Definitions and Abbreviations

<b>Abbreviation/ Acronym</b>	<b>Description</b>	<b>Definition</b>
AERMOD		Air dispersion model.
APIN	Air Permit Identification Number	Identification number assigned by Boeing to permitted equipment; may also be assigned to unpermitted equipment or other sources.
CAS	Chemical Abstracts Service	
HARP	Hotspots Analysis and Reporting Program	A single integrated software package designed to promote statewide consistency, efficiency, and cost-effective implementation of health risk assessments and the Hot Spots Program.
HI	Hazard Index	Either acute or chronic hazard index.
HIA	Acute Hazard Index	A measure of the health impacts that occur over a relatively short period of time (e.g., minutes or hours). The term is used to describe brief exposures and effects which appear promptly after exposure to some toxic air contaminants.
HIC	Chronic Hazard Index	A measure of the adverse non-cancer health effects that develop and persist (e.g., months or years) over time after long-term exposure to some toxic air contaminants.
HRA	Health Risk Assessment	
MEIR	Maximally Exposed Individual Resident	
MEIW	Maximally Exposed Individual Worker	
MICR	Maximum Individual Cancer Risk	The estimated probability of a potential maximally exposed individual contracting cancer as a result of exposure to toxic air contaminants over a period of 70 years for residential receptor locations.
mmBtu	Millions of British Thermal Units	Measure of heat input
PAH	Polycyclic Aromatic Hydrocarbons	Toxic air contaminant produced by combustion of fuel. Generally the most significant carcinogen from fuel combustion.
PMI	Point of Maximum Impact	
TAC	Toxic Air Contaminant	
	Target Organs	Organs or systems within the human body that experience adverse acute or chronic health impacts from exposure to toxic air contaminants.
TCE	Trichloroethylene	Solvent used for degreasing
XAPIN	Exempt Air Permit Identification Number	Internal identification number like APIN but the "X" denotes that this equipment/source does not have a permit

# Health Risk Assessment

## Executive Summary

---

### Health Risk Assessment Executive Summary

This health risk assessment (HRA) was prepared in response to a request by the South Coast Air Quality Management District. In June 2006 an HRA of The Boeing Company - Huntington Beach facility (Boeing) was submitted to the SCAQMD and subsequently approved (Reference 6). The SCAQMD HRA request letter dated July 31, 2013 (Reference 7) explains that "With the recent addition of the two boilers purchased from Ameresco Huntington Beach (ID 140499), your facility's AB2588 HRA, submitted June 2006, is no longer representative of existing operations. Thus, you are required to submit an updated HRA..."

The Boeing facility merged with the Ameresco Huntington Beach facility and is now operated as a single facility (ID 016660). This health risk assessment utilizes the 2012 annual emission inventory and includes all air emission sources at Boeing, including the boilers that were part of the old Ameresco Huntington Beach facility.

Cancer risk was calculated to be 2.8 in one million for the nearest residential receptor, and 2.4 in one million for the nearest offsite worker receptor. Chronic and acute health risk indices were well below 1.0 for all receptors.

#### Facility Identification

**The Boeing Company  
5301 Bolsa Ave.  
Huntington Beach, CA 92647  
SCAQMD Facility ID #016660**

#### Facility Operations

The Boeing facility is an aerospace research and development facility. There are a number of laboratories that perform research and development activities. Metal parts are manufactured that may be processed in a chromic acid anodizing tank line and/or coated in a spray booth. Parts are also manufactured from composite materials. Almost all manufacturing at the facility is at the prototype level with only single or small quantities produced. There are twenty-one emergency backup generators; all are diesel-fueled.

## Emitted Substances

Operations that result in emissions of toxic air contaminants (TAC) include:

- Spray coating of aerospace coatings;
- Spray foam;
- Chromic acid anodizing tank line;
- Emergency diesel-fueled internal combustion engines (ICE);
- Natural gas combustion in boilers and heaters; and
- Solvent cleaning of metal parts.

There was no use of trichloroethylene (TCE) for degreasing in 2012.

The toxic substances and their annual and hourly emissions are shown in the following table. Annual and hourly emissions of non-Diesel Particulate Matter (DPM) substances associated with the emergency diesel-fueled ICEs have been excluded from the totals but these substances have been included in this and all other tables, by name only

Toxic Air Contaminant Hourly and Annual Emissions

Chem No.	CAS	Chemical Name	Hourly Emissions (lb/hour)	Annual Emissions (lb/year)
1	95636	1,2,4-Trimethylbenzene	9.24E-04	3.67E+00
2	106990	1,3-Butadiene	0.00E+00	0.00E+00
3	75070	Acetaldehyde	2.07E-04	2.23E-01
4	107028	Acrolein	1.76E-04	1.82E-01
5	7440382	Arsenic	0.00E+00	0.00E+00
6	71432	Benzene	3.86E-04	4.46E-01
7	7440439	Cadmium	0.00E+00	0.00E+00
8	76131	Trichlorotrifluoroethane {CFC-113}	1.87E-03	7.46E+00
9	7440508	Copper	0.00E+00	0.00E+00
10	18540299	Chromium, hexavalent (and compounds)	4.61E-06	1.78E-02

16	110543	Hexane	3.08E-04	3.55E-01
17	7439921	Lead	0.00E+00	0.00E+00
18	7439965	Manganese	0.00E+00	0.00E+00
19	101688	Methylene diphenyl diisocyanate {MDI} [POM]	2.70E-01	1.09E+03
20	78933	Methyl ethyl ketone {2-Butanone}	1.10E-01	5.00E+02
21	7439976	Mercury	0.00E+00	0.00E+00
22	108101	Methyl isobutyl ketone {Hexone}	2.88E-02	1.18E+02
23	91203	Naphthalene [PAH, POM]	6.37E-05	1.82E-01
24	7664417	Ammonia	1.92E-01	2.41E+02
25	7440020	Nickel	0.00E+00	0.00E+00
26	1151	PAHs, total, w/o individ. components reported [PAH, POM]	6.53E-06	7.54E-03
27	108656	Propylene glycol monomethyl ether acetate	1.65E-02	9.54E+01

Chem No.	CAS	Chemical Name	Hourly Emissions (lb/hour)	Annual Emissions (lb/year)
28	7782492	Selenium	0.00E+00	0.00E+00
29	584849	Toluene-2,4-diisocyanate	4.89E-05	1.83E-01
30	108883	Toluene	1.77E-03	2.12E+00
31	1330207	Xylenes	2.70E-02	1.44E+02

## Multipathway Substances and Their Pathways

All TACs enter the body through inhalation. Some TACs also enter the body through other pathways. For example, a substance may be deposited on the ground in particulate form and contribute to risk through ingestion of soil or backyard garden vegetables. The chemicals evaluated in this analysis that have multipathways are shown in the following table.

Multipathway Substances

Chemical	CAS	Pathways
Arsenic	7440382	Inhalation, soil, dermal, home-grown produce
Cadmium	7440439	Inhalation, soil, dermal, home-grown produce
Hexavalent Chromium	18540299	Inhalation, soil, dermal, home-grown produce
Lead	7439921	Inhalation, dermal, soil, home-grown produce
Mercury	7439976	Inhalation, soil, dermal, home-grown produce
Nickel	7440020	Inhalation, soil, dermal, home-grown produce
PAHs, total, w/o individ. Components	1151	Inhalation, dermal, soil, home-grown produce

The following table lists the possible pathways and whether they were evaluated for residential and/or worker receptors.

Pathways Evaluated

Pathway	Evaluated (yes/no)	Comment
Inhalation	Yes for all receptors	Evaluated for all substances at all receptors
Home Grown Produce	Yes for residential receptors No for commercial receptors	Evaluated for residential receptors
Dermal Absorption	Yes for all receptors	Evaluated for all receptors
Soil Ingestion	Yes for all receptors	Evaluated for all receptors
Mother's Milk	Yes for residential receptors No for commercial receptors	Evaluated for residential receptors
Fish	No	No bodies of water fished in the area
Beef/Dairy	No	No beef or dairy farms in the area
Drinking Water	No	No drinking water reservoirs in the area
Pigs, Chickens, Eggs	No	No farms in the area

The most significant pathway is inhalation; over 99% of the cancer risk is due to this pathway. The following table shows the relative weight of each pathway. This is the case for both residential and worker receptors. Note that the 'ORAL' risk represents the sum of the risk from the noninhalation pathways.

