides the Coachella Valley for the milestone years of 2014, 2023 and 2030.

As shown in the table, for most milestone years, Alternative E would contribute less to ozone concentration than the proposed project. Another way of looking at the results in Table 6-104 is that for most years Basin and Coachella Valley ozone concentrations improvements foregone from Alternative E are slightly less than the proposed project.

**TABLE 6-104**  
**Proposed Project and Alternative E – Contribution to Regional Ozone Concentrations**  
**(Peak 8-hour concentrations)**

Year	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Proposed Project</b>				
2014	0.9	1.4	0.5	0.6
2023	1.5	1.9	0.8	1.1
2030	2.6	2.9	1.1	1.3
<b>Alternative E</b>				
2014	0.8	1.2	0.5	0.5
2023	1.1	1.3	0.7	0.7
2030	2.0	2.0	0.9	0.9

**b. Particulate Matter Concentrations**

Table 6-105 shows the contribution of emissions from Alternative E compared to the proposed project for the predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM<sub>2.5</sub> and PM<sub>10</sub> concentrations estimated for the milestone years of 2014, 2023 and 2030. As shown in the table, for most milestone years, Alternative E contributes less to regional concentrations of particulate matter than the proposed project. Another way of looking at the results in Table 6-105 is that for most years Basin and Coachella Valley predicted annual average and 24-hour average PM<sub>2.5</sub> and PM<sub>10</sub> concentration improvements foregone from Alternative E are equal to or slightly less than the proposed project.

**TABLE 6-105**  
**Proposed Project and Alternative E – Contributions to Regional PM<sub>2.5</sub>**  
**and PM<sub>10</sub> Concentrations**

Year	Basin Annual PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Basin Annual PM <sub>10</sub> (µg/m <sup>3</sup> )	Basin Daily PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Basin Daily PM <sub>10</sub> (µg/m <sup>3</sup> )	Coachella Valley Annual PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Coachella Valley Annual PM <sub>10</sub> (µg/m <sup>3</sup> )	Coachella Valley Daily PM <sub>2.5</sub> (µg/m <sup>3</sup> )	Coachella Valley Daily PM <sub>10</sub> (µg/m <sup>3</sup> )
<b>Proposed Project</b>								
2014	0.06	0.12	0.6	0.7	0.01	0.01	0.1	0.1
2023	0.15	0.32	1.2	1.8	0.03	0.03	0.1	0.1
2030	0.21	0.47	1.6	2.5	0.05	0.05	0.2	0.2

**TABLE 6-105 (Concluded)**  
**Proposed Project and Alternative E – Contributions to Regional PM2.5 and PM10 Concentrations**

Year	Basin Annual PM2.5 (µg/m <sup>3</sup> )	Basin Annual PM10 (µg/m <sup>3</sup> )	Basin Daily PM2.5 (µg/m <sup>3</sup> )	Basin Daily PM10 (µg/m <sup>3</sup> )	Coachella Valley Annual PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Annual PM10 (µg/m <sup>3</sup> )	Coachella Valley Daily PM2.5 (µg/m <sup>3</sup> )	Coachella Valley Daily PM10 (µg/m <sup>3</sup> )
<b>Alternative E</b>								
2014	0.04	0.09	0.5	0.5	0.01	0.01	0.1	0.1
2023	0.09	0.19	0.9	1.1	0.02	0.02	0.1	0.1
2030	0.12	0.27	1.1	1.5	0.03	0.03	0.1	0.1

**c. NO2 Concentrations**

Table 6-106 shows the contributions to regional NO2 concentrations from Alternative E compared to the proposed project. The regional NO2 concentration analysis is based on an emissions-weighted approach to estimate the incremental contributions of NO2 from Alternative E. As Table 6-106 shows, Alternative E and the proposed project would result in NO2 concentrations of 1 ppb or less for all milestone years, regardless of the averaging time.

**TABLE 6-106**  
**Alternative E and the Proposed Project – Contributions to Regional NO2 Concentration**

Milestone Year	Basin 1-Hour Average NO2 (ppb)	Basin Annual Average NO2 (ppb)	Coachella 1-Hour Average NO2 (ppb)	Coachella 24-Hour Average NO2 <sup>b</sup> (ppb)
<b>Proposed Project</b>				
2014	0	0	0	0
2023	1	0	0	0
2030	1	0	0	0
<b>Alternative E</b>				
2014	0	0	0	0
2023	0	0	0	0
2030	1	0	0	0

#### d. SO<sub>2</sub> Concentrations

Table 6-107 shows the regional contributions to SO<sub>2</sub> concentrations from Alternative E compared to the proposed project. The regional SO<sub>2</sub> concentration analysis is also based on an emissions-weighted approach to estimate the incremental increased contributions of SO<sub>2</sub> from Alternative E. Both Alternative E and the proposed project would result in contributions to SO<sub>2</sub> concentrations in the Basin of 0.04 ton per day, which is less than 0.1 percent of the Basin SO<sub>x</sub> emissions, and less than 1.0 ppb for all milestone years, regardless of the averaging time. SO<sub>2</sub> is not measured in the Coachella Valley because there are so few SO<sub>2</sub> emissions sources.

**TABLE 6-107**  
**Alternative E and the Proposed Project –**  
**Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0
<b>Alternative E</b>			
2014	0	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

#### e. CO Concentrations

Ambient concentrations of carbon monoxide respond linearly to changes in the emissions inventory. Table 6-108 shows the contributions to ambient CO concentrations in the Basin from Alternative E compared to the proposed project. Table 6-108 shows that CO concentrations from Alternative E are less than or equal to concentrations from the proposed project.

**TABLE 6-108**  
**Alternative E and the Proposed Project –**  
**Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Proposed Project	Alternative E
2014	0.00	0.00
2023	0.01	0.00
2030	0.01	0.01

**Regional Criteria Pollutant Concentrations-- Cumulative Effects**

**a. Cumulative Ozone Concentrations**

In addition to analyzing project-specific contributions of Alternative E to regional pollutant concentrations, this PEA includes an analysis of the combined contributions to regional pollutant concentrations from Alternative E plus other sources receiving permits in reliance upon the SCAQMD’s internal offset accounts. Table 6-109 presents the contribution to regional ozone concentrations from such sources in terms of the 8-hour ozone concentrations as between the cumulative scenario with Alternative E compared to the cumulative scenario with the proposed project. As shown in the table, the cumulative scenario with Alternative E results in the same or less contributions to regional ozone concentrations than the proposed project.

**TABLE 6-109**  
**Proposed Project and Alternative E Cumulative Scenarios--Contributions to**  
**Regional Ozone Concentrations**  
**(Peak 8-hour Concentrations)**

Year	Basin Average Ozone (ppb)	Basin Maximum Station Ozone (ppb)	Coachella Valley Average Ozone (ppb)	Coachella Valley Maximum Station Ozone (ppb)
<b>Cumulative With Proposed Project</b>				
2014	1.1	1.8	0.8	0.8
2023	2.0	2.5	1.0	1.3
2030	3.0	3.5	1.3	1.6
<b>Cumulative With Alternative E</b>				
2014	1.0	1.5	0.6	0.6
2023	1.3	1.3	0.6	0.6
2030	2.2	2.0	0.6	0.7

### b. Cumulative Particulate Matter Concentrations

Table 6-110 presents the predicted contribution of regional particulate matter concentrations from Alternative E with the cumulative scenario compared to the proposed project with the cumulative scenario in terms of the contributions to predicted annual average and 24-hour (daily) average Basin and Coachella Valley PM2.5 and PM10 concentrations. As shown in Table 6-110, for most milestone years the cumulative scenario with Alternative E would contribute less to regional particulate matter concentrations than the cumulative scenario with the proposed project.

**TABLE 6-110**

#### **Proposed Project and Alternative E Cumulative Scenarios –Contributions to Regional PM2.5 and PM10 Concentrations**

<b>Year</b>	<b>Basin Annual PM2.5 (µg/m<sup>3</sup>)</b>	<b>Basin Annual PM10 (µg/m<sup>3</sup>)</b>	<b>Basin Daily PM2.5 (µg/m<sup>3</sup>)</b>	<b>Basin Daily PM10 (µg/m<sup>3</sup>)</b>	<b>Coachella Valley Annual PM2.5 (µg/m<sup>3</sup>)</b>	<b>Coachella Valley Annual PM10 (µg/m<sup>3</sup>)</b>	<b>Coachella Valley Daily PM2.5 (µg/m<sup>3</sup>)</b>	<b>Coachella Valley Daily PM10 (µg/m<sup>3</sup>)</b>
<b>Cumulative With Proposed Project</b>								
2014	0.18	0.38	1.1	1.8	0.04	0.04	0.1	0.1
2023	0.26	0.57	1.8	2.8	0.06	0.06	0.2	0.2
2030	0.32	0.71	2.2	3.5	0.07	0.07	0.2	0.2
<b>Cumulative With Alternative E</b>								
2014	0.16	0.34	1.0	1.6	0.03	0.03	0.1	0.1
2023	0.20	0.44	1.4	2.1	0.04	0.04	0.1	0.1
2030	0.23	0.51	1.6	2.5	0.05	0.05	0.2	0.2

### c. Cumulative NO2 Concentrations

Table 6-111 shows the contributions to regional cumulative regional NO2 concentrations from the cumulative scenario with Alternative E compared to the cumulative scenario with proposed project. As Table 6-111 shows, the cumulative scenario with Alternative E would contribute the same amount or less to regional NO2 concentrations than the cumulative scenario with the proposed project.

**TABLE 6-111**  
**Alternative E and the Proposed Project**  
**Cumulative Scenarios – Contributions to Regional NO2 Concentrations**

<b>Milestone Year</b>	<b>Basin 1-Hour Average NO2 (ppb)</b>	<b>Basin Annual Average NO2 (ppb)</b>	<b>Coachella 1-Hour Average NO2 (ppb)</b>	<b>Coachella 24-Hour Average NO2<sup>b</sup> (ppb)</b>
<b>Cumulative with Proposed Project</b>				
2014	1	0	1	0
2023	2	0	1	0
2030	2	0	1	0
<b>Cumulative with Alternative E</b>				
2014	1	0	1	0
2023	1	0	1	0
2030	1	0	1	0

**d. Cumulative SO2 Concentrations**

Table 6-112 shows the contributions to cumulative regional SO2 concentrations from the cumulative scenario with Alternative E compared to the cumulative scenario with the proposed project. As shown in the table, for most milestone years, the cumulative scenario with Alternative E would contribute roughly the same amount to regional SO2 concentrations as the cumulative scenario with the proposed project.

**TABLE 6-112**  
**Alternative E and the Proposed Project Cumulative Scenarios – Contributions to Regional SO2 Concentrations<sup>a</sup>**

<b>Milestone Year</b>	<b>Basin 1-Hour Average SO2 (ppb)</b>	<b>Basin 24-Hour Average SO2 (ppb)</b>	<b>Basin Annual Average SO2<sup>b</sup> (ppb)</b>
<b>Cumulative with Proposed Project</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0

**TABLE 6-112 (Concluded)**  
**Alternative E and the Proposed Project Cumulative Scenarios – Contributions to Regional SO<sub>2</sub> Concentrations<sup>a</sup>**

Milestone Year	Basin 1-Hour Average SO <sub>2</sub> (ppb)	Basin 24-Hour Average SO <sub>2</sub> (ppb)	Basin Annual Average SO <sub>2</sub> <sup>b</sup> (ppb)
<b>Cumulative with Alternative E</b>			
2014	1	0	0
2023	1	0	0
2030	1	0	0

<sup>a</sup> SO<sub>2</sub> is not measured in the Coachella Valley.

<sup>b</sup> Annual average daily SO<sub>x</sub> emissions from all point and areas sources are less than 0.04 tons per day, but are rounded up to the nearest whole number.

**e. Cumulative CO Concentrations**

Table 6-113 shows the contributions to CO concentrations in the Basin from the cumulative scenario with Alternative E compared to the cumulative scenario with the proposed project. Table 6-113 shows that CO concentration from the cumulative scenario with Alternative E are not noticeably less than the concentrations from the cumulative scenario with the proposed project.

**TABLE 6-113**  
**Alternative E and the Proposed Project – Cumulative Scenarios Contributions to Regional CO Concentrations**

Milestone Year	Change in Concentration (ppm)	
	Cumulative With Proposed Project	Cumulative With Alternative E
2014	0.01	0.01
2023	0.02	0.02
2030	0.02	0.02

**Localized Criteria Pollutant Concentrations**

Tables 4.1-21 and 4.1-22 in Chapter 4 show that the proposed project has the potential to increase localized PM<sub>2.5</sub> concentrations at sensitive receptors that may be located near future representative facilities. Similarly, Tables 4.1-23 through 4.1-25 show that the proposed project has the potential to increase local NO<sub>2</sub> concentrations at sensitive receptors that may be located near future representative facilities. The analysis of project-specific localized criteria pollutant impacts prepared for the proposed project

applies to Alternative E for the following reasons. Because most components of Alternative E are identical to the proposed project, the same future representative facilities that would qualify for permits pursuant to Rules 1304 or 1309.1 under the proposed project would qualify for permits under Alternative E. The same five-year database (2003 through 2008) of permits and pending permits in the SCAQMD's overall permit database that was used to analyze future localized impacts of the proposed project would be applicable to Alternative E. The same Source Classification Codes (SCCs) would be applicable: (1) to assigning stack parameters to emission sources for modeling on the basis of source type; and (2) to estimate chemical speciation of permitted emissions reported as PM and organic gases with respect to particle size composition of PM emissions.

Alternative E is similar to the proposed project in most respects except for the following; Alternative E would only allow use of offsets in an amount of up to 50 percent of the AQMP growth projection for sources potentially eligible for permits under Rules 1304 and 1309.1. As a result, fewer affected facilities would be able to obtain permits under Alternative E compared to the proposed project. Although fewer sources would be permitted under Alternative E compared to the proposed project, facilities receiving permits under Alternative E could have the same characteristics as the facilities used to analyze project-specific localized criteria pollutant impacts under the proposed project.

### ***3. Health Effects – Would Alternative E Expose Sensitive Receptors to Substantial Pollutant Concentrations***

#### **Region-wide Emissions of Criteria Pollutants—Alternative E**

The analysis of Alternative E includes a comparison of the health impacts of Alternative E to the health impacts of the proposed project. Increases in criteria pollutant emissions may result in potential adverse health effects including the following: cardiovascular, neurological, reproductive and respiratory diseases. Health effects have been evaluated by modeling criteria pollutant concentrations, which can provide information on mortality, hospital admissions, emergency room visits, minor restricted activity days, school absence days, loss of work days, and cases of acute/chronic bronchitis, nonfatal heart attacks and adverse upper/lower respiratory conditions. Table 6-114 shows the estimated health effects from the proposed project and Alternative E as a result of exposures to ozone for the milestone years of the analysis. Similarly, Table 6-115 shows the estimated health effects from Alternative E compared to the proposed project as a result of exposure to PM<sub>2.5</sub> and PM<sub>10</sub> during the milestone years analyzed. The impacts shown in Tables 6-114 and 6-115 represent additional health benefits beyond the benefits forecasted in the 2007 AQMP Final Socioeconomic Report that could occur if the project and Alternative E were not implemented, nor replaced by other growth.

