49 State: Ensures that vehicles and engines are certified to both California and USEPA standards, not just USEPA standards that are valid for the other 49 states. Dealer and Fleet Tampering: Staff inspect automobile dealerships and commercial fleets to ensure new vehicles and engines are certified to California emissions standards, and that emissions control systems are not tampered with.

LSI: CARB ensures compliance with certified emissions standards for spark-ignition engines, including large spark-ignition (LSI) engines, and the evaporative emissions control systems of vehicles and equipment like forklifts, sweeper/scrubbers, industrial tow tractors, and airport ground support equipment.

OHVR: CARB ensures off-highway recreational vehicles (OHVR), such as off-highway motorcycles and all-terrain vehicles (ATVs) used recreationally, in agriculture, building and trades, landscape maintenance and law enforcement, meet emissions standards for smog pre-cursors and evaporative emissions. Portable fuel containers: CARB ensures all gas cans (PFCs) used to fill equipment like lawnmowers, vehicles, and personal watercraft minimize spillage and meet low-emissions requirements through the implementation of low permeation plastics and automatic sealing nozzles.

R134A: CARB ensures small containers of mobile air conditioning refrigerant (HFC-134a) minimize greenhouse gas emissions by meeting requirements, such as having self-sealing valves on the containers.

SORE: CARB ensures that certified exhaust emissions standards are complied with for Small Off-Road Engines (SORE) used in lawn and garden equipment as well as other outdoor power equipment and specialty vehicles.

## Summary

Both South Coast AQMD and CARB are committed to working closely with the CSC to identify and investigate air quality issues in the community. For the mobile sources regulated by CARB, this will include actively enhancing enforcement activities through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the CSC on the status of inspections and to obtain additional areas of mobile source concern. CARB plans to have, at a minimum, annual meetings with the CSC in order to prioritize strategies and identify possible locations where non-compliant vehicles are present. CARB will report-back to the community with the number of inspections performed and the number of citations and/or Notices of Violations (NOVs) issued. Further information about CARB's and South Coast AQMD's commitments can be found in Chapter 5.

## Trucks and Freeways

### Community Concerns

The Southeast Los Angeles (SELA) community is surrounded by the Interstate 105 to the south, Interstate 110 to the west, and Interstate 710 (I-710) to the east. The I-710 is a vital transportation corridor for goods movement out of the Ports of Los Angeles and Long Beach, the busiest container ports in the United States. A daily average of up to 240,000 vehicles transit along the portion of the Interstate 710 in the SELA community.<sup>1</sup> Heavy-duty trucks contribute to about 8.7% of the average daily traffic volume and over 90% of diesel particulate matter (DPM) emissions.<sup>2</sup> Based on South Coast AQMD's MATES IV study, in 2012 DPM emissions account for about 68% of the air toxics risk in the South Coast Air Basin. However, the California Air Resources Board (CARB) projects that between 2012 and 2030 there will be over a 95% reduction in on-road DPM emissions in the South Coast Air Basin from the implementation of mobile source regulations, with most of the reductions occurring before 2023.<sup>2</sup>

The SELA community has expressed concern about emissions from heavy-duty trucks traveling along the I-710 and idling near storage yards and fueling stations. Community residents are also concerned about the general traffic congestion in their neighborhoods and the potential of large warehouses or fulfillment centers opening in the future, which may also increase truck activity. To gain understanding of the vehicle population in the SELA community, a summary of vehicles registered by model year is available at the following webpage <https://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/southeast-los-angeles>. It should be noted that many on-road vehicles categories, such as trucks, may not always operate where they are registered.

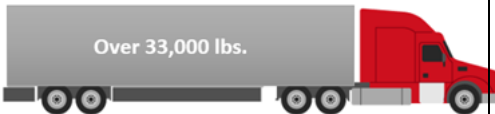

### Emissions from Trucks and Freeways

The largest sources of emissions from Trucks in SELA generally fall into two categories, including, medium heavy-duty trucks (14,001 - 33,000 lbs.) and heavy heavy-duty trucks (over 33,000 lbs.). Examples of medium heavy-duty trucks include commercial delivery trucks, beverage trucks, and school buses. Examples of heavy heavy-duty trucks are freight trucks used to move shipping containers, cement trucks, dump trucks, and city transit buses. See Figure 1 – General Trucks Categories.

<sup>2</sup> California Air Resources Board, Community Air Protection Program 2019 Community Recommendations Staff Report. <https://ww2.arb.ca.gov/resources/documents/2019-community-recommendations-staff-report>, Accessed February 18, 2020.

Figure 1 – General Truck Categories

Category	Definition	Example
Medium Heavy-Duty		
Heavy Heavy-Duty		

Based on emissions from the years 2016 and 2017, medium heavy-duty and heavy-heavy duty trucks contribute approximately 53% of all DPM in SELA.<sup>3</sup> Other large sources of DPM in SELA are locomotives (i.e., trains), off-road equipment (e.g., cargo handling equipment, construction equipment), and diesel buses. For the overall contribution of these sources by percentage, see Figure 3 – Sources of DPM in SELA. DPM is a toxic air pollutant that comes from diesel engines and is a top contributor to air toxics cancer risk. Additional information about DPM and health effects is available at <https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health>.

Trucks also contribute to fine particulate matter (PM<sub>2.5</sub>), particulate matter (PM<sub>10</sub>), volatile organic compounds (VOCs), and nitrogen oxides (NO<sub>x</sub>) emissions. PM<sub>10</sub> and PM<sub>2.5</sub> are particles smaller than 10 and 2.5 microns, respectively that can be inhaled deep into the lungs and cause health problems. Figure 4 – Particulate Size Comparison shows the relative sizes of PM<sub>10</sub> and PM<sub>2.5</sub>. Additional information about PM<sub>10</sub> and PM<sub>2.5</sub> are available at <https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health>. ROG is a group of gases that contribute to forming smog, such as acetone, benzene, and formaldehyde. NO<sub>x</sub> is a family of gases that are highly reactive with other pollutants to form both ozone (smog) and PM<sub>2.5</sub>. Ozone can harm the respiratory system. Additional information about ozone is available at <https://ww2.arb.ca.gov/resources/ozone-and-health>.

Table 1 – Emissions from Mobile Sources in SELA below, provides an overview of on-road mobile source emissions in SELA. Emissions from medium heavy-duty and heavy-heavy duty trucks are in yellow highlights.

**Table 1 – Emissions from On-Road Mobile Sources in SELA in 2018 (Tons per Year)<sup>5, 6</sup>**

On-Road Mobile Sources – SELA	NOx	ROG	PM10	PM2.5	DPM
<sup>†</sup> Light and Medium-Duty Vehicles	447.75	492.00	134.76	57.58	0.37
<sup>†</sup> Light Heavy-Duty Vehicles	17.45	20.97	2.82	1.19	--
Medium Heavy-Duty Vehicles	208.68	17.02	12.09	7.99	5.25
Heavy-Heavy Duty Vehicles	493.37	25.79	12.84	8.34	5.93
Buses	17.24	2.32	1.25	0.73	0.38
Total On-road Mobile Sources	1,184.49	558.10	163.76	75.83	11.94

<sup>†</sup>Passenger cars and pickup trucks

## Air Monitoring

The SELA community is intersected by a multitude of public roads and freeways with high traffic volumes and a high fraction of diesel trucks due to the presence of railyards, warehouses and the associated goods movement in the area. Diesel engines emit a complex mixture of air pollutants, including both gaseous and solid material. The solid material in diesel exhaust is known as DPM, which is a component of PM2.5. There is no technique to directly measure DPM (a major contributor to health risk); therefore, indirect measurements based on surrogates for diesel exhaust are used, specifically black carbon (BC). DPM is typically composed of carbon particles (“soot”, also called BC) and numerous organic compounds. Diesel exhaust also contains gaseous pollutants, including volatile organic compounds (VOC) and NOx.

The monitoring strategy to study and characterize this air quality priority consists of comprehensive measurements conducted using a mobile platform capable of monitoring a wide range of particulate and gaseous pollutants, including BC, PM, ultrafine particles (UFP), and nitrogen dioxide (NO<sub>2</sub>). Mobile monitoring is first conducted in areas identified by the CSC, such as areas with heavy-duty trucks idling near storage yards and fueling stations, as well as roadways with traffic congestion in neighborhoods, prioritized based on available truck density information. These measurements will extend to other areas within the SELA community to support implementation of emission reduction strategies and help track their progress; identify air pollution hotspots; and help to assess the impact of truck emissions on community exposure.

## Regulatory Efforts and Enforcement

Under the Clean Air Act (CAA),<sup>7</sup> the U.S. EPA sets standards for air quality for certain ‘criteria’ air pollutants, including the maximum concentration of those pollutants in the air anywhere in the United States. The CAA allows EPA to establish emission limits on mobile sources, such as heavy-duty trucks, by regulating both the composition of fuels and tailpipe emissions and on-road and off-road engines. CARB is the primary authority over mobile sources in the state of California and can set in-state fuel and tailpipe standards for many of the same vehicles as the federal government, though it often requires a waiver from EPA. South Coast AQMD has primary authority over stationary sources with some limited mobile source authority. For example, South Coast AQMD can address “indirect sources” (facilities that attract mobile sources) through facility-based measures. The sections below describe the regulatory and enforcement efforts from the U.S. EPA, CARB, and South Coast AQMD.

### **US EPA and CARB**

Since the designation in California of diesel particulate matter as a toxic air contaminant in 1998, CARB has developed a suite of regulations (rules) and Airborne Toxic Control Measures to reduce Californians’ exposure to this cancer-causing pollutant, including emissions from heavy-duty (large) diesel trucks and buses. CARB has addressed truck and bus diesel emission reductions through existing regulations, such as the Drayage Truck Regulation,<sup>8,9</sup> and the Truck and Bus Regulation,<sup>10, 11</sup> which require the use of exhaust after treatment, like diesel particulate filters; newer engines that meet lower air pollutant emissions standards; and limits on idling of diesel-fueled vehicles, such as trucks and buses. See Figure 5 - CARB Enforcement Programs Relevant to Trucks, for more details on these rules. Figure 5 – CARB Enforcement Programs Relevant to Trucks, provides an overview of CARB’s enforcement programs).

**Figure 4 – CARB Enforcement Programs Relevant to Trucks**

	CARB conducts <b>idling</b> sweeps to ensure vehicle idling limits are not exceeded. See below for further details on this rule.
	<b>Drayage vehicles</b> are heavy-duty diesel vehicles (HDDV) that move goods. HDV that enter the port or intermodal facility are required to have newer engines (2007+) that are certified to cleaner emissions standards.
	<b>Transport Refrigeration Units (TRUs):</b> Inspect secondary engines to ensure TRUs meet labeling and clean air requirements.
	For the <b>Heavy-Duty Vehicle Inspection Program</b> , CARB conducts inspections for: <ul style="list-style-type: none"> <li>• Diesel Emission Fluid (DEF): a liquid used as a reductant in heavy-duty diesel engines to reduce NOx emissions</li> <li>• Emission Control Label (ECL): Engine certification labeling requirements</li> <li>• Smoke/Tampering: Requires heavy duty trucks/buses to be inspected</li> </ul>
	<b>Statewide Truck and Bus Regulation</b> requires all vehicles with 2009 or older engines weighing over 14,000 pounds to reduce exhaust emissions by upgrading to 2010 or newer engines by 2023. Non-compliant vehicles will be denied DMV registrations.

Both CARB and South Coast AQMD enforce the idling rules, including the Commercial Vehicle Idling Regulation restricts commercial vehicle idling (with a gross vehicle weight rating of greater than 10,000 pounds).<sup>12</sup> The regulation restricts idling to five minutes or less for commercial vehicles:

- Without a “Clean Idle” sticker (2007 and newer model-year diesel engines that meet low NOx limit of 30 g/hr), or
- With a “Clean Idle” sticker and idling within 100 feet of schools, residences, hotels, or other restricted areas, or
- Operating diesel-fueled auxiliary power systems within 100 feet of restricted areas.

The regulation also provides exceptions for queuing (i.e., vehicles waiting in line to perform work where shutting engines off is not possible). Figure 5 – “Clean Idle” sticker, shows a “Clean Idle” sticker provided for diesel engines that meet CARB’s certification requirements.

<sup>12</sup> California Air Resources Board, Complaints – Idling Vehicles, <https://ww2.arb.ca.gov/our-work/programs/environmental-complaints/complaints-idling-vehicles>, Accessed July 4, 2020.

Figure 5 – CARB Certified Clean Idle Sticker

In addition, to helping cities address idling, CARB has developed an “Options for Cities to Mitigate Heavy-Duty Vehicle Idling” guidance document, which includes options for cities to address heavy-duty vehicle idling emissions in their communities.<sup>13</sup>

CARB continues to work towards reducing emissions from transport refrigeration units (TRU)<sup>14</sup> near distribution centers and other facilities where TRU activity is focused, and reducing emissions while in transit, especially near the most impacted communities. Improving freight efficiency and transitioning to zero-emission technologies will reduce toxic air contaminant, criteria pollutant, and greenhouse gas emissions. Improving freight efficiency and transitioning to zero-emission technologies will also reduce these same categories of emissions. CARB has created advisories and forms to assist TRU owners in understanding compliance requirements to ensure that regulated entities (e.g., TRU owners, TRU operators, facilities that support TRU use, etc.) are aware of their responsibilities under the TRU regulation.

CARB also recently adopted the Advanced Clean Trucks Rule requiring truck manufacturers to transition from producing diesel trucks and vans to electric zero-emission trucks including heavy-duty vehicles beginning in 2024. Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines would be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales. This rule also requires that fleets report information on a one-time basis about their vehicles to support future zero-emission fleet rules.<sup>15</sup> CARB is also considering new requirements to further reduce emissions from trucks and TRUs. Table 2 below illustrates the key upcoming activities from U.S. EPA and CARB.

<sup>13</sup> California Air Resources Board, Options for Cities to Mitigate HDV Idling, [https://ww2.arb.ca.gov/sites/default/files/2020-03/arb\\_options\\_cities\\_mitigate\\_idling.pdf](https://ww2.arb.ca.gov/sites/default/files/2020-03/arb_options_cities_mitigate_idling.pdf), Accessed July 4, 2020.

**Table 2 – Upcoming Rule Development/Activities from U.S. EPA and CARB**

Agency	Proposed Action	Expected Decision	Expected Phase-in Period
U.S. EPA	Cleaner Truck Initiative <sup>16</sup> – In response to a petition from the South Coast AQMD, U.S. EPA has committed to updating its truck engine standard to reduce NOx emissions.	2021	2027-?
CARB	Transport Refrigeration Unit Regulation <sup>17</sup> – Measure to reduce emissions and residual risk from TRUs by transitioning to zero-emission technologies.	2021	TBD
CARB	Advanced Clean Fleets <sup>18</sup> – Would require fleets to transition to zero-emissions, including drayage trucks.	2021	2024-?
CARB	Heavy-Duty Low NOx Rule <sup>19</sup> – Would set new statewide engine standards for trucks. 60-75% NOx reduction between 2024-2026. Additional reductions in 2027 and beyond.	2020	2024-?
CARB	Heavy-Duty Inspection and Maintenance - Similar to smog check for cars and light duty trucks, this would allow on-board diagnostics (OBD) system checks and require periodic OBD data submissions to identify malfunctioning emissions-related components in applicable engines, include opacity checks for pre-2013 model year engines (non-OBD engines), and require vehicle repairs, if necessary, for all vehicles operating in California. <sup>20</sup>	2021	2023-?

### **South Coast AQMD**

South Coast AQMD staff is actively working on Proposed Rule 2305 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program.<sup>21</sup> Staff released the first draft rule in May 2020. The purpose of the draft rule is to reduce local and regional NOx and DPM emissions and facilitate local and regional emission reductions associated with warehouses larger than 100,000 square feet and the

<sup>21</sup> South Coast AQMD, Proposed Rule 2305 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. [https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/warehouse-isr\\_prelim-1st-draft.pdf](https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/warehouse-isr_prelim-1st-draft.pdf). Accessed July 14, 2020.

mobile sources attracted to these warehouses. The Warehouse ISR is scheduled to be considered by the South Coast AQMD Governing Board in the first quarter of 2021.

South Coast AQMD has limited authority to regulate on mobile sources; however, the state’s Air Toxic Control Measure to address diesel particulate matter from heavy duty diesel vehicles specifically provides enforcement authority to air districts to enforce truck idling regulations. Activities for truck idling inspections fall into two categories:

- Those initiated by South Coast AQMD – that is, prearranged field operations (also referred to as “sweeps”) to identify violating trucks.
- Those prompted by an outside party, such as public complaints and agency referrals.

While there are many reasons to conduct an inspection, air pollution concerns received directly from community members by way of public complaints are a very important source of information. All complaints are assigned to an inspector for investigation. The complaint telephone line is handled by a live attendant during business hours (Monday – Friday) or by a standby system during off hours. Complainant information is always kept confidential, and while anonymous complaints are accepted, having contact information is crucial to ensure that the inspector can gather all the relevant information to conduct an effective investigation. **To report complaints, please call 1-800-CUT-SMOG (1-800-288-7664) or file an online complaint at [www.aqmd.gov](http://www.aqmd.gov).**

Truck idling inspections are unannounced to ensure that the inspector can identify any trucks that may be in violation of the truck idling standards. The locations at which inspectors conduct field operations are chosen based on community input, historical complaint data, locations of sensitive receptors, and other data sources that give insight as to where trucks may be idling in the community. If a truck is found to be in violation of California’s idling regulation, inspectors will take necessary enforcement action to address the non-compliant activity. This enforcement action generally takes the form of a Notice of Violation (NOV) to the owner of the vehicle. NOV’s generally result in a fine or other penalty.

Since truck idling has been identified as a community priority, AB 617 CERP actions include enhanced enforcement efforts intended to address SELA community concerns directly, taking community input into account where appropriate.

## Incentives

South Coast AQMD funds projects to develop zero-emission technologies, such as battery-electric and fuel cell, for heavy-duty trucks. South Coast AQMD also offers incentives to truck owners to replace older polluting trucks with cleaner trucks. Specifically, the truck owners must use these incentives to purchase trucks that are cleaner than what the regulations currently require. South Coast AQMD’s Voucher Incentive Program (VIP)<sup>22</sup> provides incentives for smaller businesses with fleets of 10 or fewer vehicles that primarily

---

<sup>22</sup> South Coast Air Quality Management District, Voucher Incentive Program.  
<http://www.aqmd.gov/home/programs/business/business-detail?title=voucher-incentive-program&parent=vehicle-engine-upgrades>, Accessed July 6, 2020

operate within California. The Carl Moyer Program<sup>23</sup> is another incentive program for truck owners to obtain cleaner trucks.

South Coast AQMD staff is exploring a new system called Portable Emissions AcQuisition System (PEAQs) equipped with Automated License Plate Readers (ALPRs)<sup>24</sup> in collaboration with the California Air Resources Board (CARB). PEAQS measures emissions as vehicles pass by the sensors, while ALPRs are high-speed, computer-controlled camera systems that can capture license plate numbers that come into their view. ALPR data, when cross-referenced with the Department of Motor Vehicles (DMV) records, can provide more information about vehicles. South Coast AQMD staff is exploring the possibility of using this technology to identify older heavy-duty diesel trucks and notify truck owners who may qualify for incentive programs to replace their truck with newer cleaner models.

In support of AB 617, the legislature has budgeted funds for local air district incentives to support advanced technologies that reduce emissions in disadvantaged communities. CARB facilitates these incentives through the Community Air Protection Program (CAPP). CAPP incentives help owners of older high-polluting vehicles and equipment replace them with newer models with much lower emissions or zero emissions. The incentives may also be used for changes at local industrial facilities that reduce emissions of toxic or smog-forming pollutants, to build zero-emission charging stations, or to support local measures that air districts and communities identify through AB 617 Community Emissions Reduction Programs.

South Coast AQMD has funded about 360 mobile source projects (resulting in approximately \$78.1 million in grants) in 2018 – designated AB 617 communities with CAPP incentives. Examples of the type of projects funded include the replacement of heavy-duty trucks, off-road equipment, and locomotives, and zero-emission infrastructure (e.g., outlet for electric-powered truck refrigeration units). For more information on CAPP incentives, including the applications submitted and final project selection for the first two years of the program, please visit the following webpage at [www.aqmd.gov/cappincentives](http://www.aqmd.gov/cappincentives).

The ports are also developing their Clean Truck Program (CTP) as part of their Clean Air Action Plan (CAAP) to reduce emissions at the ports. The CTP is aimed at generating an additional source of incentive funds for cleaner drayage trucks. The funds would be generated by charging a fee per loaded container to trucks entering the ports facilities, with a rebate for cleaner trucks. In March 2020, the ports harbor commissioners voted to support a truck rate of \$10 per Twenty Foot Equivalent (TEU), or \$20 per truck. This rate is anticipated to provide \$90 million per year for truck incentives.

Initially the ports intended to design and implement the program in 2020, with a target of starting to collect the truck rate by the end of 2020. However, due to the economic uncertainties triggered by the COVID-19 pandemic, the ports have delayed that date and both the details of the program and the start date are uncertain. The ports have stated that they remain committed to developing the CTP and will start implementing as soon as there is more certainty regarding the economic outlook.

# Rendering Facilities

## Community Concerns

The Southeast Los Angeles (SELA) community is affected by odors from rendering plants located within the emissions study area (ESA). Rendering is a process that converts waste animal tissue into grease, soap, meat meal, and other useful materials. Dry material from the process may be used for pet food, fertilizer and other products. The raw material that is rendered includes animal carcasses, slaughter waste and trimming, and out-of-date supermarket stock. Figure 1 shows the products and by-products of the rendering process. Because animal carcasses are generally not allowed to be put in landfills, these materials must go to rendering facilities to be processed. Several processes within rendering facilities can emit odors. The processes include raw material receiving, raw material size reduction, cooking, fat processing, and wastewater treatment.

**Figure 1 – Products and By-products Produced During Rendering<sup>25</sup>**

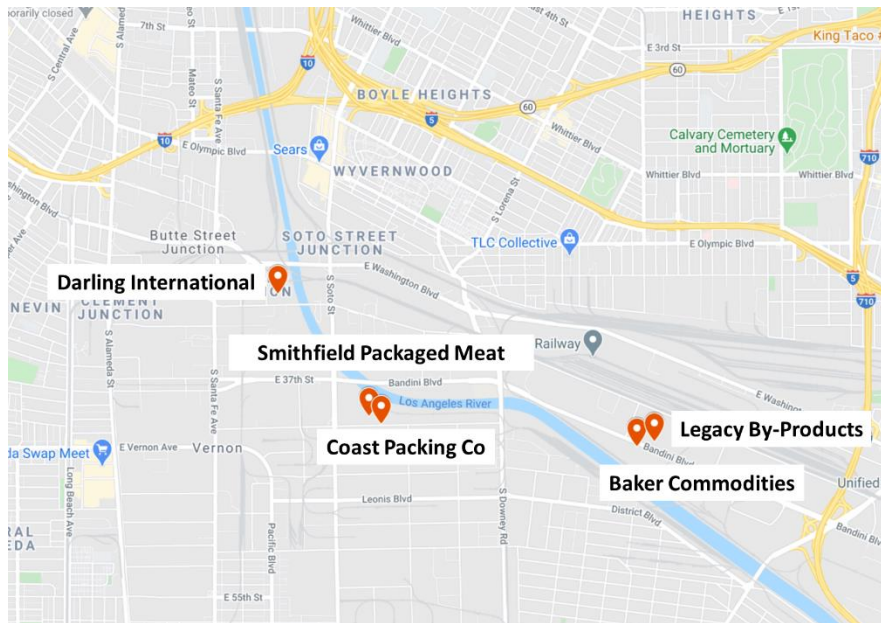

<sup>25</sup> South Coast AQMD, Final Staff Report for Proposed Rule 415 – Odors from Rendering Facilities <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-nov3-030.pdf>, Accessed October 8, 2020.

## Appendix 5 –Southeast Los Angeles

The SELA Community Steering Committee (CSC) has expressed concerns about odors from rendering facilities located in or adjacent to the Vernon area that affect the quality of life in SELA. Figure 2 shows the five rendering facilities located in the SELA emissions study area, including Baker Commodities, Darling International, Legacy By-Products (formerly D & D/West Coast Rendering), Smithfield Packaged Meat (formerly Farmer John), and Coast Packing. It is often difficult to identify which rendering facility is the source of an odor detected in the community because the facilities are located close to one another.

**Figure 2 – Map of Rendering Facilities**

## Emissions from Rendering Facilities

Odors emitted from rendering facilities can come from raw material receiving, high-intensity odors from processing operations (e.g., cooker, presses, and centrifuges), wastewater treatment, and many other sources of fugitive odors at the facility. Figure 3 shows some of the potential odor emission points in the continuous rendering process. The rendering process can release odors that cause health effects and reduced quality of life. The symptoms that accompany odors include coughing, sore throat, burning eyes, runny nose, headache, nausea, and respiratory irritation.<sup>26</sup> Table 1 includes the emissions inventory for rendering facilities in SELA during 2018 including some criteria air pollutants and toxic air contaminants.

<sup>26</sup> Science of Odors as a Potential Health Issue, Journal of Environmental Quality, (Susan Schiffman and C.M. Williams, 34:129-138 (2005)

## Air Monitoring

The rendering process involves many steps, each of which is a potential source of fugitive odors at a facility (Figure 3). In general, odors are mainly comprised of volatile organic compounds (VOCs). Even with modern air monitoring techniques, the presence and intensity of odors is difficult to measure, and the human nose is often a better detector of the presence of odorous compounds. Odors are often the product of a number of different compounds present in a single plume and an approach that captures as many of these VOCs as possible provides the best chance to understand odor sources.

To address this community concern mobile monitoring of VOCs will be conducted near the five rendering facilities identified in the emissions study area (Figure 2). These studies will be conducted using a mobile platform capable of simultaneous real-time monitoring of hundreds of VOCs at very low levels. Concurrent measurements of VOCs and wind speed/direction while driving near target facilities will enable locating potential source(s) of emissions, and onboard data visualization tools will be used to detect and track plumes of interest in real-time. Community monitoring will be conducted to help support compliance investigations, where appropriate, and to assess the extent to which emissions from rendering facilities impact the air quality of the nearby community.

## Regulatory Efforts and Enforcement

South Coast AQMD staff regularly conducts compliance and enforcement activities at rendering facilities within South East Los Angeles. These activities fall into two categories:

- Those initiated by South Coast AQMD, such as routine facility inspections or targeted rule inspections.
- Those prompted by an outside party – e.g., complaint investigations, facility notifications, and agency referrals.

While there are many reasons to conduct an inspection, air pollution concerns received directly from community members by way of public complaints are a very important source of information. All complaints are assigned to an inspector for investigation. Complaints received regarding rendering plant odors are investigated for compliance with Rule 415 – *Odors from Rendering Facilities* and Rule 402 – *Public Nuisance*. The complaint telephone line is handled by a live attendant during business hours (Monday – Friday) or by a standby system during off hours. Complainant information is always kept confidential, and while anonymous complaints are accepted, having contact information is crucial to ensure that the inspector can gather all the relevant information to conduct an effective investigation. **To report complaints, please call 1-800-CUT-SMOG (1-800-288-7664) or file an online complaint at [www.aqmd.gov](http://www.aqmd.gov).**

Inspections are generally unannounced to ensure that the inspector gets a snapshot of the normal operations at the rendering plants. Inspections can be conducted to evaluate the overall compliance status of the facility or focus on specific aspects of an operation or specific rule or regulation. At

rendering facilities, inspectors will verify compliance with Rule 415 (including the relevant BMPs), permit conditions, and any other applicable rules or regulations.

If a facility is found to be out of compliance with air pollution rules/regulations or permit conditions, inspectors will take necessary enforcement action to address the non-compliant activity. There are two methods of enforcement action:

1. A Notice to Comply (NC) may be issued for minor violations found during an inspection or to request additional information.
2. A Notice of Violation (NOV) may be issued for non-compliance with rules, permit conditions, or administrative requirements. NOV's generally result in a fine or other penalty.

If a facility cannot immediately comply with air pollution laws, it may seek a variance from a rule requirement or permit condition by filing a petition and appearing before the South Coast AQMD Hearing Board. In cases of ongoing non-compliance, an abatement order may be served on the facility and will require the company to take specific actions or shut down its operation. These processes serve to ensure that a facility can return to compliance expeditiously while minimizing air quality impacts.

Since rendering facilities have been identified as a community priority, AB 617 CERP actions include enhanced enforcement efforts intended to address SELA community concerns directly, taking community input into account where appropriate.

Figure 4 summarizes the key elements of Rule 415, including best management practices, enclosures, signage, and additional requirements.

**Figure 4 – Key Elements of Rule 415**

## Green Spaces

### Community Concerns

Green spaces, such as parks and reserves, sporting fields, greenways and trails, and community gardens provide various environmental benefits to residents. Green spaces may help reduce the concentration of pollution the air,<sup>28,29</sup> reduce noise impacts and lower outdoor temperatures reducing urban heat impacts. Additionally, residents who live near green spaces may be encouraged to engage in physical activity, which provides health benefits by increasing physical fitness, reducing depression and anxiety, and improving cognitive function.<sup>30</sup>

The CSC expressed interest in increasing green spaces in SELA through tree planting, school and community gardens, tree buffers near freeways, and greenways or tree canopy covers over bike trails.

### Green Space Programs

#### State Programs

The Coastal Conservancy has been designing and funding urban greening projects in Los Angeles county since 2008. The agency works to introduce green spaces and green infrastructure to communities that have been historically deprived of natural spaces. The Coastal Conservancy's *L.A. Urban Greening Program*<sup>31</sup> seeks to expand open space and support water quality in under-served communities in Los Angeles. The program is composed of multi-benefit projects that:

- Create new parks and improve existing parks and green spaces
- Help cool down neighborhoods with native plantings
- Create urban greenways with bike and pedestrian paths
- Improve recreation opportunities in park-poor neighborhoods
- Support the restoration of the L.A. River
- Improve groundwater recharge, reduce storm water runoff, and improve coastal water quality

<sup>28</sup> CARB, Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways <https://ww2.arb.ca.gov/resources/fact-sheets/strategies-reduce-air-pollution-exposure-near-high-volume-roadways>. Accessed October 30, 2020.

<sup>29</sup> VOCs and NOx produce ozone and secondary organic aerosols in the presence of sunlight. Therefore, low VOC emitting trees should be planted to minimize their contribution to air pollution.

<sup>30</sup> C. Haaland and C.K. van den Bosch. Urban Forestry & Urban Greening 14 (2015) 760 – 771. <https://doi.org/10.1016/j.ufug.2015.07.009>. Accessed July 30, 2020.

Accessed August 4, 2020.

Table 1 shows a description of a current L.A. Urban Greening Program project in SELA

**Table 1 – L.A. Greening Program Projects in SELA**

Location	Project	Description
<b>South Gate</b>	Hollydale Regional Park	Use green infrastructure to enhance urban forestry and native habitat, improve water quality of the LA river, and create a safe and beautiful park to benefit critically park-deficient residents. The project aims to reduce water and fertilizer use by replacing grass with native plants and replacing invasive plants with native trees and shrubs.

The California Natural Resources Agency works to ensure access to natural lands for all Californians. The agency administers the Urban Greening Grant Program.<sup>32</sup> The projects funded under the grant program must acquire, create, enhance, or expand community parks and green spaces, and/or use natural systems or systems that mimic natural systems to achieve multiple benefits. The projects must also reduce greenhouse gas emissions. The Urban Greening Grant Program also emphasizes grant funding to critically underserved or disadvantaged communities. The California Natural Resources Agency includes the San Gabriel and Lower Los Angeles Rivers and Mountains Conservancy (RMC) which covers eastern Los Angeles County and western Orange County and provides a variety of grants for projects consistent with the agency mission and which prioritize projects in disadvantaged communities.

### *Local City and Neighborhood Plans and Ordinances*

California state law requires every city and county to prepare a comprehensive, long-term general plan to guide its future, known as a General Plan. These General Plans contain goals and policies necessary to guide public policy for future land uses, including the inclusion or expansion of green spaces. Table 2 shows SELA city general plans and a brief overview of their green space policies.

**Table 2 – SELA City and County General Plans and Ordinances**

## *Appendix 5 –Southeast Los Angeles*

The Gateway Cities Council of Governments (COG) is a regional governing body comprised of local government representatives from Southeast Los Angeles County, including the cities within the AB 617 SELA community boundary. The COG administers the Complete Street Initiative, which includes urban greening and open space elements.<sup>40</sup>

### *Nonprofit Organizations*

Several nonprofit organizations with environmental missions to expand green spaces serve the Greater Los Angeles Area, including the SELA community. Table 3 lists some of the nonprofits with missions that align with the CSC's air quality concern to increase green space in SELA.

---

<sup>40</sup> Gateway Cities Council of Governments, Complete Street Initiative.

## Metal Processing Facilities

### Community Concerns

The Southeast Los Angeles (SELA) community and emission study area (ESA) encompass the unincorporated Los Angeles County neighborhoods of Florence-Firestone, Vernon, and Walnut Park and the cities of Bell, Bell Gardens, Cudahy, Huntington Park, Maywood, and South Gate. There are one hundred and thirty-two (132) metal processing facilities within the SELA community and ESA that are affected by South Coast AQMD Rules and Regulations. Metal processing facilities in SELA conduct various operations, such as heat treating, melting, plating, machining, forging, grinding, and recycling. See Figure 1 – Examples of Metal Processing Facilities, for examples of operations at metal processing facilities.

The SELA community has expressed concern about toxic metal air pollutants, odors, and particulate matter emissions from metal processing facilities. Metal processing is a source of toxic metal air pollutants, such as arsenic, cadmium, hexavalent chromium, lead, and arsenic. Toxic metal air pollutants are a group of air pollutants that may cause or contribute to an increase in mortality or an increase in serious illness or pose a present or potential risk to human health.<sup>48</sup> For example, breathing in hexavalent chromium over long periods of time increases the risk of lung and nasal cancers.<sup>49</sup>

**Figure 1 – Examples of Metal Processing Facilities**

### Emissions from Metal Processing Facilities

Emissions information for SELA metal processing facilities is available in Chapter 3b – Emissions and Source Attribution Analysis.

## Air Monitoring

South Coast AQMD's efforts to address this air quality priority in the SELA community and ESA entail a comprehensive strategy to systematically identify and characterize sources of air toxic metals emissions using a combination of advanced air monitoring technologies and traditional methods operated in a mobile platform and/or at a fixed locations. The mobile monitoring approach will begin with an area-wide survey to measure air toxic metals around the metal processing facilities of interest and in surrounding communities. Such survey will prioritize areas with the highest density of facilities to identify air pollution hotspots and assess the potential impact of emissions from metal processing facilities on the air quality of residential neighborhoods nearby. Measurements will then extend to other areas of the SELA community where the density of metal processing facilities is not as pronounced.

If potential sources are identified through mobile monitoring, stationary measurements will also be conducted near (e.g. downwind) the identified facilities to better characterize their emissions. For this purpose, ambient levels of particulate metals will be measured using either continuous measurements with a high-time resolution, or 24-hr time-integrated sampling methods followed by chemical analysis, or a combination of both. Meteorological parameters (e.g., wind speed and direction) will be measured concurrently to help locating the source of emissions. In case these measurements suggest that any of the operations or other sources at the metal-processing facility of concern have the potential to emit Cr6+, fixed-site monitoring of Cr6+ ) will also be carried out through the collection of time-integrated samples followed by chemical analysis.

Findings from these monitoring efforts will provide information to support CERP actions. When appropriate, follow-up compliance and enforcement actions will also be taken by the South Coast AQMD inspectors to mitigate emissions.

## Regulatory Efforts and Enforcement

### State and Federal Actions

Several state and federal rules apply to sources of pollution from metal processing facilities within this community. Table 1 summarizes the state and federal programs to address toxic metal air pollutant emissions.

**Table 1 – State and Federal Programs to Address Toxic Metal Air Pollutant Emissions**

Program	Purpose
<b>CARB's Airborne Toxic Control Measures<sup>50</sup></b>	<ul style="list-style-type: none"> <li>A statewide air emission control program to reduce air emissions from mobile and stationary sources, including measures that address processes that emit metals (e.g., hexavalent chromium and cadmium)</li> </ul>
<b>Assembly Bill 2588 (AB 2588) -Air Toxics Hot Spots Program†</b>	<ul style="list-style-type: none"> <li>A statewide program that addresses air toxics pollution from certain facilities by:               <ul style="list-style-type: none"> <li>Collecting air toxics emissions information</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>○ Identifying facilities that have local impacts</li> <li>○ Providing public information about air toxics impacts from facilities</li> <li>● Reducing significant air toxics risks from facilities</li> </ul>
<b>U.S. EPA Title V</b>	<ul style="list-style-type: none"> <li>● A federal law that requires major sources of air pollutants, and certain other sources, to <ul style="list-style-type: none"> <li>○ Obtain an operating permit</li> <li>○ Operate in compliance with the permit</li> <li>○ Certify at least annually their compliance with permit requirements</li> </ul> </li> </ul>
<b>U.S. EPA Superfund Program</b>	<ul style="list-style-type: none"> <li>● A federal program that is responsible for: <ul style="list-style-type: none"> <li>○ Environmental cleanups of some of the most contaminated land</li> <li>○ Responding to environmental emergencies, oil spills, and natural disasters</li> </ul> </li> </ul>

†Applies to facilities that have an estimated annual emissions of four (4) or more tons of either sulfur oxides (SO<sub>x</sub>), volatile organic compounds (VOCs), nitrogen oxides (NO<sub>x</sub>), specific organics (SPOG), particulate matter (PM), or emissions of 100 tons per year or more of carbon monoxide (CO).

Additionally, several other state and federal agencies are also responsible for regulating, monitoring, or ensuring employee safety from exposure to hazards such as toxic metal air pollutants. The United States Department of Labor’s Occupational Safety and Health Administration (OSHA) ensures that employees work in a safe and healthful environment by setting and enforcing standards, and by providing training, outreach, education, and assistance.<sup>51</sup> The Department of Toxic Substances Control (DTSC) protects California’s people and the environment from the harmful effects of toxic substances by restoring contaminated resources, enforcing hazardous waste laws, reducing hazardous waste generation, and encouraging the manufacture of chemically safer products.<sup>52</sup> Additionally, The DTSC’s Toxicity Criteria for Human Health Risk Assessment Regulation<sup>53</sup> adopts certain toxicity criteria for all human health risk assessments, screening levels, and remediation goals. The California Office of Environmental Health and Hazard Assessment (OEHHA) protects and enhances the health of Californians and the state’s environment through scientific evaluations that inform, support, and guide regulatory and other actions.<sup>54</sup>

### South Coast AQMD

Many South Coast AQMD rules reduce metal emissions from a specific type of operation or source of pollution. For example, South Coast AQMD has rules that control air pollution from metal processing facilities. Table 2 and 3 summarize South Coast AQMD’s rules to address toxic metal air pollutants. Additionally, South Coast

### Compliance and Enforcement

South Coast AQMD staff regularly conducts compliance and enforcement activities at metals processing facilities within South East Los Angeles. These activities fall into two categories:

- Those initiated by South Coast AQMD, such as routine facility inspections or targeted rule inspections.
- Those prompted by an outside party – e.g., complaint investigations, facility notifications, and agency referrals.

While there are many reasons to conduct an inspection, air pollution concerns received directly from community members by way of public complaints are a very important source of information. All complaints

are assigned to an inspector for investigation. The complaint telephone line is handled by a live attendant during business hours (Monday – Friday) or by a standby system during off hours. Complainant information is always kept confidential, and while anonymous complaints are accepted, having contact information is crucial to ensure that the inspector can gather all the relevant information to conduct an effective investigation. **To report complaints, please call 1-800-CUT-SMOG (1-800-288-7664) or file an online complaint at [www.aqmd.gov](http://www.aqmd.gov).**

Inspections are generally unannounced to ensure that the inspector gets a snapshot of the normal operations at a facility. Inspections can be conducted to evaluate the overall compliance status of the facility or focus on specific aspects of an operation or specific rule or regulation. Different types of metal processing facilities may have different applicable rules; therefore, inspectors will verify compliance with all rules, regulations, and permit conditions that are relevant to a facility.

If a facility is found to be out of compliance with air pollution rules/regulations or permit conditions, inspectors will take necessary enforcement action to address the non-compliant activity. There are two methods of enforcement action:

3. A Notice to Comply (NC) may be issued for minor violations found during an inspection or to request additional information.
4. A Notice of Violation (NOV) may be issued for noncompliance with rules, permit conditions, or administrative requirements. NOVs generally result in a fine or other penalty.

If a facility cannot immediately comply with air pollution laws, it may seek a variance from a rule requirement or permit condition by filing a petition and appearing before the South Coast AQMD Hearing Board. In cases of ongoing noncompliance, an abatement order may be served on the facility and will require the company to take specific actions or shut down its operation. These processes serve to ensure that a facility can return to compliance expeditiously while minimizing air quality impacts.

Since metal processing facilities have been identified as a community priority, AB 617 CERP actions include enhanced enforcement efforts intended to address SELA community concerns directly, taking community input into account where appropriate.

## Incentives

CARB's Community Air Protection Incentives 2019 Guidelines (CAP Guidelines),<sup>56</sup> identifies projects eligible for incentive funds that reduce emissions, such as those from hexavalent chromium plating facilities. In the second quarter of 2020, CARB allocated about \$360,000 in CAP funds to South Coast AQMD for metal processing facilities in SELA. South Coast AQMD staff is initiating outreach efforts to work with metal plating facilities in SELA to fund the installation of emissions control device projects (e.g., installation of HEPA filters) and conversion projects (i.e., switching from the use of hexavalent chromium to trivalent chromium at chrome plating facilities) that could further reduce hexavalent chromium emissions.

## Railyards and Locomotives

### Community Concerns

Railyards are used to store, sort, or load and unload railroad cars. Common loads include containers (stacked or on trailers), tankers with chemical or petroleum products, and bulk products such as construction materials or grain. Containers can be transported to and from warehouses for storage and sorting before reaching their destination. Regional rail volumes are projected to increase between 2021 - 2040 in response to growing international trade<sup>57</sup> however, the potential amount of growth at railyards in this community is unknown. The Southeast Los Angeles (SELA) community boundary and emissions study area encompasses the BNSF Hobart Railyard, BNSF Commerce Eastern Railyard, and BNSF Sheila Mechanical railyards.

The SELA community boundary also includes parts of the Alameda Corridor that runs from the Ports of Long Beach and Los Angeles to Downtown Los Angeles, primarily along and adjacent to Alameda Street. The Alameda Corridor is a trench that parallels Alameda Street that contains three rail tracks used by BNSF and UP to transport trains to and from the ports. Nearly forty (40) trains and a volume of about thirteen thousand (13,000) twenty-foot equivalent units (TEUs) travel through the Alameda Corridor daily.<sup>58</sup> Stations and rail lines for passenger rail services operated by LA Metro, Amtrak, and Metrolink also run through the SELA community boundary, and the California High Speed Rail project has also indicated that they will use tracks in the northern part of the SELA emissions study area.<sup>59</sup>

### Emissions from Railyards and Locomotives

Air pollution is generated by equipment and vehicles that are used for railyard operations (Figure 1). These vehicles and equipment move containers and railcars into and around the railyard to load, unload, and

<sup>57</sup> Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy. <http://scagrtppscs.net/Documents/2016/final/f2016RTPSCS.pdf>. Accessed July 8, 2020.

<sup>58</sup> Alameda Corridor Transportation Authority. <http://www.acta.org/>. Accessed July 14, 2020.

<sup>59</sup> California High Speed Rail Authority, Los Angeles to Anaheim. [https://hsr.ca.gov/high\\_speed\\_rail/project\\_sections/los\\_angeles\\_anaheim.aspx](https://hsr.ca.gov/high_speed_rail/project_sections/los_angeles_anaheim.aspx). Accessed July 15, 2020.

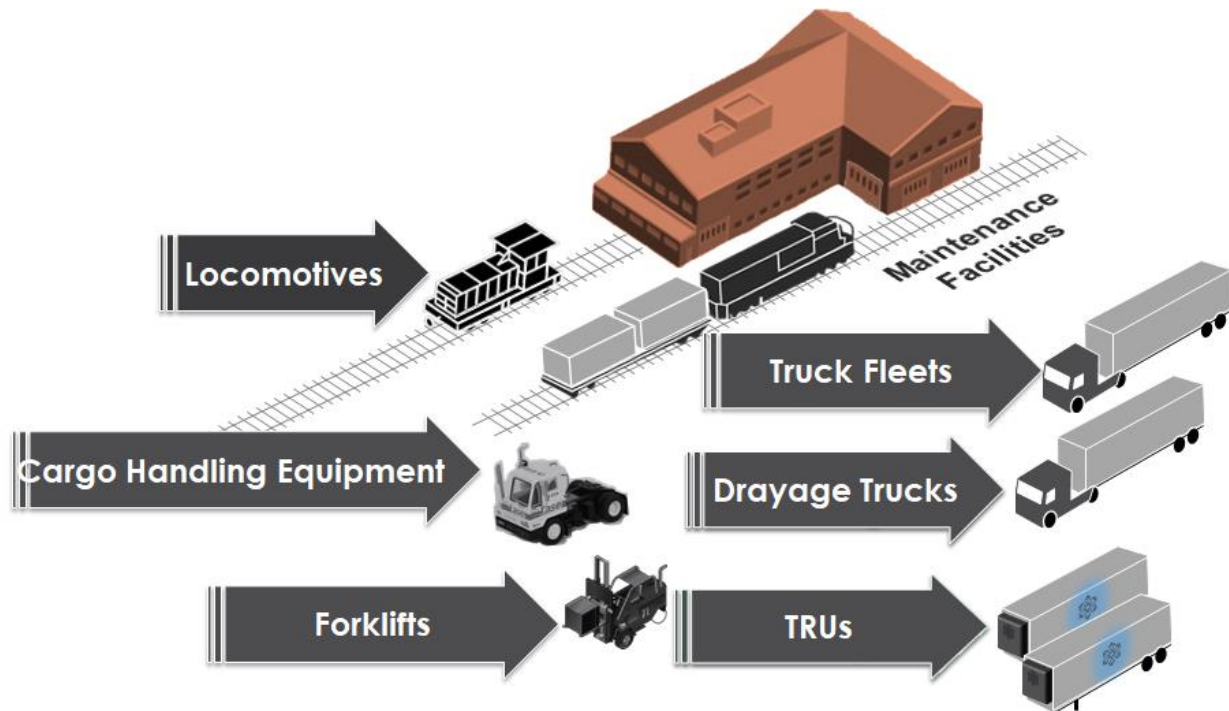

transport goods in and out of the railyard. Emissions can also be generated during maintenance activities (e.g., load testing). Examples of equipment used for railyard operations include:

- Locomotives (including ‘switchers’ that build and deconstruct trains, often within railyards, and larger ‘line-haul’ locomotives that pull trains hundreds of miles between railyards)
- Drayage trucks (i.e., on-road tractors that pull trailers loaded with containers, often from the ports)
- Cargo handling equipment (e.g., gantry cranes, top picks, and off-road yard trucks)
- Transportation Refrigeration Units (e.g., truck refrigeration units and refrigerated railcars)
- Miscellaneous equipment (e.g., fuel trucks)

Potential opportunities to reduce emissions from diesel equipment used at railyards include replacing older equipment with newer less polluting equipment (e.g., replacing diesel-fueled yard trucks with lower or zero-emission yard trucks, capturing and controlling emissions from locomotive load testing), and ensuring that the replacement or repower of equipment is based on the cleanest technology commercially available.

Accessed July 9, 2020.

## Appendix 5 – Air Quality Priorities

Based on a preliminary emissions inventory covering the years 2016 and 2017, trains (including line-haul and switcher locomotives, Metrolink, and passenger trains) contribute approximately 12% of all diesel particulate matter (DPM) in SELA. Off-road equipment, including equipment used for railyard operations, is also a source of DPM in SELA. Other large sources of DPM in SELA include medium heavy-duty trucks, heavy heavy-duty trucks, and diesel buses. For the overall contribution of these sources by percentage, see Figure 2 – Sources of DPM in SELA. DPM is a toxic air pollutant that comes from diesel engines and it is estimated that 68% of total known cancer risk related to air toxics in the South Coast Air Basin is attributable to DPM. However, the California Air Resources Board (CARB) projects that between 2012 and 2030 there will be over a 95% reduction in on-road DPM emissions in the South Coast Air Basin from the implementation of mobile source regulations, with most of the reductions occurring before 2023.<sup>61</sup> Additional information about DPM and health effects is available at <https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health>.

**Figure 2 – Sources of DPM in SELA**

Railyards and locomotives also contribute particulate matter (PM), volatile organic compounds (VOCs), and nitrogen oxides (NOx) emissions. PM10 and PM2.5 are particles smaller than 10 and 2.5 microns in diameter, respectively, that can be inhaled deep into the lungs and cause health problems. Additional information about PM10 and PM2.5 are available at <https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health>. ROG is a group of gases that contribute to forming smog, such as acetone, benzene, and formaldehyde. NOx is a family of gases that are highly reactive with other pollutants to form ozone (smog). Ozone can affect the respiratory system. Additional information about ozone is available at <https://ww2.arb.ca.gov/resources/ozone-and-health>.

Table 1 – Emissions from Off-Road Mobile Sources in SELA below, provides an overview of emissions from trains and off-road equipment in SELA. The Off-Road Equipment category includes equipment used to operate railyards (e.g., cargo handling equipment and forklifts) as well as other sources outside of railyards (e.g., diesel-

<sup>61</sup> South Coast Air Quality Management District, Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-IV). <https://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/mates-iv-final-draft-report-4-1-15.pdf>. Accessed July 15, 2020.

powered construction trucks and construction equipment). Figure 3 – Railroad Self-Reported Onsite Railyard Emissions Inventories shows the SELA railyard DPM emissions during 2005 and 2017.

**Table 1 – Emissions from Off-Road Mobile Sources in SELA (Tons per Year)**

Emissions Source	NOx	VOC	PM10	PM2.5	DPM
<b>Trains</b>	366.82	19.92	7.05	6.47	6.47
<b>Off-Road Equipment</b>	431.80	266.94	29.57	25.51	13.36

**Figure 3 – Railroad Self-Reported Onsite Rail Yard Emissions Inventories**

## Air Monitoring

The air quality concern for this source category is related to diesel exhaust emissions from locomotives, cargo handling equipment, trucks and other diesel equipment. Emissions can also be generated during maintenance activities (e.g., load testing of locomotives). Diesel engines emit a complex mixture of air pollutants, including both gaseous and solid material. The solid material in diesel exhaust is known as DPM, which is one of the components of PM<sub>2.5</sub>. There is no technique to directly measure DPM (a major contributor to health risk); therefore, indirect estimates based on surrogates for diesel exhaust are used, specifically black carbon (BC). DPM is typically composed of carbon particles (“soot”, also called BC) and numerous organic compounds. Diesel exhaust also contains gaseous pollutants, including volatile organic compounds (VOC) and NO<sub>x</sub>.

The monitoring strategy to study and characterize this air quality priority consists of measurements using a mobile platform capable of monitoring a wide range of particulate and gaseous pollutants, including BC, PM, ultrafine particles (UFP), and nitrogen dioxide (NO<sub>2</sub>). If needed, air monitoring can also be conducted to determine specific emission sources; identify activities that may lead to increase in emissions; identify potential sites for fixed monitoring, if appropriate; help assess the potential contribution of railyards to the overall air pollution burden in the SELA community; and help track the progress of emission reduction strategies.

## Regulatory Efforts and Enforcement

### *Federal Efforts*

Railroad operations are regulated at the federal level primarily by the Federal Railroad Administration and the Surface Transportation Board, and locomotive emissions are regulated by the U.S. EPA. Table 2 – Federal Line-Haul Locomotive Standards and Table 3 – Federal Switcher Locomotives below, identify the emissions standards required by the United States Environmental Protection Agency (U.S. EPA).<sup>62</sup> These agencies’ regulatory authority may preempt certain federal, state, and local regulatory authorities and actions. However, U.S. EPA has used its authority under the Clean Air Act to require new diesel locomotives to be built to meet the cleanest emission standard (also known as Tier 4).<sup>63</sup>

These regulations require the installation of devices that reduce idling (i.e., require idling limits with exceptions) on newly manufactured and remanufactured locomotives<sup>64</sup> and mandate the use of ultra-low sulfur diesel fuel.<sup>65</sup> However, these regulations do not require railroads to reduce their use of existing older, higher-emitting locomotives. Locomotives must meet federal emissions standards when they are remanufactured and may become cleaner at that time. In 2017, CARB also petitioned U.S. EPA to develop a new regulation requiring

<sup>65</sup> U.S. EPA, Diesel Fuel Standards and Rulemakings, [www.epa.gov/diesel-fuel-standards/diesel-fuel-standards-and-rulemakings#nonroad-diesel](http://www.epa.gov/diesel-fuel-standards/diesel-fuel-standards-and-rulemakings#nonroad-diesel), Accessed July 8, 2020.

engine manufacturers to meet a cleaner Tier 5 emission standard for new engines. The new emission standards would provide critical NO<sub>x</sub> and PM reductions, particularly in the disadvantaged communities that surround railyards. The U.S. EPA has not yet acted on this petition. Locomotive fleet turnover is slow as locomotive engines can last over 30 years, so even if the U.S. EPA were to develop a Tier 5 emission standard, it would not result in immediate emission reductions.

**Table 2 – Federal Line-Haul Locomotive Emission Standards**

Emission Tier	Year of Original Manufacture	NOX (g/bph·hr)	PM (g/bph·hr)	HC (g/bph·hr)
<b>Tier 0</b>	1973 - 1992	8.0	0.22	1.00
<b>Tier 1</b>	1993 - 2004	7.4	0.22	0.55
<b>Tier 2</b>	2005 - 2011	5.5	0.10	0.30
<b>Tier 3</b>	2012 – 2014	5.5	0.10	0.30
<b>Tier 4</b>	2015 or later	1.3	0.03	0.14

**Table 3 – Federal Switcher Locomotive Emission Standards**

Emission Tier	Year of Original Manufacture	NOX (g/bph·hr)	PM (g/bph·hr)	HC (g/bph·hr)
<b>Tier 0</b>	1973 - 1992	11.8	0.26	2.10
<b>Tier 1</b>	1993 - 2004	11.0	0.26	1.20
<b>Tier 2</b>	2005 - 2011	8.1	0.13	0.60
<b>Tier 3</b>	2012 – 2014	5.0	0.10	0.60
<b>Tier 4</b>	2015 or later	1.3	0.03	0.14

### *State Actions (CARB)*

CARB has signed two agreements with BNSF and UP to reduce locomotive emissions, including in and around railyards.<sup>66</sup> An agreement in 1998 required BNSF and UP to meet a fleet average of Tier 2 locomotives in the South Coast Air Basin every year between 2010 and 2030. Both railroads have met this commitment every year, though emissions in recent years have increased due to increased activity as seen in Figure 4. The second agreement between 2005 and 2015 focused on railyards and required implementation of an idling-reduction program, maximizing the use of ultra-low sulfur diesel fuel, preparation of health risk assessments, evaluation of measures to further reduce diesel particulate emissions, and an assessment of remote sensing technology to identify high-emitting locomotives.

<sup>66</sup> California Air Resources Board, 1998 Tier 2 Fleet Average in the South Coast Air Basin Agreement, [ww2.arb.ca.gov/1998-mou-summay-data-archive](http://ww2.arb.ca.gov/1998-mou-summay-data-archive), and 2005 Statewide Rail Yard Agreement, <https://ww2.arb.ca.gov/sites/default/files/2020-06/2005%20MOU%20Remediated%203102020.pdf>, Accessed June 5, 2019.

**Table 4 – CARB Concepts for Cleaner Locomotive Use**

Concept	Description
<b>Locomotive Emissions Reductions Spending Account</b>	<ul style="list-style-type: none"> <li>Require railroads to place funds in a trust account when using dirtier locomotives in the state</li> <li>Funds in the trust account could only be used to purchase cleaner locomotives</li> <li>Railroads would be required to report purchasing activity, which CARB would make available to the public.</li> <li>CARB would pursue an economic analysis to determine the relevant amounts</li> </ul>
<b>In-Use Locomotive Useful Life Limit</b>	Ban locomotives that have exceeded a second useful life from operating in California, unless the engine is remanufactured to Tier 4 standards or cleaner.
<b>Implement 30-minute Idling Limit</b>	Similar to federal requirements, this will allow CARB to respond to violations and public complaints on locomotive idling, with the potential for enforcement by air districts through an enforcement MOU

Also, CARB staff plans to develop amendments to the Cargo Handling Equipment Regulation, Transportation Refrigeration Unit Regulation, as well develop new zero-emission fleet rules to transition the state’s trucking fleet to zero-emission starting in 2024 with a focus on drayage and railyards.<sup>67, 68, 69</sup>

Currently, CARB enforces several regulations at railyards. The Cargo Handling Equipment Regulation requires equipment such as yard trucks, rubber-tired gantry cranes, top and side picks, forklifts, etc. at ports and intermodal railyards to meet engine performance standards and opacity standards. The Drayage Truck Regulation requires heavy-duty vehicles that transport containers and bulk to and from ports and intermodal railyards to meet engine emission performance standards and be registered with CARB. The Transportation Refrigeration Unit (TRU) Regulation requires refrigeration units to meet engine performance standards and be registered with CARB. At railyards, TRUs can be found on truck trailers, railcars, and connected to shipping containers as generator sets (gensets). CARB is also fielding locomotive complaints by working with air districts, railroad companies, and U.S. EPA to resolve them.

### *South Coast AQMD*

South Coast AQMD has limited authority over locomotives and railroad activity, and any regulations it might pass will likely require federal approval before they can go into effect. With these limits in mind, South Coast

## Appendix 5 – Air Quality Priorities

AQMD is pursuing four concepts to reduce emissions from railyards, including developing an Indirect Source Rule (ISR).<sup>70</sup> These include:

- Reducing exposures from locomotive maintenance and service emissions
- Requiring railroads to develop zero emission infrastructure plans for railyards
- Developing new incentive programs to focus on incentivizing cleaner locomotive activity instead of cleaner locomotive purchases
- Evaluating new monitoring approaches for in-use locomotives

South Coast AQMD staff continues to work with stakeholders (i.e., rail yard operators, communities, etc.) on proposed concepts for the Railyard ISR. The proposed Railyard ISR is currently scheduled for consideration by the Governing Board in the second quarter of 2021.

### Incentives

South Coast AQMD has various programs through which incentives are available to reduce emissions from both locomotives and railyard operations. Table 5 summarizes some of South Coast AQMD's programs, the amounts distributed, and the equipment replaced through these incentive programs. Further, South Coast AQMD has also proposed a new incentive program concept to focus on the cleanest locomotive use. Current incentive programs have limited effectiveness in accelerating the widespread use of the cleanest locomotives (Tier 4). Therefore, South Coast AQMD staff is working on a concept for a new local program that provides incentives tied to clean locomotive use, not replacements. This approach will attract the cleanest existing locomotives now and achieve faster emissions reductions than regulations. The concept also includes the potential for increased incentives in disadvantaged communities.

**Table 5 – South Coast AQMD Railyard and Locomotive Incentive Programs**

Program	Description	Emission Source	Amount Distributed	Equipment Replaced
<b>Prop IB: Goods Movement Emission Reduction Program</b>	To reduce diesel air pollution from goods movement operations and achieve the earliest possible health risk reduction in nearby communities	Locomotives and cargo handling equipment at rail yard facilities	<sup>71</sup> \$16,885,195	6 Yard Tractors 4 Forklifts 10 Locomotives
<b>Carl Moyer</b>	To obtain emission reductions from heavy-duty vehicles and other equipment operating in California as early and as cost-effectively as possible	On- and off-road heavy-duty vehicles/equipment and infrastructure for zero and near-zero emission technologies	<sup>72</sup> \$12,776,780	7 Locomotives

<sup>72</sup> Data since 2018

***Clean Off-Road Equipment Voucher Incentive Project***

CARBS's Clean Off-Road Equipment Voucher Incentive Project (CORE)<sup>73</sup> is designed to accelerate deployment of cleaner off-road technologies by providing a streamlined way for fleets ready to purchase specific zero-emission equipment to receive funding to offset the higher cost of such technologies. CORE specifically target zero-emission off-road freight equipment that is currently in the early stages of commercial deployment. CORE will provide vouchers to California purchasers and lessees of zero-emission off-road freight equipment on a first-come, first-served basis, with increased incentives for equipment located in disadvantaged communities.

# APPENDIX 6:

## CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) ANALYSIS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

The California Environmental Quality Act (CEQA) is a state law that requires agencies to consider the environmental impacts of a proposed project. CEQA describes and imposes specific legal requirements that agencies must follow when evaluating and making decisions about whether a project will cause a significant environmental impact. The information below describes South Coast AQMD staff's analysis and CEQA determination with respect to this project – the Community Emissions Reduction Plan (CERP) for Southeast Los Angeles. The information below contains some legal terms because that is the language contained in the law and use of that language is part of how an agency demonstrates compliance with CEQA. As noted below, South Coast AQMD staff has looked at all aspects of the CERP and has determined that the CERP is exempt from the requirements of CEQA. The paragraphs below identify the CEQA exemptions that apply to the CERP. If the South Coast AQMD Governing Board agrees with staff and determines that the CERP is exempt from CEQA, and adopts the CERP, a Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

Pursuant to CEQA, the South Coast AQMD, as lead agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Because the physical changes that may occur as a result of implementing portions of the proposed project would only require minimal construction activities and cause negligible physical impacts, it can be seen with certainty that there is no possibility that any physical actions that may be associated with the proposed project may have a significant adverse effect on the environment. Therefore, the project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, the overall purpose of this project is to improve the environment and health of residents of this selected community and all of the action items within the CERP support this goal. Thus, the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment.

The following action items within the CERP involve feasibility and planning studies, because the collection of information is needed in order to make an informed decision about whether to take further actions such as rule development for certain emission sources. However, these action items neither prescribe or commit to specific rule requirements, nor require advance approval or adoption of future actions because they require an open public process. Specifically, after the portion that qualifies as a feasibility or planning study is completed, and if it results in a decision to go forward with future rule development, the regulated community, stakeholders, interested parties, and the public will be invited to participate in the rule development process in a public forum. For these reasons, the following action items for the CERP are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies:

- Continuing the ongoing development of Facility-Based Mobile Source Measures (e.g., Indirect Source Rule) for warehouse and railyards;
- Identify and evaluate the need for additional requirements to address odors related to rendering facilities (e.g., conduct additional air monitoring for VOCs and odorous compounds) and establish a rule development schedule, if needed;
- Initiate rule development process to address housekeeping and best management practices at metal recycling plants to reduce fugitive emissions; and
- Support CARB's relevant rulemaking activities, including those for Transport Refrigeration Unit (TRU), Advance Clean Fleets, In-Use Locomotive, and amendments for cleaner cargo handling equipment and facility infrastructure at ports and railyards.

The following action items within the CERP involve minor physical modifications to existing structures or buildings which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301 – Existing Facilities:

- Partner with CSC, CARB, land-use agencies, school districts, and law enforcement agencies to install and enforce “No Idling” signs; and
- Work with local school districts, and CSC members to identify and prioritize schools exposed to truck emissions that may benefit from installation of air filtration systems.

The following action item within the CERP involves minor construction of small structures which is categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures:

- Work with partners and provide support to increase the availability of publicly accessible electric vehicle charging stations in the community.

The following action items within the CERP involve information collection activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection:

- Support CARB's efforts of establishing Community Pollution Enforcement Workgroup for trucks and other vehicles and conducting quarterly workgroup meetings to collaborate, outreach for reducing non-critical idling, and creating catalytic converter theft deterrence program;
- Identify freeway projects within the community that are circulated to South Coast AQMD for review under the CEQA;
- Conduct air monitoring in the community to support implementation of truck emission reduction strategies and help track concentration trends of key indicator pollutants of truck emissions;
- Work with local school districts, and CSC members to identify and prioritize schools exposed to truck emissions that may benefit from installation of air filtration systems;
- Collaborate with land-use, state and local agencies, and nonprofit organizations to develop a list a low-VOC and drought tolerant trees;
- Evaluate opportunities to use future settlement funds to support community green space projects;
- Work with relevant agencies to identify and prioritize locations for installing vegetative buffers near freeways;

- Develop metal processing facility list, applicable rules list, compliance history, air monitoring data, or other sources of information;
- Conduct CSC activity to prioritize sources of metal emissions. Develop strategies list, if appropriate;
- Conduct air monitoring to identify potential sources of emissions;
- Conduct air monitoring around railyards and in the community to assess how railyard related emissions may contribute to the overall air pollution burden in this community;
- Identify potential strategies to reduce emissions from railyards and the Alameda Corridor; and
- Prioritize emissions sources for further investigation under the general industrial facilities category; identify potential air monitoring (conduct air monitoring, where feasible), emissions and exposure reduction measures, if necessary.

The following action items within the CERP involve inspection activities that check for performance or compliance, and/or involve enforcement activities. They are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections, or CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies:

- Conducting idling enforcement sweeps with CARB;
- Continue complaint response and Rule 415 compliance inspections; and
- Make referrals to the appropriate agencies when issues are found during inspections that fall outside of South Coast AQMD's jurisdiction (e.g., Water Board, DTSC, Cal-OSHA).

Further, there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions. Therefore, the proposed project is exempt from CEQA.

# APPENDIX 7:

## BRACKETED COMMENT LETTERS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

**From:** Tahirah Farris <[TFarris@planning.lacounty.gov](mailto:TFarris@planning.lacounty.gov)>  
**Sent:** Wednesday, November 4, 2020 9:11 AM  
**To:** Gina Triviso <[gtriviso@aqmd.gov](mailto:gtriviso@aqmd.gov)>  
**Subject:** RE: Now posted: Draft SELA CERP for your review

Hi Gina,

Thank you for the opportunity to comment on the CERP. I've provided a list of comments by section below. Please let me know if you have any questions based on the comments or would like to have any follow-up conversation.

#### Executive Summary:

- Page 2 mentions ongoing activities such as regulation and enforcement. Is this further clarified somewhere else in the document on what and how that plays out? What does ongoing regulation look like? Is it regular compliance checks, indefinitely?

1-1

#### Chapter 5a: Introduction

- Page 1, under "Ongoing Efforts" references the LA County Green Zones Program. There should be a footnote to explain this program and link to more information.
- Page 1, the last sentence references "rule development." I believe rules are discussed in more detail in Chapter 4, but should be clear about what a rule is/means for AQMD (ex, this is the method for establishing regulations and provides a check to ensure compliance). Is rule synonymous with regulation?

1-2

1-3

#### Chapter 5b: Tucks and Freeways

- Page 2, action A describes establishment of a Community Pollution Enforcement Workgroup. The only metric listed under this action is the number of meetings held. Think about adding additional metrics tied to the goals of the group, such as number of complaints identified through the workgroup and number of complaints addressed by CARB, number of complaint referrals to other agencies, etc.

1-4

#### Chapter 5c: Rendering Facilities

- Should there be an explanation of what rendering facilities are similar to the explanation for metal processing facilities?
- General comment: Is odor the only concern with rendering facilities? Are there other types of emissions from these facilities such as dust, particulate matter, other compounds, etc.? If so, should there be some way to measure and address other outputs from these facilities?
- Is the goal simply to reduce odors from existing facilities or prevent new facilities from emitting odors?
- What is AQMD's role in permitting when new rendering facilities are established? This is something our two agencies are beginning to discuss, but I wonder if there can be some inclusion about review and inspection of proposed facilities to ensure compliance with AQMD's rules. Consider a goal regarding coordination with land use agencies/County Green Zones Program.

1-5

1-6

1-7

1-8

#### Chapter 5d: Green Spaces

- Goal A mentions collaboration with land-use agencies. It would be good to also include Public Works as they can implement greening along right-of-ways and Parks and Rec/public parks

1-9

agencies as an additional agencies. Aside from requiring landscaping on private property, the Planning Department has little to no control in actually designating new open/green spaces that would be designed and maintained by Parks and Rec.

1-9 Cont.

#### Chapter 5e: Metal Processing Facilities

- Goal G discusses referrals to other agencies. Please include land use agencies (e.g. Planning). Public Health might be appropriate as well.

1-10

#### Chapter 5g: General Industrial Facilities

- Goal B discusses identifying a list of industrial facilities of concern. This should be done in collaboration with other agencies. The County has an Industrial Use Task Force that focuses on the Alameda Corridor. It is still operating as a pilot, but would be great if we could expand this work or at least continue coordination with AQMD and other agencies so we are all aware of the facilities of concern.

1-11

#### Chapter 6: Community Air Monitoring Plan

- A summary of the CAMP is provided. Is the full plan available somewhere else or will that be detailed in Appendix 6?

1-12

Thank you  
Tahirah

**Subject:** Now posted: Draft SELA CERP for your review

**CAUTION:** External Email. Proceed Responsibly.

Dear CSC members and Interested Parties,  
The draft CERP for SELA has now been posted online at the link below:

<http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/southeast-los-angeles/cerp-archive>

If you have time to review portions of the plan before our meeting tomorrow, please focus on chapters 5 and 6. Looking forward to seeing you tomorrow at our meeting. Have a good night. Thank you.

Best regards,  
Gina

**Subject:** SELA CERP Comments

Hi Gina,

I know I'm several hours past the 5pm Friday 11/6 deadline, but it's still COB Friday right? 😊 It's been a really busy time for me at work, but I wanted to make sure I had the time to thoroughly read through the CERP and provide my feedback. My comments are below. I'd be happy to discuss further!

#### Chapter 4 Enforcement Plan

- This chapter does not provide additional details on the additional enforcement and inspection to be conducted in SELA. Reads to me as business as usual activities would be conducted. 2-1
- Figure 4-1 is meant to show the number of complaints and the response, but according to the data presented in Appendix 4 (Table 4-2) out of the 692 complaints received, 632 resulted in no action. There is a big disconnect here and I realize that any nuisance odor or fugitive emission may not be present when an inspector comes by, but my recommendation would be to increase the frequency of inspection (e.g. once or twice a week for a month?) in the area where the complaint originated. The current enforcement actions in place are just not enough. 2-2
- If possible, could Figure 4-2 be modified to show the different categories of facility types that received an NOV or NC? As I looked at all of the facilities in the appendix there are many schools and even city facilities that are getting dinged for things like not updating their permit. Are these NOVs actually being given to a toxics facility of concern? It's like giving a speeding ticket. People are still going to speed. In my opinion, the figure is really misleading. 2-3

**Chapter 5:** Overall I think it's very well written and captures a lot of the recommendations made by the CSC. Comments to this section are as follows

- Chapter 5c (Rendering Facilities) under Table 1, row D. I recognize Rule 415 is being implemented in 2023, but are there any additional controls above and beyond what 415 requires that we could possibly put in place sooner? This is just a suggestion as this seems to be something that has been a huge nuisance for over 20 years. 2-4
- Chapter 5g (General Industrial Facilities). I know we didn't have enough time to get into more details on what the concern of the community is, but as I've mentioned in the past, I really want to see a reduction in air toxics in SELA. I recognize PM2.5 and NOx are huge air pollutant sources, but reactive organic gases are a significant contributor to poor air quality that needs to be addressed. The figure from our January 9 CSC meeting highlights this (see below). Through the AB 617 process CARB developed "Regulation for the Reporting of Criteria Air Pollutants and Toxic Air Contaminants" to implement statewide annual reporting of criteria air pollutant and toxic air contaminant emissions data from facilities. The reporting regulation became effective January 1, 2020. In Chapter 5g, we need to include CARB as a responsible entity as the community needs to be aware of this new regulation and we need to know what is being reported. CARB 2-5

and SCAQMD need to work together to figure out how to use the CTR as a tool to identify which facilities are toxics hotspots. As 2020 data will be available mid next year, I propose we have CARB give us an update during Q2 of 2021. I recommend we take out Action A as an informational handout is just too generic and replace it with the following action:

**Action:** Conduct an annual community workshop with CARB to educate the community on the CTR process and share the data that has been collected from facilities in the SELA community. SCAQMD and CARB to help community interpret results and identify industrial facilities with highest toxics emissions.

**Responsible Entity:** CARB/AQMD

**Metric:** Conduct CTR Public Workshop and Identify Industrial Facilities of Highest Concern

**Timeline:** Annual. Starting Q3 2021/End 2025.

2-5

Dr. Jo Kay Ghosh  
 Director of Community Air Programs/Health Effects Officer  
 South Coast Air Quality Management District (SCAQMD)  
 21865 Copley Drive  
 Diamond Bar, CA 91765

**Re: Comments on AB 617 Community Emissions Reduction Plans (CERP) for the Southeast Los Angeles (SELA) Community**

Dear Dr. Ghosh,

The Coalition for Clean Air (CCA) is writing to provide comments regarding the discussion draft CERP for the SELA community. Since its passage in 2017, CCA has been actively involved with the implementation of AB 617 (C. Garcia) at both the statewide and local level. CCA staff has participated in many of the AB 617 meetings hosted by the California Air Resources Board (CARB) and SCAQMD. We also advocate for AB 617 funding before the California State Legislature. Specific to the SELA Community, CCA has partnered with a local community-based organization, Comite Pro Uno, to deploy a community air monitoring network within the city of Maywood. We have also worked with the City of South Gate's Community Environmental Health Action Team (CEHAT) to deploy air quality monitors.

CCA recognizes the SELA AB 617 process faced unique challenges due to the COVID-19 pandemic. SCAQMD was required to quickly reinvent the AB 617 process to ensure the safety of the Community Steering Committee (CSC) members, staff, and the public at large. This is in addition to the other challenges posed by COVID-19, such as working remotely, constraints on staff capacity, and other difficulties. SCAQMD staff, the CSC, and others who participated in the process should be commended for overcoming these challenges. CCA understands that some data may be unavailable and the discussion draft CERP may not be as complete as the Year 1 discussion drafts. Yet, the COVID-19 pandemic stresses the need for immediate and real emissions reduction. Long-term exposure to elevated air pollution levels is a contributing factor to COVID-19 mortality.<sup>1</sup>

---

<sup>1</sup> Michael Petroni, Dustin Hill, Lylla Younes, Liesl Barkman, Sarah Howard, I Brielle Howell, Jaime Mirowsky, and Mary B Collins, *Hazardous air pollutant exposure as a contributing factor to COVID-19 mortality in the United States*, [https://www.eenews.net/assets/2020/09/11/document\\_gw\\_15.pdf](https://www.eenews.net/assets/2020/09/11/document_gw_15.pdf) (accessed November 3, 2020.)

(916) 527-8048

CCA’s comments are not intended to speak for the Community Steering Committee (CSC) or the local community. Rather, our comments seek to identify opportunities to strengthen the CERP. Through AB 617, SCAQMD can begin righting decades of environmental injustice by developing the strongest possible emissions reduction plan and empowering the local community.

- **The discussion draft CERP addresses many of the significant environmental justice concerns facing the community. SCAQMD must avoid “cookie-cutter” implementation for concerns shared with other AB 617 communities. Similarly, SCAQMD must also acknowledge and address other threats such as contamination from Exide and pollution from aviation operations.**

3-1

Being a hub for industry and goods movement, Southeast LA has long been disproportionately impacted by air pollution. As with the Year 1 communities, Southeast LA has subsidized much of the global economy with their health and quality of life. The six areas identified as community concerns are among the most pressing air quality challenges in the region. Some of these concerns, however, are shared with other AB 617 communities. Truck traffic,<sup>2, 3, 4</sup> railyards,<sup>2, 3, 4</sup> metal finishing operations,<sup>4</sup> and rendering plants<sup>4</sup> were also identified as concerns in other communities’ CERPs. While this is expected, SCAQMD must avoid taking a “cookie-cutter” approach to these concerns. Ultimately, the CERP must be implemented in a way that addresses the local needs of each community.

Further, there are other pressing environmental justice issues which are not referenced in the CERP. Though the CERP cannot address every single air quality issue in the community, both contamination from the Exide battery recycling plant as well as emissions from aviation should also be acknowledged and addressed. As with the East LA, Boyle Heights, and West Commerce (ELABHWC) AB 617 community, SELA was contaminated by lead and other heavy metals from Exide.<sup>5</sup> Additionally, aviation fuel

was dumped on the City of Cudahy and other SELA communities in early 2020.<sup>6</sup> Being under the flight path of one of the world's busiest airports, SELA is disproportionately impacted by aircraft emissions. Though the CERP may not need a specific section for these and other issues, it should acknowledge they exist and commit to taking action to protect the community. Such action should include school HVAC modernization and installation through newly enacted legislation: AB 841 (Ting, 2020.)<sup>7</sup>

- **The next draft of the CERP should include emissions reduction projections. Further, these targets should have a nexus with community health needs. Reductions from future rulemakings should be shared with the CSC as soon as they are available.**

3-2

The discussion draft CERP does not contain any specific emissions reduction projections; rather, these projections are listed as “TBD.”<sup>8</sup> While this is likely due to constraints stemming from the pandemic, SCAQMD should include these projections in the next draft of the CERP. Further, these projections should be shared with the CSC ahead of the Stationary Source Committee's consideration of the CERP, which is scheduled for November 20<sup>th</sup>, 2020. The text of AB 617 mandates emissions reduction targets: section 44391.2(c)(3) of the Health and Safety Code (HSC) states, “[T]he community emissions reduction programs shall be consistent with the state strategy and include emissions reduction targets, specific reduction measures, a schedule for the implementation of measures, and an enforcement plan.”<sup>9</sup>

In addition to providing specific emissions reduction, these targets should have a demonstrated benefit to community health. In response to our comments on the Year 1 CERPs, SCAQMD staff stated tying emissions reduction to health outcomes was difficult, if not impossible to demonstrate. While demonstrating a direct causation between emissions reduction and individual cases of cancer, asthma, or other ailments is indeed difficult, SCAQMD should set emissions targets that directly address community health needs. SCAQMD will be better able to tailor the CERP implementation to local

November 3, 2020.)

needs if community health is considered. To this end, CCA, in partnership with local community-based organizations, is conducting a community health survey in some AB 617 communities to identify these health needs. This community health survey is funded through CARB's Office of Community Air Protection, which is part of AB 617.

Lastly, as with the other AB 617 CERPs, we understand that emissions reduction from future rulemaking proceedings may not yet be available. SCAQMD should commit to informing the CSC of anticipated emissions reduction from future rulemaking processes.

- **To the greatest extent possible, CERP emissions reduction should meet the same criteria as the State Implementation Plan (quantifiable, surplus, enforceable, and permanent.) Projects and efforts that do not meet these criteria (e.g., working with local agencies to rectify bad land use decisions) should be included on their merits.**

3-3

The emissions reduction achieved by the CERP should be real, measurable, and verifiable. "Paper" compliance threatens to undermine the effectiveness of the CERP and reduce the benefit to the local communities. The closer they are to meeting the criteria for being SIP creditable, the more confidence the community will have in the effectiveness of the Community Air Protection program.

At the same time, we recognize that not every important reduction and mitigation measure lends itself to meeting these criteria. Other opportunities which are not as easily measured but still have a positive community-level impact should still be prioritized. In particular, the CERP's green space priority will promote environmental justice and climate resiliency even though it will not directly lead emissions reduction. As such, we support green space being prioritized in the SELA CERP.

- **SCAQMD and the CERP should substantially expand its commitments relating to Interstate 710 expansion, which is the next environmental injustice facing SELA communities.**

3-4

SCAQMD must commit to stronger action as it relates to the expansion of Interstate 710. This project poses a significant threat to the health of three Los Angeles County AB 617 communities. Rather than merely identifying already well-known impacts, SCAQMD and the CERP should adopt a set of community air protection principles targeting the I-710 expansion project. These principles should stipulate that any 710 south freeway project must:

- Reduce diesel emissions and exposure in AB 617 communities
- Fully comply with Clean Air Act transportation conformity requirements

- Avoid displacement of residences and businesses
- Include dedicated clean truck lanes
- Incorporate complete streets and active transportation components in communities within the 710 corridor, and
- Provide for meaningful and substantive opportunities for public participation throughout the decision-making process.

Further, SCAQMD must commit to being actively engaged in the 710 south freeway project decision-making process. SCAQMD has a responsibility to protect community members from any adverse air pollution impacts that could result from the construction and operation of the freeway. We laud SCAQMD for protecting communities impacted by the ports and freight transportation industry through California Environmental Quality Act lawsuits. These include the lawsuits against China Shipping, the Southern California International Gateway (SCIG), and World Logistics Center. We also appreciate SCAQMD for notifying environmental advocates and community members about the proposed Colton Railyard, as well as expressing concerns about the project. We strongly urge SCAQMD to not ignore I-710 expansion and to take an active role in protecting the SELA community, as well as all communities that will be adversely impacted by freeway expansion.

- **Some strategies in the discussion draft are vague and only commit to further study, identification of sources, and developing reduction strategies later. Rather than deferring action and implementation, SCAQMD should strengthen these strategies and yield immediate emissions reduction.**

3-5

The strategies addressing the Alameda Corridor and “General Industrial Facilities” are exceptionally vague. Rather than committing to immediate emissions reduction, both strategies only commit to studying emissions or identifying pollution sources and developing strategies in the future. While we understand and appreciate the desire to be thorough, these portions of the CERP need to be strengthened.

Regarding the Alameda Corridor, CCA recognizes SCAQMD has limited authority over rail transportation. We appreciate the district’s work with CARB to create a new emissions tier of locomotive engines. In the meanwhile, SCAQMD and CARB should do what it can to increase the number of cleaner locomotives that operate in the Alameda Corridor. The district should also commit to mitigation and exposure reduction for what emissions it cannot reduce. Again, AB 841 should be included as part of the strategy.

Further, more action and specificity are needed regarding “General Industrial Facilities.” Based on SCAQMD’s F.I.N.D. tool, there are at least 19 Title V and RECLAIM facilities

within the SELA AB 617 community’s ZIP codes. While there are many different types of industries that impact the SELA community, the CERP should do better in identifying these sources and outlining strategies to reduce their emissions, including increased regulation and enforcement.

- **As with other SCAQMD AB 617 CERPs, the SELA CERP relies heavily on incentives and funding which may not exist. Additionally, it does not adequately assign responsibilities to polluters.**

3-6

The SELA CERP relies heavily on incentive to the possible detriment of more stringent rules and enforcement. Additionally, due to the state’s budget uncertainty, this revenue source may run dry. While incentives should be included as part of the final CERP, other strategies need to be prioritized. For example, creating strong Indirect Source Rules over warehouse and railyards, mandating on-site mitigation, and requiring, rather than just incentivizing, zero-emissions warehouse and railyard equipment are clear examples where tighter rules will yield emissions reduction. Additionally, rules must be enforced in order to be effective. As such, SCAQMD should include tougher penalties as authorized by Section 9 of AB 617 along with greater enforcement efforts as part of its overall strategy.

- **Clarity over the implementation of Best Available Retrofit Control Technology (BARCT) requirements is needed, especially considering the heavy industrial presence in the region.**

3-7

The SELA CERP discussion draft does not specifically reference BARCT implementation for any of its areas of concern. This omission is problematic, given the large number of industrial sources in the region. The community would benefit greatly from knowing what BARCT is and if it is being implemented in the SELA community. Lastly, any applicable BARCT requirements should be implemented no later than the 2023 deadline set by Health and Safety Code §40920.6(c)(1).<sup>10</sup>

- **We support the community’s call for stronger action relating to odors from rendering plants.**

3-8

Rendering plants are a unique problem to the SELA and ELBHC communities. The odors from these facilities have a significant impact on the quality of life. In addition to emitting odorous compounds, rendering plants also emit volatile organic compounds and

<sup>10</sup> California Legislature, *Assembly Bill 617: Nonvehicular air pollution: criteria air pollutants and toxic air contaminants*, [http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill\\_id=201720180AB617](http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180AB617) (accessed November 3, 2020.)

other pollutants which can harm human health. The CSC members have called for stronger action and regulation of odors from rendering plants. We strongly support this call and urge the district to restrict fugitive odors and emissions from these sources.

- **The CERP needs to commit to a strong Indirect Source Rule (ISR) for railyards, warehouses, and other pollution magnets.**

3-9

A major contributor to the SELA community's air pollution challenges are warehouses and facilities that attract trucks. Similarly, the railyards bring in pollution from trains and cargo handling equipment. As such, the finalized CERP should commit SCAQMD to developing a strong ISR to address these pollution magnets. We applaud SCAQMD for beginning to develop the framework for a strong warehouse ISR, as well as committing to develop a railyard ISR rather than a memorandum of understanding. The CERP, however, should go into greater detail as to what the rules would look like. This includes requiring on-site mitigation, near-zero and zero-emissions cargo handling equipment, plug-in technology and other emission reduction and exposure-reduction strategies, as well as firm deadlines.

We appreciate the opportunity to submit these comments for your consideration. CCA acknowledges and commends the thousands of staff-hours put into the implementation of AB 617, and understands this is a living, evolving process and document. However, the draft SELA CERP still needs much work and strengthening if it is going to live up to the promise of bringing cleaner, healthier air to California's most polluted, vulnerable communities.

Sincerely,

Christopher Chavez  
Deputy Policy Director

RE: CBE Comments to AQMD on AB617 SELA Draft CERP

Dear Ms. Triviso,

Below are comments of Communities for a Better Environment (CBE) on the Draft Community Emission Reduction Plan (CERP) of the South Coast Air Quality Management District (AQMD), pursuant to AB 617 (California Assembly Bill 617, C. Garcia, 2017). CBE appreciates the hard work of AQMD staff and the Community Steering Committee (CSC). We also want to ensure adoption of a strong CERP with clear goals and measures to substantially and measurably cut pollution in our overburdened communities of Southeast Los Angeles (SELA). We support many measures in the plan. We have both detailed comments in this letter and in the attached tables, as well as key contextual comments below.

Communities for a Better Environment is a statewide Environmental Justice organization, organizing our communities disproportionately burdened by industrial and other pollution in Southeast LA, Wilmington, Richmond, and East Oakland. The mission of CBE is to build people's power in California's communities of color and low-income communities to achieve environmental health and justice by preventing and reducing pollution and building green, healthy and sustainable communities and environments. CBE has been working with SELA community members since the mid-1990s, collectively challenging serial polluters and working towards a just transition. Many SELA community members are part of CBE's staff.

It is important to review the context of cumulative impacts in SELA. For example, two reports by CBE have long identified the need to deeply address environmental injustice and environmental racism in SELA. While the facilities have changed, the overarching approach and recommendations are the same: SELA is still saturated with polluting sources, and stricter standards in rule design and permitting must be applied to protect residents. In fact, current requirements are not health-protective for a wide range of sources. Even existing weak permits are not adequately enforced, and community complaints and input are often not taken seriously by AQMD. We ask the District to review these observations and recommendations in detail in two reports which remain all-too relevant:

- *Holding Our Breath: Environmental Injustice Exposed in Southeast Los Angeles. Communities for a Better Environment*, Shipra Bansal, et al., July 1998, and
- *Cumulative Impacts Changing Regulatory Culture to Address Environmental Injustice & Environmental Racism Case Studies and Recommendations*, Bahram Fazeli, CBE, October 2009.<sup>1</sup>

<sup>1</sup> Available at: <http://www.cbecal.org/wp-content/uploads/2012/05/Cululative-Impacts-report.pdf>

**Northern California Office**  
 340 Marina Way  
 Richmond CA 94801  
 510.302.0430

**Southern California Office**  
 6325 Pacific Blvd, Suite 300  
 Huntington Park, CA 90255  
 323.826.9771

## I. We urge three steps to begin to adequately address these deep structural and cultural regulatory failings

**As a first step, AQMD needs to assemble a transparent / open-source comprehensive database online**, of all the polluting sources in SELA, to identify all possible measures that could reduce emissions or eliminate emissions regardless of the cost, for each of these. This will assist both the community and AQMD in solving specific and overall cumulative impacts. This approach should include the upcoming Industrial Source category (yet to be completed for the CERP), as well as all sources.

4-1

**Second, some facilities are likely too close to sensitive receptors including schools, even when best emission reductions measures and practices are put in place.** Consequently, there must be a partnership between AQMD, the City, impacted communities and industry for creating land-use solutions, zoning changes, amortization proceedings, and relocation of these facilities.

4-2

**Third, AQMD needs to cooperate with CalOSHA (in addition to other agencies) to assist facilities to comply with best practices** for creating worker safety standards and programs. Workers are often the most impacted group in polluting facilities, are frequently people of color or low-income people, who may also live in the local community, and worker and community safety overlap in many ways. While AQMD regularly states that worker conditions are outside its purview, that does not mean that AQMD should ignore severe worker hazards it witnesses when doing its own inspections. CBE has directly witnessed such cases when AQMD inspectors ignored such conditions. AQMD has the ability to document and report hazardous conditions to OSHA, and to work to develop strong pollution prevention measures for everyone. Poor working conditions frequently also translate to poor health and safety for the residential community. Conversely, facilities with strong pollution prevention measures protect both the community and workers. We urge AQMD to incorporate a deeper analysis and implementation of pollution prevention.

4-3

## II. We also urge specific additions to the CERP Tables.

In addition to incorporating the above into all aspects of the CERP, here are a few additional specific comments on the overall plan and for the categories of Metals operations, Trucks & Freeways, and Rendering. (We do not have capacity at this time to comment on every category; we do support other EJ organizations work on other sources such as reducing rail emissions.)

### • Overall goals

- **Add robust emission reductions to Table 1:** at least 50% cuts by 2025, at least 75% by 2030 in SELA.
- The plan is still missing a list of measures by the California Air Resources Board (CARB, in Table 2).
- **Add a measure to begin developing a SELA community-specific Just Transition Plan for inherently safer energy sources, with equity.**
- **Add a measure to support adoption of a robust regional ozone attainment plan for expeditious reductions of criteria pollutants in SELA**, consistent with AQMD & CARB regional development of the next plan. This plan must bring SELA into attainment with Clean Air Act health standards.
- We do not support “bridge fuels” such as Natural Gas for transportation, which have major damaging impacts during extraction, transport, and refining, and are not zero emission options.

4-4

4-5

4-6

4-7

4-8

- **Metals**

- It is important to **add an overall goal to eliminate community exposure to hazardous metals processing and nuisance odors and noise.** | 4-9
- AQMD should review existing regulations such as Bay Area metals processing rules and others, for potential inclusion of any strong measures into an AQMD regulation. | 4-10
- Include installation of **permanent monitoring**, so as not to overly rely on monitoring snapshots in time. | 4-11

- **Trucks and Freeways**

- In addition to the Warehouse Indirect Source Rule (ISR), AQMD should adopt a Ports ISR rule, which will benefit all communities along the freeway corridors including SELA, which are heavily impacted by diesel traffic. This is well-within AQMD's authority, and has been put off for too long. | 4-12
- Include specific goals for Zero Emission Transportation as soon as possible. We need CARB and AQMD staff to do everything in their power to plan and implement Zero Emission Transportation. | 4-13
- Include a goal to make the 710 Freeway a Zero Emissions Corridor. | 4-14
- AQMD should ensure that CalTrans and Metro revise the 710 South Freeway Project EIR (Environmental Impact Report) to include Zero Emissions options, and should coordinate with other agencies like CARB, to strengthen zero emissions requirements. | 4-15
- AQMD should include more efforts to support truck drivers. Too many responsibilities now fall mostly on individual truckers. Truckers need places to rest legally without causing idling emissions in neighborhoods, and need more support in transitioning to clean fuels. | 4-16

- **Rendering**

- Add an overall goal to eliminate noxious odors from rendering facilities | 4-17
- Identify specific monitoring equipment in the CERP, since odorous compounds can be difficult to detect. Identify an expeditious deadline for a monitoring plan, with public comment. | 4-18
- Report to community on status and progress on compliance with Rule 415 | 4-19
- Regarding exploring the schools odor notification process – also work with Community Groups that already work with schools to help facilitate this process, including Huntington Park High School and others, and report on progress to CSC biannually. | 4-20

- **Green Spaces**

- Create state and local partnerships that would ensure new housing developments in SELA incorporate Green Spaces in their building designs.
  - In instances where affordable housing sites are being contemplated, collaborate with state agencies like Department of Housing and Community Development to incentivize integration of Green Spaces. | 4-21
- Incentivize green spaces to all new developments within SELA (this includes, bikeways, river paths, transit corridors). | 4-22

- Identify appropriate sites where local communities have access to land for community gardens.

4-23

Thank you for your consideration. **Please also see our comments in the attached tables, with edits and additional measures added to tables in the CERP.**

Sincerely,

Dilia Ortega, SELA Youth Program Coordinator, CBE, and AB617 Steering Committee Member

Lena Ruvalcaba, Huntington Park community member and AB617 Steering Committee Member

Natalie Martinez, South Gate community member and AB617 Steering Committee Member

Citlalli Gutierrez, Huntington Park community member and AB617 Steering Committee Member

Dayana Ortega, Florence-Firestone community member and AB617 Steering Committee Member

## CARB Comments on the Draft Discussion CERP for SELA

### Process

- Overall the CERP does a good job of responding to CSC member air quality concerns by incorporating a variety of measures to address those concerns. South Coast AQMD and the CSC members could benefit from keeping the monthly meeting schedules while developing Actions C and D on page 5e-2 and Actions B and C on page 5g-1 and 5g-2. 5-1
- To help the CSC and CARB review the CERP for requirements in the Blueprint, will South Coast AQMD provide a chart mapping the Blueprint checklist to the CERP? 5-2
- CSC member participation has been an issue some of the 2018 Selected communities and more recently in ECV, to promote transparency CSC member attendance could be added to Table 2-3: Meeting Dates, Times, and Locations in Appendix 2. 5-3

### Emission Reduction Targets

- Will Table 1 - CERP Emission Reduction Targets in Chapter 5a incorporate emission reduction targets for those strategies South Coast AQMD is the responsible agency? 5-4

### Technical Foundation

- Though documentation of data sources and methods were provided, the CERP could include a discussion about any existing data gaps as described in the Blueprint on page C-16. 5-5

### CARB Statewide Regulations

- The TRU regulation referenced in the Rail Action 5e is specific to trucks, it would be a good idea to make a distinction between the Trucks TRU and the Railcar TRU that will be considered by the CARB board in 2023. 5-6

Dear Ms. Triviso:

Lakewood  
 Long Beach  
 Lynwood

The Gateway Cities Council of Governments (Gateway Cities COG) thanks the South Coast Air Quality Management District ([AQMD](#)) staff for their important work in developing the draft Southeast Los Angeles (SELA) Community Emissions Reduction Plan (CERP) through Assembly AB 617.

Maywood  
 Montebello  
 Norwalk

Gateway Cities COG staff is grateful for the opportunity to participate in the SELA Community Steering Committee (CSC) as a representative for six of its 27-member jurisdictions, which include all of the SELA community jurisdictions of Bell, Bell Gardens, Cudahy, Huntington Park, South Gate, and unincorporated areas of the County such as Florence-Firestone.

urban greening funding opportunities,  
includin maintenance.

**Chapter Se: Metal ProcessinQ Facilities**

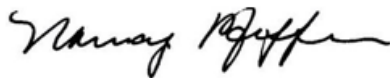

Action	Comments/Questions
A. Conduct an informational workshop for the public regarding various types of metal processing facilities in their <u>neighborhood highlighting</u> current and future South Coast AQMD regulatory efforts.	Include "number of participants" as a metric.
E. Conduct air monitoring to help identify elevated levels of air toxic <u>metals and</u> support efforts to identify potential sources of emissions.	Include "reporting of elevated levels of air toxic metals to the CSC" to the metrics.