Cancer Risk Percentage by Pathway

Pathway	Cancer Risk	% of Total
INHAL	2.8E-06	99.09%
DERM	7.3E-09	0.26%
SOIL	8.2E-09	0.29%
MOTHER	0.0E+00	0.00%
FISH	0.0E+00	0.00%
WATER	0.0E+00	0.00%
VEG	1.0E-08	0.36%
DAIRY	0.0E+00	0.00%
BEEF	0.0E+00	0.00%
CHICK	0.0E+00	0.00%
PIG	0.0E+00	0.00%
EGG	0.0E+00	0.00%
MEAT	0.0E+00	0.00%
ORAL	2.6E-08	0.91%

## Overview of Dispersion Modeling and Exposure Assessment

Air dispersion models simulate the atmospheric transport and fate of a pollutant from the point of emission to the location of impact to arrive at ambient air concentration estimates of the pollutant. The transformation (fate) of an airborne pollutant, its movement with the prevailing winds (transport), its crosswind and vertical movement due to atmospheric turbulence (dispersion), and its removal amounts due to dry and wet deposition are influenced by the pollutant's physical and chemical properties and by meteorological and environmental conditions. Factors such as distance from the source to the receptor, meteorology, intervening land use and terrain, pollutant release characteristics, and background pollutant concentrations affect the predicted air concentration rate of an air pollutant. Estimates of the amount of gaseous and particulate material deposited by wet and dry process on outdoor surfaces are also necessary to assess impacts of toxic air pollutants. [From U.S EPA fact sheet: Computer Modeling: Dispersion Models. [www.epa.gov/ttn/atw/wks/fs-dispmode.pdf](http://www.epa.gov/ttn/atw/wks/fs-dispmode.pdf).]

AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain.

Once the concentrations of the pollutants are determined through dispersion modeling, exposure assessment is done to determine the impacts on nearby receptors. The Risk Analysis module in HARP provides the tool for preparing Health Risk Assessments as specified in the Office of Environmental Health Hazard Assessment's document *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (OEHHA, 2003).

## Dose-Response Assessment for Cancer and Noncancer Health Impacts

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with an estimated exposure. Cancer potency factors are expressed as the 95th percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance at a dose of one milligram per kilogram of body weight-day and commonly expressed in units of inverse dose (i.e., (mg/kg/day)-1). It

is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis. The Office of Environmental Health Hazard Assessment (OEHHA) has compiled cancer potency factors, which are used in risk assessments for the Hot Spots program. Cancer potency factors were derived either by the United States Environmental Protection Agency (U.S. EPA) or by OEHHA. For a detailed description of cancer potency factors, refer to *The Air Toxics Hot Spots Program Risk Assessment Guidelines; Part II; Technical Support Document for Describing Available Cancer Potency Factors* (OEHHA, 1999b and 2002).

For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute and chronic noncancer Reference Exposure Levels (RELs). The acute and chronic RELs are defined as the concentration at which no adverse noncancer adverse health effects are anticipated. The most sensitive health effect is chosen to determine the REL if the chemical affects multiple organ systems. Unlike cancer health effects, noncancer acute and chronic health effects are generally assumed to have thresholds for adverse effects. In other words, acute or chronic injury from a pollutant will not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold). The acute and chronic RELs are intended to be below the threshold for health effects for the general population. The actual threshold for health effects in the general population is generally not known with any precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies to help ensure that the chronic and acute REL values are below the threshold for human health for nearly all individuals. Some substances that pose a chronic inhalation hazard may also present a chronic hazard via non-inhalation routes of exposure (e.g., ingestion of contaminated water, foods, or soils, and dermal absorption). The methodology and derivations for acute and chronic RELs are described in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Part I; The Determination of Acute Reference Exposure Levels for Airborne Toxicants (Part I TSD)* (OEHHA 1999a) and *Air Toxics Hot Spots Program Risk Assessment Guidelines; Part III; Technical Support Document for the Determination of Chronic Reference Exposure Levels (Part III TSD)*(OEHHA 2000a).

## Target Organs

The target organs which are affected by acute and chronic noncancer impacts are defined as follows:

CV:	Cardiovascular
CNS:	Central nervous system
BONE:	Bones and teeth
DEVEL:	Developmental
ENDO:	Endocrine system
EYE:	Eye
GILV:	Gastrointestinal and Alimentary system (liver)
IMMUN:	Immune system
KIDN:	Kidney
REPRO:	Reproductive system
RESP:	Respiratory system
SKIN:	Skin
BLOOD:	Blood (hematopoietic)

The following tables show the list of chemicals emitted at this facility and the target organs affected in terms of chronic and acute health impacts.

Target Organ Systems by Substance for Chronic Noncancer Impacts

Chem No.	CAS	Chemical	Chronic Risk Target Organ Systems

### Summary of Results

Cancer risk was calculated to be 2.8 in one million for the nearest residential receptor, and 2.4 in one million for the nearest offsite worker receptor. Chronic and acute health risk indices were well below 1.0 for all receptors.

The Health Risk Assessment Summary Form is included in Appendix A.

## Location of Maximum Impact

Location of Maximum Impact

Maximum Exposure Point	UTM Coordinates (km)	Grid No.
PMI (Point of Maximum Impact)	404.343 E, 3735.153 N	355
MEIR (Maximally Exposed Individual Resident)	404.343 E, 3735.153 N	355
MEIW (Maximally Exposed Individual Worker)	404.266 E, 3734.765 N	960

Summary of Health Risk Impacts

Receptor	Grid No.	Cancer	Grid No.	Chronic	Grid No.	Acute
Residential	355	$2.8 \times 10^{-6}$	356	0.06	379	0.00 (simple)
Worker	960	$2.4 \times 10^{-6}$	957	0.09	976	0.01 (simple)
Fence line					1723	0.01 (simple)

Location of Receptors with Cancer Risk Above Ten in One Million or Health Risk Index over 1.0

There are no receptors with cancer risk above ten in one million.

There are no receptors with chronic health index over 1.0.

There are no receptors with acute health index over 1.0.

The maximum acute health risk at the facility boundary is at Boundary Receptor 1723. The maximum acute health index (HIA) was calculated to be 0.01 using the Acute HI Simple method.

The maximum residential acute health risk occurs at receptor 379. The acute health risk at that location was 0.00 using the Acute HI Simple Method.

The maximum worker acute health risk occurs at receptor 976. The acute health risk at that location was 0.01 using the Acute HI Simple Method.

## Total Potential Multipathway Risks

The total potential multipathway cancer risks at the PMI, MEIR, and MEIW are shown in the following table.

Cancer Risks at Maximum Exposure Points

Maximum Exposure Point	Maximum Individual Cancer Risk
PMI (Point of Maximum Impact)	2.8 x 10-6
MEIR (Maximally Exposed Individual Resident)	2.8 x 10-6
MEIW (Maximally Exposed Individual Worker)	2.4 x 10-6

The following table shows the nine most significant substances that contribute to cancer risk sorted by their percentage of the total cancer risk (residential) for receptor 355, the PMI. All other substances did not contribute to cancer risk. Diesel exhaust particulate matter contributes 71.46% of the cancer risk. Hexavalent chromium is next with about 27.80% of the total. Together these two substances contribute 99.26% of the total cancer risk. The pathways included for residential risk were inhalation, home grown produce, dermal absorption, soil ingestion, and mother's milk.

Cancer Risk by Substance for MEIR

Chem. No.	CAS	Substance	MICR	% of Total
11	9901	DieselExhPM	2.0E-06	71.46%
10	18540299	Cr(VI)	7.9E-07	27.80%
26	1151	PAHs-w/o	1.8E-08	0.63%
23	91203	Naphthalene	1.1E-09	0.04%
6	71432	Benzene	9.0E-10	0.03%
29	584849	T-2,4-diisocyan	7.2E-10	0.02%
13	50000	Formaldehyde	4.4E-10	0.02%
12	100414	EthylBenzene	9.7E-11	0.00%
3	75070	Acetaldehyde	4.5E-11	0.00%
<b>Total MICR</b>				<b>2.8E-06</b>

The following table shows the nine most significant substances that contribute to cancer risk sorted by their percentage of the total cancer risk (worker) for receptor 960. All other substances did not contribute to cancer risk. Diesel exhaust particulate matter contributes approximately 79.81% of the cancer risk, hexavalent chromium contributes approximately 19.97%, and PAH contributes approximately 0.13% of the total cancer risk. These three substances account for 99.92% of the total risk. The pathways included for worker risk were inhalation, dermal, and soil ingestion.