**TABLE 6-114**  
**Proposed Project and Alternative E – Estimated Ozone Health Impacts –**  
**Health Benefits Foregone**

Year	Mortality Deaths (People)	Hospital Admissions (People)	Minor Restricted Activity Days (Days)	School Absences (Days)
<b>Proposed Project</b>				
2014	7	42	29,575	31,172
2023	12	71	49,513	52,186
2030	20	122	85,339	89,947
<b>Alternative E</b>				
2014	6	37	25,826	27,220
2023	9	52	36,608	38,584
2030	16	96	67,117	70,741

**TABLE 6-115**  
**Proposed Project and Alternative E – Estimated Annual PM2.5 and**  
**PM10 Health Impacts – Benefits Foregone**

Year	Mortality Deaths (People)	Acute Bronchitis (People)	Chronic Bronchitis (People)	Non-fatal Heart Attacks (People)	Upper/Lower Respiratory (People)	Emergency Room Visits	Hospital Admissions (People)	Minor Restricted Activity Days	Work Loss (Days)
<b>Proposed Project</b>									
2014	33	59	18	29	1,262	11	13	23,374	4,074
2023	86	155	46	74	3,283	29	34	60,814	10,601
2030	125	224	66	108	4,763	42	50	88,214	15,377
<b>Alternative E</b>									
2014	23	41	12	20	876	8	9	16,222	2,828
2023	52	93	28	45	1,977	17	21	36,619	6,383
2030	71	128	38	62	2,711	24	28	50,214	8,753

The SCAQMD has not developed significance thresholds for the specific health effects identified in Tables 6-114 and 6-115. However, given the magnitude of the health effects foregone compared to health effect conditions in the absence of Alternative E, SCAQMD staff concludes that Alternative E has the potential to generate significant adverse health effects. Because Alternative E caps debit use at 50 percent of the AQMP

growth assumptions for industry categories with sources potentially eligible to receive permits under Rules 1304 and 1309.1, fewer new or modified sources are expected to be built in the future. As a result, health effects generated by Alternative E are expected to be significant, but less than health effects generated by the proposed project.

**Region-wide Emissions of Criteria Pollutants-- Cumulative Effects**

The cumulative health impacts analysis include health effects of the Alternative E, plus health effects of the reasonably foreseeable power plant projects, and the effects of the additional three years of past sources permitted in reliance on the SCAQMD’s internal offset account (2007 through 2009). Table 6-116 shows the estimated health effects from the proposed project as a result of cumulative exposures to ozone for the milestone years of the analysis. Table 6-117 shows the estimated cumulative health effects from the cumulative scenario with the proposed project compared to the cumulative scenario with Alternative E as a result of exposures to PM2.5 and PM10 for the milestone years of the analysis.

**TABLE 6-116  
Proposed Project And Alternative E -  
Estimated Cumulative Ozone Health Impacts**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days (Days)</b>	<b>School Absences (Days)</b>
<b>Cumulative With Proposed Project</b>				
2014	9	54	37,662	39,696
2023	15	92	64,780	68,278
2030	24	143	100,213	105,624
<b>Cumulative With Alternative E</b>				
2014	8	47	32,706	34,472
2023	10	61	42,517	44,813
2030	17	102	71,514	75,375

**TABLE 6-117**  
**Proposed Project And Alternative E -**  
**Estimated Cumulative Annual PM2.5 and PM10 Health Effects**

<b>Year</b>	<b>Mortality Deaths (People)</b>	<b>Acute Bronchitis (People)</b>	<b>Chronic Bronchitis (People)</b>	<b>Non-fatal Heart Attacks (People)</b>	<b>Upper/Lower Respiratory (People)</b>	<b>Emergency Room Visits</b>	<b>Hospital Admissions (People)</b>	<b>Minor Restricted Activity Days</b>	<b>Work Loss (Days)</b>
<b>Cumulative With Proposed Project</b>									
2014	102	184	55	89	3,908	34	41	72,384	12,618
2023	152	273	81	132	5,803	51	61	107,476	18,735
2030	189	341	101	164	7,231	63	76	133,938	23,347
<b>Cumulative With Alternative E</b>									
2014	92	165	49	80	3,510	31	37	65,019	11,334
2023	118	212	63	102	4,496	39	47	83,275	14,516
2030	136	244	72	117	5,177	45	54	95,889	16,715

The SCAQMD has not developed specific significance thresholds for cumulative health impacts. Given the magnitude the cumulative health benefits foregone that would occur if Alternative E were implemented, the contribution to cumulative impacts from Alternative E is concluded to be cumulatively considerable, but less than the proposed project.

### Region-wide Emissions of TACs

Basin toxic risks (measured in cancer risk per million person population over a lifetime of exposure, 70 years) were estimated using the MATES-III modeling platform for 2014, 2023 and 2030 model year simulations for Alternative E. For reference, the MATES-III study for 2008 attributed the cancer risk from stationary sources, which include industries, and businesses such as dry cleaners and chrome plating operations at approximately 51 additional cancers in a population of one million individuals while total regional cancer risk from toxic air contaminants was 853 in one million. Table 6-118 summarizes the additional region-wide cancer risk and cancer burden reductions foregone if Alternative E or the proposed project were implemented as compared to conditions without the project. Table 6-118 also shows the contribution to cancer risk and cancer burden from the cumulative scenario with Alternative E and the cumulative scenario with the proposed project.

**TABLE 6-118**  
**Proposed Project and Alternative E – Cancer Risk and Cancer Burden Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cumulative Cancer Risk Reduction Not Achieved<sup>a</sup></b>	<b>Cancer Burden Reductions Not Achieved</b>	<b>Cumulative Cancer Burden Reductions Not Achieved</b>
<b>Proposed Project</b>				
2014	0.91	3.35	16	59
2023	2.86	5.15	54	96
2030	4.4	6.59	86	129
<b>Alternative E</b>				
2014	0.51	2.96	9	52
2023	1.51	3.80	28	71
2030	2.28	4.47	45	88

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

As shown in Table 6-118, neither the proposed project nor Alternative E would generate project-specific or cumulative cancer risk impacts that exceed the SCAQMD's cancer risk significance threshold of 10 in one million ( $10 \times 10^{-6}$ ).

The proposed project and Alternative E would result in a cancer burden impacts that exceed the SCAQMD's significance threshold of 0.5. Compared to the without project scenario, the proposed project would create an increased cancer burden impact in the year 2030 of 87. Alternative E would create an increased cancer burden impact in the year 2030 of 45. In addition, the cumulative scenarios with both the proposed project and with Alternative E result in significant cancer burdens compared to the without project scenarios. The contributions to cumulative cancer burden impacts from Alternative E are considered to be cumulatively considerable, but less than the proposed project.

A hazard index (HI) is a summation of the hazard (non-cancer) quotients for all chemicals to which an individual is exposed. A hazard index can be measured as a result of chronic (long-term) exposure or acute (short-term) exposure. SCAQMD's significance threshold for non-cancer chronic or acute HI value is 1.0 because if the HI is less than 1.0, it is presumed that no significant adverse human health effects (non-cancer) are expected to occur. Table 6-119 shows the population-weighted project-specific change in chronic HI between the conditions without the project and the proposed project and between the conditions without the project and Alternative E.

Table 6-119 also shows the changes between the conditions without the project and cumulative scenarios with the proposed project and with Alternative E.

**Table 6-119**  
**Proposed Project and Alternative E – Chronic and Acute Health**  
**Impacts (Project-specific and Cumulative)**

<b>Year</b>	<b>Chronic Health Index Not Achieved</b>	<b>Cumulative Chronic Health Index Not Achieved</b>	<b>Acute Health Index Not Achieved</b>	<b>Cumulative Acute Health Index Not Achieved</b>
<b>Proposed Project</b>				
2014	0	0.02	0.02	0.06
2023	0.02	0.03	0.05	0.09
2030	0.02	0.03	0.08	0.11
<b>Alternative E</b>				
2014	0	0.02	0.01	0.05
2023	0.01	0.02	0.03	0.06
2030	0.01	0.02	0.04	0.08

As shown in Table 6-119, neither the proposed project nor Alternative B would exceed the SCAQMD's acute or chronic HI significance threshold of 1.0. Similarly, Table 6-119 shows that acute and chronic HI impacts from the proposed project with the cumulative scenario and Alternative E with the cumulative scenario would not exceed the HI significance threshold. Therefore neither the proposed project nor Alternative E would generate project-specific or cumulatively considerable non-cancer health risk impacts, while impacts from Alternative E would be equivalent to or less than the proposed project.

### **Localized Emissions of TACs**

Under Alternative E, sources permitted under Rules 1304 and 1309.1 would be subject to the requirements in Rules 1401 and 1402 that limit the cancer risk and non-cancer hazard level, which would limit any potential significant toxic impact from each source. The thresholds in Rule 1401 are the same as the SCAQMD's CEQA significance thresholds for toxics. As a result of these regulatory prohibitions, the issuance of a permit by the SCAQMD to a stationary source of TACs would not result in stationary source emissions that exceed the CEQA significance thresholds for localized health impacts. However, the thresholds contained in Rule 1401 are

applied on a permit-unit basis; as a result, a facility with multiple permitted sources could still exceed the Hazard Index limits in Rule 1401. Such facilities would instead be subject to Rule 1402; under that rule, the allowable cancer burden is the same as under Rule 1401, but the Hazard Index limits for acute and chronic non-cancer toxic impacts are higher (3.0) than the limits under Rule 1401 and thus higher than the applicable CEQA significance thresholds. Therefore, the localized air toxic impacts of the proposed project are considered significant.

Alternative E is similar to the proposed project in most respects except for the following; Alternative E would only allow use of offsets in an amount that is 50 percent of the AQMP growth projection for sources potentially eligible for permits under Rules 1304 and 1309.1. As a result, fewer affected facilities would be able to obtain permits under Alternative E compared to the proposed project. Although fewer sources would be permitted under Alternative E compared to the proposed project, facilities receiving permits under Alternative E could have the same characteristics as the facilities receiving permits under the proposed project. Therefore, Alternative E has the potential to generate adverse localized impacts from emissions of TACs equivalent to significant impacts of the proposed project.

#### ***4. Odors – Would Alternative E Create Objectionable Odors Affecting a Substantial Number of People***

Some equipment permitted under Rules 1304 and 1309.1 could create objectionable odors, as explained in subchapter 4.1. Evaluation of permit applications includes the imposition of conditions to minimize such odors. In addition, installing BACT equipment would typically contribute to a reduction in potential odor impacts. Further, SCAQMD Rule 402 prohibits operation of a facility that creates an odor nuisance. Nevertheless, as explained in subchapter 4.1, facilities containing sources receiving permits under the proposed project could result in significant odor impacts. Alternative E could result in the same types of facilities as the proposed project; and therefore would have the same potential to result in significant odor impacts.

### **Visibility Impacts**

- 5. Visibility. Would the Alternative B create significant aesthetic impacts by resulting in air emissions that substantially degrade the existing visual character or quality of the project surroundings?**

#### **Alternative E Effects**

Table 6-120 shows predicted visibility and visual range impacts from Alternative E and the proposed project with respect to the state standard. The state standard is a light extinction coefficient of 0.23 per kilometer when relative humidity is less than 70

percent (roughly equivalent to a 10-mile visual range), over an 8-hour averaging period (10 am – 6 pm, PST). Visual range (measured in miles) is provided for informational purposes. The range of without project values for the extinction coefficient predicted for the eastern Basin represented by Riverside-Rubidoux (the worst case) is from 0.063 to 0.067 from 2014 to 2030 over the project timeframe, or one-third of the California standard. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the proposed project would not cause or contribute to a violation of the state standard and is not significant. As shown in Table 6-120, visual range impacts for Alternative E are less than or equal to the proposed project and, therefore, are also concluded to be less than significant.

**TABLE 6-120**  
**Proposed Project and Alternative E – Visibility Impacts at Riverside-Rubidoux**  
**Measured in Extinction Coefficient and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Proposed Project	Alternative E		Proposed Project	Alternative E
2014	0.0672	0.0002	0.0001	36.512	-0.091	-0.063
2023	0.0629	0.0005	0.0003	39.290	-0.274	-0.165
2030	0.0656	0.0008	0.0005	37.633	-0.469	-0.267

The deciview – an index which incorporates incremental changes in people’s perception of visibility is directly used as the metric for visibility assessment in the federal Regional Haze visibility standard. A 0.5 deciview change is used to assess significance in Class I wilderness areas. Table 6-121 summarizes the visibility effects of Alternative E and the visibility effects of the proposed project in terms of deciview changes.

**TABLE 6-121**  
**Proposed Project and Alternative E – Visibility Impacts at Class-I Wilderness Areas**  
**Measured in Deciview and Visual Range (miles)**

San Gabriel	16.321	0.058	0.033	50.405	-0.265	-0.151
Cucamonga	15.865	0.049	0.028	51.224	-0.243	-0.138
San Gorgonio	13.124	0.023	0.013	67.006	-0.138	-0.079
San Jacinto	14.056	0.020	0.011	60.075	-0.119	-0.068
Joshua Tree	11.378	0.017	0.01	89.893	-0.108	-0.061

As shown in Table 6-121, the maximum impact projected for the proposed project measured in deciviews would be less than 0.06 for all locations and milestone years, which is not significant. Similarly, implementing Alternative E would also generate a maximum impact measured in deciviews that would be less than 0.04 for all locations and milestone years, which is not significant. Further, visibility impacts from Alternative E would be less than visibility impacts from the proposed project.

**Cumulative Effects**

The cumulative visibility impacts analysis includes effects of Alternative E, plus effects of the reasonably foreseeable power plant projects and the additional three years of past sources receiving permits in reliance upon the SCAQMD’s offset accounts (2007 through 2009). Table 6-122 presents the visibility effects of the cumulative scenario with Alternative E and the visibility effects of the cumulative scenario with the proposed project. The maximum predicted impact on the light extinction coefficient ( $.001 \text{ km}^{-1}$ ) attributable to the cumulative scenario with the proposed project would not cause or contribute to a violation of the state standard and would not be significant. Neither Alternative E nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact. Visibility impacts from Alternative E would be less for all years and locations than for the proposed project.

**TABLE 6-122  
Proposed Project and Alternative E – Cumulative Visibility Impacts at Riverside-  
Rubidoux  
Measured in Deciview and Visual Range (miles)**

Milestone Year	Predicted Extinction Coefficient Without the Project ( $\text{km}^{-1}$ )	Impact on Extinction Coefficient		Visual Range Without Project (miles)	Difference in Miles	
		Cumulative with Proposed Project	Cumulative with Alternative E		Cumulative with Proposed Project	Cumulative with Alternative E
2014	0.0672	0.0003	0.0003	36.512	-0.170	-0.149
2023	0.0629	0.0008	0.0006	39.290	-0.456	-0.341
2030	0.0656	0.0008	0.0006	37.633	-0.469	-0.323

The cumulative visibility impacts analysis for class I wilderness areas includes effects of Alternative E, plus effects of the reasonably foreseeable power plant projects, and the additional three years of sources receiving permits in reliance upon the SCAQMD’s offset accounts (2007 through 2009). Table 6-123 presents the visibility effects for class I wilderness areas of the cumulative scenario with Alternative E and the visibility effects of the cumulative scenario with the proposed project in terms of deciview changes. Under the federal standard, a 0.5 deciview change would be considered a significant adverse impact and a cumulatively considerable contribution to a significant cumulative impact. Neither Alternative E nor the proposed project would make a cumulatively considerable contribution to a significant cumulative visibility impact.

