South Coast AQMD June 2020

Background

Under the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588 Program), facilities are required to provide an update of their toxics emissions inventory to South Coast Air Quality Management District (South Coast AQMD) on a quadrennial basis (or once every four years). Up until June 2001, the reporting requirement was implemented through the AB 2588 Program, which was separate from reporting of criteria and toxic pollutants under the Annual Emission Reporting (AER) Program. Beginning with the FY 2000-01 reporting cycle, toxics emission reporting for the AB 2588 Program was incorporated into South Coast AQMD's AER Program. Currently, there are approximately 471 AB 2588 facilities which are grouped into four phases for reporting purposes (i.e., Phase 1A, 1B, 2, and 3), and each phase reports once over a quadrennial (four year) cycle. Toxic inventories are based on calendar year (i.e., January 1 through December 31).

In addition to the toxics emissions reported by AB 2588 facilities, facilities emitting any of the toxic air contaminants (TAC) or ozone depleting compounds (ODC) specified in South Coast AQMD's Rule 301(e) are also required to report these emissions annually to the South Coast AQMD under the AER Program and pay the corresponding emission fees. The list of compounds can be found in Rule 301, Table IV.¹

Every year, one phase (out of the four phases) is required to submit their complete quadrennial toxics emissions inventory to South Coast AQMD. The reporting facilities will be prioritized from the information in their quadrennial inventory and facilities with a priority score² greater than ten (10) may be required to prepare a health risk assessment (HRA) using the "Hot Spots" Analysis and Reporting Program (HARP).³ (A facility that has previously prepared a HRA that reflects the actual risks associated with the facility may not be required to prepare a new HRA.) The first step a facility takes when preparing their HRA is to prepare an Air Toxics Inventory Report (ATIR).⁴ The facility will input facility information including a detailed toxics emissions inventory by device along with source parameter and location information into HARP. Facilities will have to re-enter much of their toxic emissions through HARP, but that is necessary in order to prepare the HRA. There is currently no mechanism to upload AER data into HARP.

Reporting Procedures for AB 2588 Facilities

The following is a summary of procedures for AB 2588 facilities for reporting their quadrennial toxics emissions inventory to South Coast AQMD:

• Reporting of toxic emissions is performed under South Coast AQMD's AER Program.

.

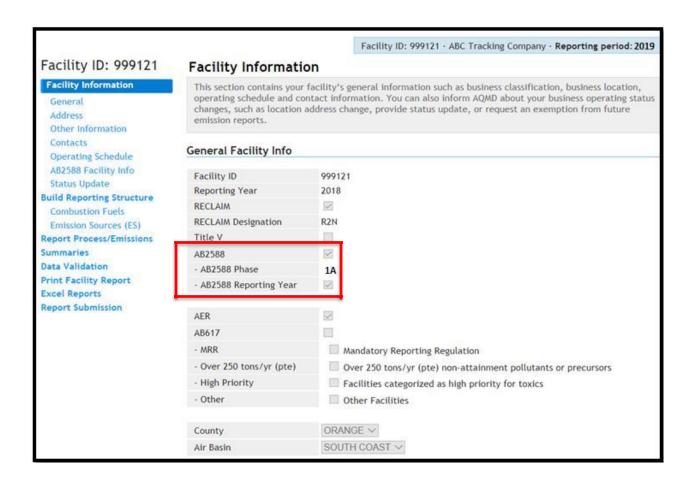

http://www.aqmd.gov/docs/default-source/rule-book/reg-iii/rule-301-July-2019.pdf

Priority score is a facility's position on a scale representing potential health risks. The priority score is determined by an algorithm that considers potency, toxicity, quantity, and volume of hazardous material released from the facility; and the proximity of the facility to potential receptors. South Coast AQMD's prioritization procedures are available at: http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab-2588-facility-prioritization-procedure-september-2019.pdf

³ HARP is a single integrated analysis tool that streamlines the emissions inventory and risk assessment requirements of the AB 2588 Program.