Cancer Risk by Substance for MEIW

<b>Chem. No.</b>	<b>CAS</b>	<b>Substance</b>	<b>MICR</b>	<b>% of Total</b>
11	9901	DieselExhPM	1.9E-06	79.81%
10	18540299	Cr(VI)	4.8E-07	19.97%
26	1151	PAHs-w/o	3.1E-09	0.13%
23	91203	Naphthalene	8.8E-10	0.04%
29	584849	T-2,4-diisocyan	4.3E-10	0.02%
6	71432	Benzene	4.0E-10	0.02%
13	50000	Formaldehyde	2.1E-10	0.01%
12	100414	EthylBenzene	4.6E-11	0.00%
3	75070	Acetaldehyde	2.0E-11	0.00%
<b>Total MICR</b>			<b>2.4E-06</b>	

## Map of Facility

The map of the facility shown below was assembled from an aerial photo. The outline of the facility is shown in white. The locations of the PMI, MEIR, and MIEW are indicated with red crosses.

• Figure 1: Facility Map

## 70-Year Lifetime Cancer Risk Zone of Impact

The map below shows the 70-year cancer risk contour using the residential risk profile. The blue contour line is the 1 in one million risk isopleth. The cancer risk at receptor location 355 (MEIR) is  $2.8 \times 10^{-6}$ , or 2.8 in one million.

• Figure 2: 70-Year Cancer Risk Zone of Impact

## Acute Hazard Impacts

The map below shows the acute health risk index contours. No isopleths are shown since the acute health index is less than 1.0 for all receptors. Calculation of acute health risk is the same for both residential and worker receptors. Maximum acute health risk was calculated at the fence line of the facility. The maximum acute health risk at the facility boundary is at Boundary Receptor 1723. The maximum acute health index (HIA) was calculated to be 0.01 using the Acute HI Simple method.

The maximum residential acute health risk occurs at receptor 379. The acute health risk at that location was 0.00 using the Acute HI Simple Method.

The maximum worker acute health risk occurs at receptor 976. The acute health risk at that location was 0.01 using the Acute HI Simple Method.

The substances that drive acute health risk are acrolein and ammonia. The primary target organ that is impacted is the eye.

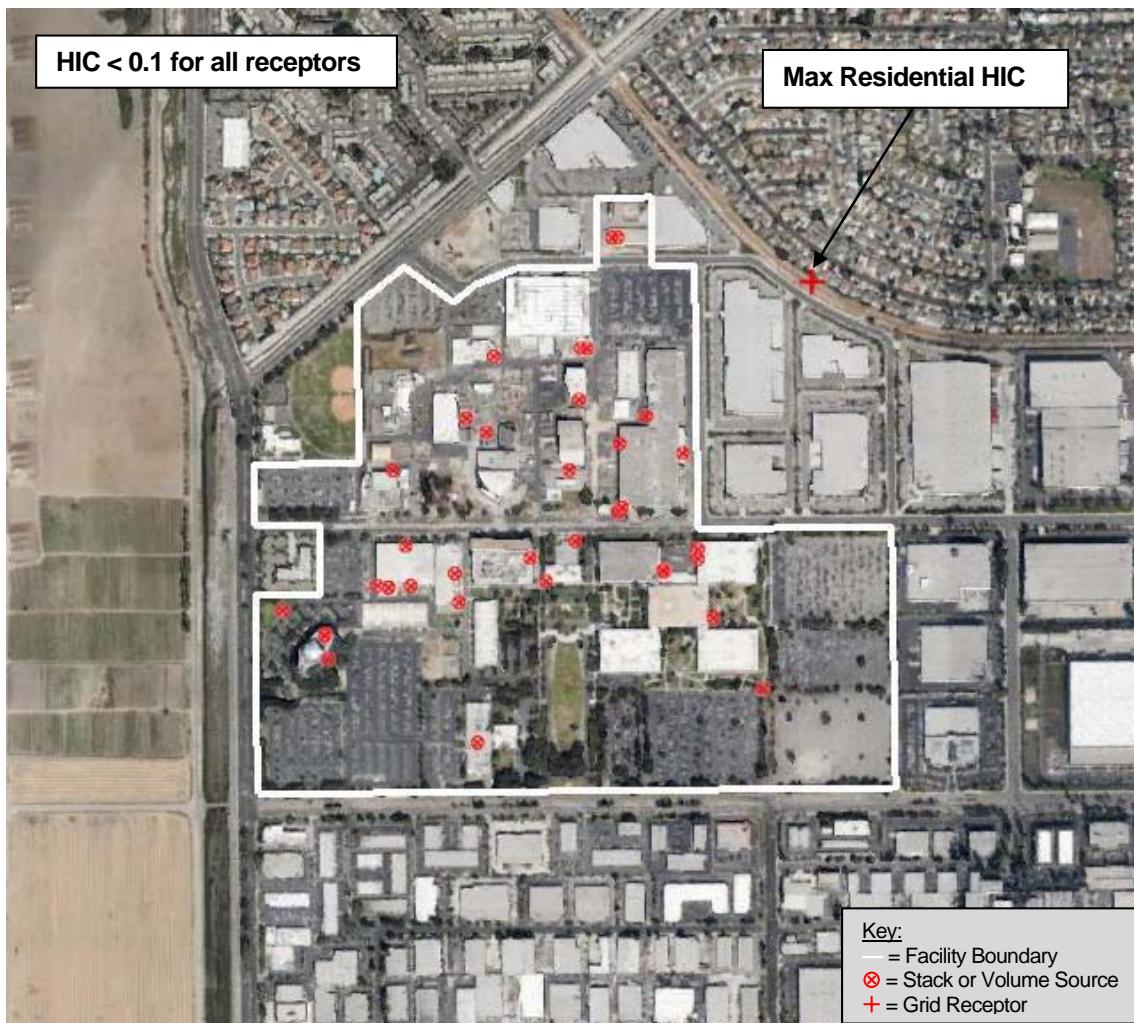

• Figure 3: Acute Health Risk

## Chronic Hazard Impacts

### Residential

The maximum residential chronic impact occurs at receptor 356. The chronic health index (HIC) at that receptor is 0.06. No isopleths are shown since the chronic health index is less than 0.1 for all receptors.

• Figure 4: Residential Chronic Health Risk

The substances that drive chronic noncancer health risk are: Methylene diphenyl diisocyanate, diesel exhaust PM, toluene-2,4-diisocyanate and ammonia. The primary target organ that is impacted is the respiratory system.

## Worker

The maximum worker chronic impact occurs at receptor 957. The chronic health index (HIC) at that receptor is 0.09. No isopleths are shown since the chronic health index is less than 0.1 for all receptors.

• Figure 5: Worker Chronic Health Risk

The substances that drive chronic noncancer health risk are: Methylene diphenyl diisocyanate, diesel exhaust PM, toluene-2,4-diisocyanate and ammonia. The primary target organ that is impacted is the respiratory system.

## Population Exposure

The cancer burden was estimated to be  $2.31 \times 10^{-2}$ . The population inside the  $1 \times 10^{-6}$  cancer isopleth was estimated to be 8,237 based on census block group data.

## Versions of Software and Risk Assessment Guidelines

HARP Version 1.4f was used for this analysis.

The risk assessment guidelines used for this analysis were the Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act (AB2588), dated June 2011.

## Executive Summary Conclusion

This analysis demonstrates that the cancer, cancer burden, and chronic health risk are below the Action Risk Levels defined in Rule 1402.

# Health Risk Assessment Report

---

## Health Risk Assessment Report

This health risk assessment (HRA) was prepared in response to a request by the South Coast Air Quality Management District. In June 2006 an HRA of The Boeing Company - Huntington Beach facility (Boeing) was submitted to the SCAQMD and subsequently approved (Reference 6). The SCAQMD HRA request letter dated July 31, 2013 (Reference 7) explains that "With the recent addition of the two boilers purchased from Ameresco Huntington Beach (ID 140499), your facility's AB2588 HRA, submitted June 2006, is no longer representative of existing operations. Thus, you are required to submit an updated HRA..."

The Boeing facility merged with the Ameresco Huntington Beach facility and is now operated as a single facility (ID 016660). This health risk assessment utilizes the 2012 annual emission inventory and includes all air emission sources at Boeing, including the boilers that were part of the old Ameresco Huntington Beach facility.

Cancer risk was calculated to be 2.8 in one million for the nearest residential receptor, and 2.4 in one million for the nearest offsite worker receptor. Chronic health risk indices were well below 1.0 for all receptors. Acute health risk at the facility fence line was determined to be 0.56.

## Hazard Identification

### Emitted Substances

The operations that result in emissions of toxic air contaminants include:

- Spray coating of aerospace coatings;
- Spray foam;
- Chromic acid anodizing tank line;
- Emergency diesel-fueled internal combustion engines (ICE);
- Natural gas combustion in boilers and heaters; and
- Solvent cleaning of metal parts.