**Climate Change**

**6. Greenhouse Gas Emissions – Would Alternative B result in greenhouse gas emissions that may have a significant impact on the environment, based on any applicable threshold of significance?**

The methodology for deriving GHG emission impacts for the project alternatives is the same methodology used for the proposed project, which makes two assumptions. First, SOx emissions were selected as a surrogate to prorate the GHG emissions because SOx emissions result primarily from sulfur contained in fossil fuels. Using a ratio of GHG emissions to SOx emissions from the AQMP inventory, the GHG emissions from the proposed project and project alternatives are calculated using the estimated SOx emissions from the proposed project and multiplying by the ratio factor (see subchapter 4.0 and Appendix D).

Second, an analysis of the statewide inventory was conducted to determine the impact from the remaining GHG pollutants, including HFCs, PFCs and SF6. Combustion GHG emissions are proportional to SOx emissions, while emissions of HFCs, PFCs and SF6 are analyzed as proportional to emissions of CO2, CH4 and N2O, based on the statewide inventory. (See Subchapter 4.0 for additional discussion of the methodology for calculating GHG emissions.). Table 6-124 lists the total GHG emissions from all six GHG pollutants attributed to Alternative E, as well as the GHG emissions attributed to the proposed project.

**TABLE 6-124  
Proposed Project and Alternative E – SOx Emissions and Greenhouse Gas Emissions**

<b>Attainment Year Periods</b>	<b>SOx Emissions (tons/day)</b>	<b>SOx Emissions (tons/year)</b>	<b>CO2, CH4 and N2O Emissions (million MT CO2 eq /year)</b>	<b>HFCs, PFCs and SF6 Emissions<sup>a</sup> (million MT CO2 eq /year)</b>	<b>TOTAL GHG Emissions<sup>b</sup> (million MT CO2 eq /year)</b>
<b>Proposed Project</b>					
2014	0.16	58.4	4.52	0.29	4.81
2023	0.49	178.85	13.83	0.90	14.74
2030	0.74	270.1	20.89	1.36	22.26

**TABLE 6-124 (Concluded)**  
**Proposed Project and Alternative E – SOx Emissions and Greenhouse Gas Emissions**

Attainment Year Periods	SOx Emissions (tons/day)	SOx Emissions (tons/year)	CO2, CH4 and N2O Emissions (million MT CO <sub>2</sub> eq /year)	HFCs, PFCs and SF6 Emissions <sup>a</sup> (million MT CO <sub>2</sub> eq /year)	TOTAL GHG Emissions <sup>b</sup> (million MT CO <sub>2</sub> eq /year)
<b>Alternative E</b>					
2014	0.1	36.5	2.82	0.18	3.01
2023	0.27	98.55	7.62	0.50	8.12
2030	0.39	142.35	11.01	0.72	11.72

<sup>a</sup> Calculated based on ratio of 0.065 of high GWP/total GHGs. Thus, CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions x 0.065 = HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 million MT CO<sub>2</sub> eq /year x 0.065 = 0.29 million MT CO<sub>2</sub> eq /year)

<sup>b</sup> Total GHG emissions = CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O Emissions + HFCs, PFCs and SF<sub>6</sub> emissions (for example, 4.52 + 0.29 = 4.81 million MT CO<sub>2</sub> eq /year). Total GHG emissions may not be exact due to rounding.

SCAQMD's adopted Tier 3 GHG significance threshold for SCAQMD lead agency projects is 10,000 MT CO<sub>2</sub>eq per year. Projects with incremental increases below this threshold are not considered to be cumulatively considerable. As shown in Table 6-124, potential GHG emissions from Alternative E exceed 10,000 MT CO<sub>2</sub>eq per year and are concluded to be significant, but less than the GHG emissions from the proposed project. Therefore, GHG emissions from are considered to be cumulatively considerable (CEQA Guidelines §15065(a)(3)), and are expected to contribute to significant adverse climate change impacts.

### Cumulative Effects

The cumulative analysis includes GHG emissions from Alternative E, plus GHG emissions from the reasonably foreseeable power plant projects, and the additional three years of past cumulative impacts (2007 through 2009). Table 6-125 presents the GHG emissions from the cumulative scenario with Alternative E and the GHG emissions from the cumulative scenario with the proposed project.

As explained above, cumulative GHG emissions from Alternative E are considered to be cumulatively considerable and, therefore, would contribute to significant adverse climate change impacts.

**TABLE 6-125**  
**Proposed Project and Alternative E – Cumulative Greenhouse Gas Emissions**

Attainment Year Periods	TOTAL GHG Emissions (million MT CO <sub>2</sub> eq /year)
<b>Cumulative With Proposed Project</b>	
2007-2014	11.98
2007-2023	21.61
2007-2030	29.13
<b>Cumulative With Alternative E</b>	
2007-2014	9.96
2007-2023	14.99
2007-2030	18.60

1.

## LEAST TOXIC ALTERNATIVE

In accordance with SCAQMD’s policy document, Environmental Justice Program Enhancements for FY 2002-03, Enhancement II-1 recommends that all EIR equivalent CEQA documents for SCAQMD regulatory projects include an analysis of a potentially feasible project alternative with the lowest air toxics emissions. In other words, at least one alternative, where feasible, shall be considered from a “least harmful” perspective with regard to hazardous air pollutant emissions.

The proposed project, may result in siting, constructing and operating new and modified sources (see Chapter 5). Future facilities that qualify for exemptions pursuant to Rule 1304 or that are eligible for offsets from the priority reserve could emit air toxics in addition to VOCs and criteria pollutants, although air toxics would continue to be stringently regulated pursuant to Regulation XIV rules, in particular Rule 1401 – New Source Review of Toxic Air Contaminants.

Projects exempt from offsets pursuant to Rule 1304 or that obtain offsets pursuant to Rule 1309.1 vary in size, location and operation type. Because toxicity of different air toxics may vary widely, toxic emissions are not necessarily size dependent and could be emitted from both small and large businesses.

With regard to localized air toxics effects, all alternatives have the potential to generate significant cancer and non-cancer health effects because it is expected that similar types and sizes of facilities would be constructed in the future under the proposed project and all alternatives.

With regard to a regional evaluation of cancer and non-cancer effects of the alternatives shown in Tables 6-126, 6-127, and 6-128, Alternative A, the No Project Alternative is the least toxic alternative. Of the remaining alternatives, Alternative D is concluded to be the least toxic alternative for the following reasons. Alternative D is projected to generate the lowest regional cancer risk and cancer burden for the most number of milestone years. Similarly, Alternative D has lower or equivalent regional chronic hazard impacts for more milestone years than the other alternatives. Based on the results in Tables 6-126 through 6-128, Alternative D is considered to be the least toxic alternative because it has the lowest overall air toxics impacts for most milestone years.

## **CONCLUSION AND ENVIRONMENTALLY SUPERIOR ALTERNATIVE**

Pursuant to CEQA Guidelines §15126.6(e)(1), a CEQA document should identify an environmentally superior alternative. If the environmentally superior alternative is the “no project” alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives. The following paragraphs discuss the various characteristics of the project alternatives and identify the environmentally superior alternative.

Environmentally, adopting Alternative A would avoid the significant adverse air quality and greenhouse gas impacts that are projected to occur under the proposed project. However, since future affected facilities would not be able to modernize their equipment, some beneficial air quality projects also would not occur. Further, as discussed in Chapter 7, Alternative A would result in greater effects on water supply, wastewater treatment capacity and public services than the proposed project because Alternative A would hinder construction of new and expanded essential public services to accommodate anticipated population growth.

**Table 6-126**  
**Alternatives' Cancer and Non-cancer Impacts – 2014**

		<b>Cancer Risk Reduction not Achieved<sup>a</sup></b>	<b>Cancer Burden Reduction not Achieved</b>	<b>Chronic Health Index Not Achieved</b>	<b>Acute Health Index Not Achieved</b>

<sup>a</sup> Additional cases of cancer in a population of one million individuals.

<sup>b</sup> Alternative A is considered to be the baseline, so cancer and non-cancer impacts are considered to be zero, while the impacts of the proposed project represent benefits forgone compared to Alternative A.

Since the No Project Alternative is concluded to be the environmentally superior alternative, an environmentally superior alternative must be identified among the remaining alternatives.

Implementing Alternative B could potentially generate a little over three million dollars to more than 400 million dollars of user fees per pollutant, depending on the milestone year period and through 2030 (Table 6-23). User fees would be used to fund emission

reduction projects. Emission reductions achieved using the offset user fees would not be allowed to create credits that would be returned to the SCAQMD's offset accounts to replace offsets used to demonstrate equivalency with federal offset requirements. Instead, emission reductions generated by the offset user fees would be retired for the benefit of the environment. Alternative B has the potential to produce substantial air quality (see, for example Tables 6-25, 6-26, and 6-129) benefits as well as visibility, and greenhouse gas benefits compared to the proposed project and the remaining project alternatives.

With regard to indirect impacts for the non-air quality topic areas, Alternative B would generate greater impacts than the proposed project for the following reasons. Although Alternative B would result in providing offsets for the same number and types of facilities as the proposed project, emission reduction projects funded by the user fees could also generate additional indirect impacts to each environmental topic area. Significant adverse indirect impacts from Alternative B are also expected to be greater than the indirect impacts from Alternative C, D, and E as explained below.

**TABLE 6-129

<b>Alternative E - Tons per Day</b>						
2014	14.1	1.03	0.1	1	0.44	0.28
2023	25.04	1.71	0.27	2.77	1.44	0.91
2030	30.08	2.18	0.39	3.81	2.24	1.42

The main difference between Alternative C and the proposed project is that Alternative C would prohibit the SCAQMD from offsetting emission increases from large businesses using offsets from the SCAQMD's internal offset accounts. In effect, this means that large business would no longer qualify for exemptions from federal offset requirements pursuant to Rules 1304 and 1309.1. Air quality and greenhouse gas impacts resulting from Alternative C, would be less than the proposed project, but still significant, because fewer facilities would qualify for the exemptions from federal offset requirements in Rules 1304 and 1309.1. The air quality, health, greenhouse gas impacts resulting from Alternative C would be greater than the air quality, health, and greenhouse gas impacts from Alternatives B, D and E but less than the proposed project.

The analysis of indirect impacts in Chapter 7 assumes that the magnitude of the indirect impacts is positively correlated with the number of facilities receiving permits pursuant to Rule 1304. As a result, since Alternative C would prohibit applying offsets from its offset accounts to large businesses, it is assumed that fewer facilities would be constructed and operated in the future that could generate significant adverse indirect environmental impacts.

As with other project alternatives, Alternative D differs from the proposed project in one major aspect. Alternative D would eliminate the SCAQMD's existing offset accounts and only credits generated starting in the year 2009 and beyond could be used as offsets

for facilities that qualify for the offset exemption in Rules 1304 and 1309.1. Offsets for facilities seeking an exemption from offset requirements pursuant to Rules 1304 and 1309.1 could only be provided in the amounts that accrue each year. If offsets are not available in the amounts that would satisfy all facility operators seeking offset exemptions, permitting for those facilities where the SCAQMD cannot provide sufficient offsets would cease until such time as offsets become available. If all offsets are not used in the year they are generated, they would roll-over to the next year. Air quality information for Alternative D shows that it has the least air quality, visibility, and greenhouse gas impacts among the alternatives, other than Alternative A. Alternative D would reduce impacts from SO<sub>x</sub> and PM<sub>10</sub> emissions to a less-than-significant level.

Alternative D would also result in fewer indirect impacts than the other project alternatives because it would not enable growth in the industry categories that otherwise would receive permits under Rules 1304 and 1309.1. However, Alternative D would result in greater cumulative effects on water supply, wastewater treatment capacity and public services than the proposed project and other project alternatives because it would hinder construction of new and expanded essential public services needed to accommodate population growth.

The main difference between Alternative E and the proposed project is that Alternative E would establish an offset cap equal to 50 percent of the offset cap established for the proposed project. As shown in tables 6-100 and 6-101, emissions from the AQMP growth projections would be 50 percent of the AQMP growth projections of the proposed project, while emissions reductions from shutdowns of currently permitted sources obtaining offsets from SCAQMD offset accounts would be the same for both Alternative E and the proposed project. Based on the information in Tables 6-100, 6-101, and 6-129, fewer offsets would be available to provide exemptions from federal offset requirements pursuant to Rules 1304 and 1309.1. As a result, fewer future facilities would be constructed and built compared to the proposed project. Alternative E would have fewer air quality impacts than the proposed project and Alternative C.

With regard to indirect impacts, Alternative E would result in fewer facilities constructed in the future compared to the proposed project and Alternatives B and C. As a result indirect impacts from Alternative E would be less compared to the proposed project and Alternatives B and C. However, because Alternative E would restrict use of offsets available to essential public services, it could result in greater impacts to water supply, wastewater treatment capacity and public services than the proposed project, and Alternatives B and C.

Based on the above information, Alternative D is concluded to be the environmentally superior alternative. Alternative D has the potential to result in substantially lower air quality, health, and greenhouse gas impacts for most milestone years than the proposed project and the other project alternatives.

## **CHAPTER 7**

---

### **ALTERNATIVES -- INDIRECT IMPACTS**

**Introduction**

**Alternatives Rejected as Infeasible**

**Description of Alternatives**

**Evaluation of the Comparative Effects of the Project Alternatives**

---

## **INTRODUCTION**

As indicated in Chapter 6, this chapter provides a discussion of indirect impacts of the alternatives, as compared to the proposed project. To provide an analysis of impacts from the alternatives consistent with the analysis of impacts from the proposed project, the analysis of air quality, visibility and greenhouse gas impacts from the project alternatives is included in Chapter 6 (see Subchapter 4.1 of this PEA for the analysis of the same impacts from the proposed project). The analysis of indirect impacts from the project alternatives can be found in this chapter of the PEA (see the subchapters in Chapter 5 of this PEA for the analysis of indirect impacts from the proposed project). This format enables the reader to compare all environmental effects of the project alternatives with all environmental effects of the proposed project.

Chapter 6 includes discussions of the various CEQA requirements for an alternatives analysis. Rather than repeat information in Chapter 6, the descriptions of the alternatives have been summarized in the following subsections.

### **Alternatives Rejected as Infeasible**

Chapter 6 explains why the following alternatives have been considered, but have not been carried forward for more detailed analysis:

- Prohibit the Use of Offsets from Shutdowns or Reductions at Minor Sources to Demonstrate Equivalency with Federal Offset Requirements;
- Pre-Rule 1315 Offset Tracking;
- Fossil Fueled Power Plant Project Alternative;
- Other Alternatives Suggested by the Superior Court; and
- Issue Offsets to Priority Projects First.

The main reasons the alternatives were rejected as infeasible was because they were not consistent with, or would not achieve, the project objectives. In addition, some of the rejected alternatives would be expected to avoid few impacts, if any, compared to the proposed project.

## **DESCRIPTION OF PROJECT ALTERNATIVES**

Detailed descriptions of the project alternatives are provided in Chapter 6. Summaries of the components of the proposed project and the five project alternatives are provided in Tables 6-3 in Chapter 6 and 7-1. As a reminder, when considering approval of the proposed project, the SCAQMD's Governing Board may choose all of or portions of any of the alternatives analyzed as well as variations on the alternatives.

