AQ-SPEC

Air Quality Sensor Performance Evaluation Center

Sensor Description

Manufacturer/Model:
Wicked Device/Air Quality Egg 2022 Model (O_3 & NO_2)

Pollutant:
O_3

Time Resolution:
1-min

Additional

Evaluation Summary

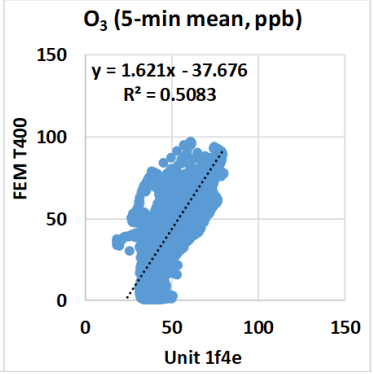
- Overall, the accuracy of the Air Quality Egg 2022 Model sensors ranged from 83.9% to 98.5% and decreased as O_3 conc. increased over the tested concentration range. The sensors underestimated the O_3 measurements from FEM T400 in the laboratory experiments at 20 °C and 40% RH.
- The Air Quality Egg 2022 Model sensors exhibited high precision for all T/RH combinations and all O_3 concentrations.
- The Air Quality Egg 2022 Model sensors (IDs: 233d, 1f4e, 8a60) showed low to moderate intra-model variability in the field and laboratory evaluations.
- Data recovery was ~100% from all units in both field and laboratory evaluations.
- The Air Quality Egg 2022 Model sensors showed very weak to moderate correlations ($0.20 < R^2 < 0.51$, 5-min mean) with the corresponding FEM T400 data in the field evaluation and very strong correlations with the FEM T400 in the laboratory evaluations (R^2 ~0.98).
- The same three Air Quality Egg 2022 Model units were tested both in the field (1st stage of testing) and in the laboratory (2nd stage of testing).

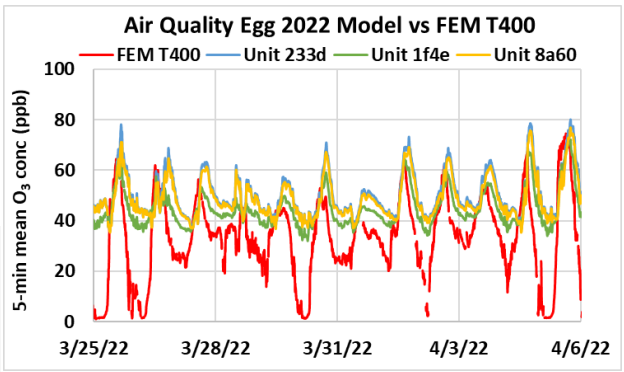
Field Evaluation Highlights

- Deployment period 03/18/2022 to 05/18/2022 : the three Air Quality Egg 2022 Model sensors showed very weak to moderate correlations with the corresponding FEM O_3 data.
- The units exhibited low intra-model variability and data recovery for O_3 measurements was ~100% from all units.

5-min mean

$0.20 < R^2 < 0.51$





Coefficient of Determination (R^2) quantifies how the three sensors followed the O_3 concentration change by the reference instruments.

An R^2 approaching the value of 1 reflects a near perfect agreement, whereas a value of 0 indicates a complete lack of correlation.

Laboratory Evaluation Highlights

Accuracy (O_3)