6-8

6-9

Thank you again for the opportunity to review and provide comments on the Draft CERP for the SELA community. We would like to channel all communications in regards to this comment letter to Gateway Cities COG staff Stephanie Cadena at [scadena@gatewaycog.org](mailto:scadena@gatewaycog.org) or (562)663-6850.

Sincerely,

Nancy Pfeffer, Executive Director  
Gateway Cities Council of Governments

## **ATTACHMENT B**

### **RESOLUTION NO. 20-\_\_\_\_\_**

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that the Community Emissions Reduction Plan for the Southeast Los Angeles community (SELA CERP) is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board Adopting the Community Emissions Reduction Plan for the Southeast Los Angeles community.**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the SELA CERP is considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that the proposed project is exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that it can be seen with certainty that there is no possibility that the proposed project may have any significant effects on the environment, and is therefore exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project contains action items which qualify as feasibility or planning studies which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project may result in some minor physical modifications to existing structures or buildings, such as installing air filters or monitoring equipment, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301 – Existing Facilities; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project may result in some minor construction of small structures, such as electric vehicle charging stations, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 –New Construction or Conversion of Small Structures; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project involves the collection or exchange of information or data obtained from inspections and air monitoring, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project also involves inspections that require performance or compliance checks which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project relies on enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, the South Coast AQMD staff has prepared a Notice of Exemption for the proposed project that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, the SELA CERP and other supporting documentation, including but not limited to the Notice of Exemption, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, as well as has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, Assembly Bill (AB) 617 directs the California Air Resources Board (CARB) to select locations around the state for preparation of community emissions reduction programs; and

**WHEREAS**, in 2019, the South Coast AQMD Governing Board recommended communities to CARB for the AB 617 program; and

**WHEREAS**, in 2019, CARB selected the community of Southeast Los Angeles as one of the communities for which a Community Emissions Reduction Plan shall be prepared; and

**WHEREAS**, the AB 617 statute specifies that the air district must adopt the Community Emissions Reduction Plan within one year of the state board's selection of the community; and

**WHEREAS**, the SELA CERP is a planning document designed to assist future regulatory programs and rule development efforts, and to reduce emissions of and exposure to air toxics and other pollutants; and

**WHEREAS**, the SELA CERP is required by AB 617 and it builds upon existing criteria pollutant and air toxic programs, with greater emphasis on cumulative and localized impacts, and

**WHEREAS**, although the results of MATES IV show regional reductions in health risk from exposure to toxic air contaminants, some communities such as Southeast Los Angeles are disproportionately impacted by air toxics, and other environmental pollution, as well as social and economic burdens; and

**WHEREAS**, the Southeast Los Angeles Community Steering Committee has worked with staff to develop the Community Emissions Reduction Plan to reflect the community's air quality priorities and strategies to address these priorities; and

**WHEREAS**, the Community Emissions Reduction Plan aims to reduce air toxics and other pollutants in the Southeast Los Angeles community.

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the SELA CERP is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, the SELA CERP contains action items which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies. The proposed project contains action items

that are also categorically exempt from CEQA pursuant to, CEQA Guidelines Section 15301 – Existing Facilities, CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures, CEQA Guidelines Section 15306 – Information Collection, CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, CEQA Guidelines Section 15309 – Inspections, and CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies. No exceptions to the application of the categorical exemptions set forth in CEQA Guidelines Section 15300.2 – Exceptions, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on the proposed SELA CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board finds that the SELA CERP meets the requirements of AB 617 and will advance the mission of reducing air pollution at a community scale in the Southeast Los Angeles community and will provide emission reduction benefits toward achieving state and national air quality standards; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby adopt the SELA CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board hereby directs the Executive Officer to forward a copy of this Resolution and the SELA CERP to the California Air Resources Board for approval; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board directs staff to periodically report to the Stationary Source Committee on the implementation of the SELA CERP, including updates on the actions within the plan and the emissions reductions achieved.

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: COMMUNITY EMISSIONS REDUCTION PLAN FOR THE SOUTHEAST LOS ANGELES COMMUNITY PER ASSEMBLY BILL 617**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

**To:** Governor's Office of Planning and Research -  
State Clearinghouse  
1400 Tenth St, Suite 222  
Sacramento, CA 95814-5502

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

---

**Project Title:** Community Emissions Reduction Plan for the Southeast Los Angeles Community per Assembly Bill 617

---

**Project Location:** The project is located in the following communities within the jurisdiction of the South Coast Air Quality Management District (AQMD): South Gate, Florence-Firestone, Walnut Park, Huntington Park, Cudahy, and Bell Gardens, referred to herein as Southeast Los Angeles (SELA) community in Los Angeles County.

---

**Description of Nature, Purpose, and Beneficiaries of Project:** Assembly Bill (AB) 617, signed into state law in 2017 (see Health and Safety Code Section 44391.2), requires air districts to prepare a Community Emissions Reduction Plan (CERP) for environmental justice communities selected by the California Air Resources Board (CARB). CERPs provide a blueprint for achieving reductions of air pollution emission and exposure within selected communities and are tailored to address each community's air quality priorities. The SELA community was selected by CARB to prepare a CERP in December 2019. The purpose of this project is to implement a CERP for the SELA community per AB 617. The beneficiary of the project is the identified community and the nearby areas, but the entire region within South Coast AQMD's jurisdiction will also benefit.

The SELA CERP includes actions to reduce emissions and/or exposures to toxic air contaminants and criteria air pollutants, an implementation schedule, an enforcement plan, and a description of the process and outreach conducted to develop the CERP. Implementation of the SELA CERP actions is expected to occur over five years beginning in 2021. A summary of the action items by category is described below.

**Trucks and Freeways:** 1) Support CARB's efforts of establishing a Community Pollution Enforcement Workgroup for trucks and other vehicles and conduct quarterly workgroup meetings; 2) Conduct quarterly enforcement sweeps with CARB; 3) Partner with CSC, CARB, land-use agencies, school districts, and law enforcement agencies to install and enforce "No Idling" signs; 4) Continue to develop Warehouse Indirect Source Rule to reduce emissions from large warehouses and fulfillment center; 5) Conduct truck incentive outreach to small businesses and local fleets; 6) Conduct community outreach events to encourage replacement of older polluting vehicles with cleaner vehicles, and increase the availability of publicly accessible electric vehicle charging stations in the community; 7) Identify freeway projects within the community undergoing CEQA review; 8) Conduct air monitoring in the community to support implementation of truck emission reduction strategies; and 9) Work with local school districts and CSC members to identify and prioritize schools exposed to truck emissions that may benefit from installation of air filtration systems.

**Rendering Facilities:** 1) Engage in community outreach and provide information on Rule 415 and how to file odor complaints; 2) Conduct air monitoring for VOCs and odorous compounds near each rendering facility and in the community to better characterize the emissions and make data available to the public; 3) Continue complaint response and Rule 415 compliance inspections; 4) Identify and evaluate the need for additional requirements to address odors and establish a rule development schedule, if needed; and 5) Explore the development of an odor event notification system for schools and sensitive receptors.

**Green Spaces:** 1) Collaborate with land-use, state and local agencies, and nonprofit organizations to develop a list a low-VOC and drought tolerant trees; 2) Evaluate opportunities to use future settlement funds to support community green space projects; 3) Collaborate with nonprofits, local, and regional agencies to provide letters of support and air quality information for urban greening funding opportunities; and 4) Work with relevant agencies to identify and prioritize locations for installing vegetative buffers near freeways.

**Metal Processing Facilities:** 1) Conduct public outreach explaining various types of metal processing operations and metals-related rules; 2) Initiate rule development process to address housekeeping and best management practices at metal recycling plants to reduce fugitive emissions; 3) Develop metal processing facility list, applicable rules list, compliance history, air monitoring data, or other sources of information; 4) Conduct CSC activity to prioritize sources of metal emissions and develop a strategies list, if appropriate; 5) Conduct air monitoring to identify potential sources of emissions; 6) Implement strategies and approaches based on the prioritization of sources and issues identified; 7) Make referrals to the appropriate agencies when issues are found during inspections that fall outside of South Coast AQMD's jurisdiction (e.g., Water Board, DTSC, Cal-OSHA); and 8) Collaborate with local land-use agencies to provide outreach information to metal processing facilities on required South Coast AQMD permits.

**Railyards and Locomotives:** 1) Conduct air monitoring around railyards and in the community to assess how railyard related emissions may contribute to the overall air pollution burden in this community; 2) Identify potential strategies to reduce emissions from railyards and the Alameda Corridor; 3) Continue to develop the Railyard Indirect Source Rule; 4) Incentivize the replacement of older diesel equipment (e.g., locomotives); 5) Coordinate with CARB to

---

conduct community outreach on locomotive idling regulations and how to file complaints; and 6) Support CARB's relevant rulemaking activities, including those for Transport Refrigeration Unit, Advance Clean Fleets, In-Use Locomotive, and amendments for cleaner cargo handling equipment and facility infrastructure at ports and railyards. General Industrial Facilities: 1) Develop general industrial facilities document and identify facilities of concern; 2) Prioritize emissions sources for further investigation; identify potential air monitoring (conduct air monitoring, where feasible), emissions and exposure reduction measures, if necessary; and 3) Identify measures requiring Board action in the annual CERP progress report.

---

**Public Agency Approving Project:**

South Coast Air Quality Management District

**Agency Carrying Out Project:**

South Coast Air Quality Management District

---

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15262 – Feasibility and Planning Studies

CEQA Guidelines Section 15301 – Existing Facilities

CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures

CEQA Guidelines Section 15306 – Information Collection

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

CEQA Guidelines Section 15309 – Inspections

CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies

---

**Reasons why project is exempt:** Pursuant to the California Environmental Quality Act (CEQA), South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Because the physical changes that may occur as a result of implementing portions of the proposed project would only require minimal construction activities and cause negligible physical impacts, it can be seen with certainty that there is no possibility that any physical actions that may be associated with the proposed project may have a significant adverse effect on the environment. Therefore, the project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3). Further, because the overall purpose of this project is to improve the environment of the SELA community and nearby areas, and all of the action items within the SELA CERP support this goal, the action items are also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308. The SELA CERP contains action items involving feasibility and planning studies, because information needs to be collected to make an informed decision about further actions such as rule development. However, these action items neither prescribe or commit to specific rule requirements, nor require advance approval or adoption of future actions because they require an open public process. Thus, the SELA CERP action items involving feasibility or planning studies are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262. The SELA CERP contains action items requiring minor physical modifications to existing structures or buildings, such as installing air filters or monitoring equipment, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301. The SELA CERP contains action items requiring minor construction of small structures, such as electric vehicle charging stations, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303. The SELA CERP contains action items involving the collection or exchange of information or data obtained from inspections and air monitoring, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306. The SELA CERP contains action items involving inspections requiring performance or compliance checks, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309. The SELA CERP contains action items relying on enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321. Finally, there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions. Therefore, the proposed project is exempt from CEQA.

Program Supervisor, CEQA

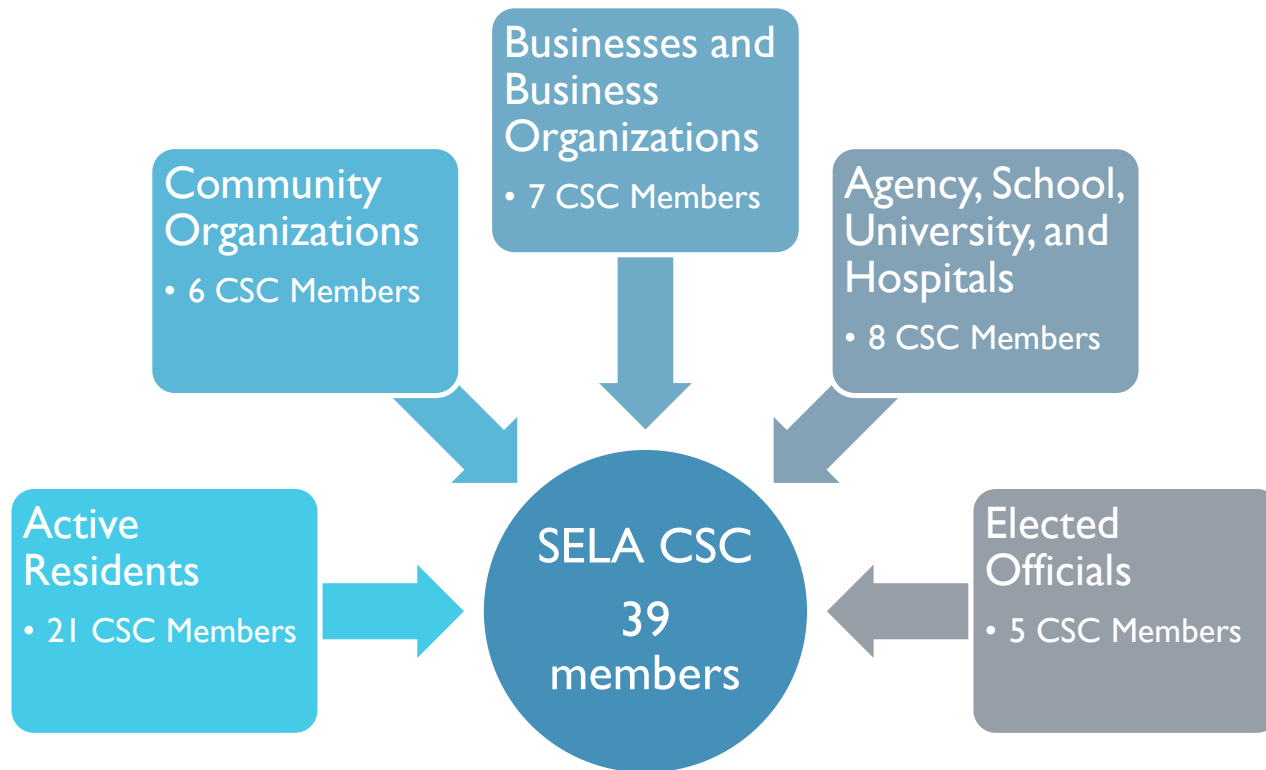

Planning, Rule Development, and Area Sources

# SOUTHEAST LOS ANGELES COMMUNITY EMISSIONS REDUCTION PLAN

BOARD MEETING  
DECEMBER 4<sup>TH</sup> 2020

# COMMUNITY DRIVEN PROCESS

## Community Engagement

- 9 CSC meetings
- 2 Technical Advisory Group (TAG) Meetings
- Question and Answer Workshop on Discussion Draft CERP
- Over 40 one-on-one meetings (Zoom or phone)
- 8 Informational Handouts/Fact Sheets
- Interpretation and materials in English and Spanish
- Meetings recorded and available online

# SELA CERP FRAMEWORK

## 9 emissions and exposure reduction goals

Reduce emissions from sources of air pollution

Reduce exposures to sources of air pollution

Gather data/information (e.g., monitoring, sampling, etc.)

## 46 actions to achieve goals

### Air Monitoring

- Conduct mobile air monitoring in areas prioritized by the CSC

### Collaboration

- Pursue collaborations with land-use agencies to provide outreach to metal processing facilities (e.g., rule requirements)

### Incentives

- Provide incentives to small businesses and local fleets for zero-emission trucks, where commercially available

### Rule Development

- Initiate rule development process to address housekeeping and best management practices at metal recycling plants

### Enforcement

- Conduct quarterly heavy-duty truck enforcement sweeps in collaboration with CARB

# CERP ACTIONS – HIGHLIGHTS

## Truck Traffic and Freeways

- CARB to collaborate with South Coast AQMD to conduct quarterly enforcement sweeps, evaluate findings, seek input from CSC, and report back to CSC periodically
- Provide outreach to small businesses (e.g., independent truck owners/operators) and local fleets for incentive funds, prioritizing zero emission trucks where commercially available

## Rendering Facilities

- After the installation of emissions controls required by Rule 415, work with the CSC to identify remaining odor concerns, evaluate the need for additional requirements to address odors, (e.g., conduct additional air monitoring for VOCs and odorous compounds) and establish a rule development schedule, if needed)

## Green Spaces

- Collaborate with land-use, state and local agencies, and nonprofit organizations to develop a list of low-VOC and drought-tolerant trees
- Collaborate with nonprofits, local, and regional agencies to provide letters of support and air quality information for urban greening funding opportunities, including maintenance

# CERP ACTIONS – HIGHLIGHTS

## Metal Processing Facilities

- Conduct air monitoring to help identify elevated levels of air toxic metals and support efforts to identify potential emission sources
- Make referrals to the appropriate agencies when issues are found during inspections that fall outside of South Coast AQMD's jurisdiction (e.g., Water Board, DTSC, Cal-OSHA)

## Railyards and Locomotives

- Continue development of the Railyard Indirect Source Rule
- Through the development of the Railyard Indirect Source Rule and incentives, pursue the replacement of older diesel-fueled equipment at railyards with lowest emissions technology available

## General Industrial Facilities

- Work with the CSC to identify and prioritize specific industrial facilities of concern in the community
- Provide information about applicable rules, facility compliance history, and available emissions data and air monitoring data collected at or near facilities

# ESTIMATED EMISSION REDUCTION TARGETS

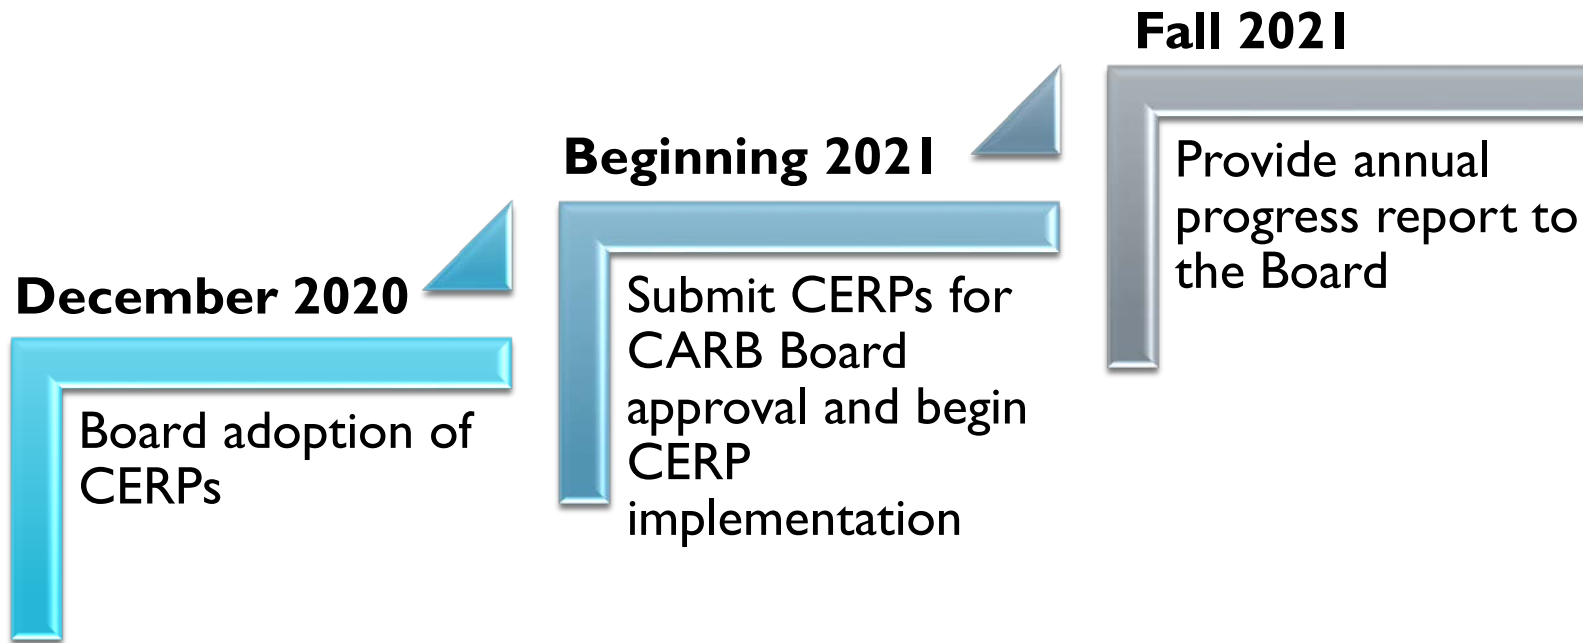

Emissions	NO <sub>x</sub>	DPM
<b>2018 Emissions (tpy*)</b>	2,868	36
<b>Projected 2025 Emissions Baseline (tpy)</b>	2,098	16
<b>Emission Reductions from CERP, by 2025 (tpy)</b>	155	1
<b>Overall Emission Reductions from 2018 (%)</b>	32	58
<b>Projected 2030 Emissions Baseline<sup>[1]</sup> (tpy)</b>	1,983	13
<b>Emission Reductions from CERP, by 2030 (tpy)</b>	266	2
<b>Emission Reductions from CERP from 2018 (%)</b>	40	69

\*tons per year

# ADDITIONAL COMMENTS RECEIVED & KEY ISSUES

Comment	Staff Response
Add robust emission reductions to metal processing air quality priority of at least 50% reductions by 2025, and at least 75% by 2030 in SELA	The CERP includes actions to work with the CSC to assess metal processing facilities in SELA and identify and implement strategies to address the issues and to initiate rule development process to address housekeeping and best management practices at metal recycling plants to reduce fugitive emissions, which will result in emission reductions
Several of the CERP comments received have a reoccurring topic of either implementing land-use agency requirements or collaborating with land-use agencies	South Coast AQMD recognizes the importance of collaboration with local land-use agencies and other relevant agencies to address land-use, zoning, and other issues surrounding facility emissions. Therefore, the CERP actions commit to collaboration and outreach for the Truck Traffic and Freeways, Rendering, Metal Processing, General Industrial and Green Spaces air quality priorities

# NEXT STEPS & STAFF RECOMMENDATIONS

## **STAFF RECOMMENDATIONS:**

- Determine that the Community Emissions Reduction Plan for Southeast Los Angeles is exempt from CEQA
- Adopt the Community Emissions Reduction Plan for Southeast Los Angeles

BOARD MEETING DATE: December 4, 2020

AGENDA NO. 29

**PROPOSAL:** Determine that Eastern Coachella Valley Community Emissions Reduction Plan is Exempt from CEQA and Adopt the Community Emissions Reduction Plan

**SYNOPSIS:** Assembly Bill 617 requires CARB to select communities for the preparation of Community Emissions Reduction Plans (CERPs) and air districts with a selected community to adopt the CERP within one year of selection. CARB selected the Eastern Coachella Valley Community in December 2019. The Eastern Coachella Valley CERP provides a blueprint for air pollution emission and exposure reductions to address the community's air quality priorities. The CERP includes a description of the process to develop the plan, actions to reduce emissions and exposures, an implementation schedule, and an enforcement plan. Community partnership and engagement have been critical throughout the development of the CERP. Staff will propose an amendment to the CERP in June 2021 to incorporate additional details on the CERP monitoring objectives, collaborations with other entities, and incentive strategies. This action is to: 1) Determine that the AB 617 CERP for the Eastern Coachella Valley community is exempt from the California Environmental Quality Act; and 2) Adopt the AB 617 CERP for the Eastern Coachella Valley community.

**COMMITTEE:** Stationary Source, November 20, 2020, Reviewed

**RECOMMENDED ACTIONS:**

1. Determine that the AB 617 CERP for the Eastern Coachella Valley community is exempt from the requirements of the California Environmental Quality Act; and
2. Adopt the AB 617 CERP for the Eastern Coachella Valley community.

Wayne Nastri  
Executive Officer

## Background

California law known as Assembly Bill (AB) 617 established new requirements for improving air quality in disadvantaged communities in California. AB 617 requires a statewide strategy with focused actions for communities heavily impacted by air pollution. These actions include developing community air monitoring plans (CAMPs) and community emissions reduction plans (CERPs) to reduce emissions of toxic air contaminants (TACs) and criteria pollutants.

In 2018, CARB adopted the Community Air Protection Blueprint (Blueprint) as the statewide strategy to guide the development (e.g., public process), content, and implementation of CAMPs and CERPs. An overview of the process to develop these documents as described in the CARB Blueprint is provided in Figure 1 – Overview of Community Emissions Reduction Program Process.

Figure 1: *Overview of Community Emissions Reduction Program Process*

On December 5, 2019, CARB selected two communities in the South Coast Air Basin to prepare a CAMP and CERP. The two communities selected by CARB are: 1) Southeast Los Angeles; and 2) Eastern Coachella Valley. The AB 617 statute directs air districts to adopt CERPs within one year of CARB’s selection.

The Draft Eastern Coachella Valley CERP includes over 50 actions to address the community’s top six (6) air quality priorities recommended by the Community Steering Committee (CSC). Additionally, staff is committed to continue working with the CSC in the next six months to incorporate additional details on the CERP air monitoring objectives, collaborations with other entities, and incentive strategies. In June 2021, staff will recommend the Board amend the CERP to include these additional details.

## Public Process

*Community Steering Committee, Charter Working Group, Technical Advisory Group, and Public Outreach*

Beginning January 2020, a community-focused process was implemented in the Eastern Coachella Valley community to develop the CERP. A CSC was formed as the foundation of the community-led process. The CSCs are made up of active residents, community leaders, local business owners or workers, community organizations, local

agencies, schools, universities, hospitals, tribal organizations, and representatives from offices of elected officials. The CSC provides input and guidance based on community knowledge and expertise, and this feedback is instrumental to developing the CERPs. CSC members also conduct their own community-level outreach to reach more members within the community who are not able to attend CSC meetings. Since January 2020, a total of 16 community meetings were held to develop the Eastern Coachella Valley CERP. The meetings included nine CSC meetings, four charter working group meetings, one question and answer workshop session, and two Technical Advisory Group meetings. Approximately 30 to 75 people attended each meeting. Meeting agendas, presentations and handouts were provided in English and Spanish. Additionally, English and Spanish interpretation was provided for each meeting to encourage broader participation.

From January to July 2020, CSC members worked to develop and finalize the charter. The Charter Working Group, which consisted of all CSC members who wished to be part of this working group, worked on developing the charter. CSC members provided line-by-line feedback on the charter and staff circulated multiple drafts with CSC edits. On September 24, 2020, the CSC voted on the charter resulting in a 25-1-2 for Yes, No, and Abstained, respectively. The charter establishes the CSC goals and objectives, procedures, and member roles and responsibilities.

In July 2020, three CSC members from the Eastern Coachella Valley community joined the AB 617 Technical Advisory Group (TAG). The TAG provides a forum to discuss technical details related to source attribution, air monitoring and other technical analysis needed to develop the CAMPs and CERPs. The TAG met in July and October.

In addition to the CSC and TAG meetings, staff held a community workshop, a question and answer session and 50 small group meetings with CSC members and stakeholders to enhance community participation and input in the development of the CERPs. South Coast AQMD staff also created a community webpage to post updates and information about the development of the CAMP and CERP.

### **Proposal**

Staff recommends adopting the Eastern Coachella Valley CERP. Through the CSC and public participation at the community meetings, this community identified their highest air quality priorities based on local sources of air pollution. The CSC worked with staff to develop a set of actions to be implemented by South Coast AQMD, in collaboration with other government agencies, organizations, businesses, and other entities. Each action is to be carried out based on a set of strategies with goals and timelines to reduce emissions, exposure, and/or gather and disseminate information. The entity (e.g., government agency, organization, or business) responsible for the action is also identified. While some actions would be conducted within the timeframes specified in

the plan, other activities such as regulations and notification systems would remain in place beyond the implementation period of the plan.

#### *Air Quality Priorities and CERP Development Process*

The Eastern Coachella Valley CSC identified the Salton Sea, pesticides, fugitive road dust (including off-roading activities), open burning and illegal dumping, diesel mobile sources, and the Greenleaf Desert View Power Plant as air quality priorities. Some of the community's concerns about these air quality priorities fall outside South Coast AQMD's jurisdictional authority. For example, the CSC expressed a need for additional pesticide regulation; however, Health and Safety Code Section 39655(a) provides that regulation of pesticides in their pesticidal use is reserved to the Department of Pesticide Regulation. Additionally, the CSC has an interest in fining entities that are dumping illegally on tribal lands. However, South Coast AQMD regulations do not apply on tribal lands based on *California v. Cabazon Band of Mission Indians*, 480 U.S. 202 (1987).

Notable actions in the Draft Eastern Coachella Valley CERP that address the community's air quality priorities include:

- Reducing emissions by paving unpaved roads (e.g., mobile home parks);
- Establishing a notification system for permitted agricultural burning;
- Working with scientists at public health agencies with expertise in pesticide toxicity to identify key pesticides of concern for air monitoring;
- Expanding the monitoring network to address concerns about emissions from the Salton Sea (H<sub>2</sub>S and PM), agricultural pesticide use, open burning (PM), and fugitive road dust (PM) through collaboration with various entities;
- Installing air filtration systems in schools, homes, and community centers near sources of air pollution; and
- Incentivizing the replacement of older, higher polluting on-road and off-road equipment with cleaner technology.

The timeline embedded in the statutory requirements of AB 617 is extremely compressed, and with the time lost due to the COVID-19 pandemic and needing to transition to a virtual format, the work on the Draft CERP was further compressed. Additionally, the charter development process took a very long time. For these reasons, staff is committed to continue working with the CSC in the first two quarters of 2021 to add detail into the CERP and return to the Board by June 2021 with a revised CERP.

#### *Emission Reduction Targets*

The CERP outlines actions to address the air quality concerns prioritized by the Eastern Coachella Valley CSC. These actions are estimated to result in reductions of 54 tons per year (tpy) nitrogen oxides (NO<sub>x</sub>), 0.8 tpy diesel particulate matter (DPM), and 2.4 tpy

particulate matter of 10 microns or less (PM10) by 2025. The actions are also estimated to result in reductions of 115 tpy NOx, 2.5 tpy DPM, and 2.4 tpy PM10 by 2030. Other emission reductions from the CERP may be achieved through rule development and enhanced enforcement efforts. CERP actions that are expected to result in emission reductions but cannot be quantified at this time are the adoption of open burning alternatives, reduction of illegal dumping which often leads to burning and resulting emissions, and collaboration with other regulatory agencies to reduce emissions from pesticide use and application.

## **Key Issues**

### *CERP Development and Review Timeline*

The Eastern Coachella Valley CSC expressed concern about the short amount of time to develop and review the CERP. The timeline to develop the CERP is driven by AB 617 (Health and Safety Code Section 44391.2(c)) that requires “within one year of the state board’s selection, the district encompassing any location selected pursuant to this subdivision shall adopt, in consultation with the state board, individuals, community-based organizations, affected sources, and local governmental bodies in the affected community, a community emissions reduction program to achieve emissions reductions for the location selected using cost-effective measures...” Staff acknowledges the timeline embedded in the statutory requirements of AB 617 is extremely compressed, and the work on the Draft CERP was further compressed with the time lost due to the COVID-19 pandemic and other factors noted above. Therefore, staff is committed to continuing working with the CSC to provide additional details on the CERP monitoring objectives, collaborations with other entities, and incentive strategies. Staff will return to the Board in June 2021 to amend the CERP to include these details. An overview of the timeline to amend the CERP to address monitoring objectives, collaborations with other entities and incentive strategies is provided below.

2021	Process to Address CERP Amendment
January – February	Hold two (2) CSC meetings to receive additional community input about monitoring objectives, collaborations with other entities and incentive strategies
March – April	Hold two (2) CSC meetings to review draft amendments to the Eastern Coachella Valley CERP that address community input received at the two (2) CSC meetings held in January and February 2021
May	Proposed amendments presented to Stationary Source Committee
June	Governing Board to consider adoption of the proposed amendments

### *Community-led Process*

The Eastern Coachella Valley CSC expressed concern that the CERP development process was not a community-led process and that South Coast AQMD staff pushed for a 1-strategy CERP until the CSC requested additional priorities be addressed, resulting in lost time. Given the tight time frame, staff suggested to the CSC that one option was to fully develop actions for one priority before December and then add details for the other five priorities in the following months. When many members of the CSC wanted three or more priorities addressed more fully before December, staff quickly responded and now the CERP includes over 50 actions to address the six (6) air quality priorities identified by the CSC. No time was lost by merely making this suggestion. To develop these actions staff held nine (9) CSC meetings, four (4) charter working group meetings, one (1) question and answer session, 50 small group meetings with CSC members and two (2) Technical Advisory Group meetings. The overall number of meetings to develop the CERP exceeds that of any other AB 617 community CERP development process in South Coast AQMD. Additionally, the charter developed by the Eastern Coachella Valley community includes a specific purpose and objectives for the CERP development process that was followed by staff.

### **California Environmental Quality Act (CEQA)**

Pursuant to the California Environmental Quality Act (CEQA Guidelines Sections 15002(k) and 15061, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3), 15262, 15301, 15303, 15306, 15308, 15309, and 15321. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption has been prepared pursuant to CEQA Guidelines Section 15062 and is included as Attachment C to this Board Letter. If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQA net Web Portal which may be accessed by via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed by via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **Implementation Plan/Schedule**

Implementation of the Eastern Coachella Valley CERP is anticipated to begin in the first quarter 2021. CARB staff is expected to begin reviewing and evaluating this CERP and will hold a public hearing to approve the CERP in 2021. The implementation of this CERP is to take place over approximately five years.

**Benefits to South Coast AQMD**

The implementation of the Eastern Coachella Valley CERP will help advance South Coast AQMD's mission to clean the air, especially in the most impacted and disadvantaged communities within South Coast AQMD's jurisdiction. Additionally, emission reductions achieved through implementation of the CERPs will provide emission reduction benefits toward achieving state and national air quality standards.

**Resource Impacts**

South Coast AQMD received \$21.8 million to support implementation of AB 617 for the upcoming year of this program for all South Coast AQMD AB 617 communities. In addition, Community Air Protection incentive funds will be used toward implementing incentive projects that are located in environmental justice communities. In 2020, South Coast AQMD received \$69,824,849 in total grant funding through the Community Air Protection funds for all AB 617 communities in South Coast, which include up to 6.25% for administrative costs. Staff continues to work with the California state legislature to secure sustained funding for AB 617 statewide.

Implementation costs for future years are dependent on the number of communities that are selected, and the amount of funding allocated by the legislature to support AB 617 implementation by the local air districts.

## Summary of Response to Comments

The Community Steering Committee (CSC), South Coast AQMD and CARB closely collaborated to develop the Eastern Coachella Valley (ECV) Community Emissions Reduction Plan (CERP). Development of the CERP occurred over a year-long process that included nine CSC Meetings, two Technical Advisory Group (TAG) Meetings, four CSC Charter Working Group Meetings, a Community Workshop, a Question and Answer Session and over 50 individual meetings. The South Coast AQMD staff received *comments* from community members and organizations for the CERP. The table summarizes each comment, where the comment was from, the commenter(s), and identifies if the commenter's request is included (●) or not included (◆) in the CERP. The table also provides a brief staff response that explains where requests that are included in the CERP can be found or why the request was not included. Any written comments that were submitted are included in Appendix 7: Bracketed Comments Letters of the ECV CERP.

Comment From	Summary of Comment	Commenter(s)	Included=● Not Included=◆	Staff Response
<b>General Comments on the CERP</b>				
1-1	The review period for the Discussion Draft CERP was shortened and CSC reserves the right to raise additional concerns prior to South Coast AQMD's planned Governing Board meeting on December 4, 2020. The CERP and CAMP are living documents that maintain the capacity to be revised beyond adoption and approval. The ECV CERP does not comply with AB 617 requirements. The commenter asks CARB reject approval of the CERP if recommendations are not included and additional time is not provided for input.	Rebecca Zaragoza, et al.	n/a	<p>The draft CERP that is brought to the Governing Board meets all statutory requirements. The discussion draft released in early November focused on the key components of the CERP where CSC input was most needed at that stage. Of note, staff has already committed to working with the CSC in the first two quarters of 2021 to add detail to the CERP and bring this back to the Governing Board by June 2021. Therefore, the CSC will have ample opportunity to develop additional details in the CERP.</p> <p>Regarding development of the discussion draft CERP, many of the actions included in the CERP were provided in the informational handouts to the CSC on October 2, 2020 to gather community input. Staff continued to discuss these actions with the CSC during the Question and Answer session and at CSC Meetings. Therefore, the CSC had many opportunities to comment on the CERP actions before portions</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				<p>of the CERP were released November 5<sup>th</sup>. Staff explained to the CSC why the comment period could not be extended in order to provide the documents in time for the December Board meeting. Comments submitted after November 13<sup>th</sup> will be considered; however, once the Governing Board package is posted, it is difficult to incorporate additional changes into the CERP. The Governing Board may direct staff to incorporate additional changes at the Board Hearing. The CERP must be adopted by the South Coast AQMD Governing Board to begin implementation.</p> <p>After the CERP has been adopted by the Governing Board, any significant changes to the CERP will require Board consideration. AB 617 requires South Coast AQMD to seek approval of the CERPs from CARB and they may elect to reject the CERP, if it is not approvable. Air districts are allowed to resubmit for approval. If a CERP is not approvable, CARB is required to initiate a public process to discuss options to achieve an approvable CERP. Staff have repeatedly tried to move the process forward and explained timelines in order to allow more time for CERP and CAMP development; however, the CSC elected to focus more time on the charter instead of CERP and CAMP development. Staff will continue to work with the CSC in the first two quarters of 2021 to further refine the CERPs. The CERP implementation process is dynamic and certain action items have been written with built-in flexibility to allow adjustments as new information becomes available. The CAMP was developed with CSC input from CSC meetings and will not be ad is not required to be included as part of the Board Package.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
1-2	CERP development process was not a community-led process. South Coast AQMD pushed for a 1-strategy CERP until the CSC asked for more priorities to be addressed, resulting in lost time. South Coast AQMD did not provide fair consideration of CSC's request to call special Stationary Source Committee and Governing Board Meetings. South Coast AQMD mismanaged the implementation of AB 617 and needs to improve its process and facilitation of CSC meetings, develop follow-up process for request and recommendations and allow the CSC to make decisions and govern itself.	Rebecca Zaragoza, et al.		<p>Staff is open to making changes to improve the process. Throughout this past year, staff have worked hard to follow the CSC's lead in three key areas: (1) topics of discussion at CSC meetings (e.g. charter, educational materials, CERP/CAMP development), (2) air quality priorities, and (3) meeting frequency/materials/logistics.</p> <p>(1) the CSC requested that staff allow the CSC to complete the charter before beginning to work on CERP development. Staff allowed the CSC to continue developing the charter, which was completed and approved by the CSC in September 2020. Staff discussed with the CSC the limited time remaining and suggested developing one AQ priority for the CERP for the December Board submittal and work on the remaining AQ priorities in 2021. The CSC requested staff include all 6 AQ priorities in the CERP, which staff has included in the CERP.</p> <p>(2) Staff began working with the CSC to discuss the Air Quality (AQ) priorities for the CERP in February 2020 and emphasized the one-year statutory requirement to complete CERP development. Staff presented the draft list of the top AQ priorities to the CSC over the course of multiple meetings and received no disagreement on this list. During the Q&amp;A workshop held in October 2020, staff received many positive comments from CSC members regarding the potential CERP actions on the top AQ priorities.</p> <p>(3) The CSC requested staff hold additional meetings and include Spanish interpretation and translation of materials.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				<p>Staff has had Spanish interpretation and translated materials for 16 meetings (Kick-off, CSC, workshop/question and answer session, and Charter Working Group Meetings). Staff has also conducted over 50 one-on-one meetings with CSC members throughout this process through Zoom or on the phone.</p> <p>Regarding the request for special meeting, staff explained to the CSC the complexities of holding special meetings outside of the normally scheduled meetings. Regardless, rescheduling the Stationary Source Committee Meeting would have no impact on public comment deadlines because the deadlines were driven by the need to have the CERP adopted by the Governing Board within one year of community designation. Staff continues to work collaboratively with the CSC in the AB 617 process.</p>
1-3	Draft CERP should require monthly and quarterly progress reports to the CSC and allow new monitoring data to guide CSC decisions. The Draft CERP should provide a spreadsheet which identifies the annual criteria and toxic pollutants emitted from each facility. The Draft CERP should elevate the native and indigenous communities that live in the ECV in Chapter 3a.	Rebecca Zaragoza, et al.		The CERP metrics include regular updates to the CSC, so that the CSC would continue to be informed about the progress, and also continue to work with staff to implement the plans. For our 2018-designated communities, the CSCs have met quarterly and also receive newsletters that provide additional updates; staff would be able to have a similar schedule for the 2019-designated communities. Monitoring data will be publicly available on the website, in real-time or near real-time where possible. In addition, the CARB Blueprint requires South Coast AQMD provide an annual progress report to the Governing Board and CARB, so that report would also provide a summary of the progress made. Resources are limited and need to be divided amongst the five AB 617 communities.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				<p>Source attribution analysis includes criteria and toxic pollutant emissions information in Chapter and Appendix 3b. Permitted facilities exceeding the criteria pollutant thresholds (as specified in South Coast AQMD's Rule 301) are required to report annual emissions and pay applicable fees. Emissions information for facilities within the ECV community that report emissions (Year 2019) to South Coast AQMD through the Annual Emissions Reporting (AER) program can be found here: <a href="http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/aer-data-2019.pdf?sfvrsn=8">http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/aer-data-2019.pdf?sfvrsn=8</a>. The Spanish language version of this data is also available on the webpage. Appendix 3a identifies facilities under the AB 2588 program. The AB 2588 program requires districts to inventory air toxics from individual facilities. Additionally, public information about South Coast AQMD-regulated facilities (facilities required to have a permit) is available through the Facility Information Detail (F.I.N.D): <a href="https://www.aqmd.gov/nav/FIND">https://www.aqmd.gov/nav/FIND</a>.</p> <p>A section has been added to Chapter 3a to highlight the native and indigenous tribal communities in the ECV community.</p>
<b>1-4</b>	The Draft CERP should include the expedited Best Available Retrofit Control Technology (BARCT) evaluation of rules and sources.	Rebecca Zaragoza, et al.		Appendix 3a identifies rules being evaluated for BARCT and facilities in ECV subject to BARCT requirements.
<b>1-5</b>	The Draft CERP should be revised to state that CARB is responsible for resolving any disputes between South Coast AQMD and the CSC regarding CERP implementation, and that CSC members should be able to file a complaint with CARB if there are disputes	Rebecca Zaragoza, et al.		CARB is not authorized to resolve disputes between an air district and the CSC concerning implementation. There is nothing in AB 617 that provides such authority to CARB. AB 617 specifies: "In implementing the [community emissions reduction] program, the district and the state board shall be responsible for measures consistent with their respective

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				<p>authorities.”<sup>1</sup> AB 617 does not require that a CSC be established in the selected communities. Instead, AB 617 only requires that the CERP be developed in consultation with certain types of community stakeholders.<sup>2</sup> However, since the district has established a CSC as the main mechanism for community engagement in this process, any differences in interpretation or implementation regarding the CERP’s measures would best be resolved directly between the CSC and the South Coast AQMD. The letter cites Sections 39002 and 41500, but neither of these sections provides CARB with the authority to interfere with district implementation mentioned in this letter. Section 39002 is limited to providing CARB the ability to undertake “control activities” after holding public hearings if it determines after the hearing that the district has “failed to meet the responsibilities given to it by this division or by any other provision of law.” The statute does not give CARB the ability to tell the district what to do in the case of a dispute regarding implementation. Instead, if it finds a failure, CARB must step into the shoes of the district and actually undertake the necessary control activities itself. In other words, CARB must assume the district’s responsibilities itself and carry them out. Section 41500, cited in the letter, allows CARB to review the enforcement practices of the districts, which is reiterated in Section 41505. This is obviously a highly unusual and drastic action and would require a public hearing and additional requirements pursuant to Section 39002.</p>

<sup>2</sup> Health & Safety Code Section 44391.2(c)(2)

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				South Coast AQMD staff are always willing to discuss issues with the CSC and others, including CARB, and resolve them directly.
1-6	<p>The Draft CERP should:</p> <ul style="list-style-type: none"> <li>Identify each permitted facility</li> <li>Provide a summary of complaints as to each facility</li> <li>Describe the inspection history of each facility</li> <li>Detail all enforcement actions against each facility</li> </ul>	Rebecca Zaragoza, et al.		<p>Public information about South Coast AQMD-regulated facilities (including facilities required to have a permit) is available through the Facility Information Detail (F.I.N.D): <a href="https://www.aqmd.gov/nav/FIND">https://www.aqmd.gov/nav/FIND</a>.</p> <p>Appendix 4 identifies the compliance history for January 2017 through December 2019 in the ECV.</p> <p>Also, see Response to Comment 1-3 for facility emissions information.</p>
1-7	The CSC identified over 20 air quality priorities. Six of these issues are not addressed in the Draft CERP: off-roading vehicles and activities, the Thermal racetrack, the Thermal Airport, the freight train, land use, outreach, and education.	Rebecca Zaragoza, et al.		<p>An AQ prioritization activity was conducted at CSC Meeting #1 (February 2020). Off-roading, Thermal Airport and Thermal Racing Club were mentioned by the CSC; however, the top 7 AQ priorities were all ranked higher by the CSC as their top 3 choices. At CSC Meeting #3, the CSC requested to combine Open Burning with Illegal Dumping; resulting in 6 AQ priorities. Focusing on 6 AQ priorities uses resources more effectively and in past AB 617 communities 6 to 7 AQ priorities were written into each of the CERPs. The six issues have been included in the CERP. Staff included off-roading vehicles and activities into Chapter 5d. The Thermal racetrack and Thermal Airport are included in Chapter 5a. The freight train is included in Chapter 5f.</p> <p>Chapter 5a includes strategies to address land use and Chapters 5b and 5f include actions to work with land use agencies. The CERP contains actions in Chapters 5b through 5f to provide</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				outreach and information to reduce emissions and/or exposure from the AQ priorities.
1-11	<p>South Coast AQMD should work with other land use agencies to support decisions that do not adversely affect the air quality and public health of ECV (e.g., land use strategies to prevent warehouse and diesel pollution). South Coast AQMD should add a separate section for land use strategies and incorporate land use strategies within each of the AQ Priority CERP chapters. The Draft CERP should include:</p> <ul style="list-style-type: none"> <li>• Working with the various jurisdictions to limit the approval and permitting of polluting land use projects in ECV.</li> <li>• Become a partner in the implementation of the current City of Coachella, City of Indio, and County of Riverside Climate Action plans and programs, including the Transformative Climate Communities Program and the Regional Neighborhood Mobility Plans for the ECV unincorporated communities.</li> <li>• Become a partner in the planning and implementation of SB 1000 in the City of Coachella, City of Indio,</li> </ul>	Rebecca Zaragoza, et al.		<p>South Coast AQMD is specifically prohibited by state law from making land use decisions; however, staff works with land use agencies through California Environmental Quality Act (CEQA). Through the CEQA process, staff has the opportunity to provide technical expertise and recommendations to mitigate air quality impacts. South Coast AQMD has a robust Intergovernmental Review (IGR) program, in which staff reviews and comments on hundreds of CEQA documents per year, focusing on the adequacy of air quality analyses. South Coast AQMD CEQA comments are meant as guidance for lead agencies, including local land use agencies or entities, to ensure a reasonable air quality analysis is conducted to estimate air quality impacts, and significant air quality impacts are mitigated to the extent feasible. Local land use agencies often consult with South Coast AQMD staff during preparation of an environmental analysis and staff provides mitigation measures to ensure they are incorporated into projects early in the development process. Staff will review the plans mentioned in the comment to provide support, where needed. Staff will also provide updates to the CSC on future development projects as discussed in Chapter 5a.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	and Riverside County and engage in general plan updates			
1-12	<p>The Draft CERP should include actions for outreach and education that are appropriate and safe to be conducted during a pandemic. The Draft CERP should contain actions and strategies that include:</p> <ul style="list-style-type: none"> <li>• Creating a public participation and outreach plan</li> <li>• Adopting a resolution or ordinance committing to providing all the requested material, resources, websites, and apps in Spanish</li> <li>• Partnering with the Desert Mirage High School (DMHS) and Coachella Valley High School (CVHS) green academies and other youth groups (e.g., Sierra Club Youth Group) to do education and community service programs to improve air quality</li> </ul>	Rebecca Zaragoza, et al.		<p>The CERP includes commitments for outreach in Chapters 5b through 5f. The examples in the outreach actions are appropriate during a pandemic (e.g., Zoom meetings, digital newsletters, Public Service Announcements (PSAs), informational handouts, etc.). Staff has added a commitment in Chapter 2 to work to develop an outreach plan. Staff is making every effort to provide Spanish translation and interpretation for materials, meetings, and the website to the extent possible and will continue to make every effort to do so where needed and as resources allow. An Outreach Plan will be developed to support the strategies and actions of the CERP. Staff hopes to find creative, mutually beneficial ways to partner with the CSC, community organizations and local community members. As part of the Outreach Plan, staff will work with the CSC to determine how CERP actions will help increase awareness, gain community recognition, and encourage action among the ECV community.</p> <p>Language has been added to Chapters 5b, 5d, and 5e to extend outreach to include schools and other youth groups, such as Sierra Club Youth Group.</p>
1-13	The CERP does not set health-based and quantifiable emission reduction targets. The Draft CERP relies on “outreach” and “incentives” to achieve emissions reductions and includes vague commitments that do	Rebecca Zaragoza, et al.		The CERP uses a combination of strategies to achieve emission reductions including enforcement, collaboration/partnerships with other entities, and monitoring. Emission reduction targets have been identified, where quantifiable, and are included in Chapter 5a. Actions utilizing outreach, monitoring and/or

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	not meet AB 617 requirements. The Draft CERP should be revised to include emission reduction targets for all toxic air contaminants and criteria air pollutants identified in Chapter 3b, as well as for pesticides.			<p>enforcement strategies will result in emission reductions; however, they are not quantifiable at this time. Emission reduction targets for pesticides cannot be determined until further data is gathered. Chapter 5c includes an action to gather data about pesticides use, evaluate community impacts, and identify opportunities to reduce pesticide emissions and exposures. Once these actions are implemented, emission reductions will be quantified where possible.</p> <p>Reducing air pollution will have public health benefits and the most direct method to measure CERP progress is to evaluate what emission reductions have been achieved. Emission reductions in the CERP will provide long-term benefits for public health.</p>
1-20	Chapter 5 should include quantifiable measures and drive enforcement. The Draft CERP should incorporate CARB's role and responsibility over mobile source emissions. South Coast AQMD should not rely solely on external funding sources to implement the draft actions and identify how it plans on using its own internal budget and allocated funding for this program. Additional actions and strategies can be found in the Draft CERP Edits (renamed as Comment Letter #2).	Rebecca Zaragoza, et al.		<p>See Response to Comment 1-13. Actions in the CERP are also intended to drive enforcement of South Coast AQMD air quality regulations, as well as support enforcement efforts of other agencies. For example, outreach efforts for reporting dust complaints would help to drive focused enforcement efforts to address fugitive dust. Another example is using monitoring to identify hotspots to determine if enforcement is needed to address an ongoing issue. For additional information on CARB's role and responsibility over mobile source emissions, please see Chapter 4.</p> <p>While state AB 617 funding is the primary source of funding for many AB 617 program efforts, including CERP development and implementation, several CERP actions commit South Coast AQMD staff to pursuing additional funding opportunities from many other sources. Note that the funding received for AB 617</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				is consistently less than what it costs South Coast AQMD to implement this state law, so South Coast AQMD supplements such funding by using its other funds to help support some of the activities needed for CERP implementation, such as many of the rule development and enforcement commitments. South Coast AQMD continues to seek additional sustained funding to support the AB 617 program, including support for CERP and CAMP implementation. Staff can provide additional implementation and incentive budget details in future CSC meetings. Please see Responses 2-1 through 2-20.
1-21	<p>South Coast AQMD should review, facilitate coordination and implementation with the following plans:</p> <ul style="list-style-type: none"> <li>• The Regional and Neighborhood Mobility Plan for the Eastern Coachella Valley (Thermal, Oasis, Mecca and North Shore)</li> <li>• The Eastern Coachella Valley's Action Plan for Climate Resilience (Coachella, Thermal, Oasis, Mecca, and North Shore)</li> <li>• The City of Indio's Transformative Climate Communities Plan</li> <li>• Dust Suppression Action Plan</li> <li>• Salton Sea Management Program</li> <li>• Coachella Valley Extreme Ozone State Implementation Plan</li> </ul> <p>Mitigation and other types of strategies, actions, and projects identified in these</p>	Rebecca Zaragoza, et al.		<p>See Response to Comment 1-11 and Chapter 5a. Specific mitigation and other types of strategies, actions, and projects identified in the plans will be addressed through CEQA comments and other appropriate action such as collaboration with other agencies. Plans or projects submitted to the South Coast AQMD are identified as projects in AB 617 communities. Projects identified in AB 617 communities are reviewed to include comments, as applicable, with a nexus to CERP actions (see Chapter 5a for more information on land use strategies).</p> <p>Regarding the Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone Standard, this plan shows that the Coachella Valley is expected to achieve the 1997 8-hour ozone standard by the end of 2023 through continued implementation of existing rules and regulations. In addition, recently adopted regulations by South Coast AQMD and CARB will provide further reductions to ensure that the Coachella Valley will attain the standard in or before 2023. Staff will provide updates</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	plans should be included in the Draft CERP, specifically the ECV's Action Plan for Climate Resilience			<p>to the CSC on the status of the ozone attainment in the Coachella Valley during the CERP implementation process.</p> <p>Chapter 5b includes actions to collaborate with other entities (e.g., Imperial Irrigation District (IID)) to work to implement dust suppression projects. Dust suppression projects are currently written into the Dust Suppression Action Plan and Salton Sea Management Program.</p> <p>In the first two quarters of 2021, staff will review the specified community plans listed in this comment and identify appropriate areas for coordination and collaboration with the lead agencies to help reduce emissions and/or exposures to air pollution within the air quality priorities addressed in the CERP.</p>
1-23	The Draft CERP falls short of expectations and does not reflect community input. Incorporate comments and edits into the Draft CERP and develop a review and response mechanism to manage public comments, questions, and requests moving forward. All public comments and feedback received on the Draft CERP should be made publicly available. The CSC should have the right to make additions or changes to the CERP in the future.	Rebecca Zaragoza, et al.	n/a	<p>Staff has received and incorporated CSC input throughout the CERP development process through multiple mechanisms. One such mechanism is the AB 617 email, which staff receive input and respond to inquiries. Other mechanisms include gathering input during CSC and one-on-one meetings with Zoom or phone calls.</p> <p>Comments submitted on the online portal can be seen here: <a href="http://onbase-pub.aqmd.gov/publicaccess/DatasourceTemplateParameter.aspx?MyQueryID=257&amp;OBKey__1409_1=ECV">http://onbase-pub.aqmd.gov/publicaccess/DatasourceTemplateParameter.aspx?MyQueryID=257&amp;OBKey__1409_1=ECV</a>. Written comments received on the Discussion Draft CERP prior to the posting of the Governing Board package will be included in Appendix 7: Bracketed Comment Letters. Responses to the Comments received are in the Executive Summary - Response to Comments. Additionally, the CERP must be adopted by the South Coast AQMD Governing Board to begin implementation.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				Once the CERP has been adopted by the Governing Board, any significant changes to the CERP will require Board consideration. South Coast AQMD will continue to work with the CSC during CERP implementation.
<b>2-1</b>	Commenters requested language changes in the Executive Summary chapter.	Rebecca Zaragoza, et al.		The majority of these language changes have been added to the Executive Summary chapter. South Coast AQMD does not have land use jurisdiction and therefore supports the implementation of mitigation projects by lead agencies that improve air quality. Staff works with lead agencies preparing CEQA analyses to provide technical expertise on the air quality analysis and to ensure projects mitigate significant air quality impacts to the extent feasible. Staff also provides recommendations on ways to further reduce community member exposure to project emissions, however, South Coast AQMD does not have the discretionary authority to require a project to implement these measures. For example, staff may recommend the lead agency to require a project to establish a vegetative barrier or buffer zone between an emission source and nearby residents to reduce exposure. However, this is the discretionary authority of the lead agency under CEQA, which is usually a city or county with land use jurisdiction.
<b>2-2</b>	Commenters requested language changes in Chapter 1 and indicated that this Chapter does not depict an accurate or meaningful depiction of ECV.	Rebecca Zaragoza, et al.		The language changes have been incorporated. Chapter 1 provides an introduction to the AB 617 and the ECV community. Chapter 3a includes the Community Profile which provides a description of the ECV community.
<b>2-3</b>	Commenters requested language changes in Chapter 2, to:	Rebecca Zaragoza, et al.		The language changes have been incorporated. The Draft CERP incorporated information about the Spanish recordings becoming available in October 2020, the roster update, and

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<ul style="list-style-type: none"> <li>• Include the updated roster in the write-up</li> <li>• Specify that Spanish recordings were not provided until requested by CSC</li> <li>• Provide context to the CSC Charter Working Group section, and noted that there was a full month delay in approving the charter because it was not provided in Spanish</li> <li>• Include the name of community organizations and filmmakers that organized past community meetings and emphasized that the Chapter 2 should better acknowledge the work residents and community organizations have put into the program</li> </ul>			identified that the CSC Charter was provided in Spanish following the August CSC meeting. The names of the local filmmakers that produced "Estamos Aquí" have been included in the Draft CERP. Additional community organizations were acknowledged in the Draft CERP to recognize the work that residents have done in the community. Residents and community organizations have provided recommendations to staff to create educational workshops and informational handouts on air quality priorities and draft CERP actions and strategies. Staff will continue work with the CSC in the first half of 2021 to determine additional information to include in Chapter 2 to better acknowledge the work residents and community organizations have put into the program.
2-4	Commenters requested language changes in Chapter 3a and asked to include the list of about 20 priorities that the CSC first compiled.	Rebecca Zaragoza, et al.		The language changes have been incorporated and a link to the list of air quality priorities that the CSC first compiled has been added.
2-5	Commenters requested a language change in Chapter 3b.	Rebecca Zaragoza, et al.		The language change has been incorporated.
4-1	An update should be provided to each affected city in the Eastern Coachella Valley of the major milestones planned and achieved by the CERP, in order to determine	Anetha Lue		South Coast AQMD staff will pursue collaborative partnerships with the Cities in ECV as well as the County of Riverside to address several actions written in the CERP. Updates will be provided to the CSC as noted in the metrics of the actions. In addition, the Cities or County (or any collaborative entities) will

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	methods by which the efforts of the cities can support the actions in the CERP			be invited to attend the CSC meetings where quarterly updates will be provided.
4-2	The CERP should also consider an imposing cap on dust emissions from stationary sources and requiring new sources of dust to offset significant new/increased sources of emissions	Anetha Lue		Such a cap on dust emissions may not be effective in reducing PM emissions in ECV given the relatively small number of industrial facilities in this community. However, new and redevelopment projects may provide opportunities to mitigate air quality impacts, therefore, staff commits to present an overview of the South Coast AQMD CEQA – IGR program to the CSC and recommended mitigation measures staff generally provides for new and redevelopment projects within the second quarter of 2021. This information has been added to Chapter 5a. Refer to response 1-14.
<b>Community Air Monitoring Plan (CAMP) (including Air Monitoring Network)</b>				
CSC Meeting #8	Expand monitoring network to include additional pollutants beyond H2S and PM and all monitoring data should be provided in real-time	Rebecca Zaragoza		Near real-time monitoring for these and other air pollutants is being pursued to supplement existing monitoring efforts, as noted in Chapter 6 and the CAMP to conduct and evaluate CERP priorities. All near real-time data from South Coast AQMD monitors will be shown in the AB 617 data display tool. Results from the laboratory analysis of time-integrated samples will not be available in real-time but will also be displayed on South Coast AQMD air monitoring website for the AB 617 program. Progress reports to summarize all monitoring results will be posted periodically. This supplemental data will also be used to evaluate the long-term air monitoring network strategy.
CSC Meeting #8	Work with the CSC (e.g., survey) or other entities (e.g., University of California	Ryan Sinclair, María		Staff will work with the CSC to identify high priority locations for air monitors and/or sensors during CAMP implementation.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	Riverside (UCR) to develop air monitoring station/sensor locations	"Conchita" Pozar		
1-22, 2-21	The CSC has not had the time to discuss the development of the Community Air Monitoring Plan (CAMP) in any meaningful way during the past year and the South Coast AQMD has not prioritized it. The Draft CERP and CAMP should identify ways in which South Coast AQMD will conduct or enhance air monitoring. South Coast AQMD should utilize additional air monitoring data and environmental justice work recently done in the ECV to inform the Draft CERP. South Coast AQMD has not invested in the ECV in the past to properly conduct comprehensive air monitoring.	Rebecca Zaragoza, et al.		The draft CERP and the CAMP include actions to supplement existing air monitoring activities and identify ways South Coast AQMD will conduct additional air monitoring in ECV to address each air monitoring priority through targeted actions. A specific action has been added to gather available data from the Imperial County Air Pollution Control District air monitoring network. Staff will work with the CSC to identify additional detail regarding the air monitoring efforts in ECV.
<b>Salton Sea</b>				
CSC Meeting #8	Collaborate with following agencies to address concerns about the Salton Sea: <ul style="list-style-type: none"> <li>The Salton Sea Authority (SSA) and Torres-Martinez Desert Cahuilla Indians (TMDCI) to address Salton Sea emissions</li> <li>United States Green Building Council and Southern California Gas Company on home weatherization projects</li> </ul>	Miguel Vasquez, Sienna Thomas, Deborah McGarrey		The SSA works in consultation and cooperation with the State of California to oversee the restoration of the Salton Sea. It has representatives from the Coachella Valley Water District, Imperial Irrigation District, Riverside County, Imperial County, and the Torres Martinez Desert Cahuilla Indians. The tables in Chapter 5b specifies the entity(ies) that the South Coast AQMD will pursue collaboration with to address Salton Sea emissions. Chapter 5b includes the CSC suggested collaborating agencies, where applicable. Responsible entities include collaborating

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<ul style="list-style-type: none"> <li>Imperial County Air Pollution Control District (ICAPCD) for monitoring station data to address emissions</li> </ul> <p>CSC requested adding a “Supporting Agency” column to the action table</p>			agencies that have jurisdictional authority and/or supporting entities to implement the actions.
1-14	<p>The Draft CERP should be revised to include more enforceable measures such as implementing dust reduction measures to reduce pollution from the Salton Sea, rather than proposing a monitoring program and only pursuing collaborations. The Draft CERP should contain actions and strategies that include:</p> <ul style="list-style-type: none"> <li>Improve monitoring timelines for installing and making data available to the community</li> <li>Collaborate with CNRA and the Imperial Irrigation District (IID) to expedite this process by starting in the 1st quarter of 2021</li> <li>Conduct a thorough review and update of Rules 403 and 403.1 by the 3rd quarter of 2021</li> <li>Any member of the public should not be required to make a formal request in order to access real-time data, air quality data should be made fully available, including health care providers</li> </ul>	Rebecca Zaragoza, et al.		<p>The Salton Sea Authority in consultation and cooperation with the State of California oversees the restoration of the Salton Sea. The California Natural Resources Agency (CNRA) Salton Sea Management Program (SSMP) addresses the urgent public and ecological health issues resulting from the drying and shrinking of the Salton Sea. The primary authority to address Salton Sea emissions is with other entities. Accordingly, South Coast AQMD staff must pursue collaborations to reduce emissions from the Salton Sea.</p> <p>All near real-time data from South Coast AQMD monitors will be shown publicly in the AB 617 data display tool. South Coast AQMD will also conduct baseline monitoring to look at the chemical composition of PM10 (including particulate air toxics and sea spray indicators) in the ECV community by collecting time-integrated samples and performing chemical analysis. Results from the laboratory analysis of samples will not be available in real-time but will also be displayed publicly on South Coast AQMD air monitoring website for the AB 617 program. Public records requests are part of the South Coast AQMD's policy and may be required for certain cases. South Coast AQMD will work with health care providers to provide the data they are trying to access. Chapter 5c includes actions to develop a monitoring strategy for key pesticides that contribute to community impact (e.g., toxicity) and address pesticide drift</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<ul style="list-style-type: none"> <li>Include toxics in monitoring network and address other pollutants, (e.g., pesticide drift and agricultural runoff, various contaminants in sea spray blowing to nearby communities)</li> </ul>			<p>through reporting and enforcement. Chapter 5b pursues collaboration to identify opportunities to mitigate pesticide run-off into the Sea.</p> <p>In the first two quarters of 2021, staff will work with the CSC to identify the specific fugitive dust concerns, and evaluate whether Rule 403 and/or 403.1 amendments, and/or enhanced enforcement of existing provisions, are needed to address these concerns. This has been added to Chapter 5d.</p>
2-6	Commenters requested language changes in Chapter 5b and inquired about what occurs when the H2S state standard is exceeded.	Rebecca Zaragoza, et al.		<p>The language changes have been added.</p> <p>South Coast AQMD has a notification system in place that alerts community members when the H2S levels exceed the state standard. In addition to these alerts, South Coast AQMD issues odor advisories when H2S levels are forecasted to exceed the state standard and they have information about the potential effects H2S might cause. At that level, most individuals can smell the odor and some may experience symptoms such as headaches and nausea. However, the symptoms associated with this level of exposure are temporary and are not expected to cause any long-term health effects. People can detect H2S odors at extremely low concentrations, down to a few parts per billion. No enforcement action takes place in this case because the H2S is caused by naturally occurring anaerobic digestion in the Sea.</p> <p>South Coast AQMD Advisory updates can be found at the following link: <a href="http://www.aqmd.gov/advisory">http://www.aqmd.gov/advisory</a></p> <p>To subscribe to air quality alerts, advisories and forecasts by email, go to <a href="http://AirAlerts.org">http://AirAlerts.org</a>.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				Visit <a href="http://saltonseaodor.org">http://saltonseaodor.org</a> for current H2S monitored values in the Salton Sea area or to sign up for H2S alerts.
2-7	Commenters requested partnering with UCR School of Medicine on the soil chemical and microbiome composition study and to expand the study to include adult populations in ECV (Table 1, Action E)	Rebecca Zaragoza, et al.		Language changes have been added to the action to reflect UCR School of Medicine as a responsible entity and to work with the project team to expand the project to adult populations in ECV.
2-8	<p>Commenters requested in Chapter 5b, Table 2:</p> <ul style="list-style-type: none"> <li>Implementing community-identified dust suppression projects, adding Salton Sea Authority and Riverside County as responsible entities, partnering with residents to identify locations for projects, and including community-supported projects (in the Dust Suppression Action Plan (DSAP) and Salton Sea Management Program (SSMP) along the Northern shore of the Sea) (Action C)</li> <li>Mitigating pesticide runoff into the Sea by developing alternative disposal options of agricultural runoff and developing water treatment facilities and filtration systems at all Salton Sea tributary entryways by collaborating with responsible entities Regional Water Quality Control Board (RWQCB)</li> </ul>	Rebecca Zaragoza, et al.		Suggested language has been added within Chapter 5b. Staff will provide CSC with updates on ongoing Salton Sea efforts with AB 617 implementation; however, since the Salton Sea Authority and California Natural Resources Agency are leading efforts to address the Salton Sea and hold public stakeholder meetings, rather than duplicating those efforts, staff encourages interested CSC members to attend those meetings. Appendix 4, Table 4-2 provides a list of all complaints received in ECV between January 2017 and December 2019 and the outcome (e.g., Notice of Violation and referrals to other agencies) of the complaints. Additionally, Chapter 5b – Salton Sea, Action H has been added to the ECV CERP to work with the Coachella Valley Environmental Justice Task Force to request monthly updates from South Coast AQMD, CNRA, the Salton Sea Authority, community organizations, and other agencies.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<p>Region 7 and State Water Regional Control Board (SWRCB) (Action D)</p> <ul style="list-style-type: none"> <li>Including the development of a list of potential responses or solutions that AQMD will pursue in response to dust complaints (Action G)</li> <li>Establishing ongoing public stakeholder meetings between South Coast AQMD, CNRA, the Salton Sea Authority, community organizations, and other agencies</li> </ul>			
2-9	<p>Commenters requested language changes and additions in Chapter 5b, Table 3 including:</p> <ul style="list-style-type: none"> <li>All actions should identify steps that AQMD to utilize internal, budgeted, and allocated funding</li> <li>Add filtration (including all schools (e.g., adult) within the boundary) and weatherization projects to all air quality priorities</li> <li>Making all air quality data available in real time to the public</li> <li>Collaborate with CNRA, Riverside County and the Salton Sea Authority to implement vegetation barriers on dry lakebed along the northern shore of the Sea and urban greening projects by collaborating with</li> </ul>	Rebecca Zaragoza, et al.		<p>See Response to Comment 1-20 regarding budgeted and allocated funding. Vegetation on the dry playa will be used as a strategy for the dust suppression projects that CNRA and IID are currently implementing around the Salton Sea (additional language was made to Action C) Air filtration and weatherization projects were added to all of the Air Quality Priorities chapters. During CERP implementation, the CSC will develop criteria to determine which schools receive air filtration systems. See Response to Comment 1-14 for real-time data. Urban greening action has been included in Table 3.</p>

	Riverside County, City of Indio and the City of Coachella			
<b>Pesticides</b>				
<b>1-15, 2-10</b>	<p>The Draft CERP should address the following in Chapter 5c:</p> <ul style="list-style-type: none"> <li>Require comprehensive monitoring for toxic pesticide emission.</li> <li>Require that monitors are placed at residential areas and sensitive receptors (such as schools, nursery homes, and daycares) located near fields where toxic pesticide exposures occur.</li> <li>Draft CERP must do more than commit to attempting to work with other agencies to reduce pesticide exposures</li> <li>Adopt a similar process as Shafter Pilot Notification System project in the 1st quarter of 2021 in the ECV</li> <li>Require setbacks for pesticide applications near residences and sensitive receptors and identify the target amount of contaminants and</li> </ul>	Rebecca Zaragoza, et al.		<p>South Coast AQMD has limited jurisdiction when it comes to pesticides. Health and Safety Code Section 39655(a) provides that the regulation of pesticides in their pesticidal use is reserved to the Department of Pesticide Regulation. Collaborations with CARB, DPR, the Riverside County Agricultural Commissioner, and local farmers are critical to reduce emissions from this source. South Coast AQMD lacks the authority to require notification actions and buffer zones since we lack authority over land uses<sup>3</sup>. Finally, South Coast AQMD can impose air pollution requirements on sources of pollution, but lacks the authority to require farmers to apply for the Healthy Soils Program or to provide PPE for their workers. Nevertheless, the CERP includes several commitments to collaborate with agencies with the appropriate authority and/or expertise to implement actions to reduce pesticide exposures in the community.</p> <p>The Department of Pesticide Regulation (DPR) is initiating efforts to develop a statewide pesticide application notification system. The CERP includes an action to provide the CSC an annual update on statewide efforts to develop a pesticide</p>

Eastern Coachella Valley (ECV) – Draft CERP

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<p>toxic pesticide exposures that will be reduced by the CERP strategies</p> <ul style="list-style-type: none"> <li>• Pesticide use information should be posted on a publicly accessible website in real time</li> <li>• Improve the timelines in Chapter 5b of the CERP</li> </ul> <p>Commenters requested language additions in Chapter 5c, Table 2, including:</p> <ul style="list-style-type: none"> <li>• Requiring growers to provide physical announcements at agricultural sites that warn about future pesticide application events as well as after application occurs</li> <li>• Creating and implementing a pesticide application notification system across the ECV</li> <li>• Requiring farmers to apply for the Healthy Soils Program every application cycle</li> <li>• Implementing vegetation barriers between agricultural fields and sensitive receptors</li> <li>• Requiring farmers and employers to provide free Personal Protective Equipment (PPE) to all farmworkers</li> <li>• Establishing 24/7 buffer zones of 1 mile for all pesticide TACs for all sensitive sites</li> </ul>			<p>application notification system based on the Shafter Pilot Project. Staff expects to begin consulting with DPR and providing annual updates to the CSC beginning in the 1<sup>st</sup> quarter of 2022.</p> <p>South Coast AQMD will work with CARB, DPR and the CSC to develop a comprehensive, effective and feasible monitoring strategy to address pesticide emissions. Staff will also work with the CSC in the first two quarters of 2021 to discuss specific CSC priorities related to the Salton Sea and to evaluate the feasibility of accelerating the timelines.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	Collaborating with Growing Coachella Valley Local Farmers and Growers			
<b>Fugitive Road Dust</b>				
<b>CSC Meeting #8</b>	Collaborate with Southern California Gas Company on home weatherization projects	Deborah McGarrey		Staff will pursue collaboration with Southern California Gas Company to implement home weatherization projects. See Chapter 5d.
<b>1-8</b>	South Coast AQMD should identify additional actions, monitoring, and strategies to address off-roading emissions in Chapters 5d and 5g	Rebecca Zaragoza, et al.		Staff incorporated off-roading in Chapter 5d.
<b>1-16</b>	<p>The Draft CERP should identify enforceable mitigation measures, including the following:</p> <ul style="list-style-type: none"> <li>• Include a requirement that South Coast AQMD increase its efforts to enforce its fugitive dust rules, Rules 403 and 403.1</li> <li>• Equip all mobile home parks and Polanco Parks in the ECV with air monitors for particulate matter and specific toxics that are identified to be of concern</li> </ul>	Rebecca Zaragoza, et al.		Staff incorporated in Chapter 5d, Table 2, to evaluate and identify opportunities to improve enforcement of Rules 403 and 403.1. It should be noted that a sensor library program is being developed and staff will consider deploying additional sensors at specific locations of interest after consulting with the CSC, if appropriate and pending resource availability.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
3-1	Specify a plan for paving projects to reduce fugitive dust at mobile home parks. Consider using the example timeline and identified locations provided. Also, consider adding a landscaping element to paving projects.	Pueblo Unido CDC/Unión De Polancos		Staff will consider entities beyond homeowner's associations, including mobile home park owners, for the implementation of paving projects. Staff outlined steps to develop a plan for paving projects (e.g., evaluate landscaping component to paving projects). The suggested timeline and identified locations will be considered during CERP implementation. See Chapter 5d.
2-11	Commenters explained that the section does not address the off-roading concerns raised by the CSC.	Rebecca Zaragoza, et al.		This comment is addressed in Chapter 5d.
2-12	Commenters requested to improve the resolution and regional reporting ability that the regulatory sensors currently have (Table 1, Action B)	Rebecca Zaragoza, et al.		As indicated in the draft CERP and CAMP a sensor network will be developed to supplement existing air monitoring activities in the ECV community. These sensors are capable of providing near real-time air quality information with spatial and temporal resolution that is often greater than what can be achieved by other, more established and more expensive monitoring technologies. All sensor data will be reported in near-real time in the South Coast AQMD data display tool that was created specifically for the AB 617 program. This will provide easy access to air quality data for CSC members and the public. South Coast AQMD staff are also working to implement a new method to use data from some air pollution sensors to help inform the Air Quality Index map. This method will provide much higher resolution information to the public in a way that is scientifically sound.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
2-13	<p>Commenters requested to:</p> <ul style="list-style-type: none"> <li>• Install speed limit signs within mobile home parks and other communities (Table 2, Action B).</li> <li>• Collaborate with Riverside County and CVAG to actively pursue funding opportunities to pave Polanco Parks, mobile home parks, and other unpaved roads identified by the community</li> <li>• Work to pass legislation to support the paving of Polanco parks (following the steps of AB 1318 with added climate resilient co-benefits).</li> <li>• Require all commercial landscapers, including City and County landscapers, to use electric and zero emission gardening equipment within the next 5 years of this plan's implementation period</li> </ul> <p>Commenters also asked whether the collaborative partnership with homeowners' associations will benefit mobile home park communities, and mentioned that funds from the Greenleaf Power Plant mitigation program should stay within ECV</p>	Rebecca Zaragoza, et al.		<p>The collaboration between South Coast AQMD and homeowners' associations will benefit mobile home park communities since both parties will pursue reducing emissions by paving unpaved roads and mobile home parks. Mobile home parks cannot be paved without permission from the homeowners' associations that may own the parks. South Coast AQMD does not have the authority to require installing speed limit signs within mobile home parks and other communities. The comment about the Greenleaf Power Plant is addressed in Chapter 5g, Table 1, Action B. South Coast AQMD is preempted from requiring all commercial landscapers to use electric and zero emissions garden equipment. We are prohibited from adopting or enforcing emission standards for nonroad engines, including lawn and garden equipment.<sup>4</sup> While gasoline-powered lawn and garden equipment has air pollution emissions, using zero-emission models of this equipment will not help reduce fugitive dust.</p> <p>The paving of Polanco Parks was specified as an example in Table 1, Action A. Prioritization of paving projects will be determined with the CSC during CERP implementation. See additional language added to outline the process for paving projects. Community Air Protection Program (CAPP) guidelines would allow AB 617 funds for community identified projects (e.g., road paving) through the AB 617 incentive funds. Also,</p>

<sup>4</sup> 42 United States Code (U.S.C.) Section 7543(e). A fleet purchase requirement would be a preempted emission standard. Engine Manufacturers Assn. v. South Coast AQMD, 541 US 246 (2004)

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
				staff can provide technical information for the community's legislative efforts.
2-14	<p>Commenters requested additions in Table 3 from Chapter 5d and suggested that there are GGRF programs for weatherization projects. Language additions include:</p> <ul style="list-style-type: none"> <li>Applying for state funds for urban greening and forestry to improve tree cover in the community</li> <li>Requiring all facilities identified in the technical assessment and emissions inventory to incorporate mitigation measures such as planting shrubs, greenery, trees, and other native plants around the perimeter of their facilities</li> </ul>	Rebecca Zaragoza, et al.		As part of ongoing efforts, staff continues to explore and identify additional funding opportunities to reduce emissions in AB 617 communities as noted in Chapter 5a. Staff will evaluate the efficacy and feasibility of requiring planting of shrubs and other vegetation around facility perimeters.
<b>Open Burning and Illegal Dumping</b>				
CSC Meeting #8	<p>Collaborate with following agencies to address concerns about the Open Burning and Illegal Dumping:</p> <ul style="list-style-type: none"> <li>Coachella Valley Association of Governments (CVAG)</li> <li>Torres Martinez Desert Cahuilla Indians</li> </ul>	Sienna Thomas		Staff will pursue a collaborative partnership with CVAG and Torres Martinez Desert Cahuilla Indians to pursue opportunities to address open burning and illegal dumping. See Chapter 5e.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
CSC Meeting #8	Include Public Service Announcements (PSA) (i.e., news, radio, social media) for outreach	Sienna Thomas		Staff included PSAs as outreach in Chapter 5e, Table 4.
CSC Meeting #8	Consider using camera and/or drone technology to identify potential illegal dumping sites and investigate potential illegal burning	Miguel Vasquez, Sienna Thomas, George Tudor		Staff will explore opportunities to use drones equipped with cameras to identify the location(s) of illegal dumping sites. The implementation of this potential solution will be dependent upon resource availability and the feasibility of specific deployments where the use of drone technology is deemed to be more effective than the implementation of more traditional ground-based methods. Additional language was incorporated in Chapter 5e, Table 4, Actions A and C.
1-17	<p>Commenters requested the CERP:</p> <ul style="list-style-type: none"> <li>• Discuss the Open Burn Program and increase enforcement of Rule – 444 to reduce open burning of materials</li> <li>• Specify a quantifiable emission reduction target</li> <li>• Identify feasible alternatives to agricultural burning by: <ul style="list-style-type: none"> <li>○ Enforcing agricultural burning rules and identifying alternatives to agricultural burning</li> <li>○ Requiring agricultural companies and growers to comply with such rules by the end of 2025</li> <li>○ Developing and implementing a plan to phase out agricultural burning entirely</li> </ul> </li> </ul>	Rebecca Zaragoza, et al.		<p>Staff provided information on the Open Burn Program at CSC Meeting #4 and provided a handout on the Open Burn Program in the May Newsletter sent to the CSC on May 8th, 2020. This handout can be accessed here: <a href="http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/agricultural-burning.pdf?sfvrsn=14">http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/agricultural-burning.pdf?sfvrsn=14</a> and is included in Appendix 5. Additional actions for enforcement of Rule 444, (e.g., unannounced inspections, focused enforcement) have been added to Table 2, Action A of Chapter 5e, in response to this comment. Further refinements of these actions will be discussed with the CSC in the first half of 2021 as we work toward adding more details to the CERP. Staff will reach out to staff at San Joaquin APCD to seek additional information.</p> <p>Alternatives to burning will be identified during CERP implementation. Agricultural companies and growers who are subject to Rule 444 are required to comply with provisions of the rule. The suggested action to phase out agricultural burning</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	<ul style="list-style-type: none"> <li>○ Seeking guidance from similar actions by the San Joaquin Valley Air Pollution Control District</li> </ul>			entirely is prohibited by State regulation. As written in Title 17 of the California Code of Regulations, Section §80102(b), "...no local or regional authority may ban agricultural or prescribed burning." When staff develops a list of available technologies, best practices, and alternatives and assesses the feasibility of new requirements (Chapter 5e, Table 2, Action A) staff will identify feasible opportunities used in other air districts to address open burning.
<b>2-15</b>	Commenters requested language additions to Chapter 5e and provided additional information about unpermitted and uncontrolled open burning	Rebecca Zaragoza, et al.		Additional language was incorporated.
<b>2-16</b>	<p>Commenters requested actions in the CERP to:</p> <ul style="list-style-type: none"> <li>• Provide support to small farmers and farmers of color (Table 2, Action C)</li> <li>• Develop a public outreach campaign in hotspots (especially around Tribal lands) with signage on the harms and consequences of illegal dumping and burning</li> <li>• Collaborate with the Congressman's Office, Riverside County Torres Martinez, and the Desert Healthcare District (DHCD) to develop an emergency response to collectively respond to fires within Tribal land</li> </ul>	Rebecca Zaragoza, et al.		<p>Staff is evaluating additional language on providing support to small farmers and farmers of color and public outreach campaigns was listed as an example and providing information on the harms and consequences of illegal dumping and burning was incorporated in Table 2. Outreach efforts such as public information strategies can be further discussed with the CSC in the first half of 2021. South Coast AQMD currently has a response plan with other entities to respond to fires on tribal lands.</p> <p>South Coast AQMD was part of the inter-agency response to the Martinez Fire at the Sun Valley Recycling Center in the fall of 2019, and staff are willing to participate in the Congressman's and DHCD's efforts to develop the emergency response plan to respond to fires on Tribal land. See Chapter 5e, Table 2, Action B.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
2-17	<p>Commenters requested language changes and additions to Table 4, including:</p> <ul style="list-style-type: none"> <li>• Collaborate with Growing CV, farmers and Riverside County to identify alternative solutions for farmers to dispose of green waste that are environmentally friendly</li> <li>• Fine entities that are dumping illegally on tribal land, implement a security system in partnership with Torres Martinez and others, and identify existing waste disposal sites</li> <li>• Collaborate with CCV and Coachella Valley Environmental Justice Task Force (CVEJETF) to create and implement an outreach campaign for the IVAN reporting system for illegal dumping</li> <li>• Collaborate with Riverside County, Community Councils, and Waste Management to create and implement an ongoing community clean-up and trash disposal program</li> </ul>	Rebecca Zaragoza, et al.		South Coast AQMD regulations do not apply on tribal lands, California v. Cabazon Band of Mission Indians, 480 U.S. 202 (1987). Therefore, South Coast AQMD lacks the authority to enforce illegal dumping on tribal lands. Riverside Code Enforcement is responsible for addressing illegal dumping on non-tribal lands. Additional language has been incorporated in Table 4, Action A..
<b>Diesel Mobile Sources</b>				
1-8	South Coast AQMD should identify additional actions, monitoring, and strategies to address off-roading emissions in Chapters 5d and 5g.	Rebecca Zaragoza, et al.		Off-roading has been added to Chapter 5d.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
1-9	Regarding the Thermal Club and the Jacqueline Cochran Regional Airport, South Coast AQMD should identify the type of contaminants being emitted, conduct air monitoring at these sites, and engage in land-use discussions with the community and Riverside County to deter projects like the aforementioned from being placed in an already disadvantaged community.	Rebecca Zaragoza, et al.		See Responses to Comment 1-3 and 1-7. See Chapter 5a.
1-10	The Draft CERP should include actions and strategies to address the freight train in ECV, including coordination with federal agencies with jurisdiction over freight emissions	Rebecca Zaragoza, et al.		Freight trains have has been added to Chapter 5f.
1-18	The Draft CERP must be revised to specify diesel emission reductions targets. The Draft CERP should address the Thermal Club and airport. The Draft CERP should include strategies from CARB's Freight Handbook Concept Paper. Address the DTSC's Air Toxic Control Measure (ATCM) for Stationary Compression Ignition (CI) Engines.	Rebecca Zaragoza, et al.		The Thermal Club and Airport have been added to Chapter 5a under Land Use. See Chapter 5a for emission reduction targets. Staff will work with the CSC to continue addressing the concerns of diesel mobile sources (e.g., trucks, trains) in 2021 as outlined in Table 1 of Chapter 5f. Staff will also collaborate with CARB to identify opportunities for additional actions to address diesel mobile sources, since they have primary jurisdiction on mobile sources. Table 1, Action A outlines the process to address the diesel mobile sources including providing an informational workshop on diesel mobile sources and prioritizing actions. Information on strategies from CARB's Freight Handbook Concept Paper, CARB's Air Toxic Control Measure (ATCM) for Stationary Compression Ignition (CI) Engines, and South Coast AQMD rules (such as Rule 1110.2) may be considered during CERP implementation.

Comment From	Summary of Comment	Commenter(s)	Included= Not Included= 	Staff Response
2-19	<p>Commenters requested including the following in Chapter 5f:</p> <ul style="list-style-type: none"> <li>• Include the freight train, Thermal racetrack, and the Thermal airport in the Chapter</li> <li>• Outline existing funds and incentives that will be used for Table 1, Action C</li> <li>• Collaborate with The City of Indio, City of Coachella, County of Riverside, and to apply to state funding sources to mitigate pollution and climate impacts and improve livability</li> <li>• Collaborate with the City of Indio, City of Coachella, and Riverside County to implement vegetative barriers around the railroad that passes through communities in the ECV</li> <li>• Review models produced by South Coast AQMD (2019 TAG) on I -10 traffic and the potential PM2.5 from diesel traffic in ECV</li> </ul>	Rebecca Zaragoza, et al.		<p>Staff included off-roading vehicles and activities in Chapter 5d. The Thermal racetrack and Thermal Airport are included in Chapter 5a. The freight train has been added to Chapter 5f. As discussed in the October 15, 2020 AB 617 Incentives Strategies meeting, staff will be developing an overall strategy based on the community input received and statutory requirements, and will be providing this draft strategy to each of the CSCs in the AB 617 designated communities for feedback before bringing the recommendations to the Board. Additionally, South Coast AQMD staff will provide the CSC with updates on incentive funding opportunities and projects as this information becomes available. Staff appreciates the suggestion for the Technical Advisory Group (TAG) on I-10 traffic emissions information and will share it with the staff developing information for TAG meetings. Heavy-duty truck traffic from the I-10 contributes to ECV's diesel particulate matter (DPM) and is incorporated in the emissions inventory. As part of ongoing efforts, staff continues to explore and identify additional funding opportunities to reduce emissions in AB 617 communities. Collaboration with land use agencies (e.g., City of Indio, City of Coachella, and Riverside County) to implement vegetative barriers around the railroad has been added to Chapter 5f, Table 1, Action A. See Response to Comment 1-20 regarding budget allocation.</p>
<b>Greenleaf Desert View Power Plant</b>				
1-19	<p>Fenceline monitors for criteria and toxic air pollutants should be installed on the facility. Ten or more monitors should be strategically placed near homes and sensitive receptors</p>	Rebecca Zaragoza, et al.		<p>As discussed during one of the CSC meetings (in the CAMP breakout group), the South Coast AQMD is planning to conduct PM monitoring upwind and downwind of the power plant to identify potential emissions from the facility and assess the</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
	near the facility. Mobile monitoring should take place to identify and quantify pollutants that occur at this facility.			<p>potential impact on the community. After consulting with the CSC, the South AQMD will deploy an appropriate number of PM sensors at strategic locations to gather the necessary information to fully address this air quality concern under variety of wind condition. In this particular situation a fixed monitoring strategy is preferred to one which includes the use of a mobile platform, as emissions from the power plant may occur during different times of the day (e.g., at night) when mobile measurements cannot be taken. It should be noted that air monitoring can only quantify the ambient concentration of PM and not the emission rate from the facility.</p> <p>Currently, South Coast AQMD operates one fixed monitoring site (Mecca air monitoring station) near the Greenleaf Power Plant; this site is located within the perimeter of Saul Martinez Elementary School and approximately one mile southeast to the power plant. An analysis of the wind direction gathered during the last three years shows that the air monitoring station in Mecca was downwind of the power plant more than 50% of the time and, hence, this is a suitable site for exploring the impact of Greenleaf emissions on the surrounding community. South Coast AQMD will conduct baseline measurements (including certain air toxic pollutants) at this site.</p>

Comment From	Summary of Comment	Commenter(s)	Included= Not Included=  	Staff Response
2-20	<p>Commenters requested changes in Chapter 5g, Table 1, which include:</p> <ul style="list-style-type: none"> <li>• Requiring all allocations of funds from the Greenleaf Desert View Power Plant be used to reduce emissions and exposures in the ECV</li> <li>• Collaborating with CVAG, Riverside County, Greenleaf Power Plant, and Cabazon Band of Mission Indians to deploy mobile monitoring in key locations</li> <li>• Requiring Greenleaf Power Desert View Plant to incorporate mitigation measures such as planting shrubs, greenery, trees, and other native plants around the perimeter of the facility</li> <li>• Add a land use, and outreach and education section</li> </ul>	Rebecca Zaragoza, et al.		<p>While South Coast AQMD cannot require CVAG to use all its funds from the Greenleaf Desert View Power Plant for ECV, staff will pursue a collaboration with CVAG to consider using these funds in the ECV.</p> <p>As for the idea of conducting mobile monitoring at key locations, it should be noted that, in this particular situation, a fixed monitoring strategy is preferred to one which includes the use of a mobile platform, as emissions from the power plant may occur during different times of the day (e.g., at night) when mobile measurements cannot be taken. As detailed in the Response to Comment 1-19, the South Coast AQMD is planning to conduct PM monitoring upwind and downwind of the power plant to identify potential emissions from the facility and assess the potential impact on the community.</p> <p>Greenleaf Desert View Power Plant is on tribal land, staff lacks the authority to require the facility to plant shrubs around the perimeter to limit access. Staff will work to develop strategies to reduce emissions and exposure from the facility. An action to reduce exposure has been included in the table to identify funding for air filtration system installation and maintenance and weatherization project implementation. A land use section was added in Chapter 5a and includes mitigation measures through the CEQA process. Outreach and education actions are already incorporated within the actions of each Air Quality Priority.</p>

## Executive Summary

---

The Eastern Coachella Valley (ECV) Community Emissions Reduction Plan (CERP) is a critical part of implementing Assembly Bill (AB) 617 (Health and Safety Code Section 44391.2), a California law that addresses the disproportionate impacts of air pollution in environmental justice communities. The AB 617 program invests new resources and focuses on improving air quality in environmental justice communities. The CERP outlines goals and actions by the Community Steering Committee (CSC), the South Coast AQMD, and the California Air Resources Board (CARB) to reduce air pollution in the ECV community and improve public health. An essential piece of the program is partnership and collaboration with the community to address the community's air quality priorities in the CERP. The CSC is a diverse group of people, including youth, who live, work, own businesses, or attend school, within the community. Local public health agencies, regulatory agencies, tribal organizations, and elected officials are represented on the CSC. The CSC guides the development and implementation of the CERP.

One year from the date that CARB designates a new AB 617 community, the local air district must develop and adopt a CERP in consultation with CARB, community-based organizations, affected sources, and local governmental bodies.<sup>1</sup> The ECV community had to account for the onset of the COVID-19 pandemic and its impact on the CERP development schedule. Despite a delay in the schedule, the ECV CSC and South Coast AQMD staff worked together to develop this plan for consideration by South Coast AQMD's Governing Board in December 2020.

Based on the sources of air pollution impacting the community, the ECV CSC identified the following air quality priorities to be addressed by this plan:

- Salton Sea
- Pesticides
- Open Burning and Illegal Dumping
- Fugitive Road Dust
- Diesel Mobile Sources
- Greenleaf Desert View Power Plant

At its core, this plan seeks to address the air quality priorities with actions that reduce air pollution emissions from sources within the community and reduce air pollution exposure to people in the community and improve public health. This plan includes actions, such as developing and enforcing regulations, providing incentives to accelerate the adoption of cleaner technologies, and conducting outreach to provide useful information to support the public in making informed choices. Additionally, air monitoring efforts will provide critical information to help guide investigations, provide public information, and track progress. Collaborative efforts with other agencies, organizations, businesses and other stakeholders will amplify the impact of these actions. Many of the actions will only be conducted during the implementation timeframe of this plan; however, there are also many actions (such as regulations, ongoing enforcement activities and certain incentive programs) that will be continuing activities conducted by the South Coast AQMD.

---

<sup>1</sup> Assembly Bill 617 44391.2 (b)(2)

This plan focuses on improving air quality in the ECV community through concentrated efforts and community partnerships. The CSC will continue to engage in the process of implementing the CERP and tracking its progress.

### The Reader's Guide to the CERP

The opening chapters provide background information about the AB 617 program and timeline (Chapter 1), the CSC process and community engagement (Chapter 2), and information about the air pollution sources in the community (Chapter 3).

Information about past and ongoing enforcement activities conducted by both the South Coast AQMD and CARB staff is provided in Chapter 4. This information will provide insights into future enforcement activities.

The specific actions for emissions and exposure reductions are in Chapter 5 – Actions to Reduce Community Air Pollution. Chapter 5 is organized by air quality priorities, followed by goals and actions to address each air quality priority. The actions are organized in a table that identifies the entities responsible for each action and specifies the timeframe for implementing them. The CERP actions are numbered in the order in which they are presented in each section. The proposed plan will include a California Environmental Quality Act (CEQA) analysis based on the proposed actions.

A summary of the air monitoring approach is in Chapter 6. These efforts are described in much greater detail in the Appendix 6 for the Community Air Monitoring Plan (CAMP).<sup>2</sup> The actions described in Chapter 5 also include specific air monitoring activities related to specific actions in the CERP. Findings from air monitoring will help evaluate next steps, and South Coast AQMD staff will work with the CSC to review findings and make necessary adjustments to the CERP.

The Appendices to the CERP include additional reference material related to the CERP content.

# CHAPTER 1:

## INTRODUCTION

---

## Chapter 1: Introduction

AB 617 was signed into California law in July 2017 and focused on addressing local air pollution impacts in environmental justice communities. The bill recognizes that while California has seen tremendous regional air quality improvement, some communities are still disproportionately impacted. Many communities in the South Coast AQMD experience impacts from air pollution sources near places where people live. Major air pollution sources in EJ communities include mobile sources (trucks, locomotives, etc.) and industrial facilities. These communities also experience social and economic disadvantages that add to their cumulative burdens. The AB 617 program accelerates actions and provides additional resources to address air quality in these communities.

In 2018 (Year 1), CARB designated ten AB 617 communities statewide (see Figure 1-1), including three South Coast AQMD communities. On December 13, 2019 (Year 2), CARB designated two<sup>i</sup> additional AB 617 communities (see Figure 1-1) in South Coast AQMD, including, Eastern Coachella Valley (ECV) and Southeast Los Angeles.

**Figure 1-1: Statewide AB 617 Communities as of 2019**

Local air districts are tasked with developing and implementing Community Emissions Reduction Plans (CERPs) and Community Air Monitoring Plans (CAMPs) in partnership with residents and community stakeholders. The CAMP includes air monitoring efforts to enhance our understanding of air pollution in the designated communities and support CERP implementation.