**TABLE 7-1**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> (Key Components)	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limit Offset Availability
<b><i>Project Description Summaries</i></b>					
PR 1315 would specify the tracking system used to demonstrate equivalency with federal offset requirements. It would track offset use and establish caps on net emissions increases from issuance of permits under Rules 1304 and 1309.1 based on 2007 AQMP growth projections for applicable industry categories.	Neither the proposed project nor Alternatives B through D adopted. SB827 would allow issuance of permits under Rules 1309.1 and 1304 from January 1, 2010 until May 1, 2012, at which time permits would not be issued under Rules 1309.1 or 1304. AB 1318 and pending SB 388 could allow credits transferred to qualifying power plants until 5/1/12 and 1/1/13, respectively.	Would specify the tracking system to demonstrate equivalency with federal offset requirements. Offsets subject to fees for large businesses that qualify for permits under Rule 1304. Fees would be used for emission reduction projects. Otherwise, includes same components including caps on net emission increases. Mitigation projects could not create new offsets.	Would establish a tracking system to demonstrate equivalency with federal offset requirements. Large businesses would be prohibited from accessing the SCAQMD's internal accounts. Otherwise, includes same components as proposed project, including caps on net emission increases.	Would establish a tracking system to demonstrate equivalency with federal offset requirements. Would eliminate the SCAQMD's existing internal account balances. SCAQMD's internal accounts would only be funded by credits generated starting in 2009. Otherwise, includes same components as proposed project, including caps on net emission increases.	Would specify the tracking system to demonstrate equivalency with federal offset requirements. Caps on net emission increases established at 50% of the 2007 AQMP growth projections for the applicable industry categories. . Otherwise, includes same components as proposed project.
<b><i>Purpose (Subdivision a)</i></b>					
Maintain ability to continue to issue permits to major and minor sources for facility modernization and to accommodate population growth (implement Rules 1304 and 1309.1), memorialize procedures for demonstrating equivalency; & demonstrate sufficient credits available to demonstrate equivalency.	Rule 1315 not adopted, so sources could not obtain offsets from Rules 1309.1 or 1304 after May 1, 2012. SCAQMD would not maintain internal accounts.	Same as proposed project.	Same as proposed project. However, large businesses would no longer qualify for offset exemptions pursuant to Rule 1304.	Same as proposed project. However, only offsets generated from the year 2009 on could be used.	Same as proposed project.

**TABLE 7-1 (Continued)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b><i>Definitions Subdivision b)</i></b>					
Community Bank Net Emission Increase Offset Ratio Orphan Reduction Orphan Shutdown Priority Reserve Shortfall	Rule 1315 not adopted so no definitions	Same as proposed project, plus: Large Business	Same as proposed project, plus: Large Business	Same as proposed project.	Same as proposed project.
<b><i>Federal NSR Equivalency (Subdivision c)</i></b>					
Maintain a separate District offset account for each federal nonattainment air contaminant	Rule 1315 not adopted so no tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Annually track all emissions offsets provided to major sources from internal accounts.	Rule 1315 not adopted so no tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Annually track all eligible credits deposited in SCAQMD's internal accounts	No annual tracking because equivalency demonstration with federal offset requirements not necessary as SCAQMD would not provide offsets pursuant to Rules 1304 and 1309.1 and would not maintain internal accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 7-1 (Continued)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
Deposit appropriate emission reductions in SCAQMD's internal accounts.	Emission reductions no longer deposited into SCAQMD's internal accounts	Same as proposed project.	Same as proposed project.	Eliminate credits in existing internal accounts. Only deposit credits from major and minor sources generated after 2009.	Same as proposed project.
All unused credits in the federal offset accounts shall be discounted annually.	No tracking of federal offset accounts.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b><i>Net Emission Increases (Subdivision d)</i></b>					
All increases in potential to emit (PTE) that occur at minor sources pursuant to Rule 1304 and Rule 1309.1 shall be tracked and not constitute debits	Tracking increases in PTE not necessary.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Cumulative net emission increases shall be included in the Executive Officer's report to the Governing Board	No Report to the Governing Board required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 7-1 (Continued)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b><i>Federal NSR Equivalency Reports (Subdivision e)</i></b>					
The Executive Officer shall aggregate and track offsets debited from and offsets provided to the SCAQMD offset accounts into specific reporting periods	No offsets from or credits to SCAQMD offset accounts and no reporting periods.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Complete Preliminary Determination of Equivalency (PDE) with federal non-attainment NSR offset requirements 12 months after reporting period.	PDE is not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Complete Final Determination of Equivalency (FDE) with federal non-attainment NSR offset requirements for any account(s) for which the PDE did not demonstrate equivalence with 18 months after reporting period.	FDE is not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 7-1 (Continued)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
<b><i>Projections of Federal Offset Balances (Subdivision f)</i></b>					
PDEs & FDEs shall also include projections of the federal offset account balances at the end of each of the two subsequent reporting periods.	PDE and FDE are not required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b><i>Equivalency Backstop Provisions (subdivision g)</i></b>					
Discontinue funding the Priority Reserve if the most recent actual District offset account balances (from FDE) demonstrate a shortfall for any air contaminant.	Internal accounts no longer used so no shortfalls will occur.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Resume funding upon completion of FDE demonstrating no more shortfalls.	Internal accounts no longer used so no FDE required to demonstrate no shortfall.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
Discontinue issuing permits that rely on 1304 or 1309.1 for the air pollutants that have a shortfall.	Internal accounts no longer used so no more shortfalls.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.

**TABLE 7-1 (Continued)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project Key Components</b>	<b>Alternative A No Project</b>	<b>Alternative B Offset User Fees for Large Businesses</b>	<b>Alternative C Large Businesses Prohibited from Accessing Rule 1304 Exemptions</b>	<b>Alternative D Use of Credits Generated in 2009 and Beyond Only</b>	<b>Alternative E Limited Offset Availability</b>
If an FDE demonstrates that a shortfall exists in any of the SCAQMD offset accounts or a subdivision (f) projection predicts a shortfall, the Executive Officer shall prepare a report to the Governing Board recommending implementation of one or more backstop provisions as needed to correct the shortfall	No FDE required.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b><i>CEQA Backstop Provisions (subdivision h)</i></b>					
If the cumulative net emission increase of a nonattainment air contaminant exceeds the cap for that air contaminant, the Executive Officer shall discontinue issuing permits to construct and permits to operate that rely on new offsets from SCAQMD's internal accounts.	No internal accounts, therefore, no cumulative net increases from affected facilities.	Same as proposed project	Same as proposed project	Same as proposed project.	Same as proposed project.

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
Pollutant-specific cumulative net emission increase thresholds are established based on the 2007 AQMP-forecasted growth in emissions from industry categories potentially eligible to receive permits under Rules 1304 and 1309.1	No air contaminant-specific cumulative net emission increase thresholds established	Same as proposed project.	Same as proposed project.	Same as proposed project.	Pollutant-specific cumulative net emission increase thresholds are established based on 50% of the 2007 AQMP-forecasted growth in emissions from industry categories potentially eligible to receive permits under Rules 1304 and 1309.1
<b>State Implementation Plan Submittals (subdivision i)</b>					
Net emission increase definition, cumulative net emission increases & projected cumulative net emission increases, as well as, Rule 1315 requirements for net emissions increases and CEQA backstop provisions shall not be submitted for inclusion in the SIP.	No backstop provisions.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project.
<b>Alternatives Components</b>					
Cumulative net emissions increases capped at 2007 AQMP growth projections for industry categories potentially eligible to receive permits under Rules 1304 and 1309.1.	No debits available.	Same as proposed project.	Same as proposed project.	Same as proposed project.	Same as proposed project except caps at 50 % of 2007 AQMP growth projections for industry categories potentially eligible to receive permits under Rules 1304 and 1309.1.

**TABLE 7-1 (Concluded)**  
**Comparison of Key Components of the Proposed Project to the Alternatives**

<b>Proposed Project</b> Key Components	<b>Alternative A</b> No Project	<b>Alternative B</b> Offset User Fees for Large Businesses	<b>Alternative C</b> Large Businesses Prohibited from Accessing Rule 1304 Exemptions	<b>Alternative D</b> Use of Credits Generated in 2009 and Beyond Only	<b>Alternative E</b> Limited Offset Availability
All credits generated each year available as offsets in the future	No credits available.	Same as proposed project.	Same as proposed project.	Existing balances in internal accounts eliminated. Only credits generated from 2009 on could be used as offsets in the future.	Same as proposed project.
Large businesses have access to offsets in the SCAQMD's internal accounts (no change from pre-Rule 1315 situation).	No offset accounts available to any businesses.	Large businesses must pay a fee to access the SCAQMD's internal accounts to qualify for Rule 1304 exemptions.	Large businesses prohibited from access to Rule 1304 exemption from offsets, therefore, offsets unavailable for these sources.	Same as proposed project.	Same as proposed project.
No Fees for large businesses.	No fees.	Includes large business user fee for access to Rule 1304 exemptions; fees to be used for emission reduction projects.	No large business user fees as large businesses would not qualify for exemptions under Rule 1304.	Same as proposed project.	Same as proposed project.
<b><i>Proposed Amended Rule 1309.2 – No Longer Part of the Proposed Project, Rescinded February 5, 2010</i></b>					

In this chapter (indirect impacts of the alternatives), the No-Project Alternative includes the impacts of permits approved pursuant to SB 827 until that bill's sunset date of May 1, 2012. SB 827 is independent of the proposed project and will remain in effect regardless of whether the project is adopted. SB 827 authorizes the SCAQMD to issue permits in reliance on its internal accounts for sources that are exempt from offsets under SCAQMD Rule 1304 and for projects that are essential public services receiving offsets from the Priority Reserve under Rule 1309.1. These are the same types of sources that will be eligible to receive offsets pursuant to those two rules if Rule 1315 is readopted pursuant to the project and approved by EPA. Therefore, the indirect impacts of the no-project alternative are similar to the indirect impacts of the project until May 1, 2012.

By contrast, in Chapter 4 (direct impacts of the project), and Chapter 6 (direct impacts of the alternatives), the analysis of the No-Project alternative does not include air quality, visibility and greenhouse gas impacts of approving permits under SB 827 from July 1, 2010 forward. Instead, all air quality, visibility and greenhouse gas impacts occurring from permits relying on the SCAQMD's internal accounts beginning in July 2010 are attributed to the proposed project.

## **EVALUATION OF THE COMPARATIVE EFFECTS OF THE PROJECT ALTERNATIVES**

Indirect impacts from the proposed project (Chapter 5) were concluded to be significant for all topic areas either because one or more CEQA documents for representative projects concluded there would be significant impacts or because there could be unique circumstances or unique locations for facilities containing permitted sources that could result in significant impacts. For the same reasons, indirect impacts of all project alternatives could also be significant. Therefore, the analysis and comparison of alternatives in this PEA presents a qualitative conclusion as to whether the impacts of each alternative in each topic area would be more or less significant than the proposed project. Table 7-2 summarizes potential indirect impact conclusions for each alternative by environmental topic area.

The analysis of indirect impacts relies on use of offsets from the SCAQMD's internal accounts. This information, however, doesn't indicate how many facilities would be built in the future. For the purposes of this analysis it is assumed that air quality impacts are proportional to the number of facilities constructed and operated in the future. For example, the greater the air quality impacts, the greater the number of facilities constructed and operated in the future, and the greater the potential for indirect impacts.

**TABLE 7-2**

<b>VII. Geology and Soils</b>					
a. Expose people to risks from earthquakes, liquefaction or landslides	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant;</b> greater than PR1315. <b>Cumulative impacts: Significant;</b> greater than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.
b. Result in substantial soil erosion	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant;</b> greater than PR1315. <b>Cumulative impacts: Significant;</b> greater than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.
c. Locate project on unstable soil	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant;</b> greater than PR1315. <b>Cumulative impacts: Significant;</b> greater than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.
d. Locate project on expansive soil	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant;</b> greater than PR1315. <b>Cumulative impacts: Significant;</b> greater than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.
e. Incapable to support use of septic tanks/ alternative wastewater disposal systems	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant;</b> greater than PR1315. <b>Cumulative impacts: Significant;</b> greater than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.	<b>Project-specific impacts: Significant;</b> less than PR1315. <b>Cumulative impacts: Significant;</b> less than PR1315.

<b>VIII. Hazards and Hazardous Materials</b>					
a. Create hazards through transport, use, or disposal of hazardous materials	<b>Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.
b. Create hazard through upset/accident conditions from release of hazardous materials	<b>Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.
c. Emit hazardous emissions or material within ¼-mile of a nearby school	<b>Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.
d. Located on hazardous material site (pursuant to Gov Code §65962.5)	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.
e. Located within airport land use plan or within two miles of a public airport resulting in hazards to those in area	<b>Significant</b> through 5/1/2012; no impacts thereafter.	<b>Project-specific impacts: Significant</b> ; greater than PR1315. <b>Cumulative impacts: Significant</b> ; greater than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.	<b>Project-specific impacts: Significant</b> ; less than PR1315. <b>Cumulative impacts: Significant</b> ; less than PR1315.

**TABLE 7-2 (Continued)**

## **Aesthetics**

### **Proposed Project**

The analysis in Subchapter 5.1 concludes that the proposed project has the potential to generate significant adverse aesthetics impacts. Although CEQA documents for representative facilities identified several mitigation measures that have the potential to reduce future indirect aesthetics impacts resulting from facilities containing stationary sources such mitigation measures are not within the jurisdiction of the SCAQMD to implement. Mitigation of aesthetic impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant aesthetic impact, the potential exists for future indirect aesthetic impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Scenic Vista***

The analysis of potentially significant adverse scenic vista impacts from the proposed project was based on the review of 52 CEQA documents prepared for past projects that represent projects in all nine primary categories for facilities that may be eligible to receive permits under Rules 1304 and 1309.1. The survey of the 52 CEQA documents shown in Table 5.1-1 revealed that the following primary facility categories would significantly adversely affect scenic vistas: retail/services facilities (document #5); large commercial facilities (document #13); entertainment/recreational facilities (documents #21 and #22); and utility facilities (documents #44 and #45). The CEQA documents for the remaining primary facility categories: agricultural facilities; institutional facilities; transportation facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse scenic vista impacts. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on scenic vistas, it was concluded that the proposed project would create significant adverse indirect impacts on scenic vistas.

### ***Scenic Resources***

The survey of the 52 CEQA documents shown in Table 5.1-1 revealed that only one primary facility category, entertainment/recreational facilities (#22), would significantly adversely affect scenic resources. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse scenic resources impacts. Based on the results of the CEQA document survey

and the possibility that future individual projects in all of these facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on scenic resources, it was concluded that the proposed project would create significant adverse indirect impacts on scenic resources.

### ***Visual Character***

The survey of the 52 CEQA documents shown in Table 5.1-1 revealed that the following primary facility categories would significantly adversely affect local visual character: large commercial facilities (documents #16 and #17); entertainment/recreational facilities (#21 and #22); institutional facilities (documents #28 and #34); transportation facilities (document #40); and utility facilities (documents #44 and #45). The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; institutional facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse visual character impacts. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could create significant adverse indirect impacts on visual character, it was concluded that the proposed project would create significant adverse indirect impacts on visual character.

### ***Light/Glare***

The survey of the 52 CEQA documents shown in Table 5.1-1 revealed that the following primary facility categories would create significant adverse light and glare impacts: retail/services facilities (documents #5, #6, and #8); large commercial facilities (documents #16, #17, and #19); and entertainment/recreational facilities (#21 and #22). Light and glare impacts were generally related to lighting parking lots, live performance venues, etc. The CEQA documents for the remaining primary facility categories: agricultural facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse light or glare impacts. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could create significant adverse light and glare impacts, it was concluded that the proposed project would create significant adverse indirect light and glare impacts.

### ***Cumulative Impacts***

Project impacts to visual resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law.

