Definitions

The definitions provided below were obtained from the Office of Environmental Health Hazard's (OEHHA's) Risk Assessment Guidelines (OEHHA, 2015).

Acute Health Impacts:

An acute health impact is an adverse health effect in a human population, including sensitive subgroups, resulting from exposure to concentrations of one or more chemicals for approximately one hour.

8-Hour Chronic Health Impacts

Eight-hour chronic health impacts are adverse health effects in a human population resulting from exposure to the general public that occur on recurrent basis, but only during a portion of the day (e.g. exposures that only occur while a receptor is clocked in at work.)

Chronic Health Impacts:

Chronic health impacts are adverse health effects in a human population, including sensitive subgroups, resulting from exposure to concentrations of one or more chemicals over a long period of time (e.g. thirty years.) These health effects may not appear right away, but may develop over time.

Cancer Health Impacts:

Cancer health impacts, also known as cancer risk, is the incremental increase in excess cancer incidences resulting from exposure to concentrations of one or more chemicals for a prolonged period of time. Cancer risks are often expressed in terms of "1 in a million," which indicates that exposure to a certain concentration of a chemical has the potential to result in one additional incidence of cancer in a million people.

EXECUTIVE SUMMARY

Facility Name: Boral Roofing LLC
Physical Address: 909 Railroad Street
Corona, CA 92882
Facility ID: 1073

Business Description: Structural Clay Tile Manufacturing

1.1 Facility Operations and Site Description

The Boral Roofing LLC (Boral) facility is a clay tile manufacturing facility located in Corona, California. The facility is located in Universal Transverse Mercator (UTM) Zone 11 at coordinates 446,700 meters East and 3,749,700 meters North, which is approximately 1.75 miles west of the Interstate 15 (I-15) and California Highway 91 junction. The facility is located in Riverside County, which has an urban modeling option population of 2,189,641 according to South Coast Air Quality Management District (SCAQMD) AERMOD Guidance (SCAQMD, 2018). The nearest school, Orange Grove High School, is located approximately 0.4 miles (~2,100 feet) south of the Boral facility at 300 S Buena Vista Avenue, Corona, CA 92882.

The facility is a Title V and RECLAIM facility, and consists of one main manufacturing building, a storage shed, parking lots, and product storage areas. Within the manufacturing building, raw clay is transported to mixers and extruders where water and additives are introduced into the process. The extruders produce formed product in the desired size and shape. The wet product is transferred to the ovens via conveyor belt where it is dried. The dry tiles are then transferred to the kilns via conveyor belt for curing. Once curing is complete, the tiles are arranged and packaged for storage and shipment. The sources of toxic air emissions (TACs) at the facility are the two natural-gas fired kilns and two natural-gas fired ovens. A facility plot plan is provided as Figure 1.

Facility emissions are summarized in Table 1, and multipathway substances and their associated pathways are provided in Table 2.

1.2 Overview of Dispersion Modeling and Exposure Assessment

Air dispersion modeling was performed to estimate ground level concentrations (GLCs) at and beyond the property boundary of the Facility. Modeling was performed using the United States Environmental Protection Agency's (USEPA's) AERMOD executable version 18081 via the BREEZE AERMOD software. The following options were used in running the AERMOD model based on SCAQMD modeling guidelines, titled "Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics 'Hot Spots' Information and Assessment Act" (SCAQMD, 2015).

- AERMOD was executed using the urban modeling option, which is SCAQMD policy for all air quality impact analyses in its jurisdiction.
- USEPA regulatory default options were implemented.
- The UTM, World Geodetic System (WGS) 1984 projection was implemented.

The Facility has a total area of approximately 15 acres. Per the SCAQMD guidelines, the maximum receptor spacing is 50 meters for facilities with total areas between 10 and 25 acres (SCAQMD, 2014). Fifty- (50-) meter spacing was used for fence-line receptors, and 50-meter spacing was used for receptors outside the property boundary.