There was no use of trichloroethylene (TCE) for degreasing in 2012.

The toxic air contaminants emitted, their annual and hourly emissions, and the types of emission sources are shown in the following table. Annual and hourly emissions of non-Diesel Particulate Matter (DPM) substances associated with the emergency diesel-fueled ICEs have been excluded from the totals but these substances are shown throughout, by name.

## Toxic Air Contaminant Emissions

CAS	Chemical Name	Source Type	Hourly Emissions (lb/hour)	Annual Emissions (lb/year)
95636	1,2,4-Trimethylbenzene	Aerospace coatings	9.24E-04	3.67E+00

### Evaluation for Cancer Risk and Noncancer Risks

This section identifies the substances that were evaluated for cancer risk and/or noncancer acute and chronic health risk impacts. In addition, substances that present a potential cancer risk or chronic noncancer hazard via noninhalation routes of exposure are identified. The following table lists the substances and their risk factors.

Risk Factors								
CAS	Chemical Description	Inhalation Cancer Unit Risk Factor ( $\mu\text{g}/\text{m}^3\text{-}1$ )	Inhalation Cancer Slope Factor ( $\text{mg}/\text{kg}\cdot\text{d}\text{-}1$ )	Oral Cancer Slope Factor ( $\text{mg}/\text{kg}\cdot\text{d}\text{-}1$ )	Inhalation Chronic REL ( $\mu\text{g}/\text{m}^3$ )	Oral Chronic REL ( $\mu\text{g}/\text{m}^3$ )	Inhalation Acute REL ( $\mu\text{g}/\text{m}^3$ )	Is Multi path way?
95636	1,2,4-Trimethylbenzene	0	0	0	0	0	0	FALSE
106990	1,3-Butadiene	0.00017	0.6	0	2	0	660	FALSE

## Types and Amounts of Emissions

This section discusses the types and amounts of continuous or intermittent predictable emissions from the facility that occurred during the reporting year. We will discuss the substance(s) released and a description of the processes that resulted in long-term and continuous releases.

### Spray Coating of Aerospace Coatings

This process emits hexavalent chromium, hexamethylene-1,6-diisocyanate, toluene-2,4-diisocyanate, xylene, formaldehyde and 1,2,4-trimethylbenzene. Emissions from spray coating of aerospace coatings only occur when the painter is spraying parts in a spray booth. This can happen at any time during business hours. However, this type of emission is intermittent since there is not a lot of aerospace coating usage at this facility. This operation occurs throughout the year.

### Spray Foam

This process creates rigid foam which is created by the combination of two different chemicals. The process of making spray foam emits toluene-2,4-diisocyanate, and methylene diphenyl diisocyanate. The spray foam lab is located in Bldg. 21. There are three pieces of equipment that are used for spray foam operations. All spray foam emissions are modeled as one source. Emissions only occur when the operator is running the spray foam equipment; this can happen any time during business hours. However, this type of emission is intermittent since the quantity of spray foam used is small. This operation occurs throughout the year.

## Solvent Cleaning of Metal Parts

Emissions from solvent cleaning of metal parts occurs any time that parts are cleaned. Solvents used for cleaning include MEK and MIBK. Usually these solvents are applied to metal parts prior to their being coated with an aerospace coating.

## Chromic Acid Anodizing Tank Line

These tanks emit hexavalent chromium. Emissions from the chromic acid anodizing tank occur when the rectifier is applying voltage to the metal part, or when the tank is being air sparged to mix the solution. The chrome conversion tanks and other tanks that contain chromium only emit hexavalent chromium when the tanks are being air sparged. Tank line APIN 178 is in the laboratory and the usage is low and infrequent. Sparging of the tanks is limited by Rules 1469 and 1426 to those times when parts are being processed in the tanks.

## Emergency Diesel-Fueled Internal Combustion Engines (ICE)

These engines are only used in emergency situations so use is intermittent. The engines are run on a weekly or monthly basis for maintenance and testing. This typically amounts to less than 20 hours per year per engine. If there is an emergency, the engines start automatically; emissions due to emergencies are intermittent and unscheduled.

## Natural Gas Combustion in Boilers and Heaters

External combustion of natural gas emits acetaldehyde, acrolein, benzene, formaldehyde, PAH, naphthalene, and toluene. The boilers and heaters operate during the colder months of the year. During the warm months, the smaller units do not operate and the operation of the larger units is reduced. There is some small usage of natural gas in the kitchen throughout the year.

## Degreasing Using Trichloroethylene (TCE)

There is one degreaser that uses TCE. Emissions of TCE only occur while the equipment is operating. This equipment was not operated at all in 2012.

## Exposure Assessment

### Facility Description

**The Boeing Company – Huntington Beach**  
**5301 Bolsa Ave., M/C H45N-E104**  
**Huntington Beach, CA 92647**  
**SCAQMD Facility ID #016660**

### Local Topography

The local topography of this area is flat. This facility is about three miles northeast of the Pacific Ocean at an elevation of about 20 feet above sea level. The surrounding area is generally at the same elevation. As you move towards the east the elevation rises very slightly.

### Facility Plot Plan

A facility plot plan is included in Appendix B.

### Site/Route Dependent Exposure Pathways

The facility is located in an area that has both commercial and residential receptors nearby. To the west across Bolsa Chica Avenue is the Naval Weapons Station - Seal Beach. There are no drinking water reservoirs, fishable waters, beef/dairy pastures, or farms in the area.

Since there are residents in the area that could raise homegrown produce, the homegrown produce pathway was included. In accordance with SCAQMD guidance, 5.2% is the fraction of homegrown fruits and vegetables consumed. Dermal, mother's milk and soil ingestion pathways were also included for the residential receptors.

For the worker receptors, dermal absorption, and soil ingestion were included.

### Emissions Inventory

Facility emissions of toxic air contaminants (TAC) reportable under AB2588 were determined for the one year period from January 1, 2012 through December 31, 2012. Many of the TACs were reported under the SCAQMD's Annual Emissions Reporting (AER) program. There were also some additional TACs that were not reported on the 2012 AER, but are on the list of AB2588 TACs.

Appendix D contains information on facility sources and emissions in table format as specified in Appendix K of the OEHHA Guidelines (2003) (Ref. 3). Sources are identified within the facility by "APIN" numbers (Air Permit Identification Numbers). However, not all APIN numbers refer to permitted equipment; some equipment is exempt from permitting and has an APIN number, or XAPIN number, to facilitate identification.

### Spraying of Aerospace Coatings

Aerospace coatings and solvents contain toxic materials: hexavalent chromium, hexamethylene-1,6-diisocyanate, toluene-2,4-diisocyanate, formaldehyde, xylene, 1,2,4-trimethylbenzene, methyl ethyl ketone, and methyl isobutyl ketone. Emissions were estimated by taking the total quantity of coatings and solvents used at the facility during the year and calculating the weight of each TAC as determined

from the MSDS's. Most of the TACs are volatile and are assumed to be emitted through evaporation. Hexavalent chromium is not volatile.

The most significant TAC is hexavalent chromium. The annual amount of chrome-containing paint was determined from spray booth usage logs. The amount of chrome in the paint was determined from the MSDS's. All chrome in the paint is assumed to be hexavalent chromium. Transfer efficiency from the spray gun to the parts of 65% was assumed. The control efficiency of the spray booth filters was assumed to be 99.63%. The combined control efficiency is calculated to be:

$$\text{Control Efficiency} = 1 - (1 - 0.65)(1 - 0.9963) = 0.9987 \text{ (99.87%)}$$

Each of the chromated coatings, and the chrome weight in terms of lb/gal, are listed in the following table. The Hex Chrome Emissions were calculated by the following equation:

$$\text{Cr-VI Emissions(lb/yr)} = \text{Volume Used (gal/yr)} \times \text{Chrome Wt. (lb/gal)} (1-0.9987)$$

<b>Coating</b>	<b>Total (gal/yr)</b>	<b>Chrome Wt. (lb/gal)</b>	<b>Hex Chrome Emissions (lb/yr)</b>
DMS 1786	0.17	0.23	0.0001
DPM 2232	0.35	0.23	0.0001
44-GN-054	2.76	0.23	0.0008
HBPM-24-008-03	0.02	0.23	0.0000
DMS 1850	0.15	0.17	0.0000

BMS 10-79	0.39	0.14	0.0001
PR-1432-GV	0.01	0.28	0.0000
<b>Total</b>	<b>27.48</b>		<b>0.0182</b>

Chromated coatings were only applied in spray booths APIN 17 and 60. The following table lists quantities of coatings and solvents used in these two spray booths.