It was concluded that the proposed project would make a cumulatively considerable contribution to significant impacts to visual resources.

### **Alternative A - No Project Alternative**

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets from January 1, 2010 through May 1, 2012. In addition, it is reasonably foreseeable that three new power plants could be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project

Under the No Project Alternative, it is assumed that facilities that previously relied on access to the SCAQMD's internal accounts in the past to demonstrate equivalency with federal offset requirements, through either Rule 1304 or Rule 1309.1, would no longer have access to those offsets when applying for a permit for new or modified equipment. Although these facilities could potentially obtain credits on the open market, these offsets, if available, would likely be unaffordable to most facilities. As a result, the analysis in this PEA assumes that no facilities that would have obtained offsets pursuant to Rules 1304 or 1309.1 would be built after May 1, 2012.

Since it is assumed that, starting May 1, 2012, future facilities that would have obtained offsets from the SCAQMD's internal accounts would not be constructed and operated under the No Project Alternative, impacts to aesthetics resources, in general, would not be expected to occur after May 1, 2012, and would be less than the significance determination for the proposed project.

### ***Scenic Vista***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets from January 1, 2010 through May 1, 2012. In addition, it is reasonably foreseeable that three new power plants could be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, scenic vista impacts are considered to be significant. Starting May 1, 2012, projects that previously

would have had access to the SCAQMD's internal accounts would no longer have access to these sources of offsets. Therefore, after May 1, 2012 potential adverse indirect impacts to scenic vistas in the district would be relatively small compared to the proposed project, so under the No Project Alternative scenic vista impacts would not be expected to occur after May 1, 2012, and would be less than the significance determination for the proposed project.

### ***Scenic Resources***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets from January 1, 2010 through May 1, 2012. In addition, it is reasonably foreseeable that three new power plants could be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, scenic resources impacts are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be little or no change to scenic resources as a result of implementing Alternative A, so significant scenic vista impacts would not be expected to occur after May 1, 2012, and would be less than the significance determination for the proposed project.

### ***Visual Character***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets from January 1, 2010 through May 1, 2012. In addition, it is reasonably foreseeable that three new power plants could be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, visual character impacts are considered to be significant. Starting May 1, 2012, future facilities that

would have had access to the SCAQMD's internal accounts would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be few, if any, changes to visual character as a result of implementing Alternative A, so visibility impacts under the No Project Alternative would not be expected to occur after May 1, 2012, and would be less than the significance determination for the proposed project.

### ***Light/Glare***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets from January 1, 2010 through May 1, 2012. In addition, it is reasonably foreseeable that three new power plants could be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, light/glare impacts are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no new facilities that rely on offsets from the SCAQMD's internal offset and that could produce light and/or glare impacts are assumed to be constructed and operated. Consequently, light and glare conditions in the district would not change compared to the proposed project, so light and glare impacts would not be expected to occur after May 1, 2012, would not be significant, and would be less than the significance determination for the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

Alternative B would impose user fees on large businesses that qualify for an exemption from federal offset requirements under Rule 1304 exemption. User fees would be used to fund emission reduction projects, with preference given to locating the emission reduction projects in the vicinity of the new or modified facility.

Typical types of emission reduction projects that could be funded by the offset user fees under Alternative B are identified in Table 7-3. Although emission reduction projects funded by the offset user fees are intended to produce air quality benefits, it is recognized that they could generate potentially significant adverse secondary environmental impacts.

**TABLE 7-3**  
**Alternative B – Impacts from Potential Emission Reduction Projects**

Key to Impacts Identified in CEQA Document(s): S = Significant; LS = Less than Significant; LSM = Less-than-Significant with Mitigation; NE = Not Evaluated; N = No impacts; B = Beneficial

1. California Energy Commission. 2008. Final Staff Assessment Victorville 2 Hybrid Power Project Application for Certification (02-AFC-1) San Bernardino County. <http://www.energy.ca.gov/2007publications/CEC-700-2007-021/CEC-700-2007-021-FSA.PDF>. (250-acre solar thermal project generating 50 MW of electricity, part of a larger electricity generating project). (Note: LSM determination for operational air quality is based on mitigation for the non-solar portion of the project.)
2. City of Palm Springs and Bureau of Land Management. 2007. Mountain View IV Wind Energy Project EIS/EIR. [http://www.blm.gov/ca/st/en/fo/palmsprings/mtnview\\_windenergy.html](http://www.blm.gov/ca/st/en/fo/palmsprings/mtnview_windenergy.html). (The proposed 49 MW wind generation project consists of either 58 Gamesa Eolica G52 (850 kW) or 49 Mitsubishi Heavy Industries (MHI) 1000A (1,000 kW) wind turbine generators (WTG), padmounted electric transformers, ancillary facilities, gravel roads, underground and overhead interconnection lines, and an electrical substation.)
3. California Energy Commission. 2003. Final Staff Assessment Salton Sea Geothermal Unit #6 Power Project For Certification (07-AFC-2) Imperial County. [http://www.energy.ca.gov/sitingcases/saltonsea/documents/2003-08-05\\_FSA\\_1.PDF](http://www.energy.ca.gov/sitingcases/saltonsea/documents/2003-08-05_FSA_1.PDF). (80-acre geothermal steam power plant, associated water supply, production and reinjection wells and pads, brine pipelines, two 161 kV transmission lines). (Note: PM2.5 emissions were not evaluated.)

4. City of Banning. 2008 Draft EIR for City of Banning's Liberty XXIII Renewable Energy Power Plant Project, Liberty Energy Centre" (June 2008) prepared by Aspen Environmental. *(Liberty Energy is proposing to construct a new biomass power plant, which would include three power generation units (trains) to produce 15 MW (17.5 MW gross). The units would be fueled with a mixture of biosolids and biomass.)*
5. South Coast Air Quality Management District. 2009. Notice of Preparation and Initial Study (NOP/IS) for the Sunshine Gas Producers' Renewable Energy Project. <http://www.aqmd.gov/ceqa/nonaqmd.html>. (The proposed project consists of installing five gas turbines and ancillary equipment to generate renewable electricity using landfill gas that is currently being flared. Because the Draft Subsequent Environmental Impact Report has not yet been completed, circulated for public review, or finalized, results here are considered to be preliminary.)
6. Inland Empire Utilities Agency. 2001. Proposed Negative Declaration by the Inland Empire Utilities Agency for the On-site Dairy Digester/Chino 1 Desalter Power Generation Pilot Scale Project. *(IAUA has developed an organics management strategy for the Chino Basin and the Santa Ana River Basin and includes, for example, installing anaerobic digestion technology that would operate using biogas from dairy manure to produce 1.75 MW of electricity, 30 tons per day of organic fertilizer, and prevent 12 tons per day of salts/nitrates from entering the groundwater. In total, all projects that are part of the organics management strategy have the potential to generate up to 50MW of electricity.)*

Initial Statement of Reasons Proposed Clean On-road School Bus Regulation for School Buses Operating in the South Coast Air Quality Management District. <http://www.arb.ca.gov/regact/scschl05/isor.pdf>. (If funding is not available to purchase alternative fuel school buses that meet the emission limits prescribed in the regulation, then the school bus fleet operator may purchase a new bus not meeting the best requirements providing the bus purchased is equipped with a California-certified engine meeting a PM standard of 0.01 g/bhp-hr through use of a particulate filter.)
10. South Coast Air Quality Management District. 2000. Final Program Environmental Assessment for: Proposed Fleet Vehicle Rules and Related Rule Amendments. <http://www.aqmd.gov/ceqa/documents/2000/aqmd/finalEA/1190/1190FEA.html>. *(Significance conclusions reflect impacts from converting fleet vehicles to alternative clean fuels and impacts from refinery modifications to produce low sulfur diesel.)*
11. <sup>a</sup> South Coast Air Quality Management District. 2008. Final Environmental Assessment for: Proposed Rule 2449 – Control of Oxides of Nitrogen Emissions from Off-Road Diesel Vehicles. <http://www.aqmd.gov/ceqa/documents/2008/aqmd/finalEA/FEA2449.pdf>. *(PR 2449 would require owners of affected off-road fleets to apply for incentive funds by a deadline established by SCAQMD's program announcement. Affected fleets which are in-use off-road diesel vehicle fleets with over 20,000 hp and over 40 percent of their statewide fleet consisting of Tier 0 and Tier 1 engine ratings as of January 1, 2008.)*  
<sup>b</sup> California Air Resources Board. 2007. Technical Support Document: Proposed Regulation for In-use Off-road Diesel Vehicles. Note: CARB identified a slight increase in NOx emissions from some control technologies, but, overall, the regulation reduces NOx emissions from affected vehicles.
12. South Coast Air Quality Management District. 2008. Final Environmental Assessment: Proposed Amended Rule 1110.2 – Emissions from Gaseous- and Liquid-Fueled Internal Combustion Engines (ICEs). <http://www.aqmd.gov/ceqa/documents/2008/aqmd/finalEA/1110.2/FinalEA.pdf>. *(PAR 1110.2 Would reduce NOx, VOC and CO emissions from gaseous and liquid-fueled ICEs, which may include replacing diesel ICEs with microturbines. Several other replacement technologies were analyzed, but results in the table are only for microturbines.)*

13. California Air Resources Board. 2004. Staff Report: Initial Statement of Reasons for Proposed Rulemaking, Proposed Regulatory Amendments Extending the California Standards for Motor Vehicle Diesel Fuel to Diesel Fuel Used in Harborcraft and Intrastate Locomotives. <http://www.arb.ca.gov/regact/carblohc/isor.pdf>. (CARB staff required that, beginning January 1, 2007, diesel fuel sold, supplied, or offered for sale to California intrastate locomotive operators statewide be required to meet the specifications for vehicular diesel fuel. CARB is investigating means to encourage the early introduction of Tier II locomotives in the rest of the state.)
14. Federal Energy Regulatory Commission and Port of Long Beach. 2004. Draft EIS/EIR for the SES Long Beach LNG Import Project” (October 2005) prepared by Port of Long Beach and Federal Energy Regulatory Commission. (The proposed project consists of constructing and operating a liquefied natural gas (LNG) receiving terminal and associated facilities in the Port of Long Beach as a place of entry for the importation of LNG.)
15. No CEQA documents identified.
16. Port of Los Angeles. 2008. Draft Subsequent Environmental Impact Statement/Supplemental Environmental Impact Report for the Pacific L.A. Marine Terminal LLC Crude Oil Terminal . [http://www.portoflosangeles.org/EIR/PacificLAMarine/SEIR/seir\\_pacificLA\\_marine.asp](http://www.portoflosangeles.org/EIR/PacificLAMarine/SEIR/seir_pacificLA_marine.asp). (The proposed Project would include construction and operation of a new marine terminal 15 at Berth 408 on Pier 400 (Marine Terminal), new tank farm facilities. In addition, the proposed project includes an alternative maritime power (AMP) System, which focuses on reducing emissions from vessels docked at the Port by allowing vessels to “plug in” and utilize electricity generated by onshore sources (not fuel cells) rather than using onboard diesel-fueled generators. This practice is termed alternative marine power (AMP). The Port would build the infrastructure (i.e., pile supported platform) necessary to support AMP as an element of the proposed Project. AMP means impact conclusion is for the AMP portion of the project. Otherwise, impact determinations are for the entire project, not just the AMP project.)
17. California Air Resources Board. 2008. Staff Report: Initial Statement of Reasons for Proposed Regulation for In-use On-road Diesel Vehicles. <http://www.arb.ca.gov/regact/2008/truckbus08/tbisor.pdf>. (This regulation would achieve NOx and PM emission reductions by requiring fleet owners to modernize their fleets and install exhaust retrofits.)
18. South Coast Air Quality Management District. 2008. Final Environmental Assessment: Proposed Amended Rule 1110.2 – Emissions from Gaseous- and Liquid-Fueled Internal Combustion Engines (ICEs). <http://www.aqmd.gov/ceqa/documents/2008/aqmd/finalEA/1110.2/FinalEA.pdf>. (PAR 1110.2 Would reduce NOx, VOC and CO emissions from gaseous and liquid-fueled ICEs, which may include replacing diesel ICEs with alternative fuel engines, primarily liquefied natural gas (LNG). Several other replacement technologies were analyzed, but results in the table are only for alternative fuel engines.)
19. South Coast Air Quality Management District. 2009. Final Program Environmental Assessment for: Proposed Rule 2702 – Greenhouse Gas Reduction Program. [http://www.aqmd.gov/ceqa/documents/2009/aqmd/finalEA/FPEA\\_2702.pdf](http://www.aqmd.gov/ceqa/documents/2009/aqmd/finalEA/FPEA_2702.pdf). (PR2702 establishes a greenhouse gas (GHG) reduction program where participants can pay fees to the SCAQMD and the SCAQMD will use the fees for GHG reduction projects using adopted protocols, including leaf blower and lawn mower exchanges to replace gasoline powered lawn mowers with electric lawn mowers and high polluting two-stroke leaf blowers with low polluting four-stroke leaf blowers. Impacts are based on impacts from the lawn mower and leaf blower exchanges only.)

To address secondary adverse environmental impacts that could be generated by future emission reduction projects, SCAQMD staff surveyed 16 CEQA documents for projects that are comparable to the emission reduction projects that could be funded by the user offset fees. The results of the survey, summarized in Table 7-3, have been used to identify potentially significant adverse indirect impacts from Alternative B.

### ***Scenic Vista***

The analysis of potential indirect scenic vista impacts as a result of implementing Alternative B is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified the following primary facility categories that would significantly adversely affect scenic vistas: retail/services facilities, large commercial facilities, entertainment/recreational and utility facilities. Due to their potential to be located in areas affecting scenic vistas, all primary facility categories were deemed to result in significant impacts to scenic vistas. Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar or fewer scenic vista impacts compared to the proposed project.

The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on scenic vistas. For example, a number of emission reduction projects could be located in or near scenic vistas, resulting in their degradation of scenic vistas. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons it is concluded that Alternative B would create significant adverse indirect impacts on scenic vistas equivalent to or greater than the proposed project. The contribution to cumulative scenic impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Scenic Resources***

The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely affect scenic resources. Due to their potential to be located in areas affecting scenic resources, all primary facility categories were deemed to result in significant impacts to scenic resources. Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar scenic resources impacts compared to the proposed project.

The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on scenic resources. For example, a number of emission reduction projects could be located in or near scenic resources, resulting in degradation of these scenic resources. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that the Alternative B would create significant adverse indirect impacts on scenic resources equivalent to or greater than the proposed project. The contribution to cumulative scenic resources impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Visual Character***

The analysis of potential indirect visual character impacts as a result of implementing Alternative B is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for visual character impacts from the proposed project identified the following primary facility categories that would significantly adversely affect visual character: large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and utility facilities. Due to their potential to be located in areas affecting visual character, all primary facility categories were deemed to result in significant impacts to visual character. Because the same types and members of facilities could be built under Alternative B, Alternative B would generate similar visual character impacts compared to the proposed project.

The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on visual character. For example, a number of emission reduction projects could be located in or near areas with unique or important visual character, resulting in degradation of visual character in affected areas. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters. However, these same types of projects would also be expected to reduce pollution, thus providing beneficial effects to air quality and the associated visual character in the district.