The facility is mostly surrounded by commercial and industrial properties. A residential neighborhood exists to the south of the facility, across Railroad Street. Receptors located within this residential neighborhood were designated as residential receptors and assumed to be sensitive receptors. All other receptors were designated as non-residential or worker receptors. No discrete sensitive receptors were identified within the direct vicinity of the facility. Air dispersion modeling results in terms of period average and maximum one-hour concentration were exported as plot (.plt) files, and separate plot files were created for each source.

1.3 Overview of Dose-Response Assessment

Air dispersion modeling results (plot files) were imported into the California Air Resources Board's (CARB's) Hot Spots Analysis and Reporting Program (HARP) software. HARP2, Air Dispersion Modeling and Risk Tool (ADMRT) software version 17320 was utilized to the dose-response assessment. The dose-response assessment was performed in accordance with OEHHA's "Air Toxics Hot Spots Program, Risk Assessment Guidelines" (OEHHA, 2015) and SCAQMD's Supplemental Guidelines (SCAQMD, 2015). Dose for residential receptors was calculated assuming a 30-year exposure and the inhalation, soil ingestion, dermal absorption, mother's milk, and home-grown produce exposure pathways. Dose for worker receptors was calculated assuming a 25-year exposure and the inhalation, soil ingestion, and dermal absorption exposure pathways. Annual and hourly TAC emissions for each source were entered into HARP, and each pollutant's target organ system(s) for non-cancer health impacts are shown in Table 3.

HARP2 ADMRT was used to estimate the incremental increase in cancer risk, non-cancer chronic hazard index (HI), and non-cancer acute HI for all receptors. Using these results, the Point of Maximum Impact (PMI), Maximum Exposed Individual Resident (MEIR), and Maximum Exposed Individual Worker (MEIW) were identified, and their respective cancer risks, non-cancer chronic HIs, and non-cancer acute HIs were estimated. Risks for PMI purposes were estimated using residential exposure assumptions (residential exposure pathways, 30-year exposure, etc.).

1.4 Summary of Results

A summary of the HRA results is presented below. The HRA Summary Form is provided as Attachment 1.

1.4.1 Location

The PMI is located on the property fenceline along the north side of the facility. The MEIR is located across Railroad Street, and the MEIW is located at the facility to the north of the facility across the railway. UTM coordinates for the PMI, MEIR, and MEIW are provided below, and maps of their locations are provided in Figures 2 through 6.

Receptor	UTM X (m)	UTM Y (m)
PMI	446,659.5	3,749,812
MEIR	446,650	3,749,600
MEIW	446,700	3,749,850

1.4.2 Cancer Risk

The total potential multipathway cancer risks for the PMI, MEIR, and MEIW are approximately 103, 6.41, and 1.90 in one million, respectively. The cancer risk for the PMI and MEIR were calculated using the residential receptor exposure assumptions, which include the five exposure pathways addressed in Section 1.3 and a 30-year exposure scenario. The cancer risk for the MEIW was calculated using worker exposure assumptions, three exposure pathways (listed in Section 1.3) and a 25-year exposure scenario. The PMI is located on the facility boundary, and a residential receptor is not expected to reside there. Using the worker exposure scenario, the cancer risk at the PMI was estimated to be 4.33 in one million. Arsenic and Hexavalent Chromium appear to drive the cancer risk. Cancer risk contribution for each substance at the MEIR and MEIW are provided in Table 4. Cancer risk isopleths are provided in Figure 2 and Figure 3.

1.4.3 Non-Cancer Hazard

The non-cancer chronic HIs for the PMI, MEIR, and MEIW are 9.63, 0.57, and 2.72, respectively. Similarly, to cancer risk, the HI for the PMI presented in the previous sentence was estimated assuming the residential exposure scenario. When using the worker exposure, the non-cancer chronic HI for the PMI was estimated to be 6.24. Hydrogen chloride (HCl), arsenic, hydrogen fluoride (HF), and fluorides appear to drive the non-cancer chronic HI. The primary target organ for the non-cancer chronic HI is the respiratory system. Non-cancer chronic HI contribution by each substance at the MEIR and MEIW are provided in Table 5 and Table 6 respectively. Non-cancer chronic HI isopleths are provided in Figure 4 and Figure 5.