### Purpose of the Community Emissions Reduction Plan (CERP)

The CERP is developed to achieve air pollution emission and exposure reductions within the ECV community and address this community's air quality priorities. The plan describes the community outreach conducted to develop

<sup>i</sup> ECV, Stockton, and Southeast Los Angeles were designated in 2019 to develop both a community emissions reduction plan and a community air monitoring plan. San Diego designated in 2018 to develop a community air monitoring plan, which was expanded in 2019 to develop a community emissions reduction plan.

the CERP and provides emissions and exposure reduction actions, an implementation schedule and an enforcement plan.

Some actions in the CERP include a series of steps to address certain air quality concerns raised by the CSC. These actions provide flexibility for plan adjustments when new information becomes available. Staff will provide an annual progress report to the South Coast AQMD Governing Board on CERP implementation and identify actions that may require Board action.

### CERP Development Process and Emphasis on Community Input

Community engagement and input to inform both the process and the actions in the CERP are a primary element of the AB 617 program. Figure 1-2 provides the CERP development process. Public meetings, workshops, conversations, and communications among committee members, South Coast AQMD staff and CARB staff contributed to development of the plan. Chapter 2 describes the CSC and outreach efforts for CERP development.

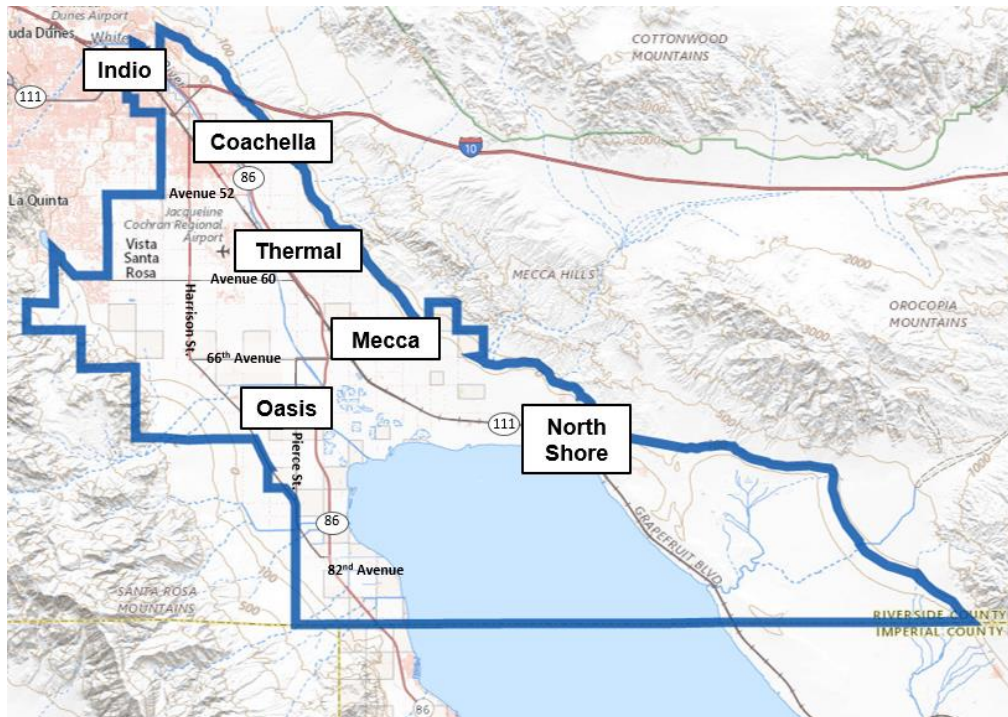

**Figure 1-2: Overview of ECV Community Emissions Reduction Plan (CERP) Timeline**

\*Meetings include CSC, Charter Working Group, workshop, question and answer session, and Technical Advisory Group (TAG) meetings.

## About this Community

The community extends from the City of Indio south to the Riverside County boundary along the Salton Sea. It includes the City of Indio, the City of Coachella, a small portion of the City of La Quinta (southern part of the city), and the unincorporated areas of Thermal, Mecca, Oasis and North Shore (Figures 1-3 and 1-4).

**Figure 1-3: ECV Community Boundary**

**Figure 1-4: Location of the ECV community in the South Coast AQMD jurisdiction**

Figure 1-5: Population of the ECV community, based on 2010 Census

Figure 1-6: Population by Race/Ethnicity in ECV and the state of California, based on 2010 Census<sup>ii</sup>

More than 80,000 people live within the ECV community (Figure 1-5). Most of the people living in this community are Hispanic or Latinx (Figure 1-6). About 6.2% of the residents in this community are White, 0.5% are African American, and 0.3% are American Indian or Alaska Native. The population in this community is younger than the California population, with about 21.4% of children under the age of 10 years and 6.5% adults over the age of 65 years (Figure 1-7). These age categories are particularly important because young children and older adults can be more sensitive to air pollution's health effects.

<sup>ii</sup> Definitions of races are the same as CalEnviroScreen 3.0.

**Figure 1-7: Age profile in ECV and the state of California, based on 2010 Census**

# CHAPTER 2:

## COMMUNITY OUTREACH, COMMUNITY STEERING COMMITTEE AND PUBLIC PROCESS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 2: Community Outreach, Community Steering Committee and Public Process

### Introduction

Community engagement, outreach, and public process were crucial to developing the Eastern Coachella Valley (ECV) Community Emission Reduction Plan (CERP). Key features of the outreach efforts include establishing a Community Steering Committee (CSC), monthly CSC meetings, CSC member and South Coast AQMD staff presentations, providing materials (in English and Spanish) via email and a webpage, live-streaming all CSC meetings (with English and Spanish interpretation), and establishing a Technical Advisory Group (TAG). Additionally, upon

request of the CSC, Spanish video recordings were made available beginning in October 2020. Also, numerous interactions between CSC members and South Coast AQMD staff occurred in one-on-one or small group meetings, allowing for in-depth discussions on joint development and creating the CERP.

### Chapter 2 Highlights

- The Community Steering Committee (CSC) and Technical Advisory Group worked with South Coast AQMD staff to develop the CERP
- Despite the COVID-19 Stay-At-Home Order, regularly scheduled CSC meetings resumed using a virtual platform to engage with the CSC and public
- The Community Liaison served as the point of contact
- A series of Charter Working Group Meetings were held to develop a CSC Charter
- Additional one-on-one, small group, and community meetings also played an important part in community engagement
- A Community Webpage was created as an information portal

### Community Liaisons

A Community Liaison from the South Coast AQMD served as the point of contact to communicate with members of the CSC and members of the public to address concerns regarding logistics and development of the CERP and Community Air Monitoring Plan (CAMP) (Figure 2-1). The Community Liaison ensured communication throughout the CERP development process and worked with community members to identify the best ways to make information accessible and user-friendly. The South Coast AQMD Community Liaison for the Eastern Coachella Valley (ECV) is Arlene Farol ([afarol@aqmd.gov](mailto:afarol@aqmd.gov)). In addition, Pedro Piqueras ([ppiqueras@aqmd.gov](mailto:ppiqueras@aqmd.gov)) serves as the South Coast AQMD point of contact for CERP-related discussions.

**Figure 2-1: South Coast AQMD staff assisting CSC members and the public at a meeting in the city of Coachella**

### Community Steering Committee (CSC)

A steering committee was formed in late January 2020 for the ECV community, and monthly in-person meetings were organized, starting February 19, 2020 (Figure 2-2). However, due to the COVID-19 pandemic and the resulting executive orders from the Governor<sup>1</sup>, the remaining CSC meetings were transitioned to a video conferencing format. The March and April CSC meetings were cancelled and resumed in May using the Zoom platform. The main role of the CSC is to provide input and guidance as well as to propose actions for the community plans (i.e., CERP and CAMP). The CSC is comprised of stakeholders with community knowledge to help drive community action and develop the CERP and CAMP. The CSC creates a way to incorporate community expertise and direction in developing and implementing clean air programs in each community. Staff will continue to seek recommendations and feedback from the CSC during CERP implementation and adjust the outreach approaches to be more effective.

The ECV CSC has 50 primary members and 12 alternate members representing active residents, community organizations, and businesses. While 20 primary members are on the roster representing active residents, an additional 10 primary members also reside within the community (resident percentage on the CSC = 60%). Additionally, there are 10 primary members and 8 alternate members representing agencies, schools/universities, or offices of elected officials who serve this community.<sup>2</sup> The roster as of November 12, 2020 is available at: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>. The CSC Meetings consistently lacked a quorum preventing a CSC vote; thus, CSC members requested a roster update. CSC members who had not attended five months of CSC meetings were contacted to determine if they would like to continue to be a member of the CSC.

<sup>1</sup> Governor Newsom issued Executive Order N-25-20 on March 12, 2020 and Executive Order N-29-20 on March 17, 2020.

<sup>2</sup> Per discussion with CARB staff, members representing agencies, schools, universities, hospitals, and offices of elected officials are not included in the calculation of resident percentage on the CSC.

**Figure 2-2: Community Steering Committee meeting in Coachella**

### CSC Charter Working Group

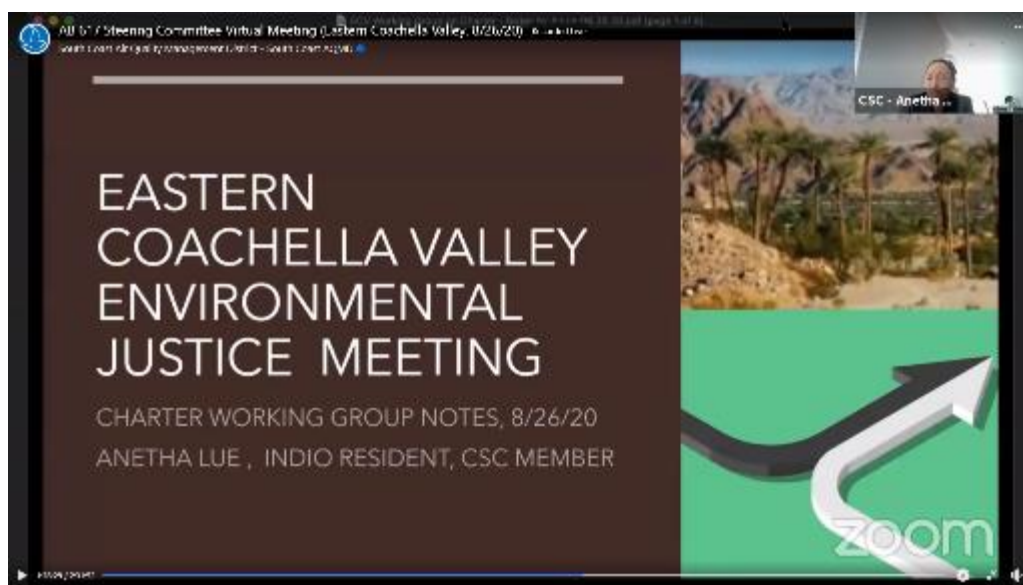

The South Coast AQMD's original draft charter was presented at the February 20<sup>th</sup> CSC meeting. CSC member Rebecca Zaragoza of Leadership Counsel for Justice and Accountability (LCJA), in coordination with residents and other community organizations (i.e., Alianza, Pueblos Unidos CDC), drafted a proposed charter based on the community's input. In the March 2020 meeting, Ms. Zaragoza provided an update on the revised charter. The CSC recommended forming a Charter Working Group to draft the charter to include all CSC input. At the May 20<sup>th</sup> CSC meeting, all CSC members were invited to participate in the Charter Working Group/CSC meetings, and updates were provided to the full membership during CSC meetings. The first Charter Working Group meeting was held on June 23, 2020 followed by subsequent weekly meetings (a total of 4 meetings of this Working Group).

During the Charter Working Group meetings, CSC members discussed ideas for the committee meeting process, including a request to incorporate elements of the Brown Act into the charter and to form subcommittees to discuss specific topics. Additionally, Committee members requested stipends, transit, childcare, availability of alternative community locations with internet access for future meetings, outreach via mass mailing of materials, air quality training and workshops, printed meeting materials to be delivered to organizations and residents, and that materials be provided far in advance of meetings.

A Google document was created for CSC members to provide recommendations and direct edits to the draft charter. At each Charter Working Group meeting, CSC members discussed the edits and suggestions provided in the draft charter. CSC members edited the Google document until July 29<sup>th</sup> when a draft was presented to members at the Charter Working Group meeting. CSC members provided comments and the feedback received was included in the revised charter. A vote was taken by CSC members recommending not to bring the Brown Act item to the next CSC meeting for a vote, and instead continue developing the language in the charter, removing the sentence that mentions the Brown Act. Additionally, the CSC also recommended presenting a clean version of the charter for consideration the next CSC meeting.

At the August 26<sup>th</sup> CSC meeting, CSC member Anetha Lue presented a thorough summary of the discussions during the various Charter Working Group meetings. In her summary, she stated the general agreement that the charter should ensure inclusion and fairness, achieving results and a leadership role for the community (Figure 2-3). Following her summary, the CSC requested to postpone a vote to approve the charter until Spanish translation was provided.

**Figure 2-3: CSC Member Anetha Lue presented an update at the August 26<sup>th</sup> CSC meeting**

The final charter, provided in English and Spanish, was approved by the CSC on September 24<sup>th</sup> and is available at the links below.

CSC Final Charter - September 24, 2020 version:

- English: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter.pdf?sfvrsn=8>  
Spanish: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter-span.pdf?sfvrsn=8>

## Committee Presenters

A critical aspect of the CERP is development and implementation through collaboration with committee members and the agencies, organizations, businesses, or other entities that they represent. Committee members were invited to share their work that is complementary to the actions being developed in the CERP, such as programs carried out by their organization that help address air quality issues in the community.

On July 31<sup>st</sup>, an informational workshop on Salton Sea and Pesticides was held to identify the roles of various public agencies dealing with the Salton Sea and pesticides. The workshop included presentations from CARB, Department of Pesticide Regulation, Imperial Irrigation District, Riverside County Agricultural Commissioner's Office and UC Riverside.

Committee members Dr. Ann Cheney, Adriana Chavez and Conchita Pozar provided information about ongoing studies related to the Salton Sea. Daniel Delgado represented committee member Ruben Arroyo from the Riverside County Department of Agriculture and Measurement (Agricultural Commissioner) Standards and described the role of the Agricultural Commissioner in implementing pesticide regulations.

### Community Testimonials

In February 2019, at the North Shore Community Center, Leadership Counsel for Justice and Accountability (LCJA), in coordination with South Coast AQMD and the California Air Resources Board

**Figure 2-4: Community members are invited to share their personal air pollution concerns**

(CARB), invited residents from the ECV community to learn about the AB 617 program. Community members were invited to share personal stories, outline their concerns with air pollution and describe how it has negatively impacted their lives and community. A video documentary, “Estamos Aquí” was presented by local filmmakers, some of whom became ECV CSC Members, Bryan Mendez (filmmaker), Olivia Rodriguez (writer), and Daniel Morando (editor). These types of conversations from the

community during CSC meetings have helped provide perspective and context to frame the discussions during the CSC meetings (Figure 2-4).

### Community Meetings

CARB designated the ECV community for the AB 617 program in December 2019. South Coast AQMD staff has hosted community meetings on a regular basis in the community or through virtual meetings. This included one kick-off meeting, a series of CSC meetings, community workshops, Q&A sessions, and Charter Working Group meetings.

### Community Kick-Off Meeting

The Community Kick-Off Meeting in the ECV community was held on Wednesday, January 22, 2020 at the Coachella Library Conference Center (Figure 2-5). During this meeting, staff presented information about the AB 617 program and explained the critical role of the CSC in the development and implementation of the CERP and CAMP. During the kick-off meeting, community members were invited to fill out an interest form to express their interest in becoming a CSC member, and were then notified by mail or phone if they were selected to be a member or an alternate.

**Figure 2-5: Community kick-off meeting at the Coachella Library**

## CSC Meeting Schedule

The CSC meetings were held on an approximately monthly basis, and all meetings were intended to be held in various locations throughout the community. However, due to the COVID-19 pandemic and the resulting executive orders from the Governor<sup>3</sup>, only one in-person meeting was held in February, and the remaining CSC meetings were transitioned to a video conferencing format. Because of the additional work needed to manage this transition to virtual formats, two meetings (March and April) were postponed, but CSC meetings resumed in May using the Zoom videoconferencing platform (Figure 2-6). Each meeting was open to the public, and Spanish interpretation was available at the kick-off meeting and at every CSC meeting. A full list of the meetings and details are provided in Table 2-1 of Appendix 2.

In response to the CSC members' requests for additional meetings to discuss the charter and to develop the CERP and CAMP, staff added several CSC meetings over the course of the year, for a total of 15 meetings for the ECV community.

**Figure 2-6: Community Steering Committee meeting via Zoom**

## Meeting Facilitator

CSC meetings were facilitated by Jeanette Flores and Valerie Martinez of VMA Communications ([www.vmapr.com](http://www.vmapr.com)).

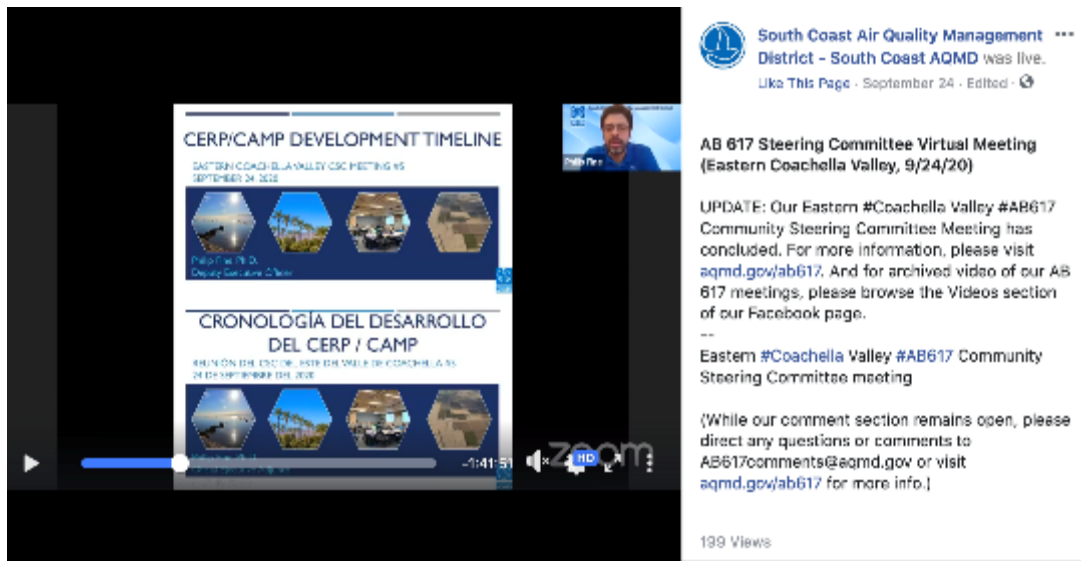

## Social Media

Staff received a suggestion from one committee member to live-stream meetings on social media in order to engage youth who use this technology and who may not be able to attend the meetings in person. All

<sup>3</sup> Governor Newsom issued Executive Order N-25-20 on March 12, 2020 and Executive Order N-29-20 on March 17, 2020.

CSC meetings were subsequently live-streamed using Facebook Live (Figure 2-7). The links to the live-stream recording were also posted on the South Coast AQMD community webpage, so that members who could not attend or view the meeting live could view the recorded video of the meeting. All CSC meetings are publicized on Instagram (Figure 2-8), Twitter, and Facebook events, and are available in English and Spanish. Each video received more than 100 views.

**Figure 2-7: Screen shot of Facebook Live recording of ECV CSC**

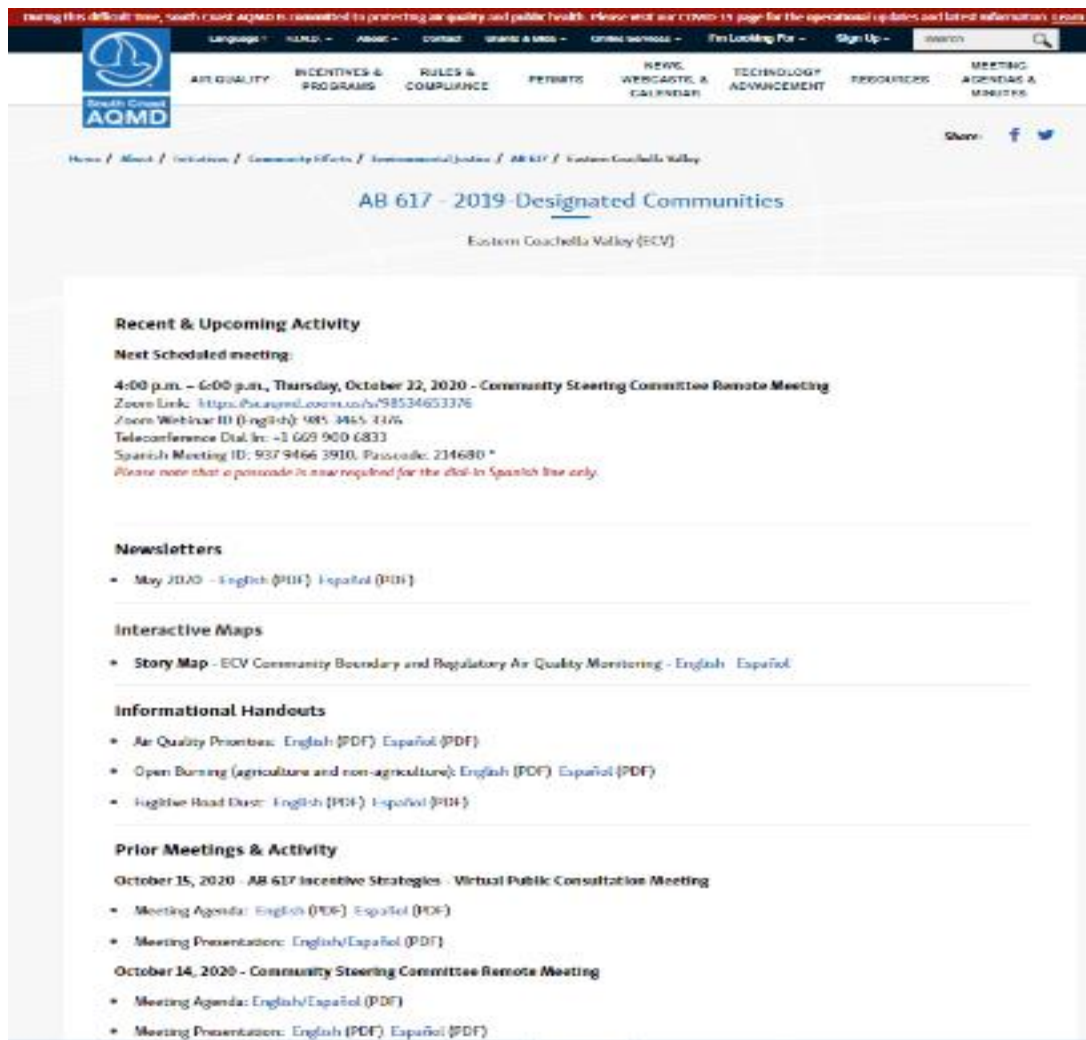

**Figure 2-8. Screen shot of Instagram post of ECV CSC**

## Community Webpage

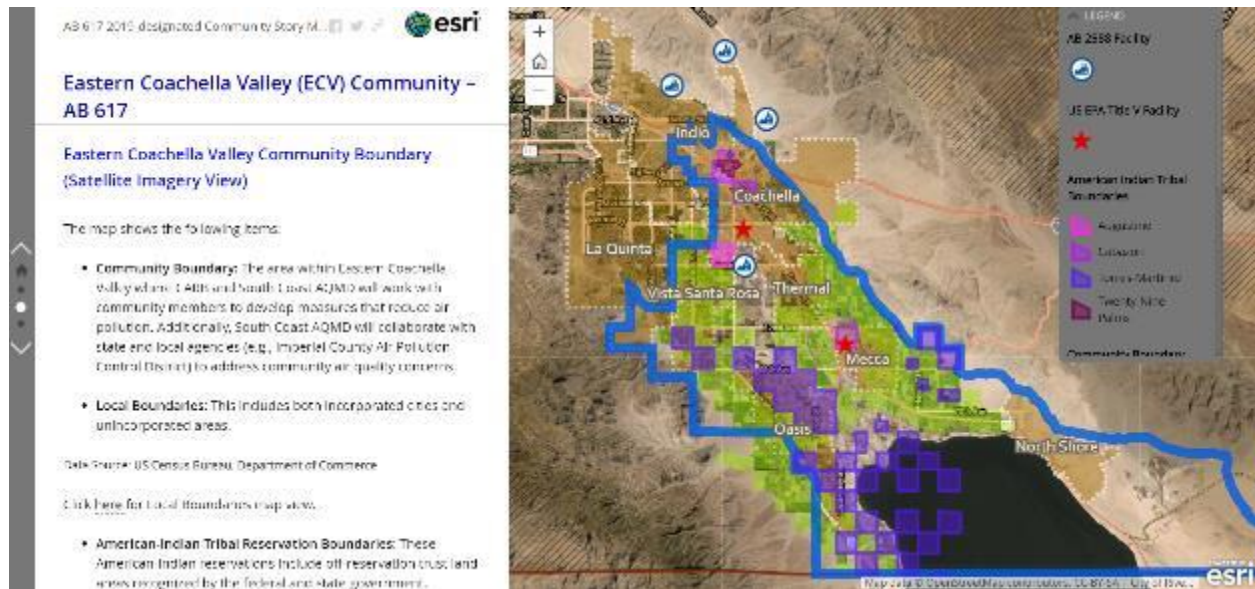

A community webpage (Figure 2-9) was created for the ECV community. The webpage includes information about upcoming meetings, meeting materials (flyers, agendas, presentations, handouts, live stream links, and meeting summaries). Additionally, the ECV community page includes interactive maps, the CSC roster, and the CAMP and CERP documents. All flyers, agendas, social media posts, presentations, and handouts to the CSC were made available in English and Spanish. Webpage: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

**Figure 2-9: Community webpage for the Eastern Coachella Valley community**

The interactive maps on the webpage presented data about the community. Figure 2-10 is an example of an interactive map that was created for the ECV community. These interactive maps provide data on land use, locations of facilities, schools, hospitals, and daycare centers, and the air quality concerns identified by the CSC and members of the public. This information was provided to help inform air quality priorities for the CERP.

**Figure 2-10: Interactive map showing land use in the ECV community**

## Community Bus Tour

A critical part of the CERP development and implementation is collaboration with committee members and the agencies, organizations, businesses, or other entities that they represent. In early 2020, a Community Bus Tour was being organized by some committee members in collaboration with South Coast AQMD staff. However, due to the Governor's executive orders related to the COVID-19 pandemic, the community bus tour remains on hold until it is deemed safe to hold such an event.

## Technical Advisory Group

In February 2019, the AB 617 Technical Advisory Group (TAG) was established to provide a forum to discuss technical details related to the development and implementation of the CAMPs and CERPs.<sup>4</sup>

In 2020, the TAG met twice to discuss technical details related to the CERP and CAMP development for the two 2019-designated communities (SELA and Eastern Coachella Valley). Topics discussed included monitoring equipment and laboratory capabilities, methodology and data sources for developing an air toxics emissions inventory at a community scale, methodology for forecasting emissions in future years, and methodology for modeling air toxics levels across geographical areas. All meetings were open to the public, webcast on the [www.aqmd.gov](http://www.aqmd.gov) webpage, and included an email option to send questions to be answered during the meeting.

Many of these technical considerations apply to all five AB 617 designated communities, thus the TAG includes up to 3 members from each CSC, and additional technical experts from academia, research institutes, and governmental agencies. The ECV CSC members who served as TAG members in 2020 are

<sup>4</sup> The webpage for the TAG: <http://www.aqmd.gov/nav/about/initiatives/environmental-justice/ab617-134/technical-advisory-group>

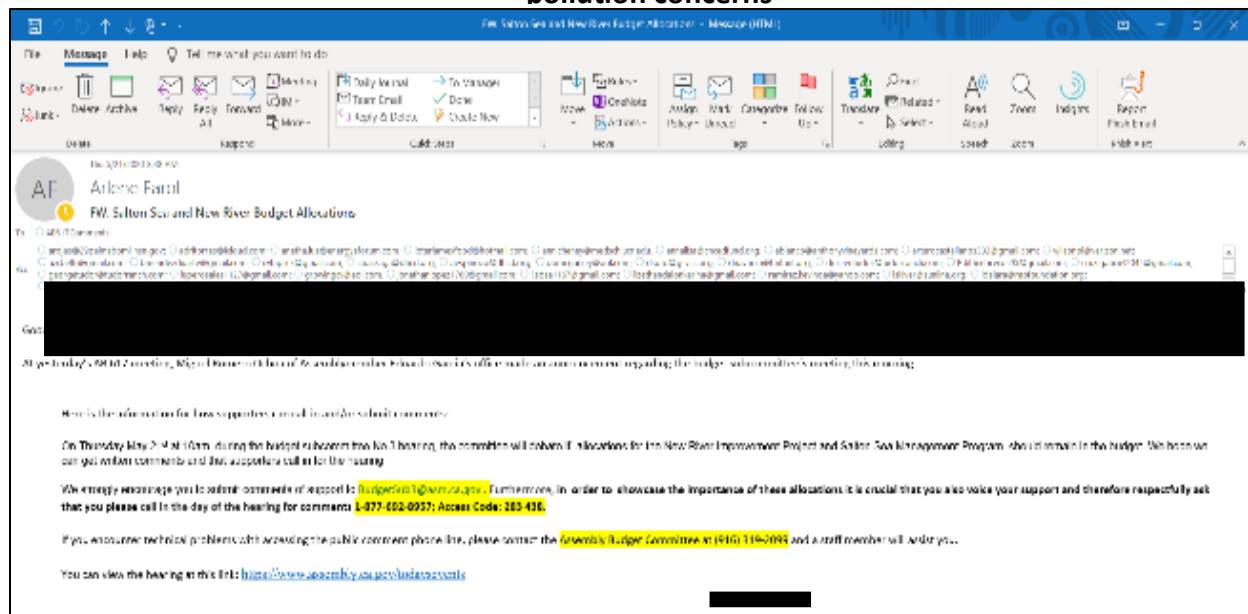

Lilian Garcia and Ryan Sinclair. Additional information about the TAG and the 2020 TAG meeting schedule are provided in the Chapter 2 Appendix.

## Additional Community Engagement

In addition to establishing the CSC and convening monthly meetings, South Coast AQMD staff participated in one-on-one or small group meetings with members, and attended meetings led by various community organizations. These meetings gave committee members an opportunity to communicate directly with staff. Additionally, these meetings give staff an opportunity to answer questions and clarify information requested from CSC members. Staff was able to gain a better understanding of the unique issues faced by each community by attending and participating in meetings led by community organizations.

Broader public engagement is also important to the AB 617 program. Every CSC meeting agenda includes an opportunity for committee members to suggest agenda items to co-create future agendas for upcoming meetings. Staff reviews comments after each CSC meeting, and responds as needed. (Figure 2-11).

**Figure 2-11: Community members are invited to share community information on air pollution concerns**

Throughout the development of the CERP, community liaisons and other staff met with community members, environmental justice organizations, industry, and other stakeholders to provide assistance and prompt response to concerns raised about the CSC process. Community liaisons also attended meetings from local organizations, environmental justice groups, city and county government to promote participation in the development and implementation of the CERP. Staff attended meetings hosted by other entities in this community to give presentations on AB 617 CERP development and had more than 35 in-person, phone, and meetings with committee members to discuss the CSC process and seek input on CERP actions. South Coast AQMD staff will continue to work with the CSC to implement the CERP actions and provide periodic community updates on implementing the plan. Community engagement is essential to the success of the CERP and the AB 617 program as a whole, and all parties

are committed to building and improving upon existing outreach efforts. An Outreach Plan will be developed to support the strategies and actions of the CERP. Staff hopes to find creative, mutually beneficial ways to partner with the CSC, community organizations and local community members. As part of the Outreach Plan, staff will work with the CSC to determine how CERP actions will help increase awareness, gain community recognition, and encourage action among the ECV community.

**Figure 2-12: Small group air quality priority exercises with CSC members and South Coast AQMD staff**

---

# CHAPTER 3A:

## COMMUNITY PROFILE

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 3a: Community Profile

### Native Lands

The Eastern Coachella Valley (ECV) is home to many native and indigenous communities, with their natural and cultural resources enriching the community in which we do this work. There are four federally-recognized tribes within the ECV: the Twenty-Nine Palms Band of Mission Indians Tribe, the Cabazon Band of Mission Indians Tribe, the Torres-Martinez Desert Cahuilla Indians Tribe, and the Augustine Band of Cahuilla Indians Tribe. South Coast AQMD recognizes the sovereignty of these tribes, and is committed to work in collaboration with these tribes on actions within the CERP that affect tribal land.

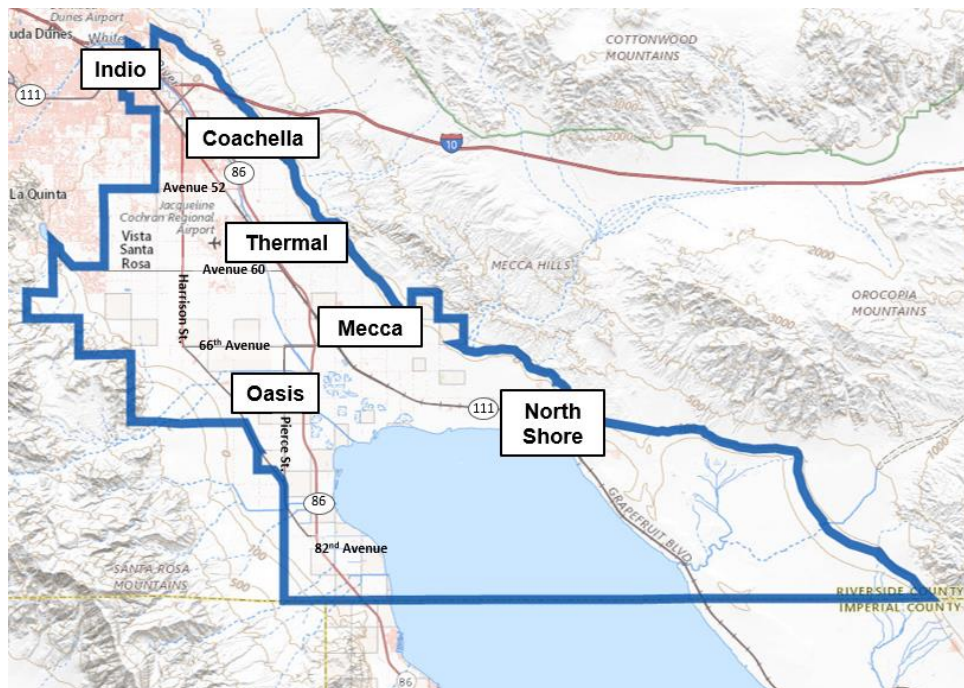

### Introduction

The community profile describes the characteristics of ECV and the types of air pollution sources that impact the community. Understanding the characteristics of ECV and the air pollution sources affecting the community is crucial to addressing the air quality priorities outlined in Chapter 5. Additional community details (e.g., types of stationary sources and socioeconomic information) are available in Appendix 3a – Community Profile.

### Community Boundary and Air Quality Priorities

The AB 617 community of ECV stretches from the City of Indio south to the Riverside County portion of the Salton Sea; it includes the City of Indio, the City of Coachella, a small portion of the City of La Quinta (southern part of the city), and the unincorporated areas of Thermal, Mecca, Oasis and North Shore (Figure 3a-1). This community is located within Riverside County and within the Salton Sea Air Basin and shares its southern border with the Imperial County Air Pollution Control District.

**Figure 3a-1: ECV Community Boundary**

During the development of the Discussion Draft CERP, the ECV CSC discussed the geographic areas and neighborhoods to include in the ECV community boundary under the AB 617 program. The CSC members focused on the most populated areas that are most burdened by environmental impacts.

The ECV CSC established one distinct geographic boundary to represent this community for the purpose of the CERP (Figure 3a-1). The “community boundary” focuses on places in the community where residents live, work, attend school, and spend most of their time, and also includes nearby air pollution sources (e.g., facilities and major truck routes), normally included in the “emissions study area.”

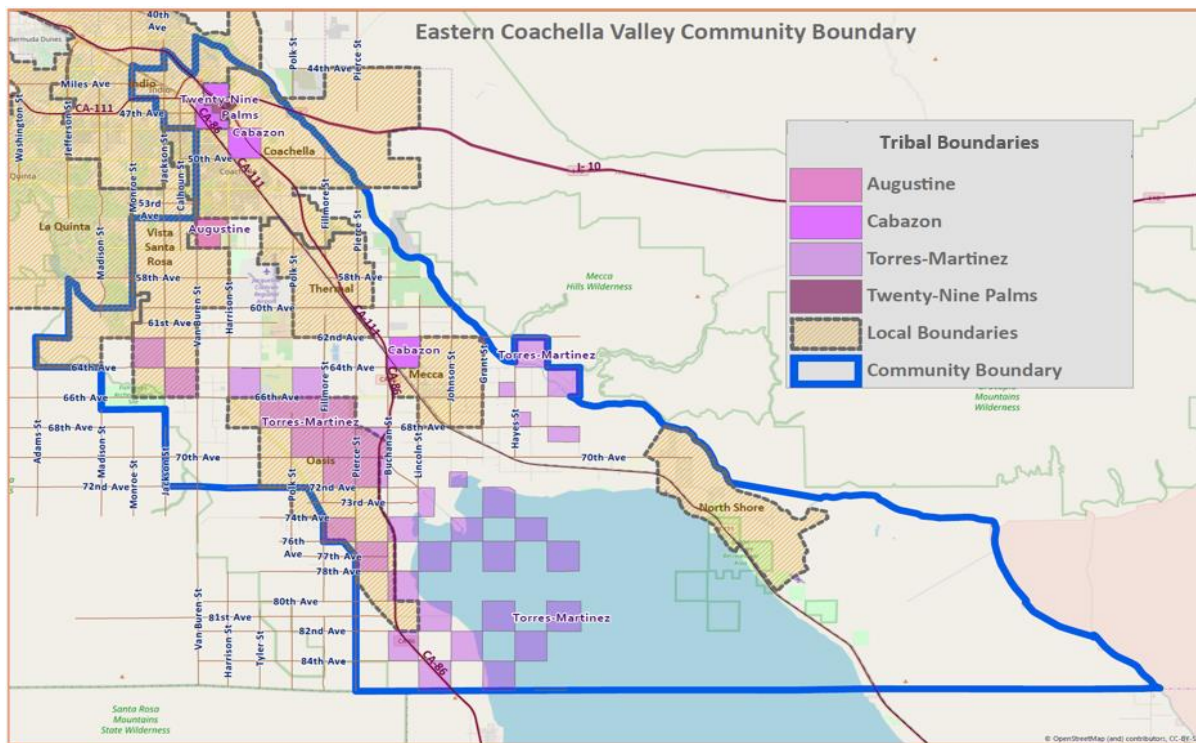

A member of Comité Civico del Valle described the community in the following way during the self-nomination process for AB 617 consideration in 2019:

*“The Eastern Coachella Valley is subject to extreme heat, gusty winds, sandstorms, and reduced precipitations patterns that regularly occur in the region, increasing exposures to harmful dusts from fields, roads, and the receding shores of the Salton Sea. Its highly transited transport corridor connecting Los Angeles, Phoenix and Northern Mexico truck routes are among the largest contributors of regional air pollutions. Furthermore, ECV a heavily undeserved (sic: underserved) agricultural community lacks the most basic infrastructure and subjective to high levels of pollution burdens. Monitoring the air quality and developing emissions reductions program will give the community the opportunity to a better quality of life in the process transforming the entire regions characteristic.”*

During the community selection process, it was widely recognized that the ECV has many unique air pollution issues (e.g., the Salton Sea, agricultural pollution, and particulate matter (PM10) in windblown dust) that are very different from those for the South Coast Air Basin. Local sources of air pollution in the ECV include fugitive dust from construction activities, vehicles on roadways (including unpaved roads), agricultural burning, and the increased exposure of the Salton Sea playa. Strong and sustained wind conditions transport particulates and contribute to high PM10 levels.

This is an area that includes several cities and rural communities within Riverside County. There are multiple sources of pollution in the region that are associated with agricultural activities, goods movement, industrial facilities and hazardous waste facilities. ECV is home to four Tribal Reservations (Figure 3a-2). These include the Twenty-Nine Palms Band of Mission Indians Tribe, the Cabazon Band of Mission Indians Tribe, the Torres-Martinez Desert Cahuilla Indians Tribe, and the Augustine Band of Cahuilla Indians Tribe. These Tribal reservations include off-reservation trust land areas recognized by the federal and state government. Another characteristic that makes this community unique is that it is highly impacted by the declining Salton Sea levels.

**Figure 3a-2: Eastern Coachella Valley Community Boundary with Local Boundaries and Tribal Reservation Boundaries**

### Indio

The City of Indio is located in the northern most portion of the community boundary, northwest of Coachella and approximately 23 miles east of Palm Springs, CA.

### Coachella

The City of Coachella is located southeast of Indio, and approximately 40 miles east of Palm Springs, California - east of Jackson Street, between Avenues 44 and Airport Boulevard with two main highways that intersect: Highway 111 and CA-86.

### Thermal

Thermal is an unincorporated community located south of the City of Coachella. Its rough boundaries are Harrison Street and CA-86; Airport Boulevard and Avenue 66, about halfway between the City of Coachella and the Salton Sea. Some residents in this community are not connected to a public water or sewer system and rely on groundwater from wells for their water.

### Oasis

Oasis is an unincorporated community located south of Thermal from Avenues 66 to 82 and between Harrison Street and CA-86. It also edges up to the northwestern part of the Salton Sea.

### Mecca

Mecca is an unincorporated community located east of Thermal. Its boundaries are CA-86 and Johnson Street, and Avenues 64 and 66, about halfway between Thermal and the Salton Sea. Mecca is the most developed and clustered community out of the four unincorporated communities in the ECV. Mecca is surrounded by agricultural fields and is located right next to Grapefruit Boulevard (Highway 111) and about one mile from CA-86. This community also houses an industrial facility adjacent to housing projects named Greenleaf Desert View Power Plant. In addition, tribal lands near the Mecca community have been hotspots for illegal dumping from outside sources and produce odors to neighboring residents and passersby.

## North Shore

North Shore is an unincorporated community located east of Oasis and southeast of Mecca edging up to the northeastern part of the Salton Sea. This community is about 20 miles from the City of Coachella and comprised of three different clusters of homes.

## Community Characteristics

In the ECV, residents work primarily in agriculture, contributing to one of the most vital agricultural regions in both the state and country. Coachella Valley's agricultural industry is the second largest contributor to the local economy. ECV residents are also the backbone of the hospitality and tourism industries in the western Coachella Valley.

The ECV is an area where the population is increasing relatively quickly. Its location is of great importance due to the proximity to the California/Mexico Border, in which most immigrants tend to settle in search of year-round or seasonal work. Those communities within the ECV community boundary are home to underserved, low-income, immigrant communities of color, Tribes, and other indigenous populations, reflecting rich, vibrant and resilient cultures that have allowed cross-cultural interaction between community members. Parts of the east side of the community lack access to the most basic and fundamental services such as potable drinking water, sewer systems, reliable transportation, and other amenities that residents need daily.

After finalizing the community boundary, the CSC discussed their air quality concerns and identified a set of air quality priorities (the full list can be found here: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/aq-priority-list.pdf?sfvrsn=8>) through an air quality prioritization activity. The results of the air quality prioritization activity (ranked list can be found here: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/priorities-june25-2020.pdf?sfvrsn=8>) was used to determine the top air quality priorities and the actions necessary to address them. The top air quality priorities for the ECV community are:

- Salton Sea
- Pesticides
- Open Burning and Illegal Dumping
- Fugitive Road Dust and Off-Road
- Diesel Mobile Sources
- Greenleaf Desert View Power Plant

The actions to address each air quality priority are described in Chapter 5.

## Community Land Use Profile and Related Data

The ECV community is shown in Figure 3a-1. The community boundary includes a land area of approximately 288 square miles. About 2% of this land area is used for residential living, 1% is zoned for commercial uses, 1% is zoned for industrial uses, 3% is used for freeways, roadways, and utilities and communications services, 29% is used for agriculture which is land that is used primarily for the production of food, fiber, and livestock, 39% is used for vacant land which is land that had not been built-up with man-made structures, and 25% is water which includes open water bodies which are greater than 2.5 acres in size. (Figure 3a-3).<sup>i</sup>

---

<sup>i</sup> Land use refers to how certain areas of land are classified for development and use. Land use data is often used for city or county planning, such as the placement of housing developments and transportation hubs. Land use data is derived from the 2016 Southern California Association of Governments (SCAG) Regional Transportation Plan/ Sustainable Communities Strategy, which is based on 2012 data.

**Figure 3a-3: Land use profile in ECV**

Appendix 3a presents data based on previous cumulative impact studies<sup>ii</sup> to describe the impacts of toxic air pollutants in this community, as well as other environmental pollution, public health factors, and social and economic factors that make people more sensitive or vulnerable to the health effects of pollution.<sup>1</sup> The Multiple Air Toxics Exposure Study IV (MATES IV) and CalEnviroScreen 3.0 are two tools used to evaluate the characteristics that describe this community. The South Coast AQMD conducts the MATES study, which used air toxics monitoring, emissions inventories, modeling, and health risk assessment techniques to calculate the cancer risk due to toxic air pollutants (“air toxics cancer risk”). CalEnviroScreen3.0 is a screening tool developed by the California Office of Environmental Health Hazard Assessment (OEHHA) that is used to identify communities that are most affected by various sources of pollution, and where people are especially vulnerable to the effects of pollution.

THIS PAGE IS INTENTIONALLY LEFT BLANK

---

# CHAPTER 3B:

## FUGITIVE EMISSIONS AND SOURCE ATTRIBUTION

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 3b: Fugitive Emissions and Source Attribution

The Community Emissions Reduction Plan (CERP) identifies air quality priorities based on community input and from evaluating technical data on emission sources in the community. The CERP defines actions and strategies to reduce the emissions and exposure burden from sources of criteria air pollutants (CAPs) and toxic air contaminants (TACs). To accurately determine emission reductions from these actions and strategies, a baseline emissions profile needs to be established. Baseline emissions can be determined through an emissions inventory that includes accounting of sources and their emissions. Source attribution analysis is the accounting of sources, their emissions and their contribution to the cumulative exposure burden and is required to meet AB 617 statutory requirements. The baseline reference year is 2018. Emissions information for facilities within the ECV community that reported emissions in 2019 to South Coast AQMD through the Annual Emissions Reporting (AER) program can be found here:

<http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/aer-data-2019.pdf?sfvrsn=8>

### Chapter 3B Highlights

- Information about the sources of air pollution in this community is presented in a “source attribution” analysis
- Diesel particulate matter (DPM) is currently the main air toxic pollutant in this community, and it comes mostly from on-road and off-road mobile sources
- Other key air toxic pollutants in this community are cadmium and arsenic from construction and demolition, and 1,3-butadiene (from mobile sources and industry)
- In future years, diesel emissions will decrease substantially due to ongoing and newly proposed regulations, but these emissions continue to be the main driver of toxicity in this community

There are many possible approaches to a source attribution analysis. Based on the data that were available for this community, this source attribution analysis emphasizes identifying sources within the community (emissions inventory) and an air quality modeling analysis to identify how much these different sources contribute to air pollution levels in the community. More information on source attribution methods is included in the Source Attribution Methodology report<sup>1</sup>. The most recent air quality modeling analysis was conducted as part of the Multiple Air Toxics Exposure Study (MATES IV) conducted in 2012 and 2013. MATES V is currently underway and will update cancer risk estimation for the Eastern Coachella Valley (ECV) as well as other parts of the South Coast AQMD jurisdiction. Previous special monitoring campaigns also identified sources of odors and hydrogen sulfide and analyzed the contribution of dust from the Salton Sea playa. More information on earlier analyses can be found in the community identification profiles<sup>2</sup>. The detailed methodology used to develop the emissions inventory is provided in

<sup>1</sup> Methodology for Source Attribution Analyses for the first year AB 617 Communities in the South Coast Air Basin (Technical Report), 2019. <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/technical-advisory-group/source-attribution-methodology.pdf?sfvrsn=8>

<sup>2</sup> Submittal to CARB – AB617 2019 Designated Communities: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/year-2/community-identification-prioritization/final-submittal-year-2.pdf>

the Source Attribution Methodology report<sup>3</sup>. A community-specific emissions inventory was developed for CAPs, including Nitrogen Oxides (NOx), volatile organic compounds (VOC), and fine particulate matter (PM 2.5), and TACs based on the most recent available data.

The primary sources of air pollution emissions in the ECV community are on-road vehicles, farming equipment, trains, off-road equipment, and certain industrial activities. This community is also highly impacted by the declining Salton Sea levels, resulting in increasing dust emissions from the Salton Sea playa. Figure 3b-1 shows the primary source categories contributing to CAPs in the ECV community in 2018.

Below is a summary of the CAP emissions in 2018:

- NOx emissions in this community are dominated by mobile sources – both on-road and off-road – which account for more than 80% of the total emissions. Heavy-duty truck traffic, trains, and off-road equipment are the largest sources for NOx. Stationary sources contribute less than 10% of NOx emissions in this community, mostly from fuel combustion in the industrial sectors.
- VOC emissions are dominated by stationary sources, with consumer products being the largest source. Passenger vehicles and off-road equipment, such as lawn mowers and small gasoline engines, are the largest contributors to VOC from on-road and off-road mobile sources, respectively.
- PM2.5 emissions are largely from stationary source emissions, with construction and demolition being the most important source. Other sources include paved and unpaved road dust and farming operations. While paved road dust is also related to vehicles traveling on roads, it is considered as a stationary source rather than a mobile source.

It is important to note that the inventory does not account for some sources of particulate matter such as unpermitted or illegal burning of waste, wildfire emissions, windblown dust from dust storms, or dust blown from the Salton Sea playa. These sources may affect air quality in specific events, but are challenging to quantify due to their inherent uncertainty. Although these emissions are not able to be quantified using available scientific methods, they are important sources of emissions that are being addressed in this CERP.

---

<sup>3</sup> Methodology for Source Attribution Analyses for the first year AB 617 Communities in the South Coast Air Basin (Technical Report), 2019. <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/technical-advisory-group/source-attribution-methodology.pdf?sfvrsn=8>

**Figure 3b-1: Primary source categories of NO<sub>x</sub>, VOC, and PM<sub>2.5</sub> emissions in the ECV community in 2018 (tons/year)**

For TACs in the baseline year 2018, DPM is the main air toxic pollutant in this community, with on-road and off-road mobile sources as the predominant sources. The primary contributors of DPM are heavy-duty trucks, trains, farm equipment, and industrial off-road diesel equipment. Stationary sources contribute to the emissions of cadmium and arsenic from the construction and demolition sector, and to emissions of 1,3-butadiene from the chemical industry. Other significant TACs include benzene and formaldehyde from on-road mobile sources. Figure 3b-2 shows TACs in ECV by toxicity-weighted diesel-equivalent emissions in 2018. The emissions are weighted based on the cancer potency of each TAC relative to DPM. For example, cancer potency of arsenic is approximately 11 times higher than that of DPM per unit of mass. Thus, arsenic emissions are multiplied by 11 to estimate the toxicity-weighted emissions of arsenic. This weighting approach shows a comparison of the contribution of each TAC to overall toxicity using a consistent scale.

**Figure 3b-2: TAC emissions in the ECV community in 2018 (toxicity-weighted diesel-equivalent, lbs/year)**

As part of the source attribution analysis, emission trends are determined for two future milestone years. The future milestone years are 2025 and 2030. Future emission trends of CAPs and TACs in the ECV community are projected using the best available information on population growth, economic growth and emission adjustments reflecting the ongoing implementation of existing regulations that reduce specific air pollutants. Regulations reflected in these projections include South Coast AQMD and CARB regulations.

Figure 3b-3 shows the projected CAP emissions (NO<sub>x</sub>, VOC and PM<sub>2.5</sub>) in the ECV community in the two future milestone years 2025 and 2030, along with the baseline year 2018. Below is a summary of the CAP emissions between 2018 to 2030:

- NO<sub>x</sub> emissions in the community are expected to decrease substantially between the year 2018 through 2030, due to the existing regulations on mobile sources, despite the expected increase in industrial and mobile source activities.
- VOC emissions are expected to increase between 2018 and 2030, mostly due to increased consumer product use and industrial activities, including industries in degreasing, coatings, adhesives, and waste disposal.

- PM2.5 emissions are also projected to increase between 2018 and 2030, due to increases in construction and demolition activities.

**Figure 3b-3: Emission trends in ECV for NOx, VOC, and PM2.5 (tons/year) for the years 2018, 2025 and 2030**

Trends for TAC emissions are shown in Figure 3b-4. DPM continues to dominate the TAC emissions inventory in future years, despite a significant reduction in DPM from heavy-duty trucks and off-road equipment. DPM emissions are projected to decrease by 67% between 2018 and 2030. Emissions of cadmium, arsenic, nickel and lead are projected to increase due to the increase in construction and demolition activities as well as paved road dust. Emissions of 1,3-butadiene are expected to increase due to an increase in industrial activity in the chemical sector and in off-road equipment emissions. Benzene and formaldehyde emissions are projected to decrease from 2018 to 2025 due to decreases in the emissions from vehicles, but they are expected to increase slightly through 2030 due to increasing emissions from industry and off-road equipment. Additional details on the source attribution for ECV can be found in Appendix 3b.

**Figure 3b-4: Emission trends in ECV for TACs (toxicity-weighted diesel-equivalent, lbs/year) for the years 2018, 2025 and 2030**

---

# CHAPTER 4:

## ENFORCEMENT PLAN

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 4: Enforcement Plan

### Introduction

This chapter describes the history and overall approach to enforcement by South Coast AQMD and the California Air Resources Board (CARB). In addition, the Community Emissions Reduction Plan (CERP) includes focused enforcement actions, which are described in Chapter 5 (e.g., open burn inspections).

### Enforcement Programs - Purpose and Jurisdiction

The primary goal of enforcement activities is for regulated entities to comply with air quality rules and regulations, and to protect public health. Part of this process involves consistently identifying and resolving violations, thereby ensuring a level playing field for all regulated entities and preventing unfair advantages for companies that do not comply with rules and permit conditions.

Both CARB and South Coast AQMD enforce air pollution regulations, conduct inspections of air pollution sources, and have the authority to issue Notices of Violations that can lead to the recovery of penalties.<sup>i</sup>

An air pollution source can be a specific piece of equipment, a business, a government agency, or any other entity that creates air pollution. CARB is primarily responsible for enforcing rules that apply to mobile sources, while South Coast AQMD is primarily responsible for stationary sources (e.g., facilities).

### Chapter 4 Highlights

- From 2017 through 2019, CARB conducted over 1,500 inspections and South Coast AQMD responded to approximately 370 complaints and conducted over 300 inspections within the Eastern Coachella Valley community.
- Both CARB and South Coast AQMD will continue to coordinate their enforcement programs to address air pollution sources effectively within their respective jurisdictions.
- An enforcement approach that utilizes specialized program structures, outreach efforts in the community, use of technology, and interagency partnerships can lead to further emission reductions.

**Table 4--1: Overview of regulatory authority for South Coast AQMD and CARB**

Air Pollution Source Category	Examples	Main Regulatory Agency
<b>Mobile sources<sup>ii</sup></b>	Trucks, buses, ships, boats, cargo handling equipment	CARB
<b>Stationary sources</b>	Refineries, power plants, oil/gas facilities, manufacturing plants	South Coast AQMD
<b>Area-wide sources</b>	Paint used on buildings, prescribed burning, open burning	South Coast AQMD
<b>Sources of greenhouse gases</b>	Methane and certain other mobile source emissions, refrigerants, and other sources	CARB and South Coast AQMD

<sup>i</sup> More information about penalties is provided in Appendix 4.

<sup>ii</sup> Railroad operations are regulated at the federal level primarily by the Federal Railroad Administration and the Surface Transportation Board, and locomotive emissions are regulated by the U.S. EPA. These agencies' regulatory authority may preempt certain federal, state, and local regulatory authorities and actions.

## Enforcement History

Both CARB and South Coast AQMD enforcement staff have had a significant presence in the community of Eastern Coachella Valley for many years. This section provides the most recent three-year enforcement history for each agency in this community.

### South Coast AQMD Enforcement History in the ECV Community

South Coast AQMD's enforcement presence is comprised of many different compliance-related activities including, but not limited to, investigating complaints, responding to breakdowns and performing facility inspections.

Responding to complaints is a crucial part of South Coast AQMD's enforcement program. By taking complaints directly from members of the public, inspectors can focus their efforts to identify and address air pollution problems that matter to the community. South Coast AQMD's enforcement team gives priority to complaints and attempts to respond to every air quality complaint received. Figure 4-1 shows the number and types of complaints received and responded to by South Coast AQMD staff.

**Figure 4-1: Number of complaints (by type) in the Eastern Coachella Valley community**

South Coast AQMD enforcement staff perform inspections at facilities and other air pollution sources. These can include onsite inspections for permitted and non-permitted equipment, fugitive emissions, and compliance with rules and permit conditions, as well as surveillance activities in the community, such as efforts to trace the source of an odor. Additionally, South Coast AQMD enforcement staff perform inspections of open burn piles to ensure compliance with rules governing open burning. As of September 2020, there are approximately 233 facilities

permitted by the South Coast AQMD in this community. A list of these facilities is available in Appendix 4. From 2017 through 2019, South Coast AQMD staff conducted 63 facility inspections within the ECV Community Boundary, and 250 open burn inspections.

Enforcement actions may involve issuing two types of notices:

- *Notice to Comply* (NC) – requiring a facility to correct a minor violation or to provide specified records; or
- *Notice of Violation* (NOV) – formally identifying violations of particular rules or regulations, which may result in civil penalties or, in some cases, referral for criminal prosecution.

From 2017 through 2019, South Coast AQMD issued 75 NCs and 62 NOVs in the ECV community. Figure 4-2 shows the number of NCs and NOVs in this community during this period. A list of these enforcement actions is available in Appendix 4.

**Figure 4-2: Number of Notices to Comply (NCs) and Notices of Violation (NOVs) issued in the Eastern Coachella Valley community**

### CARB Enforcement History in this Community

CARB's enforcement approach is two-pronged: ensuring compliance through robust, regular inspections and deterring violations through the penalty assessment process. From the compliance side, it includes conducting both field inspections and fleet-wide audits. For field inspections, the focus has been on enforcing heavy-duty diesel vehicle (HDDV) regulations, such as the Truck and Bus Regulation, the airborne toxic control measure (ATCM) to limit idling, and the Heavy-Duty Vehicle Inspection Program (HDVIP). At refineries and fueling stations, CARB enforces fuel formulation regulations. For railyards, CARB enforces regulations related to drayage trucks, transportation refrigeration units (TRUs), and cargo handling equipment (CHE) (see Figure 4-4: **CARB**

**Enforcement Programs Relevant to the ECV Community** below for a more detailed description of the enforcement program). From the deterrence-side, CARB Enforcement encourages violators to support CARB's community-based projects by setting aside a portion of penalties paid from enforcement action settlements for Supplemental Environmental Projects (SEPs).

As shown in Figure 4-3 below, CARB conducted over 1,500 HDDV inspections in the ECV community from 2017 to 2019 (see Appendix 4, Table 1 for a summary of HDDV enforcement activities in ECV, and Appendix 4, Table 3 to review individual HDDV inspection data). The overall compliance with CARB regulations was 90 percent but varies annually. This may depend on a few factors, including the number of vehicles inspected and the method of selecting vehicles for inspection (e.g., targeting vehicles that might fail inspection). Over the three-year period, CARB issued 157 citations in the ECV community, 122 of which were for emissions-related violations (i.e., violations that directly contribute to air pollution) and 35 for non-emissions related violations (e.g., violations that could contribute indirectly to air pollution, such as a truck not complying with labeling requirements).

**Figure 4-3: CARB 2017-2019 HDDV Enforcement History in ECV**

Of the 784 heavy-duty trucks and buses and off-road equipment CARB has observed idling in the ECV community over the past three years, 38 were not in compliance with CARB's commercial vehicle, off-road equipment, or school bus idling rules (95 percent compliance overall). Reasons for a heavy-duty diesel truck to be compliant with the idling regulation can include idling for less than five minutes or idling greater than 100 feet from restricted areas such as schools and senior care facilities with a certified clean idle sticker. Compliance with CARB's idling

rules does not mean a vehicle complies with other CARB rules. CARB field enforcement has begun to focus on ensuring that these idling vehicles are also in compliance with all other pertinent CARB rules by conducting heavy-duty diesel compliance inspections along with idling inspections. Two important areas with lower compliance rates were off-road vehicles, like construction equipment, and TRUs— small transportation refrigeration units used to cool truck cargo areas—with compliance rates of 31 percent and 46 percent, respectively. Inspections under the Drayage Truck Regulation and the HDVIP were low and may not accurately reflect the rate of compliance under each program in the ECV community.

CARB field enforcement can only inspect a limited number of trucks. Therefore, vehicles more likely to be out of compliance, such as older or smoking vehicles tend to be pulled over more frequently than other vehicles. Additionally, compliance with the Truck and Bus Regulation is now supported by the California Department of Motor Vehicles (DMV) registration holds, moving that compliance rate even closer to 100 percent.

Beginning in 2018, CARB added the Streamlined Truck Enforcement Program (STEP) to enhance its ability to enforce the Truck and Bus Regulation through fleet-wide audits. From January 2018 to October 2019, CARB audited 377 fleets with a total of 1,155 vehicles in the ECV community and found 881 vehicles were compliant. CARB sent 244 fleets warning letters, and 308 Notice to Comply or Notice of Violation letters to vehicle owners during this time period. From this process, CARB brought 30 vehicles into compliance through meeting CARB's Truck and Bus Regulation requirements and an additional 191 vehicles into compliance by requesting registration holds from the California DMV. Other vehicles are either in compliance through declaration of non-operational or low mileage usage status, sold out of state, or still in the process of being brought into compliance. While this process is faster than in-person fleet inspections, CARB staff believes that compliance with the Truck and Bus Regulation will continue to improve as California DMV vehicle registration is tied to compliance with the regulation through the end of 2023.

In addition to heavy-duty diesel vehicle inspections, CARB inspected 24 other, less common vehicle types and smaller engines, such as off-highway recreational vehicles and small off-road engines, from 2017 through 2019 in the ECV community, and found one violation under the Dealer and Fleet Tampering Program<sup>iii</sup>.

In summary, from 2017 through 2019, both CARB and South Coast AQMD have conducted a range of compliance activities in the community. This includes more than 1,500 inspections from CARB enforcement staff related to heavy-duty diesel vehicles. Of those inspections, the majority (90 percent) were in compliance. South Coast AQMD enforcement staff conducted approximately 63 facility inspections, 250 open burn inspections, responded to approximately 370 complaints, and conducted numerous other investigatory activities in ECV. South Coast AQMD issued 62 Notices of Violation. A compliance rate may not be an effective predictor of overall compliance within the area, since a portion of compliance actions are against the same facilities. Due to the CSC's air pollution concerns in this community, an enforcement approach by both agencies that fully utilizes their specialized program structures, outreach efforts in the community, use of technology, and interagency partnerships can lead to further reductions in noncompliance and emissions. Both CARB and South Coast AQMD will continue to work closely with the CSC to identify and investigate air quality issues within the community.

## Enforcement Approach

CARB and South Coast AQMD have each designed their programs to effectively address compliance with air pollution sources under their respective jurisdictions.

---

<sup>iii</sup> See Appendix 4 for Vehicles and Engines Enforcement History in ECV for more information

## South Coast AQMD's Office of Compliance & Enforcement (OCE)

The structure of this group is based on inspection teams that focus on source type, with most inspectors assigned by geographic region. The organizational structure based on source type enables inspectors to become technical specialists on the air pollution regulations that apply to the types of industries or facilities assigned to that team. In addition, assigning inspectors by geographic area improves the agency's ability to respond in a timely manner to complaints or compliance issues in their assigned areas.

A list of OCE teams is provided in Figure 4-5 below. Examples of those teams include the Industrial team which has broad knowledge and inspects a wide variety of source types and equipment, the Toxics & Waste Management team which has the training and personal protective equipment to conduct inspections at facilities with toxic air contaminants, and the Service Station team which specializes in inspecting gas stations. Certain facilities may be inspected by staff members from multiple teams. This ensures that the approach is focused enough to address a variety of sources, yet flexible enough to handle complex facilities.

For most teams, the inspectors conduct regular inspections at their assigned facilities or within their assigned geographic regions. The frequency of regular inspections depends on the type of facility. For example, a chrome plating facility is inspected more frequently than an auto body shop. It is important to consider that there are approximately 110 chrome plating facilities in the South Coast Air Basin, compared to over 1,500 auto body facilities in the region. When considering limited resources, priority for inspections is typically given to higher risk pollution sources – that is, those facilities that emit the more toxic air pollutants and/or are close to schools, hospitals, and residential areas.

**Figure 4-5: South Coast AQMD Enforcement Program**

The **Area Sources team** focuses on small emissions sources that are relatively common and widely distributed; although each individual source is small, together these sources have a substantial total impact on air pollution. Examples include paints, consumer products (e.g. hairspray, home cleaning products), residential water heaters, and agricultural burning.

The **Industrial team** focuses on the widest variety of sources, ranging from dry cleaners to large manufacturing facilities to idling trucks. Inspectors in this team are assigned a geographic region and normally spend much of their time in the field. From this team, inspectors regularly conduct compliance activities in ECV.

The **Major Sources team** focuses on sources that are in the RECLAIM\* program. Examples of these sources include power plants, oil production sites, and large manufacturing facilities. Inspectors in this team are assigned by facility, with each inspector assigned a set of facilities, some of which are in ECV.

The **Service Station team** focuses on gasoline service stations that serve the public, which can emit volatile organic compounds (VOCs). Inspectors in this team are assigned a geographic region. From this team, inspectors regularly conduct compliance activities in ECV.

The **Toxics team** focuses on facilities that emit Toxic Air Contaminants, including hexavalent chromium, lead, and other toxic metals. Examples include landfills, waste treatment facilities, and chromium plating shops. Inspectors in this team are assigned a geographic region, and regularly conduct compliance activities in ECV.

The following teams are part of OCE, but do not regularly conduct activities in ECV:

The **Energy team** focuses on crude oil production, energy storage sites, and bulk petroleum terminals. Inspectors in this team are assigned by facility, with each inspector assigned a set of facilities.

The **Refinery team** focuses on all the refineries, auxiliary hydrogen plants, and marine terminals in the South Coast Air Basin. Inspectors in this team are assigned by facility, with each inspector dedicated to a refinery and auxiliary plants. This team is based full-time in the Long Beach Field Office to ensure close proximity to the refinery sources that it regulates.

\*Regional Clean Air Incentives Market requires participating facilities to manage their total nitrogen oxides (NO<sub>x</sub>) and/or sulfur oxides (SO<sub>x</sub>) emissions by adding pollution controls, changing their equipment or processes, or buying credits from other RECLAIM facilities that have lower emissions than their cap. The allowable amount of such emissions is reduced over time. The program is being transitioned to a command-and-control regulatory program.

## CARB Enforcement's Program Structure

CARB enforcement's structure is based on over 50 enforcement programs that focus on specific source types. One of CARB's most comprehensive inspection programs has been around for decades—the Heavy-Duty Vehicle Inspection Program that ensures that vehicles are well-maintained in order to help keep air pollution low and meet the engine and smoke opacity standards. Last year, CARB's smoke opacity standard was tightened so that almost any smoke coming out of a HDDV is in violation of the standard (smoke opacity must be less than five percent for diesel particulate filter-equipped vehicles). This program helps ensure vehicles engines and emissions controls are properly maintained.

While this was the only truck rule CARB had related to reducing particulate matter emissions from trucks before the year 2000, the classification of diesel particulate matter as a toxic air contaminant in 1998 in California increased CARB's ability to regulate emissions from diesel vehicles. CARB regulations now reduce emissions from all types of fleets, like trash trucks, trucks and buses owned by public agencies, drayage trucks that carry cargo containers to and from ports and railyards, and most other trucks and buses over 14,000 pounds. Most of these trucks and buses are now required to have 2010 or newer model year engines by the end of 2023 to legally operate in California. In January 2020, the California DMV began requiring compliance with CARB's Truck and Bus Regulation for some of the older trucks in order to get the vehicle registered.

CARB has other rules that may be pertinent to the ECV community. TRUs, the small engines that keep goods in trucks cooled, are significant sources of diesel particulate matter for areas with cold storage warehouses. Under the Consumer Products Regulation, CARB ensures the VOCs that contribute to smog-formation are minimized in cleaners and other household goods through extensive statewide inspections. CARB also inspects motor vehicle fuels such as gasoline and diesel fuel to make sure they meet fuel standards that help achieve the maximum degree of emissions reduction possible from vehicular and other mobile sources. Finally, CARB ensures commercial trucks and buses, school buses, and off-road vehicles idle in compliance with the three corresponding regulations<sup>iv</sup>. Please see Figure 4-4: **CARB Enforcement Programs Relevant to the ECV Community** below and Appendix 4 for more HDDV enforcement program descriptions.

---

<sup>iv</sup> Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Vehicle Idling: <https://ww3.arb.ca.gov/regact/idling/idling.htm>; School Bus Idling Airborne Toxic Control Measure: <https://ww3.arb.ca.gov/toxics/sbidling/sbidling.htm>; Off-road Diesel Regulation: <https://ww3.arb.ca.gov/msprog/offroadzone/landing/offroad.htm>

**Figure 4.4: CARB Enforcement Programs Relevant to the ECV Community**

CARB ensures regulatory truck and bus **idling** limits are not exceeded. Trucks and buses with certified Clean Idle stickers are allowed to idle for longer than the five-minute limit. However, all trucks and buses - including those with certified Clean Idle stickers - are not allowed to idle within 100 feet of the property line of restricted areas such as schools, hospitals, and senior care facilities.

**Drayage** vehicles move goods by certified heavy-duty diesel vehicles (HDDV). HDDVs that enter the port or intermodal rail facility are required to be certified to meet 2007 Engine Model Year emission standards.

For the **Heavy-Duty Vehicle Inspection Program**, CARB regularly conducts inspections for:

- Diesel Emission Fluid (DEF): a liquid used as a reductant in heavy duty diesel engines to reduce NOx emissions.
- Emission Control Label (ECL): Engine certification labeling requirements
- Smoke/Tampering: Requires heavy duty trucks/buses to be inspected

**Statewide Truck and Bus** program requires all vehicles with 2009 or older engines weighing over 14,000 pounds to reduce exhaust emissions by upgrading to 2010 or newer engines by 2023. Non-compliant vehicles are denied DMV registrations.

**Transportation Refrigeration Units (TRUs)** are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products transported in various containers. CARB staff inspect TRUs to ensure that the units are meeting labeling and in-use performance standards.

The **Off-Road Regulation** requires off-road fleets (i.e., of construction equipment such as bulldozers, graders, and backhoes) to meet fleet average emission standards and be equipped with best available control technology (BACT).

Through targeted enforcement and public complaints, CARB identifies potential violations. CARB staff then contacts the responsible party to explain the enforcement process and to obtain additional information. Enforcement staff evaluates the information collected and works with CARB's Legal Office to determine violations of statutory and/or regulatory requirements. When violations are substantiated, CARB staff can take enforcement action, at which point the responsible party is provided an opportunity to discuss the violation.

Enforcement actions within the scope of CARB’s enforcement authority may include issuing cease and desist orders, Notices of Violation, mitigation, or pollution prevention actions. Cases can be resolved via civil and criminal litigation as well as administrative penalties. In lieu of litigation, cases are typically resolved via mutual settlement. Penalties are sought that provide adequate deterrence to future non-compliance or public nuisance, and to take away any economic benefit of non-compliance.

For example, in 2017, CARB settled cases with Union Pacific Railroad Company (UP) and BNSF Railway regarding inaccurate and incomplete reporting of non-compliant drayage trucks entering their intermodal facilities. Under CARB’s Drayage Truck Regulation, California ports and Class I rail terminals must report to CARB any non-compliant heavy-duty diesel trucks entering their facilities. For years, BNSF and UP failed to accurately report to CARB information on non-compliant trucks entering their facilities, which hampered CARB staff’s ability to enforce the regulatory requirements. The settlements resulted in UP turning away non-compliant trucks from their facilities and BNSF accurately reporting truck data to CARB for enforcement, resulting in reduced diesel emissions from heavy-duty diesel trucks around both UP and BNSF facilities.<sup>ν</sup>

During the settlement process, violators have the opportunity to allocate up to 50 percent of their penalties to a Supplemental Environmental Project (SEP). SEPs are community-proposed and community-based projects that aim to improve public health, reduce pollution, increase environmental compliance or bring public awareness to air pollution issues. If community members are interested in submitting a SEP proposal, please contact the Community Outreach and Enforcement Section at [COES@arb.ca.gov](mailto:COES@arb.ca.gov) (See Appendix 4 for additional information on SEPs).

## How the Public Helps Reduce Air Pollution

Members of the public play an important role in communicating air quality concerns to both CARB and South Coast AQMD. The complaint process helps both agencies identify issues that are directly affecting the ECV community. The most effective way to contact the agencies is through the complaint hotlines. In addition to South Coast AQMD’s mobile application, both agencies can be contacted by phone and online:

<p><b>CARB - Mobile Sources</b></p> <p><b>Automobiles, Trucks, Off-road Equipment, or other Vehicles</b></p> <p>Phone: 1-800-END-SMOG</p> <p>Online: <a href="http://calepa.ca.gov/enforcement/complaints">calepa.ca.gov/enforcement/complaints</a></p>	<p><b>South Coast AQMD - Stationary Sources</b></p> <p><b>Odors, Smoke, Dust, or other Air Contaminants</b></p> <p>Phone: 1-800-CUT-SMOG (1-800-288-7664)</p> <p>Online: <a href="https://www.aqmd.gov/home/air-quality/complaints">https://www.aqmd.gov/home/air-quality/complaints</a></p>
---	--

Both CARB and South Coast AQMD value input from those who live and work every day in the community. Communicating air quality issues directly to the agencies with the information below is the best way to address an air pollution concern. Reporting an issue when it is occurring rather than after the fact helps the investigating agency’s ability to find the source of the problem.

An effective complaint should contain information with specific details. It is very helpful to let CARB or South Coast AQMD know of a problem when it is occurring. This information helps inspectors conduct a thorough investigation and take appropriate enforcement action. The information below is valuable to complaint investigations:

<sup>ν</sup> Other examples of enforcement settlement cases can be found in CARB’s Annual Enforcement Reports (<https://www.arb.ca.gov/enf/reports/reports.htm>).

- Type of air quality concern (odor, smoke, dust, etc.)
  - o Odors: description of odor
  - o Smoke: color of smoke; does the smoke disappear or hang in the air?
  - o Dust: type of dust (e.g., construction activities)
- Location of air pollution concern
- Name or address of potential source
- Time of day that the air quality issue began, and is the concern still occurring?
- Has the concern occurred before, and do other people in your community experience it as well?
- Contact information for the person reporting the complaint<sup>vi</sup>

## Enforcement Considerations

An effective enforcement program must be flexible and adaptable to address the needs of the communities that are being served. Part of being adaptable is the ability to identify and address gaps in the enforcement process, such as previously unknown facilities or new pollutants of concern. As revealed over the course of the public process for CERP development, one such gap has been a lack of communication with members of the community, who have firsthand experience with local emissions sources and whose input is valuable to enforcement efforts. South Coast AQMD staff has therefore prioritized outreach and added staff to interact directly with the AB 617 communities. Because South Coast AQMD organizes its enforcement division both by source type for technical specialization and by geographic region, there is not a single dedicated enforcement team for AB 617; rather, the effort is spread across multiple existing teams so that a larger number of complaints and potential violations of air quality rules can be identified and addressed.

In addition, both CARB and South Coast AQMD currently maintain extensive records of compliance-related activities using databases and other digital resources. South Coast AQMD uses these resources to track metrics such as complaints, inspections, and enforcement actions. The data provided in this chapter and Appendix 4 are obtained from those databases. The statistics being tracked are also routinely reevaluated. For example, South Coast AQMD recently added an Agency Technical Assistance metric for instances where South Coast AQMD was asked by another agency to assist in that agency's efforts. CARB and South Coast AQMD will both continue to evaluate new metrics that may help to track and analyze inspectors' efforts in the AB 617 communities in order to attempt to identify more effective allocations of resources and/or potential solutions to air quality issues.

Finally, enforcement mechanisms exist to promote, and if necessary, compel, compliance by regulated sources. As discussed above, after South Coast AQMD inspectors investigate complaints and/or conduct facility inspections, they can issue NCs or NOVs. While both NCs and NOVs will generally require further action by a source, NOVs are referred to the Office of the General Counsel, where civil penalties are negotiated. If no settlement is reached, a civil lawsuit may be filed in superior court. Ongoing noncompliance, however, may lead to a petition before the South Coast AQMD Hearing Board. CARB and South Coast AQMD have each had a presence in this community that has led to various enforcement actions against local facilities.<sup>vii</sup>

In summary, the compliance process seeks to ensure that all rules and regulations are followed through a fair and robust enforcement program, resulting in reduced air pollution emissions. Adaptability is crucial, whether in the programs overall, or in day-to-day operations, to ensure that community concerns are addressed, and that enforcement action is taken when violations are identified. Both CARB and South Coast AQMD enforcement teams will continue to search for innovative strategies, take swift action to address noncompliance, and update the CSC on enforcement actions in the community.

<sup>vi</sup> Although anonymous complaints are accepted, staff have found that having contact information helps with confirming locations and other information necessary for a successful investigation, as well as reporting back to the complainant.

<sup>vii</sup> Additional details on South Coast AQMD and CARB enforcement actions can be found in Appendix 4.

---

# CHAPTER 5A:

## INTRODUCTION

---

## Chapter 5a: Introduction

---

### Introduction

The Community Emissions Reduction Plan (CERP) and the Community Air Monitoring Plan (CAMP) provide an overall path to reducing air pollution in the ECV community. Through the development of the CERP and CAMP, the Community Steering Committee (CSC) identified air quality priorities based on sources of air pollution that are of concern to the community (e.g., Salton Sea, potentially toxic dust, open burning). To reduce air pollution from these sources, the CSC identified a set of actions for inclusion in the CERP to be implemented by government agencies, organizations, businesses and other entities.

The CSC identified the Salton Sea, pesticides, open burning and illegal dumping, fugitive road dust, diesel sources, and the Greenleaf Desert View Power Plant (formerly Colmac Energy, Inc.) as air quality priorities to address in the CERP and CAMP. These air pollution sources are often near homes, schools, and other community areas where the public can be exposed to harmful pollutants. Therefore, additional air monitoring in the community to inform emissions and exposure reduction measures is also important to the CSC.

### Ongoing Efforts

The South Coast AQMD, the California Air Resources Board (CARB), United States Environmental Protection Agency (USEPA), and Tribal EPA has air quality regulations to reduce air pollution from sources such as trucks, diesel farm equipment, open burning, fugitive road dust and electricity-generating facilities such as the Greenleaf Desert View Power Plant. As part of ongoing efforts, staff continues to explore and identify additional funding opportunities to reduce emissions in AB 617 communities. The relevant agencies also enforce these regulations. More information on enforcement efforts is available in Chapter 4.

### Opportunities for Action

In addition to the ongoing efforts described above, the CSC, in collaboration with South Coast AQMD staff, identified 15 goals to reduce air pollution in the ECV community. The CERP defines how progress toward each goal is assessed by including specified metrics and timelines for each action. Additionally, the CERP identifies the entities responsible for implementing the actions. Responsible entities include collaborating agencies that have jurisdictional authority and/or supporting entities to implement the actions. The actions define a path to reduce emissions and exposures in the ECV community. In some instances, the actions reaffirm ongoing rule development efforts and provide new commitments for localized reductions, sharing emissions data, new or accelerated timelines, and other related information.

### Emission Reduction Targets

The actions in the CERP prioritize emissions reductions in the ECV community. The CERP includes emission reduction targets, where quantifiable, for oxides of nitrogen (NO<sub>x</sub>), diesel particulate matter (DPM), and particulate matter 2.5 microns or smaller (PM<sub>2.5</sub>). Table 1 below, provides a list of the overall emission reduction targets for the CERP. Additionally, the CERP is expected to reduce 2.4 tpy of particulate matter 10 microns or smaller (PM<sub>10</sub>) by 2030. Baseline emissions refer to expected future emissions without any new action or regulation beyond those already adopted. The CERP is expected to result in additional emission reductions that have yet to be quantified (e.g., actions focused on enforcement and outreach).

Table 1 – CERP Emission Reduction Targets		
Emissions	NOx	DPM
2018 Emissions in tons per year (tpy))	1,376	24
Projected 2025 Baseline Emissions (tpy)	982	11
Emission Reductions from CERP, by 2025 (tpy)	54	1
Overall Emission Reductions from 2025 (%)	33	58
Projected 2030 Baseline Emissions <sup>1</sup> (tpy)	878	8
Emission Reductions from CERP, by 2030 (tpy)*	115	2
Overall Emission Reductions from 2030 (%)	45	77

\*Estimated emission reduction targets from CERP, by 2030 include 15.6 tpy NOx, 1.4 tpy DPM from projected incentive projects.

Table 2 – Emission Reduction Targets for Statewide Measures*						
Statewide Measure	Action Date	Implementing Entity	Emission Reductions Targets 2025/2030 (tpy)			
			NOx	VOC	DPM	PM2.5
Advanced Clean Car 2	2020-2021	CARB	-/1.0	-/0.5	-/<0.1	-/<0.1
Heavy-Duty Inspection and Maintenance	2020	CARB	38.4/47.8	-/-	0.7/0.7	0.6/0.7
Low NOx Engine Standard	2019	CARB	2.7/22.3	-/-	-/-	-/-
Small Off-Road Engine Amendment	2020	CARB	13.2/28.0	12.3/56.5	0.1/0.4	0.2/1.4

\*Emission reduction targets based on estimates from CARB. Emission reductions are subject to future assessment and regulatory analysis that may result in emission reduction adjustments.

## Land Use

Land use planning is the process of regulating or managing the use of land to consider factors (e.g., social, economic) to guide the development of a community and preserve its resources and quality of life. These decisions are generally made by city or county planning agencies. Zoning is used to help governments

regulate the physical development of land and type of uses on these lands (e.g., residential, commercial, industrial). State law expressly prohibits South Coast AQMD from land use decisions. Although South Coast AQMD does not have land use jurisdiction, staff works with land use agencies through California Environmental Quality Act (CEQA). CEQA requires state and local agencies to identify and reduce the environmental impacts of land-use decisions. Through the CEQA process, staff has the opportunity to provide technical expertise and recommendations to mitigate air quality impacts. South Coast AQMD has a robust Intergovernmental Review (IGR) program, in which staff reviews and comments on hundreds of CEQA documents per year, focusing on adequacy of air quality analyses. South Coast AQMD CEQA comments are meant as guidance for lead agencies, including local land use agencies or entities, to ensure a reasonable air quality analysis is conducted to estimate air quality impacts, and significant air quality impacts are mitigated to the extent feasible. Local land use agencies often consult with South Coast AQMD staff during preparation of an environmental analysis and staff provides mitigation measures to ensure they are incorporated into projects early in the development process. Existing projects that are already developed, such as the Thermal Racing Club and Thermal Airport, are difficult to change. However, South Coast AQMD recognizes it can take actions to reduce emissions for future development projects (e.g., race tracks, airports, warehouses) in the ECV through the CEQA process and provide the CSC updates on these types of projects. Recognizing the cumulative impacts that the ECV community faces, additional actions were written into the CERP specific to certain air quality priorities such as providing additional air quality expertise for new development projects near the Salton Sea and pursuing collaboration with Riverside County, the City of Indio and the City of Coachella to identify, secure and implement greenspace projects near sensitive receptors near the Salton Sea (see Chapter 5b), identifying opportunities to collaborate with local land use and transportation agencies to restrict heavy-duty trucks from transiting near sensitive land uses (e.g., residences) and pursuing collaboration with land use agencies to implement vegetative barriers around the railroad that passes through the ECV community (Chapter 5f).

Table 1 below provides a goal, action, responsible entity, applicable metrics and an implementation timeline to develop strategies to address land use.

**Table 1 –Goal: Develop strategies with land use agencies to lessen cumulative impacts and reduce emissions and exposure**

# CHAPTER 5B:

## SALTON SEA

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 5b: Salton Sea

### Background

The Salton Sea is California's largest lake at approximately 25 miles long and up to 15 miles wide. The largest portion of the Salton Sea is in Imperial County while the northern portion is in the Eastern Coachella Valley (ECV) in Riverside County. In recent geologic history, lakes were formed on numerous occasions due to flooding of the Colorado River that filled this natural trough or sink, which is below sea level. The modern-day Salton Sea was formed in 1905 when the Colorado River breached an irrigation inlet and flowed unchecked into the area for 18 months. In the years after the breach, the

Salton Sea has been fed largely by small rivers, creeks and drains that include agricultural runoff. The relatively shallow lake has no outlet and inflow does not keep pace with evaporation, causing the Salton Sea to gradually shrink. Salts are left behind when the water evaporates, leading to increasing salinity. The Salton Sea is currently over 50 percent saltier than the Pacific Ocean.

In 2003, multiple parties, including the State and three water districts in the region, entered into a series of agreements to address longstanding issues regarding usage of Colorado River water. These agreements are known collectively as the Quantification Settlement Agreement (QSA). The QSA includes an agreement to transfer water that was historically used to irrigate farm fields near the Sea to other Southern California water districts for residential use. To accommodate the QSA transfer, the Imperial Irrigation District (IID) has reduced its water use by increasing efficiencies and fallowing some fields. By reducing the amount of water available for agricultural uses in the Imperial Valley, these transfers have the effect of decreasing the amount of fresh water that runs off fields into the Sea. The State had required some mitigation inflow water to continue to be provided to the Salton Sea, but that requirement expired in December 2017. This has expedited the rate at which the Sea shrinks and becomes more saline. The Salton Sea is one of the most important links on the Pacific Flyway, supporting over 400 species of birds and a myriad of invertebrates, although deteriorating conditions may be detrimental to this habitat. As the Salton Sea continues to recede, an average of 4,800 acres of shoreline playa is estimated to be newly exposed each year. The increasing area of exposed playa is expected to increase windblown particulate matter and related health impacts.

Created in 1993, the Salton Sea Authority is a Joint Powers Authority (JPA) responsible for working in consultation and cooperation with the State of California to oversee the comprehensive restoration of the Salton Sea. Although the Salton Sea Authority and its partner agencies recognize the state and federal roles and responsibilities at the Salton Sea, the Salton Sea Authority is directed by board-adopted policy

to assert a leadership role to ensure local priorities are recognized. The State has committed to mitigating the effects of the water transfers through a cooperative effort between State and federal agencies and IID to implement habitat and dust suppression projects. The California Natural Resources Agency (CNRA) Salton Sea Management Program (SSMP) was created to address the urgent public and ecological health issues resulting from the drying and shrinking of the Salton Sea. While the SSMP is a long-range program, its immediate focus is on the development and implementation of the 2018 SSMP Phase I: 10-Year Plan<sup>1</sup>, by providing planning, engineering, and environmental expertise for design and implementation of dust-suppression and habitat projects. The Phase I Plan includes projects that will be completed as early as the end of 2022.

## Community Concerns

CSC members expressed that dust emissions resulting from the receding Salton Sea is a major concern in the ECV community. As the Salton Sea evaporates, its receding shoreline exposes sediments deposited at the bottom of the Sea, also referred to as “playa.” The loose soil is blown off by strong gusty winds, contributing to PM<sub>10</sub> (inhalable particulate matter) emissions that could impact air quality. Projections suggest that windblown PM<sub>10</sub> exposure from the playa is expected to increase over time in an area already impacted by high PM<sub>10</sub> events from strong winds through the San Geronio Pass that blow along the Coachella Valley or from summertime thunderstorm outflows that transport dust from the desert areas to the south and east into the Coachella Valley. While the composition of the playa is variable, current data suggests that the soils are high in salt content and may contain constituents that could be toxic. CSC members expressed concerns that the playa may also contain components from agricultural runoff, possibly including remnants of fertilizers and pesticides. Previous studies have detected selenium, cadmium and nickel, which could pose a risk to human health, in sufficient amounts. CSC members have mentioned that they would like IID and the State of California to move more quickly to develop and implement dust suppression projects for the exposed Salton Sea playa, as well as increase air monitoring around the Salton Sea, particularly in the northern region.

Elevated levels of hydrogen sulfide (H<sub>2</sub>S) occur from natural processes in the Salton Sea. While H<sub>2</sub>S, a gas that smells like rotten eggs, does not have a federal standard, there is a California State standard (30 parts-per-billion) that is exceeded numerous times each year near the shores of the Salton Sea. A few times each year, H<sub>2</sub>S odors are transported toward the northwest to inland areas of the Coachella Valley farther from the Salton Sea and, more rarely, through the San Geronio Pass into metropolitan Riverside and San Bernardino Counties. H<sub>2</sub>S odor events occur most frequently in the hot summer months but can occur whenever local breezes bring H<sub>2</sub>S from the Salton Sea into ECV communities. At levels above the State standard, most individuals can smell the odor and some may experience temporary symptoms such as headaches and nausea. Some individuals can smell H<sub>2</sub>S at very low concentrations, down to a few parts-per-billion. The long-term levels of H<sub>2</sub>S are unlikely to be above chronic Reference Exposure Levels, and therefore below thresholds where toxic impacts would be a concern. However, because odors can cause temporary health effects, and since H<sub>2</sub>S odors occur frequently in some areas of the ECV, this can lead to negative quality of life impacts. However, the symptoms associated with this level of exposure are temporary and are not expected to cause any long-term health effects. CSC members have expressed that

---

<sup>1</sup> <https://resources.ca.gov/CNRALegacyFiles/wp-content/uploads/2018/10/SSMP-Phase-1-10-Year-Plan.pdf>

they experience acute health effects (e.g., headaches and nosebleeds) during both windblown dust and Salton Sea H<sub>2</sub>S odor events. Because there continue to be concerns around the unknown or unquantified health impacts of the Salton Sea emissions, this is an ongoing topic of research at several academic research institutions, including UC Riverside, Loma Linda University and others. The community members requested additional monitoring and improvements to notification systems to better understand emissions from the Salton Sea and reduce exposure in the community. Please see Appendix 5b for more details.

### **Actions to Address the Salton Sea**

To address community concerns and reduce exposure from the Salton Sea in ECV, South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP). Tables 1, 2 and 3 below provide goals, actions, responsible entities, metrics, and a timeline to achieve the exposure reductions from the Salton Sea.

**Table 1 - Goal: Expand monitoring networks and improve notification systems**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Expand the existing South Coast AQMD's hydrogen sulfide (H<sub>2</sub>S) monitoring network in ECV to:</p> <ul style="list-style-type: none"> <li>• Provide near real-time H<sub>2</sub>S data and inform community members about potential odors, including a notification system for when ambient levels exceed the State standard; continue H<sub>2</sub>S odor advisories for multi-day odor events when H<sub>2</sub>S levels are forecasted to exceed the state standard</li> <li>• Use the monitoring data to help assess the odor's origin, community impact and extent to which the odors may transport in the community and beyond</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Monitors installed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	2 <sup>nd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>B</b>	<p>Identify opportunities to expand the South Coast AQMD's PM<sub>10</sub> monitoring network in the ECV to:</p> <ul style="list-style-type: none"> <li>• Provide real-time PM<sub>10</sub> and wind data and inform community members of PM<sub>10</sub> levels in ECV, and if they exceed federal and/or State standards</li> <li>• Gain a better understanding of dust emissions and assess methods to distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>• Track the concentration trends of PM<sub>10</sub> over time to help determine the effectiveness of emissions reduction measures as highlighted in the CERP</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Monitors installed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	4 <sup>th</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

<b>C</b>	<p>Establish baseline air monitoring to:</p> <ul style="list-style-type: none"> <li>• Characterize the chemical composition of fugitive dust emissions from different sources to help distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>• Analyze existing chemical speciation data and work with the CSC and CARB to determine which chemical species should be sampled. For example, this may include certain metals (such as selenium) and sea spray indicators</li> <li>• Track the concentration trends of key indicator pollutants of Salton Sea emissions</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>D</b>	<p>Seek new opportunities to work with the CSC to create an air quality sensor network in the ECV community to:</p> <ul style="list-style-type: none"> <li>• Provide real-time PM10 data</li> <li>• Supplement the PM10 monitoring network in the ECV and cover a larger area in the community</li> <li>• Co-locate air quality sensors with a reference PM10 monitor at one of South Coast AQMD's air monitoring station to verify the sensors performance prior to deployment and implement a data calibration and correction protocol to enhance sensor PM10 data quality after deployment</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Air quality sensors deployed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	4 <sup>th</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>E</b>	<p>Pursue a collaborative partnership with UCR School of Medicine, provide support to the ongoing study on soil chemical and microbiome composition of the Salton Sea playa dust samples, and work with the project team to expand this study to include adult populations in the ECV.</p>	South Coast AQMD, UCR School of Medicine	<ul style="list-style-type: none"> <li>• Updates provided to the CSC</li> <li>• Develop strategies list, if appropriate</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

**Table 2 - Goal: Reduce emissions from the Salton Sea**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	Provide additional air quality expertise to: <ul style="list-style-type: none"> <li>• The State for the implementation of the Salton Sea Management Program</li> <li>• Land use agencies for new development projects near the Salton Sea</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026
<b>B</b>	Work with other agencies (e.g., IID and the State of California) to collect emissivity and dust emissions data to improve South Coast AQMD's emissions inventory	South Coast AQMD, IID, the State of California	<ul style="list-style-type: none"> <li>• Data collected and incorporated in South Coast AQMD's emissions inventory</li> <li>• Updates provided to the CSC</li> </ul>	4 <sup>th</sup> quarter, 2021	4 <sup>th</sup> quarter, 2026
<b>C</b>	Pursue a collaborative partnership and support IID, the Salton Sea Authority, Riverside County, Torres Martinez Desert Cahuilla Indians and the State of California with implementing dust suppression projects (e.g., Dust Suppression Action Plan (DSAP) and Salton Sea Management Plan) around the Salton Sea by: <ul style="list-style-type: none"> <li>• Helping to identify locations in partnership with residents for future dust suppression projects (includes vegetation to reduce emissivity through the DSAP) in the ECV community; and</li> <li>• Providing letters of support for additional funding to help expedite dust suppression projects near population centers (e.g., North Shore) in the Riverside County portion of the Salton Sea</li> </ul>	South Coast AQMD, IID, the State of California	<ul style="list-style-type: none"> <li>• Number of projects worked on or supported</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026

	<ul style="list-style-type: none"> <li>• Provide updates to the CSC on ongoing Salton Sea efforts (e.g., Coachella Valley Environmental Justice Task Force Meetings) in coordination with AB 617 implementation</li> </ul>				
<b>D</b>	Pursue a collaborative partnership with IID, Regional Water Quality Control Board (RWQCB) Region 7 and State Water Regional Control Board (SWRCB) to identify opportunities to mitigate pesticide run-off into the Sea (e.g., developing alternative disposal options of agricultural runoff or water treatment facilities and filtration systems at all Salton Sea tributary entryways)	South Coast AQMD, IID	<ul style="list-style-type: none"> <li>• Number of projects worked on or supported</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026
<b>E</b>	Pursue a collaborative partnership with Imperial County Air Pollution Control District (ICAPCD) to address cross-jurisdictional air pollution emissions from the Sea and dust suppression projects around the Salton Sea and gather air monitoring network data	South Coast AQMD, ICAPCD	<ul style="list-style-type: none"> <li>• Number of projects worked on or supported</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2022	1 <sup>st</sup> quarter, 2026
<b>F</b>	Conduct outreach to facility operators/workers/owners on South Coast AQMD Rules 403 – Fugitive Dust and 403.1 – Supplemental Fugitive Dust Control Requirements for Coachella Valley Sources and best practices to reduce dust during the implementation of projects	South Coast AQMD	<ul style="list-style-type: none"> <li>• Development of materials for distribution</li> <li>• Number of outreach events staff participates in the ECV</li> <li>• Number of entities the information is shared with (i.e., newsletter distribution list)</li> </ul>	4 <sup>th</sup> quarter, 2021	4 <sup>th</sup> quarter, 2022

<b>G</b>	<p>Pursue a collaborative partnership with community organizations to conduct outreach in the community (e.g., door hangers, handouts) to inform community members on how to file dust complaints</p> <ul style="list-style-type: none"> <li>Develop a list of potential responses and solutions that South Coast AQMD staff can pursue in response to dust complaints</li> </ul>	South Coast AQMD, community organizations	<ul style="list-style-type: none"> <li>Development of materials for distribution</li> <li>Number of outreach events staff participates in the ECV</li> <li>Number of entities the information is shared with (i.e., newsletter distribution list)</li> </ul>	4 <sup>th</sup> quarter, 2021	4 <sup>th</sup> quarter, 2022

# CHAPTER 5C:

## PESTICIDES

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 5c: Pesticides

### Community Concerns

The ECV community is home to a large amount of agricultural activities, including the production of dates, grapes, citrus, and other crops. The CSC expressed concerns about the use and application of pesticides and the resulting agricultural run-off that may collect in the Salton Sea sediment. Concerns raised by the CSC include the unknown adverse health effects of pesticides, odors and potential toxicity resulting from possible exposure. CSC members expressed concerns regarding regulatory enforcement. They reported that pesticides are being applied during restricted hours and drift into homes

and schools near application sites, despite current regulations that are in place. The CSC also raised concerns about farmworker exposure to pesticides, often in excessive amounts and without proper personal protective equipment and training. CSC members expressed a need for a pesticide application notification system that informs the community before pesticides are applied, allowing residents to make informed decisions about avoiding outdoor activities that could increase their exposure (e.g., outdoor exercise). Please see Appendix 5c for more details.