Detailed information on preparing an ATIR and HRA are available at: http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab-2588-supplemental-guidelines-201809.pdf

- The reporting cycle is based on calendar year (CY) (i.e., January 1 to December 31) to be consistent with the AER Program.
- Streamlined AB 2588 reporting process:
 - For a list of applicable toxics (177 substances), refer to Appendix A.
 - Beginning with the 2008 reporting cycle, South Coast AQMD provides a web-based tool for facilities to use for preparing the annual emission reports. The web-based reporting system consolidates criteria, toxics, and optional greenhouse gases (GHG) reporting.
 - The web-based AER Reporting Tool (tool) is the only acceptable means of reporting criteria, toxics, and optional GHG emissions.
 - AER Reporting Tool will automatically identify if your facility is in the AB 2588 Program and subject to a quadrennial update, as illustrated in the image below.
 - Facilities will report their toxic emissions based on the emission categories identified in the tool.
 - Stack parameters and operating profile by equipment do not need to be reported. South Coast AQMD, however, may request this information at a later time, if necessary.

 AB 2588 facilities are also required to report the corresponding criteria pollutant emissions on the applicable forms and pay corresponding emissions fees if they exceed the thresholds. As specified in South Coast AQMD's Rule 301(e), facilities emitting 4 tons or more of reactive organic gases (ROG), oxides of nitrogen (NO_X), oxides of sulfur (SO_X), specific organics (SPOG), and particulate matter (PM) or emitting 100 tons or more of carbon monoxide (CO) are required to pay emission fees based on the total weight of emissions.

- During the sixty (60) days allowed for filing the report, South Coast AQMD will conduct public outreach through informational workshops and public assistance through telephone hotline, fax, e-mail, and Internet to assist facilities in filing their reports. Individual appointments may be arranged upon request. Users are referred to the on-line Help⁵ for the available program support.⁶
- The toxics emissions data submitted by facilities will be used for determining whether a health risk assessment needs to be conducted or an existing one to be revised.
- South Coast AQMD maintains the right to review and audit the reported data and request additional data for clarification, if necessary.
- Please refer to the AER website for more detailed program updates, software instructions, what to submit, frequently asked questions, and other helpful program information.

Recommendations

- Read the instructions under Help & Support.
- Attend one or more of the workshops.
- Take advantage of any or all of the program support listed in the on-line Help.
- Default emission factors for internal and external fuel combustion are provided in Appendix B. The provided emission factors are conservative, and therefore may overestimate emissions. If any of your facility's equipment has South Coast AQMD-approved source test results, these should be used for emission calculation.
- Additional default emission factors and calculation methodologies including but not limited to plating operations, spray coating operations, and asbestos abatement can be found on the AER website and also under the Factors section of the AER Help and Support Manual.

Worker and Residential Receptor Distances

Receptor locations are off-site locations where persons may be exposed to toxic emissions from equipment. Residential receptor locations include current residential land uses and areas that may be developed for residential uses in the future, given land use trends in the general area. Commercial receptor locations include areas zoned for manufacturing, light or heavy industry, retail activity, or locations that are regular work sites.

<u>Worker Receptor Distance</u> – Closest distance between any source of air toxic emissions at your facility and the property boundary of any one of the following receptors: other business or worksite, shopping center, or any other commercial site.

.

Additional information for the AER program is available here: https://www.aqmd.gov/home/rules-compliance/compliance/annual-emission-reporting

Additional information for the AB 2588 program is available here: https://www.aqmd.gov/home/rules-compliance/compliance/toxic-hot-spots-ab-2588

<u>Residential Receptor Distance</u> - Closest distance between any source of air toxic emissions at your facility and the property boundary of any one of the following receptors: house, apartment, convalescent home, trailer park, or other residence.

If you are an AB 2588 facility that is filing a quadrennial toxic emissions inventory, list your closest worker and residential receptor distance in the space provided in the tool. Please see Facility Information section of the AER Help and Support Manual.