The non-cancer acute HIs for the PMI, MEIR, and MEIW are 0.51, 0.18, and 0.38 respectively. HF, fluorides, and HCl appear to drive the non-cancer acute HI, and the primary target organ systems are the eye and respiratory system. Non-cancer acute HI contribution by each substance at the PMI, MEIR and MEIW are provided in Table 7, Table 8 and Table 9 respectively. The non-cancer acute HI isopleth is provided as in Figure 6.

The non-cancer 8-hour chronic HIs for the PMI is 0.16. Manganese, arsenic, and mercury appear to drive the non-cancer 8-hour chronic HI, and the primary target organ is the central nervous system.

1.4.4 Population Exposure

The majority of the receptors with a cancer risk above 1 in a million and/or a hazard index above 1 are located directly adjacent to the facility. For worker receptors, the neighboring facility located north of the Boral facility across the railway is the only facility exposed to a cancer risk above 1 in a million and a hazard index above 1. For residential receptors, non-cancer hazard indexes are not above 1 and cancer risk under the 70-year exposure scenario drops below 1 in a million near the line demarcated by UTM Y coordinate 3,749,350. This area includes the residential neighborhood within a quarter-mile radius of the facility. According to USEPA Enforcement and Compliance History Online (ECHO), approximately 17,050 persons live within one mile of the facility. Conservative multiplying the cancer risk under the 70-year scenario at the MEIW (7.59×10^{-6}) by 17,050 results in a cancer burden of approximately 0.13.

1.4.5 Notification/Risk Reduction

The non-cancer chronic HI at the MEIW is greater than 1 and less than 3. Therefore, notification will be required for the facility north of the Boral facility across the railway. No other notification or risk reduction is required.

EXECUTIVE SUMMARY TABLES

Table 1
Facility Emissions Summary
Boral Roofing LLC, Corona, CA

Substance Name	CAS	Annual Average Emissions	Maximum Hourly Emissions
		(lb/yr)	(lb/hr)
Fluorides (excluding HF)	1101	5,114.688	8.87E-01

2.0 BACKGROUND

2.1 Regulatory Framework

Assembly Bill (AB) 2588 is a California state-wide program that was enacted in order to collect emissions data, identify facilities with TAC emissions that may result in localized health impacts, notify nearby residents of potential significant risks, and reduce significant risks to acceptable levels. Facilities that are subject to the AB2588 program must submit an air toxics inventory to the local air district every four years.

The Corona Facility is subject to the AB2588 program and submitted its latest quadrennial toxics emissions inventory for Reporting Year (RY) 2015. Based on the emissions reported in this quadrennial emissions inventory, SCAQMD sent the Corona Facility a “Notice to Prepare Air Toxics Inventory Report,” dated March 30th, 2017.

Boral Roofing LLC (Boral) submitted an Air Toxics Inventory Report (ATIR) for on August 25, 2017. SCAQMD staff provided comments on October 25, 2017, which included a request for a revised ATIR. The revised ATIR was reviewed and approved on November 16, 2017. A subsequent Health Risk Assessment (HRA) pursuant to SCAQMD Rule 1402 was requested by SCAQMD in a letter dated March 27, 2018.

2.2 Facility Setting

The Boral facility is located in UTM Zone 11 at coordinates 446,700 meters East and 3,749,700 meters North, which is approximately 1.75 miles west of the I-15 and California Highway 91 junction. The facility is located in Riverside County, which has an urban modeling option population of 2,189,641 according to SCAQMD AERMOD Guidance (SCAQMD, 2018). The nearest school, Orange Grove High School, is located approximately 0.4 miles (~2,100 feet) south of the Boral facility at 300 S Buena Vista Avenue, Corona, CA 92882.