Spray Booth	Coatings & Solvents (lbs/year)	Coatings & Solvents %	Hex Chrome Emissions (lb/year)
APIN 17	110.4	29%	0.0077
APIN 60	265.7	71%	0.0106
Total	376.0		0.0182

Emissions of volatile compounds were determined from annual usage and the percentage of TAC in each material.

In addition to APIN 17 and APIN 60, there was one additional spray booth that emitted TACs during 2012, APIN 63. For the materials that were used in APIN 17 or APIN 60, either the % of coatings & solvents above was used to distribute the TAC emissions or, if a material was known to be used in APIN 17 or APIN 60 only, the emissions were assigned to one booth or the other.

Source No.	Description of Emission Source	Emissions	CAS	Annual Quantity (lbs)
17/60	Aerospace coatings/solvents	Formaldehyde	50000	2.47E-02
17/60	Aerospace coatings/solvents	1,2,4-Trimethylbenzene	95636	2.15E+00
17/60	Aerospace coatings/solvents	Hexamethylene-1,6-diisocyanate	822060	1.73E-01
17/60	Aerospace coatings/solvents	Toluene-2,4-diisocyanate	584849	1.93E-01
17/60	Aerospace coatings/solvents	Methyl ethyl ketone {2-Butanone}	78933	1.72E+02
17/60	Aerospace coatings/solvents	Methyl isobutyl ketone {Hexone}	108101	1.01E+02
17/60	Aerospace coatings/solvents	Xylenes	1330207	1.31E+02
63	Aerospace coatings/solvents	Xylenes	1330207	1.29E+00

### Spray Foam

Spray foam materials contain toluene-2,4-diisocyanate, and methylene diphenyl diisocyanate. Emissions of these materials were estimated based on the weight of these compounds used at the facility during the year. It was assumed that all of the TACs in the raw materials were emitted, although some of the material is reacted in the process and bound in the foam.

### Chromic Acid Anodizing Tank Line

The chromic acid anodizing tank emits hexavalent chromium from plating operations. Fumetrol 140 mist suppressant is used to control chromium emissions. Hexavalent chromium is calculated by using the emission factor in Reference 4, page 22, Table 2-C, of 0.000022 lb/1000 amp-hour. 6,381 amp-hours were used for the year. Thus, hexavalent chromium emissions were calculated as:

$$\text{Cr-VI (lb/year)} = (6381 \text{ amp-hr})/1000 \times (0.000022 \text{ lb})/1000 \text{ amp-hr} = 0.00014 \text{ lb/yr}$$

### Diesel Internal Combustion Engines

Emissions for twenty-one diesel-fueled internal combustion engines were estimated using the DPM emission factor from Reference 4, Table B-2. The other substances are included throughout this document by name but are not included in any emissions or risk quantifications.

TAC Emission Factors for Diesel Engines

TAC Code	Pollutant	CAS	Emission Factor (lb/1000 gal)
2	Benzene	71432	0.1863
4	1,3-Butadiene	106990	0.2174
5	Cadmium	7440439	0.0015
12	Formaldehyde	50000	1.7261
13	Hexavalent chromium	18540299	0.0001
14	Arsenic	7440382	0.0016
15	Lead	7439921	0.0083
17	Nickel	7440020	0.0039
19	Naphthalene	91203	0.0197
19	PAHs (excluding Naphthalene)	1151	0.0362
29	Acetaldehyde	75070	0.7833
30	Acrolein	107028	0.0339
32	Ammonia*	7664417	2.9000
36	Copper	7440508	0.0041
40	Ethyl Benzene	100414	0.0109
44	Hexane	110543	0.0269
46	Hydrogen Chloride	7647010	0.1863
49	Manganese	7439965	0.0031
50	Mercury	7439976	0.0020
64	Selenium	7782492	0.0022
68	Toluene	108883	0.1054
70	Xylenes	1330207	0.0424
72	Diesel exhaust particulates	9901	33.5000

Reference 4, Table B-2, page 14

TAC emissions are calculated as follows:

$$\text{Diesel PM (lb)} = \text{Quantity of Diesel Consumed (gal)}/1000 \times 33.5 \text{ (lb/1000 gal)}$$

### Natural Gas External Combustion

There are two permitted high temperature hot water generators (APIN 233 and 234) in building 51 that are greater than 10 mmBtu/hr. There are two unpermitted (<2 mmBtu/hr) boilers (XAPIN 212) on the roof of building 17, and two boilers (XAPIN 223) on the roof of building 28. There is other miscellaneous external combustion equipment, mostly in the cafeteria (XAPIN 213), Building 16. Emissions from external combustion of natural gas were estimated using the emission factors in Reference 4.

TAC Emission Factors for Natural Gas External Combustion

TAC Code	Pollutant	CAS No.	Emission Factor (lb/mmcf)	
			<10 MMBTU/HR	10-100 MMBTU/HR
2	Benzene	71432	0.008	0.0058

Reference 4, Table B-1, Page 13, External Combustion Equipment (Boiler, Oven, Dryer, Furnace, Heater, Afterburner)

TAC emissions are typically calculated as follows:

$$\text{Benzene (lb)} = \text{Quantity of natural gas consumed (mmcf)} \times 0.008 \text{ (lb/mmcf)}$$

#### Solvent Cleaning of Aerospace Parts

TAC emissions from solvents used to clean aerospace parts were determined based on the quantity of solvents used for the year. The total quantities of these solvents used for the year were determined from purchase records. The weights of the TACs were determined from the percentages as listed in the MSDS. These TAC emissions were distributed between buildings 21 (APIN 215) and building 45 (APIN 216) since those are the two buildings that are the most significant users of solvents. In addition to the solvents, there were small quantities of other miscellaneous organics that were assigned to B21 and B45. The table below shows the quantities of these TACs.

Source No.	Description of Emission Source	Emissions	CAS	Quantity (lbs)
B21/B45	Coatings/Solvents	Formaldehyde	50000	4.63E-03
B21/B45	Coatings/Solvents	Naphthalene	91203	1.76E-01
B21/B45	Coatings/Solvents	1,2,4-Trimethylbenzene	95636	1.54E+00
B21/B45	Coatings/Solvents	Hexamethylene-1,6-diisocyanate	822060	5.42E-02
B21/B45	Coatings/Solvents	Methylene diphenyl diisocyanate {MDI} [POM]	101688	0.00E+00
B21/B45	Coatings/Solvents	Toluene-2,4-diisocyanate	584849	3.31E-03
B21/B45	Coatings/Solvents	Methyl ethyl ketone {2-Butanone}	78933	3.28E+02
B21/B45	Coatings/Solvents	Methyl isobutyl ketone {Hexone}	108101	1.67E+01
B21/B45	Coatings/Solvents	Xylenes	1330207	9.57E+00

#### Asbestos from Demolition

Although asbestos emissions were reported in the 2012 AER, it is not included in this HRA because it was emitted from demolition activities and does not represent an ongoing emission source.

## Air Dispersion Modeling

### Modeling Overview

The air dispersion modeling used for the Boeing HRA was performed using the American Meteorological Society/Environmental Protection Agency (AMS/EPA) Regulatory Model (AERMOD, Version 12345). AERMOD calculates the atmospheric transport and fate of pollutants from source of emissions. The model essentially calculates the ambient air concentration of selected pollutants at specific downwind ground-level points, such as residential or off-site workplace receptors. The transformation (fate) of an airborne pollutant, its movement with the prevailing winds (transport), its crosswind and vertical movement due to atmospheric turbulence (dispersion), and its removal amounts due to dry and wet deposition are influenced by the pollutant's physical and chemical properties and by meteorological and environmental conditions. Factors such as distance from the source to the receptor, meteorological conditions, intervening land use and terrain, pollutant release characteristics, and background pollutant concentrations are all considered by the model when calculating downwind ground-level concentrations of an air pollutant.

### Modeling Release Scenarios

Two release scenarios were analyzed to compliment the HRA. The two scenarios included:

1. Maximum 1-hour emissions; and
2. Annual average emissions.

### Modeling Options

The air dispersion modeling analysis utilized standard AERMOD default options recommended by SCAQMD and EPA. In addition, the area surrounding the facility was evaluated to determine if urban or rural dispersion coefficients should be used in the analysis. Since urban areas typically have considerably more surface roughness as well as structures and surfaces that absorb heat, atmospheric dispersion can be somewhat different compared to rural areas. However, the SCAQMD generally requires the use of the more conservative "Urban" option, therefore the urban option was used for this project.