### Actions to Address Pesticides

South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP) to address community concerns about pesticide emissions and exposures. Additionally, the Department of Pesticide Regulation (DPR) is initiating efforts to develop a statewide pesticide application notification system. Tables 1 and 2 below provide a goal, action, responsible entity, applicable metrics, and an implementation timeline to achieve the emission and exposure reductions due to pesticide use and applications.

**Table 1 - Goal: Air Monitoring for Pesticides**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
A	<p>Pursue a collaborative partnership with CARB and consult with California Department of Pesticide Regulation (DPR) and Riverside County Agricultural Commissioner to consider developing an air monitoring strategy to study the use of pesticides in ECV, and work with scientists at public health agencies with expertise in pesticide toxicity to identify key pesticides of concern for air monitoring:</p> <ul style="list-style-type: none"> <li>• Conduct a screening evaluation of the pesticides used in this community, and work with the CSC to identify the key pesticides of concern for monitoring efforts</li> <li>• Work with DPR to define the purpose of air monitoring, and develop a plan that identifies the sampling locations, extent of sampling, and equipment that will be used</li> <li>• Determine if specific pesticides are present and at what levels to help determine community impact</li> <li>• Assess the monitoring data and if monitoring results show unacceptable pesticide levels in ambient air, work with DPR and Riverside County Agricultural Commissioner to take steps towards identifying potential exposure reduction measures (e.g., development of new use restrictions by the Riverside County Agricultural Commissioner, or pesticide regulations by DPR, if needed)</li> </ul>	South Coast AQMD, CARB, DPR	<ul style="list-style-type: none"> <li>• Type of equipment to be deployed and extent of the deployment</li> <li>• Updates provided to the CSC</li> </ul>	3 <sup>rd</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026

**Table 2 – Goal: Reduce Pesticide Emissions and Exposures**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Pursue a collaborative partnership with CARB and Growing Coachella Valley Local Farmers and Growers and consult with the California DPR and the Riverside County Agricultural Commissioner to:</p> <ul style="list-style-type: none"> <li>• Gather data about the use of pesticides in the community (e.g., the frequency, volume, composition, potential for community exposures and toxicity of pesticides applied to agricultural crops)</li> <li>• Based on data on pesticide use, evaluate potential community impacts from agricultural pesticide use in ECV</li> <li>• Based on the evaluation of community impacts, identify and evaluate opportunities to reduce pesticide emissions and exposures, such as               <ul style="list-style-type: none"> <li>○ Identify funding to install and maintain air filtration systems at schools, community centers and homes to reduce exposure to pesticides,</li> <li>○ Identify funding to implement weatherization projects in homes near agricultural fields</li> <li>○ Based on opportunities identified, evaluate emission reduction targets, where quantifiable</li> </ul> </li> </ul>	South Coast AQMD, CARB	<ul style="list-style-type: none"> <li>• Number of opportunities identified and pursued to reduce pesticide emissions and exposure</li> <li>• Number of weatherization and air filtration projects implemented</li> <li>• If quantifiable, amount of emissions and/or exposure reductions achieved</li> <li>• Updates (e.g., pesticide data, community impacts, monitoring results) provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	1 <sup>st</sup> quarter 2026
<b>B</b>	<p>Consult with DPR and the Riverside County Agricultural Commissioner and collaborate with Growing Coachella Valley Local Farmers and Growers to:</p> <ul style="list-style-type: none"> <li>• Provide the CSC an annual update on statewide efforts to develop a pesticide application notification system based on the Shafter Pilot Project</li> <li>• Provide community members with information on the types of pesticides applied in ECV, how to report pesticide drift and ways to reduce pesticide exposure</li> </ul>	South Coast AQMD, DPR	<ul style="list-style-type: none"> <li>• Development of a notification system</li> <li>• Number of informational handouts or educational materials provided</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2022	TBD

<b>C</b>	Consult with the Riverside County Agricultural Commissioner and scientists at public health agencies with expertise in pesticide toxicity to make pesticide data for the ECV community more easily accessible (e.g., publicly available) for community members, including farm workers	South Coast AQMD	<ul style="list-style-type: none"> <li>• Updates provided to the CSC</li> </ul>	3 <sup>rd</sup> quarter, 2022	TBD
<b>D</b>	Consult with DPR and USEPA Region 9 to provide outreach materials, training, information on personal protective equipment and ways to reduce worker exposure during pesticide application	South Coast AQMD	<ul style="list-style-type: none"> <li>• Number of trainings or information provided (e.g., handouts)</li> </ul>	2nd quarter, 2022	TBD

---

### Community Concerns

The ECV CSC expressed concerns regarding health effects from inhalable particulate matter (PM<sub>10</sub>) emitted from unpaved and paved roadways and from dust resuspended by off-road vehicles. Thus, they requested additional PM monitoring in the community. CSC members also mentioned that roadway paving projects implemented in the past have improved PM<sub>10</sub> levels for residents in the immediate area, although dust impacts from the surrounding desert areas may continue to have an impact on their overall PM<sub>10</sub> exposures.

### Actions to Address Fugitive Road Dust and Off-Roading

To address community concerns about emissions from fugitive road dust in ECV, South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP). Tables 1, 2, and 3 below provide goals, actions, metrics and a timeline to achieve the emission or exposure reductions for fugitive road dust.

**Table 1 - Goal: Expand monitoring networks**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Identify opportunities to expand the current South Coast AQMD PM10 monitoring network in the ECV community to:</p> <ul style="list-style-type: none"> <li>• Provide near real-time PM10 and wind data and inform community members of PM10 levels in the ECV, and assess how levels compare to Federal and/or State ambient air quality standards</li> <li>• Track the concentration trends of PM10 levels over time to help determine the effectiveness of emission reduction strategies</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Monitors installed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	3 <sup>rd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>B</b>	<p>Seek new opportunities and work with the CSC to create an air quality sensor network to:</p> <ul style="list-style-type: none"> <li>• Provide real-time PM10 data</li> <li>• Supplement the PM10 monitoring network in the ECV and cover a larger area in the community, prioritizing locations identified by the CSC, areas where the public spends a significant amount of time (e.g., schools and residential areas) and areas close to sources of fugitive dust</li> <li>• Co-locate air quality sensors with reference PM10 monitor at one of South Coast AQMD air monitoring stations to verify sensors performance prior to deployment and implement a data calibration and correction protocol to enhance sensor PM10 data quality after deployment</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Air quality sensors deployed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	3 <sup>rd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

**Table 2 - Goal: Reduce emissions from fugitive road dust and off-roading**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Pursue a collaborative partnership with appropriate entities (e.g., homeowners' associations, mobile home park owners) and the County of Riverside to implement paving projects (e.g., unpaved roads and mobile home parks such as Polanco Parks) by:</p> <ul style="list-style-type: none"> <li>• Working with the CSC to specify a plan, including locations and timelines, for paving projects to reduce fugitive dust</li> <li>• Evaluating the addition a landscaping component to paving projects, where feasible</li> </ul>	South Coast AQMD, homeowners' associations, County of Riverside	<ul style="list-style-type: none"> <li>• Square miles of paved roads and parks</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

	<ul style="list-style-type: none"> <li>Identifying funding opportunities to implement paving projects</li> </ul>				
<b>B</b>	<p>Pursue a collaborative partnership with the cities within ECV, tribes, and the County of Riverside to identify opportunities and funding to reduce emissions, such as:</p> <ul style="list-style-type: none"> <li>Restrict unnecessary public access to unpaved roads or areas where off-roading takes place (e.g., installing signs and physical barriers)</li> <li>Reduce speed limits on unpaved roads</li> <li>Identify funding to plant natural vegetation on unpaved surfaces no longer being used as roadways;</li> <li>Stabilize loose road surfaces with grading and gravel on unpaved roads and maintain treated roads (based on Vehicle Miles Traveled (VMT)); and</li> <li>Identify funding to expand street sweeping services beyond existing service levels</li> </ul>	<p>South Coast AQMD, City of Coachella, City of Indio, City of La Quinta, County of Riverside, the Twenty-Nine Palms Band of Mission Indians Tribe, the Cabazon Band of Mission Indians Tribe, the Torres-Martinez Desert Cahuilla Indians Tribe, and the Augustine Band of Cahuilla Indians Tribe</p>	<ul style="list-style-type: none"> <li>Number of projects completed or supported (e.g., reduced speed limits)</li> <li>Number of restricted roads</li> <li>Number of treated unpaved roads or square miles of unpaved roads treated with chemical stabilizers</li> <li>Number of miles swept</li> <li>Amount of funding identified</li> <li>Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026
<b>C</b>	<p>Pursue a collaborative partnership with Comité Civico del Valle (CCV) to obtain complaint data from their IVAN community-based reporting system to address road dust- related air quality concerns within the ECV community. For example, this data may help identify potential high priority areas for surface stabilizing projects (e.g., road paving)</p>	<p>South Coast AQMD, CCV</p>	<ul style="list-style-type: none"> <li>Data collected from CCV</li> <li>Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>D</b>	<p>Work with the CSC to identify the specific fugitive dust concerns, and evaluate whether Rules 403 and/or 403.1 amendments, and/or enhanced enforcement of existing provisions are necessary and conduct outreach to off-road equipment operators on Rules 403 and 403.1, including practices to reduce fugitive dust from roads</p>	<p>South Coast AQMD</p>	<ul style="list-style-type: none"> <li>Number of outreach events staff participates in the ECV</li> <li>Number of entities the information is shared with (i.e., newsletter distribution list)</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2022

			<ul style="list-style-type: none"> <li>• Updates provided to the CSC</li> </ul>		
<b>E</b>	Conduct outreach to the general public, including schools and other youth groups (e.g., Sierra Club Youth Group), on how to file dust complaints	South Coast AQMD	<ul style="list-style-type: none"> <li>• Number of outreach events staff participates in the ECV</li> <li>• Number of entities the information is shared with (i.e., newsletter distribution list)</li> </ul>	3 <sup>rd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2022

# CHAPTER 5E:

## OPEN BURNING AND ILLEGAL DUMPING

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 5e: Open Burning and Illegal Dumping

### Community Concerns

The Eastern Coachella Valley (ECV) community has a significant amount of agricultural activity that produces grapes, dates, citrus and other crops. The burning of agricultural waste is a common method of disposal in the agricultural industry. Burning material is also a method to prevent crops from freezing. In many cases, open burning is done in a way that minimizes emissions, exposure and visible smoke. The Community Steering Community (CSC) expressed concern about the adverse health effects of air pollution from open burning including, smoke, particulate matter (PM) and potential pesticides burned. The CSC also identified concerns about air quality impacts from open burning near schools, childcare centers and homes and dangers to farmworkers. Additionally, the CSC expressed

concerns about open burning that is not permitted and uncontrolled (e.g., the 50-acre mulch fire in 2019 at a recycling center in Thermal that was near three local schools). The CSC also cited concerns about open burning on tribal lands, which falls outside of South Coast AQMD's jurisdiction (i.e., not subject to South Coast AQMD regulations).

The CSC also identified illegal dumping of waste materials as an air quality concern since the materials can subsequently catch fire and produce emissions. Among the open burning types, illegal dumping and burning activities are the most difficult to track and monitor trends.<sup>1</sup>

### Potential Alternatives to Burning

Health and Safety Code Sections 41801 and 41850 reaffirm that open burning for necessary purposes is allowed. However, the CSC has expressed an interest in exploring alternatives to burning. Potential alternatives may include composting or using heavy-duty equipment (e.g., chipper or grinder) to break material down into smaller pieces that can be disposed of through composting or recycling. There are also alternative methods for frost prevention that do not involve open burning. Composting is when organic waste decomposes naturally under oxygen-rich conditions. One of the actions to address open burning will be to explore the feasibility of other alternatives.

### Actions to Address Open Burning and Illegal Dumping

South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP) to address community concerns about open burning and illegal dumping emissions and exposures. Tables 1, 2, 3, and 4 below provide a goal, action, responsible entity, applicable metrics, and an implementation timeline to achieve the emission and exposure reductions due to open burning and illegal dumping.

---

<sup>1</sup> Illegal dumping does not have air quality impacts and therefore, South Coast AQMD does not have jurisdiction over illegal dumping. Air quality impacts occur when illegally dumped trash is burned; however, these impacts are difficult to monitor and track because they are not permitted.

**Table 1 – Goal: Improve Monitoring Network**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
A	<p>Work with the CSC to establish an air quality sensor network to:</p> <ul style="list-style-type: none"> <li>• Gain a better understanding of the PM2.5 levels in various community areas that may be impacted by legal and illegal burning occurring in the community</li> <li>• Identify areas within ECV where burning (legal and/or illegal) occurs repeatedly to characterize the potential impact on nearby communities and gather useful information to better address this air quality concern</li> <li>• Improve public information on PM2.5 levels in the community (e.g., better characterize the spatial and temporal variability of PM2.5 in the community)</li> <li>• Gather information to help identify illegal burning emissions and conduct follow-up investigations, as needed</li> <li>• Provide information to the community on how a sensor-network can help identify pollution hotspots and emissions from illegal burning. Specific locations for sensor deployment will be selected after gathering input from CSC and community members and accounting for long-term availability of potential sites. Input from the CSC and community members regarding specific and/or illegal burning events in ECV will also be taken into account in the development of the sensor network and the selection of specific monitoring sites</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Air quality sensors deployed</li> <li>• Updates provided to the CSC</li> <li>• Follow-up investigations, as needed</li> </ul>	3 <sup>rd</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026

**Table 2 – Goal: Reduce Emissions from Open Burning**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Pursue emission reductions from open burning by:</p> <ul style="list-style-type: none"> <li>Developing a list of available technologies, best practices and alternatives to be distributed to farm owners and operators, including reaching out to San Joaquin Valley Air Pollution Control District (APCD) to seek additional information</li> <li>Assessing the feasibility of new requirements for open burning (e.g., identify alternatives to open burning of agricultural waste by identifying opportunities used in other air districts) based on the developed list</li> <li>Enhancing enforcement efforts by conducting additional inspections beyond pre-burn inspections (e.g., unannounced inspections on burn days)</li> <li>Conducting follow-up investigations of potential illegal burning emissions in response to public complaints and/or monitoring data collected</li> <li>Provide referrals to appropriate agencies if an inspector sees a problem regarding other AQ Priorities (e.g., illegal pesticide applications) that is outside of South Coast AQMD's jurisdiction</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>List of available technologies and feasibility assessment of new requirements provided to CSC and distributed to farm owners and operators</li> </ul>	1st quarter, 2022	4 <sup>th</sup> quarter, 2023
<b>B</b>	<p>Continue existing and pursue additional collaborative partnerships with and participate in:</p> <ul style="list-style-type: none"> <li>Local tribes to identify opportunities to reduce open burning through outreach, enforcement, and/or open burning regulations (e.g., technical guidance, burn and no-burn days, permitting system)</li> <li>Riverside County Fire Department to conduct focused enforcement at illegal burn sites on non-Tribal lands and Tribal lands, when permitted</li> <li>Congressman's Office and Desert Healthcare District (DHCD) efforts to develop the emergency response plan to respond to fires on tribal lands</li> </ul>	South Coast AQMD, local tribes, Riverside County Fire Department	<ul style="list-style-type: none"> <li>Updates provided to CSC on opportunities with tribes, enforcement efforts, complaints and investigations</li> </ul>	1st quarter, 2022	1 <sup>st</sup> quarter, 2026

<b>C</b>	<p>Pursue funding opportunities for equipment or services to be used as alternatives to:</p> <ul style="list-style-type: none"> <li>• Agricultural burning (e.g., chippers, grinders, digesters, air curtain destructors, etc.)</li> <li>• Emergency burning for freeze prevention (e.g., fan systems)</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Number of projects implemented</li> <li>• Amount of funding and when available, emission reductions</li> </ul>	3 <sup>rd</sup> quarter, 2022	1 <sup>st</sup> quarter, 2026
<b>D</b>	Conduct outreach to farm owners, operators and workers to encourage best burn practices and methods to reduce emissions (e.g., conservation burning, cleaner piles, no rolling, cleaner ignition device)	South Coast AQMD	<ul style="list-style-type: none"> <li>• Number of outreach events staff participates in the ECV</li> <li>• Number of entities the information is shared with (i.e., newsletter distribution list)</li> </ul>	1st quarter, 2022	2 <sup>nd</sup> Quarter, 2022
<b>E</b>	Provide community members and farm owners, operators and workers information (e.g., workshops/presentations, public outreach campaign) relating to rules and regulations on open burning and ways to report suspected illegal burning	South Coast AQMD	<ul style="list-style-type: none"> <li>• Material provided</li> <li>• Number of workshops and presentations</li> </ul>	1st quarter, 2022	2 <sup>nd</sup> Quarter, 2022

**Table 3 – Goal: Reduce Exposure to Open Burning**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Pursue collaborative partnerships with:</p> <ul style="list-style-type: none"> <li>• Riverside County Fire Department and/or appropriate public health agencies to develop informational materials relating to open burning, fire safety, and air pollution (e.g., potential harms and consequences of illegal dumping and burning)</li> <li>• Community organizations (e.g., Growing Coachella Valley, Alianza, Leadership Counsel, Communities for a New California) to distribute informational materials relating to open burning, fire safety and air pollution in the community</li> </ul>	South Coast AQMD, Riverside County Fire Department, community organizations	• Fire safety informational materials provided	3 <sup>rd</sup> Quarter, 2021	4 <sup>th</sup> Quarter, 2022

	<ul style="list-style-type: none"> <li>Desert Health Care District (DHCD) to obtain information and provide an update to the community on their response and prevention plan</li> </ul>				
<b>B</b>	Pursue opportunities to develop an online system (e.g., notification system, database) that informs the community when South Coast AQMD permitted burning is expected to occur	South Coast AQMD	<ul style="list-style-type: none"> <li>Number of successful notifications</li> </ul>	3 <sup>rd</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026
<b>C</b>	Identify funding to implement weatherization projects and to install and maintain air filtration systems at schools and homes located near frequent burn sites	South Coast AQMD	<ul style="list-style-type: none"> <li>Number of air filtration systems installed</li> <li>Number of weatherization projects implemented</li> </ul>	3 <sup>rd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

**Table 4 – Goal: Reduce Illegal Dumping**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Pursue collaborative partnerships with:</p> <ul style="list-style-type: none"> <li>• Riverside County Code Enforcement to conduct focused enforcement of illegal dumping laws and to improve the system to report potential dumping violations</li> <li>• Riverside County Fire Department to provide guidance and educational materials to the community about potential fire hazards related to illegal dumping and how to report such fires</li> <li>• Community-based organizations to establish a complaint-report tracking system to better track illegal dumping activities</li> <li>• Waste Management, Riverside County Department of Waste Resources, and Community Councils to identify ways to reduce illegal dumping and/or conduct clean-up services (e.g., monthly free waste collection day and related outreach)</li> <li>• Local farm owners, landowners, and landscapers to identify ways (e.g., fencing, composting) to reduce illegal dumping on empty lands</li> <li>• Combustible Material Task Force to support green waste complaint reporting and follow-up investigations</li> <li>• Coachella Valley Association of Governments (CVAG) to encourage future allocations of funds to address illegal dumping</li> <li>• Torres Martinez Desert Cahuilla Indians (TMDCI) to pursue opportunities (e.g., fencing, berm construction, camera/drone technology) to address illegal dumping on tribal lands</li> <li>• Comité Civico Del Valle (CCV), Coachella Valley Environmental Justice Task Force (CVEJTF) to implement an outreach campaign for the IVAN reporting system for illegal dumping</li> </ul>	<p>South Coast AQMD, Riverside County Code Enforcement, Riverside County Fire Department, community-based organizations, Waste Management and Riverside County Department of Waste Resources, local farm owners, and landscapers, Combustible Material Task Force, CVAG, CCV, TMDCI</p>	<ul style="list-style-type: none"> <li>• Number of focused enforcement efforts and follow-up investigations</li> <li>• Complaint tracking system</li> <li>• Number of illegal dumping incidences tracked</li> <li>• Number of outreach events staff participates in the ECV</li> <li>• Number of entities the information is shared with (I.e., newsletter distribution)</li> <li>• Updates to the CSC on efforts</li> </ul>	3 <sup>rd</sup> Quarter, 2021	1 <sup>st</sup> quarter, 2026

<b>B</b>	Conduct outreach (e.g., Public Service Announcements (PSAs) to community members, including schools and other youth groups (e.g., Sierra Club Youth Group), and farm workers on how to report illegal dumping activities	South Coast AQMD	<ul style="list-style-type: none"> <li>• Number of outreach events staff participates in the ECV</li> <li>• Number of entities the information (e.g. PSAs) is shared with (i.e., newsletter distribution list)</li> </ul>	1st quarter, 2022	4 <sup>th</sup> quarter, 2022
<b>C</b>	Pursue funding opportunities for: <ul style="list-style-type: none"> <li>• Waste collection services (agricultural and non-agricultural waste that has been dumped illegally)</li> <li>• Non-agricultural waste disposal (e.g., tire disposal)</li> <li>• Fencing or berm construction or drone/camera technology to discourage illegal dumping</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Amount of funding awarded</li> <li>• Amount of waste collected</li> </ul>	3 <sup>rd</sup> quarter, 2022	1 <sup>st</sup> quarter, 2026

# CHAPTER 5F:

## DIESEL MOBILE SOURCES

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 5f: Diesel Mobile Sources

### Community Concerns

The Eastern Coachella Valley (ECV) CSC expressed concerns about diesel emissions from mobile sources in the ECV community. CSC members raised concerns about heavy-duty trucks traveling along the State highways 111 and 86, school buses, freight trains that transit the community and heavy-duty agricultural equipment (e.g., tractors and harvesting equipment). CSC members mentioned that trucks and school buses often transit in residential areas and near sensitive receptors. CSC members also cited concerns about trucks idling around the Mecca area within ECV.

### Actions to Address Diesel Mobile Sources

To address community concerns and reduce emissions from diesel mobile sources, South Coast AQMD developed actions for the Community Emissions Reduction Plan (CERP). Table 1 below provides goals, actions, responsible entities, metrics, and a timeline to achieve emission reductions from diesel mobile sources.

**Table 1 - Goal: Reduce Emissions and Exposure from Diesel Mobile Sources**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
A	Work with the CSC to:	South Coast AQMD, CARB	TBD	2 <sup>nd</sup> Quarter 2021	1 <sup>st</sup> Quarter 2026
	<ul style="list-style-type: none"> <li>Identify air quality concerns related to diesel mobile sources (e.g., trucks, trains), quantify emissions (e.g., baseline, projected) from diesel mobile sources, and provide an informational workshop (e.g., summary of regulations and compliance information) on diesel mobile sources</li> <li>Prioritize actions to address the community's main concerns around diesel mobile source pollution. For example, actions may include: <ul style="list-style-type: none"> <li>Create an air quality sensor network for measurements of PM2.5 and NO2 supported by black carbon measurements (where possible and for limited duration) to better understand the impact of diesel emissions in the community</li> <li>Collaborating with CARB to identify opportunities for focused enforcement and additional regulatory measures (e.g., Air Toxic Control Measure, Freight Handbook), if needed</li> <li>Identifying opportunities to collaborate with local land use and transportation agencies to restrict heavy-duty trucks from transiting near sensitive land uses (e.g., schools and residences)</li> <li>Collaborating with CARB to conduct outreach on how to report idling trucks</li> <li>Pursue collaboration with land use agencies (e.g., City of Indio, City of Coachella, and Riverside County) to implement vegetative barriers around the railroad that passes through the ECV community</li> <li>Identify funding to implement weatherization projects and to install and maintain air filtration systems at</li> </ul> </li> </ul>				

	schools, community centers and homes to reduce exposure to diesel mobile sources				
<b>B</b>	Identify opportunities to incentivize the replacement of older, higher polluting on-road (e.g., trucks) and off-road (e.g., tractors, freight trains, agricultural equipment) equipment with cleaner technology	South Coast AQMD, CARB	TBD (e.g., number of projects incentivized)	1 <sup>st</sup> Quarter 2021	1 <sup>st</sup> Quarter 2026
<b>C</b>	Identify funding opportunities to replace older diesel school buses with zero or near-zero emission school buses in ECV in all school districts within ECV	South Coast AQMD, CARB	TBD (e.g., number of projects incentivized)	1 <sup>st</sup> Quarter 2021	1 <sup>st</sup> Quarter 2026

# CHAPTER 5G:

## GREENLEAF DESERT VIEW POWER PLANT

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 5g: Greenleaf Desert View Power Plant

### Community Concerns

Greenleaf Desert View Power Plant is a biomass electrical generation facility located on the Cabazon Band of Mission Indians Reservation at 62300 Gene Welmas Dr, Mecca, CA 92254. It has been in operation since 1992, first as Colmac Energy, Inc. and then in 2011, the power plant was purchased by Greenleaf Power. Biomass (e.g., urban wood waste, orchard removal trees) is used at this facility as a fuel to help generate electricity. This facility operates as a steam-electric power plant<sup>1</sup>. Typically, these power plants operate by burning fuel in a furnace to generate heat that is used in a boiler to produce steam. The steam flows into the turbine and spins the blades inside a turbine, which is connected to a generator to create electricity.

Since this facility is located on tribal land, it is regulated by Region 9 of the United States Environmental Protection Agency (USEPA).<sup>2</sup> The ECV CSC expressed concern about visible emissions and smoke from the facility and the limited information about the facility that is available to the community.

### Actions to Address the Greenleaf Desert View Power Plant

To address community concerns and reduce emissions from the Greenleaf Desert View Power Plant, South Coast AQMD developed actions for the Community Emissions Reduction Plan (CERP). Table 1 below provides goals, actions, responsible entities, metrics, and a timeline to achieve emission reductions from the Greenleaf Desert View Power Plant.

# CHAPTER 6:

## COMMUNITY AIR MONITORING PLAN (CAMP) SUMMARY

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Chapter 6: Community Air Monitoring Plan (CAMP) Summary

---

The Community Air Monitoring Plan (CAMP) for the Eastern Coachella Valley (ECV) community has been developed through close collaboration between the Community Steering Committee (CSC) and South Coast AQMD staff. It outlines the objectives and strategies for monitoring air pollution in ECV based on the air quality priorities identified by the CSC. Air monitoring will play an important role in improving our understanding of air pollution in ECV, will help support the emissions and exposure reduction strategies developed in the Community Emissions Reduction Plan (CERP), and will track the progress of the CERP actions in this community. Specific air monitoring strategies are included in the actions described in Chapter 5 of the CERP: Chapters 5b Salton Sea, 5c Pesticides, 5d Fugitive Road Dust, 5e Open Burning and Illegal Dumping, 5f Diesel Mobile Sources, and 5g Greenleaf Desert View Power Plant. Overall, while the CERP and CAMP are separate documents, they work together to help achieve and track emissions and exposure reductions designed to improve local air quality in ECV.

Air monitoring provides information that can help address specific questions about pollutant concentrations in the community. To achieve the community-specific air monitoring objectives described in the CERP and CAMP, it is critical to develop a sound air monitoring approach and use appropriate monitoring methods and equipment specific for each purpose. The general monitoring approach in ECV consists of expanding the existing air monitoring network and deploying additional air monitoring equipment, including regulatory monitors and air quality sensors, to enhance the overall geographical coverage of measurements. Most of the air quality priorities in ECV, such as dust emissions from the Salton Sea and surrounding deserts and fugitive road dust, and smoke from open burning, are intermittent in nature and impact relatively large areas. Therefore, air monitoring at fixed locations provides an opportunity to capture both long-term and short-term trends, identify periods when these sources impact the community, and help pinpoint the most critical locations of concern.

A detailed description of air pollutants to be measured and types of monitoring methods and technologies to be deployed in ECV is provided below and in the CAMP. Overall, community air monitoring will implement the recommendations provided in CARB's "Community Air Protection Blueprint"<sup>i</sup>, support the implementation of the CERP, and track the progress towards improved air quality in the ECV community.

---

<sup>i</sup> CARB (2018) *Community Air Protection Blueprint*. Available at: <https://ww2.arb.ca.gov/our-work/programs/community-air-protection-program/community-air-protection-blueprint>.

## Air Quality Priorities in the Eastern Coachella Valley Community

Each community has unique air quality challenges, and local community members have first-hand knowledge of important information, including emission sources and sensitive receptor locations. In order to ensure a collaborative process in developing and implementing a successful CERP and CAMP, it is critical to understand the specific air quality concerns in ECV. The CSC meetings provided a forum for identifying community-specific air quality priorities and potential contributing sources of air pollution to develop consensus and a shared understanding of specific air pollution challenges. In addition to actively collaborating with the CSC, the South Coast AQMD engages in a robust public process to provide additional opportunities for broad engagement both during CAMP development and throughout its implementation. This is achieved through periodic community meetings, workshops, South Coast AQMD Committee meetings and Governing Board meetings. Input and feedback provided by the CSC and the public will continue to be incorporated to improve and update the monitoring strategies throughout the implementation of this CAMP.

South Coast AQMD staff gathered information on the main CSC air quality concerns through a series of community meetings. As a result, the following categories have been selected as the highest air quality priorities: Salton Sea, Pesticides, Open Burning and Illegal Dumping, Fugitive Road Dust, Diesel Mobile Sources, and Greenleaf Desert View Power Plant (formerly Colmac Energy, Inc.). A detailed description on each of these categories is provided in the following sections.

### Salton Sea

The Salton Sea is the largest lake in California and, as its shorelines continue to recede and expose the sediments deposited at the bottom of the Sea (also referred to as the “playa”), emissions from the Salton Sea contribute to poor air quality for ECV residents. The CSC has expressed their concerns about the Salton Sea, mainly with respect to odors caused by emissions of hydrogen sulfide ( $H_2S$ ) and inhalable dust / particulate matter ( $PM_{10}$ ; particles with diameters of 10 microns or smaller). Elevated levels of  $H_2S$  result from natural processes in the Salton Sea; these can lead to strong foul odors that negatively affects the quality of life of local residents and at high levels can cause acute health effects (e.g., headaches and nosebleeds). Dust emissions from the Salton Sea occur when the playa sediments get blown off by strong gusty winds and contribute to  $PM_{10}$  emissions in the area, further deteriorating air quality. The CSC is also concerned that the soil from the playa may contain residuals of pesticides and other pollutants from agricultural runoff (toxic elements and metals, such as selenium (Se), cadmium (Cd), and nickel (Ni)), which can pose a risk to human health. Moreover, the CSC has conveyed that additional monitoring and improvements to notification systems are needed to better understand emissions from the Salton Sea.

The main monitoring strategy to address CSC concerns regarding  $H_2S$  emissions from the Salton Sea includes enhancement of the existing  $H_2S$  monitoring network in ECV to expand its geographical coverage, provide real-time  $H_2S$  data at more locations, and inform the community members about the odors they smell and where they come from, including a notification system for when ambient levels exceed the State standard. Currently,  $H_2S$  monitoring is being conducted at two fixed-site monitoring stations within the ECV community boundary; at the Mecca and Salton Sea Near-Shore air monitoring stations. A notification system for  $H_2S$  exceedances at these sites is available through “The Salton Sea Hydrogen Sulfide Monitoring” website<sup>ii</sup>. As part of this monitoring strategy, South Coast AQMD staff will work with the CSC

---

<sup>ii</sup> <https://saltonseaodor.org/>

to identify opportunities to expand its air monitoring network. Continuous wind speed and wind direction data will also be collected to help better identify the location(s) of the odors. The expansion of the H<sub>2</sub>S monitoring network will lead to covering a larger part of the ECV community and will help assess community impact and the extent to which the odors may be transported in the community and beyond.

Currently, PM<sub>10</sub> monitoring is being conducted at six fixed monitoring stations within the ECV community boundary. Two of these sites (Mecca and Indio) are operated by the South Coast AQMD. One of these stations, 29 Palms, has been established by a partnership between Twenty-Nine Palms Band of Mission Indians and the Cabazon Band of Mission Indians in the ECV community through an AB 617 Community Air Grant awarded by CARB to the tribes.<sup>iii</sup> One monitoring station has been established by Torres-Martinez Desert Cahuilla Indians. The Salton Sea Park and Salton Sea Near-Shore monitoring stations are operated by the Imperial Irrigation District. The location of these stations is shown in figure 6-1 and the pollutants monitored at each site are presented in Table 6-1.

Figure 6-1. Current air monitoring stations in the ECV community

<sup>iii</sup> Twenty-Nine Palms Tribal EPA, Air Quality: <https://www.29palmstribes.org/epa-air-quality>

Table 6-1- Pollutants monitored at each station in the ECV community

Station Name	Site Location	Agency	Monitored Pollutants
Indio	46990 Jackson Street Indio, CA 92201	South Coast AQMD	Ozone, PM2.5, PM10
Mecca (Saul-Martinez Elementary School)	65705 Johnson Street Mecca, CA 92254	South Coast AQMD	H <sub>2</sub> S, PM10
Torres-Martinez Tribal	66-725 Martinez Road, Thermal, CA 92274	Torres-Martinez Cahuilla Indians	PM10
Salton Sea Near Shore	Lincoln Ave. & 73rd Ave., Mecca CA 92254	Imperial Irrigation District	H <sub>2</sub> S*, PM2.5, PM10
Salton Sea Park	100-225 State Park Rd., North Shore CA 92254	Imperial Irrigation District	PM2.5, PM10
29 Palms	33.719724, -116.189578	Twenty-Nine Palms Band of Mission Indians	PM2.5, PM10

\* H<sub>2</sub>S monitor is operated by the South Coast AQMD

As part of our efforts to better characterize PM10 emissions from the Salton Sea, South Coast AQMD staff will work with the CSC to identify opportunities to expand the PM10 monitoring network in ECV to provide additional air quality information in residential areas that do not currently have such measurement data. This, together with continuous wind speed and wind direction data, will help gain a better understanding of dust emissions and distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea. It can also help track the concentration trends of PM10 over the course of the AB 617 program to help assess the effectiveness of dust suppression projects. Data from this monitoring network will be provided in near real-time to inform community members of PM10 levels in ECV, and if emissions Federal and/or State standards.

The above-mentioned monitoring network will be supplemented by a network of PM10 sensors to enhance the spatial coverage of PM10 measurements at more locations of interest. Data from these sensors will provide real-time information and improve our understanding of the variations in PM10 levels across the ECV community. This will help identify the source(s) of PM10 emissions and their origin (e.g., fugitive road dust and wind-blown desert dust). Air quality sensors will be co-located with a reference PM10 monitor at one of the South Coast AQMD air monitoring stations to verify sensor performance prior to deployment. A data calibration and correction protocol has been developed to systematically enhance the data quality of the PM10 sensors after deployment. The sensor deployment process will be carried out in close collaboration with the South Coast AQMD Air Quality Sensor Performance Evaluation Center (AQ-SPEC). AQ-SPEC is the most comprehensive sensor evaluation program in the United States that provides community residents, scientists and other sensor users with unbiased information on sensor performance based on rigorous field and laboratory testing<sup>iv</sup>.

These measurements will be accompanied by baseline monitoring to better characterize the chemical composition of dust in the ECV community. Chemical composition data will be beneficial in characterizing

<sup>iv</sup> Air Quality Sensor Performance Evaluation Center (AQ-SPEC): <http://www.aqmd.gov/aq-spec>

the relative contributions of playa dust emissions and dust from other sources (e.g., fugitive road dust and wind-blown desert dust) to the ambient concentrations of PM<sub>10</sub> measured in ECV. Baseline measurements will also help track the trends of key indicator pollutants of Salton Sea emissions and address specific CSC concerns about the chemical composition and potential toxicity of playa dust emissions.

Lastly, South Coast AQMD staff will pursue a collaborative partnership with other organizations (e.g., University of California – Riverside) to support the ongoing study of soil chemical and microbiome composition of the Salton Sea playa dust samples.

### Pesticides

Pesticides are unique among air toxic substances because they are produced specifically for their toxicity to a target pest and purposely introduced into the environment. Pesticides play a major role in agricultural production all around the world to help protect crops from pests. Farming operations in the ECV commonly use pesticides on agricultural land. Pesticide regulations do not only focus on assessing their toxicity and potentially banning pesticides but also on protecting people by reducing the risk of harmful exposure.

The CSC expressed their concerns about the health impacts of pesticides used in agriculture, including exposure to farm workers, in residential areas (e.g., odor nuisance and pesticide exposure from wind drift or runoff), and in schools that are close to application sites. The CSC also emphasized their apprehension regarding the lack of information on the actual amount of pesticides being used in ECV, and the dates when pesticides are being applied. This information is critical for the public when planning to participate in outdoor activities.

Federal, State, and local regulatory agencies are responsible for ensuring safe use of pesticides in California. At the Federal level, the U.S. Environmental Protection Agency (EPA) approves the use of each pesticide. At the State level, the California Department of Pesticide Regulation (DPR) has legal authority to regulate and enforce rules that address the sale and use of pesticides in California. In addition, DPR monitors the levels of pesticides in the air, water and produce. The information regarding pesticides usage and the measured levels is reported periodically on DPR's public website<sup>v</sup>.

South Coast AQMD staff will pursue collaboration with DPR, California Air Resources Board (CARB) and Riverside County Agricultural Commissioner (CAC) to assess currently available pesticide data and develop a monitoring strategy for studying and characterizing this air quality priority.

For the evaluation of pesticide data, South Coast AQMD staff will collaborate with DPR, CARB, and other agencies that currently have information for identifying the potential impact of pesticides on the community. This analysis will be based on currently available data, such as annual pesticide usage, pesticide toxicity and volatility, season and method of application. This screening evaluation will identify the pesticides that are most impactful in this community and will provide information for focusing subsequent air monitoring efforts. South Coast AQMD staff will also reach out to the CSC, members of the public and local growers to gather feedback on the collected data and any other information that may help inform the pesticide monitoring efforts.

---

<sup>v</sup> <https://www.cdpr.ca.gov/docs/pur/purmain.htm>

South Coast AQMD staff will present the results of the data evaluation to the CSC and community members. Following this screening process, staff will work with the CSC to select the most relevant pesticides in the community and identify representative locations and periods for monitoring pesticides levels. South Coast AQMD staff will consult with DPR and CARB to evaluate which sampling and analysis techniques will be used, as appropriate. Air monitoring will be conducted to determine if specific pesticides are present and at what levels. If elevated levels of pesticides are found in ambient air, South Coast AQMD staff will work with DPR, CARB and the Riverside CAC to identify potential exposure reduction measures and/or to develop new use restrictions or regulations to be enforced by the Riverside CAC. The screening analysis and the outcome results from this monitoring plan will lay the foundation for future assessments of the impact of pesticides on the ECV community and the effectiveness of regulations.

### Open Burning and Illegal Dumping

The ECV community has a large agricultural industry, including the production of grapes, dates, citrus and other crops. With such a large agricultural industry in the area, the burning of agricultural waste is a common method of disposal. In some cases, burning may occur to prevent crops from freezing. The CSC also identified illegal dumping of various waste materials, which can subsequently catch fire, as an air quality priority. The open burning can cause smoke, impacting schools, childcare centers and homes.

The main strategy to characterize emissions from open burning in this community will center around the deployment of a network of air quality sensors to measure PM<sub>2.5</sub>. Due to the sporadic nature of open burning, fixed monitors are necessary to capture the spatial and temporal variability of emissions. Fixed monitoring using air quality sensors will provide real-time air quality data to gain a better understanding of the locations, frequency, and magnitude of PM emissions from open burning, help identify the locations impacted by the smoke, and improve overall public information on PM<sub>2.5</sub> levels in the community.

South Coast AQMD staff will work with the CSC to effectively deploy these sensors at appropriate locations. South Coast AQMD staff will also pursue opportunities to augment one of the existing and/or new monitoring stations with a black carbon monitor to better characterize emissions. Black carbon is a by-product of biomass burning but can also be emitted from diesel mobile sources.

### Fugitive Road Dust

The CSC identified emissions from fugitive road dust as an air quality priority in ECV. Fugitive road dust in this community is generated when vehicles travelling on paved and unpaved roads kick up loose solid materials deposited on the surface and make them airborne. The CSC has expressed concerns about dust emitted from unpaved roadways when there are windy conditions or when off-road vehicles drive on these roads. Community residents are also concerned about the potential health effects associated with exposure to high PM<sub>10</sub> levels resulting from fugitive road dust emissions.

Currently, six air monitoring stations in the ECV community (Table 6-1) measure PM<sub>10</sub>. The Indio and Mecca air monitoring stations are operated by the South Coast AQMD, while the rest of the stations are operated by other agencies.

The monitoring strategy for fugitive road dust includes expanding the current South Coast AQMD PM<sub>10</sub> monitoring network in ECV, which will provide near real-time PM<sub>10</sub> and wind data to inform community members about PM<sub>10</sub> levels and if they exceed Federal and/or State standards. These measurements will help track the concentration trends of PM<sub>10</sub> levels over time to help determine the effectiveness of emission reduction strategies.

South Coast AQMD staff will seek new opportunities and work with the CSC to create an air quality sensor network to augment the fixed monitoring network for PM<sub>10</sub> measurements to cover a larger area in the community, prioritizing areas where the public spends a significant amount of time (e.g. schools and residential areas) and areas close to sources of fugitive dust. Data from these sensors will provide near real-time data and improve our understanding of the spatial and temporal variability in PM<sub>10</sub> levels across ECV. This information will help better distinguish where the PM<sub>10</sub> emissions are coming from (e.g. dust emissions from the Salton Sea or wind-blown dust from surrounding deserts). Air quality sensors will also provide more opportunities for community engagement in different aspects of the air monitoring process. All sensors will be co-located at one of the air monitoring stations with reference PM<sub>10</sub> monitors to check their performance prior to deployment. It should be noted that the sensors for PM<sub>10</sub> measurements usually show a good performance at the lower concentration levels while their uncertainty increases significantly during regional dust events with high PM<sub>10</sub> levels. A systematic data calibration and correction protocol has been developed and will be implemented to improve data quality for the entire sensor network. During dust events, which have regional impacts, the reference monitors can help determine the community impact.

### Diesel Mobile Sources

The CSC has expressed concerns about exposure to diesel emissions from several mobile sources and locations in the ECV community including heavy-duty trucks traveling along the State highways 111 and 86, school buses, and heavy-duty agricultural equipment (e.g., tractors and harvesting equipment). Diesel truck emissions are complex and are comprised of a variety of toxic gases and particles. Pollutants associated with diesel exhaust include PM<sub>2.5</sub>, and nitrogen dioxide (NO<sub>2</sub>). Diesel exhaust also contains the toxic air contaminant diesel particulate matter (DPM), which is a component PM<sub>2.5</sub>. DPM cannot be monitored directly but is estimated by measuring black carbon (BC or “soot”).

Two existing air monitoring stations (Indio station operated by the South Coast AQMD and 29 Palms monitoring station operated by Twenty-Nine Palms Band of Mission Indians) measure PM<sub>2.5</sub> within the community (Figure 6-1 and Table 6-1). The proposed monitoring strategy to address this priority consists of creating a sensor network that can measure PM<sub>2.5</sub> and NO<sub>2</sub>. South Coast AQMD staff will work with the CSC to effectively deploy these sensors at appropriate locations. This additional data will help quantify emissions from truck traffic to better understand the impact of diesel emissions in the community and to help track the effectiveness of emission reduction strategies outlined in the CERP. South Coast AQMD will also pursue opportunities to augment one of the existing or new monitoring stations with a stationary BC monitor. If necessary, short-term BC monitoring will be conducted at locations where sensor data indicate relatively high diesel emissions.

### Greenleaf Desert View Power Plant

The CSC expressed concerns regarding the Greenleaf Power Desert View Power Plant (formerly Colmac Energy, Inc.), because of visible emissions and smoke from the facility. This facility is a biomass electrical generation facility that has been operating since 1992 and is located on the Cabazon Band of Mission Indians Reservation at 62300 Gene Welmas Dr, Mecca, CA 92254. This plant is subject to U.S. EPA regulations and uses emission control devices and measures to reduce nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>x</sub>) and PM emissions.

To address CSC concerns, South Coast AQMD staff will evaluate currently available combustion-related emissions data to help assess how emissions from the Greenleaf power plant contribute to the overall

pollution burden in ECV. Based on these findings and if additional monitoring is necessary, South Coast AQMD staff will implement an appropriate monitoring strategy that focuses on measuring relevant pollutants near the facility and close to sensitive receptors (e.g., schools).

This power plant is operating all year round and, therefore, a monitoring strategy based on fixed monitoring will be adopted. Fixed monitoring allows for a more comprehensive characterization of air pollution trends over an extended period of time, although it only provides air quality information when the monitoring locations are downwind of the source. Currently, South Coast AQMD operates one fixed monitoring site (Mecca air monitoring station) near the Greenleaf power plant; this site is located within the perimeter of Saul Martinez elementary school and approximately one mile southeast to the power plant. An analysis of the wind direction gathered during the last three years shows that the air monitoring station in Mecca was downwind of the power plant more than 50% of the time and, hence, this is a suitable site for exploring the impact of Greenleaf emissions on the surrounding community.

Since the general monitoring approach for ECV relies on creating an air quality sensor network, South Coast AQMD will work with the CSC to identify strategic locations for deploying these sensors to capture potential PM<sub>2.5</sub> emissions from this facility, if appropriate, under variety of wind conditions.

---

# APPENDIX 2:

## COMMUNITY OUTREACH, COMMUNITY STEERING COMMITTEE AND PUBLIC PROCESS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

**APPENDIX to Chapter 2:****Eastern Coachella Valley (ECV)**

The Eastern Coachella Valley (ECV) Community Outreach Summary includes an overview of the public engagement efforts and the Community Steering Committee (CSC) process that has been integral in the development of the CERP. This Appendix contains additional information on committee documents, meeting materials, and additional community engagement. Many of these materials are posted on the community's webpage:

<http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

**ROSTER:**

CSC membership consisted of 50 CSC primary members, along with various organizations designated alternates. Due to the lack of attendance and issues with reaching a quorum at CSC meetings, the CSC requested that staff contact CSC members who have missed 5 or meetings. As of November 19<sup>th</sup>, the roster was updated to reflect the 38 remaining CSC members.

## CHARTER

A Charter was developed by South Coast AQMD and CSC member to cover committee objectives, roles and responsibilities, meeting frequency, meeting dates, times, and locations, etc.

English: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter.pdf?sfvrsn=8>

Spanish: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter-span.pdf?sfvrsn=8>

## SIGN-IN SHEETS

At every CSC meeting, members of the CSC and public were requested to sign in. The initial community kick-off meeting and the first meeting of the ECV CSC were in-person meetings, but the rest of the meetings were held virtually via zoom webinars. Thus, the zoom attendance report is included for each virtual meeting.

(attached)

## AGENDAS

Prior to every CSC meeting, the meeting agenda was emailed to CSC members and interested parties as well as posted online in English and Spanish.

<http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley> (attached)

## MEETING DATES, TIMES, LOCATION

Recent and upcoming activities regarding the ECV community, including interactive maps, the discussion draft of the CERP and CAMP, all meeting invitations, presentations, materials and summary notes can be found on South Coast AQMD's website:

<http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

Specific links for meeting flyers, presentations, and agenda are listed below:

## MEETING INTERPRETATION

Spanish interpretation was available at each kick-off meeting and CSC meeting. The following interpreters were contracted through California Certified Interpreters and provided their interpretation services at the various ECV CSC meetings:

Table 2-4. Meeting Interpreters

Alejandro Franco	Monica Desiderio	Madeline Rios
Patricia Hyatt	Estela Moll	Edna L. Santizo

## MEETING FACILITATION

All ECV CSC meetings were facilitated by VMA Communications ([www.vmapr.com](http://www.vmapr.com)) by either Jeanette Flores and Valerie Martinez.

Table 2-5. Technical Advisory Group Meetings in 2019-2020

Meeting #	Date	Approximate Attendees
1	February 27, 2019	45
2	May 29, 2019	45
3	July 18, 2019	40
4	July 31, 2020	40
5	October 23, 2020	40

Table 2-6. AB 617 Technical Advisory Group (TAG) Roster As of October 23, 2020

Name	Affiliation	Community
Jesse Marquez	Coalition for a Safe Environment	Wilmington, Carson, West Long Beach
Erica Blyther	City of Los Angeles	Wilmington, Carson, West Long Beach
Jill Johnston	University of Southern California	Wilmington, Carson, West Long Beach
Tim DeMoss (Alternate for Erica Blyther)	Port of Los Angeles	Wilmington, Carson, West Long Beach
Ryan Sinclair	Loma Linda University	San Bernardino, Muscoy

Name	Affiliation	Community
Andreas Beyersdorf	California State University, San Bernardino	San Bernardino, Muscoy
Tammy Yamasaki	Southern California Edison	San Bernardino, Muscoy
Hector Garcia	Our Lady of Victory	East LA, Boyle Heights, West Commerce
Rafael Yanez	Active Resident	East LA, Boyle Heights, West Commerce
Aaron Rojas	Tribal Air Technician, Twenty-Nine Palms Band of Mission Indians	Eastern Coachella Valley
Ryan Sinclair	Loma Linda University	Eastern Coachella Valley
Lilian Garcia	Active Resident	Eastern Coachella Valley
Laura Cortez	East Yard Communities for Environmental Justice	Southeast Los Angeles
Rudy Morales	Morales Galindo Group	Southeast Los Angeles
Manuel Pastor	Univ. Southern California, Sociology and American Studies & Ethnicity	Technical Expert
Scott Fruin	Univ. Southern California, Preventive Medicine	Technical Expert
Luis Portillo	Inland Empire Partnership	Technical Expert
Cesunica (Sunny) Ivey	UC Riverside	Technical Expert
Ken Davidson	US EPA Region 9 Air Division, Air Toxics, Radiation, and Indoor Air Office	Technical Expert
Janet Whittick	California Council for Environmental and Economic Balance (CCEEB)	Technical Expert
Melissa Lunden	Aclima	Technical Expert

### ADDITIONAL OUTREACH

Table 2-7. South Coast AQMD staff had more than 50 in-person, phone, or Zoom meetings with CSC members.

Date	Meeting
12/10/20	Ryan Sinclair, Pati Leal, Rebecca Zaragoza
1/17/20	Pati Leal
2/20/20	Torres Martinez Desert Cahuilla Indians Reservation - Vice Chairman Mirelez, Tony Quiroz, Sienna Thomas
3/19/20	Twenty-Nine Palms EPA – Shawn Muir, Levi Anderson, Aaron Rojas
4/1/20	Rebecca Zaragoza, Sahara Huazano, Patricia Leal, Yaneth Andrade-Magaña, Olivia Rodriguez, Ryan Sinclair, Miguel Hernandez
6/5/20	Anetha Lue
6/5/20	Rebecca Zaragoza
6/9/20	Josefina Sosa

Date	Meeting
6/9/20	Maria Conchita Pozar
6/9/20	Odalys Beltran
6/9/20	Azucena Beltran
6/9/20	Leticia de Lara
6/9/20	Britney Sowell
6/11/20	Ryan Sinclair
6/9/20	Miguel Hernandez
6/12/20	Otoniel Quiroz
6/12/20	Pati Leal
6/26/20	Yaneth Andrade
6/26/20	Janell Percy
7/15/20	Marco Romero Villa
7/15/20	Monica Mandujano
7/15/20	Janell Percy
7/16/20	Manuel Arredondo
7/16/20	Karina Andelon
7/23/20	Manuela Ramirez
7/23/20	Rene Chavez
7/23/20	CSC Workshop Presenters (DPR, California Natural Resources Agency (CNRA), IID, CARB, UC Riverside, County of Riverside Ag Commissioner)
8/7/20	Aaron Rojas
9/16/20	Anetha Lue
9/16/20	Rebecca Zaragoza
9/16/20	Pati Leal
9/18/20	George Tudor
9/18/20	Bryan Mendez
9/18/20	Olivia Rodriguez
9/18/20	Rebecca Zaragoza
9/18/20	Karina Andalon
9/21/20	Miguel Romero Ochoa
9/22/20	Miguel Vazquez
9/22/20	Deborah McGarrey
9/22/20	Anetha Lue
9/22/20	Brittney Sowell

Date	Meeting
9/23/20	Lilian Garcia
9/24/20	Anna Lisa Vargas
9/30/20	Adriana Chavez
9/30/20	Pati Leal
10/22/20	Lil Garcia
11/11/20	Aaron Rojas
11/17/20	Angela Bedolla
11/17/20	Arturo Castellenos Jr
11/17/20	Gabriel Cruz
11/17/20	Guadalupe Rosales
11/17/20	Maria Griselda Garcia
11/17/20	Rene Chavez
11/17/20	Marco Romero-Villa
11/17/20	Aurora Wilson
11/19/20	Monica Mondujano
11/20/20	Anetha Lue

### ADDITIONAL COMMUNITY ENGAGEMENT

Table 2-8. South Coast AQMD staff attended various meetings hosted by community organizations and local government agencies in order to better understand the unique issues facing ECV.

Date	Meeting
2/19/19	Leadership Counsel for Justice and Accountability (LCJA), CARB
3/7/19	Coachella Valley EJ Task Force
4/24/19	Coachella Valley EJ Task Force
5/14/19	Coachella School District Community Meeting
6/12/19	Coachella Valley EJ Task Force
7/17/19	Riverside County Health Coalition   SB1000 & Environmental Justice
7/19/19	CCV
8/28/19	Coachella Valley EJ Task Force
9/20/19	Twenty-Nine Palms Tribal EPA - Coachella Air Monitoring Tour
9/25/19	Coachella Valley EJ Task Force
10/16/19	IID Salton Sea Tour (Imperial County)
10/16/19	North Shore Community Gathering

<b>Date</b>	<b>Meeting</b>
10/17-10/8/19	2019 Salton Sea Summit
10/23/19	SB 1000 Mecca Community Collaboration, Mecca
11/1-11/2/19	Imperial Valley EJ Summit
11/8/19	SunLine Transit
11/20/19	Coachella Valley EJ Task Force
12/18/19	Coachella Valley EJ Task Force
1/22/20	Coachella Valley EJ Task Force
2/7/20	Alianza Ribbon Cutting
2/20/20	Cabazon Band of Missions
2/20/20	Coachella Leadership Briefing
2/26/20	Coachella Valley EJ Task Force
3/25/20	SSMP: Draft Dust Suppression Action Plan - Interagency Air Quality Coordination Meeting
3/25/20	Air Studies Meeting with Luis Olmedo and Dr. Paul English
4/8/20	SSMP: DSAP Comment Coordination
4/22/20	Estamos Aqui Documentary Public Viewing
4/22/20	Coachella Valley EJ Task Force
5/20/20	Coachella Valley EJ Task Force
5/22/20	Briefing for American Cancer Society
6/21/20	Coachella Valley EJ Task Force
7/7/20	Department of Water Resources
7/10/20	Department of Pesticide Regulation
7/22/20	Coachella Valley EJ Task Force
7/28/20	Department of Pesticide Regulation
8/26/20	Coachella Valley EJ Task Force
10/28/20	Coachella Valley EJ Task Force
10/28/20	EJ Conference – AB 617

## COMMUNITY PROFILE

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 3a: Community Profile

### Process of CSC Input on CERP Elements

The elements and actions described in the CERP were developed during monthly CSC meetings and workshops, where committee members, members of the public, and South Coast AQMD staff worked together to discuss the various air quality concerns within the community boundary and identified opportunities to address them. The input process is summarized in Table Appendix 3a-1.

Table Appendix 3a-1: Process of CSC Input on CERP Elements

Meeting	Discussion Topic(s)	CSC input	How was this CSC input used in the CERP development process?
CSC Meeting #1 February 20, 2020	<ul style="list-style-type: none"> <li>CSC Orientation</li> <li>CSC Charter</li> <li>Community Boundary</li> <li>Air Monitoring</li> <li>Source Attribution</li> <li>Air Quality (AQ) Prioritization Activity</li> </ul>	<ul style="list-style-type: none"> <li>Identified Community Boundary and AQ concerns</li> <li>Requested revisions to charter and meeting format</li> </ul> <p><u>Outcome:</u> List of AQ concerns and request for further Charter discussion</p>	Boundary is used to define focus area for CERP actions. AQ concerns were identified for potential inclusion in the CERP.
CSC Meeting #2 May 20, 2020	<ul style="list-style-type: none"> <li>CERP timeline and process</li> <li>CSC meeting format, charter, and schedule</li> <li>Informational handouts (on two (2) proposed AQ Priorities)</li> <li>CARB Blueprint overview</li> </ul>	<ul style="list-style-type: none"> <li>CSC sub-group to work on draft charter</li> <li>Requested additional charter working group meetings</li> </ul> <p><u>Outcome:</u> Charter Working Group Meetings (see Charter Working Group Meetings #1 to 4).</p>	CSC Charter guides CSC meeting format and decision-making process during CERP development.
Charter Working Group #1 June 23, 2020	<ul style="list-style-type: none"> <li>CSC Charter, including:               <ul style="list-style-type: none"> <li>Goals and Mission Statement</li> <li>Responsibilities and Membership</li> <li>Meeting Procedures</li> <li>Brown Act Elements and Stipends</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Requested a Google Document for CSC members to provide input on the charter</li> <li>Some CSC members requested that the CSC become a Brown Act Committee</li> </ul> <p><u>Outcome:</u> Provided CSC Charter Google Document and informational handout on the Brown Act</p>	CSC Charter guides CSC meeting format and decision-making process during CERP development.

CSC Meeting #3 June 25, 2020	<ul style="list-style-type: none"> <li>Finalize Community Boundary</li> <li>CSC Charter Working Group Meeting summary</li> <li>CERP and CAMP Process Overview</li> <li>Brown Act Overview</li> <li>Proposed AQ Priorities</li> <li>Air Monitoring</li> </ul>	<ul style="list-style-type: none"> <li>Requested CERP development be delayed until charter is finalized</li> <li>Requested educational workshop on the Salton Sea and Pesticides</li> <li>Some CSC members requested the CSC become a Brown Act Committee</li> </ul> <p><u>Outcome:</u></p> <p>Three (3) additional Charter Working Group Meetings, educational workshop on Salton Sea and Pesticides, Combined AQ Priorities Open Burning and Illegal Dumping as one</p>	Boundary is used to define focus area for CERP actions. CSC Charter guides CSC meeting format and decision-making process during CERP development. Strategies and Actions will be tailored to address Open Burning and Illegal Dumping.
Charter Working Group #2 July 15, 2020	<ul style="list-style-type: none"> <li>CSC Charter, including:               <ul style="list-style-type: none"> <li>Goals and Mission Statement</li> <li>Responsibilities and Membership</li> <li>Meeting Procedures</li> <li>Brown Act Elements and Stipends</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Line-by-line feedback provided on the CSC Charter Google Document</li> <li>Some CSC members requested again that the CSC become a Brown Act Committee</li> <li>CSC sub-group voted to decide if the whole CSC should have a formal vote on pursuing becoming a Brown Act Committee</li> </ul> <p><u>Outcome:</u></p> <p>Incorporated CSC sub-group suggestions and edits. Vote results were 15-4-1 for No, Yes, and Abstained, respectively.</p>	CSC Charter guides CSC meeting format and decision-making process during CERP development.
Charter Working Group #3 July 22, 2020			
Charter Working Group #4 July 29, 2020			

Salton Sea and Pesticides Workshop July 30, 2020	<ul style="list-style-type: none"> <li>Salton Sea presentations:               <ul style="list-style-type: none"> <li>Imperial Irrigation District (IID)</li> <li>California Air Resources Board (CARB)</li> <li>South Coast AQMD's Monitoring program</li> <li>University of California Riverside (UCR) in collaboration with CSC Member Maria "Conchita" Pozar</li> </ul> </li> <li>Pesticides presentations:               <ul style="list-style-type: none"> <li>Department of Pesticide Regulation (DPR) and CARB</li> <li>Riverside County Agricultural Commissioner's Office</li> </ul> </li> <li>Proposed next steps</li> </ul>	<ul style="list-style-type: none"> <li>Asked about air monitoring, including public access to data and expanding the network, and the composition and health impacts of the dust around the Salton Sea</li> </ul> <p><u>Outcome:</u></p> <p>CSC input, such as deploying additional monitors, expanding the network, and collaborating with other agencies, was incorporated into CERP actions, where feasible</p>	CSC input was incorporated into CERP actions to address Salton Sea and Pesticides, where feasible.
CSC Meeting #4 August 26, 2020	<ul style="list-style-type: none"> <li>Coachella Valley ozone standard reclassification</li> <li>South Coast AQMD's Open Burn Program</li> <li>Resources for reporting illegal dumping</li> <li>Overview of Technical Advisory Group (TAG) Meeting</li> <li>CSC Draft Charter</li> </ul>	<ul style="list-style-type: none"> <li>Provided details on Open Burning and/or Illegal Dumping concerns and suggested alternatives to open burning</li> <li>Requested the Draft CSC Charter be translated into Spanish before a formal CSC vote is conducted</li> </ul> <p><u>Outcome:</u></p> <p>CSC input was incorporated into CERP actions, where feasible. Staff provided Draft CSC Charter in English and Spanish.</p>	CSC input was incorporated into CERP actions to address Open Burning and Illegal Dumping, where feasible.

CSC Meeting #5 September 24, 2020	<ul style="list-style-type: none"> <li>Finalize CSC Charter</li> <li>CERP Development timeline and process to meet statutory deadlines</li> <li>Finalize AQ Priorities</li> </ul>	<ul style="list-style-type: none"> <li>Vote to approve the CSC Charter resulted in 25-1-2 for Yes, No, and Abstained, respectively</li> <li>Suggested potential CERP strategies and actions (i.e., monitoring)</li> <li>Requested informational handouts with emissions data (if available) and potential CERP actions for four (4) AQ Priorities: Salton Sea, Pesticides, Fugitive Road Dust, and Open Burning and Illegal Dumping</li> <li>Requested survey to prioritize AQ priority to develop for December CERP submittal</li> </ul> <p><u>Outcome:</u></p> <p>Provided 4 AQ Priority informational handouts and AQ Priority Survey</p>	Suggestions on CERP strategies and actions (i.e., monitoring) were incorporated in the informational handouts and into the CERP.
CSC Q & A Workshop October 7, 2020	<ul style="list-style-type: none"> <li>Open forum Question &amp; Answer Session for four (4) AQ Priority informational handouts</li> </ul>	<ul style="list-style-type: none"> <li>Suggested ways to refine some proposed actions and emissions data and suggested additional actions</li> <li>Requested staff re-survey CSC to rank the four (4) AQ priorities in chronological order of how they would like the AQ priorities to be addressed</li> </ul> <p><u>Outcome:</u></p> <p>Input was incorporated in CERP, where feasible.</p>	CSC input used to refine CERP actions and include additional actions. AQ Priority survey prioritized development of AQ Priority chapters in the CERP.
CSC Meeting #6 October 14, 2020	<ul style="list-style-type: none"> <li>Summary of recent meetings</li> <li>CSC suggestions from Q &amp; A Workshop</li> <li>AQ Priority Survey results</li> </ul>	<ul style="list-style-type: none"> <li>Requested all six (6) AQ Priorities to be developed in the CERP</li> </ul> <p><u>Outcome:</u></p> <p>CERP includes six (6) AQ Priority chapters</p>	CERP includes six (6) AQ Priority chapters.

CSC Meeting #7 October 22, 2020	<ul style="list-style-type: none"> <li>CERP development process, plan elements, timeline, and next steps</li> <li>Draft CERP actions</li> </ul>	<ul style="list-style-type: none"> <li>Suggested additional collaborating entities (e.g., Riverside County Waste Management Services), educational information, and land use actions</li> <li>Requested the CERP be released in English and Spanish and South Coast AQMD conduct two CSC meetings in November</li> </ul> <p><u>Outcome:</u> Staff provided Discussion Draft CERP in English and Spanish and conducted two November meetings (see CSC Meetings #8 and 9 below).</p>	CSC input was incorporated into the CERP, where feasible.
CSC Meeting #8 November 12, 2020	<ul style="list-style-type: none"> <li>Chapter 5 Draft CERP; Proposed actions, goals, metrics; Development Process Timeline</li> </ul>	<ul style="list-style-type: none"> <li>Feedback on Discussion Draft CERP. Ideas for specific goals for each CERP action.</li> </ul> <p><u>Outcome:</u> Incorporate CSC input for Draft CERP</p>	Feedback on Draft CERP and ideas for specific goals will be used to inform the Draft CERP prior to Stationary Source Committee.
CSC Meeting #9 November 19, 2020	<ul style="list-style-type: none"> <li>CERP final comments and CSC approval</li> </ul>	<ul style="list-style-type: none"> <li>Feedback on CERP prior to Stationary Source Committee</li> </ul> <p><u>Outcome:</u> Final CERP presented to the South Coast AQMD Governing Board</p>	Final comments to be addressed in December 2020 Governing Board Package.

### Key Stationary Sources in the Community

The South Coast AQMD develops and enforces air pollution regulations to reduce emissions, improve air quality and protect public health. Many South Coast AQMD rules apply to a specific type of operation or pollution source. *Figure Appendix 3a-1* describes the number of facilities in this community that are subject to some key South Coast AQMD rules to control emissions from facilities processing metals. The figure also includes information about facilities that are in important state and federal programs, which include major sources of air pollution or other types of environmental pollution.

Figure Appendix 3a-1: Key stationary sources in the Eastern Coachella Valley community, by regulatory program

### 1 Facility in the AB2588 program

**Assembly Bill 2588** (AB2588) is a statewide program that focuses on reducing air toxics pollution from facilities, and requires facilities above certain levels to disclose and/or reduce risks

### 1 Facility subject to U.S. EPA Title V

The **U.S. EPA Title V program** is a permitting program that includes all major sources of air pollutants across the United States.

## Information on Best Available Retrofit Control Technology and the AB 2588 Program

AB 617 requires air districts to implement Best Available Retrofit Control Technology (BARCT) for facilities in the state greenhouse gas cap-and-trade program by December 31, 2023. The Eastern Coachella Valley community does not have any facilities that are subject to BARCT nor any larger facilities that are in the REgional CLean Air Incentives Market (RECLAIM) program. In addition, CARB's Blueprint states that facilities located within the community with Risk Reduction Plans under the Assembly Bill (AB) 2588 program must be identified. Descriptions of the facilities that are subject to BARCT (specifically RECLAIM facilities) and the AB 2588 program are provided below.

## Best Available Retrofit Control Technology (BARCT)

### *RECLAIM facilities*

Facilities within the RECLAIM program are typically larger facilities that have NO<sub>x</sub> emissions greater than four tons per year. The RECLAIM program<sup>1</sup> uses a market-based approach to achieve emission reductions from facilities for nitrogen oxides (NO<sub>x</sub>) and sulfur oxides (SO<sub>x</sub>) in the aggregate. However, an analysis of the RECLAIM program has shown that the ability to achieve NO<sub>x</sub> emission reductions using a market-based approach has diminished; therefore, pursuant to Board direction, RECLAIM NO<sub>x</sub> facilities will transition<sup>2</sup> to a command-and-control regulatory structure to ensure facilities meet BARCT. RECLAIM facilities that are also in the State greenhouse gas cap-and-trade program are subject to the BARCT requirements of AB 617. South Coast AQMD staff completed an analysis of the equipment at each RECLAIM facility, giving higher priority to older, higher polluting units that will need to install retrofit controls. The higher polluting units at RECLAIM facilities will be or have been evaluated for BARCT and will be subject to the following

<sup>1</sup> South Coast AQMD, RECLAIM, <http://www.aqmd.gov/home/programs/business/business-detail?title=reclaim>, Accessed September 10, 2020.

<sup>2</sup> For more information on the RECLAIM transition please see: <http://www.aqmd.gov/home/rules-compliance/reclaim-transition>.

South Coast AQMD rules: Rules 1109.1,<sup>3</sup> 1110.2,<sup>4</sup> 1117,<sup>5</sup> 1118.1,<sup>6</sup> 1134,<sup>7</sup> 1135,<sup>8</sup> 1146, 1146.1, 1146.2,<sup>9</sup> 1147, 1147.1,<sup>10</sup> and 1147.2.<sup>11</sup> A BARCT assessment includes an evaluation of emission limits for existing units, South Coast AQMD regulatory requirements, other regulatory requirements, and pollution control technologies. Although the AB 617 program calls for an expedited schedule for BARCT, there are no RECLAIM facilities or BARCT facilities within the Eastern Coachella Valley community.

#### *Non-RECLAIM facilities*

As a result of the BARCT assessment conducted for RECLAIM facilities, some equipment at non-RECLAIM facilities will also be affected and will be required to meet BARCT NO<sub>x</sub> emissions. The BARCT assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities that may be subject to additional requirements is being developed, none of which are within the Eastern Coachella Valley community boundary.

#### *AB 2588 Program*

The AB 2588 Program<sup>12</sup> is a statewide program that requires air districts to inventory air toxics from individual facilities.<sup>13</sup> The AB 2588 program is implemented in South Coast AQMD through

<sup>3</sup> South Coast AQMD, PR 1109.1: Refinery Equipment, <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/proposed-rules#1109.1>, Accessed September 10, 2020.

<sup>11</sup> South Coast AQMD, PAR 1147.2: NO<sub>x</sub> Reductions from Metal Processing Equipment, <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/proposed-rules#1147.2>, Accessed September 10, 2020.

<sup>12</sup> South Coast AQMD, Air Toxics “Hot Spots” Program (AB 2588), <http://www.aqmd.gov/home/rules-compliance/compliance/toxic-hot-spots-ab-2588>, Accessed September 10, 2020.

<sup>13</sup> The South Coast AQMD’s AB 2588 Program incorporates the requirements of the state AB 2588 program, as well as additional and/or more stringent requirements.

Rule 1402 - Control of Toxic Air Contaminants from Existing Sources<sup>14</sup> which requires certain facilities to conduct Health Risk Assessments to assess the health risk (long-term versus short-term) to the surrounding community. Facilities are required to submit Health Risk Assessments<sup>15</sup> based upon the toxicity and volume of toxic air contaminants released within proximity to potential receptors (e.g., hospitals, residences, work sites). Depending on the risk, facilities may be required to provide public notices and hold a public meeting. If a facility is determined to exceed the significant risk level, as determined by each air district, they are required to reduce this risk by submitting a Risk Reduction Plan (RRP).<sup>16</sup> The RRP outlines what measures (e.g., high-efficiency particulate air (HEPA) filters) the facility will incorporate to reduce their risk. (Some facilities may be subject to the AB 2588 program, but do not exceed the action risk threshold and therefore are not required to submit a RRP.) Under Rule 1402, some facilities may also choose to voluntarily reduce their risk by submitting a voluntary RRP (VRRP).<sup>17</sup> If a facility has an approved VRRP, the risks will be reduced below the voluntary risk threshold.

---

<sup>14</sup> South Coast AQMD, Rule 1402 – Control of Toxic Air Contaminants from Existing Sources, <http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1402.pdf>, Accessed September 10, 2020.

<sup>15</sup> South Coast AQMD, Health Risk Assessment, <http://www.aqmd.gov/home/rules-compliance/compliance/toxic-hot-spots-ab-2588/health-risk-assessment>, Accessed September 10, 2020.

<sup>16</sup> South Coast AQMD, Risk Reduction, <http://www.aqmd.gov/home/rules-compliance/compliance/toxic-hot-spots-ab-2588/risk-reduction>, Accessed September 10, 2020.

<sup>17</sup> Some facilities may have submitted applications for a VRRP; however, if the facility is found to be already under the voluntary risk threshold, no further reduction measures are required.

Table Appendix 3a-2<sup>18</sup> shows the one facility within the Eastern Coachella Valley community that is currently in the AB 2588 program in the South Coast AQMD. This table includes the facility name, location address, and the most recent status under the AB 2588 program. Facilities in the AB 2588 program without a RRP or VRRP will have the prioritization level (High, Intermediate, or Low)<sup>19</sup> and what year the prioritization was conducted listed as the status. Prioritization is based on reporting every four years.

---

<sup>18</sup> Facilities listed in the table are reducing risk or in the process of reducing risk.

<sup>19</sup> Facilities designated as high priority are required to submit Health Risk Assessments to assess the risk to their surrounding community based on their air toxics emissions. Facilities ranked as Intermediate priority are required to submit a complete toxics inventory once every four years. Facilities ranked as low priority are exempt from reporting.

Table Appendix 3a-2: Facility in the AB 2588 program within the Eastern Coachella Valley community

Facility ID	Facility Name	Facility Address	Status within the AB 2588 Program
62862	IMPERIAL IRRIGATION DISTRICT/ COACHELLA	51-170 SHADY LN, COACHELLA, CA 92236	Prioritization from 2017 - Intermediate

### Technology Clearinghouse

South Coast AQMD staff have been conducting Best Available Control Technology (BACT) analyses and working closely with CARB to provide data for the Technology Clearinghouse. Requirements for Toxics-Best Available Control Technology (T-BACT) are established through the adoption and amendment of rules affecting air toxics (i.e., Regulation XIV). Staff will reference the Technology Clearinghouse and applicable air toxic rule requirements (inclusive of state Air Toxic Control Measures (ATCMs) and federal National Emission Standards for Hazardous Air Pollutants (NESHAPs), when available, to evaluate potential tightening of South Coast AQMD rules through the rule development process. Permit considerations for both new and modified sources throughout the district are based on rule requirements.

### Community Air Pollution Profile Details and Related Data

Understanding what air pollution sources exist in the community and what air pollutants come from these sources helps identify key issues that can be addressed through CERP actions. This section presents data based on previous cumulative impact studies<sup>20</sup> to describe the impacts of toxic air pollutants in this community, as well as other environmental pollution, public health factors, and social and economic factors that make people more sensitive or vulnerable to the health effects of pollution.<sup>21</sup>

Air toxics are one group of air pollutants that can affect public health on a local community scale. This includes pollutants from diesel exhaust, metal particulate pollutants (e.g., hexavalent chromium, lead, arsenic, nickel, etc.), and gases (e.g., benzene, formaldehyde, etc.). The South Coast AQMD conducts the Multiple Air Toxics Exposure Study (MATES) every few years to understand the cumulative health impacts of air toxics in communities across the region. The most recently completed study was MATES IV, which was released in 2015, and used air toxics monitoring, emissions inventories, modeling, and health risk assessment techniques to calculate the cancer risk due to toxic air pollutants (“air toxics cancer risk”).<sup>22</sup> MATES V is currently in

<sup>20</sup> More information regarding MATES IV and the final report can be found on South Coast AQMD’s website at, <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/matesiv>.

<sup>21</sup> Office of Environmental Health Hazard Assessment. CalEnviroScreen 3.0. <https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-30>, Accessed September 10, 2020.

<sup>22</sup> More information regarding MATES IV and the final report can be found on South Coast AQMD’s website at: <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/matesiv>.

progress. Based on MATES IV modeled data, approximately three-quarters of the air toxics cancer risk in the Basin is due to diesel particulate matter (

Figure Appendix 3a-2). The average air toxics cancer risk in the Eastern Coachella Valley community is lower than the Basin-wide average and dominated by diesel particulate matter.

Figure Appendix 3a-2: Air toxics cancer risk, based on MATES IV modeled data

Figure Appendix 3a-3: Diesel mobile sources in Eastern Coachella Valley

Mobile sources include trucks, trains, cars, buses, and other mobile equipment, such as farming and off-road equipment. Much of this equipment is powered by diesel, which is the air toxic pollutant with the highest impact in this community. The community includes more than 46 miles of freeways, and many of these are located near residential areas (

Figure Appendix 3a-3).

Understanding the community's public health and socioeconomic profile helps to provide context for the work being done through this CERP. CalEnviroScreen 3.0 is a screening tool developed by the California Office of Environmental Health Hazard Assessment (OEHHA) that is

used to identify communities that are most affected by various sources of pollution, and where people are especially vulnerable to the effects of pollution. The CalEnviroScreen 3.0 data show that this community has public health factors, as well as social and economic factors, that make the community more sensitive and vulnerable to the harmful effects of air pollution compared to statewide averages (

Figure Appendix 3a-4 and

Figure Appendix 3a-5). These data show that, on average, the Eastern Coachella Valley community has generally better public health factors and generally more social and economic disadvantages compared to California as a whole. The public health factors specifically show that this community has higher rates of emergency department visits for heart disease, and lower rates of asthma and babies born with a low weight in comparison to statewide averages.

Figure Appendix 3a-4: CalEnviroScreen 3.0 scores for public health factors in Eastern Coachella Valley compared to statewide averages

Figure Appendix 3a-5: CalEnviroScreen 3.0 scores for social and economic factors in Eastern Coachella Valley compared to statewide averages<sup>23, 24</sup>

<sup>23</sup> The metric of Educational Attainment in CalEnviroScreen 3.0 is defined as the percent of people whose highest level of education is less than a high school education. A lower percentile score shown in the blue bar on the graph for this metric means the community has fewer people who have completed a high school education.

<sup>24</sup> The metric of Linguistic Isolation in CalEnviroScreen 3.0 is defined as the percent of households where no one over age 14 speaks English well. A higher percentile score shown in the blue bar on the graph for this metric means there are more households that meet this definition.

# APPENDIX 4:

## ENFORCEMENT

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 4: Enforcement

---

### South Coast AQMD

The primary goal of South Coast AQMD enforcement activities is for regulated entities to achieve compliance with air quality rules and regulations, and to protect public health. Part of this process involves consistently identifying and resolving violations, thereby ensuring a level playing field for all regulated entities and preventing unfair advantages for companies that do not comply with rules and permit conditions.

Air pollution concerns received directly from community members by way of public complaints are a very important source of information. All complaints are assigned to an inspector for investigation, with priority for ongoing issues that are impacting the public. In addition to receiving complaints from community members, South Coast AQMD also receives notifications directly from facilities and referrals from other agencies.

South Coast AQMD also performs unannounced inspections at facilities to verify compliance.

### California Air Resources Board

CARB's enforcement approach is two-pronged: ensuring compliance through robust, regular inspections and deterring violations through our penalty assessment process. From the compliance-side, it includes conducting both field inspections and fleet-wide audits. For field inspections, the focus has been on enforcing heavy-duty diesel vehicle (HDDV) regulations, such as the Truck and Bus Regulation, the airborne toxic control measure (ATCM) to limit idling, and the Heavy-Duty Vehicle Inspection Program (HDVIP). At refineries and fueling stations, CARB enforces fuel formulation regulations. In railyards, CARB enforces regulations related to drayage trucks, transportation refrigeration units (TRUs), and cargo handling equipment (CHE). From the deterrence-side, CARB Enforcement encourages violators to support CARB's community-based projects program by setting aside a portion of penalties paid from enforcement action settlements for Supplemental Environmental Projects (SEPs).

### CARB Statewide Truck and Bus Regulation

CARB is achieving compliance with the Statewide Truck and Bus (STB) Regulation, section 2025 of Title 13, California Code of Regulations (STB) by 2023 via a streamlined auditing process. STB requires diesel trucks with a Gross Vehicle Weight Rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters or replace older engines with cleaner engine technology on a phased-in schedule based on the model year of the engine and GVWR. CARB staff process data from vehicle registration, compliance reporting, and inspection databases to identify potentially non-compliant fleets and prioritize them for enforcement action.

In April 2017, the Governor signed Senate Bill 1 (SB1) into law which included a provision that, beginning in 2020, a vehicle must demonstrate compliance with the STB regulation before it can be registered with the Department of Motor Vehicles (DMV). Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant heavy-duty diesel vehicles (HDDV) based on the model year of the HDDV, so that by the end of 2023, 100% compliance will be achieved for the truck and bus rule.

### Authority and Legal Right to Issue Violations and Penalties

Under both the federal Clean Air Act and the California Health & Safety Code, South Coast AQMD is under a legal obligation to make and enforce air pollution regulations. These regulations are primarily meant to ensure that the surrounding (or ambient) air will meet federal and state air quality standards. However, South Coast AQMD also has broad authority to regulate toxic and hazardous air emissions, which are enforced in the same manner as rules regulating criteria pollutants to attain the ambient air quality standards.

To enforce local, state, and federal air pollution regulations, CARB and South Coast AQMD both use their authority to conduct inspections of alleged air pollution sources under their jurisdiction and issue notices of violations that can lead to civil and criminal penalties. Civil penalties vary based on multiple factors, however in the most egregious cases, penalties can be up to \$250,000 per day for individuals and up to \$1,000,000 per day for corporations. In cases with potential criminal violations, South Coast AQMD may refer matters to federal, state, or local prosecuting agencies. Inspection warrants also may be obtained if necessary when access to facilities or potential emissions sites is denied.

For further information on South Coast AQMD's<sup>1</sup> and CARB's<sup>2</sup> authority, please refer to our websites.

### South Coast AQMD Hearing Board

The Hearing Board is a quasi-judicial panel authorized to provide relief from South Coast AQMD regulations under certain circumstances and to order businesses to take specific actions to come into compliance with regulations. As state law requires, Hearing Board members are appointed by, but act independently of, the South Coast AQMD Governing Board.

The Hearing Board is authorized to hear:

- Petitions by entities (individuals, companies, public agencies, etc.) companies for variances.

---

<sup>1</sup> <https://www.aqmd.gov/nav/about/authority/enforcement>

<sup>2</sup> <https://ww2.arb.ca.gov/about/history>

- Petitions for abatement orders. An abatement order requires an entity operating out of compliance to take specific actions or to shut down its operation. This is a severe remedy normally reserved for serious violations.
- Appeals regarding granting of permits, permit conditions, permit denials and suspensions, denials of emission reduction credits, and denials of pollution control plans.
- Appeals by third parties.

The Hearing Board is not authorized to:

- Modify rules.
- Exempt an entity from complying with a rule.
- Grant a variance from a violation of the public nuisance law, such as one that creates an odor problem or threatens public health or property.
- Review a violation notice in any way.

After hearing all sides of a case in which an entity is having problems complying with South Coast AQMD rules, the Hearing Board weighs the evidence and reaches a decision.

#### CARB Supplemental Environmental Project Process

During the settlement process, violators have the opportunity to allocate up to 50 percent of their penalties to a Supplemental Environmental Project (SEP). SEPs are community-proposed and community-based projects that aim to improve public health, reduce pollution, increase environmental compliance, and bring public awareness to air pollution issues.

Proposals of SEP projects that meet the following four requirements: reducing direct/indirect air emissions or exposure to air pollution, relates to the violation, does not benefit the violator, and goes above and beyond regulatory requirements can be submitted for consideration for future settlements through the SEP proposal form (<https://calepa.ca.gov/sep-proposal-form>). Nine SEPs have been funded within South Coast AQMD's jurisdiction including paid environmental education internships, planting trees, writing articles to inform community about air pollution and resources, conducting research (e.g., air monitoring, truck traffic survey), and school air quality education programs and filtration systems. If community members are interested in submitting a SEP proposal, please contact the Community Outreach and Enforcement Section at [coes@arb.ca.gov](mailto:coes@arb.ca.gov).

### CARB HDDV Enforcement Program Descriptions

**Heavy-Duty Vehicle Inspection Program (HDVIP).** The HDVIP program requires inspection of heavy-duty trucks and buses for excessive smoke and tampering, and engine certification label compliance. Any heavy-duty vehicle traveling in California, including vehicles registered in other states and foreign countries may be tested. CARB inspection teams perform tests at border crossings, CHP weigh stations, fleet facilities, and randomly selected roadside locations. Owners of trucks and buses found in violation are subject to minimum penalties starting at \$300 per violation and up to \$1,000 a day.

**Off-Road Construction Equipment (Off-road regulation).** Construction equipment is a major contributor to air pollution, especially when large construction projects are adjacent to neighborhoods. To address this source of air pollution, CARB adopted the nation's first regulation aimed at cleaning up off-road construction equipment such as bulldozers, graders, and backhoes. The off-road regulation requires off-road fleets to meet fleet average emission standards and be equipped with best available control technology (BACT).

**The Tractor-Trailer Greenhouse Gas Regulation (Smart Way).** This regulation requires 53-foot or longer dry van or refrigerated van trailers and the tractors that pull them on California highways to use certain equipment that the U.S. EPA Smart Way program has verified or designated to meet their efficiency standards and reduce fuel consumption.

**Solid Waste Collection Vehicles (SWCVs).** The Solid Waste Collection Vehicle regulation required vehicle owners to upgrade solid waste collection vehicles by December 31, 2010. On January 24, 2019, the Board approved amendments that now require reporting for SWCVs with 2006 model year and older engines to avoid unnecessary registration delays at the California Department of Motor Vehicles (DMV) starting in 2020 due to Senate Bill 1 requirements. The approved amendments also added heavy diesel-fueled on-road single engine cranes to the regulation and became effective on July 1, 2019. These specialized cranes are required to phase-in 2010 or newer model year engines from 2019 to 2027.

**Transport Refrigeration Unit (TRU).** TRUs are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Because diesel particulate matter is an identified toxic air contaminant, CARB adopted an airborne toxic control measure (ATCM) for TRUs and TRU generator sets. CARB staff inspect TRUs to ensure that the units are meeting labeling and in-use performance standards identified in the TRU regulation.

**Drayage.** The Drayage Truck Regulation is part of CARB's ongoing efforts to reduce particulate matter (PM) and oxides of nitrogen (NOx) emissions from diesel-fueled engines and improve air quality associated with goods movement. Heavy-duty vehicles that carry goods to or from a port or intermodal facility are required to be equipped with a 2007 or newer model year engine. This requirement becomes

stricter in 2023, when drayage trucks are required to be equipped with a 2010 or newer model year engine, because drayage trucks will be required to meet the standards of the Statewide Truck and Bus regulation.

**Statewide Truck and Bus (STB).** The Statewide Truck and Bus regulation requires diesel trucks with a gross vehicle weight rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters, or replace older engines with cleaner engine technology, on a schedule based on the model year of the engine and GVWR. The following timeline outlines the engine requirements HDDV must meet to be in compliance with the regulation.

**Idling.** Idling and opacity inspections are performed to ensure an HDDV is compliant with emission standards and is not violating CARB's Idling regulation. Idling for more than five minutes is prohibited unless the HDDV is certified clean idle and the vehicle is more than 100 feet away from a school or restricted area (exceptions apply). Vehicle owners and drivers in violation are subject to minimum penalties starting at \$300 per violation and up to \$1000 per day.

More information on CARB's Heavy-Duty Diesel Vehicle Programs is available at [arb.ca.gov/truckstop](http://arb.ca.gov/truckstop).

## Technology

Both South Coast AQMD and CARB enforcement staff have embraced the use of technology as a means for more efficient and effective inspections. South Coast AQMD inspectors have access to advanced instruments to help identify air pollution issues in real-time. The following portable instruments are available to inspectors:

**Figure 4-1: Portable instruments used by South Coast AQMD inspectors in the field**

*Toxic Vapor Analyzers (TVA):* Inspectors can use TVAs to measure the level of certain gases in a specific area. This includes methane and volatile organic compounds (VOCs), which are emitted by petroleum sources and other types of sources.

*Infrared Cameras:* Inspectors can use specialized infrared cameras to view emissions of gases (including methane and VOCs) that would otherwise be invisible to the naked eye. This equipment enables inspectors to scan areas for emissions and quickly check for large leaks at a facility.

*X-Ray Fluorescence (XRF):* Inspectors can use this handheld instrument to identify the types of chemicals that are on a surface or in a dust pile. This tool helps identify potential pollutants that are particles. For example, an XRF can be used to scan surfaces at a facility to identify which specific toxic metals may be deposited in that location, and which locations have the highest levels of those toxic metals.

*H<sub>2</sub>S Analyzers (Jerome Meters):* Inspectors can use this handheld instrument to measure hydrogen sulfide gas levels in the air. This information can be used to identify a potential source of rotten egg type odors.

## Further Information on Technology Used for Compliance Investigations

### Toxic Vapor Analyzer (TVA)

Using a Flame Ionization Detector (FID) or Photoionization Detector (PID), this instrument can detect a wide variety of organic and inorganic compounds. The unit must be calibrated to identify specific compounds. Any day that the instrument is used for conducting compliance inspections, a trained inspector calibrates the equipment to a set calibration standard depending on the inspection type. For example, in an oil and gas process leak inspection to identify VOCs, a 3-Point Methane Calibration Curve is used.

This instrument displays concentrations of the gas it is calibrated to detect in parts per million (ppm), also known as the number of molecules of that gas per one million molecules of air. Inspectors can use TVAs to identify organic and inorganic vapors according to a standard set by the U.S. Environmental Protection Agency (EPA) Method 21 – Determination of Volatile Organic Compound Leaks.<sup>3</sup> This method from U.S. EPA sets the standard for the specifications and performance criteria of the instrument, as well as the process of identifying a leak.

### Infrared Cameras

Using infrared cameras equipped with Optical Gas Imaging (OGI) technology, inspectors can detect hydrocarbon leaks at a variety of facilities, including those in the oil and gas industry. The device uses a non-contact technology which identifies the infrared energy (heat) of a specific gas and converts it into an electronic signal. This signal is processed into an image, giving inspectors the ability to view emissions that would otherwise be invisible to the naked eye.

Using infrared OGI cameras enables inspectors to scan areas for emissions and quickly gain an overall understanding regarding any large leaks there may be at a facility. The technology generally used by OCE is specifically calibrated to methane, enabling users to visibly identify VOC leaks. Inspectors can follow up with a TVA to quantify the leak. Inspectors who use this equipment have training through a multi-day course to understand the technology, as well as its uses and limitations.

### X-Ray Fluorescence (XRF)

A handheld instrument which uses a non-destructive method to determine the chemistry of a sample. The device sends an x-ray to the sample that displaces the electrons, causing a release of energy. The energy released is measured by the special detector to analyze the chemistry of the sample. Inspectors can scan surfaces for the presence of toxic metals to identify sources of contamination and fugitive emissions.

<sup>3</sup> U.S. EPA, Method 21 – Volatile Organic Compound Leaks. <https://www.epa.gov/emc/method-21-volatile-organic-compound-leaks>. Accessed October 30, 2020.  
Eastern Coachella Valley – Draft CERP

### H<sub>2</sub>S Analyzer (Jerome Meters)

A handheld instrument that can detect hydrogen sulfide in the air. This device takes in a small sample of air and provides a reading on the amount of H<sub>2</sub>S within a few seconds, down to levels in the parts per billion (ppb) range. This instrument serves as a safety tool for inspectors conducting an inspection in an area with potential H<sub>2</sub>S.

In addition, inspectors are trained on how to collect field samples, including air samples, liquid samples, and bulk material samples. These samples can then be provided to the South Coast AQMD laboratory or contract laboratories for analysis. The results of these analyses can be used as evidence to support investigations and/or Notices of Violation issued to air pollution sources.

### Interagency Collaborations

CARB and South Coast AQMD are committed to working with other agencies on joint initiatives that will directly result in cleaner air. The combined resources, expertise, and legal authorities of different agencies can create a well-rounded approach to the regulatory process that leverages their respective strengths to address issues that cumulatively impact public health. For example, the Los Angeles City Attorney's Office partnered with South Coast AQMD to conduct inspections at specific facilities, including auto-body shops, in the City of Los Angeles.

**Figure 4-2: Examples of agencies that routinely collaborate with South Coast AQMD and CARB**

CARB partners with local agencies to create memoranda of understanding (MOUs), such as an agreement with South Coast AQMD to enforce CARB's greenhouse gas standards at certain types of facilities. In addition, CARB has already established partnerships with California DMV working on implementing registration holds for non-compliant trucks and buses, California Highway Patrol (CHP) to conduct roadside inspections, and other state and regional agencies to ensure the agencies are supporting each other's enforcement efforts. Both South Coast AQMD and CARB have experience working in close collaboration with other regulatory agencies, cities and counties, public health agencies, and local police and fire departments to conduct investigations and provide public information about local air pollution sources.

### South Coast AQMD & CARB Enforcement Approach

South Coast AQMD regulates over 25,000 facilities, receives approximately 10,000 public complaints per year, and operates a vast air quality monitoring network; and CARB regulates mobile sources throughout the state through ensuring compliance with over 50 programs. Analyzing the data that results from these efforts can provide insight into the trends and sources of air pollution as well as new enforcement opportunities. Both agencies use information technology to enhance the ability to conduct investigations and enforce regulations. As an example, for CARB's truck fleet enforcement program, the traditional approach was to inspect several thousand trucks annually through fleet-based inspections. From January 2018 through December 2019, CARB's Streamlined Truck Enforcement Process (STEP), and was able to conduct 20,000 to 25,000 inspections per year through the use of a data-driven approach, non-compliance letters, and a scheduled settlement process. South Coast AQMD's investigation of crude oil tankers is another example of using information technology and interagency collaboration in enforcement activities. Inspectors used mapping software, weather data, ship databases, and support from other local government entities to help identify an oil tanker as a potential source of emissions. The oil tanker was later issued a Notice of Violation when it berthed at a port. These multi-faceted approaches can be applied to address other air pollution concerns in the East Coachella Valley community. Providing transparent access to the information that both agencies possess will lead to a stronger partnership with the community.