3.0 HAZARD IDENTIFICATION

The sources of TACs at the facility are the two natural-gas fired kilns and two natural-gas fired ovens. Therefore, the processes that result in continuous, long-term releases of TACs include, combustion of natural gas, firing of clay within the kilns, and drying of clay within the ovens. The facility does not have any intermittent sources of TACs, and no diesel-fueled combustion sources were used during the reporting year (2015).

The following TACs are emitted at the facility and were evaluated for cancer risk and/or non-cancer health impacts:

CAS	Pollutant Name
1101	Fluorides (excluding HF)
71432	Benzene
74873	Chloromethane
84662	Diethylphthalate
91203	Naphthalene
106467	1,4-dichlorobenzene
107028	Acrolein
117817	Bis(2-ethylhexy)phthalate (DEHP)
7439921	Lead
7439965	Manganese
7439976	Mercury
7440020	Nickel
7440360	Antimony
7440382	Arsenic
7440417	Beryllium
7440439	Cadmium
7647010	Hydrogen Chloride
7664393	Hydrogen Fluoride
7664417	Ammonia
7782492	Selenium
7782505	Chlorine
18540299	Hexavalent Chromium

The facility emits additional TACs in quantities below the de minimis thresholds for inclusion in an HRA. As determined during the ATIR, the following substances are emitted from the facility but not evaluated for cancer risk or non-cancer health impacts because they are emitted in quantities below the de minimis thresholds:

CAS	Pollutant Name
50000	Formaldehyde
71556	1,1,1-trichloroethane
74884	Iodomethane
75003	Chloroethane
75070	Acetaldehyde
75150	Carbon Disulfide
78933	2-butanone (MEK)
84742	Di-n-butylphthalate
85687	Butylbenzylphthalate
91576	PAHs (Total Except Naphthalene)
100414	Ethylbenzene
100425	Styrene
108883	Toluene
108952	Phenol
110543	Hexane
127184	Tetrachloroethene (PCE)
1330207	Xylene
7440484	Cobalt

4.0 EXPOSURE ASSESSMENT

4.1 Site Description and Facility Operations

Facility Name: Boral Roofing LLC
Physical Address: 909 Railroad Street
Corona, CA 92882
Facility ID: 1073

The Boral Roofing LLC facility is a clay tile manufacturing facility located in Corona, California. The facility is a Title V and RECLAIM facility. The facility consists of one main manufacturing building, a storage shed, parking lots, and product storage areas. Within the manufacturing building, raw clay is transported to mixers and extruders where additives are introduced into the process. The extruders produce formed product in the desired size and shape. The wet product is transferred to the ovens via conveyor belt where they are dried. The dry tiles are then transferred to the kilns via conveyor belt for curing. Once curing is complete, the tiles are arranged and packaged for storage and shipment. The facility operates 24 hours a day, seven days a week. The sources of TACs at the facility are the two natural-gas fired kilns and two natural-gas fired ovens. A facility plot plan is provided as Figure 1.

The facility does not have any extraordinary features that would result in any site/route dependent exposure pathways besides the default exposure pathways.

4.2 Emissions Estimates

Source release parameters were obtained from source test results, as-built drawing, and facility personnel's knowledge of the facility. Source parameters, such as name, location, release height, etc. are provided in Table 10 Annual emissions in pounds per year (lb/yr) and hourly emissions in pounds per hour (lb/hr), and hourly emissions in grams per second (g/s) for each source are provided in Table 11, 12, and 13, respectively. Please note that only pollutants above the de minimis thresholds are included in Tables 11 through 13. Total facility emissions in lb/yr and lb/hr are summarized in Table 1.

4.3 Air Dispersion Modeling

Air dispersion modeling was performed to estimate GLCs at and beyond the property boundary of the Facility. USEPA's AERMOD executable version 18081 via the BREEZE AERMOD software. AERMOD input (.ami) and output (.amz) files are provided as part of this HRA.

4.3.1 Meteorological Data

AERMOD-ready meteorological data were obtained from SCAQMD. Data from the Chino Airport (KCNO) meteorological station were selected as the Chino Airport station is the closest to the Boral Facility. Data at KCNO are available for years 2012 through 2016. There are no intervening terrain features between KCNO and the Boral facility. The surface (.sfc) and profile (.pfl) files are provided electronically as part of this HRA.