### Meteorological Data

The air dispersion modeling analysis utilized AERMOD-ready pre-processed meteorological data files. The representative 5-year meteorological data set consisted of upper air data and surface air data provided by the SCAQMD. All 5 years of meteorological data was included in the AERMOD runs.

The meteorological station used in this analysis is Costa Mesa. This station is the nearest representative meteorological station to the facility. The MET data file is from 2010 for acute risk and 2009 for residential and worker cancer and chronic risk.

### Building Downwash

When an emission source is located near a structure, such as a building, the structure can have an effect on the dispersion pattern of stack exhaust. This is called the "building downwash effect", which can impact the pollutant concentrations calculated by the model. Therefore, dimensions (length, width, and height) for nearby buildings were included in the air dispersion model so that potential impacts from building downwash were evaluated.

## Terrain Elevation Data

The area surrounding the power plant was evaluated to determine if elevated or complex terrain features exist. Since elevated and complex terrain did exist in the area, digital elevation data was imported into AERMOD and the model was run in the "elevated" terrain mode. Digital elevation data was obtained from United States Geological Survey data sources.

### Grid Spacing

An overall grid was set with spacing of 100 meters. For the property boundary, the grid was also set up with 20 meter spacing. A line of receptors was set along the nearest line of residences which are to the north of the facility. The grid spacing for this set of residential receptors was about 70 meters. See Appendix E for details on the receptors.

### Annual Average Concentrations

The PMI, MEIR, and MEIW receptors are shown in the following table.

Maximum Exposure Point	UTM Coordinates (km)	Grid No.
PMI (Point of Maximum Impact)	404.343 E, 3735.153 N	355
MEIR (Maximum Exposed Individual Resident)	404.343 E, 3735.153 N	355
MEIW (Maximum Exposed Individual Worker)	404.266 E, 3734.765 N	960

The average annual ground level concentrations of all substances are shown in the following table.

Average Annual Ground Level Concentrations for PMI, MEIR, MEIW

Chem No.	CAS	Chemical Description	Ground Level Concentration ( $\mu\text{g}/\text{m}^3$ )	
			PMI, MEIR Receptor 355	MEIW Receptor 960

## Risk Characterization

HARP version 1.4f was used to generate the health risk analysis results presented in this section. Cancer risk was calculated to be 2.8 in one million for the nearest residential receptor, and 2.4 in one million for the nearest offsite worker receptor. Chronic health risk indices were well below 1.0 for all receptors. Acute health risk was determined at the fence line of the facility to be 0.01.

### Receptors

The facility is located in an area that has both commercial and residential receptors nearby. To the west across Bolsa Chica Avenue is the Naval Weapons Station - Seal Beach. To the immediate north and east are commercial/industrial areas. To the northwest and northeast are residential areas. Farther to the east and southwest are schools. The receptors that were quantified include residential, worker, school, and sensitive (nursing home) receptors. See Appendix B for the map of the area and Appendix E for a list of receptors.

Receptors were added to the model to ensure that the health risk impacts on the closest residences were evaluated. There are offsite businesses to the east and north of the facility. Receptors were added to the model to calculate the health risk impacts on the closest offsite workers. Receptors location for local schools and two nursing homes are also included. See Appendix E for details on the receptors.

### Site/Route Dependent Exposure Pathways

There are no drinking water reservoirs, fishable waters, beef/dairy pastures, or farms in the area.

Since there are residents in the area that could raise homegrown produce, the homegrown pathway was included. In accordance with SCAQMD guidance, 5.2% is the fraction of homegrown fruits and vegetables consumed. Dermal, mother's milk and soil ingestion pathways were also included for the residential receptors.

For the worker receptors, dermal absorption, soil ingestion pathways were included.

## Cancer Risk

The location of the Point of Maximum Impact (PMI), Maximum Exposed Individual Resident (MEIR), and Maximum Exposed Individual Worker (MEIW) are shown in the following table:

Location of Maximum Impact		
Maximum Exposure Point	UTM Coordinates (km)	Grid No.
PMI (Point of Maximum Impact)	404.343 E, 3735.153 N	355
MEIR (Maximum Exposed Individual Resident)	404.343 E, 3735.153 N	355
MEIW (Maximum Exposed Individual Worker)	404.266 E, 3734.765 N	960

70-year, 30-year, and 9-year cancer risk for the MEIR and MEIW are shown in the following table. The 70-year risk uses the Derived (Adjusted) Method, and the 30 and 9-year risks use the Derived (OEHHA) Method:

		Cancer Risk: 70, 30, and 9 Year Risks		
Receptor	Grid No.	Cancer Risk		
		70 year Adult Resident	30 year Adult Resident	9 year Adult Resident
MEIR	355	2.8 x 10-6	1.57 x 10-6	4.72 x 10-7
MEIW	960	2.4 x 10-6	n/a	n/a

## Contribution by Substance

The breakdown of the cancer risk contribution by substance is shown in the following table. Diesel exhaust particulate matter is the substance with the most significant impact of approximately 71.46%.

Cancer Risk Contribution by Substance for MEIR					
Chem. No.	CAS	Substance	MICR	% of Total	
11	9901	DieselExhPM	2.0E-06	71.46%	
10	18540299	Cr(VI)	7.9E-07	27.80%

#### Contribution by Source

The breakdown of the residential cancer risk contribution by source is shown in the following table. The most significant source is spray booth APIN 60 accounting for approximately 22% of the total risk. The next most significant sources are five diesel engines that account for about 37% of the total cancer risk.

Residential Cancer Risk Contribution by Source

## Residential Risk Contours

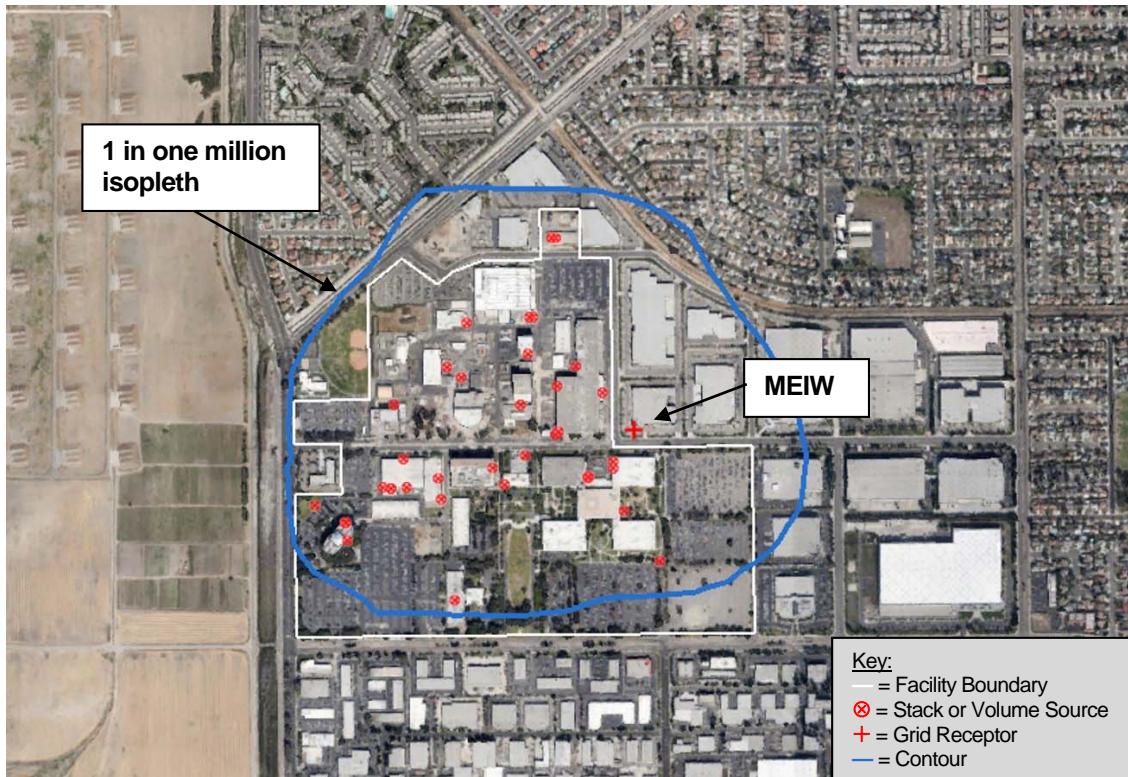

The map below shows the cancer risk contour using the residential risk profile. The blue contour is the 1 in one million isopleth. MEIR is the Maximally Exposed Individual Resident. The cancer risk at that location is  $2.8 \times 10^{-6}$ , or 2.8 in one million. The receptor is number 355.