## South Coast AQMD Compliance History in ECV, January 2017 to December 2019

### List of All Active Facilities with Active or Expired Permits

This table contains all the facilities that are considered active and have valid or expired permits, that are located within the ECV Emissions Study Area. Expired permits are included to ensure that any facilities that are still in operation but had not paid fees at the time of the query were still included.

**Table 4 -1: List of All Active Facilities with Active or Expired Permits**

#### Summary of All Complaints Received<sup>4</sup>

This table contains a summary of the number of complaints received by complaint type and sorted by their disposition between January 2017 and December 2019 for this community.

**Table 4 -2: List of All Complaints Received**

Complaint Disposition	Asbestos	Dust	Gas Station	Odors	Other	Smoke or Fire
Investigation in Progress	-	1	-	-	-	-
No Enforcement Action Taken <sup>5</sup>	3	104	1	62	12	133
Notice of Violation Issued	-	14	-	-	-	-
Notice to Comply Issued	-	20	-	-	-	1
Referred to Another Agency	-	11	-	2	2	4

<sup>4</sup>. The complaint information is based on the following Zip Codes: 92201, 92203, 92253, 92254, 92274, and 92236.

<sup>5</sup> No Enforcement Action Taken means that the complaint investigation has concluded but did not result in any formal enforcement action. For example, an alleged air pollution source may have been operating in compliance at the time of the inspection or the event underlying the complaint was no longer occurring.

## List of all Inspections Conducted

This table contains a list of inspections conducted within the ECV Community Boundary between January 2017 and December 2019. Additional information can be found via the Facility INformation Detail (FIND) portal on the South Coast AQMD webpage.<sup>6</sup>

## Summary

Both South Coast AQMD and CARB are committed to working closely with the CSC to identify and investigate air quality issues in the community. For the mobile sources regulated by CARB, this will include actively enhancing enforcement activities through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the CSC on the status of inspections and to obtain additional areas of mobile source concern. CARB plans to have, at a minimum, annual meetings with the CSC in order to prioritize strategies and identify possible locations where noncompliant vehicles are present. CARB will report-back to the community with the number of inspections performed and the number of citations and/or Notices of Violations (NOVs) issued. Further information about CARB's and South Coast AQMD's commitments can be found in Chapter 5.

## Salton Sea

---

### A. Informational Handout

#### Air Quality Priority: Salton Sea

#### Purpose of Document

The purpose of this document is to summarize the Eastern Coachella Valley (ECV) Community Steering Committee (CSC) air quality concerns, and provide potential strategies and actions to address these concerns in the Community Emissions Reduction Plan (CERP). The CSC will determine the final strategies and actions proposed in the CERP. The ECV CERP will be considered for adoption by the South Coast AQMD Governing Board.

#### Community Concerns (CC)

The ECV CSC has expressed air quality concerns about the Salton Sea. The CSC concerns about emissions from the Salton Sea are provided below:

- CC-1 The Salton Sea is drying up due to decreased inflow of water. As the Salton Sea evaporates, its receding shoreline exposes sediments that are deposited at the bottom of the Sea, also referred to as the “playa”. The loose soil is blown off by strong gusty winds, contributing to PM10 (inhalable particulate matter) emissions that could impact air quality.
- CC-2 The soil from the playa may contain components from agricultural runoff, which could pose a risk to human health. Previous tests have detected selenium, cadmium and nickel in the playa.
- CC-3 Elevated levels of hydrogen sulfide (H<sub>2</sub>S) occur from natural processes in the Salton Sea and cause a strong odor that causes health effects and negatively affects the quality of life in ECV.
- CC-4 CSC members would like Imperial Irrigation District (IID) and the State of California to move more quickly to develop and implement dust suppression projects around the Salton Sea.
- CC-5 CSC members experience acute health effects (e.g., headaches and nosebleeds) during windblown dust and Salton Sea H<sub>2</sub>S odor events.
- CC-6 Additional monitoring and improvements to notification systems are needed to better understand emissions from the Salton Sea.

## Salton Sea Playa Emissions Estimates

**PM10 Emissions Estimates (tons/day)<sup>1,2,3</sup>**

<sup>1</sup> Data from IID's Salton Sea Air Quality Mitigation Program Annual Report and Emissions Estimates: [https://saltonseaprogram.com/aqm/docs/2018 2019 Annual Report and Emissions Estimates w attachments.pdf](https://saltonseaprogram.com/aqm/docs/2018%202019%20Annual%20Report%20and%20Emissions%20Estimates%20w%20attachments.pdf)

<sup>2</sup> PM emissions from the Salton Sea are expected to increase as more playa becomes exposed in future years

<sup>3</sup> Additional information on the Salton Sea was provided at CSC meetings and workshops. Presentations on the Salton Sea, factsheets, and other handouts are posted on the ECV community website:

<http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

## Potential Strategies and Actions to Address Salton Sea

Below are potential strategies and actions to address CSC concerns about emissions from the Salton Sea. The final strategies and actions in the proposed CERP will be determined by the CSC. The proposed CERP will be considered for adoption by the South Coast AQMD Governing Board.

Goals	Potential Strategies and Actions
Reduce emissions from the Salton Sea	<ul style="list-style-type: none"> <li>Provide additional air quality expertise to the State for the implementation of the Salton Sea Management Program</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3, CC-4, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Work with other agencies (e.g., IID and the State of California) to collect emissivity and dust emissions data to improve South Coast AQMD's emissions inventory</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership and support IID and the State of California with implementing dust suppression projects around the Salton Sea by:               <ul style="list-style-type: none"> <li>Helping to identify locations for future dust suppression projects in the ECV community; and</li> <li>Providing letters of support for additional funding to help expedite dust suppression projects near population centers (e.g., North Shore) in the Riverside County portion of the Salton Sea.</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-4, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with Imperial County Air Pollution Control District to address cross-jurisdictional air pollution emissions from the Sea and dust suppression projects around the Salton Sea</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Conduct outreach on South Coast AQMD's Rule 403, Rule 403.1 and conservation practices to project implementation contractors to reduce dust while dust suppression projects are being implemented</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-4, CC-5</b></p>
	<ul style="list-style-type: none"> <li>Conduct outreach to community members on how to file dust complaints</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-4, CC-5</b></p>
Expand monitoring networks and improve notification systems	<ul style="list-style-type: none"> <li>Expand the existing South Coast AQMD's hydrogen sulfide (H<sub>2</sub>S) monitoring network in ECV to:               <ul style="list-style-type: none"> <li>Provide real-time H<sub>2</sub>S data and inform the community members about the odors they smell and where they come from, including a notification system for when ambient levels exceed the State standard</li> <li>Determine community impact and extent to which the odors may transport in the community and beyond</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-3, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Identify opportunities to expand the current South Coast AQMD's PM<sub>10</sub> monitoring network in the ECV to:               <ul style="list-style-type: none"> <li>Provide real-time PM<sub>10</sub> and wind data and inform community members of PM<sub>10</sub> levels in ECV, where they come from, and if they exceed Federal and/or State standards</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>○ Gain a better understanding of dust emissions and distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>○ Track the emission reduction progress and success of dust suppression projects</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-6</b></p>
	<ul style="list-style-type: none"> <li>• Establish baseline air monitoring to:               <ul style="list-style-type: none"> <li>○ Characterize the chemical composition of fugitive dust emissions from different sources to help distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>○ Track the progress of emission reduction strategies</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-6</b></p>
	<ul style="list-style-type: none"> <li>• Seek new opportunities and work with the CSC to expand low-cost sensor deployments in ECV to:               <ul style="list-style-type: none"> <li>○ Provide real-time PM10 data</li> <li>○ Supplement the PM10 monitoring network in the ECV and cover a larger area in the community</li> <li>○ Co-locate low-cost sensors at monitoring stations with reference PM10 monitors and develop a systematic data calibration and correction protocol to enhance low-cost sensor PM10 data quality</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-6</b></p>
	<ul style="list-style-type: none"> <li>• Pursue a collaborative partnership with other entities (e.g., University of California – Riverside) to support the ongoing study on soil chemical and microbiome composition of the Salton Sea playa dust samples</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-6</b></p>
Reduce exposure from the Salton Sea	<ul style="list-style-type: none"> <li>• Install air filtration systems at schools and homes located near the Salton Sea to reduce odors and exposure to dust emissions</li> </ul> <p><b>Community Concern(s) addressed: CC-3, CC-5</b></p>
	<ul style="list-style-type: none"> <li>• Identify funding to implement home weatherization projects near the Salton Sea</li> </ul> <p><b>Community Concern(s) addressed: CC-3, CC-5</b></p>
	<ul style="list-style-type: none"> <li>• Conduct outreach in the community to inform community members on how to subscribe for alerts and how to use the South Coast AQMD app to obtain air quality information</li> </ul> <p><b>Community Concerns(s) addressed: CC-3, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>• Pursue a collaborative partnership with community organizations to conduct outreach in the community to inform community members what to do when H2S levels surpass the California Ambient Air Quality Standard (0.3 ppm)</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-5, CC-2</b></p>

## Pesticides

---

### *A. Informational Handout*

#### Air Quality Priority: Pesticides

#### Purpose of Document

The purpose of this document is to summarize the Eastern Coachella Valley (ECV) Community Steering Committee (CSC) air quality concerns and provide potential strategies and actions to address these concerns in the Community Emissions Reduction Plan (CERP). The CSC will determine the final strategies and actions proposed in the CERP. The ECV CERP will be considered for adoption by the South Coast AQMD Governing Board.

#### Community Concerns (CC)

The ECV CSC expressed air quality concerns about the use and application of pesticides. The concerns raised by the CSC include:

- CC-1      The unknown adverse health effects of pesticides applied in ECV and the odors emitted from them.
- CC-2      Pesticide drift into homes and schools near application sites.
- CC-3      The application of pesticides during school hours and a lack of regulatory enforcement.
- CC-4      The impacts on farm workers regularly exposed to pesticides, often in excessive amounts. and without proper personal protective equipment and/or training.
- CC-5      Pesticide run-off into streams and other tributaries that flow into the Salton Sea.
- CC-6      Pesticide toxicity and whether some pesticides should be banned or more heavily regulated.
- CC-7      The lack of a system to notify community members of pesticide applications and provides information to residents in order for them to make informed decisions about participating in outdoor activities (e.g., outdoor exercise).
- CC-8      Agricultural operators should find alternatives to pesticide use (e.g., organic farming).

#### Emissions Inventory or Data

*To Be Determined*

## Potential Strategies and Actions to Address Pesticides

Below are potential strategies and actions to address CSC concerns. The final strategies and actions in the proposed CERP will be determined by the CSC. The proposed CERP will be considered for adoption by the South Coast AQMD Governing Board.

Goals	Potential Strategies and Actions
Reduce pesticide emissions and/or exposures	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with the California Department of Pesticide Regulation (DPR), the Riverside County Agricultural Commissioner, and the California Air Resources Board (CARB) to:               <ul style="list-style-type: none"> <li>Gather data about the use of pesticides in the community (e.g. the frequency, volume, and toxicity of pesticides applied to agricultural crops)</li> <li>Conduct air monitoring to identify potential local air quality impacts from the use of pesticides (see air monitoring details below)</li> <li>Evaluate community impacts from pesticide use in ECV</li> <li>Evaluate opportunities to reduce pesticide emissions and/or exposures (e.g., best management practices, alternative pest management approaches, modified application methods, focused enforcement and additional regulatory measures)</li> </ul> </li> </ul> <p><b>Community Concerns Addressed: CC-1, CC-2, CC-3, CC-4, CC-5, CC-6, and CC-8</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with DPR and the Riverside County Agricultural Commissioner to:               <ul style="list-style-type: none"> <li>Develop a pilot project in ECV for a pesticide application notification system</li> <li>Provide community members with information (e.g., material safety data sheet) relating to pesticide types and usage and ways to report pesticide drift</li> </ul> </li> </ul> <p><b>Community Concerns Addressed: CC-1, CC-2, CC-7</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with the Agricultural Commissioner to make pesticide use data more easily accessible for community members, including farm workers.</li> </ul> <p><b>Community Concerns Addressed: CC-1, CC-4, CC-6, CC-7</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with DPR and Occupational Safety and Health Administration (OSHA) to consider providing training, information on personal protective equipment and ways to reduce worker exposure during pesticide application</li> </ul> <p><b>Community Concerns Addressed: CC-1, CC-4</b></p>
Air Monitoring for Pesticides	<ul style="list-style-type: none"> <li>Pursue collaborative partnerships with DPR, CARB and Riverside County Agricultural Commissioner to consider developing an air monitoring concept and work with California Office of Environmental Health Hazard Assessment (OEHHA) to make pesticide and toxicity data more accessible               <ul style="list-style-type: none"> <li>Work with DPR to define the air monitoring purpose and develop a detailed plan that identifies the sampling equipment that will be used and where the sampling will take place</li> </ul> </li> </ul>

- Determine if a pesticide is present and at what levels to help determine the community impact
- Assess the monitoring data and if monitoring finds unacceptable pesticide levels in ambient air, work with DPR and Riverside County Agricultural Commissioner to take steps to identify potential exposure reduction measures, or to develop new use restrictions administered by the Riverside County Agricultural Commissioner, or pesticide regulations

***Community Concerns Addressed: CC-1, CC-2, CC-3, CC-6***

## Fugitive Road Dust

---

### *A. Informational Handout*

#### Air Quality Priority: Fugitive Road Dust

#### Purpose of Document

The purpose of this document is to summarize the Eastern Coachella Valley (ECV) Community Steering Committee (CSC) air quality concerns and provide potential strategies and actions to address these concerns in the Community Emissions Reduction Plan (CERP). The CSC will determine the final strategies and actions proposed in the CERP. The ECV CERP will be considered for adoption by the South Coast AQMD Governing Board.

#### Community Concerns (CC)

The ECV CSC has expressed air quality concerns about Fugitive Road Dust. The CSC concerns about fugitive dust emissions from roads are provided below:

- CC-1 Road dust from unpaved roadways is a major concern. Roadway paving projects implemented in the past have improved particulate matter (PM<sub>10</sub>) levels in the community.
- CC-2 CSC members are concerned about health effects experienced from high PM<sub>10</sub> levels in ECV.
- CC-3 CSC members expressed concerns about dust emissions from off-road vehicles.
- CC-4 CSC members requested additional PM monitoring in ECV.

## Road Dust Compared to Other PM Sources in ECV

Emissions Estimates in ECV (tons/day)<sup>1,2</sup>

<sup>1</sup>Road dust information was calculated using the Vehicle Miles Traveled (VMT) reported by the California State Highway System and emissions information from 2017.

<sup>2</sup>This information was provided to the CSC:

- Handout: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/fugitive-road-dust.pdf?sfvrsn=8>
- CSC meeting presentation: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/presentation-feb20-2020.pdf?sfvrsn=8>

## Potential Strategies and Actions to Address Fugitive Road Dust

Below are potential strategies and actions to address CSC concerns about fugitive road dust in ECV. The final strategies and actions in the proposed CERP will be determined by the CSC. The proposed ECV CERP will be considered for adoption by the South Coast AQMD Governing Board.

Goals	Potential Strategies and Actions
Reduce emissions from fugitive road dust	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with the Cities within ECV and the County of Riverside to:               <ul style="list-style-type: none"> <li>Restrict unnecessary public access to unpaved roads (e.g., installing signs and physical barriers);</li> <li>Reduce speed limits on unpaved roads;</li> <li>Identify funding to plant natural vegetation on unpaved surfaces no longer being used;</li> <li>Treat unpaved roads with chemical stabilizers to stabilize loose road surface;</li> <li>Improve dust removal from paved roadways (e.g., street sweeping); and</li> <li>Identify funding to expand street sweeping services beyond existing levels</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with homeowners' associations and the County of Riverside to pave unpaved roads and parks</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2</b></p>
	<ul style="list-style-type: none"> <li>Pursue a collaborative partnership with Comité Civico del Valle to obtain complaint data from their IVAN's community-based reporting system to address road dust-related air quality concerns within the ECV community</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3</b></p>
	<ul style="list-style-type: none"> <li>Conduct outreach to off-road equipment operators on Rule 403 and Rule 403.1, and practices to reduce fugitive dust from roads</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3</b></p>
	<ul style="list-style-type: none"> <li>Conduct outreach to the general public on how to file dust complaints</li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3</b></p>
Expand monitoring networks	<ul style="list-style-type: none"> <li>Identify opportunities to expand the current South Coast AQMD's PM10 monitoring network in the ECV to:               <ul style="list-style-type: none"> <li>Provide real-time PM10 and wind data and inform community members of PM10 levels in the ECV, and if they exceed Federal and/or State standards</li> <li>Track the progress of emission reduction strategies</li> </ul> </li> </ul> <p><b>Community Concern(s) addressed: CC-1, CC-2, CC-3, CC-4</b></p>
	<ul style="list-style-type: none"> <li>Seek new opportunities and work with the CSC to expand low-cost sensor deployments to:               <ul style="list-style-type: none"> <li>Provide real-time PM10 data</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>○ Supplement the PM10 monitoring network in the ECV and cover a larger area in the community, prioritizing areas where the public spends a significant amount of time (e.g. schools and residential areas) and areas close to sources of fugitive dust</li> <li>○ Co-locate low-cost sensors at monitoring stations with reference PM10 monitors and develop a systematic data calibration and correction protocol to enhance low-cost sensor PM10 data quality</li> </ul> <p><b><i>Community Concern(s) addressed: CC-1, CC-2, CC-3, CC-4</i></b></p>
Reduce exposure from fugitive road dust	<ul style="list-style-type: none"> <li>• Conduct community outreach on subscribing to air quality alerts using the South Coast AQMD app to check air quality information (e.g., high wind advisories, air quality index, and air quality forecasts)</li> </ul> <p><b><i>Community Concern(s) addressed: CC-2</i></b></p>
	<ul style="list-style-type: none"> <li>• Install air filtration systems at schools, community centers, and homes to reduce exposure to dust emissions</li> </ul> <p><b><i>Community Concern(s) addressed: CC-2</i></b></p>
	<ul style="list-style-type: none"> <li>• Identify funding to implement home weatherization projects</li> </ul> <p><b><i>Community Concern(s) addressed: CC-2</i></b></p>

## B. Infographic

### WHAT ACTIONS CAN HELP REDUCE FUGITIVE ROAD DUST?

**Unpaved roads:**

- Pave unpaved roads
- Consider restricting public access to unpaved roads with signs or physical barriers
- Reduce speed limits to 15 miles per hour (mph) on unpaved roads
- Establish natural vegetation on unpaved surfaces no longer being used
- Treating unpaved roads with chemicals to help stabilize loose road surfaces

**Paved roads:**

- Remove dust from paved roadways (e.g., street sweeping)
- Work with off-road equipment operators (e.g., farmers) to reduce dust tracked onto paved roadway

**Other:**

- Clean the underside of haul trucks before leaving parking or staging area

### WHAT SOUTH COAST AQMD RULES APPLY TO FUGITIVE ROAD DUST?

**Rules 403 and 403.1**

Applies to operations that emit or track out fugitive dust, for example, construction sites or mining sites

**Rule 1186**

Applies to vehicle travel on paved public roads and at livestock operations

### WHAT SHOULD I DO IF I SEE FUGITIVE ROAD DUST?

Call 1-800-CUT SMOG (1-800-288-7664) and report:

Time, date, and whether it is continuing at the time of your call

Location (e.g., address or intersection) and specifics of what's happening (e.g., trucks exiting a construction site)

Your name, address, and phone number\*

\*This information is kept confidential, unless needed for legal purposes. We accept complaints from anonymous callers. However, inspectors will not be able to follow up with additional details or to advise of findings.

## Open Burning and Illegal Dumping

### A. Informational Handout

#### Air Quality Priority: Open Burning and Illegal Dumping

#### Purpose of Document

The purpose of this document is to summarize the Eastern Coachella Valley (ECV) Community Steering Committee (CSC) air quality concerns and provide potential strategies and actions to address these concerns in the Community Emissions Reduction Plan (CERP). The CSC will determine the final strategies and actions proposed in the CERP. **The ECV CERP will be considered for adoption by the South Coast AQMD Governing Board.**

#### Community Concerns (CC)

The ECV CSC expressed air quality concerns about open burning and illegal dumping. The concerns raised by the CSC include:

- CC-1 Adverse health effects of air pollution from open burning (i.e., smoke, particulate matter (pm), potential pesticides being burned).
- CC-2 Emissions from burning occurring near schools, childcare centers, and homes, and the health impacts on those community members.
- CC-3 Burns that are not permitted and burn uncontrollably (e.g., the 2019 50-acre mulch fire at a recycling center in thermal).
- CC-4 Open burning (e.g., agricultural and non-agricultural) occurring on tribal lands, which falls outside of South Coast AQMD's jurisdiction, and are therefore not subject to South Coast AQMD's open burning regulation.
- CC-5 Emissions from permitted agricultural burning, where there may be opportunities to further reduce emissions (e.g., rule amendment, incentivize alternatives to burning).
- CC-6 Waste is being illegally dumped because of a lack of regulatory enforcement and may subsequently catch fire.

#### Emissions from Agricultural Burning<sup>5</sup>

##### 2017 Criteria Pollutants (in tons per year)\*

	VOC** (tons/year)	NOx** (tons/year)	CO** (tons/year)	PM10** (tons/year)	PM2.5** (tons/year)
<b>Agricultural Burning</b>	2.15	24.87	1.43	2.97	2.82

\*Emissions data from 2017 was developed by South Coast AQMD staff.

\*\*VOC= volatile organic compounds; NOx=oxides of nitrogen; CO=carbon monoxide; PM10=particulate matter of less than or equal to 10 microns in diameter (inhalable PM); PM2.5=particulate matter less than or equal to 2.5 microns in diameter (fine PM).

<sup>5</sup> The information in this section was provided to the CSC in the Open Burning (agriculture and non-agriculture) Infographic: [Open Burning \(agriculture and non-agriculture\)](#)

**Total Acres Burned by Location – Year 2017\***

\*Data does not include burns on tribal lands, nor burns that are not permitted by the South Coast AQMD (e.g., illegal burns).

\*\*Areas outside cities and census designated places.

**Type of Material Burned in Acres – Year 2017**

## Potential Strategies and Actions to Address Open Burning and Illegal Dumping

Below are potential strategies and actions to address CSC concerns. The final strategies and actions in the proposed CERP will be determined by the CSC. The proposed CERP will be considered for adoption by the South Coast AQMD Governing Board.

Goals:	Potential Strategies and Actions
Reduce emissions from open burning	<ul style="list-style-type: none"> <li>Pursue emission reductions from open burning by:               <ul style="list-style-type: none"> <li>Developing a list of available technologies, best practices and alternatives to be distributed to farm owners and operators, and</li> <li>Assessing the feasibility of new requirements for open burning (e.g., alternatives to open burning of agricultural waste) based on the list</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-5</b></p>
	<ul style="list-style-type: none"> <li>Continue existing and pursue additional collaborative partnerships with:               <ul style="list-style-type: none"> <li>local tribes to identify opportunities to reduce open burning through outreach, enforcement, and/or open burning regulations (e.g., technical guidance, burn and no-burn days, permitting system)</li> <li>Riverside County Fire Department to conduct focused enforcement at illegal burn sites</li> <li>Combustible Material Task Force to support green waste complaint-reporting and follow-up investigations</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-3, CC-4, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Pursue funding opportunities for equipment to be used as an alternative to:               <ul style="list-style-type: none"> <li>agricultural burning (e.g., chippers, grinders, digesters, air curtain destructors, etc.)</li> <li>emergency burning for freeze-prevention (e.g., fan systems)</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-4, CC-5</b></p>
	<ul style="list-style-type: none"> <li>Conduct outreach to farm owners/operators/workers to encourage best burn practices/methods to reduce emissions (e.g., conservation burning, cleaner piles, no rolling, cleaner ignition device)</li> </ul> <p><b>Community Concern(s) Addressed: CC-1</b></p>
	<ul style="list-style-type: none"> <li>Provide community members and farm owners/operators/workers information (e.g., workshops/presentations) relating to rules and regulations on open burning and ways to report burning</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-3, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Deploy low-cost sensors to establish a monitoring network to identify illegal burning emissions and conduct follow-up investigations, as needed</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-3, CC-5, CC-6</b></p>
	<ul style="list-style-type: none"> <li>Pursue collaborative partnerships with:</li> </ul>

<p><b>Reduce exposure from open burning</b></p>	<ul style="list-style-type: none"> <li>○ Riverside County Fire Department to develop informational materials relating to open burning, fire safety, and air pollution</li> <li>○ community organizations to distribute informational materials relating to open burning, fire safety, and air pollution in the community (e.g., Growing Coachella Valley, Alianza, Leadership Counsel, Communities for a New California)</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-3, CC-4, CC-5</b></p> <ul style="list-style-type: none"> <li>● Pursue opportunities to develop an online system (e.g., notification system, database) that informs the community when South Coast AQMD permitted burning is expected to occur</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-5</b></p> <ul style="list-style-type: none"> <li>● Pursue funding opportunities to install air filtration systems at schools, and homes located near frequent burn sites</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-6</b></p>
<p><b>Improve monitoring network</b></p>	<ul style="list-style-type: none"> <li>● Deploy low-cost sensors to establish a monitoring network to:             <ul style="list-style-type: none"> <li>○ gain a better understanding of the locations, frequency, and magnitude of smoke impacts from legal and illegal burning occurring in the community</li> <li>○ identify pollution hotspots and gather more information to identify potential source(s) of emissions</li> <li>○ improve public information on PM2.5 levels in the community (e.g. better characterize the spatial and temporal variability of PM2.5 in the community)</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-3, CC-4, CC-5, CC-6</b></p>
<p><b>Reduce illegal dumping</b></p>	<ul style="list-style-type: none"> <li>● Pursue collaborative partnerships with:             <ul style="list-style-type: none"> <li>○ Riverside County Code Enforcement to conduct focused enforcement of illegal dumping laws and to improve reporting system</li> <li>○ Riverside County Fire Department to notify them of potential fire hazards resulting from illegal dumping</li> <li>○ community-based organizations to establish a complaint-report tracking system to better track illegal dumping activities</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-2, CC-3, CC-4, CC-6</b></p> <ul style="list-style-type: none"> <li>● Conduct outreach to community members and farm workers on how to report illegal dumping activities</li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-3, CC-4, CC-6</b></p> <ul style="list-style-type: none"> <li>● Pursue funding opportunities to provide funding for:             <ul style="list-style-type: none"> <li>○ waste collection services (agricultural and non-agricultural waste that has been dumped illegally)</li> <li>○ non-agricultural waste disposal (e.g., tire disposal)</li> </ul> </li> </ul> <p><b>Community Concern(s) Addressed: CC-1, CC-3, CC-6</b></p>

**South Coast AQMD**

# South Coast AQMD Agricultural Burning Rule

Assembly Bill (AB) 617 Community Air Protection  
Program - Eastern Coachella Valley

---

## Rule 444 Open Burning

minimizes emissions from open burning to protect public health and safety.

**This rule applies to:**

**Agricultural burning**

**Emergency burning to prevent crops from freezing**

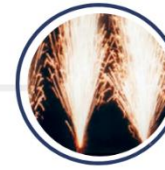

**Fire department training**

**Burning required to reduce fire hazard**

**Tumbleweed disposal**

**Other**

### Agricultural Burning Requirements

**Agricultural burning:**

- must be at least 1,000 feet away from homes, schools, daycare centers, and hospitals
- must begin one hour after sunrise and be finished two hours before sunset
- must be less than 41 acres per day
- must contain only agricultural waste (free of dirt, soil, and other debris)
- must be lit with an approved device (does not produce black smoke)

**Waste allowed to be burned\***

- Citrus
- Fruit bearing trees
- Grape vines
- Date palm fronds
- Brush
- Vegetables
- Other land clearing for agricultural operations (e.g., tamarisk scrub)

\*All agricultural waste must be free of trash, non-agricultural waste, dirt, soil, and visible moisture.

**Waste NOT allowed to be burned**

- Trash, plastics, tires, oil filters
- Pallets, chemically treated wood
- Material with asbestos
- Packaging material
- Pesticide and fertilizer containers
- Construction and demolition material
- Ornamental or landscape vegetation (e.g., grass, weeds, and trimmings)

### Agricultural Burn Permit Process

- 1

**Burn Management Plan & Pre-Burn Inspection**

Submit a Burn Management Plan and request a Pre-Burn Inspection from the South Coast AQMD by calling (909) 396-3403.
- 2

**The Day Before a Burn**

Obtain a Burn Authorization Number from the South Coast AQMD by calling (909) 396-3403 before 4:00 p.m.
- 3

**Contact Local Fire Department**

After receiving a Burn Authorization Number, contact your local fire department the morning of the burn to see if burning is allowed.
- 4

**Burn and Report Back**

Follow rule requirements and use best practices to reduce emissions.

Submit an annual burn report including information such as material(s) burned, amount burned, and the total emissions.

# APPENDIX 6:

## CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) ANALYSIS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 6: California Environmental Quality Act (CEQA) Analysis

---

The California Environmental Quality Act (CEQA) is a state law that requires agencies to consider the environmental impacts of a proposed project. CEQA describes and imposes specific legal requirements that agencies must follow when evaluating and making decisions about whether a project will cause a significant environmental impact. The information below describes South Coast AQMD staff's analysis and CEQA determination with respect to this project – the Community Emissions Reduction Plan (CERP) for Eastern Coachella Valley (ECV). The information below contains some legal terms because that is the language contained in the law and use of that language is part of how an agency demonstrates compliance with CEQA. As noted below, South Coast AQMD staff has reviewed all aspects of the CERP and has concluded that the CERP is exempt from the requirements of CEQA. The paragraphs below identify the CEQA exemptions that apply to the CERP. If the South Coast AQMD Governing Board agrees with staff and determines that the CERP is exempt from CEQA, and adopts the CERP, a Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notice/ceqa-notice/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

Pursuant to CEQA, the South Coast AQMD, as lead agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Because the physical changes that may occur as a result of implementing portions of the proposed project would only require minimal construction activities and cause negligible physical impacts, it can be seen with certainty that there is no possibility that any physical actions that may be associated with the proposed project may have a significant adverse effect on the environment. Therefore, the project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, the overall purpose of this project is to improve the environment and health of residents of this selected community and all of the action items within the CERP support this goal. Thus, the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment.

The following action items within the CERP involve feasibility and planning studies, because the collection of information is needed in order to make an informed decision about whether to take further actions such as rule development for certain emission sources. However, these action items neither prescribe or commit to specific rule requirements, nor require advance approval or adoption of future actions because they require an open public process. Specifically, after the portion that qualifies as a feasibility or planning

study is completed, and if it results in a decision to go forward with future rule development, the regulated community, stakeholders, interested parties, and the public will be invited to participate in the rule development process in a public forum. For these reasons, the following action items for the CERP are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies:

- Explore the development of an odor event notification system;
- Collaborate with and support state and local agencies in implementing dust suppression projects, addressing cross-jurisdictional air pollution emissions from the Salton Sea and identifying opportunities to mitigate pesticide run-off into the Sea;
- Provide an update on the Shafter Pilot Notification System project, evaluate the feasibility of a pilot notification system, provide information on pesticides applied, reporting pesticide drift, and ways to reduce exposure; and
- Assessing the feasibility of new requirements for open burning, enhanced and focused enforcement efforts.

The following action item within the CERP involves minor physical modifications to existing structures or buildings which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301 – Existing Facilities:

- Identify funding for air filtration system installation and maintenance and home weatherization project implementation; assess the benefits and feasibility of filtered “clean rooms.”

The following action item within the CERP involves minor construction of small structures which is categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures:

- Pursue funding opportunities to discourage illegal dumping such as non-agricultural waste disposal, fencing or berm construction or camera/drone technology.

The following action items within the CERP involve information collection activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection:

- Expand South Coast AQMD’s monitoring networks and seek new opportunities to create an air quality sensor network in the ECV community;
- Work with other agencies to collect emissivity and dust emissions data to improve South Coast AQMD’s emissions inventory;
- Collaborate with the various entities to support the ongoing study on Salton Sea playa dust;
- Identify key pesticides of concern to develop an air monitoring strategy and gather pesticide use data, evaluate community impacts, and identify opportunities to reduce pesticide emissions and exposure;
- Identify opportunities to expand the PM10 monitoring network and seek new opportunities to create an air quality sensor network;
- Pursue a collaborative partnership with Comité Civico del Valle (CCV) to obtain complaint data to address road dust-related air quality concerns within the ECV community and to identify potential high priority areas for surface stabilizing projects;
- Work with the CSC to establish an air quality sensor network and conduct follow-up investigations, as needed;
- Pursue emission reductions from open burning by developing a list of available technologies, best practices and alternatives;

- Pursue opportunities to develop an online permitted burning notification system;
- Establish a complaint-report tracking system regarding illegal dumping;
- Work with the CSC to identify air quality concerns, quantify emissions and provide information on trucks;
- Prioritize actions around diesel mobile source pollution such as an air quality sensor network; and
- Work with the CSC and federal government entities to reduce emissions from the Greenleaf Desert View Power Plant facility by identifying air quality concerns, compiling air quality data, identifying locations for air quality sensor deployment, and developing strategies.

The following action items within the CERP involve inspection activities that check for performance or compliance, and/or involve enforcement activities. They are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections and CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies:

- Continue existing and pursue additional collaborations with local tribes and county agency to identify opportunities to reduce open burning through outreach, enforcement or regulations;
- Support green waste complaint reporting and follow-up investigations;
- Conduct focused enforcement and improve the reporting system to reduce illegal dumping; and
- Collaborating with CARB for focused enforcement around diesel mobile sources.

The following action items, which are speculative at this time as they require collaboration with other entities, might have some secondary air quality impacts: 1) paving unpaved roads and mobile home parks, stabilizing loose road surfaces with grading and gravel on unpaved roads; 2) replacing agricultural and/or emergency open burning with alternative equipment or services such as chippers and grinders and digesters, and 3) funding waste collection services to discourage illegal dumping. However, activities associated with those action items are subject to existing South Coast AQMD rule requirements. For instance, South Coast AQMD Rules 403, 1120, and 1186 cover paving related activities, Rule 1133.1 covers chipping and grinding activities, Rule 1133.2 and 1133.3 cover digesters, and Rule 1196 requires acquiring alternative fuel refuse collection heavy-duty vehicles. These existing rules not only require reducing any potential air quality impact to the minimum, but also have gone through CEQA review during the rulemaking process. If a discretionary action triggering CEQA review is needed to implement those action items, a CEQA review will be conducted at that time.

Further, there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions. Therefore, the proposed project is exempt from CEQA.

# APPENDIX 7:

## BRACKETED COMMENT LETTERS

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

November 13, 2020

Wayne Nastri  
Executive Officer  
South Coast Air Quality Management District

**RE: Comments on the Eastern Coachella Valley Draft Community Emission Reduction Plan**

Dear Mr. Nastri,

On behalf of the undersigned entities and members of the Community Steering Committee (CSC), we respectfully submit the following comments with concerns and recommendations for the draft Community Emissions Reduction Plan (draft CERP) for the Eastern Coachella Valley (ECV). These comments build on past written correspondence as well as concerns, questions, and recommendations raised during CSC and workshop meetings throughout the AB 617 implementation process. Given the extremely short one-week period South Coast AQMD has allowed for public comments on the draft plans, we reserve the right to raise additional concerns prior to the District's Governing Board meeting on December 4, 2020 and to continue to make revisions and suggestions even after this period. The CERP and Community Air Monitoring Plan (CAMP) should be living documents even after its adoption on December 4, 2020, and the CSC

1-1

should have the authority to revise and incorporate additional strategies and input in future years. As currently drafted, the CERP fails to comply with the requirements set forth by AB 617 and fails to adequately respond to CSC priorities with meaningful action to improve air quality in the region. The California Air Resources Board (CARB) must reject this plan should it be submitted without recommendations included below and additional time for meaningful public input.

1-1 cont.

### **Process, Timeline, and Review**

Unfortunately, the draft CERP development process has been far from community-led. South Coast AQMD did not allow the CSC to make decisions on the process or timeline for development of these plans. It was inappropriate and contrary to AB 617 for South Coast AQMD to try to push for a 1-strategy CERP when the CSC felt and asked for more, if not all, priorities to be addressed in the draft CERP in 2020. This poorly facilitated process and dismissal of community and CSC requests resulted in a great loss of time.

South Coast AQMD released the draft CERP in chapters starting on the evening of November 5th. As of November 10th, South Coast AQMD had not released Chapter 4 or any of the appendices for the draft CERP. Chapter 4 was released late on November 10th without notice and only in English. Despite requests from the CSC to expand its public review period, South Coast AQMD provided less than a week for the CSC and the public to review the available chapters, with a comment deadline of November 13th. In addition, the CAMP has not been released or co-developed with the CSC, and is intended to also be presented to the board on December 4th, without giving substantial time for the CSC and the public to thoroughly review. We believe this to be an unacceptable timeline which has resulted in making the CSC disillusioned with the process, and residents especially, feel very stressed and rushed to review the draft CERP and provide comments.

1-2

Additionally, the CSC requested South Coast AQMD to try it's best in calling special meetings for its November 20th Stationary Source Committee meeting and its December 4th Governing Board meeting in order to provide more time for development and review, but the request was not given fair consideration.

Overall, South Coast AQMD has mismanaged the implementation of AB 617 in the ECV by not following an authentic and meaningful community-led process. The draft CERP does not accurately represent all the priorities or recommendations of the CSC and community, nor does it serve its intended purpose of reducing emissions and improving public health which falls short of expectations and is unacceptable. South Coast AQMD has failed consistently by ignoring the CSC's requests and only following certain guidelines and rules set in the CSC charter. South Coast AQMD needs to improve it's process and facilitation of CSC meetings, develop a follow

up process for requests and recommendations, and fully allow the CSC to make decisions and govern itself.

1-2 cont.

### Comments on Chapter 1, 2, and 3

The CERP should require progress reports to the CSC and opportunities for CSC decisions based on new monitoring data. The draft CERP is intended to “provide flexibility for plan adjustments when new information becomes available.” *See* Ch.1, at 1-2. However, the draft CERP does not contain any requirement that the South Coast AQMD update the CSC on new information to allow the CSC to decide on appropriate reduction measures based on the new data. Instead, the draft CERP provides that staff will provide an annual progress report to the Governing Board on CERP implementation. This undermines the purpose of the draft CERPs “flexibility,” and potentially cuts the CSC out of the implementation process. The CERP should require progress reports to the CSC on at least a monthly basis. In addition, the CERP should require at least quarterly meetings with the CSC to decide on appropriate actions to address new air quality information.

Chapter 2 notes how South Coast AQMD heavily relies on community meetings conducted outside of the CSC process, including meetings from 2018-2019 conducted by Leadership Counsel for Justice and Accountability.

1-3

The draft CERP does not provide a detailed inventory of emissions by each permitted source in ECV. The Blueprint requires “granular community-scale emissions inventories” in CERPs because such inventories are critical” for understanding current emissions and tracking future emissions reductions.<sup>1</sup> Indeed, CERPs in other AB 617 communities provide detailed inventories of permitted facilities’ emissions.<sup>2</sup> Thus, the draft CERP should provide a spreadsheet which sets forth each facility and the annual criteria and toxic pollutants emitted from each facility.

Additionally, South Coast AQMD should elevate the native and indigenous communities that live in the ECV in the community narrative. The draft CERP fails to extensively recognize these communities or provide any significant support to tribal governments.

### Enforcement Plan

The CERP should include South Coast AQMD’s best available retrofit control technology (BARCT) evaluation of rules and sources in the ECV. The draft CERP does not contain any

1-4

<sup>1</sup> Blueprint, Appendix C at C-14.

<sup>2</sup> *See, e.g.*, South Central Fresno CERP, Appendix C at C-4, [http://community.valleyair.org/media/1504/09scfresno\\_appc.pdf](http://community.valleyair.org/media/1504/09scfresno_appc.pdf) (last visited November 13, 2020).

discussion of AB 617's expedited BARCT review requirements. AB 617 requires air districts in nonattainment areas such as ECV to perform a BARCT analysis of existing rules for all categories of facilities subject to AB 32 and to propose an expedited schedule for sources that are found to not meet BARCT requirements. Health & Safety Code § 40920.6(c). Facilities are to upgrade at the earliest possible time, and no later than December 31, 2023. *Id.* Accordingly, the CERP should set forth the District's expedited BARCT analysis schedule, identifying each District Rule and source in ECV that will be reevaluated for BARCT under AB 617. Other air districts have implemented robust BARCT analysis processes subject to public review as part of AB 617 implementation.<sup>3</sup> In fact, South Coast AQMD itself has included BARCT evaluations in CERPs for other AB 617 communities.<sup>4</sup> The South Coast AQMD should do the same here.

1-4 cont.

In addition, the draft CERP should confirm that the California Air Resources Board (CARB) is responsible for resolving any disputes between South Coast AQMD and the CSC regarding implementation. The draft CERP's enforcement chapter does not say how the draft CERP is to be enforced should there be disagreements between the CSC and South Coast AQMD regarding implementation. The CERP should be revised to state that CARB will resolve any disputes regarding implementation. CARB is responsible for overseeing AB 617 implementation, including ensuring that: (1) CERPs result in emissions reductions in the community; and (2) effective community air monitoring is implemented. *See* Health & Safety Code §§ 42705.5, 44391.2(c)(5). Moreover, CARB has a wide range of oversight powers and responsibilities as to the air districts. *See id.* §§ 39002, 41500. For example, CARB has broad authority to take action when it determines that an air district has failed to meet the responsibilities given to it by any provision of law. *Id.* § 39002. Accordingly, the draft CERP should be revised to state that the CSC and community members may file a complaint with CARB if there are disputes about implementation, and that CARB will resolve such complaints expeditiously.

1-5

Furthermore, the CERP should identify all permitted facilities in the ECV and their compliance status. As other CERPs have done, the CERP should: (1) identify each permitted facility; (2) provide a summary of complaints as to each facility; (3) describe the inspection history of each facility; and (4) detail all enforcement actions against each facility.<sup>5</sup>

1-6

### Community Concerns and Requests Remain Unaddressed

<sup>3</sup> San Joaquin Valley Air Pollution Control District Website, <http://community.valleyair.org/best-available-retrofit-control-technology-barct> (last visited November 13, 2020).

<sup>4</sup> SCAQMD Website, Wilmington, Carson, West Long Beach, <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/wilmington/cerp/blueprint-checklist-wcwlw.pdf?sfvrsn=8> (last visited November 13, 2020).

<sup>5</sup> Shafter CERP, Appendix F, [http://community.valleyair.org/media/1495/12-shafterappf\\_enforcementplan.pdf](http://community.valleyair.org/media/1495/12-shafterappf_enforcementplan.pdf) (last visited November 13, 2020).

The CSC initially identified over 20 air quality priorities that were grouped into six final priorities. Six of these issues are not addressed in the draft CERP: offroading vehicles and activities, the Thermal racetrack, the Thermal Airport, the freight train, land use, outreach and education.

1-7

1. Offroading

Offroading is a top concern for residents in the ECV, particularly for the communities of Mecca and North Shore. This topic was raised consistently during the CSC meetings and was specifically identified as an air quality priority during the AB 617 Kick-Off meeting in January 2020. However, the draft CERP does not address this air quality concern at all. Testimony provided by community residents during community meetings informs us that while offroading activity has been a constant occurrence within the ECV, it has actually increased significantly during the COVID-19 pandemic. Given the stay at home ordinances, more residents and outside visitors can be found offroading through the Mecca and North Shore areas on a daily basis. With the air quality concerns in the ECV, we know that residents already experience numerous public health concerns in terms of dust exposure, and this increase in offroading activity has increased those respiratory and health impacts faced by residents. South Coast AQMD should identify additional actions, monitoring, and strategies to address offroading emissions in Chapters 5d (Fugitive Road Dust) and 5g (Diesel Mobile Sources).

1-8

Recommended strategies include:

2. The Thermal Club and the Jacqueline Cochran Regional Airport

Both of these air quality priorities were raised at our first CSC meeting in early 2020, but are not included in the draft CERP. The concerns raised around these issues include gentrification, increased air pollution, and traffic. There are direct pollution impacts to residents living nearby in mobile home parks, apartments, and houses, including CVUSD schools like John Kelley Elementary, La Familia, Las Palmitas Elementary, Toro Canyon Middle School, and Desert Mirage High School. This pollution also harms farm workers working in fields nearby.

1-9

South Coast AQMD should conduct further research on the reach of this pollution, identify the type of contaminants being released, conduct air monitoring at these sites, and engage in land-use discussions with the community and Riverside County to deter these environmentally harmful projects from being placed in an already disadvantaged community.

3. Freight Train

1-10

Chapter 5f also fails to address the freight/rail corridor that passes through the ECV, directly impacting traffic and air quality in all of the unincorporated communities, including the Cities of Indio and Coachella. The freight train is known to pass through at least 5 times a day, with passenger trains occasionally travelling through the night. Residents raised this issue during CSC meetings, but no additional information was provided to the CSC and South Coast AQMD failed to conduct further research. Actions and strategies for this air quality priority should include coordination with federal agencies that hold primary jurisdiction over freight emissions.

1-10  
cont.

#### 4. Land Use

CSC members have also identified land use issues as a crucial and underlying issue for air quality in the ECV. Although the South Coast AQMD does not have direct jurisdiction over land use decisions, it can take actions to reduce emissions such as incentivizing low/zero-emission vehicles and alternative modes of transportation, as well as supporting the planning process in the ECV to reduce pollution. Other CERPs have adopted detailed land use strategies.<sup>6</sup> Here, South Coast AQMD has the opportunity to engage with Riverside County, Torres Martinez Desert Cahuilla Indians and Cabazon Band of Mission Indians, recognizing their tribal sovereignty, and other land use entities to ensure that land use practices, policies, and future decisions do not adversely affect the air quality and public health of the ECV. This is a good way in which South Coast AQMD can serve as a good and supportive partner to the community.

We recommend that South Coast AQMD add a separate section for land use strategies, but to also incorporate individualized land use strategies within each of the priority chapters. One topic that South Coast AQMD should be aware of is the possible development of warehouses in the ECV in the future. Given the growing concerns in the Inland Empire regarding warehouse and diesel pollution, South Coast AQMD should work to identify land use strategies that prevent these harmful and degrading land use patterns in environmental justice communities.

1-11

Actions and strategies for this section include:

- South Coast AQMD will work with the various jurisdictions to limit the approval and permitting of polluting land use projects within the AB 617 ECV boundary.
- South Coast AQMD will be an active partner in the implementation of the current City of Coachella, City of Indio, and County of Riverside Climate Action plans and programs. This also includes the Transformative Climate Communities Program and the Regional and Neighborhood Mobility Plans for the ECV unincorporated communities.

<sup>6</sup> See West Oakland CERP, at 6-2, <https://www.baaqmd.gov/~media/files/ab617-community-health/west-oakland/100219-files/final-plan-vol-1-100219-pdf.pdf?la=en> (last visited November 13, 2020).

- South Coast AQMD will be an active partner in the planning and implementation of SB 1000 in the City of Coachella, City of Indio, and Riverside County, as well as engage in general plan updates.

1-11  
cont.

## 5. Outreach and Education

The CSC has also uplifted the importance of outreach and education towards youth and community members. While we recognize that the COVID-19 pandemic has made it harder to reach the general public and community within the AB 617 boundaries, we continue to believe that identifying ways to support community education and engagement is an important component of AB 617.

South Coast AQMD has identified several outreach strategies throughout the different sections of Chapter 5. However, these strategies rely heavily on community-based and non-profit organizations to do this on the groundwork. Community-based and non-profit organizations can support and provide guidance on how to conduct strong outreach and education, responsibility still lies primarily with South Coast AQMD to fund and implement these actions.

1-12

Additionally, we recommend that as implementation of the program moves forward, South Coast AQMD should drastically increase its outreach and education efforts to the larger public on the program overall. The draft CERP should include actions for outreach and education that are appropriate and safe to be conducted during a pandemic. Local community-based and non-profit organizations have quickly adapted and found new ways to conduct these activities to stay in touch with the community. Sunline has also adopted some of these strategies thanks to the support and guidance from local organizations.

Actions and strategies for this section include:

- Create a public participation and outreach plan.
- Adopt a resolution or ordinance that commits South Coast AQMD to provide all material, resources, websites, and apps in Spanish and/or other languages as requested.
- Partner with the DMHS and CVHS green academies and other youth groups (e.g. Sierra Club Youth Group) to do education and community service programs to improve air quality

## **Draft CERP does not Establish Clear Quantifiable Emission Reduction Actions, Strategies, or Targets**

The draft CERP and CAMP do not provide sufficiently concrete commitments by South Coast AQMD to ensure meaningful reductions in cumulative air pollution burdens on ECV residents. CERPs are the “cornerstone” of AB 617. AB 617 requires CERPs to include: (1) emissions reduction targets; (2) specific reduction measures; (3) a schedule for the implementation of

1-13

measures; (4) and an enforcement plan. *Id.* § 44391.2(c). CERPs must result in measurable emissions reductions in the community. *Id.* § 44391.2(c)(3).

Here, the draft CERP largely requires “incentives,” “outreach,” and suggestions that South Coast AQMD “pursue” collaborations with other agencies to possibly monitor or reduce pollution. While all of this is extremely important to include in the draft CERP, these vague commitments fall short of the specific, enforceable, and measurable reduction strategies required by AB 617. For example, CARB’s Community Air Protection Blueprint (Blueprint) requires CERPs to set forth health-based and quantifiable emission reduction targets.<sup>7</sup> Here, the draft CERP does not contain any such targets. *See, e.g.*, CERP at 5a-1 & 5a-2. The plans must be revised to comply with AB 617 and CARB’s Blueprint.

Based on community advocacy from the past several years, including meetings and workshops on separate efforts like the Salton Sea, residents and stakeholders front the ECV have consistently elevated the need for South Coast AQMD to be engaged and build relationships with different local, regional, and state agencies. These concerns and recommendations have also been raised in CSC meetings, but the draft CERP clearly demonstrates that those relationships and partnerships have not been developed throughout this year of AB 617 implementation in the ECV.

1-13  
cont.

The CERP must include quantifiable emission reduction targets for all criteria and toxic air contaminants of concern in ECV. The Blueprint requires CERPs to include “quantifiable emissions reduction targets for applicable pollutants contributing to the cumulative exposure burden.”<sup>8</sup> Although the draft CERP identifies significant toxic air contaminants and PM pollution in ECV, the draft CERP does not specify reduction targets for these pollutants. Rather, the CERP merely states that reduction targets for NO<sub>x</sub> and diesel are “to be determined.” This failure to identify reduction targets violates AB 617 and the Blueprint. The draft CERP should be revised to include reduction targets for all toxic air contaminants and criteria air pollutants identified in Chapter 3b, as well as for pesticides.

Another area that’s lacking in the draft CERP is mitigation. In addition to emission reduction actions, we believe that mitigation strategies and actions are also important to include in order to be able to provide public health benefits in the short term.

#### 1. Salton Sea

The draft CERP should be revised to include enforceable measures to reduce pollution from the Salton Sea. The draft CERP proposes nothing more than a monitoring program for Salton Sea emissions. The draft CERPs proposal to consult with other agencies is important but is

1-14

<sup>7</sup>Blueprint, Appendix C at C-18.

<sup>8</sup>Blueprint, Appendix C at C-17.

ultimately insufficient under AB 617 and the Blueprint. In addition to outreach and inter-agency coordination, the draft CERP must identify quantifiable reduction targets and measures, such as committing to implementing dust reduction measures.

CSC members and residents have been actively involved in the California Natural Resources Agency's (CNRA) planning efforts to rehabilitate the Sea. As we've mentioned before, there needs to be much better and more transparent communication and coordination between South Coast AQMD, CNRA, Riverside County, the Salton Sea Authority, and other stakeholders so that the AB 617 process can reflect, contribute to, and complement CNRA's and others' efforts to reduce emissions and dust exposure at the Sea. With that comes the identification and acknowledgement of mitigation efforts and projects that the community has been pushing for. This includes reforestation and greening, recreational projects, and other dust calming and mitigating measures.

1-14  
cont.

Below are additional recommendations for Chapter 5b:

- The Salton Sea air monitoring network needs better timelines and for actually installing and making data available to the community. The current timeline proposal with a start date of the 2nd quarter of 2021 with completion in the 4th quarter of 2025 is unacceptable. South Coast AQMD should collaborate with CNRA and the Imperial Irrigation District (IID) to expedite this process by starting in the 1st quarter of 2021.
- South Coast AQMD should conduct a thorough review and update of Rule 403 - Fugitive Dust and Rule 403.1 - Supplemental Fugitive Dust Control Requirements for Coachella Valley Sources. Conducting outreach to facility operators/workers/owners is not sufficient. This action shall be completed by the 3rd quarter of 2021.
- All air quality data must be made fully available to the public, including health care providers. Any member of the public should not be required to make a formal request in order to access real-time data.
- The monitoring network must include toxics and address other pollutants in addition to hydrogen sulfide. This includes pollutants coming from pesticide drift and agricultural runoff and various contaminants in sea spray blowing to nearby communities from the surface of the Salton Sea.

## 2. Pesticides

As previously mentioned, Chapter 5c also relies heavily on partnerships and collaborations, but doesn't provide significant emission reduction actions, or mitigation and exposure reduction measures. Chapter 5c should address the following recommendations:

1-15

- The CERP should require comprehensive monitoring for toxic pesticide emissions. The draft CERPs monitoring “goal” is inadequate. The draft CERP merely commits South Coast AQMD to “[p]ursue a collaborative partnership” and “consult” with other agencies regarding pesticide monitoring. However, the South Coast AQMD has authority to monitor emissions of toxic air contaminants including pesticides; the South Coast AQMD does not need any other agency’s permission to do so. *See Harbor Fumigation, Inc. v. County of San Diego Air Pollution Control Dist.*, 50 Cal. Rptr. 2d 874 (Cal. App. 4th Dist. 1996). Moreover, under AB 617, South Coast AQMD has an affirmative duty to create a monitoring system to measure exposures to toxic air contaminants and health risks at or near sensitive receptor locations in disadvantaged communities. Health & Safety Code § 42705.5(a)(1). The CERP and/or CAMP must include monitoring for pesticide emissions.
- It is critical that the CERP and CAMP require that monitors are placed at residential areas and sensitive receptors (such as schools, nursery homes, and daycares) located near fields where toxic pesticide exposures occur. ECV has one of the highest pesticide burdens for exposures and environmental effects in the state.<sup>9</sup> In Riverside County, soil fumigants such as metam sodium (aka metham sodium) and 1,3-Dichloropropene (1,3-D) are used in significant amounts.<sup>10</sup> Metam sodium, and its byproduct MITC, and 1,3-D are toxic air contaminants under California law and are subject to AB 617’s monitoring requirements. Although toxic pesticide emissions are widespread in ECV, South Coast AQMD does not presently monitor them. The CERP and CAMP should remedy this monitoring vacuum.
- While we generally support interagency collaboration in the AB 617 process, the draft CERP must do more than commit to attempting to work with other agencies to reduce pesticide exposures. The CSC will, of course, assist the South Coast AQMD with identifying residential areas and sensitive receptors in ECV that are impacted by pesticide air emissions.
- The draft CERP’s emission and exposure reduction goals are not sufficient under AB 617. These goals merely require the South Coast AQMD to “[i]dentify and evaluate opportunities to reduce pesticide emissions and exposures based on the evaluation of community impacts.” Conducting an evaluation and providing a yearly update on the Shafter Pilot Notification System project is inadequate. These evaluations fall short of AB 617’s requirement that CERPs include enforceable measures that ensure quantifiable reductions in cumulative exposures. We recommend that a similar process be implemented immediately (1st quarter of 2021) in the ECV. It’s feasibility does not need to be evaluated. This is a minimal task that South Coast AQMD, the Riverside County

1-15

<sup>9</sup> CARB Community Air Protection Program, 2019 Community Recommendations, Staff Report [https://ww2.arb.ca.gov/sites/default/files/2019-12/2019\\_community\\_recommendations\\_staff\\_report\\_november\\_8\\_acc\\_3.pdf](https://ww2.arb.ca.gov/sites/default/files/2019-12/2019_community_recommendations_staff_report_november_8_acc_3.pdf), at 33, Table 6.

<sup>10</sup> DPR Pesticide Use Reporting tool <https://www.cdpr.ca.gov/docs/pur/purmain.htm>

Agricultural Commissioner, and the Department of Pesticide Regulation (DPR) should already be implementing in the region.

- The CERP should also include a commitment from South Coast AQMD to work with DPR to require setbacks for pesticide applications near residences and sensitive receptors. And the CERP must identify the target amount of contaminants and toxic pesticide exposures that will be reduced by the CERP strategies.
- In addition, the draft CERP says the South Coast AQMD will provide the community with “information on the types of pesticides applied in ECV.” However, this information is already readily available to the District. As South Coast AQMD knows, the Riverside County Agricultural Commissioner and DPR are in custody of detailed data concerning all pesticides applied in ECV. Accordingly, all relevant information concerning the pesticides applied in ECV should be included in the CERP and made easily accessible and easily readable to the larger community. An important detail is that pesticide use information should be posted on a publically viewable website in real time. Pesticide application data that is older than 3 months may be of no use to the local community and sensitive receptors.
- South Coast AQMD needs to vastly improve the timelines for this chapter's actions. It is unclear what will be accomplished when or how the draft actions will be implemented within the expansive timelines provided.

1-15  
cont.

### 3. Fugitive Road Dust

The draft CERP does not contain sufficiently concrete commitments to reduce fugitive dust. Instead, South Coast AQMD says it will “pursue” partnerships, “conduct outreach” and “identify funding.” Although these actions are certainly part of achieving reductions, South Coast AQMD must specifically identify enforceable mitigation measures in the CERP. This includes the following:

- The draft CERP should include a requirement that South Coast AQMD increase its efforts to enforce its fugitive dust rules, Rules 403 and 403.1. Under AB 617 and the Blueprint, it is not adequate to merely “conduct outreach” regarding the fugitive dust rules. The draft CERP should be revised accordingly.
- All mobile home parks and Polanco Parks in the ECV should be equipped with air monitors for particulate matter and specific toxics that are identified to be of concern.

1-16

### 4. Open Burning and Illegal Dumping

The draft CERP consists of outreach and incentives aimed at reducing open burning by the agricultural industry. This is not enough to meet AB 617’s requirements. For instance, the draft CERP does not discuss the District’s open burning program (Rule 444), which is intended to “ensure open burning in the South Coast AQMD is conducted in a manner that minimizes

1-17

emissions and impacts, and that smoke is managed consistent with state and federal law in order to protect public health and safety.” The draft CERP should require the South Coast AQMD to increase enforcement of the rule to materially reduce open burning. Likewise, the draft CERP should specify a quantifiable reduction target for reductions in open burning.

South Coast AQMD should also identify feasible alternatives to agricultural burning by doing the following:

- Enforce agricultural burning rules.
- Identify alternatives to agricultural burning.
- Require agricultural companies and growers to comply with such rules by the end of 2025.
- Develop and implement a plan to phase out agricultural burning entirely.
- South Coast AQMD can look for guidance from similar actions by the San Joaquin Valley Air Pollution Control District

1-17  
cont.

## 5. Diesel Mobile Sources

As with the pollution sources discussed above, the draft CERP fails to require meaningful reduction measures and does not identify any reduction targets. Stating that monitoring will be conducted is only part of the CERP process; the CERP must actually adopt strategies for reducing the emissions. Accordingly, the CERP must be revised to specifically describe how the South Coast AQMD will reduce diesel emissions and identify quantifiable emission targets. The draft CERP also fails to address the Thermal Club and airport as noted in previous sections. South Coast AQMD should include necessary strategies from CARB’s Concept Paper for the Freight Handbook in the draft CERP as well. This section should also address the DTSC’s Air Toxic Control Measure (ATCM) for Stationary Compression Ignition (CI) Engines that includes on farm diesel equipment and yard trucks used in some agricultural packing houses and other facilities.

1-18

## 6. Greenleaf Desert View Power Plant

In addition, we note that the proposed monitoring regarding the Greenleaf power plant is inadequate. The plant is located near a populated area in Mecca. It emits, among other things, significant amounts of benzene and formaldehyde according to CARB data. Accordingly, fenceline monitors for criteria and toxic air pollutants should be installed on the facility. In addition, at least ten monitors should be strategically placed near homes and sensitive receptors near the facility. Mobile monitoring should take place to identify and quantify pollutants that occur at this facility during early mornings and late evenings as the plant operates over 24 hours. This will help inform what kind of fixed monitoring should be placed near the facility to inform

1-19

emission reduction measures. South Coast AQMD has successfully used mobile monitoring to identify hotspots and unknown sources over the fence in Wilmington and these practices should be adopted in the ECV on sites like the Greenleaf Desert View Power Plant. The CERP should be revised to incorporate these measures.

1-19  
cont.

Overall, Chapter 5 needs significant improvement in order to develop a plan that actually includes quantifiable measures and drives enforcement. The draft CERP should incorporate CARB's role and responsibility over mobile source emissions in the ECV. In terms of funding, South Coast AQMD should not rely solely on external sources to implement the draft actions, but should also note how it plans on using it's own internal budget and allocated funding for this program.

1-20

*Additional actions and strategies can be found in our attached file titled: Draft CERP Edits 11/13.*

### **Coordination with Community Plans**

AB 617 is only one of the opportunities to improve public health and the environment in the ECV. In the past several years, all cities and communities within the AB 617 boundaries have undergone extensive planning efforts to advance active transportation and mobility, climate resilience and sustainability, as well as land use policies. Some of these plans include the following:

- The Regional and Neighborhood Mobility Plan for the Eastern Coachella Valley (Thermal, Oasis, Mecca and North Shore)
- The Eastern Coachella Valley's Action Plan for Climate Resilience (Coachella, Thermal, Oasis, Mecca, and North Shore)
- The City of Indio's Transformative Climate Communities Plan
- Dust Suppression Action Plan
- Salton Sea Management Program
- Coachella Valley Extreme Ozone State Implementation Plan

1-21

It is important for South Coast AQMD to review and coordinate with these plans as needed to identify ways that can benefit the AB 617 process. This process should be institutionalized within South Coast AQMD and other agencies to facilitate coordination and implementation. There are many mitigation and other types of strategies, actions, and projects identified in a few of these plans that should be included in the draft CERP. The ECV's Action Plan for Climate Resilience in particular includes several dust suppression and air monitoring projects that are not identified in the draft CERP.

## CAMP Development and Summary

The CSC has not had the time to discuss the development of the Community Air Monitoring Plan (CAMP) in any meaningful way during the past year. Since there is no statutory deadline or formal approval process for CAMP's, it seems that South Coast AQMD has not prioritized it appropriately. It is now November 2020, and the CSC has yet to discuss opportunities for expanding air monitoring in the ECV. Many of the actions and strategies identified in the draft CERP state that South Coast AQMD will work with the CSC to identify opportunities for additional air monitoring in the ECV. Is unacceptable for these actions to be included when the draft CERP and CAMP should already identify the ways in which South Coast AQMD will conduct or enhance air monitoring.

1-22

There has also been additional air monitoring and environmental justice work done in the ECV, as noted in our 2019 AB 617 Nomination and CSC meetings. It is important for South Coast AQMD to acknowledge these past efforts and utilize these systems and data to inform the draft CERP. Additionally, the lack of air monitoring and emission reduction strategies point to the larger problem of South Coast AQMD not investing in the ECV in the past to properly conduct comprehensive air monitoring.

\* \* \* \* \*

We appreciate the work that South Coast AQMD has done in the past year to work with the CSC, but as described above, this process has been difficult and stressful for us as the CSC. The draft CERP falls short of what we expected from South Coast AQMD and it is disappointing to see that our comments for the past year alone have not been fully addressed or incorporated in the draft CERP. We ask that our comments and edits be incorporated into the draft CERP and that South Coast AQMD develop a review and response mechanism to manage public comments, questions, and requests moving forward. We also ask that all public comments and feedback received on the draft CERP be made publicly available on the South Coast AQMD AB 617 website and that the CSC have the right to make additions or changes to the CERP in the future.

Executive Summary

## Executive Summary

The Eastern Coachella Valley (ECV) Community Emissions Reduction Plan (CERP) is a critical part of implementing Assembly Bill (AB) 617 (Health and Safety Code Section 44391.2), a California law that addresses the disproportionate impacts of air pollution in environmental justice communities. The AB 617 program invests new resources and focuses on improving air quality in environmental justice communities. The CERP outlines goals and actions by the Community Steering Committee (CSC), the South Coast AQMD, and the California Air Resources Board (CARB) to reduce air pollution in the ECV community and improve public health. An essential piece of the program is partnership and collaboration with the community to address the community's air quality priorities in the CERP. The CSC is a diverse group of people, including youth, who live, work, own businesses, or attend school, within the community. Local public health agencies, regulatory agencies, tribal organizations, and elected officials are represented on the CSC. The CSC guides the development and implementation of the CERP.

One year from the date that CARB designates a new AB 617 community, the local air district must develop and adopt a CERP in consultation with CARB, community-based organizations, affected sources, and local governmental bodies.<sup>1</sup> The ECV community had to account for the onset of the COVID-19 pandemic and its impact on the CERP development schedule. Despite a delay in the schedule, the ECV CSC and South Coast AQMD staff worked together to develop this plan for consideration by South Coast AQMD's Governing Board in December 2020.

Based on the sources of air pollution impacting the community, the ECV CSC identified the following air quality priorities to be addressed by this plan:

- Salton Sea
- Pesticides
- Open Burning and Illegal Dumping
- Fugitive Road Dust
- Diesel Mobile Sources
- Greenleaf Desert View Power Plant

At its core, this plan seeks to address the air quality priorities with actions that reduce air pollution emissions from sources within the community and reduce air pollution exposure to people in the community and improve public health. This plan includes actions, such as developing and enforcing regulations, providing incentives to accelerate the adoption of cleaner technologies, implementing mitigation projects, and conducting outreach to provide useful information to support the public in making informed choices. Additionally, air monitoring efforts will provide critical information to help guide investigations, provide public information, and track progress. Collaborative efforts with other agencies, organizations, businesses and other stakeholders will amplify the impact of these actions. Many of the actions will only be conducted during the implementation timeframe of this plan; however, there are also many actions (such as regulations, ongoing enforcement activities and certain incentive programs) that will be continuing activities conducted by the South Coast AQMD.

<sup>1</sup> Assembly Bill 617 44391.2(b)(2)

Executive Summary

This plan focuses on improving air quality in the ECV community through concentrated efforts and community partnerships. The CSC will continue to engage in the process of implementing the CERP and tracking its progress.

The Reader’s Guide to the CERP

The opening chapters provide background information about the AB 617 program and timeline (Chapter 1), the CSC process and community engagement (Chapter 2), and information about the air pollution sources in the community (Chapter 3).

Information about past and ongoing enforcement activities conducted by both the South Coast AQMD and CARB staff is provided in Chapter 4. This information will provide insights into future enforcement activities.

The specific actions for emissions and exposure reductions are in Chapter 5 – Actions to Reduce Community Air Pollution. Chapter 5 is organized by air quality priorities, followed by goals and actions to address each air quality priority. The actions are organized in a table that identifies the entities responsible for each action and specifies the timeframe for implementing them. The CERP actions are numbered in the order in which they are presented in each section. The proposed plan will include a California Environmental Quality Act (CEQA) analysis based on the proposed actions.

A summary of the air monitoring approach is in Chapter 6. These efforts are described in much greater detail in the Appendix 6 for the Community Air Monitoring Plan (CAMP).<sup>2</sup> The actions described in Chapter 5 also include specific air monitoring activities related to specific actions in the CERP. Findings from air monitoring will help evaluate next steps, and South Coast AQMD staff will work with the CSC to review findings and make necessary adjustments to the CERP.

The Appendices to the CERP include additional reference material related to the CERP content.

2-1 cont.

<sup>2</sup> South Coast AQMD, Community Air Monitoring Plan for ECV, ([Link Coming Soon](#))

Chapter 1: Introduction

AB 617 was signed into California law in July 2017 and focused on addressing local air pollution impacts in environmental justice communities. The bill recognizes that while California has seen tremendous regional air quality improvement, some communities are still disproportionately impacted. Many communities in the South Coast AQMD experience impacts from air pollution sources near places where people live. Major air pollution sources in EJ communities include mobile sources (trucks, locomotives, etc.) and industrial facilities. These communities also experience social and economic disadvantages that add to their cumulative burdens. The AB 617 program accelerates actions and provides additional resources to address air quality in these communities.

In 2018 (Year 1), CARB designated ten AB 617 communities statewide (see Figure 1-1), including three South Coast AQMD communities. On December 13, 2019 (Year 2), CARB designated two additional AB 617 communities (see Figure 1-1) in South Coast AQMD, including Eastern Coachella Valley (ECV) and Southeast Los Angeles.

Figure 1-1: Statewide AB 617 Communities as of 2019

Local air districts are tasked with developing and implementing Community Emissions Reduction Plans (CERPs) and Community Air Monitoring Plans (CAMPs) in partnership with residents and community stakeholders. The CAMP includes air monitoring efforts to enhance our understanding of air pollution in the designated communities and support CERP implementation.

Purpose of the Community Emissions Reduction Plan (CERP)

The CERP is developed to achieve air pollution emission and exposure reductions within the ECV community and address this community’s air quality priorities. The plan describes the community outreach conducted to develop

<sup>i</sup>ECV, Stockton, and Southeast Los Angeles were designated in 2019 to develop both a community emissions reduction plan and a community air monitoring plan. San Diego designated in 2018 to develop a community air monitoring plan, which was expanded in 2019 to develop a community emissions reduction plan.

Chapter 1

the CERP and provides emissions and exposure reduction actions, an implementation schedule and an enforcement plan.

Some actions in the CERP include a series of steps to address certain air quality concerns raised by the CSC. These actions provide flexibility for plan adjustments when new information becomes available. Staff will provide an annual progress report to the South Coast AQMD Governing Board on CERP implementation and identify actions that may require Board action.

CERP Development Process and Emphasis on Community Input

Community engagement and input to inform both the process and the actions in the CERP are a primary element of the AB 617 program. Figure 1-2 provides the CERP development process. Public meetings, workshops, conversations, and communications among committee members, South Coast AQMD staff and CARB staff contributed to development of the plan. Chapter 2 describes the CSC and outreach efforts for CERP development.

Figure 1-2: Overview of ECV Community Emissions Reduction Plan (CERP) Timeline

- CARB designated AB 617 Year 2 communities
- Community Kickoff meeting
- CSC convened, developed and finalized charter, finalized community boundary, and identified air quality priorities
- Community workshops on air quality priorities and Technical Advisory Group (TAG) meeting, begin CERP development
- CSC discussion on potential draft CERP actions
- Draft CERP released to CSC for review
- Draft CERP revised to address CSC comments
- Draft CERP presented to Stationary Source Committee
- Draft CERP considered by South Coast AQMD Governing Board for adoption

\*Meetings include CSC meetings, workshops, and Technical Advisory Group (TAG) meetings.

Commented [RZ1]: Charter was adopted in September not July and draft CERP was released in November.

2-2 cont.

About this Community

The community extends from the City of Indio south to the Riverside County boundary along the Salton Sea. It includes the City of Indio, the City of Coachella, a small portion of the City of La Quinta (southern part of the city), and the unincorporated areas of Thermal, Mecca, Oasis and North Shore (Figures 1-3 and 1-4).

Figure 1-3: ECV Community Boundary

Figure 1-4: Location of the ECV community in the South Coast AQMD jurisdiction

2-2 cont.

Figure 1-5: Population of the ECV community, based on 2010 Census

80,592  
Total Population

Figure 1-6: Population by Race/Ethnicity in ECV and the state of California, based on 2010 Census<sup>ii</sup>

More than 80,000 people live within the ECV community (Figure 1-5). Most of the people living in this community are Hispanic or Latino (Figure 1-6). About 6.2% of the residents in this community are White, 0.5% are African American, and 0.3% are American Indian or Alaska Native. The population in this community is younger than the California population, with about 21.4% of children under the age of 10 years and 6.5% adults over the age of 65 years (Figure 1-7). These age categories are particularly important because young children and older adults can be more sensitive to air pollution's health effects.

<sup>ii</sup> Definitions of races are the same as CalEnviroScreen 3.0.

2-2 cont.

Deleted: o

Chapter 1

Figure 1-7: Age profile in ECV and the state of California, based on 2010 Census

Commented [RZ2]: I don't think this chapter depicts an accurate or meaningful reflection of the ECV. Maybe it's not necessary for this type of document, but it feels very superficial and focused on numbers.

2-2 cont.

Chapter 2: Community Outreach, Community Steering Committee and Public Process

Introduction

Community engagement, outreach, and public process were crucial to developing the Eastern Coachella Valley (ECV) Community Emission Reduction Plan (CERP). Key features of the outreach efforts include establishing a Community Steering Committee (CSC), monthly CSC meetings, CSC member and South Coast AQMD staff presentations, providing materials (in English and Spanish) via email and a webpage, live-streaming all CSC meetings (with English and Spanish interpretation), and establishing a Technical Advisory Group (TAG). Also, numerous interactions between CSC members and South Coast AQMD staff occurred in one-on-one or small group meetings, allowing for in-depth discussions on joint development and creating the CERP.

- The Community Steering Committee (CSC) and Technical Advisory Group worked with South Coast AQMD staff to develop the CERP
- Despite the COVID-19 Stay-At-Home Order, regularly scheduled CSC meetings resumed using a virtual platform to engage with the CSC and public
- The Community Liaison served as the point of contact
- A series of Charter Working Group Meetings were held to develop a CSC Charter
- Additional one-on-one, small group, and community meetings also played an important part in community engagement
- A Community Webpage was created as an information portal

Community Liaisons

A Community Liaison from the South Coast AQMD served as the point of contact to communicate with members of the CSC and members of the public to address concerns regarding logistics and development of the CERP and Community Air Monitoring Plan (CAMP) (Figure 2-1). The Community Liaison ensured communication throughout the CERP development process and worked with community members to identify the best ways to make information accessible and user-friendly. The South Coast AQMD Community Liaison for the Eastern Coachella Valley (ECV) is Arlene Farol ([afarol@aqmd.gov](mailto:afarol@aqmd.gov)). In addition, Pedro Piqueras ([ppiqueras@aqmd.gov](mailto:ppiqueras@aqmd.gov)) serves as the South Coast AQMD point of contact for CERP-related discussions.

2-3

Commented [RZ3]: Spanish recordings were not provided until much later, probably summer or later when requested by CSC.

**Figure 2-1: South Coast AQMD staff assisting CSC members and the public at a meeting in the city of Coachella**

**Community Steering Committee (CSC)**

A steering committee was formed in late January 2020 for the ECV community, and monthly in-person meetings were organized, starting February 19, 2020 (Figure 2-2). However, due to the COVID-19 pandemic and the resulting executive orders from the Governor<sup>1</sup>, the remaining CSC meetings were transitioned to a video conferencing format. The March and April CSC meetings were cancelled and resumed in May using the Zoom platform. The main role of the CSC is to provide input and guidance as well as to propose actions for the community plans (i.e., CERP and CAMP). The CSC is comprised of stakeholders with community knowledge to help drive community action and develop the CERP and CAMP. The CSC creates a way to incorporate community expertise and direction in developing and implementing clean air programs in each community. Staff will continue to seek recommendations and feedback from the CSC during CERP implementation and adjust the outreach approaches to be more effective.

The ECV CSC has 50 primary members and 12 alternate members representing active residents, community organizations, and businesses. While 20 primary members are on the roster representing active residents, an additional 10 primary members also reside within the community (resident percentage on the CSC = 60%). Additionally, there are 10 primary members and 8 alternate members representing agencies, schools/universities, or offices of elected officials who serve this community.<sup>2</sup> The roster is available at: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

Commented [RZ4]: Should include updated roster info as well and that changes were requested in the fall.

<sup>1</sup> Governor Newsom issued Executive Order N-25-20 on March 12, 2020 and Executive Order N-29-20 on March 17, 2020.

<sup>2</sup> Per discussion with CARB staff, members representing agencies, schools, universities, hospitals, and offices of elected officials are not included in the calculation of resident percentage on the CSC.

Figure 2-2: Community Steering Committee meeting in Coachella

CSC Charter Working Group

The South Coast AQMD's original draft charter was presented at the February 20<sup>th</sup> CSC meeting. In March 2020 meeting, CSC member Rebecca Zaragoza provided a revised charter based on input from some of her fellow CSC members. Because they felt it was important for the CSC as a whole to discuss the Charter, the CSC recommended forming a Charter Working Group to draft the charter to include all CSC input. At the May 20<sup>th</sup> CSC meeting, all CSC members were invited to participate in the Charter Working Group/CSC meetings, and updates were provided to the full membership during CSC meetings. The first Charter Working Group meeting was held on June 23, 2020 followed by subsequent weekly meetings (a total of 4 meetings of this Working Group).

During the Charter Working Group meetings, CSC members discussed ideas for the committee meeting process, including a request to incorporate elements of the Brown Act into the charter and to form subcommittees to discuss specific topics. Additionally, Committee members requested stipends, transit, childcare, availability of alternative community locations with internet access for future meetings, outreach via mass mailing of materials, air quality training and workshops, printed meeting materials to be delivered to organizations and residents, and that materials be provided far in advance of meetings.

A Google document was created for CSC members to provide recommendations and direct edits to the draft charter. At each Charter Working Group meeting, CSC members discussed the edits and suggestions provided in the draft charter. CSC members edited the Google document until July 29<sup>th</sup> when a draft was presented to members at the Charter Working Group meeting. CSC members provided comments and the feedback received was included in the revised charter. A vote was taken by CSC members recommending not to bring the Brown Act item to the next CSC meeting for a vote, and instead continue developing the language in the charter, removing the sentence that mentions the Brown Act. Additionally, the CSC also recommended presenting a clean version of the charter for consideration the next CSC meeting.

2-3 cont.

Commented [RZ5]: This section lacks background and context. LCJA worked with residents, Alianza, PUCDC, LLU, and others who advocated for the selection of the ECV in 2019 to get a head start on the charter so that once the CSC started meeting, we could focus on developing the CERP and CAMP and use our time wisely.

2-3 cont.

Commented [RZ6]: Presented in English only. This should note that there was a full months delay in approving the charter after it was conditionally finalized, because it was not provided in Spanish.

Chapter 2

At the August 26<sup>th</sup> CSC meeting, CSC member Anetha Lue presented a thorough summary of the discussions during the various Charter Working Group meetings. In her summary, she stated the general agreement that the charter should ensure inclusion and fairness, achieving results and a leadership role for the community (Figure 2-3).

**Figure 2-3: CSC Member Anetha Lue presented an update at the August 26<sup>th</sup> CSC meeting**

2-3 cont.

The final charter was approved by the CSC on September 24<sup>th</sup> and is available at the links below.

CSC Final Charter - September 24, 2020 version:

- English: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter.pdf?sfvrsn=8>
- Spanish: <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/eastern-coachella-valley/final-charter-span.pdf?sfvrsn=8>

Committee Presenters

A critical aspect of the CERP is development and implementation through collaboration with committee members and the agencies, organizations, businesses, or other entities that they represent. Committee members were invited to share their work that is complementary to the actions being developed in the CERP, such as programs carried out by their organization that help address air quality issues in the community.

On July 31<sup>st</sup>, an informational workshop on Salton Sea and Pesticides was held to identify the roles of various public agencies dealing with the Salton Sea and pesticides. The workshop included presentations from CARB, Department of Pesticide Regulation, Imperial Irrigation District, Riverside County Agricultural Commissioner's Office and UC Riverside.

Committee members Dr. Ann Cheney, Adriana Chavez and Conchita Pozar provided information about ongoing studies related to the Salton Sea. Daniel Delgado represented committee member Ruben Arroyo

Chapter 2

from the Riverside County Department of Agriculture and Measurement (Agricultural Commissioner) Standards and described the role of the Agricultural Commissioner in implementing pesticide regulations.

Community Testimonials

On February 2019, South Coast AQMD, along with the California Air Resources Board (CARB) invited residents from the ECV community to learn about the AB 617 program. Community members were invited

**Figure 2-4: Community members are invited to share their personal air pollution concerns**

to share personal stories, outline their concerns with air pollution and describe how it has negatively impacted their lives and community. A video documentary, "Estamos Aquí" was presented by local filmmakers. These types of conversations from the community during CSC meetings have helped provide perspective and context to frame the discussions during the CSC meetings (Figure 2-4).

Community Meetings

In February 2019, a community meeting was held at the North Shore Community Center to provide an introduction to the AB 617 program. Since CARB designated the ECV community for the AB 617 program in December 2019, South Coast AQMD staff has hosted community meetings on a regular basis in the community or through virtual meetings. This included one kick-off meeting, a series of CSC meetings, community workshops, Q&A sessions, and Charter Working Group meetings.

Community Kick-Off Meeting

The Community Kick-Off Meeting in the ECV community was held on Wednesday, January 22, 2020 at the Coachella Library Conference Center (Figure 2-5). During this meeting, staff presented information about the AB 617 program and explained the critical role of the CSC in the development and implementation of the CERP and CAMP. During the kick-off meeting, community members were invited to fill out an interest form to express their interest in becoming a CSC member, and were then notified by mail or phone if they were selected to be a member or an alternate.

**Figure 2-5: Community kick-off meeting at the Coachella Library**

2-3 cont.

**Commented [RZ7]:** This meeting was organized by LCJA in which AQMD and CARB were invited to. It is important to acknowledge the work that residents and community organizations have done to bring AB 617 to the ECV.

**Deleted: i**

**Commented [RZ8]:** The filmmakers should be named as their contributions are highly recognized and important. They are also CSC members.

**Commented [RZ9]:** Same comments as above.

2-3 cont.

Chapter 2

CSC Meeting Schedule

The CSC meetings were held on an approximately monthly basis, and all meetings were intended to be held in various locations throughout the community. However, due to the COVID-19 pandemic and the resulting executive orders from the Governor<sup>3</sup>, only one in-person meeting was held in February, and the remaining CSC meetings were transitioned to a video conferencing format. Because of the additional work needed to manage this transition to virtual formats, two meetings (March and April) were postponed, but CSC meetings resumed in May using the Zoom videoconferencing platform (Figure 2-6). Each meeting was open to the public, and Spanish interpretation was available at the kick-off meeting and at every CSC meeting. A full list of the meetings and details are provided in Table 2-1 of Appendix 2.

In response to the CSC members’ requests for additional meetings to discuss the charter and to develop the CERP and CAMP, staff added several CSC meetings over the course of the year, for a total of 15 meetings for the ECV community.

Figure 2-6: Community Steering Committee meeting via Zoom

2-3 cont.

Meeting Facilitator

CSC meetings were facilitated by Jeanette Flores and Valerie Martinez of VMA Communications ([www.vmapr.com](http://www.vmapr.com)).

Social Media

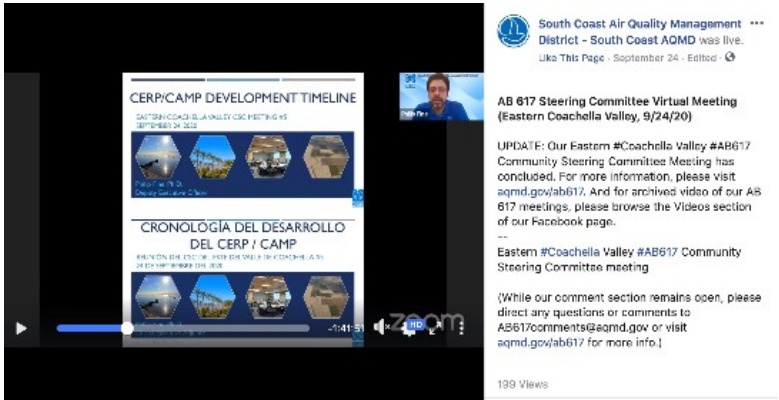

Staff received a suggestion from one committee member to live-stream meetings on social media in order to engage youth who use this technology and who may not be able to attend the meetings in person. All

<sup>3</sup> Governor Newsom issued Executive Order N-25-20 on March 12, 2020 and Executive Order N-29-20 on March 17, 2020.

Chapter 2

CSC meetings were subsequently live-streamed using Facebook Live (Figure 2-7). The links to the live-stream recording were also posted on the South Coast AQMD community webpage, so that members who could not attend or view the meeting live could view the recorded video of the meeting. All CSC meetings are publicized on Instagram (Figure 2-8), Twitter, and Facebook events, and are available in English and Spanish. Each video received more than 100 views.

Figure 2-7: Screen shot of Facebook Live recording of ECV CSC

2-3 cont.

Figure 2-8. Screen shot of Instagram post of ECV CSC

Community Webpage

A community webpage (Figure 2-9) was created for the ECV community. The webpage includes information about upcoming meetings, meeting materials (flyers, agendas, presentations, handouts, live stream links, and meeting summaries). Additionally, the ECV community page includes interactive maps, the CSC roster, and the CAMP and CERP documents. All flyers, agendas, social media posts, presentations, and handouts to the CSC were made available in English and Spanish. Webpage: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/eastern-coachella-valley>

Figure 2-9: Community webpage for the Eastern Coachella Valley community

2-3 cont.

The interactive maps on the webpage presented data about the community. Figure 2-10 is an example of an interactive map that was created for the ECV community. These interactive maps provide data on land use, locations of facilities, schools, hospitals, and daycare centers, and the air quality concerns identified by the CSC and members of the public. This information was provided to help inform air quality priorities for the CERP.

Figure 2-10: Interactive map showing land use in the ECV community

Community Bus Tour

A critical part of the CERP development and implementation is collaboration with committee members and the agencies, organizations, businesses, or other entities that they represent. In early 2020, a Community Bus Tour was being organized by some committee members in collaboration with South Coast AQMD staff. However, due to the Governor’s executive orders related to the COVID-19 pandemic, the community bus tour remains on hold until it is deemed safe to hold such an event.

Technical Advisory Group

In February 2019, the AB 617 Technical Advisory Group (TAG) was established to provide a forum to discuss technical details related to the development and implementation of the CAMPs and CERPs.<sup>4</sup>

In 2020, the TAG met twice to discuss technical details related to the CERP and CAMP development for the two 2019-designated communities (SELA and Eastern Coachella Valley). Topics discussed included monitoring equipment and laboratory capabilities, methodology and data sources for developing an air toxics emissions inventory at a community scale, methodology for forecasting emissions in future years, and methodology for modeling air toxics levels across geographical areas. All meetings were open to the public, webcast on the [www.aqmd.gov](http://www.aqmd.gov) webpage, and included an email option to send questions to be answered during the meeting.

Many of these technical considerations apply to all five AB 617 designated communities, thus the TAG includes up to 3 members from each CSC, and additional technical experts from academia, research institutes, and governmental agencies. The ECV CSC members who served as TAG members in 2020 are

<sup>4</sup> The webpage for the TAG: <http://www.aqmd.gov/nav/about/initiatives/environmental-justice/ab617-134/technical-advisory-group>

Chapter 2

Lilian Garcia and Ryan Sinclair. Additional information about the TAG and the 2020 TAG meeting schedule are provided in the Chapter 2 Appendix.

Additional Community Engagement

In addition to establishing the CSC and convening monthly meetings, South Coast AQMD staff participated in one-on-one or small group meetings with members, and attended meetings led by various community organizations. These meetings gave committee members an opportunity to communicate directly with staff. Additionally, these meetings give staff an opportunity to answer questions and clarify information requested from CSC members. Staff was able to gain a better understanding of the unique issues faced by each community by attending and participating in meetings led by community organizations.

Broader public engagement is also important to the AB 617 program. Every CSC meeting agenda includes an opportunity for committee members to suggest agenda items to co-create future agendas for upcoming meetings. Staff reviews comments after each CSC meeting, and responds as needed. (Figure 2-11).

Figure 2-11: Community members are invited to share community information on air pollution concerns

2-3 cont.

Throughout the development of the CERP, community liaisons and other staff met with community members, environmental justice organizations, industry, and other stakeholders to provide assistance and prompt response to concerns raised about the CSC process. Community liaisons also attended meetings from local organizations, environmental justice groups, city and county government to promote participation in the development and implementation of the CERP. Staff attended meetings hosted by other entities in this community to give presentations on AB 617 CERP development and had more than 35 in-person, phone, and meetings with committee members to discuss the CSC process and seek input on CERP actions. South Coast AQMD staff will continue to work with the CSC to implement the CERP actions and provide periodic community updates on implementing the plan. Community engagement is

Chapter 2

essential to the success of the CERP and the AB 617 program as a whole, and all parties are committed to building and improving upon existing outreach efforts.

**Figure 2-12: Small group air quality priority exercises with CSC members and South Coast AQMD staff**

2-3 cont.

## Chapter 3a: Community Profile

### Introduction

The community profile describes the characteristics of Eastern Coachella Valley (ECV) and the types of air pollution sources that impact the community. Understanding the characteristics of ECV and the air pollution sources affecting the community is crucial to addressing the air quality priorities outlined in Chapter 5. Additional community details (e.g., types of stationary sources and socioeconomic information) are available in Appendix 3a – Community Profile.

### Community Boundary and Air Quality Priorities

The AB 617 community of ECV stretches from the City of Indio south to the Riverside County portion of the Salton Sea; it includes the City of Indio, the City of Coachella, a small portion of the City of La Quinta (southern part of the city), and the unincorporated areas of Thermal, Mecca, Oasis and North Shore (Figure 3a-1). This community is located within Riverside County and within the Salton Sea Air Basin and shares its southern border with the Imperial County Air Pollution Control District.

Figure 3a-1: ECV Community Boundary

During the development of the Discussion Draft CERP, the ECV CSC discussed the geographic areas and neighborhoods to include in the ECV community boundary under the AB 617 program. The CSC members focused on the most populated areas that are most burdened by environmental impacts.

The ECV CSC established one distinct geographic boundary to represent this community for the purpose of the CERP (Figure 3a-1). The “community boundary” focuses on places in the community where residents live, work, attend school, and spend most of their time, and also includes nearby air pollution sources (e.g., facilities and major truck routes), normally included in the “emissions study area.”

Chapter 3a

A member of Comite Civico del Valle described the community in the following way during the self-nomination process for AB 617 consideration in 2019:

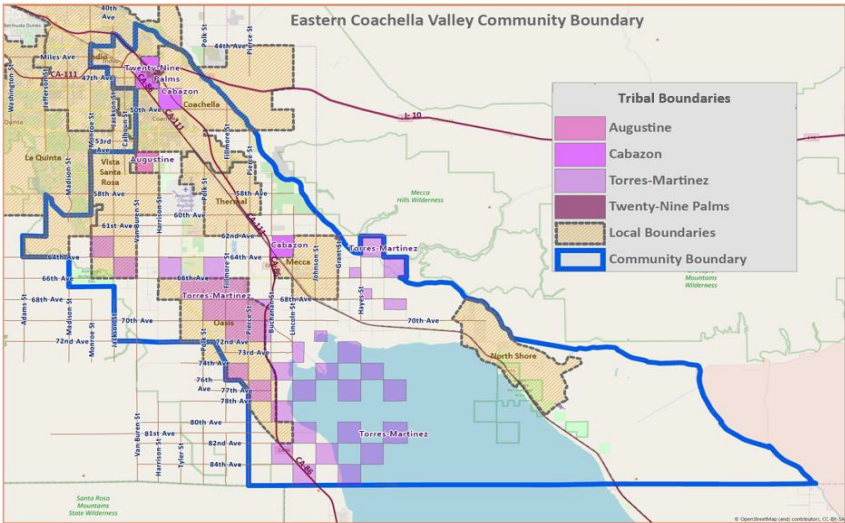

*“The Eastern Coachella Valley is subject to extreme heat, gusty winds, sandstorms, and reduced precipitations patterns that regularly occur in the region, increasing exposures to harmful dusts from fields, roads, and the receding shores of the Salton Sea. Its highly transited transport corridor connecting Los Angeles, Phoenix and Northern Mexico truck routes are among the largest contributors of regional air pollutions. Furthermore, ECV a heavily undeserved (sic: underserved) agricultural community lacks the most basic infrastructure and subjective to high levels of pollution burdens. Monitoring the air quality and developing emissions reductions program will give the community the opportunity to a better quality of life in the processtransforming the entire regions characteristic.”*

During the community selection process, it was widely recognized that the ECV has many unique air pollution issues (e.g., the Salton Sea, agricultural pollution, and particulate matter (PM10) in windblown dust) that are very different from those for the South Coast Air Basin. Local sources of air pollution in the ECV include fugitive dust from construction activities, vehicles on roadways (including unpaved roads), agricultural burning, and the increased exposure of the Salton Sea playa. Strong and sustained wind conditions transport particulates and contribute to high PM10 levels.

This is an area that includes several cities and rural communities within Riverside County. There are multiple sources of pollution in the region that are associated with agricultural activities, goods movement, industrial facilities and hazardous waste facilities. ECV is home to four Tribal Reservations (Figure 3a-2). These include the Twenty-Nine Palms Band of Mission Indians Tribe, the Cabazon Band of Mission Indians Tribe, the Torres-Martinez Desert Cahuilla Indians Tribe, and the Augustine Band of Cahuilla Indians Tribe. These Tribal reservations include off-reservation trust land areas recognized by the federal and state government. Another characteristic that makes this community unique is that it is highly impacted by the declining Salton Sea levels.

2-4 cont.

**Figure 3a-2: Eastern Coachella Valley Community Boundary with Local Boundaries and Tribal Reservation Boundaries**

Indio

The City of Indio is located in the northern most portion of the community boundary, northwest of Coachella and approximately 23 miles east of Palm Springs, CA.

Coachella

The City of Coachella is located southeast of Indio, and approximately 40 miles east of Palm Springs, California - east of Jackson Street, between Avenues 44 and Airport Boulevard with two main highways that intersect: Highway 111 and CA-86.

Thermal

Thermal is an unincorporated community located south of the City of Coachella. Its rough boundaries are Harrison Street and CA-86; Airport Boulevard and Avenue 66, about halfway between the City of Coachella and the Salton Sea. Some residents in this community are not connected to a public water or sewer system and rely on groundwater from wells for their water.

Oasis

Oasis is an unincorporated community located south of Thermal from Avenues 66 to 82 and between Harrison Street and CA-86. It also edges up to the northwestern part of the Salton Sea.

Mecca

Mecca is an unincorporated community located east of Thermal. Its boundaries are CA-86 and Johnson Street, and Avenues 64 and 66, about halfway between Thermal and the Salton Sea. Mecca is the most developed and clustered community out of the four unincorporated communities in the ECV. Mecca is surrounded by agricultural fields and is located right next to Grapefruit Boulevard (Highway 111) and about one mile from CA-86. This community also houses an industrial facility adjacent to housing projects named Greenleaf Desert View Power Plant. In addition, tribal lands near the Mecca community have been hotspots for illegal dumping from outside sources and produce odors to neighboring residents and passersby.

North Shore

North Shore is an unincorporated community located east of Oasis and southeast of Mecca edging up to the northeastern part of the Salton Sea. This community is about 20 miles from the City of Coachella and comprised of three different clusters of homes.

Community Characteristics

In the ECV, residents work primarily in agriculture, contributing to one of the most vital agricultural regions in both the state and country. Coachella Valley's agricultural industry is the second largest contributor to the local economy. ECV residents are also the backbone of the hospitality and tourism industries in the western Coachella Valley.

The ECV is an area where the population is increasing relatively quickly. Its location is of great importance due to the proximity to the California/Mexico Border, in which most immigrants tend to settle in search of year-round or seasonal work. Those communities within the ECV community boundary are home to underserved, low-income, immigrant communities of color, Tribes, and other indigenous populations, reflecting rich, vibrant and resilient cultures that have allowed cross-cultural interaction between community members. Parts of the east side of the community lack access to the most basic and fundamental services such as potable drinking water, sewer systems, reliable transportation, and other amenities that residents need daily.

