

CH4 (ppm)

02/15/16 (08:20am to 03:45pm)

- Elevated methane concentrations (in the 10 to 24 ppm range) were measured near/around the SS-25 well, probably from multiple naturally occurring holes on the side of the hill; increased methane levels (up to 19 ppm) were also measured ~80 ft S of the SS-25 well's head
- Overall, these values are lower than those recorded at the same locations during previous site visits
- SCAQMD inspectors used a portable TVA-1000 monitor to confirm these findings and complement the LICOR data
- Videos were taken with FLIR cameras to identify the presence of natural gas