Appendix A - List of Toxic Substances, the Reporting Thresholds and Special Instructions for Reporting Select TACs

Table A-1 contains the list of compounds to be reported by AB 2588 facilities preparing their quadrennial emissions inventory under the AER Program. The table provides the compound name, its toxic air contaminant (TAC) code and Chemical Abstract Service (CAS) number, and the degree of accuracy for each toxic. The table is alphabetically sorted by name. Multiple compounds within a TAC code group are listed in alphabetical order and shown in italics. The degree of accuracy is nothing more than a de minimis emission level for reporting. As a result, facility-wide emissions of toxics greater than one-half of their corresponding degree of accuracy must be inventoried and reported. Conversely, total facility toxic emissions less than one-half of the degree of accuracy do not need to be reported for TAC Codes 24 through 31 and 33 through 73.

Also shown in the table is whether the substance is a Volatile Organic Compound (VOC), a component of particulate matter (PM), or a TAC and/or ozone depleting compound (ODC). This information should be used when estimating the VOC and PM emissions. As stated earlier, AB 2588 facilities are required to report the corresponding criteria pollutant emissions on the applicable forms and pay corresponding emission fees if they exceed the thresholds.

Table A-1 lists the family name and the individual species within the family for the following TACs:

- Chlorinated dioxins and dibenzofurans (TAC code #7)
- Fluorocarbons (chlorinated) (TAC code #22)
- Glycol ethers and their acetates (TAC code #41)
- Hexachlorocyclohexanes (TAC code #43)
- Isocyanates and diisocyanates (TAC code #48)
- Mercury and mercury compounds (TAC code #50)
- PAHs (TAC code #19)
- Phosphorous compounds (TAC code #60)
- POMS and PAH-derivatives (TAC code #61)
- Selenium and compounds (TAC code #64)
- Sulfuric acid and oleum (TAC code #67)
- Xylenes (TAC code #70)

It is important when reporting emissions for these families of compounds that emissions are not double-counted thus adversely affecting the facility's emissions and/or fees. Emissions reported for the overall family and each of the species within the family are summed for the purpose of calculating total facility emissions and/or assigning fees and prioritizing facility risks. Therefore, it is important that you either report emissions by individual species or overall emissions for the toxic family. You must report emissions by individual species whenever that information is known. Only report emissions as a group total if the individual species emissions are unknown. Table A-2 considers each toxic family and several other toxics such as, arsenic (CAS #7440382), asbestos (CAS #1332214), hexavalent chromium (CAS #18540299), lead (CAS #7439921), and nickel (CAS #7440020), and provides recommendations for emissions reporting. All TAC emissions must be reported on form TAC. It is important that the directions provided in Table A-2 be read carefully before calculating TAC emissions.

Further, specific information for materials containing toxics used by a facility can found in an SDS or a TDS. Typically, the toxic content of the material is listed as a percentile range. For calculating toxics emissions, when a range is given for a substance, the <u>maximum</u> value of the range should be used to calculate the emissions.

Table A-1. DeMinimis Reporting Limits for Toxics

1 able A-1. Delvinimis Reporting Limits for Toxics					
TAC Code	CAS Number	Substance	Type of TAC/ODC	Degree of Accuracy (lbs/yr)	
29	75070	Acetaldehyde	TAC and VOC	20	
30	107028	Acrolein	TAC and VOC	0.05	
31	107131	Acrylonitrile	TAC and VOC	0.1	
32	7664417	Ammonia	TAC only	200	
14	7440382	Arsenic and Compounds (inorganic)	TAC and PM	0.01	
1	1332214	Asbestos	TAC and PM	0.0001	
2	71432	Benzene	TAC and VOC	2	
3	7440417	Beryllium	TAC and PM	0.001	
4	106990	Butadiene [1,3]	TAC and VOC	0.1