2-4 cont.

Chapter 3a

After finalizing the community boundary, the CSC discussed their air quality concerns and identified a set of air quality priorities. The CSC built consensus to determine the top air quality priorities and the actions necessary to address them. The top air quality priorities for the ECV community are:

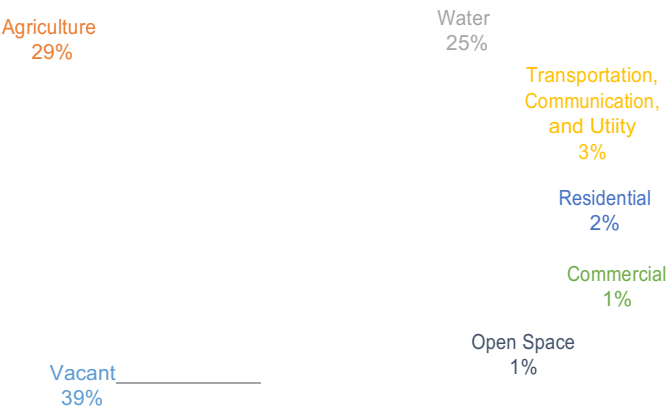

- Salton Sea
- Pesticides
- Open Burning and Illegal Dumping
- Fugitive Road Dust
- Diesel Mobile Sources
- Greenleaf Desert View Power Plant

The actions to address each air quality priority are described in Chapter 5.

Community Land Use Profile and Related Data

The ECV community is shown in Figure 3a-1. The community boundary includes a land area of approximately 288 square miles. About 2% of this land area is used for residential living, 1% is zoned for commercial uses, 1% is zoned for industrial uses, 3% is used for freeways, roadways, and utilities and communications services, 29% is used for agriculture which is land that is used primarily for the production of food, fiber, and livestock, 39% is used for vacant land which is land that had not been built-up with man-made structures, and 25% is water which includes open water bodies which are greater than 2.5 acres in size. (Figure 3a-3).<sup>i</sup>

Figure 3a-3: Land use profile in ECV

<sup>i</sup> Land use refers to how certain areas of land are classified for development and use. Land use data is often used for city or county planning, such as the placement of housing developments and transportation hubs. Land use data is derived from the 2016 Southern California Association of Governments (SCAG) Regional Transportation Plan/ Sustainable Communities Strategy, which is based on 2012 data.

Commented [RZ10]: This section should acknowledge the list of about 20 priorities that the CSC first compiled.

2-4 cont.

Chapter 3a

Appendix 3a presents data based on previous cumulative impact studies<sup>ii</sup> to describe the impacts of toxic air pollutants in this community, as well as other environmental pollution, public health factors, and social and economic factors that make people more sensitive or vulnerable to the health effects of pollution.<sup>1</sup> The Multiple Air Toxics Exposure Study IV (MATES IV) and CalEnviroScreen 3.0 are two tools used to evaluate the characteristics that describe this community. The South Coast AQMD conducts the MATES study, which used air toxics monitoring, emissions inventories, modeling, and health risk assessment techniques to calculate the cancer risk due to toxic air pollutants ("air toxics cancer risk"). CalEnviroScreen3.0 is a screening tool developed by the California Office of Environmental Health Hazard Assessment (OEHHA) that is used to identify communities that are most affected by various sources of pollution, and where people are especially vulnerable to the effects of pollution.

2-4 cont.

## Chapter 3b: Fugitive Emissions and Source Attribution

The Community Emissions Reduction Plan (CERP) identifies air quality priorities based on community input and from evaluating technical data on emission sources in the community. The CERP defines actions and strategies to reduce the emissions and exposure burden from sources of criteria air pollutants (CAPs) and toxic air contaminants (TACs). To accurately determine emission reductions from these actions and strategies, a baseline emissions profile needs to be established. Baseline emissions can be determined through an emissions inventory that includes accounting of sources and their emissions. Source attribution analysis is the accounting of sources, their emissions and their contribution to the cumulative exposure burden and is required to meet AB 617 statutory requirements. The baseline reference year is 2018.

There are many possible approaches to a source attribution analysis. Based on the data that were available for this community, this source attribution analysis emphasizes identifying sources within the community (emissions inventory) and an air quality modeling analysis to identify how much these different sources contribute to air pollution levels in the community. More information on source attribution methods is included in the Source Attribution Methodology report<sup>1</sup>. The most recent air quality modeling analysis was conducted as part of the Multiple Air Toxics Exposure Study (MATES IV) conducted in 2012 and 2013. MATES V is currently underway and will update cancer risk estimation for the Eastern Coachella Valley (ECV) as well as other parts of the South Coast AQMD jurisdiction. Previous special monitoring campaigns also identified sources of odors and hydrogen sulfide and analyzed the contribution of dust from the Salton Sea playa. More information on earlier analyses can be found in the community identification profiles<sup>2</sup>. The detailed methodology used to develop the emissions inventory is provided in the Source Attribution Methodology report<sup>3</sup>. A community-specific emissions inventory was developed

- Information about the sources of air pollution in this community is presented in a “source attribution” analysis
- Diesel particulate matter (DPM) is currently the main air toxic pollutant in this community, and it comes mostly from on-road and off-road mobile sources
- Other key air toxic pollutants in this community are cadmium and arsenic from construction and demolition, and 1,3-butadiene (from mobile sources and industry)
- In future years, diesel emissions will decrease substantially due to ongoing and newly proposed regulations, but these emissions continue to be the main driver of toxicity in this community

2-5

<sup>3</sup> Methodology for Source Attribution Analyses for the first year AB 617 Communities in the South Coast Air Basin (Technical Report), 2019. <http://www.aqmd.gov/docs/default-source/ab-617-ab-134/technical-advisory-group/source-attribution-methodology.pdf?sfvrsn=8>

Chapter 3b

for CAPs, including Nitrogen Oxides (NOx), volatile organic compounds (VOC), and fine particulate matter (PM 2.5), and TACs based on the most recent available datas.

The primary sources of air pollution emissions in the ECV community are on-road vehicles, farming equipment, trains, off-road equipment, and certain industrial activities. This community is also highly impacted by the declining Salton Sea levels, resulting in increasing dust emissions from the Salton Sea playa. Figure 3b-1 shows the primary source categories contributing to CAPs in the ECV community in 2018.

Below is a summary of the CAP emissions in 2018:

- NOx emissions in this community are dominated by mobile sources – both on-road and off-road – which account for more than 80% of the total emissions. Heavy-duty truck traffic, trains, and off-road equipment are the largest sources for NOx. Stationary sources contribute less than 10% of NOx emissions in this community, mostly from fuel combustion in the industrial sectors.
- VOC emissions are dominated by stationary sources, with consumer products being the largest source. Passenger vehicles and off-road equipment, such as lawn mowers and small gasoline engines, are the largest contributors to VOC from on-road and off-road mobile sources, respectively.
- PM2.5 emissions are largely from stationary source emissions, with construction and demolition being the most important source. Other sources include paved and unpaved road dust and farming operations. While paved road dust is also related to vehicles traveling on roads, it is considered as a stationary source rather than a mobile source.

It is important to note that the inventory does not account for some sources of particulate matters such as unpermitted or illegal burning of waste, wildfire emissions, windblown dust from dust storms, or dust blown from the Salton Sea playa. These sources affect air quality in specific events, but are challenging to quantify due to their inherent uncertainty. Although these emissions are not able to be quantified using available scientific methods, they are important sources of emissions that are being addressed in this CERP.

2-5 cont.

Deleted: may

Figure 3b-1: Primary source categories of NO<sub>x</sub>, VOC, and PM<sub>2.5</sub> emissions in the ECV community in 2018 (tons/year)

2-5 cont.

For TACs in the baseline year 2018, DPM is the main air toxic pollutant in this community, with on-road and off-road mobile sources as the predominant sources. The primary contributors of DPM are heavy-duty trucks, trains, farm equipment, and industrial off-road diesel equipment. Stationary sources contribute to the emissions of cadmium and arsenic from the construction and demolition sector, and to emissions of 1,3-butadiene from the chemical industry. Other significant TACs include benzene and formaldehyde from on-road mobile sources. Figure 3b-2 shows TACs in ECV by toxicity-weighted diesel-equivalent emissions in 2018. The emissions are weighted based on the cancer potency of each TAC relative to DPM. For example, cancer potency of arsenic is approximately 11 times higher than that of DPM per unit of mass. Thus, arsenic emissions are multiplied by 11 to estimate the toxicity-weighted emissions of arsenic. This weighting approach shows a comparison of the contribution of each TAC to overall toxicity using a consistent scale.

Chapter 3b

**Figure 3b-2: TAC emissions in the ECV community in 2018 (toxicity-weighted diesel-equivalent, lbs/year)**

2-5 cont.

As part of the source attribution analysis, emission trends are determined for two future milestone years. The future milestone years are 2025 and 2030. Future emission trends of CAPs and TACs in the ECV community are projected using the best available information on population growth, economic growth and emission adjustments reflecting the ongoing implementation of existing regulations that reduce specific air pollutants. Regulations reflected in these projections include South Coast AQMD and CARB regulations.

Figure 3b-3 shows the projected CAP emissions (NO<sub>x</sub>, VOC and PM<sub>2.5</sub>) in the ECV community in the two future milestone years 2025 and 2030, along with the baseline year 2018. Below is a summary of the CAP emissions between 2018 to 2030:

- NO<sub>x</sub> emissions in the community are expected to decrease substantially between the year 2018 through 2030, due to the existing regulations on mobile sources, despite the expected increase in industrial and mobile source activities.
- VOC emissions are expected to increase between 2018 and 2030, mostly due to increased consumer product use and industrial activities, including industries in degreasing, coatings, adhesives, and waste disposal.

## Chapter 3b

- PM2.5 emissions are also projected to increase between 2018 and 2030, due to increases in construction and demolition activities.

**Figure 3b-3: Emission trends in ECV for NOx, VOC, and PM2.5 (tons/year) for the years 2018, 2025 and 2030**

Trends for TAC emissions are shown in Figure 3b-4. DPM continues to dominate the TAC emissions inventory in future years, despite a significant reduction in DPM from heavy-duty trucks and off-road equipment. DPM emissions are projected to decrease by 67% between 2018 and 2030. Emissions of cadmium, arsenic, nickel and lead are projected to increase due to the increase in construction and demolition activities as well as paved road dust. Emissions of 1,3-butadiene are expected to increase due to an increase in industrial activity in the chemical sector and in off-road equipment emissions. Benzene and formaldehyde emissions are projected to decrease from 2018 to 2025 due to decreases in the emissions from vehicles, but they are expected to increase slightly through 2030 due to increasing emissions from industry and off-road equipment. Additional details on the source attribution for ECV can be found in Appendix 3b.

2-5 cont.

Figure 3b-4: Emission trends in ECV for TACs (toxicity-weighted diesel-equivalent, lbs/year) for the years 2018, 2025 and 2030

2-5 cont.

Chapter 5a: Introduction

Introduction

The Community Emissions Reduction Plan (CERP) and the Community Air Monitoring Plan (CAMP) provide an overall path to reducing air pollution in the ECV community. Through the development of the CERP and CAMP, the Community Steering Committee (CSC) identified air quality priorities based on sources of air pollution that are of concern to the community (e.g., Salton Sea, potentially toxic dust, open burning). To reduce air pollution from these sources, the CSC identified a set of actions for inclusion in the CERP to be implemented by government agencies, organizations, businesses and other entities.

The CSC identified the Salton Sea, pesticides, open burning and illegal dumping, fugitive road dust, diesel sources, and the Greenleaf Desert View Power Plant (formerly Colmac Energy, Inc.) as air quality priorities to address in the CERP and CAMP. These air pollution sources are often near homes, schools, and other community areas where the public can be exposed to harmful pollutants. Therefore, additional air monitoring in the community to inform emissions and exposure reduction measures is also important to the CSC.

Ongoing Efforts

The South Coast AQMD, the California Air Resources Board (CARB), United States Environmental Protection Agency (USEPA), and Tribal EPA has air quality regulations to reduce air pollution from sources such as trucks, diesel farm equipment, open burning, fugitive road dust and electricity-generating facilities such as the Greenleaf Desert View Power Plant. The relevant agencies also enforce these regulations. More information on enforcement efforts is available in Chapter 4.

Opportunities for Action

In addition to the ongoing efforts described above, the CSC, in collaboration with South Coast AQMD staff, identified 14 goals to reduce air pollution in the ECV community. The CERP defines how progress toward each goal is assessed by including specified metrics and timelines for each action. Additionally, the CERP identifies the entities responsible for implementing the actions. The actions define a path to reduce emissions and exposures in the ECV community. In some instances, the actions reaffirm ongoing rule development efforts and provide new commitments for localized reductions, sharing emissions data, new or accelerated timelines, and other related information.

Emission Reduction Targets

The actions in the CERP prioritize emissions reductions in the ECV community. The CERP includes emission reduction targets, where quantifiable, for oxides of nitrogen (NOx), diesel particulate matter (DPM) and fugitive particulate matter (PM10 and PM2.5). Table 5a-1 below, provides a list of the overall emission reduction targets for the CERP. Baseline emissions refer to expected future emissions without any new action or regulation beyond those already adopted. The CERP is expected to result in additional emission reductions that have yet to be quantified (e.g., actions focused on enforcement and outreach).

2-5 cont.

Chapter 5b: Salton Sea

Background

The Salton Sea is California's largest lake at approximately 25 miles long and up to 15 miles wide. The largest portion of the Salton Sea is in Imperial County while the northern portion is in the Eastern Coachella Valley (ECV) in Riverside County. In recent geologic history, lakes were formed on numerous occasions due to flooding of the Colorado River that filled this natural trough or sink, which is below sea level. The modern-day Salton Sea was formed in 1905 when the Colorado River breached an irrigation inlet and flowed unchecked into the area for 18 months. In the years after the breach, the Salton Sea has been fed largely by small rivers, creeks and drains that include agricultural runoff. The relatively shallow lake has no outlet and inflow does not keep pace with evaporation, causing the Salton Sea to gradually shrink. Salts are left behind when the water evaporates, leading to increasing salinity. The Salton Sea is currently over 50 percent saltier than the Pacific Ocean.

In 2003, multiple parties, including the State and three water districts in the region, entered into a series of agreements to address longstanding issues regarding usage of Colorado River water. These agreements are known collectively as the Quantification Settlement Agreement (QSA). The QSA includes an agreement to transfer water that was historically used to irrigate farm fields near the Sea to other Southern California water districts for residential use. To accommodate the QSA transfer, the Imperial Irrigation District (IID) has reduced its water use by increasing efficiencies and fallowing some fields. By reducing the amount of water available for agricultural uses in the Imperial Valley, these transfers have the effect of decreasing the amount of freshwater that runs off fields into the Sea. The State had required some mitigation inflow water to continue to be provided to the Salton Sea, but that requirement expired in December 2017. This has expedited the rate at which the Sea shrinks and becomes more saline. The Salton Sea is one of the most important links on the Pacific Flyway, supporting over 400 species of birds and a myriad of invertebrates, although deteriorating conditions may be detrimental to this habitat. As the Salton Sea continues to recede, an average of 4,800 acres of shoreline playa is estimated to be newly exposed each year. The increasing area of exposed playa is expected to increase windblown particulate matter and related health impacts.

Created in 1993, the Salton Sea Authority is a Joint Powers Authority (JPA) responsible for working in consultation and cooperation with the State of California to oversee the comprehensive restoration of the Salton Sea. Although the Salton Sea Authority and its partner agencies recognize the state and federal roles and responsibilities at the Salton Sea, the Salton Sea Authority is directed by board-adopted policy

## Chapter 5b

to assert a leadership role to ensure local priorities are recognized. The State has committed to mitigating the effects of the water transfers through a cooperative effort between State and federal agencies and IID to implement habitat and dust suppression projects. The California Natural Resources Agency (CNRA) Salton Sea Management Program (SSMP) was created to address the urgent public and ecological health issues resulting from the drying and shrinking of the Salton Sea. While the SSMP is a long-range program, its immediate focus is on the development and implementation of the 2018 SSMP Phase I: 10-Year Plan<sup>1</sup>, by providing planning, engineering, and environmental expertise for design and implementation of dust-suppression and habitat projects. The Phase I Plan includes projects that will be completed as early as the end of 2022.

### Community Concerns

CSC members expressed that dust emissions resulting from the receding Salton Sea is a major concern in the ECV community. As the Salton Sea evaporates, its receding shoreline exposes sediments deposited at the bottom of the Sea, also referred to as "playa." The loose soil is blown off by strong gusty winds, contributing to PM10 (inhalable particulate matter) emissions that could impact air quality. Projections suggest that windblown PM10 exposure from the playa is expected to increase over time in an area already impacted by high PM10 events from strong winds through the San Geronio Pass that blow along the Coachella Valley or from summertime thunderstorm outflows that transport dust from the desert areas to the south and east into the Coachella Valley. While the composition of the playa is variable, current data suggests that the soils are high in salt content and may contain constituents that could be toxic. CSC members expressed concerns that the playa may also contain components from agricultural runoff, possibly including remnants of fertilizers and pesticides. Previous studies have detected selenium, cadmium and nickel, which could pose a risk to human health, in sufficient amounts. CSC members have mentioned that they would like IID and the State of California to move more quickly to develop and implement dust suppression projects for the exposed Salton Sea playa, as well as increase air monitoring around the Sea, particularly in the northern region.

Elevated levels of hydrogen sulfide (H<sub>2</sub>S) occur from natural processes in the Salton Sea. While H<sub>2</sub>S, a gas that smells like rotten eggs, does not have a federal standard, there is a California State standard (30 parts-per-billion) that is exceeded numerous times each year near the shores of the Salton Sea. A few times each year, H<sub>2</sub>S odors are transported toward the northwest to inland areas of the Coachella Valley farther from the Salton Sea and, more rarely, through the San Geronio Pass into metropolitan Riverside and San Bernardino Counties. H<sub>2</sub>S odor events occur most frequently in the hot summer months but can occur whenever local breezes bring H<sub>2</sub>S from the Salton Sea into ECV communities. At levels above the State standard, most individuals can smell the odor and some may experience temporary symptoms such as headaches and nausea. Some individuals can smell H<sub>2</sub>S at very low concentrations, down to a few parts-per-billion. The long-term levels of H<sub>2</sub>S are unlikely to be above chronic Reference Exposure Levels, and therefore below thresholds where toxic impacts would be a concern. However, because odors can cause temporary health effects, and since H<sub>2</sub>S odors occur frequently in some areas of the ECV, this can lead to negative quality of life impacts. CSC members have expressed that they experience acute health effects (e.g., headaches and nosebleeds) during both windblown dust and Salton Sea H<sub>2</sub>S odor events. Because there continue to be concerns around the unknown or unquantified health impacts of the Salton Sea

2-6 cont.

Eastern Coachella Valley (ECV) – Discussion Draft CERP 5b-2 November 2020

Chapter 5b

emissions, this is an ongoing topic of research at several academic research institutions, including UC Riverside, Loma Linda University and others. The community members requested additional monitoring and improvements to notification systems to better understand emissions from the Salton Sea and reduce exposure in the community. Please see Appendix 5b for more details.

Actions to Address the Salton Sea

To address community concerns and reduce exposure from the Salton Sea in ECV, South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP). Tables 1, 2 and 3 below provide goals, actions, responsible entities, metrics, and a timeline to achieve the exposure reductions from the Salton Sea.

2-6 cont.

**Table 1 - Goal: Expand monitoring networks and improve notification systems**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Expand the existing South Coast AQMD's hydrogen sulfide (H<sub>2</sub>S) monitoring network in ECV to:</p> <ul style="list-style-type: none"> <li>Provide near real-time H<sub>2</sub>S data and inform community members about potential odors, including a notification system for when ambient levels exceed the State standard; continue H<sub>2</sub>S odor advisories for multi-day odor events</li> <li>Use the monitoring data to help assess the odor's origin, community impact and extent to which the odors may transport in the community and beyond</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>Monitors installed</li> <li>Data collected through air monitoring</li> <li>Updates provided to the CSC</li> </ul>	2 <sup>nd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>B</b>	<p>Identify opportunities to expand the South Coast AQMD's PM<sub>10</sub> monitoring network in the ECV to:</p> <ul style="list-style-type: none"> <li>Provide real-time PM<sub>10</sub> and wind data and inform community members of PM<sub>10</sub> levels in ECV, and if they exceed federal and/or State standards</li> <li>Gain a better understanding of dust emissions and assess methods to distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>Track the concentration trends of PM<sub>10</sub> over time to help determine the effectiveness of emissions reduction measures as highlighted in the CERP</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>Monitors installed</li> <li>Data collected through air monitoring</li> <li>Updates provided to the CSC</li> </ul>	2 <sup>nd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

2-7

Chapter 5b

C	<p>Establish baseline air monitoring to:</p> <ul style="list-style-type: none"> <li>Characterize the chemical composition of fugitive dust emissions from different sources to help distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea</li> <li>Analyze existing chemical speciation data and work with the CSC and CARB to determine which chemical species should be sampled. For example, this may include certain metals (such as selenium) and sea spray indicators</li> <li>Track the concentration trends of key indicator pollutants of Salton Sea emissions</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>Data collected through air monitoring</li> <li>Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
D	<p>Seek new opportunities to work with the CSC to create an air quality sensor network in the ECV community to:</p> <ul style="list-style-type: none"> <li>Provide real-time PM10 data</li> <li>Supplement the PM10 monitoring network in the ECV and cover a larger area in the community</li> <li>Co-locate air quality sensors with a reference PM10 monitor at one of South Coast AQMD's air monitoring station to verify the sensors performance prior to deployment and implement a data calibration and correction protocol to enhance sensor PM10 data quality after deployment</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>Air quality sensors deployed</li> <li>Data collected through air monitoring</li> <li>Updates provided to the CSC</li> </ul>	2 <sup>nd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
E	<p>Pursue a collaborative partnership with <u>UCR Scholl of Medicine and provide support</u> the ongoing study on soil chemical and microbiome composition of the Salton Sea playa dust samples, <u>and work with the project team to expand this study to include adult populations in the ECV.</u></p>	South Coast AQMD <u>UCR School of Medicine</u>	<ul style="list-style-type: none"> <li>Updates provided to the CSC</li> <li>Develop strategies list, if appropriate</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

Chapter 5c: Pesticides

Community Concerns

The ECV community is home to a large amount of agricultural activities, including the production of dates, grapes, citrus, and other crops. The CSC expressed concerns about the use and application of pesticides and the resulting agricultural run-off that may collect in the Salton Sea sediment. Concerns raised by the CSC include the unknown adverse health effects of pesticides, odors and potential toxicity resulting from possible exposure. CSC members expressed concerns regarding regulatory enforcement. They reported that pesticides are being applied during restricted hours and drift into homes

and schools near application sites, despite current regulations that are in place. The CSC also raised concerns about farmworker exposure to pesticides, often in excessive amounts and without proper personal protective equipment and training. CSC members expressed a need for a pesticide application notification system that informs the community before pesticides are applied, allowing residents to make informed decisions about avoiding outdoor activities that could increase their exposure (e.g., outdoor exercise). Please see Appendix 5c for more details.

Actions to Address Pesticides

South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP) to address community concerns about pesticide emissions and exposures. Tables 1 and 2 below provide a goal, action, responsible entity, applicable metrics, and an implementation timeline to achieve the emission and exposure reductions due to pesticide use and applications.

2-10

**Table 1 - Goal: Air Monitoring for Pesticides**

Chapter 5d: Fugitive Road Dust

Community Concerns

The ECV CSC expressed concerns regarding health effects from inhalable particulate matter (PM10) emitted from unpaved and paved roadways and from dust resuspended by off-road vehicles. Thus, they requested additional PM monitoring in the community. CSC members also mentioned that roadway paving projects implemented in the past have improved PM10 levels for residents in the immediate area, although dust impacts from the surrounding desert areas may continue to have an impact on their overall PM10 exposures.

Actions to Address Fugitive Road Dust

To address community concerns about emissions from fugitive road dust in ECV, South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP). Tables 1, 2, and 3 below provide goals, actions, metrics and a timeline to achieve the emission or exposure reductions for fugitive road dust.

**Commented [RZ15]:** This section is does not address the off-roading concerns raised by the CSC. There should be more strategies and actions added for this.

2-11

Chapter 5d

**Table 1 - Goal: Expand monitoring networks**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Identify opportunities to expand the current South Coast AQMD PM10 monitoring network in the ECV community to:</p> <ul style="list-style-type: none"> <li>• Provide near real-time PM10 and wind data and inform community members of PM10 levels in the ECV, and assess how levels compare to Federal and/or State ambient air quality standards</li> <li>• Track the concentration trends of PM10 levels overtime to help determine the effectiveness of emission reduction strategies</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Monitors installed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025
<b>B</b>	<p>Seek new opportunities and work with the CSC to create an air quality sensor network to:</p> <ul style="list-style-type: none"> <li>• Provide real-time PM10 data</li> <li>• Supplement the PM10 monitoring network in the ECV and cover a larger area in the community, prioritizing locations identified by the CSC, areas where the public spends a significant amount of time (e.g., schools and residential areas) and areas close to sources of fugitive dust</li> <li>• Co-locate air quality sensors with reference PM10 monitor at one of South Coast AQMD air monitoring stations to verify sensors performance prior to deployment and implement a data calibration and correction protocol to enhance sensor PM10 data quality after deployment</li> <li>• <u>Improve the resolution and regional reporting ability that the regulatory sensors currently have.</u></li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>• Air quality sensors deployed</li> <li>• Data collected through air monitoring</li> <li>• Updates provided to the CSC</li> </ul>	1 <sup>st</sup> quarter, 2021	4 <sup>th</sup> quarter, 2025

2-12

Formatted: Bulleted + Level: 1 + Aligned at: 0.32" +

## Chapter 5e: Open Burning and Illegal Dumping

### Community Concerns

The Eastern Coachella Valley (ECV) community has a significant amount of agricultural activity that produces grapes, dates, citrus and other crops. The burning of agricultural waste is a common method of disposal in the agricultural industry. Burning material is also a method to prevent crops from freezing. In many cases, open burning is done in a way that minimizes emissions, exposure and visible smoke. The Community Steering Community (CSC) expressed concern about the adverse health effects of air pollution from open burning including, smoke, particulate matter (PM) and potential pesticides burned. The CSC also identified concerns about air quality impacts from open burning near schools, childcare centers and homes.

Additionally, the CSC expressed concerns about open burning that is not permitted and uncontrolled (e.g., the 50-acre mulch fire in 2019 at a recycling center in Thermal that was near three local schools). The CSC also cited concerns about open burning on tribal lands, which falls outside of South Coast AQMD's jurisdiction (i.e., not subject to South Coast AQMD regulations).

The CSC also identified illegal dumping of waste materials as an air quality concern since the materials can subsequently catch fire and produce emissions. Among the open burning types, illegal dumping and burning activities are the most difficult to track and monitor trends.<sup>1</sup>

### Potential Alternatives to Burning

Health and Safety Code Sections 41801 and 41850 reaffirm that open burning for necessary purposes is allowed. However, the CSC has expressed an interest in exploring alternatives to burning. Potential alternatives may include composting or using heavy-duty equipment (e.g., chipper or grinder) to break material down into smaller pieces that can be disposed of through composting or recycling. There are also alternative methods for frost prevention that do not involve open burning. Composting is when organic waste decomposes naturally under oxygen-rich conditions. One of the actions to address open burning will be to explore the feasibility of other alternatives.

### Actions to Address Open Burning and Illegal Dumping

South Coast AQMD staff developed actions for the Community Emissions Reduction Plan (CERP) to address community concerns about open burning and illegal dumping emissions and exposures. Tables 1, 2, 3, and 4 below provide a goal, action, responsible entity, applicable metrics, and an implementation timeline to achieve the emission and exposure reductions due to open burning and illegal dumping.

<sup>1</sup> Illegal dumping does not have air quality impacts and therefore, South Coast AQMD does not have jurisdiction over illegal dumping. Air quality impacts occur when illegally dumped trash is burned; however, these impacts are difficult to monitor and track because they are not permitted.

2-15

Commented [RZ19]: And dangers to farmworkers.

Commented [RZ20]: These same fires at this location had been occurring for over 20 years. On several occasions, the fires spread to the mobile home park next to this site putting families in danger and at risk of losing their homes. Fire departments were not helpful, and residents would find themselves putting out the fire on their own, including the mobile home park owners.

Chapter 5e

**Table 1 – Goal: Improve Monitoring Network**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
<b>A</b>	<p>Work with the CSC to establish an air quality sensor network to:</p> <ul style="list-style-type: none"> <li>Gain a better understanding of the PM2.5 levels in various community areas that may be impacted by legal and illegal burning occurring in the community</li> <li>Identify air pollution hotspots and gather more information to help identify potential source(s) of emissions</li> <li>Improve public information on PM2.5 levels in the community (e.g., better characterize the spatial and temporal variability of PM2.5 in the community)</li> <li>Gather information to help identify illegal burning emissions and conduct follow-up investigations, as needed</li> </ul>	South Coast AQMD	<ul style="list-style-type: none"> <li>Air quality sensors deployed</li> <li>Updates provided to the CSC</li> <li>Follow-up investigations, as needed</li> </ul>	3 <sup>rd</sup> quarter, 2021	1 <sup>st</sup> quarter, 2026
<b>B</b>	<p>Provide information to the community on how a sensor-network can help identify pollution hotspots and emissions from illegal burning. Specific locations for sensor deployment will be selected after gathering input from CSC and community members and accounting for long-term availability of potential sites. Input from the CSC and community members regarding specific and/or illegal burning events in ECV will also be taken into account in the development of the sensor network and the selection of specific monitoring sites</p>	South Coast AQMD	<ul style="list-style-type: none"> <li>Updates provided to the CSC</li> </ul>	3 <sup>rd</sup> quarter, 2021	4 <sup>th</sup> quarter, 2022

## Chapter 5f: Diesel Mobile Sources

### Community Concerns

The Eastern Coachella Valley (ECV) CSC expressed concerns about diesel emissions from mobile sources in the ECV community. CSC members raised concerns about heavy-duty trucks traveling along the State highways 111 and 86, school buses and heavy-duty agricultural equipment (e.g., tractors and harvesting equipment). CSC members mentioned that trucks and school buses often transit in residential areas and near sensitive receptors. CSC members also cited concerns about trucks idling around the Mecca area within ECV.

Commented [RZ21]: Including the freight train, the thermal racetrack, and the thermal airport.

2-18

### Actions to Address Diesel Mobile Sources

To address community concerns and reduce emissions from diesel mobile sources, South Coast AQMD developed actions for the Community Emissions Reduction Plan (CERP). Table 1 below provides goals, actions, responsible entities, metrics, and a timeline to achieve emission reductions from diesel mobile sources.

Chapter 5f

**Table 1 - Goal: Reduce Emissions from Diesel Mobile Sources**

	Action	Responsible Entity	Metric	Timeline	
				Start	Complete
A	Work with the CSC to:				
	<ul style="list-style-type: none"> <li>Identify air quality concerns related to trucks, quantify emissions from trucks (e.g., baseline, projected), and provide informational workshop on trucks (e.g., summary of regulations and compliance information)</li> <li>Prioritize actions to address the community's main concerns around diesel mobile source pollution. For example, actions may include: <ul style="list-style-type: none"> <li>Create an air quality sensor network for measurements of PM2.5 and NO2 supported by black carbon measurements (where possible and for limited duration) to better understand the impact of diesel emissions in the community</li> <li>Collaborating with CARB to identify opportunities for focused enforcement and additional regulatory measures, if needed</li> <li>Identifying opportunities to collaborate with local land use and transportation agencies to restrict heavy-duty trucks from transiting near sensitive land uses (e.g., schools and residences)</li> <li>Collaborating with CARB to conduct outreach on how to report idling trucks</li> </ul> </li> </ul>	South Coast AQMD, CARB	TBD	1 <sup>st</sup> Quarter 2022	1 <sup>st</sup> Quarter 2026
	Identify opportunities to incentivize the replacement of older, higher polluting on-road (e.g., trucks) and off-road (e.g., tractors, agricultural equipment) equipment with cleaner technology	South Coast AQMD, CARB	TBD (e.g., number of projects incentivized)	1 <sup>st</sup> Quarter 2021	1 <sup>st</sup> Quarter 2026
	Identify funding opportunities to replace older diesel school buses with zero or near-zero emission school buses in ECV in all relevant school districts.	South Coast AQMD, CARB	TBD (e.g., number of projects incentivized)	1 <sup>st</sup> Quarter 2021	1 <sup>st</sup> Quarter 2026
B	<u>The City of Indio, City of Coachella, County of Riverside, and South Coast AQMD will apply as co-applicants to state funding sources to mitigate pollution and climate impacts within the AB 617 boundary and improve livability, such as but not limited to: GGRF, EPIC, RTP/SCS implementation, EEM, Urban</u>	<u>City of Indio, City of Coachella, Riverside County, South Coast AQMD,</u>		<u>2<sup>nd</sup> quarter 2021</u>	

**Commented [RZ22]:** This section should also address the freight train emissions, the thermal racetrack club, and the thermal airport. This section is incomplete without addressing these pollution sources. All of these were mentioned in our very first CSC meeting as well.

**Commented [RZ23]:** The plan should already include these.

2-19

**Commented [RZ24]:** AQMD should also outline how it plans to use existing funds and incentives for this action. These funds should already be identified and South Coast AQMD has internal funding for this already.

**Formatted:** Superscript

<u>Greening, LCT, ATP, LCTOP, AHSC, TCC, Climate Change Research, Woodsmoke Reduction, Low-income Weatherization, Wildfire Reponse and Readiness, Waste Diversion, Training and workforce development, Healthy Soils, Renewable Energy for Agriculture, Food production investment and the others as project leads of the seam program. The agencies involved will pursue funding from these multiple programs as an additional funding source to implement the ECV CERP. State budgeted CAPP funding should be reserved for projects and programs that cannot be funded through other means, or when as a match when required. CAPP funding may also be utilized to leverage significant state and federal funding if required.</u>	<u>Other relevant agencies: Sunline, RCTC, CVHC, CVAG, SCAG.</u>			
<u>Implement vegetative barriers around the railroad that passes through communities in the ECV.</u>	<u>City of Indio City of Coachella Riverside County South Coast AQMD</u>			
<u>Review models produced by South Coast AQMD in a 2019 TAG meeting about I-10 traffic and potential PM 2.5 from diesel traffic in the AB 617 project area.</u>	<u>South Coast AQMD</u>			

2-19 cont.

## Chapter 5g: Greenleaf Desert View Power Plant

### Community Concerns

Greenleaf Desert View Power Plant is a biomass electrical generation facility located on the Cabazon Band of Mission Indians Reservation at 62300 Gene Welmas Dr, Mecca, CA 92254. It has been in operation since 1992, first as Colmac Energy, Inc. and then in 2011, the power plant was purchased by Greenleaf Power. Biomass (e.g., urban wood waste, orchard removal trees) is used at this facility as a fuel to help generate electricity. This facility operates as a steam-electric power plant<sup>1</sup>. Typically, these power plants operate by burning fuel in a furnace to generate heat that is used in a boiler to produce steam. The steam flows into the turbine and spins the blades inside a turbine, which is connected to a generator to create electricity.

Since this facility is located on tribal land, it is regulated by Region 9 of the United States Environmental Protection Agency (USEPA).<sup>2</sup> The ECV CSC expressed concern about visible emissions and smoke from the facility and the limited information about the facility that is available to the community.

### Actions to Address the Greenleaf Desert View Power Plant

To address community concerns and reduce emissions from the Greenleaf Desert View Power Plant, South Coast AQMD developed actions for the Community Emissions Reduction Plan (CERP). Table 1 below provides goals, actions, responsible entities, metrics, and a timeline to achieve emission reductions from the Greenleaf Desert View Power Plant.

<sup>1</sup> Greenleaf Power, LLC, Desert View, <http://www.greenleaf-power.com/facilities/desert-view-power.html>, Accessed October 25, 2020.

<sup>2</sup> USEPA, Title V Permit to Operate, <https://www.regulations.gov/contentStreamer?documentId=EPA-R09-OAR-2020-0266-0001&contentType=pdf>, Accessed October 25, 2020.

November 2020

## Chapter 6

## Chapter 6: Community Air Monitoring Plan (CAMP) Summary

The Community Air Monitoring Plan (CAMP) for the Eastern Coachella Valley (ECV) community has been developed through close collaboration between the Community Steering Committee (CSC) and South Coast AQMD staff. It outlines the objectives and strategies for monitoring air pollution in ECV based on the air quality priorities identified by the CSC. Air monitoring will play an important role in improving our understanding of air pollution in ECV, will help support the emissions and exposure reduction strategies developed in the Community Emissions Reduction Plan (CERP), and will track the progress of the CERP actions in this community. Specific air monitoring strategies are included in the actions described in Chapter 5 of the CERP: Chapters 5b Salton Sea, 5c Pesticides, 5d Fugitive Road Dust, 5e Open Burning and Illegal Dumping, 5f Diesel Mobile Sources, and 5g Greenleaf Desert View Power Plant. Overall, while the CERP and CAMP are separate documents, they work together to help achieve and track emissions and exposure reductions designed to improve local air quality in ECV.

Air monitoring provides information that can help address specific questions about pollutant concentrations in the community. To achieve the community-specific air monitoring objectives described in the CERP and CAMP, it is critical to develop a sound air monitoring approach and use appropriate monitoring methods and equipment specific for each purpose. The general monitoring approach in ECV consists of expanding the existing air monitoring network and deploying additional air monitoring equipment, including regulatory monitors and air quality sensors, to enhance the overall geographical coverage of measurements. Most of the air quality priorities in ECV, such as dust emissions from the Salton Sea and surrounding deserts and fugitive road dust, and smoke from open burning, are intermittent in nature and impact relatively large areas. Therefore, air monitoring at fixed locations provides an opportunity to capture both long-term and short-term trends, identify periods when these sources impact the community, and help pinpoint the most critical locations of concern.

A detailed description of air pollutants to be measured and types of monitoring methods and technologies to be deployed in ECV is provided below and in the CAMP. Overall, community air monitoring will implement the recommendations provided in CARB's "Community Air Protection Blueprint"<sup>i</sup>, support the implementation of the CERP, and track the progress towards improved air quality in the ECV community.

**Commented [RZ26]:** The CSC has not had any significant time to discuss the development of the CAMP. Given the lack of statutory deadline for this plan, it was not prioritized by South Coast AQMD. The CAMP is not being provided to the CSC until after the comment deadline for Nov. 13<sup>th</sup>.

2-21

## Chapter 6

## Air Quality Priorities in the Eastern Coachella Valley Community

Each community has unique air quality challenges, and local community members have first-hand knowledge of important information, including emission sources and sensitive receptor locations. In order to ensure a collaborative process in developing and implementing a successful CERP and CAMP, it is critical to understand the specific air quality concerns in ECV. The CSC meetings provided a forum for identifying community-specific air quality priorities and potential contributing sources of air pollution to develop consensus and a shared understanding of specific air pollution challenges. In addition to actively collaborating with the CSC, the South Coast AQMD engages in a robust public process to provide additional opportunities for broad engagement both during CAMP development and throughout its implementation. This is achieved through periodic community meetings, workshops, South Coast AQMD Committee meetings and Governing Board meetings. Input and feedback provided by the CSC and the public will continue to be incorporated to improve and update the monitoring strategies throughout the implementation of this CAMP.

South Coast AQMD staff gathered information on the main CSC air quality concerns through a series of community meetings. As a result, the following categories have been selected as the highest air quality priorities: Salton Sea, Pesticides, Open Burning and Illegal Dumping, Fugitive Road Dust, Diesel Mobile Sources, and Greenleaf Desert View Power Plant (formerly Colmac Energy, Inc.). A detailed description on each of these categories is provided in the following sections.

### Salton Sea

The Salton Sea is the largest lake in California and, as its shorelines continue to recede and expose the sediments deposited at the bottom of the Sea (also referred to as the “playa”), emissions from the Salton Sea contribute to poor air quality for ECV residents. The CSC has expressed their concerns about the Salton Sea, mainly with respect to odors caused by emissions of hydrogen sulfide (H<sub>2</sub>S) and inhalable dust / particulate matter (PM<sub>10</sub>; particles with diameters of 10 microns or smaller). Elevated levels of H<sub>2</sub>S result from natural processes in the Salton Sea; these can lead to strong foul odors that negatively affects the quality of life of local residents and at high levels can cause acute health effects (e.g., headaches and nosebleeds). Dust emissions from the Salton Sea occur when the playa sediments get blown off by strong gusty winds and contribute to PM<sub>10</sub> emissions in the area, further deteriorating air quality. The CSC is also concerned that the soil from the playa may contain residuals of pesticides and other pollutants from agricultural runoff (toxic elements and metals, such as selenium (Se), cadmium (Cd), and nickel (Ni)), which can pose a risk to human health. Moreover, the CSC has conveyed that additional monitoring and improvements to notification systems are needed to better understand emissions from the Salton Sea.

The main monitoring strategy to address CSC concerns regarding H<sub>2</sub>S emissions from the Salton Sea includes enhancement of the existing H<sub>2</sub>S monitoring network in ECV to expand its geographical coverage, provide real-time H<sub>2</sub>S data at more locations, and inform the community members about the odors they smell and where they come from, including a notification system for when ambient levels exceed the State standard. Currently, H<sub>2</sub>S monitoring is being conducted at two fixed-site monitoring stations within the ECV community boundary; at the Mecca and Salton Sea Near-Shore air monitoring stations. A notification system for H<sub>2</sub>S exceedances at these sites is available through “The Salton Sea Hydrogen Sulfide Monitoring” website<sup>ii</sup>. As part of this monitoring strategy, South Coast AQMD staff will work with the CSC

<sup>ii</sup> <https://saltonseaodor.org/>

2-21 cont.

Chapter 6

to identify opportunities to expand its air monitoring network. Continuous wind speed and wind direction data will also be collected to help better identify the location(s) of the odors. The expansion of the H<sub>2</sub>S monitoring network will lead to covering a larger part of the ECV community and will help assess community impact and the extent to which the odors may be transported in the community and beyond.

Currently, PM<sub>10</sub> monitoring is being conducted at six fixed monitoring stations within the ECV community boundary. Two of these sites (Mecca and Indio) are operated by the South Coast AQMD. One of these stations, 29 Palms, has been established by a partnership between Twenty-Nine Palms Band of Mission Indians and the Cabazon Band of Mission Indians in the ECV community through an AB 617 Community Air Grant awarded by CARB to the tribes.<sup>iii</sup> One monitoring station has been established by Torres-Martinez Desert Cahuilla Indians. The Salton Sea Park and Salton Sea Near-Shore monitoring stations are operated by the Imperial Irrigation District. The location of these stations is shown in figure 6-1 and the pollutants monitored at each site are presented in Table 6-1.

## Chapter 6

Table 6-1- Pollutants monitored at each station in the ECV community

Station Name	Site Location	Agency	Monitored Pollutants
Indio	46990 Jackson Street Indio, CA 92201	South Coast AQMD	Ozone, PM2.5, PM10
Mecca (Saul-Martinez Elementary School)	65705 Johnson Street Mecca, CA 92254	South Coast AQMD	H <sub>2</sub> S, PM10
Torres-Martinez Tribal	66-725 Martinez Road, Thermal, CA 92274	Torres-Martinez Cahuilla Indians	PM10
Salton Sea Near Shore	Lincoln Ave. & 73rd Ave., Mecca CA 92254	Imperial Irrigation District	H <sub>2</sub> S*, PM2.5, PM10
Salton Sea Park	100-225 State Park Rd., North Shore CA 92254	Imperial Irrigation District	PM2.5, PM10
29 Palms	33.719724, -116.189578	Twenty-Nine Palms Band of Mission Indians	PM2.5, PM10

\* H<sub>2</sub>S monitor is operated by the South Coast AQMD

As part of our efforts to better characterize PM10 emissions from the Salton Sea, South Coast AQMD staff will work with the CSC to identify opportunities to expand the PM10 monitoring network in ECV to provide additional air quality information in residential areas that do not currently have such measurement data. This, together with continuous wind speed and wind direction data, will help gain a better understanding of dust emissions and distinguish between windblown dust from desert areas and playa dust emissions from the Salton Sea. It can also help track the concentration trends of PM10 over the course of the AB 617 program to help assess the effectiveness of dust suppression projects. Data from this monitoring network will be provided in near real-time to inform community members of PM10 levels in ECV, and if emissions Federal and/or State standards.

The above-mentioned monitoring network will be supplemented by a network of PM10 sensors to enhance the spatial coverage of PM10 measurements at more locations of interest. Data from these sensors will provide real-time information and improve our understanding of the variations in PM10 levels across the ECV community. This will help identify the source(s) of PM10 emissions and their origin (e.g., fugitive road dust and wind-blown desert dust). Air quality sensors will be co-located with a reference PM10 monitor at one of the South Coast AQMD air monitoring stations to verify sensor performance prior to deployment. A data calibration and correction protocol has been developed to systematically enhance the data quality of the PM10 sensors after deployment. The sensor deployment process will be carried out in close collaboration with the South Coast AQMD Air Quality Sensor Performance Evaluation Center (AQ-SPEC). AQ-SPEC is the most comprehensive sensor evaluation program in the United States that provides community residents, scientists and other sensor users with unbiased information on sensor performance based on rigorous field and laboratory testing<sup>iv</sup>.

These measurements will be accompanied by baseline monitoring to better characterize the chemical composition of dust in the ECV community. Chemical composition data will be beneficial in characterizing

<sup>iv</sup> Air Quality Sensor Performance Evaluation Center (AQ-SPEC): <http://www.aqmd.gov/aq-spec>

2-21 cont.

## Chapter 6

the relative contributions of playa dust emissions and dust from other sources (e.g., fugitive road dust and wind-blown desert dust) to the ambient concentrations of PM<sub>10</sub> measured in ECV. Baseline measurements will also help track the trends of key indicator pollutants of Salton Sea emissions and address specific CSC concerns about the chemical composition and potential toxicity of playa dust emissions.

Lastly, South Coast AQMD staff will pursue a collaborative partnership with other organizations (e.g., University of California – Riverside) to support the ongoing study of soil chemical and microbiome composition of the Salton Sea playa dust samples.

### Pesticides

Pesticides are unique among air toxic substances because they are produced specifically for their toxicity to a target pest and purposely introduced into the environment. Pesticides play a major role in agricultural production all around the world to help protect crops from pests. Farming operations in the ECV commonly use pesticides on agricultural land. Pesticide regulations do not only focus on assessing their toxicity and potentially banning pesticides but also on protecting people by reducing the risk of harmful exposure.

The CSC expressed their concerns about the health impacts of pesticides used in agriculture, including exposure to farm workers, in residential areas (e.g., odor nuisance and pesticide exposure from wind drift or runoff), and in schools that are close to application sites. The CSC also emphasized their apprehension regarding the lack of information on the actual amount of pesticides being used in ECV, and the dates when pesticides are being applied. This information is critical for the public when planning to participate in outdoor activities.

Federal, State, and local regulatory agencies are responsible for ensuring safe use of pesticides in California. At the Federal level, the U.S. Environmental Protection Agency (EPA) approves the use of each pesticide. At the State level, the California Department of Pesticide Regulation (DPR) has legal authority to regulate and enforce rules that address the sale and use of pesticides in California. In addition, DPR monitors the levels of pesticides in the air, water and produce. The information regarding pesticides usage and the measured levels is reported periodically on DPR's public website<sup>v</sup>.

South Coast AQMD staff will pursue collaboration with DPR, California Air Resources Board (CARB) and Riverside County Agricultural Commissioner (CAC) to assess currently available pesticide data and develop a monitoring strategy for studying and characterizing this air quality priority.

For the evaluation of pesticide data, South Coast AQMD staff will collaborate with DPR, CARB, and other agencies that currently have information for identifying the potential impact of pesticides on the community. This analysis will be based on currently available data, such as annual pesticide usage, pesticide toxicity and volatility, season and method of application. This screening evaluation will identify the pesticides that are most impactful in this community and will provide information for focusing subsequent air monitoring efforts. South Coast AQMD staff will also reach out to the CSC, members of the public and local growers to gather feedback on the collected data and any other information that may help inform the pesticide monitoring efforts.

<sup>v</sup> <https://www.cdpr.ca.gov/docs/pur/purmain.htm>

2-21 cont.

## Chapter 6

South Coast AQMD staff will present the results of the data evaluation to the CSC and community members. Following this screening process, staff will work with the CSC to select the most relevant pesticides in the community and identify representative locations and periods for monitoring pesticides levels. South Coast AQMD staff will consult with DPR and CARB to evaluate which sampling and analysis techniques will be used, as appropriate. Air monitoring will be conducted to determine if specific pesticides are present and at what levels. If elevated levels of pesticides are found in ambient air, South Coast AQMD staff will work with DPR, CARB and the Riverside CAC to identify potential exposure reduction measures and/or to develop new use restrictions or regulations to be enforced by the Riverside CAC. The screening analysis and the outcome results from this monitoring plan will lay the foundation for future assessments of the impact of pesticides on the ECV community and the effectiveness of regulations.

#### Open Burning and Illegal Dumping

The ECV community has a large agricultural industry, including the production of grapes, dates, citrus and other crops. With such a large agricultural industry in the area, the burning of agricultural waste is a common method of disposal. In some cases, burning may occur to prevent crops from freezing. The CSC also identified illegal dumping of various waste materials, which can subsequently catch fire, as an air quality priority. The open burning can cause smoke, impacting schools, childcare centers and homes.

The main strategy to characterize emissions from open burning in this community will center around the deployment of a network of air quality sensors to measure PM<sub>2.5</sub>. Due to the sporadic nature of open burning, fixed monitors are necessary to capture the spatial and temporal variability of emissions. Fixed monitoring using air quality sensors will provide real-time air quality data to gain a better understanding of the locations, frequency, and magnitude of PM emissions from open burning, help identify the locations impacted by the smoke, and improve overall public information on PM<sub>2.5</sub> levels in the community.

South Coast AQMD staff will work with the CSC to effectively deploy these sensors at appropriate locations. South Coast AQMD staff will also pursue opportunities to augment one of the existing and/or new monitoring stations with a black carbon monitor to better characterize emissions. Black carbon is a by-product of biomass burning but can also be emitted from diesel mobile sources.

#### Fugitive Road Dust

The CSC identified emissions from fugitive road dust as an air quality priority in ECV. Fugitive road dust in this community is generated when vehicles travelling on paved and unpaved roads kick up loose solid materials deposited on the surface and make them airborne. The CSC has expressed concerns about dust emitted from unpaved roadways when there are windy conditions or when off-road vehicles drive on these roads. Community residents are also concerned about the potential health effects associated with exposure to high PM<sub>10</sub> levels resulting from fugitive road dust emissions.

Currently, six air monitoring stations in the ECV community (Table 6-1) measure PM<sub>10</sub>. The Indio and Mecca air monitoring stations are operated by the South Coast AQMD, while the rest of the stations are operated by other agencies.

The monitoring strategy for fugitive road dust includes expanding the current South Coast AQMD PM<sub>10</sub> monitoring network in ECV, which will provide near real-time PM<sub>10</sub> and wind data to inform community members about PM<sub>10</sub> levels and if they exceed Federal and/or State standards. These measurements will help track the concentration trends of PM<sub>10</sub> levels over time to help determine the effectiveness of emission reduction strategies.

2-21 cont.

## Chapter 6

South Coast AQMD staff will seek new opportunities and work with the CSC to create an air quality sensor network to augment the fixed monitoring network for PM<sub>10</sub> measurements to cover a larger area in the community, prioritizing areas where the public spends a significant amount of time (e.g. schools and residential areas) and areas close to sources of fugitive dust. Data from these sensors will provide near real-time data and improve our understanding of the spatial and temporal variability in PM<sub>10</sub> levels across ECV. This information will help better distinguish where the PM<sub>10</sub> emissions are coming from (e.g. dust emissions from the Salton Sea or wind-blown dust from surrounding deserts). Air quality sensors will also provide more opportunities for community engagement in different aspects of the air monitoring process. All sensors will be co-located at one of the air monitoring stations with reference PM<sub>10</sub> monitors to check their performance prior to deployment. It should be noted that the sensors for PM<sub>10</sub> measurements usually show a good performance at the lower concentration levels while their uncertainty increases significantly during regional dust events with high PM<sub>10</sub> levels. A systematic data calibration and correction protocol has been developed and will be implemented to improve data quality for the entire sensor network. During dust events, which have regional impacts, the reference monitors can help determine the community impact.

#### Diesel Mobile Sources

The CSC has expressed concerns about exposure to diesel emissions from several mobile sources and locations in the ECV community including heavy-duty trucks traveling along the State highways 111 and 86, school buses, and heavy-duty agricultural equipment (e.g., tractors and harvesting equipment). Diesel truck emissions are complex and are comprised of a variety of toxic gases and particles. Pollutants associated with diesel exhaust include PM<sub>2.5</sub>, and nitrogen dioxide (NO<sub>2</sub>). Diesel exhaust also contains the toxic air contaminant diesel particulate matter (DPM), which is a component PM<sub>2.5</sub>. DPM cannot be monitored directly but is estimated by measuring black carbon (BC or “soot”).

Two existing air monitoring stations (Indio station operated by the South Coast AQMD and 29 Palms monitoring station operated by Twenty-Nine Palms Band of Mission Indians) measure PM<sub>2.5</sub> within the community (Figure 6-1 and Table 6-1). The proposed monitoring strategy to address this priority consists of creating a sensor network that can measure PM<sub>2.5</sub> and NO<sub>2</sub>. South Coast AQMD staff will work with the CSC to effectively deploy these sensors at appropriate locations. This additional data will help quantify emissions from truck traffic to better understand the impact of diesel emissions in the community and to help track the effectiveness of emission reduction strategies outlined in the CERP. South Coast AQMD will also pursue opportunities to augment one of the existing or new monitoring stations with a stationary BC monitor. If necessary, short-term BC monitoring will be conducted at locations where sensor data indicate relatively high diesel emissions.

#### Greenleaf Desert View Power Plant

The CSC expressed concerns regarding the Greenleaf Power Desert View Power Plant (formerly Colmac Energy, Inc.), because of visible emissions and smoke from the facility. This facility is a biomass electrical generation facility that has been operating since 1992 and is located on the Cabazon Band of Mission Indians Reservation at 62300 Gene Welmas Dr, Mecca, CA 92254. This plant is subject to U.S. EPA regulations and uses emission control devices and measures to reduce nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>x</sub>) and PM emissions.

To address CSC concerns, South Coast AQMD staff will evaluate currently available combustion-related emissions data to help assess how emissions from the Greenleaf power plant contribute to the overall

2-21 cont.

## Chapter 6

pollution burden in ECV. Based on these findings and if additional monitoring is necessary, South Coast AQMD staff will implement an appropriate monitoring strategy that focuses on measuring relevant pollutants near the facility and close to sensitive receptors (e.g., schools).

This power plant is operating all year round and, therefore, a monitoring strategy based on fixed monitoring will be adopted. Fixed monitoring allows for a more comprehensive characterization of air pollution trends over an extended period of time, although it only provides air quality information when the monitoring locations are downwind of the source. Currently, South Coast AQMD operates one fixed monitoring site (Mecca air monitoring station) near the Greenleaf power plant; this site is located within the perimeter of Saul Martinez elementary school and approximately one mile southeast to the power plant. An analysis of the wind direction gathered during the last three years shows that the air monitoring station in Mecca was downwind of the power plant more than 50% of the time and, hence, this is a suitable site for exploring the impact of Greenleaf emissions on the surrounding community.

Since the general monitoring approach for ECV relies on creating an air quality sensor network, South Coast AQMD will work with the CSC to identify strategic locations for deploying these sensors to capture potential PM<sub>2.5</sub> emissions from this facility, if appropriate, under variety of wind conditions.

2-21 cont.

**FUGITIVE DUST MITIGATION - UNPAVED ROADS**

For the fugitive dust chapter of the CERP, Pueblo Unido would like to make the recommendation to be intentional and specific as to the plan for the reduction of the fugitive dust affecting families directly due to the lack of paved roads in the ECV, specifically in the mobile home parks. Using the 2014/2015 Coachella Valley Mobile Home Park Paving Project as president, we can formulate a wholesome plan to address this community priority. The implementation of a second round of a mobile home park can provide our ECV community immediate benefits of the work we have been doing at the AB 617 CSC.

The success of the initial project has been measured in the miles of paved roads, mobile home parks and data around the reduction of harmful particles from the air. Community members have continued to bring the need for a second round of this project. The paved roads proved to reduce significantly the PM 10 and PM 2.5 particles. In this proposal, approximately 214 families would benefit directly from the paving of the 14 roads listed below. In addition to reduction of PM 10 and PM 2.5 particles increasing air quality, and reduction of respiratory illnesses, this project would increase access to primary services (emergency care, fire department, school buses, etc.) The timeline below was created using the previous paving project as an example. Once funding is secured, the implantation of the project for a list of 15 mobile home parks should take approximately 1- 2 years.

In addition to paving, a landscaping component could potentially be included in the project. Trees such as mesquites could be a great addition to this project.

3-1

<b>Partnerships</b>	SCAQMD, Riverside County, Non-profit, Torres Martinez Tribe
<b>Timeline</b>	<b>Activity</b>
A couple months	Strategize – establish roles and responsibilities amongst partners
1 year	Bidding & Construction contract awarded
1 -2 months	<b>Design</b> - Project design & engineering (Design, preliminary survey, Environmental, right-of-way, construction engineering & inspection construction survey,) project administration
1-3 months	<b>Construction</b> - Construction engineering & inspection, construction survey+
3-6 months	<b>Paving</b>
Ongoing	<b>Public outreach</b>
<b>Funding</b>	SCAQMD should leverage the funding needed for completion. Non-profits should be eligible applicants for funding for public outreach and implementation.
<b>Metrics</b>	The miles of paved roads
<b>Evaluation</b>	Number of families served, installation of air monitors in some of the sites to evaluate the success of the mitigation

**Comments (Unlimited Size)**  
 The CERP is a helpful guide in its current form.

Comment #1 - More can be done to expand the community outreach programs planned for the CERP. Specifically, an update can be provided to each affected city in the Eastern Coachella Valley of the major milestones planned and achieved by the CERP, in order to determine methods by which the efforts of the cities can support the actions planned by the CERP.

Comment #2 - In addition to attempting to reduce emissions from the 5 areas listed in the current draft of the CERP, consideration should also be given to imposing a cap on dust emissions from stationary sources and requiring new sources of dust (i.e. particulate matter) to offset significant new/increased sources of emissions.

## **ATTACHMENT B**

### **RESOLUTION NO. 20-\_\_\_\_\_**

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that the Community Emissions Reduction Plan (CERP) for the Eastern Coachella Valley (ECV) community (ECV CERP) is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board Adopting the Community Emissions Reduction Plan for the Eastern Coachella Valley community.**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the ECV CERP is considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that the proposed project is exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that it can be seen with certainty that there is no possibility that the proposed project may have any significant effects on the environment, and is therefore exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project contains action items which qualify as feasibility or planning studies which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project may result in some minor physical modifications

to existing structures or buildings, such as installing air filters or monitoring equipment, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301 – Existing Facilities; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project may result in some minor construction of small structures such as fencing or berms, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project involves the collection or exchange of information or data obtained from inspections and air monitoring, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project also involves inspections that require performance or compliance checks which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project relies on enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, the South Coast AQMD staff has prepared a Notice of Exemption for the proposed project that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, the ECV CERP and other supporting documentation, including but not limited to the Notice of Exemption, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, as well as has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, Assembly Bill (AB) 617 directs the California Air Resources Board (CARB) to select locations around the state for preparation of community emissions reduction programs; and

**WHEREAS**, in 2019, the South Coast AQMD Governing Board recommended communities to CARB for the AB 617 program; and

**WHEREAS**, in 2019, CARB selected the community of ECV as one of the communities for which a CERP shall be prepared; and

**WHEREAS**, the AB 617 statute specifies that the air district must adopt the CERP within one year of the state board's selection of the community; and

**WHEREAS**, the ECV CERP is a planning document designed to assist future regulatory programs and rule development efforts, and to reduce emissions of and exposure to air toxics and other pollutants; and

**WHEREAS**, the ECV CERP is required by AB 617 and it builds upon existing criteria pollutant and air toxic programs, with greater emphasis on cumulative and localized impacts, and

**WHEREAS**, although the results of MATES IV show regional reductions in health risk from exposure to toxic air contaminants, some communities such as ECV are disproportionately impacted by air toxics, and other environmental pollution, as well as social and economic burdens; and

**WHEREAS**, the ECV Community Steering Committee has worked with staff to develop the ECV CERP to reflect the community's air quality priorities and strategies to address these priorities; and

**WHEREAS**, the ECV CERP aims to reduce, air toxics and other pollutants in the ECV community; and

**WHEREAS** Staff concurs with requests from the ECV CSC that additional meetings be held and information be added to the CERP to provide additional details on monitoring objectives, collaborations with other entities, and incentive strategies developed by the CSC no later than June 30, 2021.

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the ECV CERP is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, the ECV CERP contains action items which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies. The proposed project contains action items that are also categorically exempt from CEQA pursuant to, CEQA Guidelines Section 15301 – Existing Facilities, CEQA Guidelines Section 15303 – New Construction

or Conversion of Small Structures, CEQA Guidelines Section 15306 – Information Collection, CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, CEQA Guidelines Section 15309 – Inspections, and CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies. No exceptions to the application of the categorical exemptions set forth in CEQA Guidelines Section 15300.2 – Exceptions, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on the proposed ECV CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board finds that the ECV CERP meets the requirements of AB 617 and will advance the mission of cleaning the air at a community scale in the ECV community and will provide emission reduction benefits toward achieving state and national air quality standards; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby adopts the ECV CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board directs staff to provide additional details on the ECV CERP monitoring objectives, collaborations with other entities, and incentive strategies developed by the Community Steering Committee (CSC) no later than June 30, 2021, including holding two CSC meetings between January and February 2021 to receive additional feedback on these topics, and two additional CSC meetings between March and April 2021 to review draft amendments to the ECV CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board hereby directs the Executive Officer to forward a copy of this Resolution and the ECV CERP to the California Air Resources Board for approval; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board directs staff to periodically report to the Stationary Source Committee on the implementation of the ECV CERP, including updates on the actions within the plan and the emissions reductions achieved.

(909) 396-2000 • [www.aqmd.gov](http://www.aqmd.gov)

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA  
ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: COMMUNITY EMISSIONS REDUCTION PLAN FOR THE  
EASTERN COACHELLA VALLEY COMMUNITY PER  
ASSEMBLY BILL 617**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

**To:** Governor's Office of Planning and Research -  
State Clearinghouse  
1400 Tenth St, Suite 222  
Sacramento, CA 95814-5502

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

---

**Project Title:** Community Emissions Reduction Plan for the Eastern Coachella Valley Community per Assembly Bill 617

---

**Project Location:** The project is located in communities within the jurisdiction of the South Coast Air Quality Management District (AQMD). The boundaries of the communities extend from the City of Indio south to the Riverside County boundary along the Salton Sea, including the City of Indio, the City of Coachella, a small portion of the City of La Quinta (southern part of the city), and the unincorporated areas of Thermal, Mecca, Oasis and North Shore, referred to herein as Eastern Coachella Valley (ECV) community in Riverside County.

---

**Description of Nature, Purpose, and Beneficiaries of Project:** Assembly Bill (AB) 617, signed into state law in 2017 (see Health and Safety Code Section 44391.2), requires air districts to prepare a Community Emissions Reduction Plan (CERP) for environmental justice communities selected by the California Air Resources Board (CARB). CERPs provide a blueprint for achieving reductions of air pollution emission and exposure within selected communities and are tailored to address each community's air quality priorities. The ECV community was selected by CARB to prepare a CERP in December 2019. The purpose of this project is to implement a CERP for the ECV community per AB 617. The beneficiary of the project is the identified ECV community and the nearby areas, but the entire region within South Coast AQMD's jurisdiction will also benefit.

The ECV CERP includes actions to reduce emissions and/or exposures to toxic air contaminants and criteria air pollutants, an implementation schedule, an enforcement plan, and a description of the process and outreach conducted to develop the CERP. Implementation of the ECV CERP actions is expected to occur over five years beginning in 2021. A summary of the action items by category is described below.

**Land Use:** Provide information on South Coast AQMD's CEQA Intergovernmental Review program.

**Salton Sea:** 1) Expand South Coast AQMD's monitoring networks and seek new opportunities to create an air quality sensor network in the ECV community; 2) Explore the development of an odor event notification system; 3) Work with other agencies to collect emissivity and dust emissions data to improve South Coast AQMD's emissions inventory; 4) Collaborate with the various entities to support the ongoing study on Salton Sea playa dust; 5) Provide additional air quality expertise for Salton Sea Management Program implementation and new development projects near the Salton Sea; 6) Collaborate with and support state and local agencies in implementing dust suppression projects, addressing cross-jurisdictional air pollution emissions from the Salton Sea and identifying opportunities to mitigate pesticide run-off into the Sea; 7) Conduct outreach on South Coast AQMD Rules 403 and 403.1, best practices to reduce dust during the implementation of projects, and how to file dust complaints; 8) Identify funding for air filtration system installation and maintenance and home weatherization project implementation; assess the benefits and feasibility of filtered "clean rooms"; 9) Collaborate with community organizations to conduct outreach on how to access air quality data and reduce exposure when H<sub>2</sub>S levels are above the State Standard; 10) Provide air quality data to local health care providers when requested; and 11) Pursue collaboration with other agencies to implement greenspace projects.

**Pesticides:** Pursue collaborative partnership with appropriate agencies to: 1) identify key pesticides of concern to develop an air monitoring strategy and gather pesticide use data, evaluate community impacts, and identify opportunities to reduce pesticide emissions and exposure; 2) provide an update on the Shafter Pilot Notification System project, evaluate the feasibility of a pilot notification system, provide information on pesticides applied, reporting pesticide drift, and ways to reduce exposure; 3) make pesticide data more accessible; and 4) provide outreach materials, training, and information on personal protective equipment and ways to reduce exposure.

**Fugitive Road Dust and Off-roading:** 1) Identify opportunities to expand the PM<sub>10</sub> monitoring network and seek new opportunities to create an air quality sensor network; 2) Pursue collaboration with appropriate entities, and identify opportunities and funding to reduce fugitive emissions, such as pave unpaved roads and mobile home parks, restrict unnecessary public access to and reduce speed limits on unpaved roads, plant natural vegetation on unpaved surfaces, stabilize loose road surfaces with grading and gravel on unpaved roads and maintain treated roads, and expand street sweeping services beyond existing service levels; 3) Pursue a collaborative partnership with Comité Civico del Valle (CCV) to obtain complaint data to address road dust-related air quality concerns within the ECV community and to identify potential high priority areas for surface

---

---

stabilizing projects; 4) Identify fugitive dust concerns and evaluate whether Rules 403 and/or 403.1 and or enhanced enforcement of existing provisions are necessary and conduct outreach on Rules 403 and 403.1, practices to reduce fugitive dust from roads, how to file dust complaints, subscribing to air quality alerts; and 5) Identify funding for air filtration system installation and maintenance and home weatherization project implementation.

Open Burning and Illegal Dumping: 1) Work with the CSC to establish an air quality sensor network and conduct follow-up investigations, as needed; 2) Pursue emission reductions from open burning by developing a list of available technologies, best practices and alternatives and assessing the feasibility of new requirements for open burning, enhanced and focused enforcement efforts; 3) Continue existing and pursue additional collaborations with local tribes and county agency to identify opportunities to reduce open burning through outreach, enforcement or regulations and participation in emergency response plan development efforts; 4) Pursue funding opportunities for equipment or services to be used as alternatives to agricultural burning or emergency burning for freeze prevention; 5) Pursue opportunities to develop an online permitted burning notification system; 6) Identify funding for air filtration system installation and maintenance and weatherization project implementation; 7) Pursue collaborations with appropriate entities to identify or pursue opportunities to reduce illegal dumping, such as conduct focused enforcement and improve the reporting system, establish a complaint-report tracking system, support green waste complaint reporting and follow-up investigations, and encourage future allocations of funds to address illegal dumping; 8) Pursue funding opportunities to discourage illegal dumping such as waste collection services, non-agricultural waste disposal, fencing or berm construction or camera/drone technology; 9) Pursue collaboration with appropriate agencies and community organizations to develop and distribute informational materials on open burning, fire safety, and air pollution; and 10) Conduct outreach on burn practices, methods to reduce emissions, rules, and ways to report illegal burning and illegal dumping activities.

Diesel Mobile Sources: 1) Work with the CSC to identify air quality concerns, quantify emissions and provide information on trucks; prioritize actions around diesel mobile source pollution such as an air quality sensor network, collaborating with CARB for focused enforcement and outreach on reporting truck idling, developing regulatory measures, and outreach on reporting truck idling, pursuing collaboration with local land use and transportation agencies to restrict heavy-duty trucks from transiting near sensitive land uses, pursuing collaboration with land use agencies to implement vegetative barriers around the railroad, identifying funding for air filtration system installation and maintenance and weatherization project implementation; and 2) Identify opportunities or funding to incentivize the replacement of older, higher polluting on-road and off-road equipment and older diesel school buses with cleaner technology.

Greenleaf Desert View Power Plant: 1) Work with the CSC and federal government entities to reduce emission from the facility by identifying air quality concerns, compiling air quality data, identifying locations for air quality sensor deployment, and developing strategies, identifying funding for air filtration system installation and maintenance and weatherization project implementation; and 2) Pursue a collaborative partnership with Coachella Valley Association of Governments to encourage funds to be used for emissions or exposure reduction projects in ECV.

---

**Public Agency Approving Project:**  
South Coast Air Quality Management District

**Agency Carrying Out Project:**  
South Coast Air Quality Management District

---

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15262 – Feasibility and Planning Studies

CEQA Guidelines Section 15301 – Existing Facilities

CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures

CEQA Guidelines Section 15306 – Information Collection

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

CEQA Guidelines Section 15309 – Inspections

CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies

---

---

**Reasons why project is exempt:**

Pursuant to the California Environmental Quality Act (CEQA), South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Because the physical changes that may occur as a result of implementing portions of the proposed project would only require minimal construction activities and cause negligible physical impacts, it can be seen with certainty that there is no possibility that any physical actions that may be associated with the proposed project may have a significant adverse effect on the environment. Therefore, the project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3). Further, the overall purpose of this project is to improve the environment of the ECV community and nearby areas, and all of the action items within the ECV CERP support this goal, the action items are also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308.

The ECV CERP contains the following action items, which are speculative at this time as they require collaboration with other entities, might have some secondary air quality impacts: 1) paving unpaved road and mobile home parks, stabilizing loose road surfaces with grading and gravel on unpaved roads; 2) replacing agricultural and/or emergency open burning with alternative equipment or services such as chippers and grinders and digesters, and 3) funding waste collection services to discourage illegal dumping. However, activities associated with those action items are subject to existing South Coast AQMD rule requirements. For instance, South Coast AQMD Rules 403, 1120 and 1186 cover paving related activities, Rule 1133.1 covers chipping and grinding activities, Rule 1133.2 and 1133.3 cover digesters, and Rule 1196 requires acquiring alternative fuel refuse collection heavy-duty vehicles. These existing rules not only require reducing any potential air quality impact to the minimum, but also have gone through CEQA review during the rulemaking process. If a discretionary action triggering CEQA is needed to implement those action items, a CEQA review will be conducted at that time.

The ECV CERP contains action items involving feasibility and planning studies, because information needs to be collected to make an informed decision about further actions such as rule development. However, these action items neither prescribe or commit to specific rule requirements, nor require advance approval or adoption of future actions because they require an open public process. Thus, the ECV CERP action items involving feasibility or planning studies are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262. The ECV CERP contains action items requiring minor physical modifications to existing structures or buildings, such as installing air filters or monitoring equipment, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15301. The ECV CERP contains action items requiring minor construction of small structures such as fencing or berms, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303. The ECV CERP contains action items involving the collection or exchange of information or data obtained from inspections and air monitoring, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306. The ECV CERP contains action items involving inspections requiring performance or compliance checks, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309. The ECV CERP contains action items relying on enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321. Finally, there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions. Therefore, the proposed project is exempt from CEQA.

## **EASTERN COACHELLA VALLEY**

### **COMMUNITY EMISSIONS REDUCTION PLAN**

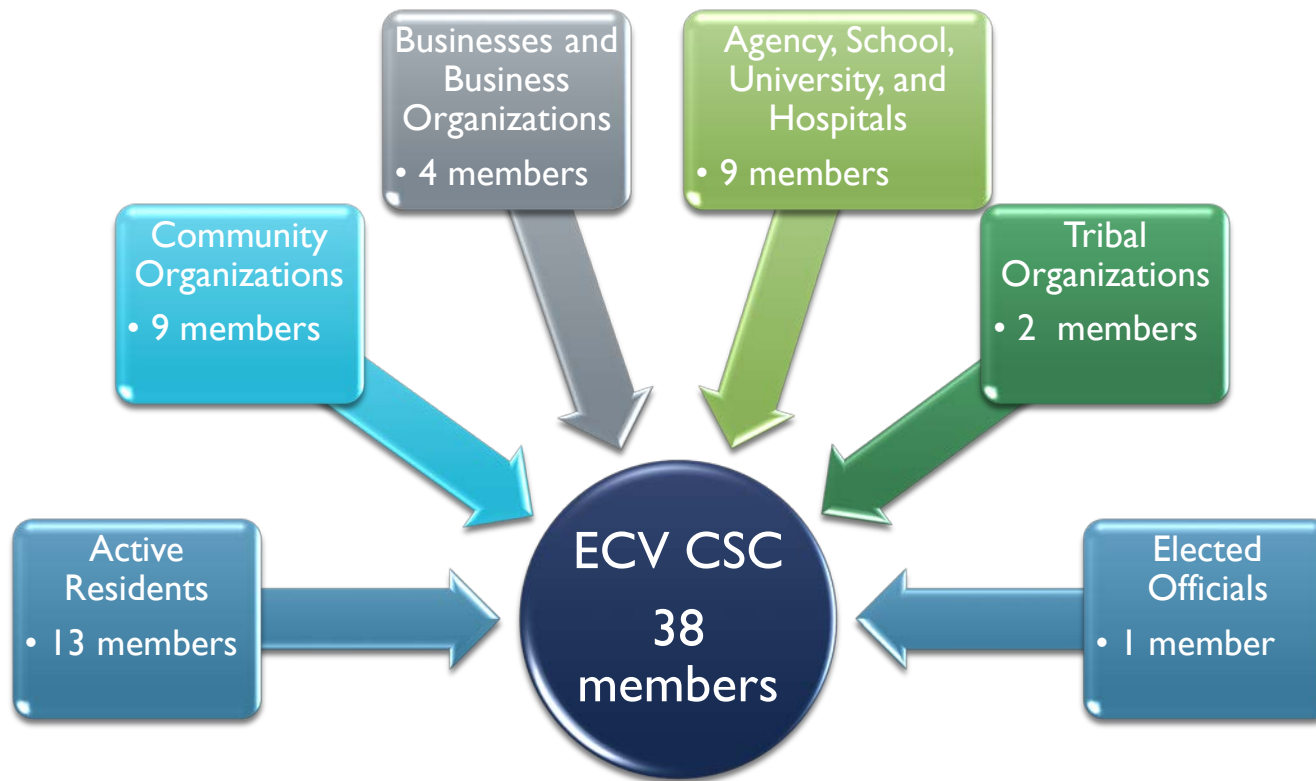

BOARD MEETING  
DECEMBER 4<sup>TH</sup>, 2020

# COMMUNITY DRIVEN PROCESS

## Community Engagement

- 17 Meetings:
  - Kick-off
  - CSC
  - Charter Working Group
  - Workshops
  - Question and Answer
- 12 Informational Handouts/Fact Sheets
- Over 50 individual meetings with CSC members (Zoom or phone)
- Interpretation and materials in English and Spanish
- Meetings recorded and available online

# ECV CERP FRAMEWORK

*15 emissions and exposure reduction goals*

Reduce emissions from sources of air pollution

Reduce exposures to sources of air pollution

Gather data/information (e.g., monitoring, sampling, etc.)

*52 actions to achieve goals*

## Air Monitoring

- Expand monitoring network for PM and H2S

## Collaboration

- Pursue collaboration with agencies to reduce Salton Sea emissions and pesticide exposure

## Incentives

- Provide incentives for alternatives to burning

## Community Outreach

- Provide information on pesticide exposure reduction

## Enforcement

- Pursue collaboration to enforce dumping laws

# AQ PRIORITIES AND CERP ACTIONS – HIGHLIGHTS

## Salton Sea

- Identify opportunities to expand monitoring for H<sub>2</sub>S and PM<sub>10</sub>
- Pursue collaborations to support dust suppression projects
- Pursue funding opportunities to install air filtration systems in schools and homes near the Salton Sea

## Pesticides

- Collaborate with CARB to develop a pesticides air monitoring strategy
- Consult with DPR and the Riverside Agricultural Commissioner to provide the CSC an annual update on statewide efforts to develop a pesticide application notification system

## Fugitive Road Dust

- Expand PM<sub>10</sub> monitoring network and provide real-time data to the community
- Pursue collaborations to pave unpaved roads and parks
- Identify opportunities to implement home weatherization projects and install air filtration systems at schools, community centers, and homes

# AQ PRIORITIES AND CERP ACTIONS – HIGHLIGHTS

## Open Burning and Illegal Dumping

- Pursue opportunities to develop an online notification system to inform the community when permitted burning is expected to occur
- Pursue funding opportunities for alternatives to burning and illegal dumping (e.g., chippers, waste collection services, fencing around frequent dumping sites)

## Diesel Mobile Sources

- Work with the CSC to identify air quality concerns for diesel mobile source emissions, create a low-cost sensor network for PM2.5 and NO2
- Collaborate with CARB to identify opportunities for focused enforcement and additional regulatory measures, if needed
- Identify incentive opportunities to replace on-road and off-road equipment and school buses with cleaner technology

## Greenleaf Desert View Power Plant

- Gather air quality information about the facility
- Work with the CSC to identify air quality concerns relating to this facility to develop further actions, e.g. low-cost sensor deployments, strategies to reduce emissions

# ESTIMATED NOX EMISSION REDUCTION TARGETS

Emissions	NOx
2018 Emissions in tons per year (tpy)	1,376
Projected 2025 Baseline Emissions (tpy)	982
Emission Reductions from CERP, by 2025 (tpy)	54
Overall Emission Reductions from 2025 (%)	33
Projected 2030 Baseline Emissions (tpy)	878
Emission Reductions from CERP, by 2030 (tpy)	115
Overall Emission Reductions from 2030 (%)	45

## NOx Trends in ECV 2018, 2025, and 2030

# ESTIMATED DPM EMISSION REDUCTION TARGETS

Emissions	DPM
2018 Emissions in tons per year (tpy)	24
Projected 2025 Baseline Emissions (tpy)	11
Emission Reductions from CERP, by 2025 (tpy)	1
Overall Emission Reductions from 2025 (%)	58
Projected 2030 Baseline Emissions (tpy)	8
Emission Reductions from CERP, by 2030 (tpy)	2
Overall Emission Reductions from 2030 (%)	77

## DPM Trends in ECV 2018, 2025, and 2030

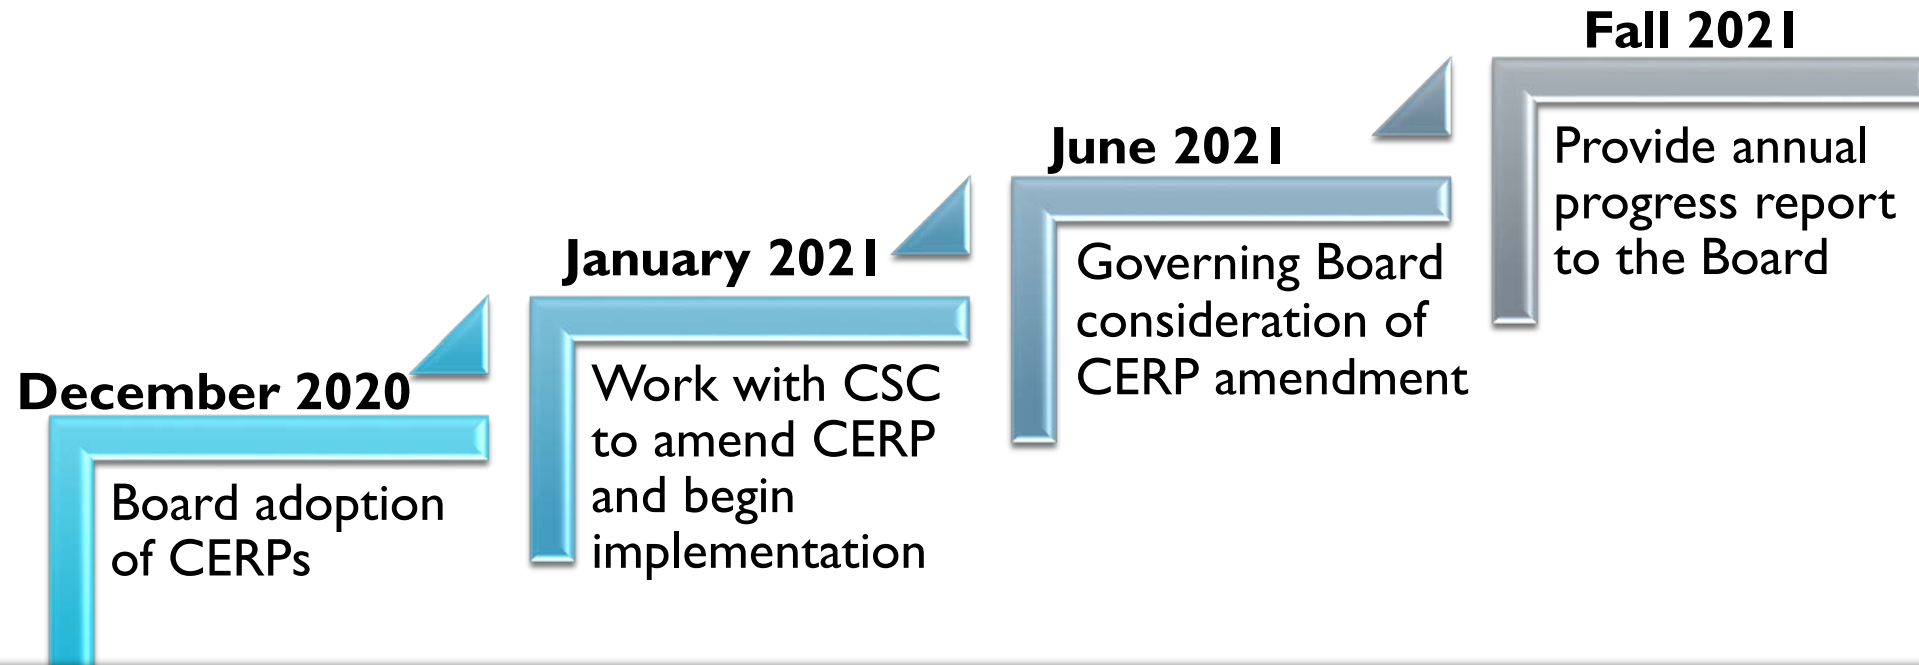

# KEY ISSUES

Key Issue	Staff Response
CERP Development and Review Timeline	<ul style="list-style-type: none"><li>• AB 617 (Health and Safety Code Section 44391.2(c)) requires the CERP to be developed with one year from when a community is selected</li><li>• Board Resolution includes a commitment to return to the Board in June 2021 to amend the CERP to address details on monitoring objectives, collaborations with other entities and incentive strategies</li></ul>
CERP development process is not community-led	<ul style="list-style-type: none"><li>• Staff held 17 public meetings in ECV and over 50 small group meetings with the CSC</li><li>• More CSC meetings to develop the ECV CERP than any other AB 617 community</li><li>• Established charter developed by the community with specific purpose and objectives to guide the CERP development process</li></ul>

# NEXT STEPS & STAFF RECOMMENDATIONS

## **STAFF RECOMMENDATIONS:**

- Determine that the Community Emissions Reduction Plan for Eastern Coachella Valley is exempt from CEQA
- Adopt the Community Emissions Reduction Plan for Eastern Coachella Valley

BOARD MEETING DATE: December 4, 2020

AGENDA NO. 30

**PROPOSAL:** Determine That Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin Is Exempt from CEQA and Approve Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin

**SYNOPSIS:** The South Coast Air Basin (Basin) is a Serious nonattainment area for the 2006 24-hour PM2.5 National Ambient Air Quality Standard (standard) with an attainment deadline of December 31, 2019. Despite significant improvement in PM2.5 levels, the Basin failed to attain this standard by the required date based on 2017-2019 monitoring data. On September 16, 2020, U.S. EPA finalized its determination of the Basin's failure to attain the 2006 24-hour PM2.5 standard by the attainment date. Accordingly, a revision to the SIP is required to be submitted to U.S. EPA by December 31, 2020. The Basin is expected to attain the 2006 PM2.5 standard in 2023 based on the continued implementation of existing regulations and programs.

**COMMITTEE:** Mobile Source, August 21, 2020, Reviewed

**RECOMMENDED ACTIONS:**

Adopt the attached Resolution:

1. Determining that the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin is exempt from the requirements of the California Environmental Quality Act; and
2. Approving the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin and directing staff to forward the Attainment Plan to CARB for approval and submission to U.S. EPA for inclusion in the SIP.

Wayne Nastri  
Executive Officer

## **Background**

In 2006, the U.S. EPA strengthened the 24-hour National Ambient Air Quality Standard (standard) for particulate matter less than 2.5 microns (PM<sub>2.5</sub>) to 35 micrograms per cubic meter (µg/m<sup>3</sup>). The South Coast Air Basin (Basin) is classified as a Serious nonattainment area for the 2006 24-hour PM<sub>2.5</sub> standard with an attainment deadline of December 31, 2019. Since 2001, PM<sub>2.5</sub> concentrations in the Basin have significantly decreased due to the implementation of regulations and programs by South Coast AQMD and CARB. Despite this progress, based on the 2017-2019 monitoring data, the Basin failed to attain the 2006 PM<sub>2.5</sub> standard by the required date. The Basin's failure to attain the standard is due to exceedances at two monitoring stations: Mira Loma and Compton. PM<sub>2.5</sub> levels in Mira Loma have decreased steadily over the years and are now very close to the standard. For Compton, a few days of unusually high PM<sub>2.5</sub> levels observed in 2017 resulted in exceedance of the standard over the 2017-2019 three-year averaging period. The 2017 high PM episodes at Compton did not occur before 2017 or reoccurred since then and were likely driven by anomalous local human activities.

On September 16, 2020, the U.S. EPA finalized its determination that the South Coast Air Basin failed to attain the 2006 24-hour PM<sub>2.5</sub> standard of 35 µg/m<sup>3</sup> by the attainment date. For a Serious PM nonattainment area that fails to attain the standard, the Clean Air Act (CAA) requires that a revision to the State Implementation Plan (SIP) be submitted to the U.S. EPA within 12 months after the applicable attainment date (i.e., December 31, 2020). The revised SIP must demonstrate attainment of the standard as expeditiously as possible but no later than five years from the date of the U.S. EPA's final determination of failure to attain the standard.

## **Proposal**

The Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin (Attainment Plan or Plan) has been developed to demonstrate how the Basin will attain the standard and also to address other federal CAA requirements. The Plan addresses directly-emitted PM<sub>2.5</sub> as well as PM<sub>2.5</sub> that is formed in the atmosphere from the four PM<sub>2.5</sub> precursors, namely nitrogen oxides (NO<sub>x</sub>), sulfur oxides (SO<sub>x</sub>), volatile organic compounds (VOC), and ammonia emissions. The following key elements are included in the Plan:

- Updated 2018 base year and 2023 future year emissions inventories based on best available data;
- Demonstrating a five percent annual reduction of NO<sub>x</sub> emissions based on continued implementation of existing regulations;
- Updated air quality modeling analysis and supplemental weight of evidence analysis for attainment demonstration;
- Evaluation of control strategies and emission reductions needed for attainment including an evaluation of potential feasible measures and the impact of existing and recently adopted rules and regulations by South Coast AQMD and CARB;

- Contingency measures; and
- Other CAA requirements such as a Reasonable Further Progress (RFP) demonstration.

The attainment demonstration in this Plan uses two different approaches to address the exceedances observed in Mira Loma and Compton. For Mira Loma (and other stations excluding Compton), a traditional approach using chemical transport modeling is used based on updated emissions inventory, which shows that the standard will be attained in 2023. Recent monitoring data suggests that Mira Loma may attain the standard by the end of 2020, before the U.S. EPA considers this plan. For Compton, the traditional modeling approach is not appropriate because the emissions inventory used in modeling does not reflect the anomalous localized sources causing the high PM<sub>2.5</sub> levels observed in 2017. As a result, applying the traditional approach to Compton would require unrealistic levels of emission reductions on a regional scale, which may not be effective in reducing PM<sub>2.5</sub> levels in Compton. Therefore, a supplemental weight of evidence analysis is provided for Compton in the Plan based on ambient air quality trends for PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors, emissions trends and other statistical analyses to demonstrate attainment of the PM<sub>2.5</sub> standard by 2023. Based on recent monitoring data from 2018 to 2020 over a three-year averaging period, Compton is anticipated to attain the standard by the end of 2020.

Based on the analysis provided in this Plan, the Basin is expected to attain the 2006 24-hour PM<sub>2.5</sub> standard in 2023 by continued implementation of existing regulations and programs by South Coast AQMD and CARB. This is two years in advance of the 2025 attainment deadline. Over the next few years, these regulations and programs are expected to provide significant reductions in NO<sub>x</sub> emissions, which is the pollutant largely contributing to PM<sub>2.5</sub> levels. Furthermore, recently adopted rules and regulations not reflected in the future baseline emissions (i.e., rules and regulations adopted since 2016 AQMP adoption) will also provide further reductions to ensure that Basin will attain the standard in or before 2023. With the Basin so close to achieving attainment, the emission reductions associated with these measures are expected to provide the needed reductions in advance of the 2025 statutory attainment date.

### **Public Process**

The draft Attainment Plan was discussed at the South Coast AQMD Mobile Source Committee on August 21, 2020 and the AQMP Advisory Group on September 3, 2020. The updated emissions inventory and modeling was also discussed at the Scientific, Technical, and Modeling Peer Review Group on August 20, 2020. The draft Attainment Plan was released on September 18, 2020 and a regional public hearing (covering the four counties in the Basin) was conducted on October 7, 2020 via video conference and by telephone to solicit information, comments, and suggestions from the public, affected businesses and stakeholders. The transcript of the regional public hearing is attached. One comment letter was received as of October 19, 2020. Key comments included clarifications on emissions inventory, air quality data analysis, and attainment

demonstration; the SIP approval status of regulations and programs relied on for attainment and RFP demonstration; and the analysis of potential measures in the control strategy. Response to these comments are included in the draft final Attainment Plan, which was released on November 3, 2020. A 30-day public hearing notice was published for the South Coast Air Basin Attainment Plan for 2006 24-hour PM2.5 Standard.

### **Resource Impacts**

The Attainment Plan will have nominal additional impact on South Coast AQMD resources.

### **California Environmental Quality Act**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 to the categorical exemption apply to the proposed project. A Notice of Exemption has been prepared pursuant to CEQA Guidelines Section 15062 and is included as Attachment D to this Board letter. If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **AQMP and Legal Mandates**

The Attainment Plan for 2006 24-Hour PM2.5 Standard for the South Coast Air Basin is required as part of the SIP revision to address the federal Clean Air Act requirements for a Serious PM nonattainment that fails to attain by the attainment deadline.

### **RESOLUTION NO. 20-\_\_\_\_\_**

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board approving the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin and directing staff to forward the Attainment Plan to California Air Resources Board (CARB) for approval and submission to United States Environmental Protection Agency (U.S. EPA) for inclusion in the State Implementation Plan (SIP).**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin is considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin is exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that, because the proposed project relies on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB to reduce emissions without proposing new requirements that would involve physical changes, it can be seen with certainty that there is no possibility that that the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin may have any significant adverse effects on the environment, and is therefore exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for the Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemption apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, South Coast AQMD staff has prepared a Notice of Exemption for the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin and other supporting documentation, including but not limited to the Notice of Exemption, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, and has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, on October 17, 2006, the U.S. EPA lowered the 24-hour PM<sub>2.5</sub> National Ambient Air Quality Standard (NAAQS or Standard) to a level of 35 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) from the previous 1997 24-hour PM<sub>2.5</sub> NAAQS of 65  $\mu\text{g}/\text{m}^3$ ; and

**WHEREAS**, effective February 12, 2016, South Coast Air Basin is classified as a Serious nonattainment area with respect to the 2006 24-hour PM<sub>2.5</sub> NAAQS with an attainment date of December 31, 2019; and

**WHEREAS**, based on 2017-2019 monitoring data, two sites within the South Coast Air Basin in Mira Loma and Compton exceeded the 24-hour PM<sub>2.5</sub> standard. As a result, the South Coast Air Basin failed to meet the standard by the 2019 attainment deadline; and

**WHEREAS**, on September 16, 2020, the U.S. EPA finalized the determination that the South Coast Air Basin failed to attain the 2006 24-hour PM<sub>2.5</sub> NAAQS (35  $\mu\text{g}/\text{m}^3$ ) by the December 31, 2019 attainment date; and

**WHEREAS**, the South Coast AQMD is required to submit a revision of the SIP to the U.S. EPA through CARB within one year of the attainment date to address the federal Clean Air Act requirements for a Serious nonattainment that fails to attain by the attainment deadline; and

**WHEREAS**, the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin has been developed to address the new planning requirements of the SIP revision. Key elements include emissions inventory, attainment demonstration, five percent annual reductions of PM<sub>2.5</sub> or PM<sub>2.5</sub> precursors, additional feasible measures analysis, reasonable further progress (RFP), and contingency measures; and

**WHEREAS**, the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin demonstrates a two-fold approach. For Mira Loma and other monitoring stations with the exception of Compton, attainment is demonstrated based on the traditional approach using updated emissions inventory and regional air quality modeling. Attainment in Compton is demonstrated through supplemental weight of evidence and air quality trend analysis based on monitoring data; and

**WHEREAS**, a draft Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin was released on September 18, 2020 with a comment period from September 18, 2020 to October 19, 2020; and

**WHEREAS**, a Regional Public Hearing was held on October 7, 2020 to solicit information, comments, and suggestions from the public, affected businesses and stakeholders; and

**WHEREAS**, the draft final Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin was released on November 3, 2020; and

**WHEREAS**, the South Coast Air Basin is expected to attain the 2006 24-hour PM2.5 Standard in 2023 based on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that a Socioeconomic Impact Assessment is not required, pursuant to Health and Safety Code Section 40440.8 or 40728.5, because these sections apply only to rules; and

**WHEREAS**, the public hearing has been properly noticed in accordance with all provisions regarding notice of revisions to the SIP in Code of Federal Regulations (CFR) Title 40, Section 51.102; and

**WHEREAS**, the South Coast AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

**WHEREAS**, the South Coast AQMD specifies that the Planning and Rules Manager of the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin is based, which are located at the South Coast AQMD, 21865 Copley Drive, Diamond Bar, California; and

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption and CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for

the Protection of the Environment. No exceptions to the application of the categorical exemption set forth in CEQA Guidelines Section 15300.2 – Exceptions, including the “unusual circumstances” exception, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby approve, pursuant to the authority granted by law, the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin as set forth in the attached, and incorporated herein by this reference; and

**BE IT FURTHER RESOLVED**, that the Executive Officer is hereby directed to forward a copy of this Resolution and the Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin to CARB for approval and subsequent submittal to the U.S. EPA for inclusion into the SIP.