4.3.2 Terrain Data

Surface elevations for the various modeling objects in the modeling domain were imported from National Elevation Dataset (NED) files developed by the United States Geological Survey (USGS). NED files are available in 1-arc second resolution. A NED file obtained from the Multi-Resolution Land Characteristics Consortium (MRLC) National Land Cover Database (NLDC) was used in the air dispersion modeling.

4.3.3 Model Options

The following options were used in running the AERMOD model based on SCAQMD modeling guidelines.

- AERMOD was executed using the urban modeling option, which is SCAQMD policy for all air quality impact analyses in its jurisdiction. The default population for Riverside County, 2,189,641, was selected.
- USEPA regulatory default options were implemented.
- The UTM, WGS 1984 projection was implemented.
- The pollutant was set to "Other"
- Regulatory default concentration only, was used, and no depletion options were selected.

4.3.4 Receptors

The Facility has a total area of approximately 15 acres. Per the SCAQMD guidelines, the maximum receptor spacing is 50 meters for facilities with total areas between 10 and 25 acres (SCAQMD, 2018). Fifty- (50-) meter spacing was used for fence-line receptors, and 50-meter spacing was used for receptors outside the property boundary. All receptors were set to a flagpole height of zero (0) meters to represent ground-level concentrations. The majority of the receptors in the vicinity of the Boral facility are non-residential (worker) receptors, except for the residential neighborhood located to the south of the facility across Railroad Street. All residential receptors were identified as sensitive receptors in AERMOD. Table 14 lists the location in UTM coordinates for all of the receptors. Table 15 lists the location of only the residential receptors.

The period average concentration for each substance at the PMI, MEIR, and MEIW are provided in Table 16.

The maximum one-hour concentration for each substance at the PMI, MEIR, and MEIW are provided in Table 17.

5.0 RISK CHARACTERIZATION

Air dispersion modeling results (plot [.plt] files) were imported into CARB's HARP software. HARP2 ADMRT software version 17320 was utilized to perform the dose-response assessment and calculate the potential cancer risk non-cancer health impacts for the various receptors surrounding the Boral facility. The dose-response assessment and risk calculations were performed in accordance with OEHHA's Risk Assessment Guidelines (OEHHA, 2015) and SCAQMD's Supplemental Guidelines (SCAQMD, 2015).

5.1 Exposure Assessment

5.1.1 Identification of Potentially Exposed Populations

The facility is mostly surrounded by commercial and industrial properties. A residential neighborhood exists to the south of the facility, across Railroad Street. Receptors located within this residential neighborhood were designated as residential receptors and assumed to be sensitive receptors. All other receptors were designated as non-residential or worker receptors. No discrete sensitive receptors were identified within the direct vicinity of the Boral facility. Table 14 lists the location in UTM coordinates for all receptors. Table 15 lists the location of the residential receptors.

5.1.2 Exposure Pathways

5.1.2.1 Residents

The residential neighborhood located to the south of the Boral facility is a typical suburban residential community. Therefore, the following default residential exposure pathways were included in this HRA:

- Inhalation
- Soil ingestion
- Dermal absorption
- Mother's Milk
- Home Grown Produce

No site- or receptor-specific exposure pathways were identified within the residential neighborhood.

5.1.2.2 Off-Site Workers

As stated above, the facility is mostly surrounded by commercial and industrial properties. The following default worker exposure pathways were included in this HRA:

- Inhalation
- Soil ingestion
- Dermal absorption

5.1.3 HARP Exposure Analysis Methods and Assumptions

Cancer and noncancer health impacts may be evaluated in HARP. Cancer risk is expressed as a theoretical probability of an individual person developing cancer as a result of exposure to

carcinogenic substances. Noncancer risk is expressed with a hazard index number (HI) for pollutant-targeted organ systems: the cardiovascular system, central nervous system, immune system, kidneys, gastrointestinal tract and liver, reproductive/developmental system, respiratory system, skin, eyes, skeletal system, endocrine system, hematological system, physiological response to odors, and general toxicity (CARB, 2018). Calculations built into HARP2 ADMRT are based on the dose and risk calculation methodologies and pollutant risk factors contained within the OEHHA Risk Assessment Guidelines.