Table A-2. Special Instructions for Reporting Select TACs

TAC code	Substance	Reporting recommendations
14	Arsenic and compounds	Be sure to consider the inorganic arsenic weight fraction in inorganic arsenic containing materials such as arsine when calculating the inorganic arsenic emissions. The arsenic weight fraction for arsine (CAS# 784421) is 0.9612.
1	Asbestos	Be sure to consider the asbestos weight fraction in mineral fibers such as erionite, talc, etc. when calculating the asbestos emissions.
		Be sure to consider the hexavalent chromium weight fraction in coating materials such as barium chromate, calcium chromate, lead chromate, sodium chromate, strontium chromate, and chromium trioxide (as chromic acid mist) when calculating the hexavalent chromium emissions. The hexavalent chromium weight fractions for these compounds are as follows:
13	Hexavalent chromium and compounds	barium chromate (CAS# 10294403) – 0.2053; calcium chromate (CAS# 13765190 – 0.3332; lead chromate (CAS# 7758976) – 0.1609; sodium dichromate (CAS# 10588019) – 0.397; strontium chromate (CAS# 7789062) – 0.2554; chromium trioxide (as chromic acid mist) (CAS# 1333820) – 0.52; zinc chromate (CAS # 13530659) – 0.2867.
7	Chlorinated dioxins and dibenzofurans	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together on form TACS to calculate the family total emissions.
22	Fluorocarbons (chlorinated)	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together on form TACS to calculate the family total emissions.
41	Glycol ethers and their acetates	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
43	Hexachlorocyclohexanes	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
48	Isocyanates and diisocyanates	Report emissions for each individual isocyanate or diisocyanate compound on form TAC. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.

Table A-2. (concluded)

TAC	Substance	Reporting recommendations
code		Be sure to consider the lead weight fraction in lead containing materials such as lead oxide, lead acetate, lead phosphate, lead subacetate, and lead chromate, when calculating the lead emissions. The lead weight fractions for these materials are as follows:
15	Lead compounds (inorganic)	lead oxide (CAS# 1314-41-6) -0.9066; lead acetate (CAS# 301042) - 0.637; lead phosphate (CAS# 7446277) - 0.7659; lead phosphite (CAS# 12141207) - 8159; lead subacetate (CAS# 1335326) - 0.7696; and lead chromate(CAS# 7758976) - 0.6411.
50	Mercury and mercury compounds	Report emissions for each individual mercury compound on form TAC. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
17	Nickel	Be sure to consider the nickel weight fraction in nickel containing materials such as nickel acetate, nickel carbonate, nickel carbonyl, nickel hydroxide, nickelocene, nickel oxide, nickel subsulfide and refinery dust when calculating the nickel emissions. The nickel weight fractions for these materials are as follows: nickel acetate (CAS# 373024) – 0.3321; nickel carbonate (CAS# 3333673) – 0.4945; nickel carbonyl (CAS# 13463393) – 0.3438; nickel hydroxide (CAS# 12054487) – 0.6332; nickelocene (CAS# 1271289) – 0.4937; nickel oxide (CAS# 1313991) – 0.7859;
		nickel chloride (CAS# 7791200) – 0.453; nickel sulfate (CAS# 7786814) – 0.379; nickel subsulfide (CAS# 12035722) – 0.2443.
19	PAHs	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together on form TACS to calculate the family total emissions.
60	Phosphorous compounds	Report emissions for each individual phosphorous compound on form TAC. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
61	POMs and PAH-derivatives	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
64	Selenium and compounds	Report emissions for each individual selenium compound on form TAC. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
67	Sulfuric acid and oleum	Report emissions for each individual sulfur compound on form TAC. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.
70	Xylenes	Report emissions by individual species whenever that information is available. Only report emissions as a group total if the individual species emissions are unknown. Do not double count the same emissions. Emissions from individual species with the same TAC code are added together to calculate the family total emissions.

Appendix B - Default Emission Factors for Fuel Combustion

Default Toxic Emission Factors for Form TAC Associated with Combustion Equipment are listed below and on the following pages. If any of your combustion sources has district-approved source tests, use the emission factors developed from the source tests to calculate emissions.