## EXECUTIVE SUMMARY

The South Coast Air Basin (Basin) is classified as a Serious nonattainment area for the 2006 24-hour PM<sub>2.5</sub> national ambient air quality standard (standard) with an attainment deadline of December 31, 2019. Since 2001, PM<sub>2.5</sub> concentrations in the Basin have significantly decreased due to the implementation of regulations and programs by South Coast Air Quality Management District (South Coast AQMD) and California Air Resources Board (CARB). Despite this progress, based on the 2017-2019 monitoring data, the Basin failed to attain the 2006 standard by the required date. Extreme drought conditions in the 2013-2016 timeframe hampered the efforts for the Basin to meet this standard earlier. Figure ES-1 illustrates the Basin's progress in attaining the 24-hour standard.

**FIGURE ES-1**

Progress towards attaining the federal 24-hour PM<sub>2.5</sub> standard in South Coast Air Basin

The Basin's recent failure to attain the standard is due to exceedances of the standard at two monitoring stations: Compton and Mira Loma. PM<sub>2.5</sub> levels in Mira Loma have decreased steadily over the years and are now very close to the standard. A few days of unusually high PM<sub>2.5</sub> levels were observed in Compton in 2017, resulting in that site exceeding the standard over the 2017-2019 three-year averaging period. The high PM episodes at Compton in 2017 have not reoccurred since. These episodes ~~and~~ were likely driven by unknown local human activities which would not have been reflected in the emissions inventory.

On July 10, 2020, the U.S. Environmental Protection Agency (U.S. EPA) issued a proposed rule determining that the Basin has failed to attain the standard by the attainment date. For a Serious PM nonattainment area that fails to attain, the Clean Air Act (CAA) requires that a revision to the State Implementation Plan (SIP) be submitted to U.S. EPA within 12 months after the applicable attainment date. The revised SIP must demonstrate attainment of the standard as expeditiously as possible but no later than 5 years from the date of the U.S. EPA's final determination of failure to attain the standard. In addition to the attainment demonstration, the updated SIP must also address several other federal CAA requirements.

This draft Plan is developed to demonstrate attainment of the 2006 24-hour PM<sub>2.5</sub> standard and to address the other federal CAA requirements. The attainment demonstration in this Plan is based on a two-fold hybrid approach which addresses the exceedances observed in Mira Loma and Compton. For Mira Loma (and other stations excluding Compton), a traditional approach using chemical transport modeling is used, which shows that the standard will be attained in 2023, if not earlier. Indeed, recent data suggests that Mira Loma may even attain the standard by the end of 2020, before the U.S. EPA considers this plan. For Compton, the traditional modeling approach is not appropriate because the emissions inventory used in modeling does not reflect the anomalous localized sources causing the high PM<sub>2.5</sub> levels observed in 2017. As a result, applying the traditional approach to Compton would require unrealistic levels of emissions reductions in a regional scale, which may not be effective in reducing levels in Compton. Therefore, a supplemental weight of evidence analysis is provided for Compton in the Plan based on ambient air quality trends for PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors, emissions trends, and other statistical analyses to demonstrate attainment of the PM<sub>2.5</sub> standard ~~as early as the end of 2020~~ by 2023. However, based on recent monitoring data (2018-2020 3-year averaging period), Monitoring data since 2018 further indicates that Compton will very likely attain the standard over the 2018-2020 time period by the end of 2020, which would also be before U.S. EPA considers this Plan.

Based on the analysis provided in this Plan, given that Compton will likely attain by the end of the year and that Mira Loma is on the edge of attainment, the Basin is expected to attain the 2006 24-hour PM<sub>2.5</sub> standard in 2023 based on the continued implementation of existing and recently adopted regulations and programs by South Coast AQMD and CARB. These existing regulations

provide significant amount of reductions in nitrogen oxides (NO<sub>x</sub>) emissions, which is the pollutant largely contributing to PM<sub>2.5</sub> levels. With the Basin so close to attainment, the emissions reductions associated with these measures are expected to provide the needed reductions well in advance of the 2025 statutory attainment date.

## 1. INTRODUCTION

### *Background*

The Federal Clean Air Act (CAA) requires the U.S. EPA to develop and enforce standards to protect the public from airborne contaminants known to be hazardous to human health. Accordingly, the U.S. EPA sets National Ambient Air Quality Standards (NAAQS or federal standards) for criteria pollutants such as particulate matter less than 2.5 microns (PM2.5) and designates areas as being in attainment or in nonattainment of the NAAQS. The U.S. EPA first promulgated the NAAQS for PM2.5 in July 1997. The 24-hour PM2.5 standard was set at a level of 65 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) based on the three-year average of the 98th percentile of 24-hour concentrations. The annual PM2.5 standard was set at a level of 15  $\mu\text{g}/\text{m}^3$ , based on the three-year average of annual mean PM2.5 concentrations. In 2006, the U.S. EPA strengthened the 24-hour standard to 35  $\mu\text{g}/\text{m}^3$ . The annual standard stayed at 15  $\mu\text{g}/\text{m}^3$  until December 14, 2012, when it was reduced to 12  $\mu\text{g}/\text{m}^3$ . Table 1-1 summarizes the attainment status of South Coast Air Basin (Basin) for all federal PM2.5 standards.

**TABLE 1-1**

South Coast Air Basin Attainment Status for PM2.5 National Ambient Air Quality Standards

Standard	Level	Attainment Deadline	South Coast Attainment Status
1997 Annual PM2.5	15 $\mu\text{g}/\text{m}^3$	2015	Attained in 2013
1997 24-hour PM2.5	65 $\mu\text{g}/\text{m}^3$	2015	Attained in 2013
2006 24-hour PM2.5	35 $\mu\text{g}/\text{m}^3$	2019	Serious Nonattainment
2012 Annual PM2.5	12 $\mu\text{g}/\text{m}^3$	2025	Serious Nonattainment

Following the U.S. EPA's adoption of the PM2.5 standards in 1997, South Coast Air Quality Management District (South Coast AQMD) began routine monitoring of PM2.5 concentrations within the Basin. In 2005, a maximum 24-hour average concentration of 132.7  $\mu\text{g}/\text{m}^3$  (recorded in East San Gabriel Valley area) and a maximum annual average PM2.5 concentration of 21.0  $\mu\text{g}/\text{m}^3$  (recorded in Metropolitan Riverside County area) were 203 and 139 percent of the 1997 24-hour and annual average standards, respectively.<sup>1</sup> However, PM2.5 concentrations in the Basin have experienced a steady and significant decline over the last two decades, where levels have decreased by 51% since 2001 (see Chapter 2- Air Quality Trends for details). South Coast AQMD and CARB's aggressive regulatory programs resulted in attainment of the original 1997 PM2.5 standards in 2013, two years ahead of the attainment deadline. The remarkable historical

<sup>1</sup> 2007 AQMP (Page 2-5). <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2007-air-quality-management-plan/2007-aqmp-final-document.pdf?sfvrsn=2>.

improvement in PM2.5 air quality is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from various sources.

For the 2006 24-hour PM2.5 standard, the Basin was initially classified as a Moderate nonattainment area with an attainment date of December 31, 2014, and later extended to 2015, pursuant to CAA Subpart 4. ~~The Basin failed to attain the 2006 24-hour PM2.5 NAAQS (35 µg/m<sup>3</sup>) by the end of 2015.~~ Attainment of the 2006 24-hour PM2.5 NAAQS standard by this deadline. The region was reclassified as a Serious nonattainment area, giving the Basin until 2019 to attain the 2006 24-hour PM2.5 NAAQS.

### *History of Air Quality Planning for the 2006 PM2.5 Standard*

The CAA requires nonattainment areas to develop and implement an emission reduction strategy that will bring the area into attainment of NAAQS in a timely manner. The state is required to submit a State Implementation Plan (SIP) to demonstrate how and when the NAAQS will be achieved and maintained. The federal SIP requirements for the Basin nonattainment area are addressed through the Air Quality Management Plans (AQMP), which are regional blueprints for achieving air quality standards, developed to meet both federal and state CAA planning requirements. Each AQMP is prepared by the South Coast AQMD in collaboration with the California Air Resources Board (CARB) and the South California Association of Governments (SCAG) through an extensive public process.

### *2012 AQMP and the 2012 State SIP Strategy: Moderate Area Plan*

The purpose of the 2012 AQMP was to set forth a comprehensive program that would lead the Basin into compliance with the 2006 24-hour PM2.5 air quality standard by 2014, and to satisfy the planning requirements of the CAA for a Moderate nonattainment area. The Basin-wide 24-hour PM2.5 attainment strategy was primarily focused on directly emitted PM2.5 and NO<sub>x</sub> reductions which could be feasibly achieved by the attainment date of 2014. The 2012 AQMP<sup>2</sup> included a number of stationary source control measures covering coatings and solvents, combustion sources, petroleum operations, fugitive VOC sources, multiple component sources, incentive programs, and educational programs as well as on-road mobile source control measures focusing on light-, medium-, and heavy-duty vehicles, and off-road vehicles and equipment. Directly emitted PM2.5 emissions were targeted to be substantially reduced by several control measures including episodic curtailment of residential wood burning and open burning and emission reductions from under-fired charbroilers, as well as secondary PM2.5 reductions through ammonia emission reductions from livestock waste. The 2012 PM2.5 Plan was fully approved by the U.S. EPA in 2018.<sup>3</sup>

### ***2015 Supplement: Subpart 4 Requirements***

In January 2013, the U.S. Court of Appeals, D.C. Circuit ruled that the U.S. EPA erred in implementing the 1997 PM<sub>2.5</sub> NAAQS pursuant solely to the general implementation provisions of Subpart 1 of the CAA, without considering the particulate matter specific provisions of Subpart 4. Although Subpart 4 relates to PM<sub>10</sub>, the Court reasoned that the plain meaning of the CAA requires implementation of the 1997 PM<sub>2.5</sub> standards under Subpart 4 because PM<sub>2.5</sub> falls within the statutory definition of PM<sub>10</sub> and are thus subject to the same statutory requirements as PM<sub>10</sub>. Subpart 4 is more specific about what states must do to bring areas into attainment through the establishment of a two-tier classification system for nonattainment areas (Moderate or Serious). Subpart 4 also has specific provisions regarding regulation of precursors of PM emissions that are not present in Subpart 1. On June 2, 2014, the U.S. EPA classified the Basin as Moderate nonattainment under Subpart 4. Subpart 4 provides for an attainment year of 2015 for Moderate areas, one year later than the attainment year in the 2012 AQMP. Thus, the Basin was provided the new attainment date of December 31, 2015 to meet the 2006 PM<sub>2.5</sub> standard for Moderate nonattainment areas.

Based on the ambient monitoring data from 2012-2014, attainment of the 2006 24-hour PM<sub>2.5</sub> NAAQS (35 µg/m<sup>3</sup>) was not achieved by the end of 2014 as anticipated in the 2012 AQMP. The higher PM<sub>2.5</sub> levels observed in 2013 and 2014 affected by extreme drought conditions in Southern California had reversed the long-term trend of improving PM<sub>2.5</sub> concentrations resulting in nonattainment. To address the Subpart 4 requirements, the 2015 Supplement included a demonstration of attainment of the 24-hour PM<sub>2.5</sub> NAAQS by 2015; a discussion of the effects of the drought on the 2014 attainment date; provided new transportation conformity budgets for 2015; updated RACM/RACT analysis; updated list of control strategy commitments; and a demonstration of compliance that applies to major stationary source PM<sub>2.5</sub> precursors.<sup>4</sup> The 2015 Supplement was submitted to the U.S. EPA on March 4, 2015 and was fully approved by the U.S. EPA in 2018.<sup>5</sup>

### ***2016 AQMP and 2016 State SIP Strategy: Serious Area Plan***

In July 2015, South Coast AQMD submitted a formal request to the U.S. EPA to reclassify the Basin as a Serious nonattainment area for the 24-hour PM<sub>2.5</sub> NAAQS based on the monitoring data, which indicated that attainment was not practicable by December 31, 2015. In January 2016, the U.S. EPA approved the Basin's re-designation as Serious nonattainment and the commitment to plan for attainment of the 24-hour PM<sub>2.5</sub> NAAQS as expeditiously as practicable, but no later than December 31, 2019. Portions of the 2016 AQMP were developed to satisfy the SIP submittal

---

<sup>4</sup> 2015 Supplement <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/2015-supplement-pmsip.pdf?sfvrsn=2>.

<sup>5</sup> 81 FR 22025 (May 16, 2016) and 83 FR 5923 (March 14, 2018).

requirements of the federal CAA as a Serious nonattainment area of the 2006 24-hour standard.<sup>6</sup> The 2016 AQMP included new and innovative ways to accomplish these goals through incentive programs, efficiency improvements, recognizing co-benefits from other programs, as well as traditional regulatory measures. It described how reductions in NO<sub>x</sub>, SO<sub>x</sub>, VOC, and ammonia emissions will contribute to attaining the PM<sub>2.5</sub> standard in the South Coast area and contained the evaluation of available control measures for all four of these PM<sub>2.5</sub> precursor pollutants as well as direct PM<sub>2.5</sub>, consistent with the regulatory presumptions under Subpart 4. Based on the 2016 AQMP's updated emission inventory and modeling, attainment of the 2006 standard was expected to be achieved by 2019 using baseline emissions, which incorporated the control impacts of already adopted rules and regulations. The Serious Area Plan, as included in the 2016 AQMP and 2016 California SIP, was approved by the U.S. EPA in 2019.<sup>7</sup>

Monitoring data from 2017 to 2019 indicated that the Basin did not attain the 2006 24-hour PM<sub>2.5</sub> standard by December 31, 2019. Two air monitoring stations, Mira Loma and Compton, exceeded the PM<sub>2.5</sub> NAAQS. While Mira Loma has been the highest design value site since 2008, Compton became the highest site in 2017 due to three anomalous high readings recorded in January and December 2017. On July 10, 2020, the U. S. EPA issued a proposed rule determining that the Basin has failed to attain the standard by the attainment deadline.<sup>7</sup> For a Serious PM nonattainment area that fails to attain, Section 189(d) of the CAA requires that within 12 months after the applicable attainment date, a revision to the California SIP must be submitted, that, among other elements, provides for expeditious attainment within the time limits prescribed by regulation and provides for a five percent annual reduction in the emissions of direct PM<sub>2.5</sub> or a PM<sub>2.5</sub> precursor pollutants.

### ***PM<sub>2.5</sub> Precursors***

PM<sub>2.5</sub> is either directly emitted into the atmosphere (primary particles) or formed through atmospheric chemical reactions from precursor gases (secondary particles). Primary PM<sub>2.5</sub> includes road dust, diesel soot, combustion products, and other sources of fine particles. Secondary PM<sub>2.5</sub> products, such as sulfates, nitrates, and complex organic carbon compounds, are formed from reactions with oxides of sulfur, oxides of nitrogen, VOCs, and ammonia. The majority of PM<sub>2.5</sub> in the South Coast Air Basin is secondary in nature.

Subpart 4 of the CAA specifies that the attainment plan requirements apply to emissions of all four precursor pollutants and direct PM<sub>2.5</sub> from all types of stationary, area, and mobile sources, except as otherwise provided in the Act (*e.g.*, in CAA Section 189(e)). Under CAA Section 189(e), control requirements that apply to PM<sub>2.5</sub> are also applicable to the precursors of PM, namely NO<sub>x</sub>, SO<sub>x</sub>, VOC and ammonia. In August 2016, U.S. EPA issued the Final Rule of “*Fine Particle Matter*

<sup>6</sup> 2016 AQMP. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>.

<sup>7</sup> 84 FR 3305 (March 14, 2019).

*National Ambient Air Quality Standards: State Implementation Plan Requirements*” (81 FR 58010) that provides a planning requirement framework for the 2012 and future PM2.5 NAAQS pursuant to Subpart 4. States must evaluate and adopt control measures for direct PM2.5 and all four PM2.5 precursors from stationary, mobile and area sources, unless states can demonstrate that the contribution of a precursor is insignificant.

### ***Purpose of This Plan***

This plan (Plan or Section 189(d) Plan) is developed to address the attainment planning requirements for the Basin due to its failure to attain the 2006 PM2.5 standard by the attainment deadline. The attainment plan addresses directly-emitted PM2.5 as well as the four PM2.5 precursors, namely NOx, SOx, VOC, and ammonia emissions. Chapter 2 of this document presents the PM2.5 air quality trends. Chapter 3 describes the base-year emissions inventory and future projections of emissions. Chapter 4 describes the overall control strategy based on the continued implementation of regional and statewide control measures for attaining the 2006 24-hour PM2.5 standard in the Basin. Chapter 5 presents the attainment demonstration and future air quality projections. Other federal CAA requirements are discussed in Chapter 6.

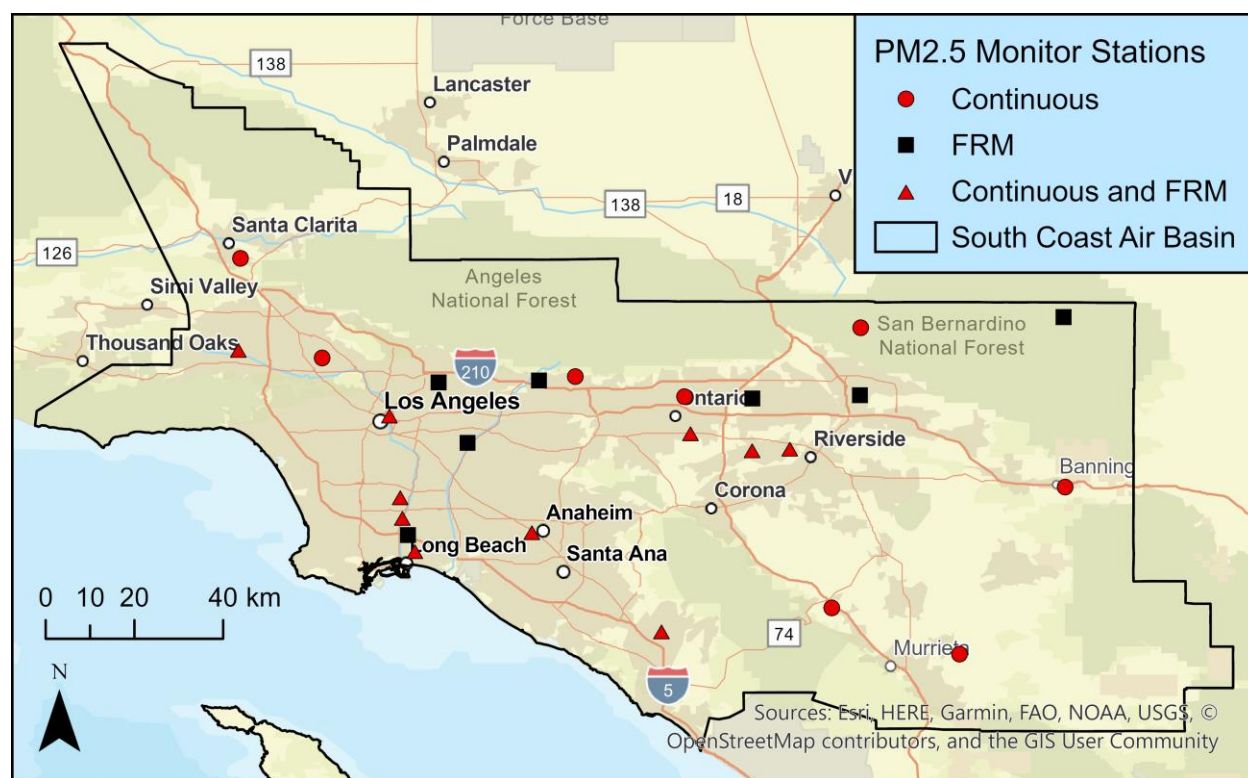

## 2. AIR QUALITY TRENDS

### *Introduction*

~~This chapter summarizes ambient fine particulate matter (PM2.5) in the South Coast Air Basin (Basin) as monitored by South Coast AQMD is summarized for the year 2019, along with prior year trends, in the South Coast Air Basin (Basin).~~ The factors influencing PM2.5 concentrations are also discussed. The Basin's recent air quality is compared to the NAAQS and to the California Ambient Air Quality Standards (CAAQS or State standards). Data presented indicate the current attainment or nonattainment status for the various NAAQS and CAAQS PM2.5 standards, showing the progress made to date and assisting the South Coast AQMD in planning for future attainment.

The South Coast AQMD began regular monitoring of PM2.5 in 1999 following the U.S. EPA's adoption of the national PM2.5 standards in 1997. In 2019, ambient PM2.5 concentrations were monitored at 24 locations throughout the South Coast Air Basin, including two near-road sites. Filter-based Federal Reference Method (FRM) PM2.5 sampling was employed at 17 of these stations. ~~Eight~~ and 8 of the FRM measurement stations sampled on a daily basis, ~~daily~~ beyond the federally required 1-in-3-day sampling schedule, including the two near-road sites. Fifteen stations, including one near-road site, employed continuous PM2.5 monitors and 8 of these were collocated with FRM measurements. Except for the continuous federal equivalent method (FEM) PM2.5 monitors in Anaheim, Rubidoux, Long Beach (South) and Ontario Route 60, only FRM filter-based monitors meet the U.S. EPA criteria to be used for NAAQS comparison.<sup>8</sup> These four monitors recently passed a comparability assessment and therefore, daily averages can be used to supplement FRM measurements on days with missing data. South Coast AQMD has been granted annual waivers by U.S. EPA precluding the use of all other FEM monitors for NAAQS attainment consideration since they do not meet comparability criteria. The continuous data is used for forecasting, real-time air quality alerts, and for evaluating hour-by-hour variations. Figure 2-1 provides the location of all regulatory PM2.5 monitors within the Basin.

<sup>8</sup> The continuous PM2.5 monitors deployed by South Coast AQMD are FEM-designated Beta Attenuation Monitor (BAM) instruments. The U.S. EPA waiver from NAAQS compliance for the continuous samplers is re-evaluated annually as part of the South Coast AQMD Annual Air Quality Monitoring Network Plan [<http://www.aqmd.gov/home/library/clean-air-plans/monitoring-network-plan>].

**FIGURE 2-1**

Location of All Regulatory Monitors in the South Coast Air Basin. All FRM monitors and the continuous monitors in Anaheim, Rubidoux, Long Beach (South) and Ontario Route 60 meet the U.S. EPA criteria to be used for NAAQS comparison.

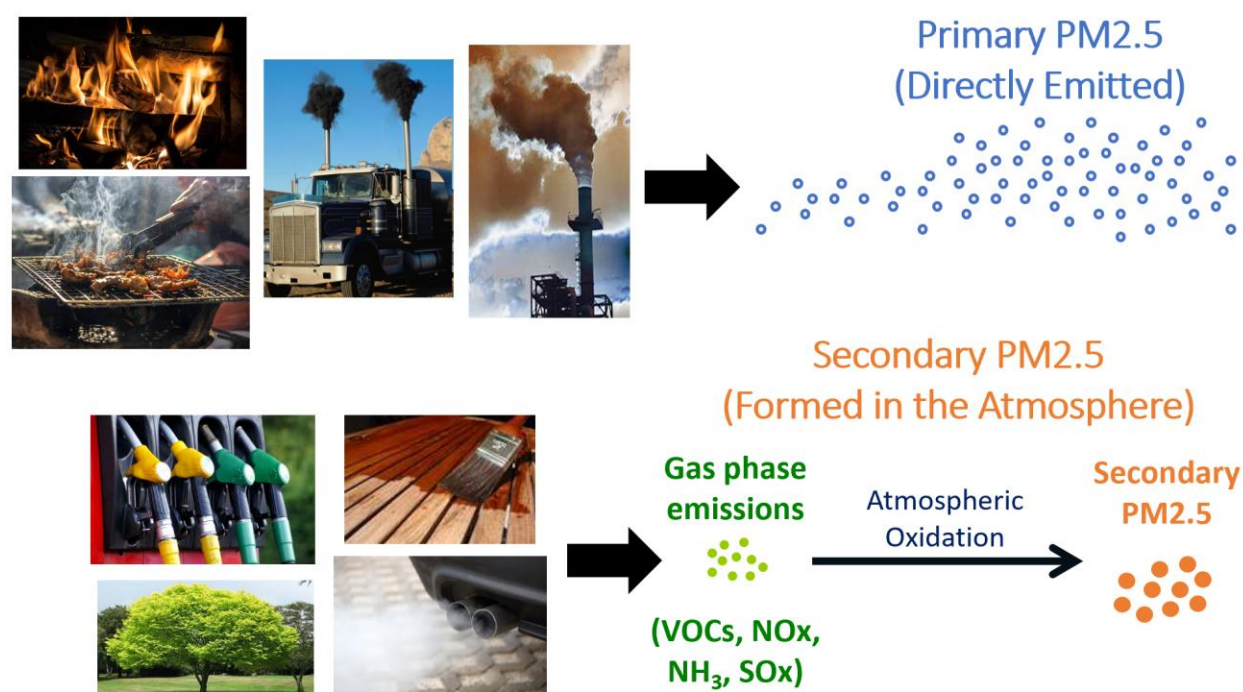

Inhalation of fine particulate matter has been associated with a wide variety of health effects such as exacerbation of symptoms in patients with respiratory or cardiovascular disease, decline in pulmonary function in children, increased risk of premature death, increased risk of lung cancer, and potentially may be linked to adverse reproductive and cognitive effects. The impacts of these health effects may be seen in increased asthma-related hospital admissions, increased school absences and lost work days. Elevated PM<sub>2.5</sub> concentrations also impair visibility. This list of health and welfare effects is not comprehensive; detailed health effects information can be found in Appendix I: Health Effects in the 2016 AQMP or in the U.S. EPA NAAQS documentation at <https://www.epa.gov/naaqs>.

### ***Factors that Influence PM<sub>2.5</sub> Concentrations***

The South Coast Air Basin's air pollution problems are a consequence of the combination of direct emissions from the nation's second largest urban area, atmospheric chemical reactions from those precursor pollutants, meteorological conditions adverse to the dispersion of those emissions, and mountainous terrain surrounding the Basin that traps pollutants as they are pushed inland with the sea breeze. PM<sub>2.5</sub> is a suspension of solid or liquid particles that are less than 2.5 micron in diameter. These particles can be directly emitted by combustion sources or can be formed in the

atmosphere. (Figure 2-2). Gas-phase volatile organic compound (VOCs), oxides of nitrogen (NO<sub>x</sub>), oxides of sulfur (SO<sub>x</sub>) and ammonia (NH<sub>3</sub>) react with each other and other atmospheric oxidants to form species with lower volatility that condense into the particle-phase. The precursors are from mobile, point and area sources, with the largest portion resulting from fuel combustion. Both directly emitted PM<sub>2.5</sub> and PM<sub>2.5</sub> that is formed in the atmosphere contribute to measured PM<sub>2.5</sub> concentrations, but in the South Coast Air Basin, secondary PM<sub>2.5</sub> formation is responsible for roughly two thirds of the total PM<sub>2.5</sub> mass (Figure 2-3).<sup>9</sup>

**FIGURE 2-2**  
PM<sub>2.5</sub> Formation Mechanisms

<sup>9</sup> Fractions of primary and secondary PM were estimated using the PM<sub>2.5</sub> speciation data measured at the Los Angeles-North Main street from June 2012 to July 2018. The total mass of the elemental carbon and metals was assigned as primary PM<sub>2.5</sub>. The total mass of inorganic ions was assigned as secondary PM<sub>2.5</sub>. For organic aerosols, we referred to Figure V-6-20 in the Appendix V of the South Coast AQMD's 2016 Air Quality Management Plan (AQMP) and assigned 30% of the organic aerosol as primary PM<sub>2.5</sub> and 70% to the secondary PM<sub>2.5</sub> fraction. Appendix V of the South Coast AQMD's 2016 Air Quality Management Plan (AQMP) is available at <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-v.pdf?sfvrsn=10>.

**FIGURE 2-3**

Approximate Contribution of Primary and Secondary PM2.5. Formation Processes in the South Coast Air Basin. The contribution was calculated based on annual averaged PM2.5 speciation measurements conducted at the Los Angeles-North Main street station from June 2012 to July 2018.<sup>9</sup>

Most sources of PM2.5 and PM2.5 precursors have regular patterns of emissions that may vary by day of the week or possibly by season. However, episodes of elevated PM2.5 can be caused by adverse meteorological conditions and emission sources that occur infrequently such as wildfires, fireworks, or residential wood combustion. Wildfires are an important source of PM2.5 and PM2.5 precursors and can lead to significant PM2.5 episodes, especially during the summer and fall months when wildfire activity is more likely. Fireworks, either from commercial displays or personal use, are a significant source of PM2.5 on July 4<sup>th</sup> and 5<sup>th</sup> each year; concentrations recorded on these days are typically the highest measured in the entire year. To a lesser extent, fireworks also influence PM2.5 concentrations on January 1<sup>st</sup> in some areas of the South Coast Air Basin. Residential wood combustion is also an important source of PM2.5 and PM2.5 precursors, predominantly during the months of November through February. Residents are more likely to burn wood on cool nights, on the weekends, and during holiday periods. Wood burning patterns also vary throughout the Basin.

While long term trends in PM2.5 concentrations are largely driven by changes in emissions, the observed daily variations in pollutant concentrations are primarily the result of meteorological changes and to some extent, residential wood combustion, except on days with elevated atypical emissions such as fireworks and wildfires. Elevated PM2.5 concentrations can occur in the Basin throughout the year but occur most frequently in fall and winter. This is mainly due to the unfavorable meteorological conditions that are more common in those months. Figure 2-5 summarizes the meteorological factors that influence PM2.5 concentrations.

**FIGURE 2-5**  
Important Factors That Influence PM<sub>2.5</sub> Concentrations

The average wind speed for Los Angeles is the lowest of the nation's 10 largest urban areas. In addition, the summertime daily maximum mixing heights<sup>10</sup> in Southern California are the lowest, on average, due to strong temperature inversions in the lower atmosphere that effectively trap pollutants near the surface. Southern California also has abundant sunshine, which drives the photochemical reactions that form a significant portion of fine particulate mass (PM<sub>2.5</sub>). Periods of fog or high humidity can also lead to elevated PM<sub>2.5</sub> concentrations as chemistry in fog droplets can increase fine particle mass.

Storms, which predominantly occur during the winter months, are effective in reducing ambient PM<sub>2.5</sub> concentrations. Enhanced ventilation and destruction of temperature inversions facilitate atmospheric mixing. Rainfall is extremely effective form of deposition, which can significantly reduce PM<sub>2.5</sub> concentrations in the atmosphere. The frequency of these storms during the winter months can strongly influence the 98<sup>th</sup> percentile daily average concentration, which is a key parameter to determine attainment of the 24-hour PM<sub>2.5</sub> standard.

<sup>10</sup> The maximum mixing height is an index of how well pollutants can be dispersed vertically in the atmosphere.

## Ambient Air Quality Standards

### Federal and State Standards

Ambient air quality standards have been set by both the federal government and the State of California for fine particulate matter. In this chapter, statistics capturing the number of days exceeding federal standards are presented along with concentration trends and design values. Exceedance metrics are instructive regarding trends and control strategy effectiveness. However, it should be noted that an exceedance of the concentration level of a federal standard does not necessarily mean that the NAAQS was violated or that it would cause nonattainment. The form of the standard must also be considered. For example, for 24-hour PM<sub>2.5</sub>, the form of the standard is the annual 98<sup>th</sup> percentile measurement of all the 24-hour PM<sub>2.5</sub> daily samples at each station.

For PM<sub>2.5</sub> NAAQS attainment/nonattainment decisions, the most recent three years of data are considered along with the form of the standard, to calculate a *design value* for each station.<sup>11</sup> The overall design value for an air basin is the highest design value of all the stations in that basin. The California State air quality standards are values that are not to be exceeded, typically evaluated over a 3-year period, and the data is evaluated in terms of a *State designation value*, which allows for some statistical data outliers and exceptional events. Attainment deadlines for the State standards are ‘as soon as practicable.’

**TABLE 2-1**

National Ambient Air Quality Standards (NAAQS) and Design Value Requirements for Fine Particulate Matter

Averaging Time**	NAAQS Level	Design Value Form of NAAQS*
<b>24-Hour (2006)</b>	<b>35 µg/m<sup>3</sup></b>	<b>3-year average of the annual 98<sup>th</sup> percentile of daily 24-hour concentration</b>
24-Hour (1997) [revised 2006]***	65 µg/m <sup>3</sup>	
<b>Annual (2012)</b>	<b>12.0 µg/m<sup>3</sup></b>	<b>Annual average concentration, averaged over 3 years (annual averages based on average of 4 quarters)</b>
Annual (1997) [revised 2012]***	15.0 µg/m <sup>3</sup>	

Bold text denotes the current and most stringent NAAQS

\* The NAAQS is attained when the design value (form of concentration listed) is equal to or less than the level of the NAAQS

\*\* Year of U.S. EPA NAAQS update review shown in parenthesis and revoked or revised status in brackets; for revoked or revised NAAQS, areas may have continuing obligations until that standard is attained.

\*\*\*On July 25, 2016 U.S. EPA finalized a determination that the Basin attained the 1997 annual (15.0 µg/m<sup>3</sup>) and 24-hour PM<sub>2.5</sub> (65 µg/m<sup>3</sup>) NAAQS, effective August 24, 2016.

<sup>11</sup> Note that for modeling attainment demonstrations, the U.S. EPA modeling guidance recommends a 5-year weighted average for the design value instead of a 3-year average.

**TABLE 2-2**

California Ambient Air Quality Standards (CAAQS) and Designation Value Requirements for Fine Particulate Matter

Averaging Time**	CAAQS Level	Designation Value Form of CAAQS*
Annual (2012)	12.0 µg/m <sup>3</sup>	Annual average of the daily 24-hour concentrations. Maximum value in a three year period.

\* The CAAQS is attained when the design value (form of concentration listed) is equal to or less than the level of the CAAQS

Under the Exceptional Events Rule,<sup>12</sup> U.S. EPA allows certain air quality data to not be considered for NAAQS attainment status when that data is influenced by exceptional events that meet strict evidential requirements, such as high winds, wildfires, volcanoes, or some cultural events (such as Independence Day or New Year's fireworks). An exceptional event meets the following criteria:

- The event affected air quality in such a way that there exists a clear causal relationship between the specific event and the monitored exceedance or violation
- The event was not reasonably controllable or preventable
- The event was caused by human activity that is unlikely to recur at a particular location or was a natural event

For a few PM measurements in the Basin between 2016 and 2019, the District applied the U.S. EPA Exceptional Events Rule to flag some PM<sub>2.5</sub> data due to wildfires and fireworks on Independence Day. All of the exceptional event flags through 2019 have been submitted with the affected data to U.S. EPA's Air Quality System (AQS) database. The preparation of the District's documentation for those events that affect regulatory decisions is under way and U.S. EPA's concurrence will be requested if these events have regulatory significance. The process to achieve an attainment designation for PM<sub>2.5</sub> in the South Coast Air Basin will likely depend upon U.S. EPA's concurrence with the exceptional event flags and the appropriate demonstrations showing that exceedances were caused by wildfire smoke and/or Independence Day fireworks.

## *PM<sub>2.5</sub> Air Quality Trends*

### *24-hour Standard*

Over the past two decades, the number of 24-hour PM<sub>2.5</sub> exceedance days have continuously decreased. The number of days when the Basin-maximum 24-hour PM<sub>2.5</sub> exceeded the 24-hour NAAQS in each month from 2000 to 2019 are shown in Figure 2-6. Compared with data collected in 2000, the number of days exceeding the standard in 2019 decreased by 89%, from 109 days to 12 days. In the 2000s, exceedance days were recorded in every month. However, in recent years,

<sup>12</sup> The Final 2016 U.S. EPA Exceptional Events Rule is available at <https://www.epa.gov/air-quality-analysis/final-2016-exceptional-events-rule-supporting-guidance-documents-updated-faqs>.

the 24-hour standard is typically only exceeded in the winter months, from November to February. Even in the winter months, there are considerably fewer number of exceedance days than in past decades.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total

2020	4	1	0	0	0	0							

**FIGURE 2-6**

Number of Days When the Basin-Maximum 24-Hour PM2.5 Concentrations Exceeded the 24-Hour PM2.5 Standard ( $35.4 \mu\text{g}/\text{m}^3$ ) in Each Month from January 2000 to June 2020 in the South Coast Air Basin.

The trend of the Basin-maximum 98<sup>th</sup> percentile 24-hour PM2.5 measured in the South Coast Air Basin is presented in Figure 2-7. This parameter is an important metric for tracking progress towards clean air goals as the three-year average of the 98<sup>th</sup> percentile concentration at each station represents the design value. As shown in the figure, the basin maximum 98<sup>th</sup> percentile 24-hour PM2.5 values have declined significantly over the past two decades. The value recorded in 2019 has decreased by 58% compared with the value recorded in 2000, from  $85.6 \mu\text{g}/\text{m}^3$  to  $36.2 \mu\text{g}/\text{m}^3$ . With the exception of 2012, Mira Loma has had the highest 98<sup>th</sup> percentile value in all years before 2017. Compton had the highest 98<sup>th</sup> percentile value in 2017 due to three anomalous measurements

(See Chapter 5 and Appendix V). The highest 98<sup>th</sup> percentile in the Basin in 2018 and 2019 was recorded at the CA710 near road monitor and Mira Loma, respectively.

**FIGURE 2-7**

Basin-Maximum 98<sup>th</sup> Percentile 24-Hour PM<sub>2.5</sub> Concentrations Measured in the South Coast Air Basin from 2000-2019

\* Data likely to be approved as exceptional events by U.S. EPA removed from analysis.

The trend of the 24-hour basin-maximum PM<sub>2.5</sub> design value measured in the South Coast Air Basin is shown in Figure 2-8. The 24-hour PM<sub>2.5</sub> design value has continuously declined and is approaching the 24-hour PM<sub>2.5</sub> federal standard (35 µg/m<sup>3</sup>). Compared with the design value in 2001, the 24-hour PM<sub>2.5</sub> design value has declined by 50%, from 76 µg/m<sup>3</sup> in 2001 to 38 µg/m<sup>3</sup> in 2019. From 2008 to 2016, the highest design value was recorded in Mira Loma. However, in the last two years, Compton has replaced Mira Loma as the station with highest 24-hour PM<sub>2.5</sub> design value due to three anomalous values recorded in 2017 (See Chapter 5 and Appendix V). The slight increasing trend in the 2014 and 2015 3-year design values is due in large part to extreme drought conditions experienced in Southern California and the associated lack of periodic storm events in the winter months that facilitate dispersion and washout of pollutants.<sup>13</sup>

Last accessed Sept 9<sup>th</sup>, 2020.

**FIGURE 2-8**

24-Hour PM<sub>2.5</sub> Design Value in the South Coast Air Basin from 2000-2019

\* Data likely to be approved as exceptional events by U.S. EPA removed from analysis.

### Annual Standard

Figure 2-9 presents the trend of the annual average PM<sub>2.5</sub> concentration measured in the South Coast Air Basin. The trend of the annual average PM<sub>2.5</sub> concentration measured in the South Coast Air Basin is presented in Figure 2-9. As shown in the figure, the Basin-maximum annual average PM<sub>2.5</sub> has decreased significantly over the past two decades. The annual average recorded in 2019 has decreased 58% compared with the value recorded in 2000, from 30.2 µg/m³ to 12.6 µg/m³. Between 2010 and 2015, the highest annual average PM<sub>2.5</sub> concentration was recorded in Mira Loma. However, annual averages recorded at the Ontario Route-60 near road station exceed averages in Mira Loma since 2015. The 2019 annual average is the lowest on record.

**FIGURE 2-9**

Basin-Maximum Annual Average PM<sub>2.5</sub> Concentrations Measured in the South Coast Air Basin from 2000-2019

\* Data likely to be approved as exceptional events by U.S. EPA removed from analysis.

Trends in the annual PM<sub>2.5</sub> design values measured in the South Coast Air Basin are shown in Figure 2-10. The annual PM<sub>2.5</sub> design value has decreased significantly over the past two decades. Compared with the design value in 2001, the annual PM<sub>2.5</sub> design value in 2019 decreased by 54%, from 29.8 µg/m<sup>3</sup> to 13.8 µg/m<sup>3</sup>. The Ontario Route-60 Near Road station currently has the highest annual design value. By the end of 2019, the annual PM<sub>2.5</sub> design value in the South Coast Air Basin was only 1.8 µg/m<sup>3</sup> higher than the 2012 annual PM<sub>2.5</sub> federal standard. The 2019 design value is the lowest since measurements began.

**FIGURE 2-10**

Annual average PM<sub>2.5</sub> design value in the South Coast Air Basin from 2000-2019

\* Data likely to be approved as exceptional events by U.S. EPA have been removed from analysis.

### Attainment Status (24-hour Standard)

The 2019 PM<sub>2.5</sub> 24-hour design values are summarized in Table 2-3. Numbers in the parentheses are calculated after removing 24-hour PM<sub>2.5</sub> data that are likely to be approved as exceptional events by the U.S. EPA. ~~Data likely to be approved as exceptional events by U.S. EPA are removed from this analysis.~~ PM<sub>2.5</sub> concentrations were highest in South Central LA County and the inland valley areas of metropolitan Riverside County. The highest 2019 PM<sub>2.5</sub> 24-hour design value of 38 µg/m<sup>3</sup> was measured in the South Central LA County area at the Compton air monitoring station. The next highest 2019 PM<sub>2.5</sub> 24-hour design value was 37 µg/m<sup>3</sup>, measured in the Metropolitan Riverside County area at the Mira Loma air monitoring station. All other 2019 PM<sub>2.5</sub> 24-hour design values were below the 24-hour NAAQS (35 µg/m<sup>3</sup>).

**TABLE 2-3**

2017–2019 24-hour PM<sub>2.5</sub> Design Values by County\*

County	2017–2019 PM <sub>2.5</sub> 24-Hour Design Value (µg/m <sup>3</sup> )	Percent of Current (2006) PM <sub>2.5</sub> NAAQS (35 µg/m <sup>3</sup> )	Area of Design Value Max
Los Angeles-	38 (38)	109 (109)	South Central LA County
Orange	31 (29) <sup>**</sup>	89 (83) <sup>49</sup>	Central Orange County Saddleback Valley
Riverside	37 (37)	106 (106)	Metropolitan Riverside County-3
San Bernardino	34 (32)	97 (91)	CA-60 Near Road

\*Numbers ~~Data in the parentheses~~ are calculated after removing 24-hour PM<sub>2.5</sub> data that are likely to be approved as exceptional events by U.S. EPA ~~removed from analysis~~

~~\*\* Anaheim in the Central Orange County area does not have a valid design value because measurements do not meet data completeness requirements~~

2019 PM<sub>2.5</sub> 24-hour design values measured at all station in the South Coast Air Basin are presented in Figure 2-11. There is no state 24-hour PM<sub>2.5</sub> standard. Although the South Coast Air Basin did not attain the 24-hour NAAQS by the 2019 deadline, if the 98<sup>th</sup> percentile 24-hour PM<sub>2.5</sub> of all stations in 2020 are below the 24-hour NAAQS, the South Coast Air Basin will attain the standard by 2020. The 2-year average (2018-2019) of the 98<sup>th</sup> percentile 24-hour PM<sub>2.5</sub> measured at all stations in the South Coast Air Basin are shown in Figure 2-12. As shown in the figure, the 2-year average is below the 24-hour federal standard at all stations. At the two highest stations, Mira Loma and Ontario Route-60 Near Road, if the 2020 98<sup>th</sup> percentile 24-hour PM<sub>2.5</sub> values are below 35.8  $\mu\text{g}/\text{m}^3$  and 44.0  $\mu\text{g}/\text{m}^3$ , respectively, both stations will have a design value below the 24-hour federal standard in 2020.

**FIGURE 2-11**

Three year (2017-2019) 24-Hour PM<sub>2.5</sub> Design Values Measured at All Stations in the South Coast Air Basin. Anaheim does not have a valid design value because incomplete data in the 2017 4<sup>th</sup> quarter. Data likely to be approved as exceptional events by U.S. EPA has been removed from the analysis.

**FIGURE 2-12**

Two-year average (2018-2019) 98<sup>th</sup> percentile 24-Hour PM<sub>2.5</sub> values at all Stations in the South Coast Air Basin. Data likely to be approved as exceptional events by U.S. EPA has been removed from the analysis.

### Attainment Status (Annual Standard)

The 2019 PM<sub>2.5</sub> annual federal design values are summarized in Table 2-4. Data likely to be approved as exceptional events by U.S. EPA are removed from this analysis. The highest 2019 PM<sub>2.5</sub> federal annual design value of 13.8 µg/m<sup>3</sup> was measured in the Ontario Route-60 Near Road air monitoring station. The next highest 2019 PM<sub>2.5</sub> federal annual design value was 13.4 µg/m<sup>3</sup>, measured in the Metropolitan Riverside County area at the Mira Loma air monitoring station.

**TABLE 2-4**  
2017–2019 Annual Federal Design Values by County\*

County	2017–2019 PM <sub>2.5</sub> Annual Design Value (µg/m <sup>3</sup> )	Percent of Current (2012) PM <sub>2.5</sub> NAAQS (12.0 µg/m <sup>3</sup> )	Area of Design Value Max
Los Angeles	12.5 (12.4)	104 (103)	South Central LA County
Orange	7.9 (7.9)**	66 (66)	Saddleback Valley
Riverside	13.5 (13.4)	113 (112)	Metropolitan Riverside County
San Bernardino	14.0 (13.8)	117 (115)	CA-60 Near Road

\* Numbers in the parentheses are calculated after removing 24-hour PM<sub>2.5</sub> data that are likely to be approved as exceptional events by U.S. EPA. Data likely to be approved as exceptional events by U.S. EPA removed from analysis.

\*\* Anaheim in the Central Orange County area does not have a valid design value because measurements do not meet data completeness requirements.

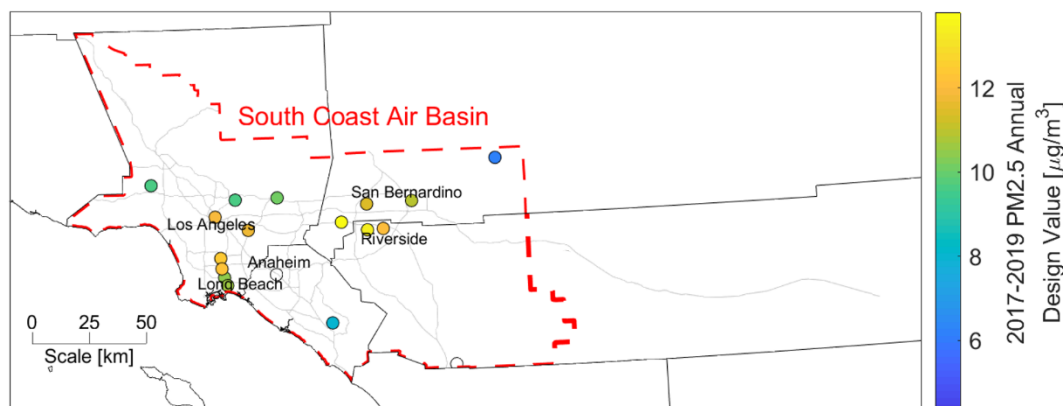

The 2019 PM<sub>2.5</sub> annual state designation values are summarized in Table 2-5. The 2019 PM<sub>2.5</sub> annual state designation values measured in Los Angeles, Riverside, and San Bernardino Counties exceed the state standard of 12 µg/m<sup>3</sup>. The highest 2019 PM<sub>2.5</sub> state annual designation value of 17 µg/m<sup>3</sup> was measured in the West San Fernando Valley area at the Reseda air monitoring station. State Designation Values are based on the maximum annual average recorded in a three-year period, and therefore, they are less responsive to year-to-year changes in concentrations. Exceptional events were not removed when calculating these state designation values, which explains why the highest annual average was recorded in the West San Fernando Valley—a location where wildfire smoke is common in the summer and fall.

**TABLE 2-5**  
2017–2019 Annual State Designation Values by County

County	2017–2019 PM <sub>2.5</sub> Annual State Designation Value (µg/m <sup>3</sup> )	Percent of Current PM <sub>2.5</sub> CAAQS (12 µg/m <sup>3</sup> )	Area of Design Value Max
Los Angeles	17	142	West San Fernando Valley
Orange	12	100	Central Orange County
Riverside	15	125	Metropolitan Riverside County
San Bernardino	16	133	CA-60 Near Road

Figure 2-13 illustrates the spatial trend of the 2019 PM<sub>2.5</sub> annual design values at all FRM PM<sub>2.5</sub> stations in the South Coast Air Basin. The highest PM<sub>2.5</sub> annual averages are in northwestern Riverside County (Mira Loma area), southwestern San Bernardino County (CA-60 Near Road), and the southern portion of Los Angeles County.

2019 PM<sub>2.5</sub> annual design values measured at all stations in the South Coast Air Basin are presented in Figure 2-14. As shown in the figure, the 2019 PM<sub>2.5</sub> annual design value exceeded the federal standard at four stations (Ontario Route-60 Near Road, Mira Loma, Compton, Long Beach Route-710 Near Road), with design values of 13.8 µg/m<sup>3</sup>, 13.4 µg/m<sup>3</sup>, 12.4 µg/m<sup>3</sup>, and 12.2 µg/m<sup>3</sup>, respectively (115, 112, 103, and 102 percent of the annual NAAQS).

**FIGURE 2-13**

All FRM PM<sub>2.5</sub> Stations in the South Coast Air Basin. The colors of circles represent the 2017–2019 annual PM<sub>2.5</sub> design value measured at each station. Anaheim in the Central Orange County area does not have a valid design value because measurements do not meet data completeness requirements. Data likely to be approved as exceptional events by U.S. EPA has been removed from analysis.

**FIGURE 2-14**

2017-2019 Annual PM<sub>2.5</sub> Design Values Measured at All Stations in the South Coast Air Basin.

Anaheim in the Central Orange County area does not have a valid design value because measurements do not meet data completeness requirements. Data likely to be approved as exceptional events by U.S. EPA has been removed from analysis.

Figure 2-15 shows the number of days when the 24-hour PM<sub>2.5</sub> exceed the 24-hour federal PM<sub>2.5</sub> standard (35.4 µg/m³) in each month of 2019 at each FRM PM<sub>2.5</sub> station in the South Coast Air Basin are presented in Figure 2-15. With the exception of the fourth and fifth of July, which are influenced by Independence Day fireworks, all exceedances occur in the months of November through January. Exceedances in the winter months are predominantly caused by cold and humid weather conditions that favor the formation of secondary inorganic aerosols and residential wood smoke. Exceedances caused by Independence Day fireworks are considered to be exceptional events; these exceedances will not be considered when determining attainment status upon U.S. EPA approval of a successful exceptional event demonstration.

	Wood burning and unfavorable meteorology					July 4 <sup>th</sup> and 5 <sup>th</sup> Fireworks			Wood burning & unfavorable meteorology

**FIGURE 2-15**

Number of Days the 24-Hour PM2.5 Exceeded the 24-Hour Federal PM2.5 Standard (35.4 µg/m<sup>3</sup>) in Each Month at Each FRM PM2.5 Station in the South Coast Air Basin in 2019. The red boxes are exceptional events that are likely to be approved by U.S. EPA.

### Summary

While the Basin has not yet attained the latest 24-hour and annual federal PM2.5 standards, PM2.5 concentrations have declined considerably since monitoring began in the early 2000s. PM2.5 concentrations in recent years have been approaching federal standards with the lowest annual average PM2.5 value recorded in 2019. In addition, the two-year average (2018-2019) of the 98th percentile daily value is below the standard at all stations in the Basin, making attainment of the 24-hour standard by the end of 2020 a distinct possibility. Attainment of 24-hour standard and the annual standard to a lesser extent, depends significantly on weather, especially humid and cold conditions that favor the formation of secondary PM2.5 and the frequency of storms during the winter months.

### 3. BASE-YEAR AND FUTURE EMISSIONS

#### *Introduction*

This chapter summarizes the PM2.5 and PM2.5 precursor emissions in the South Coast Air Basin for the 2018 baseline year as well as the projected emissions for the year 2023. The 2018 base year emissions inventory reflects actual point source emissions and estimated emissions for other categories subject to adopted regulations with current compliance dates as of 2018, whereas the 2023 future baseline emissions inventory is based on economic projections and adopted regulations for all categories with both current and future compliance dates. The current emissions inventory reflects regulations and programs adopted by South Coast AQMD as of December 2015 and by CARB as of November 2015. Regulations reflected in EMFAC2017 are included in the on-road mobile emissions. The annual average emissions inventory is used to perform PM2.5 modeling and to report emission reduction progress as required by the federal CAA.

#### *Emission Inventory Methodology*

Emissions in the inventory can be grouped into four categories: point, area, on-road mobile and off-road mobile sources. Emissions from each category are estimated using specific methodologies described briefly in the next sections. The methodologies used in this Plan are consistent with those used in the 2016 AQMP with updates where applicable. While more detailed information regarding the emissions inventory development for the base and future years is available in Chapter 3 and Appendix 3 of the 2016 AQMP<sup>14</sup>, a brief description for the four groups of emissions is provided below. Three main changes to the emissions inventory introduced in this Plan compared to the 2016 AQMP are: 1) point source emissions for the baseline year of 2018 are based on the reported actual emissions obtained from South Coast AQMD's Annual Emissions Reporting (AER) program, 2) on-road vehicle emissions are estimated using the EMFAC2017 model, which is an upgrade of the EMFAC2014 model used in the 2016 AQMP, and 3) updates in ocean-going vessel (OGV) emissions that account for growth rates for containerships, the delayed introduction of Tier 3 engines in California waters and other activity data for the ports.

#### *Point Sources*

Point sources generally correspond to permitted facilities with one or more emission sources at an identified location (e.g., power plants, refineries). The larger point source facilities with annual emissions of 4 tons or more of either Volatile Organic Compounds (VOC), Nitrogen Oxide (NOx), Sulfur Oxide (SOx), or total Particulate Matter (PM), or annual emissions of over 100 tons of Carbon Monoxide (CO) are required to report their criteria pollutant emissions and selected air toxics pursuant to Rule 301 through the Annual Emission Reporting (AER) Program. These facilities need to report emissions on an annual basis and are subject to emission audits. This Plan

<sup>14</sup> South Coast AQMD (2017), 2016 Air Quality Management Plan, Appendix III, Base and future year emission inventory. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iii.pdf?sfvrsn=6>.

uses the 2018 annual reported emissions for the 2018 baseline, as opposed to the projected emissions from 2012 that were used in the 2016 AQMP.

### ***Area Sources***

Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products and permitted sources that are smaller than the above thresholds) which are distributed across the region and are not required to individually report their annual emissions. There are about 400 area source categories for which emission estimates are jointly developed by CARB and the South Coast AQMD. The emissions from these sources are estimated using specific activity information and emission factors. Activity data are usually obtained from survey data or scientific reports (e.g., Energy Information Administration (EIA) reports for fuel consumption other than natural gas, Southern California Gas Company for natural gas consumption, paint suppliers under Rule 314 and South Coast AQMD databases). Emission factors are based on rule compliance factors, source tests, manufacturer's product or technical specification data, default factors (mostly from the U.S. EPA's AP-42 published emission factor compilations), or weighted emission factors derived from the point source facilities' annual emissions reports. The overall methodology for area sources is described in Appendix III of the 2016 AQMP. The area source emissions in this Plan are the same emissions projected in the 2016 AQMP for 2018 and 2023, using growth and control factors derived from regulatory and socio-economic data.

### ***On-Road Sources***

On-road sources include motor vehicles such as passenger cars, buses and trucks that travel on roads, streets, and highways. Emissions from on-road sources are calculated using travel activity and vehicle-specific emission factors that depend on temperature and relative humidity. This Plan uses the same travel activity data from SCAG's 2016 RTP/SCS<sup>15</sup> that was used in the 2016 AQMP, but on-road emission factors are updated based on CARB's EMFAC 2017 model, which is an update to the EMFAC 2014 model that was used in the 2016 AQMP. In addition, the Emission Spatial and Temporal Allocator (ESTA, <https://github.com/mmb-carb/ESTA>) tool developed by CARB is used to distribute the emissions spatially and temporally to generate inputs to the air quality model used in the attainment demonstration air quality simulations. CARB's EMFAC 2017 model has undergone revisions from the previous version (EMFAC 2014) which include changes in emission rates for light-, medium- and heavy-duty vehicles. More detailed information on the changes incorporated in EMFAC 2017 can be found at CARB's website.<sup>16</sup>

---

<sup>15</sup> SCAG 2016, The 2016-2040 Regional Transportation Plan/sustainable Communities Strategy: A Plan for Mobility, Accessibility, Sustainability and a High Quality of Life. Available at <http://scagrtpscscs.net/SiteAssets/ExecutiveSummary/index.html>.

<sup>16</sup> <https://ww2.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/road-documentation/msei-modeling-tools-emfac>.

Figure 3-1 compares the on-road emissions estimated using EMFAC 2014 in the 2016 AQMP and EMFAC 2017 used in the in this Plan for milestone years 2018 and 2023. In general, EMFAC 2017 tends to estimate lower VOC emissions, compared to EMFAC 2014. NOx emissions in 2018 are comparable between the two EMFAC versions. However, future NOx emissions estimated with EMFAC2017 are higher than NOx emissions estimated with EMFAC2014. In addition, the differences in NOx estimates tend to increase in future years, compared to estimates projected by EMFAC 2014. The main contributor to higher future NOx emissions estimated by EMFAC 2017 is the higher in-use NOx emission rates from medium- and heavy-duty vehicle model years of 2010 and newer. Also, light-duty vehicles have lower running exhaust emissions, but have higher start emissions in the newer version of EMFAC.

**FIGURE 3-1**

Comparison of On-Road Annual Average Emissions Estimated Using EMFAC 2014 in 2016 AQMP and EMFAC 2017 in Current Plan

### ***Off-Road Sources***

Mobile sources not included in the on-road mobile source emissions inventory are classified as off-road mobile sources. CARB uses several models to estimate emissions for more than 100 off-road equipment categories of different fuel types, engine sizes, and engine types. The models account for the effects of various adopted regulations, technology types, and seasonal effects on emissions. The models combine equipment population, equipment activity, horsepower, load factors, population growth, survival rates, and emission factors to yield the annual emissions by county, air basin, or statewide. Temporal usage profiles are used to develop seasonal emission estimates that are then spatially allocated to or within the county or air basin using surrogates such as population.<sup>17</sup> The off-road inventory for this Plan was primarily based on the 2016 AQMP inventory, which used a suite of category-specific models, with the exception of OGVs.

The only adjustment in the off-road emissions inventory since the adoption of the 2016 AQMP is for the OGV category to account for growth rates for containerships, the delayed introduction of Tier 3 engines in California waters and other activity data in ports. The OGV emissions in the 2016 AQMP had anticipated a faster turnover to cleaner vessels (i.e., vessels meeting International Maritime Organizations' Tier 3 engine standards). However, the updated OGV inventory shows NOx emissions increasing with time reflecting delayed turnover to cleaner vessels in the near future, while PM2.5 emissions decrease due to the impact of existing regulations. See CARB 2018 Updates to the California State Implementation Plan<sup>18</sup> for further details.

### ***Base Year (2018) Emission Inventory***

Table 3-1 shows the 2018 annual average emissions inventory for the South Coast Air Basin by major source category. Figure 3-2 characterizes relative contributions by stationary and mobile source categories. On- and off-road sources continue to be major contributors for each of the five pollutants. Overall, total mobile source emissions account for 44 percent of the VOC and 84 percent of the NOx emissions. The on-road mobile category alone contributes 22 percent of the VOC and 48 percent of the NOx emissions. For primary PM2.5, mobile sources represent 28 percent of the emissions with another 14 percent due to vehicle-related entrained road dust. Stationary sources account for 72% of the total directly emitted PM2.5. Paved and unpaved road dust account for 18 percent of PM2.5 emissions in the stationary source category. Under the stationary source category, commercial cooking is the predominant source of directly emitted PM2.5 emissions (26 percent). Stationary sources emit most of the SOx emissions with the point and area source categories contributing 50 percent and 8 percent of the SOx emissions in the Basin, respectively. Area sources play a major role in VOC emissions, emitting 50 percent of total emissions, with consumer products being the single largest VOC emitting source category.

<sup>17</sup> More information about off-road models can be found at [http://www.arb.ca.gov/msei/categories.htm#offroad\\_motor\\_vehicles](http://www.arb.ca.gov/msei/categories.htm#offroad_motor_vehicles)

<sup>18</sup> CARB 2018 Updates to the California State Implementation Plan, Available at <https://ww3.arb.ca.gov/planning/sip/2018sipupdate/2018update.pdf>

Figure 3-3 shows the fraction of the 2018 inventory by responsible agency for VOC, NO<sub>x</sub>, SO<sub>x</sub>, directly emitted PM<sub>2.5</sub> and NH<sub>3</sub>. The U.S. EPA and CARB have primary authority to regulate emissions from mobile sources. The U.S. EPA's authority primarily applies to aircraft, locomotives, ocean going vessels (OGVs), and some categories of on- and off-road mobile equipment. CARB also has authority over on-road categories and some off-road mobile and area source categories including OGV and consumer products, while the South Coast AQMD has direct authority over all point sources and most area sources, with limited authority over mobile sources. As shown in Figure 3-3, most of the NO<sub>x</sub> and VOC emissions in the Basin are from sources that fall under the primary jurisdiction of the U.S. EPA and CARB. For example, the U.S. EPA and CARB have direct control over 85 percent and over 70 percent of the Basin's total NO<sub>x</sub> and VOC emissions, respectively. Conversely, 58 percent of the SO<sub>x</sub> emissions, 72 percent of the directly emitted PM<sub>2.5</sub> emissions and 79 percent of the ammonia emissions are from sources under South Coast AQMD's authority. NO<sub>x</sub> and VOC are important precursors to form ozone and PM<sub>2.5</sub>, and SO<sub>x</sub> and NH<sub>3</sub> along with directly emitted PM<sub>2.5</sub>, contribute to the region's PM<sub>2.5</sub> air quality. This illustrates that actions at the federal, state, and local levels are all needed to ensure the region attains the federal ambient air quality standards.

### *Future Emissions*

Stationary and off-road mobile sources, except for OGV, in the 2023 future emissions inventory in this Plan were projected using growth and control factors developed for the 2016 AQMP, while OGV emissions were projected using later estimates from the 2018 updates to the California SIP Plan<sup>19</sup> to reflect a slower turnover to cleaner vessels. On-road mobile source emissions were projected using EMFAC 2017 emission factors applied to the 2023 vehicle activity projected in SCAG's 2016 RTP.

Future-year stationary source emissions are divided into RECLAIM and non-RECLAIM point source emissions and area sources. RECLAIM stands for REgional CLean Air Incentives Market is the world's first comprehensive market program to reduce NOx and SOx emissions using a cap-and-trade approach. Future NOx and SOx emissions from RECLAIM point sources are estimated based on their allocations as specified by South Coast AQMD Rule 2002 –Allocations for NOx and SOx. The forecasts for area source emissions were derived for the 2016 AQMP using: (1) emissions from the 2012 base year, (2) expected controls based on implementation of South Coast AQMD's rules as reflected in the 2016 AQMP, and (3) activity growth in various source categories between the base and future years. Chapter 3 and Appendix III of the 2016 AQMP provide more information on how the emissions were projected. Non-RECLAIM point sources were derived similarly to area sources, but projections were based on reported 2018 emissions.

The 2023 projected emissions reflect already adopted rules and regulations implemented up to and including 2023. Tables 3-2 presents the annual average emissions for 2023. Emissions inventories for the attainment year and the Reasonable Further Progress (RFP) milestone years (2020 and 2026) as well as the base year can be found in Appendix I.

For mobile sources, NOx emissions are expected to decrease due to existing regulations such as engine standards for new and existing on-road and off-road mobile sources and in-use fleet requirements. Emissions from on-road mobile sources are projected to decline for all pollutants from 2018 to 2023. Off-road emissions are also expected to decline, except for CO and SOx. Emissions from stationary sources, except for NOx and NH3, are expected to increase due to an increase in population and economic activity. Figure 3-4 illustrates the relative contribution to the 2023 inventory by source category. A comparison of Figures 3-2 and 3-4 indicates that the mobile category continues to be the largest contributor to NOx emissions. Figure 3-5 compares the annual average emissions of VOC and NOx between 2018 and 2023 for the four major categories. PM2.5 emissions are dominated by area sources with cooking, demolition, and road dust categories as main contributors. Because of the growth in population, economic activity and vehicle miles travelled (VMT), and existing regulations, the area source contribution to PM2.5 is projected to increase from 61 percent in 2018 to 64 percent in 2023. Emissions from paved road dust are

<sup>19</sup> CARB 2018 Updates to the California State Implementation Plan, Available at <https://ww3.arb.ca.gov/planning/sip/2018sipupdate/2018update.pdf>.

proportional to VMT and they are categorized as area sources, and not as an on-road mobile source. Point sources are the major contributor to SO<sub>x</sub>; 50 percent in 2018 and 51 percent in 2023 followed by aircraft and ocean-going vessels which are the second and third largest SO<sub>x</sub> emitters. Finally, emissions of NH<sub>3</sub> are expected to decline slightly, due to decreases in on-road mobile and area sources.

<sup>1</sup> Values are rounded to nearest integer and may not sum due to rounding<sup>2</sup> Includes 2015 RECLAIM NOx shaves***Top Ten Source Categories (2018 and 2023)***

The top ten sources of criteria pollutants in the annual inventories for 2018 and 2023 are briefly discussed in this section. Figures 3-6 and 3-7 provide the top ten categories for VOCs for the years 2018 and 2023, respectively. Consumer products are the largest contributors to VOC emissions, and are expected to continue to grow through 2023 due to the projected growth in population. Other VOC sources from industrial activities, such as coating and degreasing processes, are also expected to increase due to the increased industrial activity. In contrast, on-road emissions from light and medium duty vehicles decline from 2018 to 2023 as a result of existing regulations. Off-road equipment which include commercial/industrial, lawn and garden, construction/mining and various other mobile equipment rank the 2<sup>nd</sup> highest source of VOCs in 2023. The top 10 categories account for 72 percent of the total VOC inventory in 2018 and 71 percent in 2023.

Figures 3-8 and 3-9 show the top ten categories for NO<sub>x</sub> emissions for 2018 and 2023, respectively. Mobile source categories remain the predominant contributor to NO<sub>x</sub> emissions. Heavy-duty diesel trucks, off-road equipment, and ocean-going vessels are the top three emitters on the list for both years. NO<sub>x</sub> emissions from all top emitters are projected to decline from 2018 to 2023, except for ocean-going vessels and aircraft. The top ten categories account for 76 percent of the total NO<sub>x</sub> inventory in 2018, and 77 percent in 2023.

Figures 3-10 to 3-11 show the top ten source categories for SO<sub>x</sub> emissions in the years 2018 and 2023. The main contributors to SO<sub>x</sub> emissions represent a wide variety of sectors that include RECLAIM facilities, fuel combustion for industrial applications, and on-road and off-road sources. SO<sub>x</sub> emissions from the off-road mobile category are expected to increase reflecting increased activities at the ports and airports. The top 10 categories represent 90 percent of the SO<sub>x</sub> emissions in 2018 and 91 percent in 2023.

Figures 3-12 and 3-13 show the top ten source categories for primary PM<sub>2.5</sub> in 2018 and 2023, respectively. Commercial and industrial cooking and paved road dust are the largest contributors to PM<sub>2.5</sub> emissions and are expected to increase slightly between 2018 and 2023, due to increased population and traffic activity. The top ten categories represent 72 percent of the total primary PM<sub>2.5</sub> inventory in 2018 and 74 percent in 2023.

Figures 3-14 and 3-15 show the top ten source categories for ammonia (NH<sub>3</sub>) in 2018 and 2023, respectively. Miscellaneous processes, which include human perspiration and respiration, human and pet waste, household ammonia use, cigarette smoke and domestic fertilizer use, are the largest contributor to total ammonia emissions. Other industrial and farming activities, and on-road sources also contribute to total NH<sub>3</sub> emissions. The top ten categories represent 92 percent of the total ammonia inventory in 2018 and 91 percent in 2023.

### *Condensable and Filterable Portions of PM<sub>2.5</sub> Emissions*

Per PM<sub>2.5</sub> NAAQS final implementation rule,<sup>20</sup> the SIP emissions inventory is required to identify the condensable and filterable portions of PM<sub>2.5</sub> separately, in addition to primary PM<sub>2.5</sub> emissions. Primary PM emissions consist of condensable and filterable portions. Condensable PM is the material that is in vapor phase in stack conditions. The U.S. EPA's Air Emissions Reporting Requirements (AERR) requires states to report annual emissions of filterable and condensable components of PM<sub>2.5</sub> and PM<sub>10</sub>, "as applicable," for large sources for every inventory year and for all sources every third inventory year, beginning with 2011.<sup>21</sup> Subsequent emissions inventory guidance<sup>22</sup> from the U.S. EPA clarifies the meaning of the phrase "as applicable" by providing a list of source types "for which condensable PM is expected by the AERR." Filterable PM comprises "particles that are directly emitted by a source as a solid or liquid [aerosol] at stack or release conditions." Primary PM<sub>2.5</sub> is the sum of condensable and filterable PM<sub>2.5</sub> emissions. Category specific conversion factors developed by CARB and used in the Imperial County 2018 SIP<sup>23</sup> were applied in the current analysis to estimate condensable PM and then filterable PM was calculated by subtracting the condensable from the total PM<sub>2.5</sub> primary emissions. The baseline 2018, future attainment year 2023, and the RFP milestone years 2020 and 2026 are included in the analysis. Details on the condensable and filterable PM<sub>2.5</sub> emissions are provided in Appendix I of this Plan.

### *Uncertainties in the Emissions Inventory*

An effective AQMP/State Implementation Plan requires a complete and accurate emissions inventory. Over the years, significant improvements have been made to quantify emission sources for which control measures are developed. Increased use of continuous monitoring and source testing has contributed to the improvements in point source inventories. Technical assistance provided to facilities and auditing of reported emissions by the South Coast AQMD have also improved the accuracy of the point source emissions inventory. Area source inventories that rely on average emission factors and regional activity data have inherent uncertainties. Industry-specific surveys and source-specific studies during rule development have also provided certain degree of refinements to these emissions estimates. Mobile source inventories are also continuously updated and improved. As described earlier, many improvements are included in the on-road mobile source model EMFAC 2017, which estimates emissions from trucks, passenger cars, and buses. Improvements and updates are also included in the off-road models. Overall, the emissions inventory in this Plan is based on the most current data and methodologies, resulting in the most accurate inventory available.

Available at: [https://www.epa.gov/sites/production/files/2017-7/documents/ei\\_guidance\\_may\\_2017\\_final\\_rev.pdf](https://www.epa.gov/sites/production/files/2017-7/documents/ei_guidance_may_2017_final_rev.pdf).

<sup>23</sup> Imperial County 2018 Annual Particulate Matter less than 2.5 microns in Diameter State Implementation Plan, April 2018. Available at [https://ww3.arb.ca.gov/planning/sip/planarea/imperial/final\\_2018\\_ic\\_pm25\\_sip.pdf](https://ww3.arb.ca.gov/planning/sip/planarea/imperial/final_2018_ic_pm25_sip.pdf).

Relative to future emissions, there are many challenges inherent in making accurate growth projections, such as where vehicle trips will occur, distribution between various modes of transportation (such as trucks and trains), as well as estimates for population growth and the number and type of jobs. Forecasts are made with the best information available; nevertheless, there is uncertainty in emissions projections. AQMP updates are generally developed every three to four years, thereby allowing for frequent updates and improvements to the inventories. Interim SIP revisions between AQMPs also provide an opportunity to revisit assumptions and data used in the emissions development and to update the inventory based on best available data. In sum, the emission projected for future years in this Plan represent a reasonable forecast with the best available information and latest updates to all sectors.

## 4. CONTROL STRATEGY

The overall control strategy for meeting the 2006 PM<sub>2.5</sub> standard in the Basin is based on the continued implementation of existing South Coast AQMD and CARB regulations and programs over the next few years. With the Basin being close to attainment, the emissions reductions associated with these measures are expected to provide the needed reductions. Also, recently adopted regulations, discussed in this section, will provide additional emission reductions which will further ensure attainment of the standard before the attainment date. Chapter 5 presents future air quality and provides details on the air quality modeling analysis and attainment demonstration.

The 2016 PM<sub>2.5</sub> Plan discussed the five primary pollutants that contribute to the mass of the ambient aerosol (*i.e.*, directly emitted PM<sub>2.5</sub>, NO<sub>x</sub>, SO<sub>x</sub>, VOC, and ammonia). Various combinations of reductions in these pollutants could be effective in improving PM<sub>2.5</sub> air quality. Given the Basin's challenge to attain the federal ozone standards, in which the NO<sub>x</sub> control path is the most effective and efficient strategy in meeting the 8-hour ozone standards, a comprehensive and integrated plan focusing on NO<sub>x</sub> reduction was determined to be the most effective path to attain both PM<sub>2.5</sub> and ozone standards for the Basin. The updated modeling analysis described in Chapter 5 further confirms this conclusion.

Since the PM<sub>2.5</sub> standard was first promulgated in 1997, CARB and South Coast AQMD have made great progress in reducing PM<sub>2.5</sub> levels over the last several decades. Emissions of NO<sub>x</sub>, the most dominant PM precursor on elevated 24-hour PM<sub>2.5</sub> days, have been reduced by 76% through implementation of existing regulations and programs, contributing to reductions in PM<sub>2.5</sub> concentrations. Significant NO<sub>x</sub> controls have been implemented in stationary sources, including engine standards, retrofitting existing sources with add-on controls (e.g., selective catalytic reduction), equipment modification (e.g., low-NO<sub>x</sub> burners), and replacement of old high-emitting equipment with new and cleaner units. Aggressive NO<sub>x</sub> controls have also been implemented for mobile sources including emission standards, fleet requirements, alternative fuels, repowering with cleaner engines, and incentive programs. VOC reductions have been achieved through reformulations in consumer products, solvents, adhesives, and coatings. SO<sub>x</sub> emissions have reduced substantially through implementation of Ocean Going Vessel Fuel Regulation by CARB as well as mandatory SO<sub>x</sub> RECLAIM reductions. In addition to the above-mentioned regulations and programs, reductions of directly emitted PM<sub>2.5</sub> have also been achieved through stationary source regulations on significant PM sources such as residential wood burning and under-fired charbroilers and mobile source regulations for heavy-duty trucks, off-road equipment and OGVs.

This chapter describes existing regulations and programs providing emission reductions for the attainment of the 2006 PM<sub>2.5</sub> standard by 2023. In addition, this chapter describes the recently adopted regulations and programs since the adoption of the 2016 AQMP. These newly adopted measures will provide additional reductions beyond the existing regulations and give further assurance for meeting the 2006 24-hour PM<sub>2.5</sub> standard by the 2023 attainment date.

### *South Coast AQMD Existing Regulations and Programs Providing Emission Reductions in Future Baseline Emissions*

South Coast AQMD has implemented aggressive PM2.5 and PM2.5 precursor emission reduction strategies in the past several decades to attain the federal PM2.5 standards in the Basin. The emissions benefits of these regulations and programs are reflected in the future baseline emissions inventory which is used for air quality modeling and attainment demonstration purposes. These emissions reflect the specific control requirements in existing rules and regulations as well as the natural turnover of engines, equipment, and appliances. Appendix II provides a complete list of the South Coast AQMD's existing PM2.5, NOx, VOC, NH3 and SOx rules and regulations.

The following is a brief description of the South Coast AQMD's adopted rules for stationary sources that are not yet fully implemented and will provide further emission reductions in the next few years.

- RECLAIM Program (Regulation XX)

The NOx RECLAIM regulation, a cap-and-trade program first adopted in 1993, has been revised several times to reduce NOx emissions from the largest NOx emitting stationary sources within the South Coast AQMD's jurisdictional boundary. It has promoted additional NOx reductions by allocating and re-assessing RECLAIM Trading Credits (RTC) which periodically decline based on assessments of Best Available Retrofit Control Technology (BARCT) for a wide range of NOx-emitting equipment, such as boilers, heaters, furnaces, ovens, kilns, coke calciner, fluid catalytic cracking units, internal combustion engines, and turbines. In 1994, the initial RECLAIM RTC allocation was 110 tons per day (tpd) of NOx, which will be reduced to 14.5 tpd in 2022. NOx RECLAIM is currently transitioning to a command-and-control regulatory structure to achieve source-specific and/or industry-specific BARCT level of NOx controls, which will provide further emission reductions (more details are provided in the next section under South Coast AQMD's Adopted Rules and Programs Since 2016 AQMP).

On November 5, 2010, the Governing Board of the South Coast AQMD adopted amendments to its Regional Clean Air Incentives Market (RECLAIM) program that result in cumulative reductions of 5.7 tons per day tpd, or more than 51 percent reduction, of SOx from all RECLAIM facilities by 2019.

- Rule 1111 (Reduction of NOx Emissions from Natural-Gas-Fired, Fan-Type Central Furnaces) and CLEANair Furnace Rebate Program

Rule 1111 was originally adopted in 1978 to reduce NOx emissions from natural-gas-fired, fan-type central furnaces used for residential and commercial space heating. Rule 1111 was amended in 2009 to lower the NOx emission limit from 40 to 14 ng/Joule (ng/J), and was again amended in 2014 to include a mitigation fee option where manufacturers can pay a

per-unit fee in lieu of meeting the Ultra Low-NO<sub>x</sub> emission limit of 14 ng/J. In addition, through the CLEANair Furnace Rebate Program, South Coast AQMD provides an incentive to residents who purchase and install a compliant furnace that meets the Rule 1111 NO<sub>x</sub> emission limit. Emission reduction benefits from implementation of Rule 1111 will continue beyond 2026.

- **Rule 1146.2 (Large Water Heater, Small Boilers and Process Heaters)**  
The 1998 adoption of Rule 1146.2 established NO<sub>x</sub> emission limits for large water heaters and small boilers ranging from 75,000 Btu/hr up to and including 2 million Btu/hr (MMBtu/hr). New water heaters or boilers greater than 0.4 MMBtu/hr and less than or equal to 2 MMBtu/hr were required to meet an emission limit of 30 ppm of NO<sub>x</sub>. New units from 75,000 Btu/hr to 0.4 MMBtu/hr were required to meet a NO<sub>x</sub> emission limit of 55. Rule 1146.2 was amended in May 2006 to address NO<sub>x</sub> emission limits for new equipment. With the exception for small pool heaters rated less than or equal to 400,000 Btu/hr, new manufactured units greater than 400,000 Btu/hr must meet a NO<sub>x</sub> emission limit of 20 ppm starting January 1, 2010. Most new manufactured units less than or equal to 400,000 Btu/hr must meet a 20 ppm NO<sub>x</sub> limit by January 1, 2012. Pool heaters rated less than or equal to 400,000 Btu/hr, will continue to meet the existing limit of 55 ppm. Emission reduction benefits from implementation of Rule 1146.2 will continue until 2020.
- **Rule 1147 (NO<sub>x</sub> Reductions from Miscellaneous Sources)**  
Under Rule 1147, equipment requiring South Coast AQMD permits that are not regulated by other NO<sub>x</sub> rules must meet an emission limit of 30 or 60 parts per million (ppm) of NO<sub>x</sub> depending upon equipment type and process temperature. Compliance dates for emission limits are based on the date of equipment manufacture and emission limits are applicable to older equipment first. Owners of existing equipment are provided at least 15 years of use before they must meet rule emission limits. Specific categories of newer units have later compliance dates. Smaller and low emission units get more time to comply with emission limits than larger units. These small sources are not subject to rule emission limits until they are at least 20 years old. These units are required to demonstrate compliance with rule emission limits starting July 1, 2017. Rule 1147 was amended in September 2011 to delay implementation dates up to two years, remove a requirement for fuel or time meters and provide compliance flexibility for small and large sources. Emission reduction benefits from implementation of Rule 1147 will continue until 2023.

In addition to the regulatory approach, South Coast AQMD has also implemented incentive funding programs to encourage the immediate use of commercially available, low, near-zero and zero emissions mobile and stationary technologies. These incentive programs provide ongoing emission reductions from a variety of source categories. Examples of those incentive programs include:

- Carl Moyer Memorial Air Quality Standards Attainment Program for heavy-duty diesel engines retrofit and replacement with cleaner technologies;
- Clean School Buses Incentives for public school districts to purchase new alternative fuel school buses in order to retire their older polluting diesel buses and to replace expired alternative fuel bus tanks;
- Electric Lawn and Garden Equipment Program cleans the air through the replacement of gasoline-powered residential lawn mowers and commercial lawn and garden equipment with lower emission models at substantial discounts;
- Surplus Off-Road Opt-In for NO<sub>x</sub> (SOON) Program for the purchase of low-emission heavy-duty engines for off-road diesel fleet vehicles;
- Proposition 1B – Goods Movement Emissions Reduction Program to reduce diesel air pollution from goods movement operations;
- Enhanced Fleet Modernization Program (EFMP) for retirement of older higher polluting vehicles;
- Volkswagen Environmental Mitigation Trust that provides funding to mitigate excess emissions from the heavy-duty sector through the replacement or repower of older, heavy-duty vehicles, engines and equipment with zero emission and other clean technologies; and
- Mobile Source Air Pollution Review Committee (MSRC) Clean Transportation Initiative that the MSRC is partnering with South Coast AQMD to enhance the initiatives available under the On-Road Heavy-Duty Voucher Incentive Program (VIP). The VIP provides funding to owners/operators with fleets of 10 or fewer vehicles to replace older vehicles with engine models that are 2013 emissions-compliant or newer to help clean up emissions from older, more polluting vehicles.

These incentive programs have resulted in early emission reductions of PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors from on-road and off-road mobile sources beyond existing regulations.

### *South Coast AQMD Adopted Rules and Programs Since 2016 AQMP But Not Yet Reflected in the Inventory*

Since the adoption of the 2016 AQMP, South Coast AQMD has adopted several rules and programs to further reduce NO<sub>x</sub> and VOC emissions. While emissions reductions from existing regulations and programs are expected to provide the needed reductions for attaining the 2006 PM<sub>2.5</sub> standard, the recently adopted rules and regulations would provide additional emission reductions benefits and assurances towards attainment.

Table 4-1 summarizes NO<sub>x</sub> and VOC rules that have been adopted or amended by the South Coast AQMD since the 2016 AQMP. Pursuant to directives listed in control measure CMB-05 of the 2016 AQMP and in recently adopted state statute (AB 617), RECLAIM facilities are subject to an expedited schedule to implement additional BARCT no later than December 31, 2023. As a result, Rules 1110.2, 1117, 1134, 1135, and 1146 series have been adopted and/or amended in the 2018-2020 timeframe to implement CMB-05 and AB 617. Rule 1110.2 (Emissions from Gaseous- and Liquid-Fueled Engines) reduces emissions of NO<sub>x</sub>, VOC, and CO from all stationary and portable engines rated over 50 rated brake horsepower (bhp). Rule 1117 (Emissions of Oxides of Nitrogen from Glass Melting Furnaces) establishes NO<sub>x</sub> and SO<sub>x</sub> emission standards for container glass melting and sodium silicate furnaces, including NO<sub>x</sub> emission limits for auxiliary combustion equipment associated with container glass melting operations. Rules 1134 (Emissions of Oxides of Nitrogen from Stationary Gas Turbines) and 1135 (Emissions of Oxides of Nitrogen from Electricity Generating Facilities) apply to RECLAIM and non-RECLAIM facilities. Both rules include more stringent NO<sub>x</sub> emission limits to reflect current BARCT and provide implementation timeframes to facilitate the transition of the NO<sub>x</sub> RECLAIM program to a command-and-control regulatory structure. Amendments of Rule 1146 series (1146, 1146.1, and 1146.2) update the NO<sub>x</sub> emission limits for boilers, heaters, and steam generators covered under these rules. The revised NO<sub>x</sub> emission limits represent BARCT and apply to RECLAIM and non-RECLAIM facilities. The implementation of all these rule amendments (Rules 1110.2, 1117, 1134, 1135, and 1146 series) will result in approximately 5.7 tpd of NO<sub>x</sub> reductions over the implementation schedule specified in these rules.

The 2016 AQMP also includes Facility-Based Mobile Source Measures covering marine ports (MOB-01), railyards (MOB-02), warehouse/distribution centers (MOB-03), commercial airports (MOB-04), and new development and redevelopment projects (EGM-01). These measures are intended to help achieve the emission reductions attributed to CARB's Further Deployment of Cleaner Technology measures by reducing emissions from these facilities through South Coast AQMD actions. In May 2018, the South Coast AQMD Governing Board directed staff to pursue various approaches for reducing emissions from these large indirect sources: a voluntary Memorandum of Understanding (MOU) approach with marine ports and commercial airports, and regulatory approaches for warehouses/distribution centers, railyards and new developments and re-development projects. In December 2019, the Facility-Based Mobile Source Control Measure for Commercial Airports (in the form of MOUs with the five commercial airports) was adopted with an expected reduction of 0.52 tpd of NO<sub>x</sub> emissions in 2023. This measure implements the 2016 AQMP Control Measure MOB-04, Emission Reductions at Commercial Airports and applies to Los Angeles International Airport, John Wayne Airport, Hollywood Burbank Airport, Ontario International Airport, and Long Beach Airport.

Additional NO<sub>x</sub> emission reductions are anticipated from continued implementation of existing incentive programs with future funding. Finally, additional reductions are anticipated from deployment of Metrolink's Tier 4 locomotives, which were not included in the 2016 AQMP emissions inventory. South Coast AQMD Rule 445 Wood-Burning Devices was amended in June 2020 to implement the backstop Contingency Control Measure BCM-09 in the 2016 AQMP and to address the CAA contingency measure requirements for the PM<sub>2.5</sub> standards. The 2020 amendments extended the No-Burn day requirement Basin-wide when the daily PM<sub>2.5</sub> air quality is forecast to exceed 30 µg/m<sup>3</sup> in any source receptor area, providing additional emission reduction benefits beyond those incorporated in the baseline reductions from this source category. In addition, the No-Burn day thresholds will automatically be lowered upon the EPA's finding of failure to fulfill specific requirements as set forth in 40 CFR § 51.1014(a). The 2020 amendments of Rule 445 provide additional emission reductions in PM<sub>2.5</sub> in 2020 and beyond.

**TABLE 4-1**

Rules and Programs Adopted or Amended by South Coast AQMD since 2016 AQMP (January 2016 to August 2020)

Source	Rule No – Rule Title	Adoption Date	Implementation End Date	VOC Reductions (tons per day)	NOx Reductions (tons per day)	PM Reductions (tons per day)	2016 AQMP Control Measure

### *CARB Key Mobile Source Regulations and Programs Providing Emission Reductions in Future Baseline Emissions*

Given the severity of California's air quality challenges and the need for ongoing emission reductions, CARB has implemented the most comprehensive mobile source emissions control program in the nation. CARB's ~~comprehensive~~ program relies on four fundamental approaches:

- Stringent emissions standards that minimize emissions from new vehicles and equipment;
- In-use programs that target the existing fleet and require the use of the cleanest vehicles and emissions control technologies;
- Cleaner fuels that minimize emissions during combustion; and
- Incentive programs that remove older, dirtier vehicles and equipment and replace those vehicles with the cleanest technologies.

This multi-faceted approach has spurred the development of increasingly cleaner technologies and fuels and achieved significant emission reductions across all mobile source sectors that go far beyond national programs or programs in other states. These efforts extend back to the first mobile source regulations adopted in the 1960s, and pre-date the federal CAA of 1970, which established the basic national framework for controlling air pollution. In recognition of the pioneering nature of CARB's efforts, the CAA provides California unique authority to regulate mobile sources more stringently than the federal government by providing a waiver of preemption for its new vehicle emission standards under Section 209(b). This waiver provision preserves a pivotal role for California in the control of emissions from new motor vehicles, recognizing that California serves as a laboratory for setting motor vehicle emission standards. Since then, CARB has consistently sought and obtained waivers and authorizations for its new motor vehicle and off-road regulations. CARB's history of progressively strengthening standards as technology advances, coupled with the waiver process requirements, ensures that California's regulations remain the most stringent in the nation. A list of regulatory actions CARB has taken since 1985 is provided at the end of this analysis to highlight the scope of CARB's actions to reduce mobile source emissions.

Since 2000, CARB adopted numerous regulations aimed at reducing exposure to diesel PM and NO<sub>x</sub>. These regulations are aimed at freight transport sources such as heavy-duty diesel trucks, transportation sources such as passenger cars and buses, and off-road sources such as large construction equipment. Phased implementation of these regulations will produce increasing emission reduction benefits through 2023 and beyond, as the regulated fleets are retrofitted, and as older and dirtier portions of the fleets are replaced with newer and cleaner models at an accelerated pace.

Further, CARB and South Coast AQMD staff work closely on identifying and distributing incentive funds to accelerate cleanup of engines. Key incentive programs include: Low Carbon Transportation, Air Quality Improvement Program, Volkswagen Mitigation Trust, Community Air Protection, Carl Moyer Program, Goods Movement Program, and Funding Agricultural Replacement Measures for Emission Reductions (FARMER). These incentive-based programs work in tandem with regulations to accelerate deployment of cleaner technology.

### ***I) Light-Duty Vehicles***

NOx emissions from light-duty vehicles and key programs contributing to those reductions in the Basin have been reduced significantly since 1990 and will continue to go down through 2023 due to the benefits of CARB's longstanding light-duty mobile source program. Key light-duty programs include the Advanced Clean Cars program (ACC), On-Board Diagnostics (OBD), Reformulated Gasoline (RFG), Incentive Programs, and the Enhanced Smog Check Program.

Since setting the nation's first motor vehicle exhaust emission standards in 1966 that led to the first pollution controls, California has dramatically tightened emission standards for light-duty vehicles. California is unique in that it is the only state authorized under the Clean Air Act to set more stringent mobile source standards than the federal standards. Through CARB regulations, today's new cars pollute 99 percent less than their predecessors did thirty years ago. In 1970, CARB required auto manufacturers to meet the first standards to control NOx emissions along with hydrocarbon emissions. The simultaneous control of emissions from motor vehicles and fuels led to the use of cleaner-burning RFG that has removed the emissions equivalent of 3.5 million vehicles from California's roads. Since CARB first adopted it in 1990, the Low-Emission Vehicle Programs (LEV and LEV II) and Zero-Emission Vehicle (ZEV) Program have resulted in the production and sales of hundreds of thousands of ZEVs in California.

#### ***i. Advanced Clean Cars***

CARB's groundbreaking ACC program is now providing the next generation of emission reductions in California and ushering in a new zero emission passenger transportation system. The success of these programs is evident: California is the world's largest market for ZEVs, with over 21 models available today, and a wide variety are now available at lower price points, attracting new consumers. As of October 2019, Californians drive nearly 50 percent of all ZEVs on the road in the United States, while the U.S. makes up about half of the world market. This movement towards commercialization of advanced clean cars has occurred due to CARB's ZEV regulation, part of ACC, which affects passenger cars and light-duty trucks.

CARB's ACC Program, approved in January 2012, is a pioneering approach of a 'package' of regulations that - although separate in construction - are related in terms of the synergy developed to address both ambient air quality needs and climate change. The ACC program combines the control of smog, soot causing pollutants and greenhouse gas emissions into a single coordinated

package of requirements for model years 2015 through 2025. The program assures the development of environmentally superior cars that will continue to deliver the performance, utility, and safety vehicle owners have come to expect.

The ACC program approved by CARB in January 2012 also included amendments affecting the current ZEV regulation through the 2017 model year in order to enable manufacturers to successfully meet 2018 and subsequent model year requirements. These ZEV amendments are intended to achieve commercialization through simplifying the regulation and pushing technology to higher volume production in order to achieve cost reductions. The ACC Program benefits will increase over time as new cleaner cars enter the fleet displacing older and dirtier vehicles. However, in 2019, the federal government finalized Part 1 of the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which revoked California's authority to set more stringent greenhouse gas (GHG) and zero emission vehicle (ZEV) requirements for light duty vehicles. In 2020, Part 2 of that rule was finalized, rolling back previously adopted vehicle standards. These rules threaten the ACC Program and clean air quality progress made in California.

ii. On Board Diagnostics

California's first OBD regulation required manufacturers to monitor some of the emission control components on vehicles starting with the 1988 model year. In 1989, CARB adopted OBD II, which required 1996 and subsequent model year passenger cars, light-duty trucks, and medium-duty vehicles and engines to be equipped with second generation OBD systems. OBD systems are designed to identify when a vehicle's emission control systems or other emission-related computer-controlled components are malfunctioning, causing emissions to be elevated above the vehicle manufacturer's specifications. CARB subsequently strengthened OBD II requirements and added OBD II specific enforcement requirements for 2004 and subsequent model year passenger cars, light-duty trucks, and medium-duty vehicles and engines.

iii. Reformulated Gasoline

Since 1996, CARB has been regulating the formulation of gasoline resulting in California gasoline being the cleanest in the world. California's cleaner-burning gasoline regulation is one of the cornerstones of the State's efforts to reduce air pollution and cancer risk. RFG is fuel that meets specifications and requirements established by CARB. The specifications reduced motor vehicle toxics by about 40 percent and reactive organic gases by about 15 percent. The results from cleaning up fuel can have an immediate impact as soon as it is sold in the State. Vehicle manufacturers design low-emission emission vehicles to take full advantage of cleaner-burning gasoline properties.

iv. Incentive Programs

There are a number of different incentive programs focusing on light-duty vehicles that produce extra emission reductions beyond traditional regulations. The incentive programs work in two ways, encouraging the retirement of dirty older cars and encouraging the purchase of a cleaner vehicle.

Voluntary accelerated vehicle retirement or “car scrap” programs provide monetary incentives to vehicle owners to retire older, more polluting vehicles. The purpose of these programs is to reduce fleet emissions by accelerating the turnover of the existing fleet and subsequent replacement with newer, cleaner vehicles. Both State and local vehicle retirement programs are available.

California’s voluntary vehicle retirement program is administered by the Bureau of Automotive Repair (BAR) and provides \$1,000 per vehicle and \$1,500 for low-income consumers for unwanted vehicles that have either failed or passed their last Smog Check Test and that meet certain eligibility guidelines. This program is referred to as the Consumer Assistance Program.

In recent years, the California Legislature has allocated significant funding increases towards incentive-based programs. In fiscal year 2019-20, the Clean Vehicle Rebate Project (CVRP) was allocated \$238 million. CVRP is designed to offer vehicle rebates on a first-come, first-serve basis for light-duty ZEVs, plug-in hybrid electric vehicles, and zero-emission motorcycles. Through March 2019, CVRP has provided rebates for nearly 320,000 vehicles at a total of just over \$720 million since the project’s launch in 2010.

Clean Cars 4 All (formerly known as the Enhanced Fleet Modernization Program Plus-Up Pilot Project) provides incentives for lower-income consumers living in and near disadvantaged communities who scrap their old vehicles and purchase new or used hybrid, plug-in hybrid, or zero-emission vehicle replacement vehicles. Since fiscal year 2014–2015, CARB has allocated \$112 million for Clean Cars 4 All.

v. California Enhanced Smog Check Program

BAR is the State agency charged with administration and implementation of the Smog Check Program. The Smog Check Program is designed to reduce air pollution from California registered vehicles by requiring periodic inspections for emission-control system problems, and by requiring repairs for any problems found. In 1998, the Enhanced Smog Check program began in which Smog Check stations relied on the BAR-97 Emissions Inspection System (EIS) to test tailpipe emissions with either a Two-Speed Idle (TSI) or Acceleration Simulation Mode (ASM) test depending on where the vehicle was registered. For instance, vehicles registered in urbanized areas received an ASM test, while vehicles in rural areas or received a TSI test.