• Figure 6: Residential Cancer Risk Isopleth

## Worker Risk Contour

The map below shows the cancer risk contours using the worker risk profile. The blue contour is the 1 in one million isopleth. MEIW is the Maximally Exposed Individual Worker. The cancer risk at that location is  $2.4 \times 10^{-6}$ , or 2.4 in one million. The receptor is 960.

• Figure 7: Worker Cancer Risk Isopleth

## Acute Health Risk

The calculation of acute health risk is the same for both residential and worker receptors. Maximum acute health risk was calculated at the fence line of the facility, and at the MEIR and MEIW.

The maximum acute health risk at the facility boundary is at Boundary Receptor 1723. The acute health index (HIA) at that receptor was calculated to be 0.01 using the Acute HI Simple method.

The maximum residential acute health risk occurs at receptor 379. The acute health risk at that location was 0.00 using the Acute HI Simple Method.

The maximum worker acute health risk occurs at receptor 976. The acute health risk at that location was 0.01 using the Acute HI Simple Method.

Acute Health Risk Maximum Impact Receptors

Receptor	UTM Coordinates (km)	Grid No.	HIA Simple
MEIR	404.25 E, 3735.247 N	379	0.00
MEIW	404.15 E, 3735.184 N	976	0.01
Max Acute Risk at Fenceline	404.152 E, 3735.173 N	1723	0.01

## Target Organs

The target organs affected by acute health impacts, and the corresponding acute health risk as calculated at receptor 1723 are shown in the following table. The EYE is the most impacted target organ.

Acute Health Risk by Target Organ

Target Organ	Description	Acute Risk
CV	Cardiovascular	0.00E+00
CNS	Central nervous system	4.91E-05
BONE	Bones and teeth	0.00E+00
DEVEL	Developmental	9.33E-04
ENDO	Endocrine system	0.00E+00
<b>EYE</b>	<b>Eye</b>	<b>9.96E-03</b>
GILV	Gastrointestinal and Alimentary system (liver)	0.00E+00
IMMUN	Immune system	9.30E-04
KIDN	Kidney	0.00E+00
REPRO	Reproductive system	9.33E-04
RESP	Respiratory system	8.99E-03
SKIN	Skin	0.00E+00
BLOOD	Blood (hematopoietic)	9.30E-04

## Contribution by Substance

The following table shows the breakdown of the acute health risk by substance. Acrolein has the most significant impact with 47% of the risk, followed by ammonia. These two substances account for over 86% of the acute health risk.

Acute Health Risk Contribution by Substance

<b>Chem No.</b>	<b>CAS</b>	<b>Description</b>	<b>Acute Risk</b>	<b>% of Total</b>
4	107028	Acrolein	4.7E-03	46.88%

## Residential and Worker Risk Contours

The map below shows the acute health risk index contours. No isopleths are shown since the acute health index is less than 1.0 for all receptors. The calculation of acute health risk is the same for both residential and worker receptors. Maximum acute health risk was calculated at the fence line of the facility at Boundary Receptor 1723. The maximum acute health index (HIA) was calculated to be 0.01 using the Acute HI Simple method.

The maximum residential acute health risk occurs at receptor 379. The acute health risk at that location was 0.00 using the Acute HI Simple Method.

The maximum worker acute health risk occurs at receptor 976. The acute health risk at that location was 0.01 using the Acute HI Simple Method.

• Figure 8: Acute Health Risk Isopleths

## Chronic Health Risk

Chronic health risk was calculated for both residential and worker receptors. Maximum chronic health risk was calculated at the MEIR and MEIW. The maximum residential chronic impact occurs at receptor 356. The chronic health index (HIC) at that receptor is 0.06. The maximum worker chronic impact occurs at receptor 957. The chronic health index (HIC) at that receptor is 0.09.

Chronic Health Risk Maximum Impact Receptors

Receptor	UTM Coordinates (km)	Grid No.	HIC
MEIR	404.401 E, 3735.112 N	356	0.06
MEIW	404.265 E, 3734.900 N	957	0.09

## Target Organs

The target organs affected by chronic health impacts, and the corresponding chronic health risk as calculated at receptor 356 are shown in the following table. The RESPIRATORY SYSTEM is the most impacted target organ.

Chronic Health Risk by Target Organ

Target Organ	Description	Chronic Risk
CV	Cardiovascular	0.00E+00
CNS	Central nervous system	2.65E-05
BONE	Bones and teeth	0.00E+00
DEVEL	Developmental	3.82E-07

		Total	<b>6.0E-02</b>	

## Residential Risk Contour

The maximum residential chronic impact occurs at receptor 356. The chronic health index (HIC) at that receptor is 0.06. No isopleths are shown since the chronic health index is less than 0.1 for all receptors.

• Figure 9: Residential Chronic Health Risk Isopleths

## Worker Risk Contour

The maximum worker chronic impact occurs at receptor 957. The chronic health index (HIC) at that receptor is 0.09. No isopleths are shown since the chronic health index is less than 0.1 for all receptors.

• Figure 10: Worker Chronic Health Risk

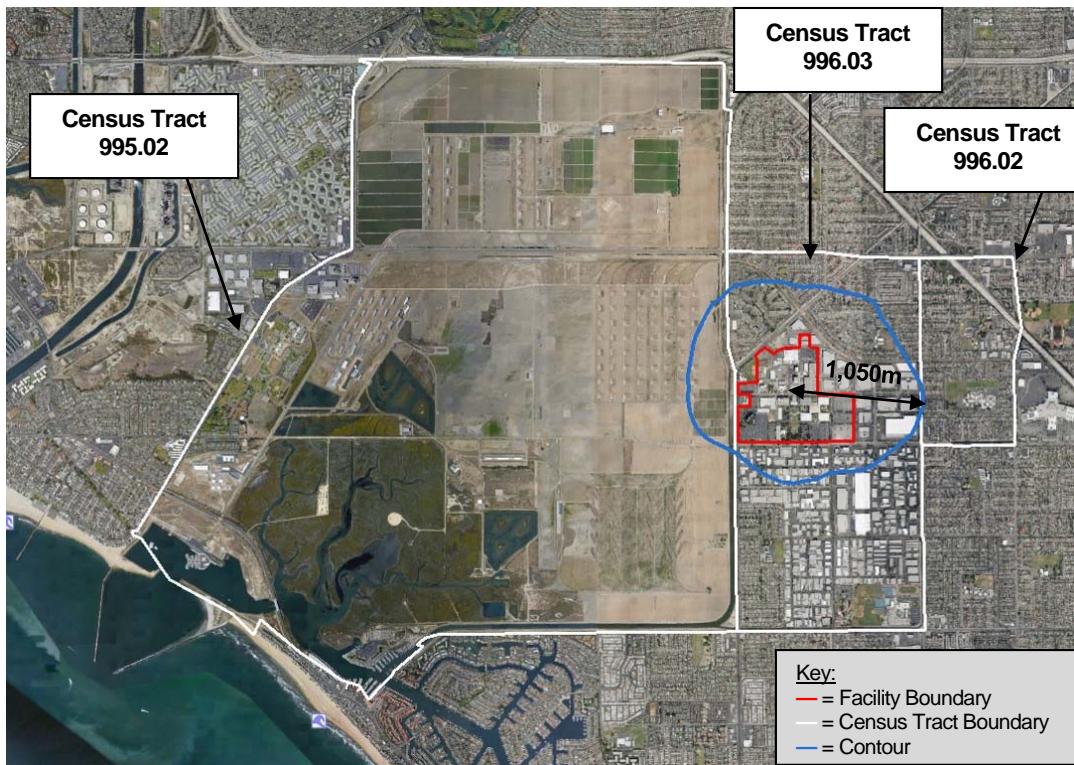

## Population Exposure

### Cancer Exposure

The following table shows the population exposure. Census block groups were used to estimate the population. The total excess cancer burden is  $2.31 \times 10^2$ .

Cancer Population Exposure		
Census Tract	Census Block Group	Population
995.02	1	598
996.02	2	1513
996.03	1	2749
996.03	2	874
996.03	3	1246
996.03	4	1257
Total		8237

The map below shows the census tracts within the exposure area. The maximum distance to the edge of the 1 and one million isopleth was approximately 1,050 meters, corresponding to an exposure area of approximately 3.5 square kilometers. Portions of three census tracts composed of six block groups were located within the exposure area. There were no populations exposed to cancer risk greater than 10 in one million.