For the above reasons, it is concluded that the Alternative B would create indirect impacts on visual character resources equivalent to or greater than the proposed project. The contribution to cumulative visual character impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Light/Glare***

The analysis of potential indirect light and glare impacts as a result of implementing Alternative B is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for light and glare impacts from the proposed project identified the following primary facility categories that would cause significant adverse light and glare impacts: retail/services facilities, larger commercial facilities, and entertainment/recreational facilities. Due to their potential to be located in areas affecting light and glare, all primary facility categories were deemed to result in significant impacts to light and glare. Because the same types and members of facilities could be built under Alternative A, Alternative B would generate similar light and glare impacts compared to the proposed project.

The main difference between Alternative B and the proposed project is Alternative B also would result in effects of light and glare from potential future emission reduction projects. For example, a number of emission reduction projects could create significant adverse light and glare impacts. Such projects include, but are not limited to: construction of anaerobic digesters, and construction of alternative fuel fueling stations.

For the above reasons, it is concluded that the Alternative B would create significant adverse indirect light and glare impacts equivalent to or greater than the proposed project. The contribution to cumulative light or glare impacts from Alternative B is expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C- Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

Alternative C is similar in most respects to the proposed project except that large businesses would be prohibited from qualifying for an exemption from offset requirements through Rule 1304. Since Alternative C would prohibit large businesses from qualifying for exemptions pursuant to Rule 1304, they would likely have to obtain credits on the open market. To provide a conservative analysis relative to impacts compared to the proposed project, it is assumed that there will not be an increase in the use of credits from Alternative C on the open market.

Offsets debited from the SCAQMD's internal accounts for large businesses represent a small percentage of the total number of offsets debited from the SCAQMD's internal accounts for all sources. As a result, it is expected that Alternative C would result in slightly fewer facilities receiving permits in reliance on the SCAQMD's offset accounts.

### ***Scenic Vista***

The analysis of potential indirect scenic vista impacts as a result of implementing Alternative C is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified the following primary facility categories that would significantly adversely affect scenic vistas: retail/services facilities, large commercial facilities, entertainment/recreational and utility facilities. Due to their potential to be located in areas affecting scenic vistas, all primary facility categories were deemed to result in significant impacts to scenic vistas. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer scenic vista impacts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential scenic vista impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. Adverse scenic vista impacts are still expected to be significant because one project could potentially generate significant adverse scenic vista impacts. The contribution to cumulative indirect impacts to scenic resources from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Scenic Resources***

The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely affect scenic resources. Due to their potential to be located in areas affecting scenic resources, all primary facility categories were deemed to result in significant impacts to scenic resources. It is expected that the same type and number of primary facility categories under Alternative C would generate similar or fewer scenic resources impacts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential scenic resources impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. Adverse scenic resources impacts are still expected to be significant because any one project could potentially generate significant adverse scenic impacts. The contribution to cumulative indirect impacts to scenic resources from Alternative C would be significant, but less than the proposed project because fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Visual Character***

The survey of CEQA documents to evaluate the potential for visual character impacts from the proposed project identified the following primary facility categories that would significantly adversely affect visual character: large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and utility facilities. Due to their potential to be located in areas affecting visual character, all primary facility categories were deemed to result in significant impacts to visual character. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer visual character impacts compared to the proposed project.

Based on the above information, there would be fewer or less significant visual character impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to visual character in the district from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Light/Glare***

The survey of CEQA documents to evaluate the potential for light and glare impacts from the proposed project identified the following primary facility categories that would cause significant adverse light and glare impacts: retail/services facilities, larger commercial facilities, and entertainment/recreational facilities. Due to their potential to be located in areas affecting light and glare, all primary facility categories were deemed to result in significant impacts to light and glare. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer light and glare impacts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential light and glare impacts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. Adverse light or glare impacts are still expected to be significant because any one project could potentially generate significant adverse light or glare impacts. The contribution to cumulative indirect light and glare impacts from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

The primary effect of implementing Alternative D is that a fewer number of new credits would be available each year after adoption of this alternative compared to the proposed project. The reason fewer offsets would be available is as follows. Under Alternative D, all offsets in the SCAQMD's existing offset accounts would be eliminated. As a result, offsets from these accounts could not be used to demonstrate equivalency with federal offset requirements in the future. Only new credits generated in 2009 and succeeding years can be used as debits to for demonstrating equivalency with federal offset requirements. Because SCAQMD's previous offset accounts would be eliminated under Alternative D, debits could not exceed the number of new credits generated each year, thus, effectively capping the number of debits that can be issued per year to an amount less than the proposed project.

The analysis of indirect environmental impacts from Alternative D assumes that regional emissions are proportional to the number of projects constructed and operated in the future as a result of implementing this alternative. This means that if direct regional emissions from Alternative D are less than the direct regional emissions from the proposed project, fewer facilities would be built in the future, resulting in fewer or less significant adverse indirect impacts.

### ***Scenic Vista***

The analysis of potential indirect scenic vista impacts as a result of implementing Alternative D is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified the following primary facility categories that would significantly adversely affect scenic vistas: retail/services facilities, large commercial facilities, entertainment/recreational and utility facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on scenic vistas, it was concluded that the proposed project would create significant adverse indirect impacts on scenic vistas. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer scenic vista impacts compared to the proposed project.

Based upon the above information, indirect scenic vista impacts as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be

available from the SCAQMD's internal offset accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative scenic vista impacts, but cumulative scenic vista impacts would be less than the proposed project.

### ***Scenic Resources***

The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely affect scenic resources. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on scenic resources, it was concluded that the proposed project would create significant adverse indirect impacts on scenic resources. Because fewer facilities could be built under Alternative D, Alternative D would generate similar or fewer scenic resources impacts compared to the proposed project.

Based upon the above information, indirect scenic resource impacts as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal offset accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative scenic resources impacts, but cumulative scenic resources impacts would be less than the proposed project.

### ***Visual Character***

The survey of CEQA documents to evaluate the potential for visual character impacts from the proposed project identified the following primary facility categories that would significantly adversely affect visual character: large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and utility facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be

sited in or near a location that could create significant adverse visual character impacts, it was concluded that the proposed project would create significant adverse indirect impacts on visual character. Based on the analysis of air quality impacts in Chapter 6, Alternative D would generate similar visual character impacts compared to the proposed project.

Based upon the above information, indirect visual character impacts as a result of implementing Alternative D are considered to be significant and approximately equivalent to the proposed project, resulting in similar overall impacts on an annual basis. Similarly, the contribution to cumulative impacts from Alternative D is expected to be significant and similar to the proposed project. Although pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated and only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements, air quality impacts from Alternative D would be approximately equivalent to the proposed project. Therefore, it is likely that similar number of facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1 compared to this proposed project. As a result, significant adverse cumulative visual character impacts would be significant and approximately equivalent to cumulative visual character impacts from the proposed project.

### ***Light/Glare***

The survey of CEQA documents to evaluate the potential for light and glare impacts from the proposed project identified the following primary facility categories that would cause significant adverse light and glare impacts: retail/services facilities, larger commercial facilities, and entertainment/recreational facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse light and glare impacts, it was concluded that the proposed project would create significant adverse indirect light and glare impacts in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar or fewer light and glare impacts compared to the proposed project.

Based upon the above information, indirect light and glare impacts as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal offset accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor

sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative light or glare impacts, but cumulative light or glare impacts would be less than the proposed project.

### **Alternative E – Limited Offset Availability**

Alternative E is similar to PR 1315 in most respects. Like the proposed project, offsets provided by Alternative would be generated by two sources. First, under Alternative E, growth in stationary source emissions for the industry categories that are potentially eligible for permits issued under Rules 1309.1 and Rule 1304 would be 50 percent of the growth in stationary source emissions from those sources anticipated by the AQMP. The second component includes the emissions from existing sources that relied on offsets from the SCAQMD internal accounts for permits issued prior to July 2010 and that would shut down during the twenty-year analysis timeframe. This second component, i.e., shutdown emissions from stationary sources returned to the SCAQMD, would be the same under the proposed project and under Alternative E.

The analysis of indirect environmental impacts from Alternative E assumes that regional emissions are proportional to the number of projects constructed and operated in the future as a result of implementing this alternative. This means that if direct regional emissions from Alternative E are less than the direct regional emissions from the proposed project, fewer facilities would be built in the future, resulting in fewer or less significant adverse indirect impacts. According to Tables 6-100 and 6-101 in Chapter 6, air quality impacts from Alternative E are less than air quality impacts from the proposed project for most milestone years. Therefore, it is assumed that indirect impacts in general from Alternative E are less than indirect impacts from the proposed project.

### ***Scenic Vista***

The analysis of potential indirect scenic vista impacts as a result of implementing Alternative E is based on comparing the relative merits of this alternative with the proposed project. The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified the following primary facility categories that would significantly adversely affect visibility: large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and utility facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on visibility, it was concluded that the proposed project would create significant adverse indirect visibility impacts. Because fewer facilities could be built under Alternative E,

Alternative E would generate similar or fewer impacts to scenic vistas compared to the proposed project.

Indirect scenic vista impacts from implementing Alternative E would be less than indirect scenic vista impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect scenic vista impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative scenic vista impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Scenic Resources***

The survey of CEQA documents to evaluate the potential for scenic vista impacts from the proposed project identified one primary facility category, entertainment/recreational facilities, which would significantly adversely affect scenic resources. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts on scenic resources, it was concluded that the proposed project would create significant adverse indirect impacts on scenic resources. Because fewer facilities could be built under Alternative E, Alternative E would generate similar or fewer scenic resources impacts compared to the proposed project.

Indirect scenic resources impacts from implementing Alternative E would be less than indirect scenic resources impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect scenic resources impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative scenic resources impacts from implementing Alternative E would be significant, but less than

the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Visual Character***

The survey of CEQA documents to evaluate the potential for visual character impacts from the proposed project identified the following primary facility categories that would significantly adversely affect visual character: large commercial facilities, entertainment/recreational facilities, institutional facilities, transportation facilities, and utility facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse visual character impacts, it was concluded that the proposed project would create significant adverse indirect impacts on visual character in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar or fewer visual character impacts compared to the proposed project.

Indirect visual character impacts from implementing Alternative E would be less than indirect visual character impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect visual character impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative visual character impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Light/Glare***

The survey of CEQA documents to evaluate the potential for light and glare impacts from the proposed project identified the following primary facility categories that would cause significant adverse light and glare impacts: retail/services facilities, larger commercial facilities, and entertainment/recreational facilities. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse light and glare impacts, it was concluded that the proposed project would create significant adverse indirect light and glare impacts in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar or fewer light and glare impacts.

Indirect light and glare impacts from implementing Alternative E would be less than indirect light and glare impacts from the proposed project because fewer representative facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If debit demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect light and glare impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative light and glare impacts from implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Agricultural and Forestry Resources**

### **Proposed Project**

In the NOP/IS for the proposed project, it was concluded that the proposed project would not generate significant adverse agricultural impacts. The rationale for this conclusion was as follows. If it is assumed that implementing PR 1315 is the necessary first step in siting future commercial or industrial projects, as claimed by environmental groups, then it is possible that industrial or commercial facilities could be sited at locations that would convert agricultural land to non-agricultural uses. In the NOP/IS SCAQMD staff rejected this rationale stating that it would be unlikely that commercial or industrial projects would be sited in areas zoned for agricultural purposes. As discussed in the following subsections, SCAQMD staff has taken a more conservative approach in this PEA and concluded that the proposed project could be considered a necessary first step in siting future land use projects and there may be situations where agriculturally zoned areas are rezoned specifically to allow other types of land uses, including commercial or industrial projects, which could result in converting agricultural land to non-agricultural uses. The analysis in Subchapter 5.02 concludes that the proposed project has the potential for significant impacts on agricultural and forestry resources.

Although the survey of CEQA documents for representative facilities identified several mitigation measures that have the potential to reduce future indirect impacts to agricultural resources resulting from the proposed project, no mitigation measures were identified that are within the jurisdiction of the SCAQMD to implement. Mitigation of indirect impacts to agricultural resources would be the responsibility of the public agency (e.g., city or county), which would normally be the lead agency.

### ***Convert Prime Farmland to Non-agricultural Uses***

The survey of the 52 CEQA documents shown in Table 5.2-1 revealed that the heavy industrial facility category could create significant adverse as a result of converting prime farmland to non-agricultural uses (document #51). Typical impacts to this environmental topic include rezoning agricultural land, e.g., dairy farms, to allow residential or commercial development to occur. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreational facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse light or glare impacts. Based on the results of the CEQA document survey and the possibility that future individual projects in any of these facility categories could be sited in or near a location that could convert prime farmland to non-agricultural uses, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The survey of the 52 CEQA documents shown in Table 5.2-1 revealed that no primary facility categories conflicted with agricultural zoning or Williamson Act Contracts. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in all of the nine facility categories could conflict with agricultural zoning and/or Williamson Act Contracts as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The survey of the 52 CEQA documents shown in Table 5.2-1 revealed that no primary facility categories generated other changes that could convert agricultural land to non-agricultural uses. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects all of in the nine facility categories could generate other changes that could convert agricultural land to non-agricultural uses as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Conflict with or Cause Rezoning of Forest Land***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects in all nine primary facility categories, did not include analysis of potential indirect impacts from the projects that have the potential to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in all of the nine facility categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Other Changes that Convert Forest Land to Other Uses***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects in all nine primary facility categories, did not include analysis of potential indirect impacts from the projects that could cause other changes that convert forest land to other uses because this requirement was not in effect at the time the 52 CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. Since future individual projects in all of the nine facility categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations and, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to agricultural and forestry resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It is concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to agricultural and resources.

## **Alternative A - No Project Alternative**

### ***Convert Prime Farmland to Non-agricultural Uses***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 would be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is

reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from converting prime farmland to non-agricultural uses are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no conversion of farmland to non-agricultural uses when compared against the proposed project, so under the No Project Alternative potential future impacts from converting farmland to non-agricultural uses would not be significant when compared to the proposed project.

#### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 would be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the District's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that may conflict with agricultural zoning or Williamson Act Contracts are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that could conflict with agricultural zoning or Williamson Act Contracts when compared to the proposed project.

### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 would be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that may cause other changes that convert agricultural land to non-agricultural uses are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future in the district for other uses that could convert agricultural land to non-agricultural uses when compared to the proposed project.

### ***Conflict with or Cause Rezoning of Forest Land***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 would be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future project that could conflict with or cause rezoning forest land are considered to be significant. Starting May 1, 2012, future facilities that previously would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, no projects that previously qualified for offsets pursuant to Rules 1304 or 1309.1 would

be constructed and operated in the future in the district for other uses that could conflict with, or cause rezoning forest land when compared to the proposed project.