According to the OEHHA and SCAQMD guidelines, different exposure scenarios should be used for residential and worker receptors. Exposure scenarios and assumptions for residential and worker receptors are identified in the following sections.

5.1.3.1 Resident

For notification and risk reduction purposes, a 30-year exposure scenario is used for residential receptors. The following additional parameters were selected in HARP:

- Receptor Type: Individual Resident
- Intake Rate Percentile: OEHHA Derived Method (when applicable)
- Exposure Frequency: 350 days per year
- Deposition Rate: 0.02 meters per second

For population-based exposure and cancer burden calculation purposes, a 70-year exposure scenario was used for residential receptors. All other parameters remained the same.

5.1.3.2 Off-Site Workers

For notification and risk reduction purposes, a 25-year exposure scenario is used for residential receptors. The following additional parameters were selected in HARP:

- Receptor Type: Worker
- Intake Rate Percentile: OEHHA Derived Method (when applicable)
- Exposure Frequency: 250 days per year
- Deposition Rate: 0.02 meters per second

The Boral facility is operational 24 hours per day, 7 days per week. Therefore, the Worker Adjustment Factor (WAF) is 1.0.

5.2 Dose-Response Assessment

According to OEHHA, dose-response assessment describes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of an adverse health impact (the response). Dose-response information for noncancer health effects is used to determine Reference Exposure Levels (RELs). Dose-response information for cancer risks are based on cancer potency factors (OEHHA, 2015). Chronic RELs, 8-hour Chronic RELs, Acute RELs, and cancer potency factors for each pollutant are listed in the OEHHA Guidelines and built into HARP2. These values are periodically updated, and new versions of HARP2 incorporate the changes.

5.3 Risk Characterization Methodology

Risks are characterized using calculations and methodology contained in the OEHHA Guidelines and built into HARP2. Risk is calculated based on dose, dose-response values (RELs or cancer potency factors), and exposure duration and frequency. For this HRA, all risks were calculated using a Tier 1 approach using OEHHA and SCAQMD default values.

5.3.1 Carcinogenic Risks

For notification and risk reduction purposes, a 30-year exposure scenario is used for residential receptors and a 25-year exposure scenario is used for worker receptors. For population-based exposure, a 70-year exposure scenario was used. The additional assumptions used for residential and worker receptor risk characterization are provided in Section 5.1.3. This HRA is a Tier 1 assessment where OEHHA and SCAQMD defaults were used. Carcinogenic risks are calculated for each receptor by calculating the dose of each pollutant at that receptor then following the calculation methodology in Section 8 of the OEHHA Guidelines. Multipathway risks are accounted for within HARP2 and follow the methodology in the guidelines.

5.3.2 Chronic Non-cancer Hazards

For notification and risk reduction purposes, a 30-year exposure scenario is used for residential receptors and a 25-year exposure scenario is used for worker receptors. For notification and risk reduction purposes, a 30-year exposure scenario is used for residential receptors and a 25-year exposure scenario is used for worker receptors. Chronic hazards are calculated using the period average ground level concentration of each pollutant compared to the chronic REL for each pollutant. The sum of the HIs for each pollutant is the total chronic HI for each receptor.

5.3.3 Acute Non-cancer Hazards

Acute non-cancer hazards are identical for residential and non-residential (worker) receptors. Therefore, only one set of methodology was utilized for acute non-cancer hazard index calculation. Acute hazards are calculated using the maximum 1-hour ground level concentration of each pollutant compared to the acute REL for each pollutant. The sum of the HIs for each pollutant is the total acute HI.

