02/24/16 (08:00am to 10:55am)

- Elevated methane concentrations (up to 45 ppm) were measured ~150-200 ft E of SS-25, probably from multiple naturally occurring holes on the side of the hill
- Methane levels immediately W and NW of well SS-25 have been decreasing during the past few days and are now lower than 7 ppm
- SCAQMD inspectors used a portable TVA-1000 monitor to confirm these findings and complement the LICOR data
- Videos were taken with FLIR cameras to identify the presence of natural gas
