04/11/16 (11:35am to 12:20pm)

- Methane concentrations ~150-200 ft E of SS-25 are still elevated (up to 27 ppm)
- Increased methane levels (up to 41 ppm) were also measured near well SS-1, in close proximity to a new power pole that was installed by SoCalGas a few weeks ago
- SCAQMD inspectors used a portable TVA-1000 monitor to confirm these findings and complement the LICOR data
- Videos were taken with FLIR cameras to identify the presence of natural gas