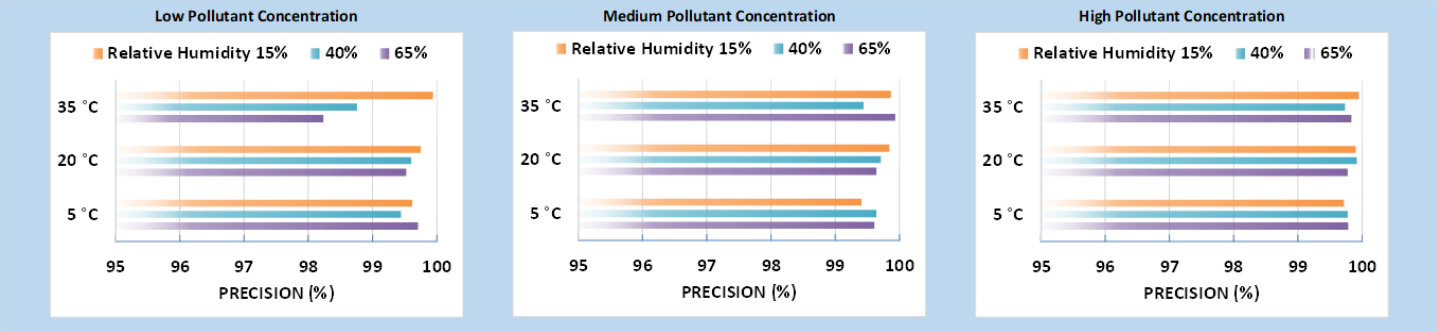
$$A\,(\%) = 100 - \frac{|\bar{X} - \bar{R}|}{\bar{R}} * 100$$

Steady State (#)	Sensor Mean (ppb)	FEM T400 (ppb)	Accuracy (%)
1	28.9	28.5	98.5
2	45.0	47.5	94.8
3	76.0	88.6	85.7
4	126.4	150.6	83.9
5	215.6	257.0	83.9

Accuracy was evaluated by a concentration ramping experiment at 20 °C and 40% RH. The sensor's readings at each ramping steady state are compared to the reference instrument.

A negative % means sensors' overestimation by more than two fold. The higher the positive value (close to 100%), the higher the sensor's accuracy.

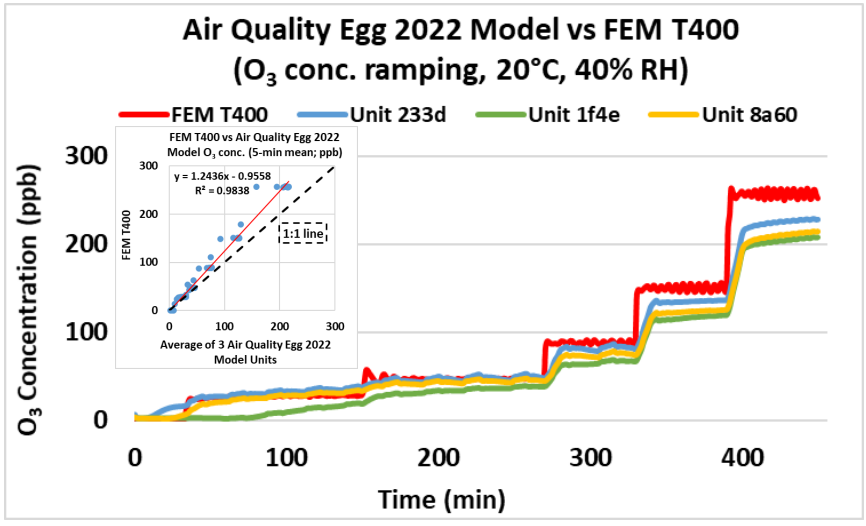
Precision (O_3)



100% represents high precision.

Sensor's ability to generate precise measurements of O_3 concentration at low, medium, and high pollutant levels were evaluated under 9 combinations of T and RH, including extreme weather conditions like cold and dry (5 °C and 15% RH) cold and humid (5 °C and 65% RH), hot and humid (35 °C and 65% RH), or hot and dry (35 °C and 15% RH).

Coefficient of Determination



The Air Quality Egg 2022 Model sensors showed very strong correlations with the corresponding FEM T400 O_3 data (R^2 ~0.98) at 20 °C and 40% RH.

Climate Susceptibility

From the laboratory studies, temperature and relative humidity had minimal effect on the precision of the Air Quality Egg 2022 Model sensors' ozone measurements.

Observed Interferents

NO_2