### ***Other Changes that Convert Forest Land to Other Uses***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but SB 827 would be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could cause other changes that convert forest land to other uses are considered to be significant. Starting May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, either through Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012 no projects that previously would have qualified for offsets pursuant to Rules 1304 or 1309.1 would be constructed and operated in the future that could convert forest land to other uses when compared to the proposed project.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Convert Prime Farmland to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential adverse indirect impacts from converting prime farmland to non-agricultural uses as a result of implementing the proposed project identified one primary facility category, the heavy industrial facility category, which would significantly adversely affect prime farmland use. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of converting prime farmland to non-agricultural uses, it was concluded that Alternative B would create significant adverse indirect impacts from converting prime farmland in the district to non-agricultural purposes.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from converting prime farmland to non-agricultural uses compared to the proposed project. The main difference between

Alternative B and the proposed project is Alternative B would result in indirect effects of potential future emission reduction projects paid for by mitigation fees that could convert prime agricultural land to non-agricultural uses. For example, a number of emission reduction projects could be located in or near agricultural areas, resulting in other uses of prime farmland. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts as a result of converting prime farmland to other uses equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of converting prime farmland to non-agricultural uses is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The survey of CEQA documents to evaluate the potential for impacts from future affected facilities that conflict with agricultural zoning or Williamson Act Contracts as a result of implementing the proposed project identified no primary facility categories that would significantly adversely conflict with agricultural zoning or Williamson Act Contracts. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with agricultural zoning or Williamson Act Contracts, it was concluded that Alternative B would create significant adverse indirect impacts as a result of future land use conflicts with agricultural zoning or Williamson Act Contracts in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that could conflict with agricultural zoning or Williamson Act contracts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects paid for by mitigation fees that could conflict with agricultural zoning or Williamson Act contract areas. For example, a number of emission reduction projects could be located in or near areas zoned agricultural or that are subject to Williamson Act contracts, resulting zoning conflicts. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts agricultural zoning impacts equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of conflicts with agricultural zoning or Williamson Act contracts is expected to be greater

than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential for other changes that could convert agricultural land to non-agricultural uses from the proposed project identified no primary facility categories that would significantly adversely cause other changes that could convert agricultural land to non-agricultural uses. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of other changes that could convert agricultural land to non-agricultural uses, it was concluded that Alternative B would create significant adverse indirect impacts on agricultural resources in the district.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts from other changes that could convert agricultural land to other uses compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects or other changes that could convert agricultural land to non-agricultural uses. For example, a number of emission reduction projects could be located in or near agricultural land, resulting in conversion of agricultural land to non-agricultural purposes. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on agriculturally zoned areas equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of converting agricultural land to other uses is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with or Cause Rezoning of Forest Land***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analysis of potential indirect impacts from the projects that have the potential to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility

categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

Because the same types of facilities would be built under Alternative B, under Alternative B would generate similar indirect impacts that could conflict with, or require rezoning of forest lands compared to the proposed project. The main difference between Alternative B and the proposed project is primarily the indirect effects of potential future emission reduction projects or other changes that could conflict with, or require rezoning of forest lands. For example, a number of emission reduction projects could be located in or near forest lands, resulting in conflict with, or require rezoning of forest lands. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts to forest areas equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of potential conflicts with, or requirements to rezone forest lands is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Other Changes that Convert Forest Land to Other Uses***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analyses of potential indirect impacts from the projects that have the potential to convert forest land to other uses because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to convert forest land to other uses as a result of being sited in or near such locations, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

Because the same types of facilities would be built under Alternative B, Alternative B would generate similar indirect impacts that could convert forest land to other uses compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in the indirect effects of potential future emission reduction projects or other changes that could convert forest land to other uses. For example, a number of emission reduction projects could be located in or near forest lands, resulting in converting forest land to other uses. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts as a result of converting forest land to other uses equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of converting forest land to other uses is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C- Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Convert Prime Farmland to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential adverse indirect impacts from converting prime farmland to non-agricultural uses as a result of implementing the proposed project identified one primary facility category, the heavy industrial facility category, which would significantly adversely affect prime farmland use. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of converting prime farmland to non-agricultural uses compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of converting prime farmland to non-agricultural uses from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of converting prime farmland to non-agricultural uses from implementing Alternative C would be significant, but less than the proposed project because fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The survey of CEQA documents to evaluate the potential for impacts from future affected facilities that conflict with agricultural zoning or Williamson Act Contracts as a result of implementing the proposed project identified no primary facility categories that would significantly adversely conflict with agricultural zoning or Williamson Act Contracts. Because fewer facilities could be built under Alternative C, Alternative C would generate similar impacts as a result of future projects conflicting with agricultural zoning or Williamson Act contracts compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of future projects conflicting with agricultural zoning or Williamson Act contracts from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of future projects conflicting with agricultural zoning or Williamson Act contracts from Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential for other changes that could convert agricultural land to non-agricultural uses from the proposed project identified no primary facility categories that would significantly adversely cause other changes that could convert agricultural land to non-agricultural uses. Because fewer facilities could be built under Alternative C, Alternative C would generate similar impacts as a result of other changes that convert agricultural land to other uses compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of other changes that convert agricultural land to other uses from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of other changes that convert agricultural land to other uses from Alternative C are concluded to be significant, but would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with or Cause Rezoning of Forest Land***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analysis of potential indirect impacts from the projects that have the potential to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse

indirect impacts to this environmental category. Because fewer facilities could be built under Alternative C, Alternative C would generate similar impacts as a result of other changes that conflict with or cause rezoning of forest land as the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of potential conflicts with, or rezoning of forest land from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of other changes that convert conflict with, or cause rezoning of forest land from Alternative C are concluded to be significant, but would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### ***Other Changes that Convert Forest Land to Other Uses***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analyses of potential indirect impacts from the projects that have the potential to convert forest land to other uses because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to convert forest land to other uses as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category. Because fewer facilities could be built under Alternative C, Alternative C would generate similar impacts from changes that convert forest land to other uses compared to the proposed project.

Based upon the above information, there would be fewer or less significant potential impacts as a result of potential changes that could convert forest land to other uses from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of other changes that could convert forest land to other uses from Alternative C are concluded to be significant, but would be less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

## **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

### ***Convert Prime Farmland to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential adverse indirect impacts from converting prime farmland to non-agricultural uses as a result of implementing the proposed project identified one primary facility category, the heavy industrial facility category, which would significantly adversely affect prime farmland use. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of converting prime farmland to non-agricultural uses, it was concluded that Alternative D would create significant adverse indirect impacts from converting prime farmland in the district to non-agricultural purposes. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of converting prime farmland to non-agricultural use.

Based upon the above information, indirect impacts from converting prime farmland to non-agricultural uses as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal offset accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative impacts from converting prime farmland to non-agricultural uses, but cumulative farmland impacts less than the proposed project.

### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The survey of CEQA documents to evaluate the potential for impacts from future affected facilities that conflict with agricultural zoning or Williamson Act Contracts as a result of implementing the proposed project identified no primary facility categories that would significantly adversely conflict with agricultural zoning or Williamson Act Contracts. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with agricultural zoning or Williamson Act Contracts, it was concluded that Alternative D would create significant

adverse indirect impacts as a result of future land use conflicts with agricultural zoning or Williamson Act Contracts in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of conflicts with agricultural zoning or Williamson Act Contracts.

Based upon the above information, indirect impacts as a result of future land use conflicts with agricultural zoning or Williamson Act Contracts as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis that could occur from converting prime agricultural land to non-agricultural uses. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative impacts from affected projects that have the potential to conflict with agricultural zoning or Williamson Act contracts, but cumulative agricultural land use impacts less than the proposed project.

#### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential for other changes that could convert agricultural land to non-agricultural uses from the proposed project identified no primary facility categories that would significantly adversely cause other changes that could convert agricultural land to non-agricultural uses. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of other changes that could convert agricultural land to non-agricultural uses, it was concluded that Alternative D would create significant adverse indirect impacts on agricultural resources in the district. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of conversion of agricultural land to non-agricultural uses.

Based upon the above information, indirect impacts from other changes that could convert agricultural land to non-agricultural uses as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new

credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative impacts, but cumulative impacts from converting farmland to other uses is expected to be less than the proposed project.

### ***Conflict with or Cause Rezoning of Forest Land***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all of the nine primary facility categories, did not include analysis of potential indirect impacts from the projects that have the potential to conflict with or cause rezoning of forest land because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

Based upon the above information, indirect impacts as a result of future land use projects that could conflict with, or cause rezoning of forest land as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis that could occur from conflicts with, or cause rezoning of forest land. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative impacts from affected projects that have the potential to conflict with, or cause rezoning of forest land, but cumulative forest land use impacts less than the proposed project.

### ***Other Changes that Convert Forest Land to Other Uses***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analyses of

potential indirect impacts from the projects that have the potential to convert forest land to other uses because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to convert forest land to other uses as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts in terms of changes that convert forest land to other uses.

Based upon the above information, indirect impacts from other changes that could convert forest land to other uses as a result of implementing Alternative D are considered to be significant, but less than the proposed project because fewer offsets are expected to be available to be used per year compared to the proposed project, resulting in less overall impacts on an annual basis. The reasons fewer offsets are available are that the existing offset accounts would be eliminated and only new credits generated from the year 2009 on could be used as offsets. The contribution to cumulative impacts from Alternative D is expected to be significant, but less compared to the proposed project because pre-2009 offsets would no longer be available from the SCAQMD's internal accounts as these would be eliminated. Further, only new credits generated from the year 2009 from both major and minor sources could be used as offsets for the purpose of demonstrating equivalency with federal offset requirements. Therefore, it is likely that fewer facilities would be able to qualify for exemptions pursuant to Rules 1304 or 1309.1. There would, however, still be significant adverse cumulative impacts, but cumulative impacts from changes that could convert forest land to other uses is expected to be less than the proposed project.

### **Alternative E – Limited Offset Availability**

#### ***Convert Prime Farmland to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential adverse indirect impacts from converting prime farmland to non-agricultural uses as a result of implementing the proposed project identified one primary facility category, the heavy industrial facility category, which would significantly adversely affect prime farmland use. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of converting prime farmland to non-agricultural uses, it was concluded that the proposed project would create significant adverse indirect impacts from converting prime farmland in the district to non-agricultural purposes. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of converting prime farmland to non-agricultural uses.

Indirect impacts from implementing Alternative E that could result in converting prime farmland to non-agricultural uses would be less than indirect farmland impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect farmland impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from converting prime agricultural land into non-agricultural uses as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with Agricultural Zoning/Williamson Act Contracts***

The survey of CEQA documents to evaluate the potential for impacts from future affected facilities that conflict with agricultural zoning or Williamson Act Contracts as a result of implementing the proposed project identified no primary facility categories that would significantly adversely conflict with agricultural zoning or Williamson Act Contracts. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with agricultural zoning or Williamson Act Contracts, it was concluded that the proposed project would create significant adverse indirect impacts as a result of future land use conflicts with agricultural zoning or Williamson Act Contracts in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of conflicts with agricultural zoning/Williamson Act Contracts.

Indirect impacts from future projects that have the potential to conflict with agricultural zoning or Williamson Act Contracts as a result of implementing Alternative E would be less than indirect agricultural conflict impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect agricultural conflict impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future projects

that have the potential to conflict with agricultural zoning or Williamson Act Contracts as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Other Changes that Convert Agricultural Land to Non-agricultural Uses***

The survey of CEQA documents to evaluate the potential for other changes that could convert agricultural land to non-agricultural uses from the proposed project identified no primary facility categories that would significantly adversely cause other changes that could convert agricultural land to non-agricultural uses. However, because of the possibility that future individual projects in any of the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of other changes that could convert agricultural land to non-agricultural uses, it was concluded that the proposed project would create significant adverse indirect impacts on agricultural resources in the district. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of changes that convert agricultural land to non-agricultural uses.

Indirect impacts from future projects that have the potential to change or convert agricultural land to non-agricultural uses as a result of implementing Alternative E would be less than indirect impacts to agricultural land from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect agricultural land impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future projects that have the potential to change or convert agricultural land to non-agricultural uses as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Conflict with or Cause Rezoning of Forest Land***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analysis of potential indirect impacts from the projects that have the potential to conflict with or

cause rezoning of forest land because this requirement was not in effect at the time the 52 CEQA documents were prepared. Since future individual projects in the nine facility categories could have the potential to conflict with, or cause rezoning of forest land as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

Indirect impacts from future projects that have the potential to conflict with, or cause rezoning of forest land as a result of implementing Alternative E would be less than indirect forest conflict impacts from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections for the relevant industry categories, under Alternative E the SCAQMD would stop issuing permits. Based on the foregoing, indirect impacts from potential conflicts with, or cause rezoning of forest land as a result of implementing Alternative E would be significant, but less compared to the proposed project. Similarly, the contribution to cumulative impacts from future projects that have the potential to conflict with, or cause rezoning of forest land as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

### ***Other Changes that Convert Forest Land to Other Uses***

The survey of CEQA documents for the 52 CEQA documents prepared for past projects that represent projects in all nine primary facility categories, did not include analyses of potential indirect impacts from the projects that have the potential to convert forest land to other uses because this requirement was not in effect at the time the 52 CEQA documents were prepared. Consequently, no conclusions can be drawn from the survey regarding potential adverse impacts to forestry resources. Since future individual projects in the nine facility categories could have the potential to convert forest land to other uses as a result of being sited in or near such locations and, using an abundance of caution, it is concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category. Because fewer facilities could be built under Alternative E, Alternative E would generate similar but fewer impacts in terms of changes.

Indirect impacts from future projects that have the potential to convert forest land to other uses as a result of implementing Alternative E would be less than indirect impacts to forest land from the proposed project because fewer facilities would be constructed and operated in the future. The reason for this conclusion is as follows. The availability

of offsets under Alternative E from the growth in stationary source emissions from for the relevant industry categories anticipated by the AQMP would be at most 50 percent of the availability of offsets compared to the proposed project, i.e., 50 percent of the 2007 AQMP growth projections. If offset demand exceeds 50 percent of the 2007 AQMP growth projections under Alternative E for the relevant industry categories, the SCAQMD would stop issuing permits. Based on the foregoing, indirect forest land impacts from Alternative E would be significant, but less compared to the proposed project. Similarly, cumulative impacts from future projects that have the potential to change or convert forest land to other uses as a result of implementing Alternative E would be significant, but less than the proposed project because fewer debits would be available to offset emissions from facilities that qualify for exemptions under Rules 1304 or 1309.1.

## **Air Quality**

The analysis of direct and indirect air quality, visibility, health, and greenhouse gas impacts resulting from each project alternative can be found in Chapter 6.

## **Biological Resources**

### **Proposed Project**

It was concluded in the NOP/IS that the proposed project could adversely affect biological resources by allowing the development of individual projects in the future that qualify to receive emissions offsets available from the SCAQMD's internal accounts. Generally, typical impacts of a project on biological resources could include loss or destruction of sensitive species or degradation of sensitive habitat. Habitat degradation, interference with movement of wildlife species or migratory fish, and impacts on migratory wildlife corridors, or wildlife nursery sites may occur through grading or excavation, increases in water or air pollutants, increased noise, light, or vibration, interruption of fresh or salt water supplies, reduction in food supplies or foraging areas, or interference with established wildlife movement patterns on or between habitat areas.

The analysis in Subchapter 5.4 concludes that the proposed project has the potential to adversely affect biological resources. Mitigation of biological impacts would be the responsibility of the public agency (e.g., city or county) that would serve as lead agency on any given future project. Since the SCAQMD cannot predict how a future lead agency might choose to mitigate a particular significant biological impact, the potential exists for future indirect impacts to be significant and unavoidable (i.e., significant even after mitigation).

### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that transportation facility projects (document #39) have the potential to significantly adversely affect habitats and/or sensitive/endangered species. The CEQA documents for the remaining primary facility categories, agricultural facilities; retail/services facilities; large commercial facilities; entertainment/recreation facilities; institutional facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts to habitats or sensitive/endangered species. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could create significant adverse indirect impacts to habitats and/or sensitive/endangered species, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic.