• Figure 11: Census Tract Map

### Acute Hazard Exposure

There are no populations exposed to acute hazard greater than 1.0.

### Chronic Hazard Exposure

There are no populations exposed to chronic hazard index greater than 0.5.

### Strengths and Weaknesses of the Risk Analysis

With so many sources, there are many parameters that go into the risk analysis. In some cases, stack heights, stack diameters, exhaust temperatures, and exhaust flow rates were estimated. Exhaust flow rate and temperature in particular are parameters that had to be estimated in some cases. For the internal combustion engines, manufacturer's data was used for exhaust flow parameters.

In the case of spray booths APIN 60, the exhaust stacks consist of two horizontal ducts that exit from the west side of the building. In accordance with EPA guidance, the exit velocity was set to a nominally low value, 0.001 m/s.

The strengths of the analysis are that with so many sources, variations in the parameters of one source will not affect the overall results significantly. Therefore, there is a high level of confidence that these results are representative.

### Control Alternatives and Remedial Measures

All health risk indices are below the public notification levels and Action Risk Levels. No additional remedial measures are required.

## HEALTH RISK ASSESSMENT SUMMARY FORM

(Required in Executive Summary of HRA)

Facility Name : The Boeing Company

Facility Address: 5301 Bolsa Ave.

Huntington Beach, CA 92647

Type of Business: Aerospace

SCAQMD ID No.: 016660

### A. Cancer Risk\*

*(One in a million means one chance in a million of getting cancer from being constantly exposed to a certain level of a chemical over 70 years)*

1. Inventory Reporting Year : 2012
2. Maximum Cancer Risk to Receptors :

a. Offsite	2.8	in a million	Location:	404.343 E, 3735.153 N (km)
b. Residence	2.8	in a million	Location:	404.343 E, 3735.153 N (km)
c. Worker	2.4	in a million	Location:	404.266 E, 3734.765 N (km)
3. Substances Accounting for 90% of Cancer Risk:

Processes Accounting for 90% of Cancer Risk:	Diesel exhaust PM, hexavalent chromium
	Diesel engine operation, aerospace coatings
4. Estimated Population Exposed to Specific Risk Levels

a. 1 to <10 in a million	8,237
b. 10 to <100 in a million	0
c. 100 to <1000 in a million	0
d. >=1000 in a million	0
e. Total >= 1 in a million	8,237
5. Cancer Burden: 2.31E-02  
Cancer Burden = (cancer risk) x (no. of people exposed to specific cancer risk)
6. Maximum Distance to Edge of  $1 \times 10^{-6}$  Cancer Risk Isopleth (meters) 1,050

### B. Hazard Indices\*

*[Long Term Effects(chronic) and Short Term Effects (acute)]*

*(non-carcinogenic impacts are estimated by comparing calculated concentration to identified reference exposure levels, and expressing this comparison in terms of a "Hazard Index")*

1. Maximum Chronic Hazard Indices:

a. Residence HI:	0.06	Location:	404.401 E, 3735.112 N (km)	toxicological endpoint:	Respiratory system
b. Worker HI :	0.09	Location:	404.265 E, 3734.900 N (km)	toxicological endpoint:	Respiratory system
2. Substances Accounting for 90% of Chronic Hazard Index: Methylene Diphenyl Diisocyanate
3. Maximum Acute Hazard Index:

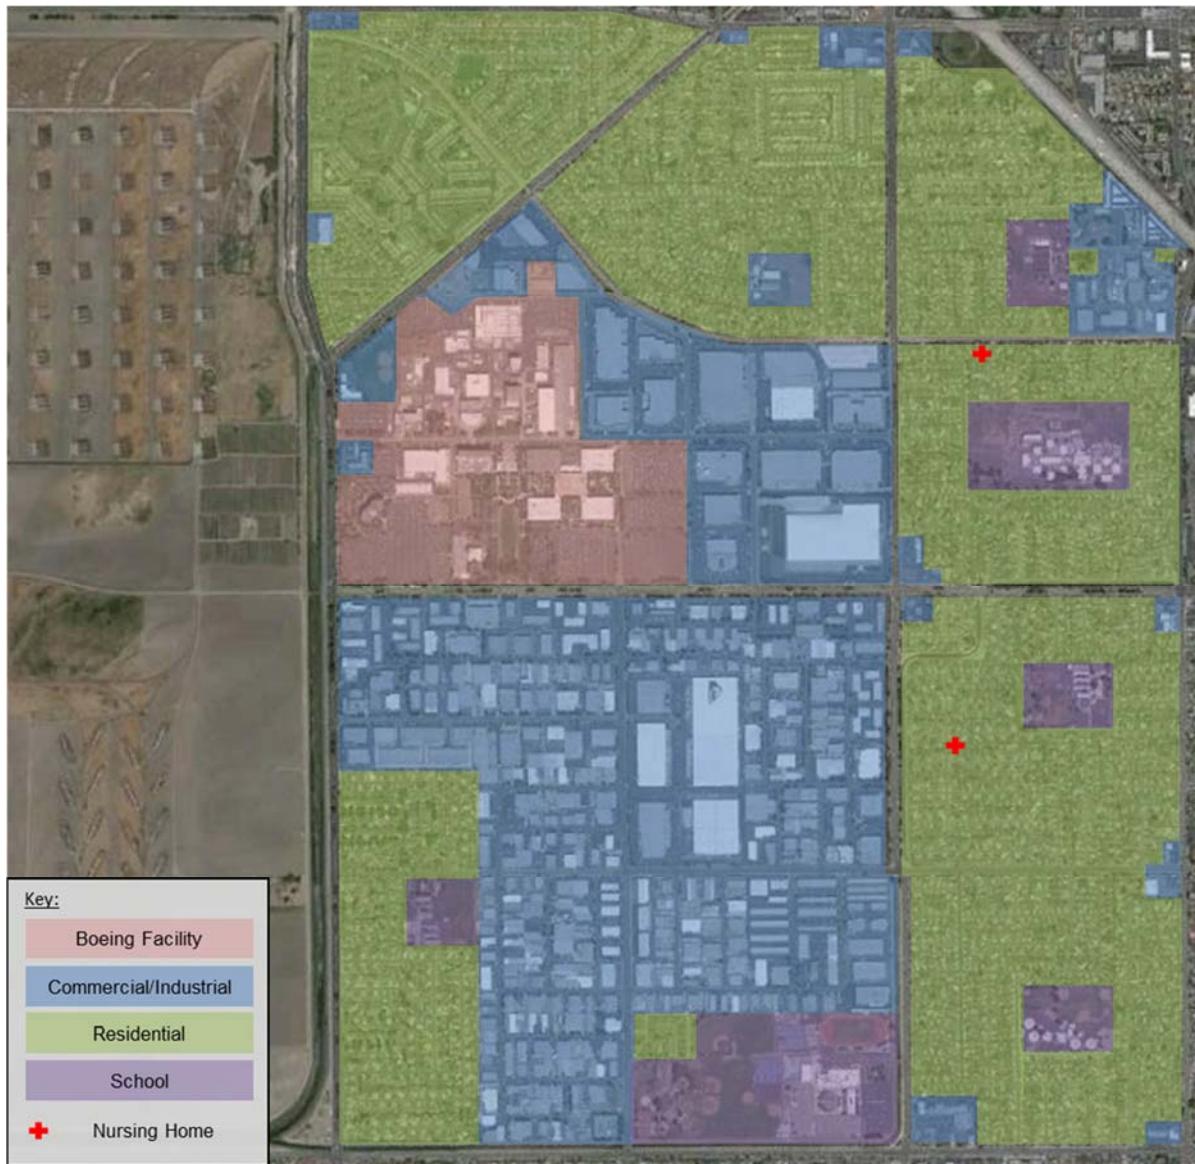

PMI:	0.01	Location:	404.152 E, 3735.173 N (km)	toxicological endpoint:	Eye
------	------	-----------	----------------------------	-------------------------	-----
4. Substances Accounting for 90% of Acute Hazard Index: Acrolein, Ammonia, Formaldehyde

\*Provide Tables listing contribution of each substance to Maximum Cancer Risk, Acute HI, and Chronic HI.

## Appendix D: Sources and Emissions

This section contains the information, in table format, specified in Appendix K of the OEHHA Guidelines (2003).

- Emission Rate by Substance and Source (RAG-001)
- Emission Rate by Substance -- Totals (RAG-002)
- Source Parameters – Stacks (RAG-003)
- Source Operating Hours (RAG-004)
- Internal Combustion Engine Fuel Usage 2012

**Emission Rate by Substance & Source**  
**RAG-001**