5.4 Risk Characterization Results

5.4.1 Cancer Risks

The following table summarizes the potential cancer risks at the PMI, MEIR, and MEIW.

Receptor	UTM X (m)	UTM Y (m)	Cancer Risk
PMI	446,659.5	3,749,812	103 in one million ¹
MEIR	446,650	3,749,600	6.41 in one million
MEIW	446,700	3,749,850	1.90 in one million

1. The cancer risk at the PMI presented above assumes the residential receptor exposure scenario. The PMI is located on the facility fenceline where residential receptors do not exist. Under the worker receptor exposure scenario, the cancer risk at the PMI is 4.33 in one million.

Arsenic and Hexavalent Chromium appear to drive the cancer risk. Cancer risk contribution for each substance at the MEIR and MEIW are provided in Table 4. Cancer risk contribution by each source at the MEIR and MEIW are provided in Table 18 and Table 19, respectively. Cancer risk isopleths are provided as Figure 2 and Figure 3.

5.4.2 Non-Cancer Chronic Health Index

The following table summarizes the potential non-cancer chronic HI at the PMI, MEIR, and MEIW.

Receptor	UTM X (m)	UTM Y (m)	Non-Cancer Chronic HI	Target Organ
PMI	446,659.5	3,749,812	9.63 ¹	RESP
MEIR	446,650	3,749,600	0.57	RESP
MEIW	446,700	3,749,850	2.72	RESP

1. The non-cancer chronic HI at the PMI presented above assumes the residential receptor exposure scenario. The PMI is located on the facility fenceline where residential receptors do not exist. Under the worker receptor exposure scenario, the non-cancer chronic HI at the PMI is 6.24.

Hydrogen chloride (HCl), arsenic, hydrogen fluoride (HF), and fluorides appear to drive the non-cancer chronic HI. The primary target organ for the non-cancer chronic HI is the respiratory system. Non-cancer chronic HI contribution by each substance at the MEIR and MEIW are provided in Table 5 and Table 6, respectively. Non-cancer chronic HI contribution by each source at the MEIR and MEIW are provided in Table 20 and Table 21, respectively. Non-cancer chronic HI isopleths are provided as Figure 4 and Figure 5.

The non-cancer 8-hour chronic HIs for the PMI is 0.163. Manganese, arsenic, and mercury appear to drive the non-cancer 8-hour chronic HI, and the primary target organ is the central nervous system.

5.4.3 Non-Cancer Acute Health Index

The following table summarizes the potential non-cancer acute HI at the PMI, MEIR, and MEIW.

Receptor	UTM X (m)	UTM Y (m)	Non-Cancer Acute HI	Target Organ
PMI	446,659.5	3,749,812	0.51	Eye
MEIR	446,650	3,749,600	0.18	Eye
MEIW	446,700	3,749,850	0.38	Eye

HF, fluorides, and HCl appear to drive the non-cancer acute HI, and the primary target organ systems are the eye and respiratory system. Non-cancer acute HI contribution by each substance at the PMI, MEIR and MEIW are provided in Table 7, Table 8, and Table 9, respectively. Non-cancer acute HI contribution by source at the PMI, MEIR and MEIW are provided in Table 22, Table 23, and Table 24, respectively. The non-cancer acute HI isopleth are provided as Figure 6.

5.4.4 Population Exposure

The majority of the receptors with a cancer risk above 1 in a million and/or a hazard index above 1 are located directly adjacent to the facility. For worker receptors, the neighbor facility located north of the Boral facility across the railway is the only facility exposed to a cancer risk above 1 in a million and a hazard index above 1. For residential receptors, non-cancer hazard indexes are

not above 1 and cancer risk under the 70-year exposure scenario drops below 1 in one million near the line demarcated by UTM Y coordinate 3,749,350 meters. This area includes the residential neighborhood within a quarter-mile radius of the facility. According to USEPA Enforcement and Compliance History Online (ECHO), approximately 17,050 persons live within one mile of the facility. Conservative multiplying the cancer risk under the 70-year scenario at the MEIR (7.59×10^{-6}) by 17,050 results in a cancer burden of 0.13. Assuming the population within one quarter mile of the facility is approximately one eighth the population within one mile, the total population exposed to a cancer risk at or above 1 in one million is estimated to be approximately 2,100 people. Population-based exposure is summarized in the tables below.