### ***Adversely Affect Riparian/Sensitive Habitats***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that no primary facility categories generated significant adverse indirect impacts to riparian/sensitive habitats. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could significantly adversely affect riparian/sensitive habitats as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Adversely Affect Federally Protected Wetlands***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that no primary facility categories generated significant adverse indirect impacts to federally protected wetlands. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that could significantly adversely affect federally protected wetlands as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Interfere with the Movement of Resident or Migratory Species***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that institutional facility projects (document #35) have the potential to create significant adverse indirect impacts that could interfere with the movement of resident or migratory species. The

CEQA documents for the remaining primary facility categories, agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts that could interfere with the movement of resident or migratory species. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could create significant adverse indirect impacts interfering with the movement of resident or migratory species, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental topic area.

### ***Conflict with Policies/Ordinances Protecting Biological Resources***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that entertainment/recreational facility projects (document #22) have the potential to create significant adverse indirect impacts that could conflict with policies/ordinance protecting biological resources. The CEQA documents for the remaining primary facility categories: agricultural facilities; retail/services facilities; large commercial facilities; institutional facilities; transportation facilities; utility facilities; light industrial/warehouse facilities; and heavy industrial projects, did not identify significant adverse indirect impacts that could conflict with policies/ordinance protecting biological resources. Based on the results of the CEQA document survey and the possibility that future individual projects in all of these facility categories could be sited in or near a location that could create significant adverse indirect impacts that could conflict with policies/ordinance protecting biological resources, it was concluded that the proposed project would create significant adverse indirect impacts to this environmental category.

### ***Conflict with Habitat Conservation Plans***

The survey of the 52 CEQA documents shown in Table 5.4-1 revealed that no primary facility categories generated significant adverse indirect impacts that conflict with habitat conservation plans. However, SCAQMD staff acknowledges that the survey of CEQA documents used for this analysis represents a snapshot in time. Further, since future individual projects in the nine facility categories could generate other changes that have the potential to conflict with habitat conservation plans as a result of being sited in or near such locations, the analysis concluded that the proposed project has the potential to create significant adverse indirect impacts to this environmental category.

### ***Cumulative Impacts***

Project impacts to biological resources could combine with impacts from other past, present and future projects, including projects permitted under SB 827, projects

permitted in reliance on ERC's and new power plants entitled to receive offsets pursuant to state law. It was concluded that the proposed project would make a cumulatively considerable contribution to significant cumulative impacts to biological resources.

### **Alternative A - No Project Alternative**

#### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The No Project Alternative assumes that neither the proposed project nor Alternatives B through E would be adopted, but that SB 827 will be in effect, which will allow the issuance of offsets between January 1, 2010, and May 1, 2012. In addition, it is reasonably foreseeable that three new power plants would be permitted pursuant to state legislation requiring the issuance of offsets from the SCAQMD's internal accounts. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could create adverse habitat modifications that affect sensitive or endangered species are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications to habitat that could affect sensitive or endangered species as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from habitat modifications that could affect sensitive or endangered species would not be expected to occur beginning May 1, 2012. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

#### ***Adversely Affect Riparian/Sensitive Habitats***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could affect riparian or sensitive habitats as a result of implementing Alternative A.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts

from future projects that could adversely affect riparian or sensitive habitats are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications to habitat that could adversely affect riparian or sensitive habitats as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from future projects that could adversely affect riparian or sensitive habitats would not be expected to occur beginning May 1, 2012.

#### ***Adversely Affect Federally Protected Wetlands***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be no newly constructed facilities beginning May 1, 2012 that could adversely affect federally protected wetlands as a result of implementing Alternative A. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could adversely affect federally protected wetlands are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications from future projects that could adversely affect federally protected wetlands as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from habitat modifications that could affect sensitive or endangered species would not be expected to occur beginning May 1, 2012.

#### ***Interfere with the Movement of Resident or Migratory Species***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could interfere with the movement of resident or migratory species as a result of implementing Alternative A. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could interfere with the movement of resident or migratory species are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications to habitat that could interfere with the movement of resident or migratory species as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from habitat modifications that could affect sensitive or endangered species would not be expected to occur beginning May 1, 2012.

### ***Conflict with Policies/Ordinances Protecting Biological Resources***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could conflict with policies or ordinances protecting biological resources as a result of implementing Alternative A. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could conflict with policies or ordinances protecting biological resources are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications from future projects that could conflict with policies or ordinances protecting biological resources as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from habitat modifications that could affect sensitive or endangered species would not be expected to occur beginning May 1, 2012.

### ***Conflict with Habitat Conservation Plans***

Under Alternative A, after May 1, 2012, future facilities that would have had access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, after May 1, 2012, there would be no newly constructed facilities in the future that could conflict with habitat

conservation plans as a result of implementing Alternative A. It should be noted, however, that issuance of permits pursuant to SB 827 and/or legislation pertaining to the power plants is independent from, and can proceed without the proposed project.

Under Alternative A, from January 1, 2010 to May 1, 2012, permits may be issued that rely on offsets from the SCAQMD's internal accounts. For this reason, and because of the potential impacts of reasonably foreseeable power plant projects, potential impacts from future projects that could conflict with habitat conservation plans are considered to be significant. Starting May 1, 2012, future facilities access to the SCAQMD's internal accounts, through either Rule 1304 or Rule 1309.1, would no longer have access to these sources of offsets. Therefore, there would be little or no modifications from future projects that could conflict with habitat conservation plans as a result of implementing Alternative A, so under the No Project Alternative potentially significant adverse indirect impacts resulting from habitat modifications that could affect sensitive or endangered species would not be expected to occur beginning May 1, 2012.

### **Alternative B – Offset User Fees for Large Businesses**

#### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The survey of CEQA documents to evaluate the potential for impacts as a result of land use projects that could create habitat modifications that could affect sensitive or endangered species from the proposed project identified one primary facility category, transportation facility projects, that would create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species, it was concluded that the proposed project would create significant adverse indirect impacts on habitats in the district that contain sensitive or endangered species.

Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar indirect habitat modification impacts compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on habitats, resulting in adverse indirect impacts to sensitive or endangered species. For example, a number of emission reduction projects could be located in or near wildlife habitats, resulting in resulting adverse effects to sensitive or endangered species. Such projects include, but are not limited to: wind turbines and solar collector panels.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on sensitive or endangered species through habitat modifications that

are equivalent to or greater than the proposed project. The contribution to cumulative impacts as a result of habitat modifications that could affect sensitive or endangered species from Alternative B are expected to be significant and greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adversely Affect Riparian/Sensitive Habitats***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts affecting riparian or sensitive habitats from the proposed project did not identify any primary facility categories that would significantly adversely affect riparian or sensitive habitats. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to riparian or sensitive habitats, it was concluded that the proposed project would create significant adverse indirect impacts affecting riparian or sensitive habitats.

Because the same types of facilities could be built under Alternative B, Alternative B would generate similar indirect impacts that could adversely affect riparian or sensitive habitats compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on riparian or sensitive habitats. For example, a number of emission reduction projects could be located in or near riparian or sensitive habitats. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on riparian or sensitive habitats equivalent to or greater than the proposed project. The contribution cumulative impacts from Alternative B that have the potential to adversely affect riparian or sensitive habitats are expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Adversely Affect Federally Protected Wetlands***

The survey of CEQA documents to evaluate the potential for impacts that could adversely affect federally protected wetlands from the proposed project did not identify any primary facility categories that would significantly adversely affect federally protected wetlands. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant impacts that could adversely affect federally

protected wetlands, it was concluded that the proposed project would create significant indirect impacts that could adversely affect federally protected wetlands in the district.

Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar indirect impacts to federally protected wetlands compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects on federally protected wetlands. For example, a number of emission reduction projects could be located in or near federally protected wetlands. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on federally protected wetlands equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of future projects adversely affecting federally protected wetlands is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

#### ***Interfere with the Movement of Resident or Migratory Species***

The survey of CEQA documents to evaluate the potential for impacts from the proposed project identified one primary facility category, institutional facility projects, that would significantly interfere with the movement of resident or migratory species. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of land use projects interfering with the movement of resident or migratory species, it was concluded that the proposed project would create significant adverse indirect impacts as a result of future land use projects interfering with the movement of resident or migratory species in the district.

Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that could interfere with the movement of resident or migratory species compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects that may interfere with the movement of resident or migratory species. For example, a number of emission reduction projects could be located in or near areas that could impede or interfere with the movement of resident or migratory species. Such projects include, but are not limited to: wind turbines, and solar collector panels.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on the movement of resident or migratory species equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of future projects that have the potential to interfere with the movement of resident or migratory species is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Policies/Ordinances Protecting Biological Resources***

The survey of CEQA documents to evaluate the potential for conflicts with policies or ordinances protecting biological resources from the proposed project identified one primary facility category, entertainment/recreational facility projects, which would significantly conflict with policies or ordinances protecting biological resources. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with policies or ordinances protecting biological resources impacts, it was concluded that Alternative B would create significant adverse indirect conflicts with policies or ordinances protecting biological resources in the district.

Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that could conflict with policies or ordinances protecting biological resources compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects that could conflict with policies or ordinance protecting biological resources. For example, a number of emission reduction projects could be located in or near areas containing important biological resources and, as a result, have the potential to indirectly conflict with policies or ordinances specifically designed to protect biological resources. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on biological resources equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of future projects that have the potential to conflict with policy ordinances protecting biological resources is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with habitat conservation plans from the proposed project did not identify any primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with habitat conservation plans, it was concluded that the proposed project would create significant adverse indirect conflicts with habitat conservation plans in the district.

Because the same types and numbers of facilities could be built under Alternative B, Alternative B would generate similar indirect impacts from future projects that have the potential to conflict with habitat conservation plans compared to the proposed project. The main difference between Alternative B and the proposed project is Alternative B also would result in indirect effects of potential future emission reduction projects conflict with habitat conservation plans. For example, a number of emission reduction projects could be located in or near areas that include or are part of habitat conservation plans, which could substantially undermine the intended effects of the habitat conservation plans. Such projects include, but are not limited to: wind turbines, solar collector panels, and construction of anaerobic digesters.

For the above reasons, it is concluded that Alternative B would create significant adverse indirect impacts on areas that are part of or contain habitat conservation plans equivalent to or greater than the proposed project. The contribution to cumulative impacts from Alternative B as a result of future projects that have the potential to conflict with habitat conservation plans is expected to be greater than cumulative impacts for the proposed project because of the combined effects of constructing and operating future facilities affected by PR 1315 as well as the future effects of constructing and operating potential emission reduction projects.

### **Alternative C- Large Businesses Prohibited from Accessing Rule 1304 Exemptions**

#### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The survey of CEQA documents to evaluate the potential for impacts as a result of land use projects that could create habitat modifications that could affect sensitive or endangered species from the proposed project identified one primary facility category, transportation facility projects, that would create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of habitat modifications that

could affect sensitive or endangered species, it was concluded that the proposed project would create significant adverse indirect impacts on habitats in the district that contain sensitive or endangered species. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of habitat modifications that have the potential to affect sensitive or endangered species compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential impacts as a result of habitat modifications that have the potential to affect sensitive or endangered species from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to from Alternative C as a result of habitat modifications that have the potential to affect sensitive or endangered species would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### ***Adversely Affect Riparian/Sensitive Habitats***

The survey of CEQA documents to evaluate the potential for adverse indirect impacts affecting riparian or sensitive habitats from the proposed project did not identify any primary facility categories that would significantly adversely affect riparian or sensitive habitats. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts to riparian or sensitive habitats, it was concluded that the proposed project would create significant adverse indirect impacts affecting riparian or sensitive habitats. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer adverse affects to any riparian or sensitive habitats compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential to generate adverse affects to any riparian or sensitive habitats from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from Alternative C from future facilities that have the potential to generate adverse affects to any riparian or sensitive habitats would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Adversely Affect Federally Protected Wetlands***

The survey of CEQA documents to evaluate the potential for impacts that could adversely affect federally protected wetlands from the proposed project did not identify any primary facility categories that would significantly adversely affect federally protected wetlands. However, because of the possibility that future individual projects in the primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant impacts that could adversely affect federally protected wetlands, it was concluded that the proposed project would create significant indirect impacts that could adversely affect federally protected wetlands. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts to federally protected wetlands compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential impacts to federally protected wetlands from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to federally protected wetlands from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Interfere with the Movement of Resident or Migratory Species***

The survey of CEQA documents to evaluate the potential for impacts from the proposed project identified one primary facility category, institutional facility projects, that would significantly interfere with the movement of resident or migratory species. For this reason and the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of land use projects interfering with the movement of resident or migratory species, it was concluded that the proposed project would create significant adverse indirect impacts as a result of future land use projects interfering with the movement of resident or migratory species. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer indirect impacts from future projects that have the potential to interfere with the movement of resident or migratory species compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential indirect impacts from future projects that have the potential to interfere with the movement of resident or migratory species as a result of implementing Alternative C compared to the proposed project because large businesses

would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts from Alternative C from future projects that have the potential to interfere with the movement of resident or migratory species would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with Policies/Ordinances Protecting Biological Resources***

The survey of CEQA documents to evaluate the potential for conflicts with policies or ordinances protecting biological resources from the proposed project identified one primary facility category, entertainment/recreational facility projects, that would significantly conflict with policies or ordinances protecting biological resources. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with policies or ordinances protecting biological resources impacts, it was concluded that the proposed project would create significant adverse indirect conflicts with policies or ordinances protecting biological resources. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of future projects conflicting with policy ordinances protecting biological resources compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential impacts as a result of future projects conflicting with policy ordinances protecting biological resources from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts as a result of future projects conflicting with policy ordinances protecting biological resources from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

### ***Conflict with Habitat Conservation Plans***

The survey of CEQA documents to evaluate the potential for conflicts with habitat conservation plans from the proposed project did not identify any primary facility categories that would significantly adversely conflict with habitat conservation plans. However, because of the possibility that future individual projects in these and other primary facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse conflicts with habitat conservation plans, it

was concluded that the proposed project would create significant adverse indirect conflicts with habitat conservation plans. Because fewer facilities could be built under Alternative C, Alternative C would generate similar or fewer impacts as a result of potential future conflicts from affected facilities with habitat conservation plans compared to the proposed project.

Based upon the above information, indirect impacts would significant, but would be fewer or less significant potential impacts as a result of potential future conflicts from affected facilities with habitat conservation plans from implementing Alternative C compared to the proposed project because large businesses would no longer qualify for the exemption from federal offset requirements pursuant to Rule 1304. The contribution to cumulative indirect impacts to as a result of potential future conflicts from affected facilities with habitat conservation plans from implementing Alternative C would be significant, but less than the proposed project because slightly fewer offsets would be debited from the SCAQMD's internal accounts as a result of prohibiting large businesses from qualifying for the offset exemption under Rule 1304, resulting in fewer facilities being constructed and operated in the future.

#### **Alternative D - Use of Credits Generated in 2009 and Beyond Only**

##### ***Habitat Modifications that Affect Sensitive/Endangered Species***

The survey of CEQA documents to evaluate the potential for impacts as a result of land use projects that could create habitat modifications that could affect sensitive or endangered species from the proposed project identified one primary facility category, transportation facility projects, that would create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species. For this reason and the possibility that future individual projects in this and other facility categories could have unique characteristics and/or be sited in or near a location that could create significant adverse indirect impacts as a result of habitat modifications that could affect sensitive or endangered species, it was concluded that the proposed project would create significant adverse indirect impacts on habitats that contain sensitive or endangered species. Because fewer facilities could be built under Alternative D, Alternative D would generate similar but fewer impacts to sensitive or endangered species.