Cancer Risk

Exposed to Cancer Risk Greater Than...	Workers	Residents
100 in one million	0	0
10 in one million	0	0
1 in one million	1 Facility	~2,100

Non-Cancer Health Index

Exposed to Non-Cancer Health Index Greater Than...	Workers	Residents
5.0	0	0
3.0	0	0
1.0	1 Facility	0
0.5	3 Facilities	~20

6.0 CONCLUSIONS

The non-cancer chronic HI at the MEIW is greater than 1 and less than 3. Therefore, notification will be required for the facility north of the Boral facility across the railway. The primary drivers for this non-cancer chronic HI is arsenic, HCl, and HF from Source 154. The cancer risk is below 10 in one million at the MEIR and MEIW, the non-cancer acute HI is less than 1 at the PMI, MEIR, and MEIW, and the non-cancer chronic HI is less than 1 at the MEIR. Therefore, no other notification or risk reduction is required.

HEALTH RISK ASSESSMENT SUMMARY FORM

(Required in Executive Summary of HRA)

Facility Name : Boral Roofing LLC
 Facility Address: 909 Railroad St
Corona, CA 92882
 Type of Business: Structural Clay Tile Manufacturing
 SCAQMD ID No.: 1073

A. Cancer Risk

(One in a million means one chance in a million of getting cancer from being constantly exposed to a certain level of a chemical over a period of time)

- Inventory Reporting Year : 2015
- Maximum Cancer Risk to Receptors : *(Offsite and residence = 30-year exposure, worker = 25-year exposure)*
 - Offsite 103 in a million Location: UTM Zone 11; X = 446,659.5, Y = 3,749,812 (m)
 - Residence 6.41 in a million Location: UTM Zone 11; X = 446,650, Y = 3,749,600
 - Worker 1.90 in a million Location: UTM Zone 11; X = 446,700, Y = 3,749,850
- Substances Accounting for 90% of Cancer Risk: Arsenic, Chromium (IV)
 Processes Accounting for 90% of Cancer Risk: 154 - Firing of Clay
- Cancer Burden for a 70-yr exposure: *(Cancer Burden = [cancer risk] x [# of people exposed to specific cancer risk])*
 - Cancer Burden 0.13
 - Number of people exposed to >1 per million cancer risk for a 70-yr exposure 2,100
 - Maximum distance to edge of 70-year, 1 x 10⁻⁶ cancer risk isopleth (meters) 400

B. Hazard Indices

*[Long Term Effects (chronic) and Short Term Effects (acute)]
(non-carcinogenic impacts are estimated by comparing calculated concentration to identified Reference Exposure Levels, and expressing this comparison in terms of a "Hazard Index")*

- Maximum Chronic Hazard Indices:
 - Residence HI: 0.57 Location: MEIR from A toxicological endpoint: Respiratory
 - Worker HI : 2.72 Location: MEW from A toxicological endpoint: Respiratory
- Substances Accounting for 90% of Chronic Hazard Index: HCl, Arsenic, HF, and Fluorides
- Maximum 8-hour Chronic Hazard Index:

8-Hour Chronic HI: 0.16 Location: PMI from A toxicological endpoint: Central Nervous System
- Substances Accounting for 90% of 8-hour Chronic Hazard Index: Manganese, Arsenic, Mercury
- Maximum Acute Hazard Index:

PMI: 0.51 Location: PMI from A toxicological endpoint: Eye
- Substances Accounting for 90% of Acute Hazard Index: HF, Fluorides, HCl

C. Public Notification and Risk Reduction

- Public Notification Required? Yes No
 - If 'Yes', estimated population exposed to risks > 10 in a million for a 30-year exposure, or an HI >1
1 Facility
- Risk Reduction Required? Yes No