In 2009, the following requirements were added in to improve and enhance the Smog Check Program, making it more inclusive of motor vehicles and effective on smog reductions:

- Low pressure evaporative test;
- More stringent pass/fail cutpoints;
- Visible smoke test; and
- Inspection of light- and medium-duty diesel vehicles.

The next major change to the program was due to AB 2289, ~~adopted in October 2010~~, a 2010 new law restructuring California's Smog Check Program, streamlining and strengthening inspections, increasing penalties for misconduct, and reducing costs to motorists. This new law sponsored by CARB and BAR, promised faster and less expensive Smog Check inspections by taking advantage of OBD software installed on all vehicles since 2000. ~~This new law also directs~~ vehicles without this equipment to high-performing stations, helping to ensure that these cars comply with current emission standards. This program will reduce consumer costs by having stations take advantage of diagnostic software that monitors pollution-reduction components and tailpipe emissions. Beginning mid-2013, ~~testing of passenger vehicles using OBD~~ testing was required on all passenger vehicles model years 2000 or newer.

## ***II) Heavy-Duty Trucks***

NOx emissions from heavy-duty vehicles and key programs contributing to those reductions in the Basin have decreased significantly since 1990 and will continue to decrease through 2023 due to the benefits of CARB's long-standing heavy-duty mobile source program. Key programs include Heavy-Duty Engine Standards, Clean Diesel Fuel, the Truck and Bus Regulation and Incentive Programs.

### *i. Heavy-Duty Engine Standards*

Since 1990, heavy-duty engine NOx emission standards have become dramatically more stringent, dropping from 6 grams per brake horsepower-hour (g/bhp-hr) in 1990 down to the current 0.2 g/bhp-hr standard, which took effect in 2010. In addition to mandatory NOx standards, there have been several generations of optional lower NOx standards put in place over the past 15 years. Most recently in 2015, engine manufacturers can certify in California to three optional NOx emission standards of 0.1 g/bhp-hr, 0.05 g/bhp-hr, and 0.02 g/bhp-hr (i.e., 50 percent, 75 percent, and 90 percent lower than the current mandatory standard of 0.2 g/bhp-hr). The optional standards allow local air districts and CARB to preferentially provide incentive funding to buyers of cleaner trucks, to encourage the development of cleaner engines.

### *ii. Clean Diesel Fuel*

Since 1993, CARB has required that diesel fuel have a limit on the aromatic hydrocarbon content and sulfur content of the fuel. Diesel powered vehicles account for a disproportionate amount of

the diesel PM, which is considered a toxic air contaminant. In 2006, CARB required a low-sulfur diesel fuel to be used not only by on-road diesel vehicles but also for off-road engines. The diesel fuel regulation allows alternative diesel formulations as long as emission reductions are equivalent to the CARB formulation.

iii. *Cleaner In-Use Heavy-Duty Trucks (Truck and Bus Regulation)*

The Truck and Bus Regulation was first adopted in December 2008. This rule represents a multi-year effort to turn over the legacy fleet of engines and replace them with the cleanest technology available. In December 2010, CARB revised specific provisions of the in-use heavy-duty truck rule, in recognition of the deep economic effects of the recession on businesses and the corresponding decline in emissions.

Starting in 2012, the Truck and Bus Regulation phases in requirements applicable to an increasingly larger percentage of the truck and bus fleet over time, so that by 2023 nearly all older vehicles will be upgraded to have exhaust emissions meeting 2010 model year engine emissions levels while continuing to lower NO<sub>x</sub> levels through 2023. The regulation applies to nearly all diesel-fueled trucks and buses with a GVWR greater than 14,000 pounds that are privately or federally owned, including on-road and off-road agricultural yard goats, and privately and publicly owned school buses. Moreover, the regulation applies to any person, business, school district, or federal government agency that owns, operates, leases or rents affected vehicles. The regulation also establishes requirements for any in-state or out-of-state motor carrier, California-based broker, or any California resident who directs or dispatches vehicles subject to the regulation. Finally, California sellers of a vehicle subject to the regulation would have to disclose the regulation's potential applicability to buyers of the vehicles. Approximately 170,000 businesses in nearly all industry sectors in California, and almost a million vehicles that operate on California roads each year are affected. Some common industry sectors that operate vehicles subject to the regulation include: for-hire transportation, construction, manufacturing, retail and wholesale trade, vehicle leasing and rental, bus lines, and agriculture.

In 2017, California passed legislation ensuring compliance with the Truck and Bus Regulation through the California Department of Motor Vehicles (DMV) vehicle registration program. Starting January 1, 2020, DMV will verify compliance to ensure that vehicles subject to the Truck and Bus Regulation meet the requirements prior to obtaining DMV vehicle registration. The law requires the DMV to deny registration for any vehicle that is non-compliant or has not reported to CARB as compliant or exempt from the Truck and Bus Regulation.

CARB compliance assistance and outreach activities that are key in support of the Truck and Bus Regulation include:

- The Truck Regulations Upload and Compliance Reporting System, an online reporting tool developed and maintained by CARB staff;

- The Truck and Bus regulation's fleet calculator, a tool designed to assist fleet owners in evaluating various compliance strategies;
- Targeted training sessions all over the State; and
- Out-of-state training sessions conducted by a contractor.

CARB staff also develops regulatory assistance tools, conducts and coordinates compliance assistance and outreach activities, administers incentive programs, and actively enforces the entire suite of regulations. Accordingly, CARB's approach to ensuring compliance is based on a comprehensive outreach and education effort.

*iv. Incentive Programs*

There are a number of different incentive programs focusing on heavy-duty vehicles that produce extra emission reductions beyond traditional regulations. The incentive programs encourage the purchase of cleaner trucks.

Several State and local incentive funding pools have been used historically, and remain available, to fund the accelerated turnover of on-road heavy-duty vehicles. Since the Carl Moyer Memorial Air Quality Standards Attainment Program (Moyer Program) began in 1998 nearly \$1 billion in Moyer Program incentive grants have been used to clean up over 60,000 older engines in California. This has reduced NOx and ROG emissions by more than 183,000 tons, and particulate matter by more than 6,700 tons statewide.

Beginning in 2008, the Goods Movement Emission Reduction Program funded by Proposition 1B has funded cleaner trucks for the region's transportation corridors; the final increment of funds will implement projects through 2020.

The California Legislature has recently allocated significant funding increases towards heavy-duty vehicle incentive-based programs. The Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP) is the cornerstone of advanced technology heavy-duty incentives, providing funding since 2010 to support the long-term transition to zero-emission vehicles in the heavy-duty market. Since its inception in 2009, HVIP has been allocated over \$447 million. HVIP has supported the purchase of 2,559 zero-emission trucks and buses, 2,631 hybrid trucks, 2,068 low NOx engines, and 195 trucks with electric power take off systems by California fleets through June 30, 2019.

CARB has also administered a Truck Loan Assistance Program since 2009. As of June 30, 2019, about \$113.2 million in Truck Loan Assistance Program funding has been expended to provide about \$1.5 billion in financing to small-business truckers for the purchase of approximately 26,000 cleaner trucks, exhaust retrofits, and trailers throughout California.

### ***III) Off-Road Sources***

Off-road sources encompass equipment powered by an engine that does not operate on the road. Sources vary from ships to lawn and garden equipment and for example, include sources like locomotives, aircraft, tractors, harbor craft, off-road recreational vehicles, construction equipment, forklifts, and cargo handling equipment.

NOx emissions from off-road equipment and key programs contributing to those reductions have decreased significantly in the Basin since 1990 and will continue to decrease through 2023 due to the benefits of CARB's and U.S. EPA long-standing programs. Key programs include Off-Road Engine Standards, Locomotive Engine Standards, Clean Diesel Fuel, Cleaner In-Use Off-Road Regulation and In-Use Large Spark Ignition (LSI) Fleet Regulation.

#### *i. Off-Road Engine Standards*

The Clean Air Act preempts states, including California, from adopting requirements for new off-road engines less than 175 HP used in farm or construction equipment. California may adopt emission standards for in-use off-road engines pursuant to Section 209(e)(2), but must receive authorization from U.S. EPA before it may enforce the adopted standards.

CARB first approved regulations to control exhaust emissions from small off-road engines (SORE) such as lawn and garden equipment in December 1990 with amendments in 1998, 2003, 2010, 2011, and 2016. These regulations were implemented through three tiers of progressively more stringent exhaust emission standards that were phased in between 1995 and 2008.

Manufacturers of forklift engines are subject to new engine standards for both diesel and large spark ignition (LSI) engines. Off-road diesel engines were first subject to engine standards and durability requirements in 1996 while the most recent Tier 4 Final emission standards were phased in starting in 2013. Tier 4 emission standards are based on the use of advanced after-treatment technologies such as diesel particulate filters and selective catalytic reduction. LSI engines have been subject to new engine standards that include both criteria pollutant and durability requirements since 2001 with the cleanest requirements phased-in starting in 2010.

#### *ii. Locomotive Engine Standards*

The CAA and the U.S. EPA national locomotive regulations expressly preempt states and local governments from adopting or enforcing "any standard or other requirement relating to the control of emissions from new locomotives and new engines used in locomotives" (U.S. EPA interpreted new engines in locomotives to mean remanufactured engines, as well). U.S. EPA has approved two sets of national locomotive emission regulations (1998 and 2008). In 1998, U.S. EPA approved the initial set of national locomotive emission regulations. These regulations primarily emphasized NOx reductions through Tier 0, 1, and 2 emission standards. Tier 2 NOx emission

standards reduced older uncontrolled locomotive NO<sub>x</sub> emissions by up to 60 percent, from 13.2 to 5.5 g/bhp-hr.

In 2008, U.S. EPA approved a second set of national locomotive regulations. Older locomotives are required to meet more stringent particulate matter (PM) emission standards upon remanufacture, ~~are required to meet more stringent particulate matter (PM) emission standards~~ which are about 50 percent cleaner than Tier 0–2 PM emission standards. U.S. EPA refers to the PM locomotive remanufacture emission standards as Tier 0+, Tier 1+, and Tier 2+. The new Tier 3 PM emission standard (0.1 g/bhp-hr), for model years 2012-2014, is the same as the Tier 2+ remanufacture PM emission standard. The 2008 regulations also included new Tier 4 (2015 and later model years) locomotive NO<sub>x</sub> and PM emission standards. The U.S. EPA Tier 4 NO<sub>x</sub> and PM emission standards further reduced emissions by approximately 95 percent from uncontrolled levels.

In April 2017, CARB petitioned U.S. EPA for rulemaking, seeking the amendment of emission standards for newly built locomotives and locomotive engines and lower emission standards for remanufactured locomotives and locomotive engines. The petition asks U.S. EPA to update its standards to take effect for remanufactured locomotives in 2023 and for newly built locomotives in 2025. The new emission standards would provide critical criteria pollutant reductions, particularly in the disadvantaged communities that surround railyards.

iii. Clean Diesel Fuel

Since 1993, CARB has required that diesel fuel have a limit on the aromatic hydrocarbon content and sulfur content of the fuel. Diesel powered vehicles account for a disproportionate amount of the diesel particulate matter which is considered a toxic air contaminant. In 2006, CARB required a low-sulfur diesel fuel to be used not only by on-road diesel vehicles but also for off-road engines. The diesel fuel regulation allows alternative diesel formulations as long as emission reductions are equivalent to the CARB formulation.

iv. Cleaner In-Use Off-Road Equipment (Off-Road Regulation)

The Off-Road Regulation which was first approved in 2007 and subsequently amended in 2010 in light of the impacts of the economic recession. These off-road vehicles are used in construction, manufacturing, the rental industry, road maintenance, airport ground support and landscaping. In December 2011, the Off-Road Regulation was modified to include on-road trucks with two diesel engines.

The Off-Road Regulation will significantly reduce emissions of diesel PM and NO<sub>x</sub> through 2023 from the over 150,000 in-use off-road diesel vehicles that operate in California. The regulation affects dozens of vehicle types used in thousands of fleets by requiring owners to modernize their

fleets by replacing older engines or vehicles with newer, cleaner models, retiring older vehicles or using them less often, or by applying retrofit exhaust controls.

The Off-Road Regulation imposes idling limits on off-road diesel vehicles, requires a written idling policy, and requires a disclosure when selling vehicles. The regulation also requires that all vehicles be reported to CARB and labeled, restricts the addition of older vehicles into fleets, and requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing verified exhaust retrofits. The requirements and compliance dates of the Off-Road Regulation vary by fleet size.

Fleets are subject to increasingly stringent restrictions on adding older vehicles. The regulation also sets performance requirements. While the regulation has many specific provisions, in general by each compliance deadline, a fleet must demonstrate that it has either met the fleet average target for that year, or has completed the Best Available Control Technology requirements. The performance requirements of the Off-Road Regulation were phased in from January 1, 2014 through January 1, 2019.

Compliance assistance and outreach activities in support of the Off-Road Regulation include the following activities.

The Diesel Off-road On-line Reporting System, an online reporting tool developed and maintained by CARB staff.

The Diesel Hotline (866-6DIESEL), which provides the regulated public with questions about the regulations and access to CARB staff. Staff is able to respond to questions in English, Spanish and Punjabi.

The Off-road Listserv, providing equipment owners and dealerships with timely announcement of regulatory changes, regulatory assistance documents, and reminders for deadlines.

v. LSI In-Use Fleet Regulation

Forklift fleets can be subject to either the LSI fleet regulation, if fueled by gasoline or propane, or the off-road diesel fleet regulation. Both regulations require fleets to retire, repower, or replace higher-emitting equipment in order to maintain fleet average standards. The LSI fleet regulation was originally adopted in 2007 with requirements beginning in 2009. While the LSI fleet regulation applies to forklifts, tow tractors, sweeper/scrubbers, and airport ground support equipment, it maintains a separate fleet average requirement specifically for forklifts. The LSI fleet regulation requires fleets with four or more LSI forklifts to meet fleet average emission standards.

vi. Incentive Programs

There are a number of different incentive programs focusing on off-road mobile sources that increase the penetration of cleaner technologies into the market. The incentive programs encourage the purchase of cleaner diesel engines.

The Clean Off-Road Equipment Voucher Incentive Project (CORE) is a voucher project similar to HVIP, but for advanced technology off-road equipment. The fiscal year 2017–2018 Funding Plan allocated \$40 million to support zero-emission freight equipment through CORE. CARB launched CORE at the end of 2019.

California's agricultural industry consists of approximately 77,500 farms and ranches, providing over 400 different commodities, making agriculture one of the State's most diverse industries. In recognition of the strong need and this industry's dedication to reducing their emissions, the State Legislature has allocated over \$330 million towards the FARMER Program since 2017. CARB staff developed the FARMER Program to meet the State Legislature's objectives and help meet the State's criteria, toxic, and greenhouse gas emission reduction goals. As of September 30, 2019, the FARMER Program has spent \$97 million on over 2,500 pieces of agricultural equipment and will reduce 250 tons of PM2.5 and 4,200 tons of NOx over the lifetime of the projects.

A complete listing of CARB's existing regulations and the adoption dates are provided in Appendix III.

### ***CARB Recent Regulations Adopted But Not Yet Reflected in the Inventory***

Recent regulations have been adopted for on-road and off-road mobile sources since the release of the 2016 AQMP. The emissions inventory and attainment demonstration included in this Plan reflect all on-road regulations incorporated in EMFAC 2017 and off-road regulations included in the 2016 AQMP. While the emissions benefits from these newly adopted programs are not yet reflected in the base or future inventories, the emissions reductions will support monitored attainment of the 24-hour PM2.5 standard in the Basin. These programs are listed below.

- Amendments to California's Heavy-Duty Vehicle Inspection Program (HDVIP) and Periodic Smoke Inspection Program (PSIP) – The HDVIP and PSIP amendments lower opacity limits for on-road heavy-duty vehicles. The amendments provide PM emissions benefits starting in 2019 as vehicles operating with damaged emissions control components and emitting above the proposed opacity limits are repaired or replaced.
- Innovative Clean Transit - The Innovative Clean Transit (ICT) Regulation seeks to transition buses in California to zero-emission by 2040. The ICT regulation requires California transit agencies to gradually transition their buses to zero-emission technologies beginning with a requirement that only zero emission buses can be purchased starting in 2029. The ICT regulation is structured to allow transit agencies to take advantage of

incentive programs by acting early and, also implementing plans that are best suited to their unique situation.

- Zero-Emission Airport Shuttle Bus - The Zero-Emission Airport Shuttle Regulation (Shuttle Regulation) will transition combustion-powered vehicles that serve California's commercial airports to zero-emission vehicles (ZEVs). Specifically, the Shuttle Regulation requires fixed route airport shuttles serving California's 13 largest airports to transition to 100 percent ZEVs by 2035. The Shuttle Regulation applies to public and private fleets, including operators of parking facilities, rental car agencies, and hotels.
- The Advanced Clean Truck (ACT) regulation adopted by the Board on June 25, 2020 will accelerate the widespread adoption of zero-emission vehicles (ZEVs) in the medium-and heavy-duty truck sector and reduce the amount of harmful emissions generated from on-road mobile sources. The ACT regulation requires truck manufacturers to sell increasing numbers of zero-emission trucks (ZEVs) in California annually. Medium- and heavy-duty vehicle manufacturers must produce and sell ZEVs beginning with the 2024 model year with increasing sales annually through the 2035 model year when 55 percent of annual Class 2b-3 vehicle sales, including pickup trucks, must be ZEVs, 75 percent of annual Class 4-8 vehicle sales must be ZEVs, and 40 percent of Class 7-8 Tractor sales must be ZEVs.
- Ocean Going Vessels-At Berth - The Control Measure for Ocean-Going Vessels at Berth (At Berth Regulation) is designed to achieve added public health and air quality benefits by requiring emission controls at additional ports and terminals, including marine terminals that operate independently from a port or port authority, and vessels not covered by the previous ocean-going vessel regulation.
- Omnibus Low-NO<sub>x</sub> Regulation - The Heavy-Duty Engine and Vehicle Omnibus Regulation (Omnibus Regulation) establishes new exhaust emission standards, test procedures, and other emission-related requirements for 2024 and subsequent model year California-certified on-road heavy-duty engines. The Omnibus Regulation implements two measures included within CARB's 2016 State Strategy for the State Implementation Plan: a "Low-NO<sub>x</sub> Engine Standard" which will significantly reduce NO<sub>x</sub> emissions from new engines during certification; and a "Lower In Use Emission Performance Level," which will ensure in-use heavy-duty vehicles continue to control emissions throughout their useful lives.

As described above, there are several on-going and new programs that will provide significant reductions of NO<sub>x</sub> and PM<sub>2.5</sub> between now and 2023 and beyond 2023. Most notably, of the already approved regulations, are the Truck and Bus regulation and the Off-Road regulation. In addition to these approved regulations, the Board is considering measures that will provide further reductions in 2023.

## 5. FUTURE AIR QUALITY

### *Introduction*

This chapter presents projected future PM2.5 air quality and demonstrates attainment of the 2006 24-hour PM2.5 standard for the South Coast Air Basin (Basin) in 2023, one year earlier than the statutory attainment year. Future attainment status is generally assessed through the modeled attainment test; however, Compton cannot demonstrate attainment through the traditional modeling approach due to an anomalous baseline design value (see Chapter 2). Therefore, a hybrid approach, combining chemical transport modeling and a suite of supplemental analyses, is used in the current attainment demonstration. This chapter describes the Relative Response Factor (RRF) approach to predict future air quality, the 5-year weighted PM2.5 design values used in the attainment demonstration, the PM2.5 chemical species fractions included in the RRF approach, future PM2.5 concentrations in the Basin, the supplemental weight of evidence approach to demonstrate attainment in Compton, and the unmonitored area analysis.

### *PM2.5 Modeling Approach*

In this attainment demonstration, 2018 is used as the base year from which future design values are projected. 2023 is projected to be the new attainment year of the 2006 24-hour PM2.5 standard for the Basin. The PM2.5 modeling employs the same approach as described in the 2016 AQMP attainment demonstrations except for updates in the modeling platform, input databases, and emissions inventory. Future year design values are determined using site-specific quarterly-averaged RRFs, which are calculated for the following PM2.5 components: ammonium, nitrate, sulfate, organic carbon, elemental carbon, crustal, salt, and particle-bound water. The RRFs are then applied to the baseline 5-year weighted PM2.5 design values per the U.S. EPA guidance (U.S. EPA, 2018).<sup>24</sup> A future design value less than or equal to 35.49  $\mu\text{g}/\text{m}^3$  attains the NAAQS.

### *Design Values*

The 24-hour PM2.5 design value is defined as the three-year average of the 98<sup>th</sup> percentile of all 24-hour concentrations sampled by Federal Reference Method (FRM) at a monitoring site. Sites with everyday sampling frequency use the 8<sup>th</sup> highest value, sites with every 3<sup>rd</sup> day sampling frequency use the 3<sup>rd</sup> highest value, and sites with every 6<sup>th</sup> day sampling frequency use the 2<sup>nd</sup> highest value as the 98<sup>th</sup> percentile.

As shown in Figure 5-1, the Basin's 24-hour PM2.5 design values have decreased significantly over the last 20 years due to the implementation of regulations by South Coast AQMD and CARB. However, the rate of decrease in the 24-hour design value has slowed or reversed in recent years despite continuing reductions of PM2.5 and its precursor emissions. This was largely due to

<sup>24</sup> U.S. EPA, (2018). Modeling Guidance for Demonstrating Air Quality Goals for Ozone, PM2.5, and Regional Haze. [https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling\\_Guidance-2018.pdf](https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling_Guidance-2018.pdf).

adverse meteorology such as persistent drought, which lasted for several years. The design value for 2001 was 76  $\mu\text{g}/\text{m}^3$  while the 2019 design value (based on 2017-2019 data) was 38  $\mu\text{g}/\text{m}^3$ . In 2019, the Basin maximum 98<sup>th</sup> percentile was 36.2  $\mu\text{g}/\text{m}^3$  at Mira Loma.

**FIGURE 5-1**  
South Coast Air Basin 24-Hour Design Values

The U.S. EPA guidance (U.S. EPA, 2018)<sup>25</sup> recommends the use of multiple year averages of design values to dampen the effects of single year anomalies due to factors such meteorological variability or radical changes in the local emissions profile. Consistent with this guidance, the attainment demonstration in this Plan relies on the 2015-2019 five-year weighted design value, which includes 2018, the base year selected for the emissions inventory, meteorology and chemical transport modeling. Table 5-1 provides the five-year weighted 24-hour average PM<sub>2.5</sub> design values for all the sites that have valid design values during the 5-year period. The design values in Table 5-1 would not include the PM<sub>2.5</sub> data if they were flagged by South Coast AQMD as an exceptional event and approved by the U.S. EPA. However, since there was no PM<sub>2.5</sub> data during the five-year period which was flagged as an exceptional event, the design values in Table 5-1 include all valid measurement data collected in the Basin.

Compton and Mira Loma currently exhibit the highest 24-hour PM<sub>2.5</sub> design values in the Basin. Historically, Mira Loma was the design site between 2008 and 2017. In 2017, Compton's DV was as high as Mira Loma and Compton continued to have the highest DVs in 2018 and 2019. This was due to the atypically high 98<sup>th</sup> percentile recorded in Compton in 2017, as indicated in Chapter 2.

Reseda	-	23.7
Riverside Rubidoux	33.0	31.4
San Bernardino	-	28.2

\* Does not meet EPA's data completeness requirement and thus no valid design value exists

### ***PM2.5 Composition***

PM2.5 is either directly emitted into the atmosphere (primary particles) or formed through atmospheric chemical reactions from precursor gases (secondary particles). Primary PM2.5 includes road dust, diesel soot, combustion products, and other sources of fine particles. Secondary products, such as sulfates, nitrates, and complex organic carbon compounds, are formed from reactions with oxides of sulfur, oxides of nitrogen, VOCs, and ammonia.

PM2.5 speciation data measured at four Chemical Speciation Network (CSN) sites provide the chemical characterization for evaluation and validation of the CMAQ model predictions. With one site in each county, the four CSN sites are strategically located to represent aerosol characteristics in the four counties in the Basin. Riverside-Rubidoux was traditionally the Basin maximum

location. Fontana and Anaheim experience high concentrations within their respective counties, and the Los Angeles site was intended to capture the characteristics of an emission source area.

For the 24-hour attainment demonstration, the U.S. EPA's guidance (U.S. EPA, 2018) recommends that the determination of species fractions be based on the top 10% of days in each quarter. This results in two days per quarter for the 1-in-6 day CSN data. Figures 5-2 through 5-5 depict the measured PM<sub>2.5</sub> chemical composition from the top two PM<sub>2.5</sub> concentration days for each quarter for the four CSN sites in the Basin. In general, concentrations in the first or fourth quarter are higher than those in the other quarters and secondary ammonium, nitrate and sulfate often comprise close to half of the total PM<sub>2.5</sub> concentrations. Organic carbon (OC), some of which is also secondary in nature, is another significant component. Due to uncertainties in the measurement of OC, the U.S. EPA recommends using the Sulfate, Adjusted Nitrate, Derived Water, Inferred Carbon Hybrid (SANDWICH) method. Figure 5-2 shows the measured PM<sub>2.5</sub> composition at Rubidoux and Figure 5-3 presents the composition after application of the SANDWICH method. Details regarding the SANDWICH method, as well as figures for other CSN sites, can be found in Appendix IV.

### *PM<sub>2.5</sub> Modeling*

The analysis uses 2018 as the baseline year to develop the meteorology and emissions inventory that are used to project future emissions and design values. While the U.S. EPA's guidance recommends to use the center year of the five-year weighted design value as the base year for the modeling and emissions inventory, the guidance states that any one of the five years can be used as the base year. 2018 was chosen to avoid meteorological abnormalities such as severe drought from 2013-2015 and stagnant conditions conducive to poor air quality from 2016-2017. Additionally, 2018 has rich measurement datasets collected during the Multiple Air Toxics Exposure Study V (MATES V), which was conducted during the period of May 2018 to April 2019.

CMAQ 5.0.2 simulations were conducted for 365 days from January 1 to December 31, 2018. The latest available CMAQ model, version 5.3.1 was used as weight of evidence and discussed in Weight of Evidence section of this Chapter. Meteorological inputs were generated using WRF 4.0.3 and biogenic VOC emissions were estimated using MEGANv3. The simulations included 8,760 consecutive hours from which daily 24-hour average PM<sub>2.5</sub> concentrations were calculated. The modeling system was applied to 2023 to predict future design values.

A set of RRFs were generated for each future year simulation for the top 10 percent of modeled PM<sub>2.5</sub> days based on modeled 24-hour average PM<sub>2.5</sub>. RRFs were generated for seven species: ammonium (NH<sub>4</sub>), nitrate (NO<sub>3</sub>), sulfate (SO<sub>4</sub>), organic carbon (OC), elemental carbon (EC), sea salts (Salt) and a combined grouping of crustal compounds and metals (Others). Future year

concentrations of the seven species were calculated by applying the model generated quarterly RRFs to the speciated 24-hour PM<sub>2.5</sub> measured data based on the eight highest PM<sub>2.5</sub> concentrations in each quarter of the five year base period. The speciation fractions used to generate 24-hour speciated PM<sub>2.5</sub> values were determined from the “high” days included in Figures 5-2 to 5-5. Particle bound water was determined using a regression model based on simulated concentrations of the ammonium, nitrate and sulfate ions (Frank, 2006). A blank mass of 0.2  $\mu\text{g}/\text{m}^3$  was added to each base and future year simulation. The 32 days in each year (top 8 high PM days per quarter) were then re-ranked based on the sum of all predicted PM species to establish a new 98<sup>th</sup> percentile concentration each year. A weighted average of the resulting future year 98<sup>th</sup> percentile concentrations for each of the five years was used to calculate future design values for the attainment demonstration. The 98<sup>th</sup> percentile value was determined based on the FRM sampling frequency. For example, every day sampling makes the 8<sup>th</sup> highest day the 98<sup>th</sup> percentile and every 6<sup>th</sup> day sampling makes the 2<sup>nd</sup> highest day the 98<sup>th</sup> percentile.

### ***Model Performance Evaluation***

Model performance was evaluated against corresponding measured PM<sub>2.5</sub> mass. Figure 5-10 depicts this comparison for Los Angeles. In general, the model performance is reasonably good, with a tendency to underestimate during summer and overestimate during winter. Statistics for all sites are presented in Table 5-2. Because the U.S. EPA guidance (U.S. EPA, 2018) requires that the model predictions be applied in a relative rather than absolute sense, potential biases present in the model prediction are less likely transferred to future design values.

***PM<sub>2.5</sub> Attainment Demonstration (for all sites except Compton)***

A CMAQ simulation was conducted for the 2023 baseline emissions scenario to assess the 24-hour PM<sub>2.5</sub> future air quality and attainment status in the Basin. Table 5-3 and Figure 5-11 present the PM<sub>2.5</sub> design concentrations in 2018 and 2023 based on the modeling analysis. As indicated earlier, attainment in Compton is addressed separately through the supplemental analysis section presented later in this chapter. As indicated in Table 5-3 and Figure 5-11, except for Compton, the highest PM<sub>2.5</sub> design concentration is projected to be 34.9 µg/m<sup>3</sup> at Mira Loma. The 2<sup>nd</sup> and 3<sup>rd</sup> highest concentrations are projected at the two near-roadway locations – Long Beach Near-Road and Ontario Near-Road, indicating elevated PM<sub>2.5</sub> levels along goods movement corridors. The rest of the stations are forecasted to be below 30 µg/m<sup>3</sup>, well below the standard. The Basin is anticipated to attain the federal 24-hour PM<sub>2.5</sub> standard in 2023 with the baseline emissions scenario indicating that emission reductions from adopted regulations are sufficient to attain the 2006 24-hour PM<sub>2.5</sub> standard by 2023.

**TABLE 5-3**  
24-Hour Average 5-Year Weighted PM<sub>2.5</sub> Concentrations (µg/m<sup>3</sup>)

Station	2018 Base Year	2023 Baseline
Azusa	26.0	24.6
Big Bear	20.3	18.2
Compton	38.3	38.2

San Bernardino	28.2	26.4

**FIGURE 5-11**

24-Hour Average PM<sub>2.5</sub> Design Concentrations: 2018 Baseline and 2023 Baseline

### ***Unmonitored Area Analysis***

The U.S. EPA modeling guidance recommends that the attainment demonstration include a formal analysis to confirm that all grid cells in the modeling domain meet the federal standard. This “unmonitored area analysis” is essential since speciation monitoring is conducted at a limited number of sites in the modeling domain. Variance in the species profiles at selected locations coupled with the differing responses to emissions control scenarios are expected to result in spatially variable impacts to PM<sub>2.5</sub> air quality. Based on the unmonitored area analysis conducted for this Plan, attainment of the 2006 24-hour PM<sub>2.5</sub> standard was confirmed at all locations within the Basin. This analysis is presented in Appendix IV.

### ***Supplemental Analysis for Attainment Demonstration in Compton***

Compton does not show attainment in 2023 with the chemical transport modeling-based attainment demonstration, as shown in the previous section. However, a suite of technical analyses using ambient measurements strongly suggests that Compton will meet the standard before 2023, and most likely in 2020. When the model and prevailing evidence do not align, the U.S. EPA’s guidance allows for a “weight of evidence” assessment in order to project attainment (U.S. EPA, 2018).<sup>26</sup> Several analyses are presented herein which demonstrate that Compton’s base year design value was anomalous and that attainment by 2023 is highly probable. Consistent with the U.S. EPA’s guidance for attainment dates in the near future, ambient data and emissions trends carry the most weight in the analysis. Additional analyses, focusing on meteorological factors and localized emission sources, are presented.

<sup>26</sup> U.S. EPA, (2018). Modeling Guidance for Demonstrating Air Quality Goals for Ozone, PM<sub>2.5</sub>, and Regional Haze. [https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling\\_Guidance-2018.pdf](https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling_Guidance-2018.pdf).

***Limitations of Regional Chemical Transport Model***

CMAQ-based modeling is inappropriate to apply to Compton due to limitations in the regulatory SIP/AQMP emissions inventory. The supplemental analysis provided in this section suggests that the high PM days in Compton – January 1, December 24<sup>th</sup> and 27<sup>th</sup>, 2017 – which caused an atypically high 98<sup>th</sup> percentile value in 2017 were likely driven by high emissions occurring in local proximity to the monitoring station. The station is located in a public parking lot, which affords access to passersby. The 2017 emission episodes, which had not occurred before nor ~~we~~ not-recurred since, were likely microscale events. Such microscale events are not reflected in a regulatory emissions inventory since the inventory is designed to capture a typical annual average day (annual average emissions) or a typical summer day (summer ozone planning emissions), but not an extremely rare event caused by episodic anthropogenic activity – e.g., wood burning, fireworks, etc. As shown in the Table 5-3, CMAQ modeling predicts that Compton’s design value will improve by 0.1 µg/m<sup>3</sup> from 2018 to 2023, while NO<sub>x</sub> and VOC combined emissions decrease by 117 TPD during the corresponding time period. This is greater than a 25% reduction from the total Basin-wide baseline NO<sub>x</sub> emissions. Consequently, a strategy based on CMAQ modeling would lead to unrealistically aggressive emission reductions due to inaccurate characterization of the high PM episodes.

***PM<sub>2.5</sub> Trend Measured at Compton***

Since FRM measurement for PM<sub>2.5</sub> began on Dec. 23, 2008, all the DVs prior to 2017 were below the 2006 24-hour PM<sub>2.5</sub> standard of 35 µg/m<sup>3</sup> in Compton. The 2017 DV was 39 µg/m<sup>3</sup>, which was caused by unusually high PM<sub>2.5</sub> readings recorded on January 1, December 24<sup>th</sup> and 27<sup>th</sup>, 2017. The 98<sup>th</sup> percentile value used in the DV calculation was 53.4 µg/m<sup>3</sup> measured on Jan 1<sup>st</sup> 2017. Since a DV comprises a three-year period, the high reading in 2017 carried over and caused exceedances in 2017, 2018 and 2019. However, as is evident from Figure 5-18, the abnormally high PM episode did not recur after 2017. The three highest values recorded in 2017 are among the top four highest PM<sub>2.5</sub> values recorded in Compton since the beginning of the PM<sub>2.5</sub> measurements. Further analysis indicates that meteorological conditions were not particularly conducive towards high PM<sub>2.5</sub> concentrations on January 1<sup>st</sup>, whereas meteorological conditions were highly conducive to PM accumulation on December 27<sup>th</sup>. This suggests that the high PM levels on January 1<sup>st</sup> and December 24<sup>th</sup> were likely caused by episodic local emissions.

**FIGURE 5-18**

Annual 98<sup>th</sup> Percentile 24-Hour PM<sub>2.5</sub> Concentrations Measured in Compton

### ***PM<sub>2.5</sub> Precursor Trend Measured at Compton***

Concentrations of NO<sub>x</sub> and VOCs, PM<sub>2.5</sub> precursors, have decreased significantly over the past decade. Annual average NO<sub>x</sub> concentrations measured at the Compton station from Feb. 2009 to Aug. 2020 are presented in Figure 5-19. The annual NO<sub>x</sub> concentration in Compton decreased at an average rate of 1.39 ppb/year from 2009 to 2019. The total speciated VOC concentrations measured in Compton during three Multiple Air Toxics Exposure Studies (MATES)<sup>27</sup> are shown in Figure 5-20. MATES are a series of year-long monitoring, modeling, and evaluation studies conducted in the South Coast Air Basin to evaluate Basin-wide cancer risk exposure caused by toxic air pollutants. The three most recent MATES iterations, MATES III, IV, and V, included monitoring conducted from April 2004 – March 2006, July 2012 – June 2013, and May 2018 – April 2019, respectively. Only speciated VOCs measured in all three MATES campaigns were considered here. As shown in Figure 5-20, VOC concentrations measured in Compton have decreased by more than a factor of two between 2004 and 2019. The emission trend indicates that the Basin-wide emission reductions are evident in the Compton area, even though ambient PM<sub>2.5</sub> does not show the same level of reductions due to the complexity of PM chemistry and year-to-year variation in meteorology. Even then, 98<sup>th</sup> percentile values in Compton have been below or close to the 35 µg/m<sup>3</sup> standard in all years except 2017, as shown in Figure 5-18.

<sup>27</sup> Reports are available at <https://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies>.

**FIGURE 5-19**  
Annual Average NO<sub>x</sub> Concentrations Measured in Compton

**FIGURE 5-20**  
Total Speciated Volatile Organic Compound (VOC) Concentrations Measured in Compton During the Multiple Air Toxics Exposure Studies (Mates)<sup>28</sup>

<sup>28</sup> MATES V data is preliminary.

### ***Emissions Inventory Trend***

Based on the emissions inventory, NOx and VOC concentrations are expected to further decrease by 2023 and thereafter. Figure 5-21 demonstrates trends in the Basin-wide VOC and NOx inventories from 2012 to 2024. While the pace of VOC reductions has slowed, NOx reductions are continuing at a steady pace. The emissions trend generally mirrors that of ambient concentrations as shown in Figures 5-19 and 5-20. NOx and VOCs are major PM and ozone precursors and reductions in their emissions are critical for the Basin to attain PM2.5 and ozone standards. In addition to the reductions shown in Figure 5-21, emission reductions resulting from recently adopted regulations that are not reflected in the baseline emissions will further ensure attainment in Compton in 2023. The additional reductions beyond the baseline emissions are discussed in Chapter 4 of this Plan.

**FIGURE 5-21**  
Basin-Wide Annual Average Emissions of NOx and VOCs.

### ***Additional Analysis***

The weight of evidence, based on emissions and air quality trends, strongly suggests that the 24-hour PM2.5 98<sup>th</sup> percentile in 2017 was anomalous. In order to further strengthen the basis for this hypothesis, additional analyses focusing on meteorological factors and localized emission sources are summarized in this section. The complete analysis is detailed in Appendix V.

#### ***Meteorology on December 24<sup>th</sup> and December 27<sup>th</sup>, 2017 was Unusual and Highly Conducive for High PM2.5 Levels***

The potential to accumulate PM2.5 was evaluated to determine the influence of meteorology on the three highest PM days in 2017. This analysis illustrated that meteorological conditions on December 27, 2017, and to a lesser extent, December 24, 2017, were unusually favorable for high PM2.5 concentrations. This indicates that the high PM2.5 recorded on December 27, 2017 was somewhat expected based on unfavorable meteorology whereas the concentration recorded on December 24<sup>th</sup> was likely partially driven by meteorology with some contribution from local emissions. The meteorology on January 1<sup>st</sup> was not particularly conducive to high concentrations, indicating that local emissions played a large role in the exceedance. Refer to Appendix V for further details on this analysis.

#### ***A Mathematical Model Suggests That Remarkably High PM2.5 Concentrations in Compton on January 1<sup>st</sup>, December 24<sup>th</sup>, and December 27<sup>th</sup>, 2017 Were Caused by Unusual or Atypical Emission Sources***

A model was developed to simulate historical PM2.5 concentrations in Compton based on actual PM2.5 measurements taken during 2009-2020, with meteorological, traffic flow, seasonal, and day-of-week data as predictor variables. The model was used to predict PM2.5 on the dates of interest as well as on dates that were randomly removed from the training dataset (held out dates). Evaluation of model performance by comparing measured concentrations with predicted concentrations on the held-out dates indicated that the model accurately simulates PM2.5 concentrations at Compton. However, the model failed to reproduce the three high PM days in question. This indicates that typical meteorology and seasonality, represented by day of a year, did not completely drive the exceptionally high concentrations recorded in Compton. Therefore, it is likely that local and infrequent episodic emissions significantly contributed to the high PM2.5 levels in Compton on the three highest days in 2017. Additional details of this analysis are provided in Appendix V.

#### ***Fireworks Contributed to the High PM2.5 Concentration on January 1<sup>st</sup>, 2017***

To quantify the impact of fireworks on high PM2.5 in Compton on January 1<sup>st</sup>, 2017, FRM filters collected during July 4<sup>th</sup> and 5<sup>th</sup>, 2017 and 2018, and the FRM filter collected at Compton on January 1<sup>st</sup>, 2017 were analyzed using the X-Ray Fluorescence (XRF) for 50 inorganic and metal species. A full list of analyzed species can be found in Appendix V. Metals are a major chemical component of firework smoke. In the South Coast Air Basin, the highest PM2.5 concentrations in the summer months have always been recorded on July 4<sup>th</sup> and 5<sup>th</sup> because of Independence Day fireworks celebrations. There are also some fireworks events on New Year's Eve and widespread

use of consumer-grade fireworks. However, fireworks activities on New Year's Eve are usually less intensive than Independence Day. By comparing measurements on Independence Day and New Year's Eve, it is possible to estimate the contribution of firework on PM<sub>2.5</sub> in Compton on January 1<sup>st</sup>, 2017. It is estimated that fireworks were responsible for 7.84 - 12.47 µg/m<sup>3</sup> of the mass, corresponding to 14.7 – 23.4% of the total PM<sub>2.5</sub> mass measured in Compton on January 1<sup>st</sup>, 2017. While this increased mass from fireworks on January 1<sup>st</sup>, 2017 was not large enough to make an exceptional event demonstration, it did play an important role in driving the atypically high concentrations on that day. Further details of this analysis are presented in Appendix V.

***PM<sub>2.5</sub> Design Value is Unlikely to Exceed the PM<sub>2.5</sub> 24-hour Federal Standards in 2020-2023***

To determine the likelihood of future PM<sub>2.5</sub> design value exceedances in Compton during 2020 – 2023 a statistical technique was developed to estimate future concentrations based on past measurements. For the purposes of this analysis, it was conservatively assumed that PM<sub>2.5</sub> precursor emissions and meteorology in future years will remain at 2009-2019 levels. We estimated the PM<sub>2.5</sub> concentration on a given future day (all days between July 2020 and December 2023) by randomly sampling one historical PM<sub>2.5</sub> measurement recorded during the same time of the year. The whole process was iterated 10,000 times to get a distribution of estimated design values for each year. The probabilities that the PM<sub>2.5</sub> design value for the year 2020, 2021, 2022, and 2023 will exceed the 24-hour federal standard are 0, 0.07%, 4.6%, and 4.5% respectively. This suggests that it is very unlikely that the design value for the year 2020, 2021, 2022, and 2023 will exceed the 24-hour standard even with the conservative assumption that PM<sub>2.5</sub> emissions and emission precursors will remain constant.

The constant emission assumption is a conservative assumption given that concentrations of NO<sub>x</sub> and VOCs, PM<sub>2.5</sub> precursors, have decreased over the past decade (Figure 5-19 and Figure 5-20). Therefore, the actual PM<sub>2.5</sub> design values in the future years are likely to be lower than the estimated design values with the assumption that emissions and chemistry involved in PM<sub>2.5</sub> formation do not change in future years. A complete description of this technique and a sensitivity analysis is presented in Appendix V.

***High PM<sub>2.5</sub> Concentrations Measured During Wintertime in Compton are Heavily Influenced by Residential Wood Burning***

Levoglucosan, a common tracer for wood combustion, was measured during MATES V. The measurements demonstrate that wood combustion is prevalent in the area surrounding Compton, particularly during winter. The average wintertime concentration measured at all MATES stations is presented in Figure 5-22. The levoglucosan concentration at Compton is 61% higher than the second highest station (West Long Beach) and 111% higher than the average of all other stations. This suggests that, during winter, PM<sub>2.5</sub> in Compton is more influenced by wood burning compared to other locations in the South Coast Air Basin.

Residential wood burning is regulated by South Coast AQMD under Rule 445. When PM2.5 is forecast to exceed a threshold, which is currently  $30 \mu\text{g}/\text{m}^3$ , a “no burn” day is declared. Since the U.S. EPA has recently finalized its determination on the South Coast Air Basin’s failure to attain the 2006 24-hour PM2.5 standard by December 31, 2019, the threshold will be lowered to  $29 \mu\text{g}/\text{m}^3$ . However, low income households or households that use wood burning as a sole source of heat are exempt under Rule 445. A large fraction of the neighborhoods surrounding Compton contain low income households. Thus, a significant amount of wood burning in Compton may occur even on “no burn” days.

**FIGURE 5-22**

Average Levoglucosan Concentration Measured at Stations Across the South Coast Air Basin from Nov. 2018 – Feb. 2019.<sup>29</sup> Error bars represent the standard error of the measurements.

To better quantify the impact of residential wood burning on PM2.5 in Compton, a forecasting tool was created to predict PM2.5 from residential wood smoke based on levoglucosan observations during MATES V. The model relies on meteorological variables and seasonal parameters, which capture the influence of human behavior on wood smoke emissions, to estimate the PM2.5 concentrations due to wood smoke. This forecast tool can be used to estimate wood smoke concentrations on days without levoglucosan measurements.

<sup>29</sup> Levoglucosan data is preliminary.

The fraction of PM<sub>2.5</sub> from wood smoke was calculated using the wood smoke PM<sub>2.5</sub> concentrations estimated by the levoglucosan model and the total PM<sub>2.5</sub> concentration measured on corresponding days. The fraction of PM<sub>2.5</sub> from wood smoke has a clear seasonal cycle, which peaks in winter months and is lowest in summer months. This analysis suggests that wood smoke substantially contributes to PM<sub>2.5</sub> mass in Compton; however, the model-predicted business-as-usual wood smoke contribution does not completely account for the high PM levels in 2017. Therefore, this indicates the presence of an abnormally high and unusual amount of local emissions on the 2017 exceedance days. Details of the model configuration and additional analysis is presented in the Appendix IV.

### ***Compton Attainment Demonstration Summary***

A weight-of-evidence approach using supplemental analyses was employed to demonstrate future attainment of the 2006 24-hr PM<sub>2.5</sub> NAAQS in Compton. Consistent with the U.S. EPA's guidance, the additional analyses included air quality and emissions trends, further reductions beyond the baseline emissions, and further technical analyses that estimated the impacts of woodsmoke, fireworks, and meteorology. Together, the analyses demonstrate attainment of the 2006 24-hour PM<sub>2.5</sub> standard in Compton by 2023. Key findings are summarized below:

- Since PM<sub>2.5</sub> FRM measurements began in 2008, all design values were below the 2006 24-hour PM<sub>2.5</sub> standard of 35 µg/m<sup>3</sup> until 2017. The unusually high PM<sub>2.5</sub> levels that caused the exceedances in 2017 did not recur. Ambient monitoring data from 2018 to the 1<sup>st</sup> half of 2020 indicates that Compton will highly likely attain the standard by December 31, 2020.
- The preliminary 2020 design value calculated with measurements in 2018, 2019, and the first two quarters of 2020 is well below the standard. This indicates that Compton will attain the standard by the end of 2020 if no more than seven days above 45 ug/m<sup>3</sup>, without wildfire influence, are recorded in the last half of the 2020—a very unlikely scenario based on the historical record.
- While the high PM<sub>2.5</sub> days in 2017 were influenced by a combination of woodsmoke, fireworks and adverse meteorology, custom-built tools using statistical algorithms indicated that the high PM<sub>2.5</sub> levels could not be explained by business-as-usual emissions or meteorology. Therefore, the 2017 high PM<sub>2.5</sub> days were likely driven by episodic and localized emissions, which have not recurred.
- The episodic and localized emissions are not reflected in the regulatory emissions inventory nor are they resolved with the spatial scale used in attainment modeling. Therefore, unrealistically aggressive emission reductions would be required to show attainment with the regional modeling system.

- In addition to Compton's likelihood of attainment by December 31, 2020, the continuation of precursor emissions reductions due to recently adopted regulations that are not reflected in the baseline emissions will further ensure attainment in Compton.
- Since the 2017 high PM<sub>2.5</sub> days raised a concern, the FRM sampling frequency was changed from every 6<sup>th</sup> day to every day, which ensures that all poor air quality days are captured and the 98<sup>th</sup> percentile value will not be unduly influenced from an atypically high value that happens to fall on a one in three measurement day.

### ***Overall Weight of Evidence***

PM<sub>2.5</sub> concentrations in the Basin have significantly decreased as shown in Figure 5-1 due to the impact of existing regulations, except from 2014-2016 when severe, persistent drought caused higher PM<sub>2.5</sub> levels. Atypically high values were also observed in 2017, but only in Compton. The historical trend provides additional confidence that the downward trend over the last two decades will continue and the Basin will attain the PM<sub>2.5</sub> standard in 2023, if not earlier. Moreover, additional emission controls that result from the implementation of the recently adopted regulations since the 2016 AQMP will further ensure timely attainment.<sup>30</sup>

Because emission projections in this Plan are consistent with the modeling set-up of the 2016 AQMP, the attainment demonstration presented here is also based on the same CMAQ version (version 5.0.2). The latest version of CMAQ (version 5.3.1, released in December 2019) includes several improvements with respect to version 5.0.2. Additional simulations using the latest version of CMAQ were conducted to determine the sensitivity of model versions on attainment demonstration results. CMAQ 5.3.1 produced very similar results compared with the ones obtained using CMAQ 5.0.2 and did not change the results in the attainment demonstration. With the latest version, the South Coast Air Basin is also expected to attain the 2006 24-hour PM<sub>2.5</sub> standard, which provides additional weight of evidence for the attainment demonstration.

### ***Conclusion***

Figure 5-23 shows the observed baseline year (2018) and projected future 24-hour PM<sub>2.5</sub> design values in 2023, the new attainment year of the 2006 24-hour PM<sub>2.5</sub> NAAQS. The 24-hour PM<sub>2.5</sub> design values in 2023 are expected to be lower than 35.4 µg/m<sup>3</sup> at all monitoring stations located within the Basin. The attainment was demonstrated with 2023 baseline emissions, which reflect on-going emission reductions from adopted regulations. The emissions inventory and numerical modeling included in this Plan demonstrate expeditious attainment of the 2006 24-hour PM<sub>2.5</sub> standard in the South Coast Air Basin by 2023.

<sup>30</sup> South Coast AQMD (2017), 2016 Air Quality Management Plan, Appendix III, Base and future year emission inventory. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iii.pdf?sfvrsn=6>.

**FIGURE 5-23**

Projection of Future PM<sub>2.5</sub> Air Quality in the Basin in Comparison with the 2006 24-Hour PM<sub>2.5</sub> NAAQS

## 6. OTHER FEDERAL CLEAN AIR ACT REQUIREMENTS

This Plan addresses the Clean Air Act (CAA) requirements which were triggered because of the Basin's failure to attain the 2006 24-hour PM<sub>2.5</sub> standard. Chapters 3 to 5 of this Plan fulfill the requirements related to the updated emission inventory, control strategy, and attainment demonstration. This chapter addresses the other CAA requirements.

### *Five Percent Annual Reduction*

CAA Section 189(d) states that in the case of a Serious nonattainment area fails to attain the NAAQS by the applicable attainment date, the State in which such area is located shall, after notice and opportunity for public comment, submit within 12 months after the applicable attainment date, plan revisions which provide for attainment of the standard and, from the date of such submission until attainment, for an annual reduction in directly emitted PM or PM precursor emissions within the area of not less than 5 percent of the amount of such emissions as reported in the most recent inventory prepared for such area.

To comply with the CAA Section 189(d) requirement of annual 5 percent reduction of PM or a PM precursor, this section demonstrates that the South Coast Air Basin meets this requirement for all the years required to be addressed in this Plan. South Coast Air Basin is expected to attain the 2006 24-hour PM<sub>2.5</sub> standard at or before 2023. Given the Plan is due to the U.S. EPA by December 31, 2020, the first year to demonstrate the 5 percent reduction is 2021 and the last year is 2023, the new attainment date. NO<sub>x</sub> is used for this demonstration, given that NO<sub>x</sub> is an important precursor for both ozone and PM<sub>2.5</sub> and the Basin's attainment strategy for PM<sub>2.5</sub> and ozone NAAQSs heavily depend on NO<sub>x</sub> reductions. The baseline and future milestone years' emissions inventory are presented in Chapter 3 of this Plan. As described in Chapter 3 (Base-Year and Future Emissions), the baseline inventory reflects regulations and programs adopted by South Coast AQMD as of December 2015 and by CARB as of November 2015. Regulations reflected in EMFAC2017 are included in the on-road mobile emissions. The rules and regulations incorporated in the baseline emissions have been SIP-approved. All years from 2021 to 2023 meet the requirement, as shown in Table 6-1, therefore, South Coast Air Basin meets the CAA 189(d) requirement of annual 5 percent reduction of PM or a PM precursor.

**TABLE 6-1**  
5 Percent NOx Reductions per Year from 2020 to 2023

		% Reduction from 2018 base	5% Target (Tons per Day)	NOx baseline Emissions (Tons per Day)	Meets 5% (yes or no)
Base Year	2018			370.5	
		5 percent of 2018 Baseline Year Emission		18.5	
Year 1	2021	5%	352.0	321.7	YES
Year 2	2022	10%	333.5	297.9	YES
Year 3	2023	15%	314.9	276.6	YES

### *Control Strategy Analysis*

The CAA Section 189(d) Plan must include a control strategy satisfying the requirements of 40 CFR 51.1003(c)(1)(iii) and 51.1010(c). This control strategy must be sufficient to achieve the emissions reductions necessary for the 5% annual emissions reduction demonstration and expeditious attainment. As described in the previous section in this Chapter, reductions in the baseline emissions provide for the required 5% annual emission reduction. This section includes an evaluation of emissions sources and emissions controls and demonstrates that all best available control measures (BACM) and feasible control measures are in place in the Basin for directly emitted PM2.5 and all PM2.5 precursors. This demonstration covers: 1) implementation of BACM as approved in the 2016 AQMP and 2016 State SIP Strategy and 2) evaluation of additional feasible measures, as described below.

#### ***I. Implementation of Best Available Control Measures as Approved in the 2016 AQMP and 2016 State SIP Strategy***

The Basin was reclassified as Serious nonattainment for the 2006 24-hour standard effective February 12, 2016 with an attainment date of December 31, 2019. The Final Rule of “*Fine Particle Matter National Ambient Air Quality Standards: State Implementation Plan Requirements*” (81 FR 58010) indicates that a Serious area attainment plan must include provisions to implement BACM on sources in a Serious nonattainment area no later than four years after reclassification. The 2016 AQMP included a comprehensive BACM demonstration for stationary, area, and mobile sources for the 2006 24-hour PM2.5 standard, which was subsequently approved by the U.S. EPA in March 2019 (84 FR 3305). Below is an update on the implementation of BACM as approved in the 2016 AQMP and the 2016 State SIP Strategy.

##### ***i. South Coast AQMD Stationary Sources***

As a component of the 2016 AQMP, South Coast AQMD conducted a comprehensive BACM/BACT analysis for the 2006 PM2.5 standard. In addition to the BACT evaluation for

stationary sources, potential control measures were identified for key stationary sources by comparing existing control measures to the requirements in federal and state regulations and guidance, as well as the analogous rules in other air districts. A 7-step analysis was conducted to identify candidate measures that were potentially feasible to be implemented in the Basin. The source of information included the Air Quality Technology Symposium, RACT/BACT Evaluation, U.S. EPA Technical Support Documents, other Districts' control measures, control measures beyond RACM in the 2012 AQMP, U.S. EPA menu of control measures, and U.S. EPA guidance document (details are found in the 2016 AQMP Appendix VI-A). In summary, the 2016 AQMP BACM evaluation concluded that South Coast AQMD's rules and regulations are generally as stringent as, or more stringent than, the analogous rules in other air districts / agencies, and are considered as BACM for applicable stationary sources. There were no additional cost effective and technologically feasible control measures identified in the 2016 AQMP that could qualify as BACM or additional feasible measures for the 2006 24-hr PM<sub>2.5</sub> standard. Since the adoption of the 2016 AQMP, South Coast AQMD has continued to implement the existing rules and regulations as well as the control strategies described in the 2016 AQMP which provide emission reductions in PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors toward attainment of the 2006 PM<sub>2.5</sub> standard.

ii. CARB Mobile and Area Sources

On March 14, 2019, the U.S. EPA approved the South Coast 2016 PM<sub>2.5</sub> SIP (2016 SIP) which demonstrated that BACM, including BACT, for the control of direct PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors would be implemented no later than four years after the Basin was reclassified to Serious for the 24-hour PM<sub>2.5</sub> NAAQS. While the 2020 24-hour PM<sub>2.5</sub> SIP does not require another demonstration that the State has met BACM, CARB staff believes an affirmation that the State has met, and continues to meet, BACM requirements is appropriate.

California's long history of comprehensive and innovative emissions control has resulted in the strongest mobile source control program in the nation. The U.S. EPA has acknowledged the strength of these programs in their approval of CARB's regulations and through past waivers. In addition, the U.S. EPA has provided several past determinations that CARB's mobile source control programs meet BACM requirements, including within the approval of the 2016 SIP. Since approval of the 2016 SIP, CARB has continued to substantially enhance and accelerate reductions from its mobile source control programs through continued implementation of on-going programs such as the Truck and Bus Rule, and adoption of new regulations and more stringent engine emissions standards and in-use requirements. The continued implementation of the control strategy approved in the 2016 PM<sub>2.5</sub> SIP provides emission reductions in PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors toward attainment of the 2006 PM<sub>2.5</sub> standard.

iii. Transportation Control Measures

As required by federal and state laws, the South California Association of Governments (SCAG) is responsible for developing a long-range regional transportation plan/sustainable communities strategy (RTP/SCS) every four years and a short-term federal transportation improvement program (FTIP) every two years. The RTP/SCS provides for the development and integrated management and operation of transportation systems and facilities that will function as an intermodal transportation network for the SCAG region, while the FTIP implements the programs and projects in the RTP/SCS. SCAG must ensure that the regional transportation plan, program, and projects are supportive of the goals and objectives of applicable AQMPs/SIPs. In addition, SCAG is required to develop demographic projections and regional transportation strategy and control measures for the South Coast AQMP/SIP based on the RTP/SCS and the FTIP.

Included within these regional transportation strategy and control measures are SIP-committed transportation programs and projects that reduce vehicle use or change traffic flow or congestion conditions, better known as Transportation Control Measures (TCMs).

Reclassified as a Serious nonattainment area under the 2006 PM2.5 NAAQS since February 12, 2016, the South Coast Air Basin is required to implement BACMs including TCMs for the control of direct PM2.5 and PM2.5 precursors from on-road mobile sources. SCAG prepared a TCM BACM analysis for the Serious 2006 PM2.5 SIP included in the 2016 South Coast AQMP.<sup>31</sup> Effective March 14, 2019, US EPA approved the BACM demonstration in the Serious 2006 PM2.5 SIP including the TCM BACM demonstration.

Since the adoption of the 2016 AQMP, SCAG has been implementing all the committed TCMs described in the 2016 AQMP, including those listed in the 2016 AQMP Appendix IV-C as well as new TCMs added through the TCM selection and rollover process via the subsequent FTIP development process. The continuing TCM implementation provides emission reductions in PM2.5 and PM2.5 precursors for the attainment of the 2006 PM2.5 standard.

## ***II. Evaluation of Additional Feasible Measures***

Since the adoption of the 2016 AQMP, several regulations and policies have been developed or updated for select source categories by other agencies. For example, several air districts have revised their wood-burning rules to incorporate more stringent requirements. In addition, California has passed a suite of bills that seek to reduce greenhouse gas emissions from various sectors including electricity generation as well as residential and commercial buildings. Hence, a further evaluation of feasible measures is warranted for these source categories. The following sections provide an update of these regulations and policies and an assessment of whether they could be considered additional feasible measures for these source categories in the Basin. Finally,

---

<sup>31</sup> 2016 AQMP Appendix IV-C. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iv-c.pdf?sfvrsn=4>.

South Coast's recently adopted Reasonably Available Control Technology Demonstration is also presented here as an additional analysis for feasible measures.

*i. Residential Fuel Combustion – Wood Combustion*

Residential wood combustion is an area source category with significant PM<sub>2.5</sub> emissions, accounting for an estimated 4.9 ~~tons-per-day~~tpd of PM<sub>2.5</sub> and 7.4 ~~tpdtons-per-day~~ of VOC in year 2018. Most wood-burning devices in the Basin are fireplaces or wood stoves (or wood-burning heaters). South Coast AQMD Rule 445 (Wood Burning Devices) regulates emissions from this source category. On February 12, 2019, the U.S. EPA approved Rule 445 as BACM for the 2006 24-hour PM<sub>2.5</sub> standard (84 FR 3005). Since that time, two other California air districts and another state agency have revised their wood-burning rules to incorporate more stringent requirements. Hence, a further evaluation of feasible measures is warranted for this source category.

South Coast AQMD Rule 445 Wood-Burning Devices (Amended 6/5/2020) was adopted in March 2008 to implement the PM<sub>2.5</sub> Control Measure BCM-03 of the 2007 AQMP to reduce PM<sub>2.5</sub> emissions from wood-burning devices. Rule provisions apply to manufacturers, vendors, commercial firewood sellers, and persons owning or operating a wood-burning device. The rule prohibits burning of products not intended for use as fuel, the sale of unseasoned wood (currently from July 1 through the end of February), and mandates curtailment of wood-burning on “No-Burn” days. Wood-burning curtailment is mandatory on No-Burn days when ambient PM<sub>2.5</sub> concentration is forecast to exceed a threshold limit. Exemptions are included for low income households, where the device is the sole source of heating or no natural gas service is available within 150 feet of the property line, geographic elevations 3,000 feet or higher above mean sea level, and ceremonial fires. The rule was amended in May 2013 to implement Control Measure BCM-01 in the 2012 AQMP. The 2013 amendments expanded the wood-burning curtailment or No-Burn day restrictions by lowering the curtailment threshold from 35 to 30 µg/m<sup>3</sup>, establishing criteria for Basin-wide curtailment, and also setting standards for commercially sold solid-fuel labeling. In June 2020, Rule 445 was amended to implement the backstop Contingency Control Measure BCM-09 in the 2016 AQMP and to address the CAA contingency measure requirements for the PM<sub>2.5</sub> standards. The 2020 amendments extended the No-Burn day requirement Basin-wide when the daily PM<sub>2.5</sub> air quality is forecast to exceed 30 µg/m<sup>3</sup> in any source receptor area, providing additional emission reduction benefits beyond those incorporated in the baseline reductions from this source category. In addition, the No-Burn day thresholds will automatically be lowered upon the EPA's finding of failure to fulfill specific requirements as set forth in 40 CFR § 51.1014(a).

The following is an evaluation of recently adopted rules and regulations by other agencies for residential wood burning:

*San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) Rule 4901 (Wood Burning Fireplaces and Wood Burning Heaters, Amended 6/20/2019)*

SJVUAPCD Rule 4901 includes a tiered mandatory curtailment program that establishes different curtailment thresholds for each county based on the type of devices. During a level one episodic woodburning curtailment, operation of wood burning fireplaces and unregistered wood burning heaters is prohibited, but properly operated, registered wood burning devices may be used. During a level two episodic woodburning curtailment, operation of any wood burning device is prohibited. In the “hot spot” counties of Madera, Fresno, and Kern, the level one PM<sub>2.5</sub> threshold is 12 micrograms per cubic meter, and the level two PM<sub>2.5</sub> threshold is 35 micrograms per cubic meter. In the remaining counties in the District (San Joaquin, Stanislaus, Merced, Kings, and Tulare), the level one PM<sub>2.5</sub> threshold is 20 micrograms per cubic meter, and the level two PM<sub>2.5</sub> threshold is 65 micrograms per cubic meter. In addition, Rule 4901 prohibits the sale or transfer any real property which contains a wood burning heater without first assuring that each wood burning heater included in the real property is EPA Phase II Certified or has a more stringent certification for wood-burning devices under the NSPS at the time of purchase or installation, , as well as removal or installation of an EPA certified wood-burning heater that meets the requirements of NSPS at the time of installation during a major fireplace remodel which also requires a building permit. South Coast AQMD Rule 445 prohibits remodeling of fireplaces. Existing fireplaces constructed prior the effective date of the rule may be repaired within the existing footprint where there is a health/safety issue.

*Bay Area Air Quality Management District (BAAQMD) Regulation 6 Rule 3 (Wood-Burning Devices, Amended 11/20/2019)*

Under BAAQMD Rule 6-3, the Air District can issue a Winter Spare the Air Alert and require a Mandatory Burn Ban when air quality is forecast to be unhealthy due to elevated levels of fine particulate matter with some exemptions that allow wood burning. The rule provides for limited exemptions in the following areas: (i) sole source of heat, (ii) non-functional, permanently installed heater, and (iii) loss of natural gas and/or electric power. In 2019, BAAQMD revised its wood-burning rule to provide for curtailments year-round with a curtailment threshold of 35 µg/m<sup>3</sup>.

*Utah Administrative Code R307-302-3 (No-Burn Periods for Particulates, Effective 2/1/2017)*

Under Utah Administrative Code R307-302-3, when the ambient concentration of PM<sub>2.5</sub> measured by monitors in Box Elder, Cache, Davis, Salt Lake, Tooele, Utah or Weber counties are forecasted to reach or exceed 25 micrograms per cubic meter, a mandatory no-burn period for solid fuel burning devices goes into effect. The mandatory no-burn periods will only apply to those counties identified by the director. A person within the geographical boundaries is prohibited from using a solid fuel burning device unless it is the sole source of heat for an entire residence and registered with the director.

*Analysis of Feasible Measures for Residential Fuel Combustion (South Coast AQMD Rule 445)*

The following is an analysis of feasible measures for residential fuel combustion based on an evaluation of recently adopted rules and regulations by other air agencies.

*Lowering Curtailment Thresholds*

The 2006 standard for the 24-hour PM<sub>2.5</sub> is set at 35 µg/m<sup>3</sup>. Under Rule 445, when ambient PM<sub>2.5</sub> concentration is forecast to exceed 29 µg/m<sup>3</sup>, wood burning is prohibited. Since the curtailment threshold is significantly lower than the 24-hour standard, a No-Burn day will be called when days are forecasted to be above the standard as well as on days when PM levels are close to the standard. As such, a lower curtailment threshold will not result in additional emission reduction benefits on days with PM<sub>2.5</sub> levels exceeding 35 µg/m<sup>3</sup>, and would not have quantifiable emission reductions for the 24-hour PM<sub>2.5</sub> standard.

*Removal or Replacement of Non-Certified Devices upon Property Transfer or Remodel*

In South Coast AQMD, wood-burning curtailment is mandatory for all non-exempt households whenever ambient PM<sub>2.5</sub> concentrations are forecast to exceed the curtailment threshold. Given all non-exempt households are prohibited from using both certified and non-certified devices on no-burn days, the removal or replacement of non-certified devices upon transfer or remodel would not result in additional emission reductions on days when the curtailment thresholds are exceeded.

*EPA-Certified Devices in Exempt Households*

Households currently exempt from South Coast Rule 445 curtailment requirements include the following: where there is no existing infrastructure for natural gas service within 150 feet of the property line; locations 3,000 feet or more above mean sea level; low-income households; sole source of heat, and ceremonial fires. Ceremonial fires are regulated pursuant to the provisions of Rule 444 – Open Burning.

As discussed in the Rule 445<sup>32</sup> staff report, certified wood-burning heaters can range in price anywhere from \$2,000 to \$8,000 per unit and require professional installation. This would be a significant financial hardship for low income households and also for those not within 150 feet of natural gas service or where the unit is the sole source of heat (which are generally located in more rural and economically disadvantaged areas in the Basin). Natural gas service is generally available in the more densely populated regions of the Basin, so that with the number of units required to switch over this will likely not be a cost-effective requirement or a significant source of emissions reductions. Also staff is exploring ways to expand the existing Fireplace and Wood Stove Change Out incentive program to include additional zip codes. The program currently provides qualified applicants between \$200 to \$1,600 towards the purchase and installation of an approved wood-burning or gaseous-fueled device that replaces an existing fireplace, providing an incentive to

---

<sup>32</sup> Table 4 of Rule 445 Final staff Report. <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2020/2020-Jun5-026.pdf?sfvrsn=6>.

replace fireplaces with cleaner units. The only areas 3,000 ft or higher above mean sea level with large populations in the Basin are Idyllwild, Lake Arrowhead, and Big Bear. The only Federal Reference Method PM<sub>2.5</sub> monitor located at 3,000 feet or higher above mean sea level in the South Coast Air Basin is in Big Bear. The recorded PM<sub>2.5</sub> levels from this monitor are well below the 24-hour PM<sub>2.5</sub> standard. On days when meteorology is favorable for high PM<sub>2.5</sub> concentrations, these areas are all downwind of monitors that do not attain the 24-hour standards. Therefore, these areas are not expected to contribute to exceedances of the 24-hour standard.

#### *Extend the Curtailment Season to Year-round*

Climate in the Basin is typically more moderate than in the Bay Area and during the non-wood-burning season months, wood-burning devices are used mainly for ambience purposes. For example, based on NOAA data during the four-month wood-burning season from November 2019 through February 2020, the average ambient temperatures in the Los Angeles Downtown Area were 64.9, 59.4, 60.9 and 62.6 degrees Fahrenheit, respectively. In contrast, at San Francisco International Airport (BAAQMD) for the same time period temperatures were 56.4, 53.5, 52.1 and 55.3 degrees Fahrenheit, respectively. Similarly, for the same time period temperatures in the Fresno area (SJVUAPCD) were 57.9, 51.0, 49.0 and 55.0 degrees Fahrenheit, respectively. Both regions have significantly lower average temperatures than those typically experienced in the South Coast Air Basin. In addition, the exceedances outside the wood-burning season months are unlikely to affect the 24-hour design values. The past three Basin maximum 24-hour design values were not affected by the few exceedances occurring outside the wood-burning season.<sup>33</sup> In 2019, PM levels above the 24-hour standard were observed only during the existing curtailment season (i.e. in the months of November, December, January, and February), when meteorology is conducive to PM<sub>2.5</sub> formation in the Basin. As such, extending the curtailment season to the entire year would not result in additional emission reductions for the 24-hour standard.

#### *Conclusion*

Based on the above analysis, for this source category, no other feasible measures would result in additional emission reductions for the 2006 24-hour standard. The requirements in Rule 445 – Wood-Burning Device will be further evaluated in future rule amendments.

#### *ii. Residential and Commercial Buildings*

The South Coast Air Basin is home to approximately 17 million residents, representing 44% of the population in California, who reside in about 6 million housing units and utilize commercial space for shopping, entertainment, and places of employment. The energy consumption in the residential and commercial buildings is a direct and indirect source of criteria pollutants and greenhouse gas emissions. Residential and commercial fuel combustion accounted for 21.4 ~~tpd tons per day~~ of NO<sub>x</sub> and 7.3 ~~tpd tons per day~~ of directly emitted PM<sub>2.5</sub> in the Basin in 2018. The majority of NO<sub>x</sub> emissions within the residential and commercial buildings are from water heating and space

<sup>33</sup> Events that would reasonably be considered exceptional events such as wildfire and July 4 were removed from this analysis.

heating with the residential sector responsible for the higher direct PM<sub>2.5</sub> emissions from residential wood burning. In South Coast AQMD, Rule 1111 reduces NO<sub>x</sub> emissions from residential and commercial gas-fired fan-type residential space heating furnaces. The rule applies to manufacturers, distributors, sellers, and installers of such furnaces. Rule 1111 was amended in 2009 to require Ultra-Low NO<sub>x</sub> furnaces (14 nanograms per Joule (ng/J)) by 2014, and was subsequently amended to extend the compliance date with a mitigation fee option. The current NO<sub>x</sub> emission limit is set at 14 ng/J, which is the most stringent emission limit in California. NO<sub>x</sub> emissions from residential natural-gas fired water heaters are regulated by Rule 1121. The rule was amended in December 1999 to lower the emission limit from 40 ng/J to 20 ng/J on July 1, 2002 and 10 ng/J on January 1, 2005. In 2004, the implementation date of the final rule limit of 10 ng/J was delayed to 2006-2008 as more time was needed because a number of national safety, energy and environmental standards were delayed and must be met concurrently with the Rule 1121 final limit. The existing NO<sub>x</sub> limit of 10 ng/J is still the most stringent emission limit for natural gas fired water heaters in California.

For the residential and commercial buildings, there are potential opportunities to require and accelerate the replacement of existing equipment with cleaner zero- or near-zero emissions alternatives. The 2016 AQMP includes control measures for the applications of zero or near-zero NO<sub>x</sub> emissions appliances in the residential and commercial sectors (CMB-02), additional enhancement in reducing energy use in existing residential buildings (ECC-03), and co-benefits from existing residential and commercial building energy efficiency mandates (ECC-02). These three control measures combined are anticipated to achieve 2.6 tpd of NO<sub>x</sub> reductions by 2023. A key element of the 2016 AQMP is to use private and public funding to help further the development and deployment of the advanced cleaner technologies such as zero emission and near-zero emission technologies, and also identify co-benefits from existing programs (e.g., climate and energy efficiency). In January 2019, the South Coast AQMD Governing Board awarded 26 emission reduction incentive projects, totaling over \$47 million from several South Coast AQMD mitigation and penalty funds, to support the 2016 AQMP's goals. Of the 26 projects, 15 were selected to implement commercially available zero or near-zero control technologies as well as to support infrastructure for implementation of cleaner fuels. These projects are anticipated to result in approximately 88 tons per year of NO<sub>x</sub> and 2 tons per year of PM<sub>2.5</sub> emissions reductions in the Basin, with the majority of the projects implemented in environmental justice communities. Additionally, 11 stationary and mobile source technology demonstration projects were funded. Upon successful demonstration and deployment, these projects have the potential to provide additional long-term NO<sub>x</sub> and VOC emission reductions. The awarded projects are consistent with the commitments in various 2016 AQMP control measures including MOB-14, CMB-02, CMB-04, and ECC-03.

Since the adoption of the 2016 AQMP, California Legislature passed a suite of bills that seek to reduce greenhouse gas emissions from various sectors including electricity generation as well as

residential and commercial buildings. In 2018, California passed SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases), which sets new standards to California's renewable portfolio by requiring the state to use 50% renewable electricity by 2026, 60% renewable electricity by 2030, and 100% carbon-free electricity by 2045. In addition, two new laws directed towards the state's building sector, AB 3232 (Zero-emissions Buildings and Sources of Heat Energy) and SB 1477 (Low-emissions Buildings and Sources of Heat Energy), were signed in 2018. AB 3232 requires the California Energy Commission (CEC) to assess, by January 1, 2021, the potential for reducing GHG emissions from California's residential and commercial buildings to 40% below 1990 levels by 2030. The assessment will identify key options and policies for increasing heating efficiency while reducing carbon emissions from the state's commercial and residential buildings. SB 1477 helps promote and implement clean heating technology in the state by providing \$50 million per year through 2023 to encourage market-based development and adoption of low-emission, clean heating technologies for buildings. In 2018, Governor Brown also signed Executive Order B-55-18, committing California to total, economy-wide carbon neutrality by 2045.

Overall, California sets ambitious goals to promote clean technologies and decrease energy use in California's existing and new building stock. Reducing, managing, and changing the way energy is used in the commercial and residential sectors can provide additional emission reductions, reduce energy costs, and provide multiple environmental benefits. These state climate policies will result in NOx reduction co-benefits in the mid to long term time frame. An evaluation of the benefits of these existing and emerging energy programs to NOx reduction will be included in the 2022 AQMP. South Coast AQMD will continue to evaluate opportunities for additional feasible NOx reductions in existing and new residential and commercial buildings through regulatory or incentive-based programs.

Based on the above analysis, no other feasible measures would result in additional emission reductions for the 2006 PM2.5 standard ~~it is concluded that for this source category, no other feasible measures would result in additional emission reductions for the 2006 PM2.5 standard.~~

iii. Farming Operations - Manure Management

South Coast AQMD Rule 223 (Emission Reduction Permits for Large Confined Animal Facilities, Amended 6/2/06) reduces emissions of ammonia and VOCs, both of which are precursors of PM2.5. Rule 223 applies to Large Confined Animal Facilities (LCAFs) above certain size thresholds. Dairies with at least 1,000 milking cows, poultry facilities with at least 650,000 birds, and horse facilities with at least 2,500 horses qualify as LCAFs. Pertaining to manure management, the dairy provisions require that owners/operators implement at least six of 12 corral measures, two of seven solid manure or separated solids handling measures, one of eight liquid manure handling measures, and two of four land application measures. A Poultry LCAF owner/operator must implement at least one of seven solid manure or separated solids handling measures, and one

of eight liquid manure handling measures. Rule 223 requires applicable facilities to obtain a South Coast AQMD permit including a mitigation plan with measures chosen from the mitigation menu. The menu option approach in Rule 223 provides the flexibility of selecting the more cost-effective measures.

South Coast AQMD Rule 1127 (Emission Reductions from Livestock Waste, Adopted 8/6/2004) reduces emissions of ammonia, VOC, and PM<sub>10</sub> emissions from dairy livestock waste. Rule 1127 applies to dairy farms with 50 or more cows, heifers, and/or calves and to manure processing operations, such as composting operations and anaerobic digesters. The major requirements of Rule 1127 include Best Management Practices (BMPs) to minimize fugitive dust emissions, minimize excess water in corrals, pave feed lanes at least 8 feet on the corral side of the feed lane fence, clear corrals of accumulated manure, and timely remove on-dairy stockpiles. Manure disposal is permitted from the dairy only to a manure processing operation designed to reduce ammonia and VOC emissions from unprocessed manure; agricultural land within the SCAQMD approved for the spreading of manure; or a combination of the above options.

*SJVUAPCD Rule 4570 (Confined Animal Facilities, Amended 10/21/2010)*

SJVUAPCD Rule 4570 limits emissions of VOC and NH<sub>3</sub> from Confined Animal Facilities. Rule 4570's regulatory thresholds include facilities with at least 500 milking cows, 3,500 beef cattle, 7,500 calves, heifers, or other cattle, 400,000 heads of chicken and ducks, 100,000 heads of turkey, 3,000 heads of swine and horses, and 15,000 heads of sheep, goats, or any combination of the two. Rule 4570 is more stringent regarding its applicability compared to South Coast AQMD Rule 223 for milk cows (1,000 milk cows in South Coast AQMD vs 500 milk cows in SJVAPCD), and for chickens and ducks (650,000 birds in South Coast AQMD vs. 400,000 birds in SJVAPCD). Rule 4570 also made certain feed and housing menu items mandatory for dairies and poultry facilities. However, South Coast AQMD Rule 1127 has lower applicability thresholds for cows, heifers and/or calves. Rule 223 also has a lower applicability for horse facilities (2,500 in South Coast AQMD vs. 3,000 in SJVUAPCD). In the 2016 AQMP, the feasibility of lowering the applicability threshold was evaluated. It was determined that lowering the applicability threshold would result in 0.20 tpd of NH<sub>3</sub> reductions and 0.04 tpd of VOC reductions by 2025.

*Other State Policies*

California SB 1383, adopted in September 2016, establishes targets to reduce methane emissions from livestock manure management operations and dairy manure management operations. On March 24, 2017, ARB adopted its Short-Lived Climate Pollutant Reduction Strategy (SLCP Plan), outlining future steps for implementing SB 1383 and the need for cooperation. As the plan states, "the State will work to support improved manure management practices through financial incentives, collaboration to overcome barriers, and other market support." South Coast AQMD anticipates that the implementation of SB 1383 would result in co-benefits of VOC and NH<sub>3</sub> reductions from livestock manure management operations and dairy manure management

operations. The implementation of SB 1383 is expected to reduce the emissions from this source category.

#### *Conclusion*

Based on the above analysis, ~~it is concluded that for this source category,~~ no other feasible measures would result in additional emission reductions for the 2006 PM2.5 standard for this source category. Staff will continue to track the implementation of SB 1383 and the corresponding emissions benefits to determine whether future rule amendments may be warranted.

#### *iv. Farming Operations - Greenwaste Composting*

PM precursor emissions of VOC and NH3 are emitted from composting of organic waste materials including greenwaste and foodwaste which are regulated by South Coast AQMD Rule 1133.3 (Greenwaste Composting Operations). Although Rule 1133.3 covers foodwaste composting, the level of emissions from foodwaste composting has not been fully characterized, mainly due to the lack of related emissions test data. In the 2016 AQMP, BCM-10 (Emission Reductions from Greenwaste Composting) seeks to reduce VOC and NH3 emissions (1.5 tpd and 0.1 tpd by 2023, respectively) through emerging organic waste processing technology, restrictions on the direct land application of chipped and ground uncomposted greenwaste, and through increased diversion to anaerobic digestion.

In addition to emitting VOC and NH3, the decomposition of organic waste is a significant source of GHG emission. SB 1383, adopted in September 2016, establishes a 50 percent reduction target in the statewide disposal of organic waste from the 2014 level by 2020, and a 75 percent reduction target by 2025. Under SB 1383, CalRecycle has the regulatory authority to achieve the organic waste disposal reduction targets. It also established an additional target that not less than 20 percent of edible food that is currently disposed of is recovered for human consumption by 2025. South Coast AQMD anticipates that the implementation of SB 1383 would result in co-benefits of VOC and NH3 emission reductions from this source category.

#### *Conclusion*

Evaluation is underway to update the emission inventory, which will be used in conjunction with implementation of SB 1383 to assess the need of any potential rulemaking to further reduce emissions from this category.

#### *v. 2020 Reasonably Available Control Technology Demonstration*

In 2020, a RACT Demonstration was conducted for the South Coast Air Basin based on its Extreme nonattainment classification of the 2015 8-hour ozone standard (herein refers as 2020

RACT).<sup>34</sup> The 2020 RACT Demonstration addressed both Control Techniques Guidelines (CTG) and non-CTG major<sup>35</sup> sources in the Basin emitting the 10 or more tons per year of VOC and NO<sub>x</sub>. The 2020 RACT Demonstration evaluated over 48 of the U.S. EPA's CTG sources as well as 70 rules, regulations or guidelines adopted from March 2014 to February 2020 by other air districts, state air agencies, and the U.S. EPA. These rules and regulations were compared with the corresponding South Coast AQMD rules and regulations. The 2020 RACT Demonstration concluded that, with the exception of Rule 1115 (Motor Vehicle Assembly Line Coating Operations), South Coast AQMD's current rules for the applicable sources of VOC and NO<sub>x</sub> meet or exceed the federal RACT requirements. South Coast AQMD Rule 1115 is currently not as stringent as the U.S. EPA's CTG (Automobile and Light-Duty Truck Assembly Coatings) for several coatings and products for facilities emitting greater than 15 pounds per day. In addition, the VOC emission limits in Rule 1115 for several coating types are less stringent than those in the corresponding Antelope Valley Air Quality Management District and San Joaquin Valley Air Pollution Control District's rules. Rule 1115 applies to both light-duty and heavy-duty vehicle assembly lines, whereas the U.S. EPA's CTG applies to automobiles and light-duty trucks. For heavy-duty vehicles, the CTG provides an option to satisfy the requirement through metals products or plastic parts coatings. In the 2014 RACT analysis, all facilities subject to Rule 1115 were heavy-duty vehicles manufacturers, and RACT was fulfilled through South Coast AQMD Rule 1107 (Coatings of Metal Parts and Products). Since then, new light-duty motor vehicle manufacturing facilities are operating in the Basin that are subject to this CTG. Accordingly, light-duty motor vehicle manufacturing emission sources do not meet the U.S. EPA's CTG requirements and South Coast AQMD commits to amend Rule 1115 to meet the CTG requirements. Under South Coast AQMD New Source Review Program (Regulation XIII), the new light-duty motor vehicle manufacturing facilities are required to meet BACT for all emission sources, which by definition represents the "best available control technology." Thus, no additional feasible measure was identified for the Basin from the 2020 RACT Demonstration, which was submitted to the U.S. EPA in August 2020.

vi. Mobile Sources

Since approval of the 2016 SIP, CARB has continued to substantially enhance and accelerate reductions from our mobile source control programs through continued implementation of ongoing programs such as the Truck and Bus Rule, and adoption of new regulations and more stringent engine emissions standards and in-use requirements such as the Heavy-Duty Low NO<sub>x</sub> Omnibus Regulation approved by the Board on August 27, 2020. Other rules that CARB has adopted since 2016 include: Low Carbon Fuel Standard and Alternative Diesel Fuels Regulation adopted in April 2018, amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program adopted in May 2018, Heavy-Duty Diesel Vehicle Emission Control

<sup>34</sup> Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, South Coast AQMD, May 2020 (<http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>).

<sup>35</sup> Major sources that are not covered by the U.S. EPA CTGs are called non-CTG major sources.

System Warranty Regulation Amendments adopted in June 2018, the Innovative Clean Transit rule adopted in December 2018, the Zero Emission Airport Shuttle Bus Regulation adopted in June 2019, the Advanced Clean Trucks Regulation adopted in June 2020, and the Control Measure For Ocean-Going Vessels At Berth And At Anchor adopted in August 2020.

CARB also continues to lower emissions through the use of incentive funding, and other policies and initiatives. These efforts not only ensure that all mobile source sectors continue to achieve maximum emission reductions through implementation of the cleanest current technologies, but also promote the ongoing development of more advanced zero and near-zero technologies. As a result, California's mobile source control programs continue to be the most stringent emissions controls in the nation and provide the implementation of feasible control measures for mobile source sectors.

vii. Transportation Control Measures

The following analysis is an update to the TCM BACM Analysis in the recently approved 2016 South Coast AQMP/2006 PM<sub>2.5</sub> Standard SIP, which aims to identify additional feasible measures since the 2016 AQMP.

*Review of On-Going Implementation of TCMs in the South Coast Air Basin*

In the South Coast Air Basin, TCMs are defined to include the following three main categories of transportation improvement projects and programs that have funding programmed for right-of-way and/or construction in the first two years of the prevailing FTIP per the applicable SIPs as documented in the SCAG's Final 2019 FTIP Guidelines:

- Transit, Intermodal Transfer, and Active Transportation Measures;
- High Occupancy Vehicle (HOV) Lanes, High Occupancy Toll (HOT) Lanes, and their pricing alternatives; and
- Information-based Transportation Strategies.

*TCM Selection and TCM Rollover Process* – TCMs in the South Coast Air Basin continue to be developed through a continuous and exhaustive process. Projects identified as TCMs in the RTP/SCS are tracked as they get programmed in the FTIP. Only projects that have money programmed for right-of-way and/or construction in the first two years of the FTIP are considered TCMs subject to the Clean Air Act timely implementation requirements. Approximately every two years, as the FTIP is updated, additional TCMs will be added to the South Coast AQMPs/SIPs based on the new FTIP and the FTIP Guidelines. The rollover of TCMs updates the AQMPs/SIPs to include new projects in addition to ongoing projects from previous FTIPs. The rollover is monitored for adherence to the schedule established in the FTIP at the time a project is identified as a committed TCM. The identification of TCMs from the FTIP is agreed upon by both SCAG and the appropriate CTCs. As the FTIP gets adopted every two years, new TCMs emerge and

completed TCMs get removed. This rollover process was included in the 1994 SIP and approved by the U.S. EPA. The rollover process has been refined in the FTIP Guidelines adopted with every FTIP. The rollover process has worked remarkably well and has resulted in hundreds of TCMs being implemented/constructed. Thus, the rollover process produces more than RACM would produce and meets BACM. This ensures that RTP/SCS projects that are potential TCMs will, through the rollover process, eventually become committed TCMs.

*TCM Funding* – Funding for TCMs traditionally depended mostly on federal & state sources. But with gas tax revenues declining and both federal and state budgets tightly constrained, local agencies in California asked the state legislature for permission to go to the voters in each county for a ½ percent sales tax for transportation. This required a 2/3 voter approval in each county, and all four counties in the South Coast Air Basin won approval and extensions were also subsequently approved. While most counties impose a 0.5 percent sales tax to fund transportation projects, Los Angeles County effectively imposes a permanent two percent sales tax (a combination of four 0.5 percent sales taxes - Proposition A, Proposition C, Measure R, and Measure M) as Measure M increases from 0.5 to one percent upon the expiration of Measure R. Riverside County's Measure A will sunset in 2039, followed by San Bernardino County's Measure I in 2040, and Orange County's Measure M in 2041.

As a result of these local sales measures, the mix of revenues in the current 2019 FTIP is \$19.8 billion local (57 percent), \$8.9 billion state (26 percent), and \$5.9 billion federal (17 percent); while in the recently adopted 2020 RTP/SCS (Connect SoCal), the mix is \$297.2 billion local (60 percent) (of which 57 percent is local sales tax), \$154.8 billion state (32 percent), and \$41.1 billion federal (8 percent).

These local revenues fund mostly capital expenditures for TCM projects. For example, in the current 2019 FTIP, HOV projects receive \$1.3 billion, transit \$9.5 billion, ITS, transportation demand management (TDM), and bicycle/pedestrian combined \$691 million; and in the 2020 RTP/SCS (Connect SoCal), HOV/Express Lane projects receive \$13.4 billion, transit \$66.8 billion, and TDM and active transportation combined \$25.0 billion. HOV projects being funded include widening of SR-111, I-710, SR-55, SR-91, I-405, SR-118, and adding Express Lanes to I-405, I-10, I-605, I-15, SR-71, I-215, and US-101. Transit projects include the BRT Connector, Gold Line extension, Green Line extension, Redline extension, and West Valley Connector.

Extraordinary efforts have been undertaken to pass or extend local sales taxes for transportation in the South Coast region and continued to be successful. The effort to organize and pass or extend these local sales taxes goes well beyond what could have been expected and provides funding for TCMs which could not have been built without these local efforts. These efforts are certainly BACM, not just in revenue raised but without which, none of the major TCMs in transit rail, HOV, etc. could have been financed and constructed.

*Review of TCMs Implemented in All Serious PM2.5 Nonattainment Areas*

There are five Serious PM2.5 nonattainment areas in this country:

- South Coast Air Basin, California
- San Joaquin Valley, California
- Fairbanks, Alaska
- Provo, Utah
- Salt Lake City, Utah

SCAG performed an updated review of all new PM2.5 SIPs in these areas for available TCMs. SCAG also considered TCMs discussed and reviewed at numerous SCAG's Transportation Conformity Working Group (TCWG) meetings as part of the 2019 FTIP, 2020 RTP/SCS (Connect SoCal), and 2021 FTIP development. The review found that no new TCMs were identified for consideration from control programs both within and outside of the South Coast Air Basin. In addition, the review continued to find that TCM commitments are rarely made in other Serious PM2.5 nonattainment areas; Compared to the other Serious nonattainment area under the 2006 PM2.5 standard, the South Coast region continued to commit much greater level of funding for TCMs.

*Conclusion*

The above updated analysis demonstrates that the TCM projects being implemented in the South Coast Air Basin continue to constitute BACM, and no additional feasible TCM could be identified.

- The South Coast region continues to implement a much more robust TCM selection process, commit a much greater level of funding for TCMs, has increased and will continue to increase the TCM infrastructure than other PM2.5 nonattainment areas.
- No new TCMs were identified for consideration from TCM programs both within and outside of the South Coast region.
- The exclusion justifications for those measures referenced in the previous BACM analysis continue to be valid because those measures cannot be implemented due to lack of implementation authority, no or non-quantifiable emission reduction benefits, not feasible, or not cost-effective.

***Reasonable Further Progress***

The CAA requires that SIPs for most nonattainment areas demonstrate reasonable further progress (RFP) towards attainment through emission reductions phased in from the time of the SIP submission until the attainment date. The RFP requirements in the CAA are intended to ensure that there are sufficient emission reductions in each nonattainment area to attain the NAAQS by the applicable attainment date. Per CAA Section 171(1), RFP is defined as:

*“such annual incremental reductions in emissions of the relevant air pollutant as are required by this part or may reasonably be required by the Administrator for the purpose of ensuring attainment of the applicable national ambient air quality standard by the applicable date.”*

As stated in subsequent federal regulation, the goal of the RFP requirements is for areas to achieve generally linear progress toward attainment. To determine RFP for the attainment date, the U.S. EPA guidance states that the plan should rely only on emission reductions achieved from sources within the nonattainment area. Section 172(c)(2) of the CAA requires that nonattainment area plans show ongoing annual incremental emissions reductions toward attainment, which is commonly expressed in terms of benchmark emissions levels or air quality targets to be achieved by certain interim milestone years.

For PM<sub>2.5</sub> nonattainment areas, in addition to the CAA Title I, Part D, Subpart 1 (*General Requirements*) RFP requirements, Subpart 4 (*Provisions for PM*) Section 189(c)(1) introduces the requirement for states to submit quantitative milestones for both “moderate” and “serious” areas. Milestones are to be achieved every three years until the area is re-designated attainment and demonstrate RFP. As stated in the U.S. EPA’s final rule for “*Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements*” (81 FR 58010), the statutory Serious area attainment plan must contain quantitative milestones to be achieved by 7.5 years from the area’s date of designation of nonattainment. In the case of the 2006 24-hour PM<sub>2.5</sub>, the effective date of designation is December 14, 2009, and thus the first milestone year is 2017. The final rule (81 FR 58010) also requires that all Serious area attainment plans to contain one additional quantitative milestone to be met in the 3-year period beyond the attainment date. The 2016 AQMP included the RFP and quantitative milestone analysis for the 2006 PM<sub>2.5</sub> standard for the Basin as a Serious nonattainment area. Following U.S. EPA guidance, the milestone years included in the 2016 AQMP RFP demonstration were 2017 (7.5 years from designation) and 2020 (post-attainment milestone).

Since the 2016 AQMP already addressed the RFP requirements for the 2006 PM<sub>2.5</sub> standard up to 2017, this RFP demonstration continues from the last RFP milestone year of 2017 to the new attainment year of 2023 and post attainment milestone year of 2026. Emission reductions required under an RFP plan for PM<sub>2.5</sub> are directly emitted PM<sub>2.5</sub> and applicable precursor air pollutants. As described in Chapter 3 – Base-Year and Future Emissions, the base year of this Plan is 2018, which also serves as the base year for purposes of tracking RFP. Table 6-2 presents the PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors emissions for the base year and the RFP milestones years. A more detailed breakdown of the emissions inventory by major source category can be found in Appendix I of this Plan.

**TABLE 6-2**  
Baseline Emissions for Base Year and Milestone Years  
(Annual Average – Tons per Day)

	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM2.5	NH3
<b>2018</b>	369.2	370.5	14.0	62.4	73.0
<b>2020</b>	357.0	338.6	14.9	62.4	72.0
<b>2023</b>	344.8	276.6	15.2	61.9	71.6
<b>2026</b>	337.6	265.5	15.5	62.0	71.7

As previously stated, RFP means the annual incremental reductions in emissions of direct PM2.5 and PM2.5 precursors which are necessary to ensure attainment of the applicable PM2.5 NAAQS as expeditiously as practicable. RFP should demonstrate that by the end of the calendar year for each milestone date for the area, pollutant emissions will be at levels that reflect either generally linear progress or stepwise progress in reducing emissions on an annual basis between the base year and the attainment year. Based on the modeling analysis as presented in Chapter 5 of this Plan, attainment of the 2006 PM2.5 standard is expected in 2023 relying on reductions in baseline emissions. As such, the required annual percent reduction needed to show linear progress is determined from the difference between baseline emissions in the 2018 base year and the 2023 attainment year. Table 6-3 summarizes the RFP calculations.

**TABLE 6-3**  
Summary of 24-Hour PM2.5 Reasonable Further Progress Calculation

ROW	CALCULATION STEP	VOC	NO <sub>x</sub>	SO <sub>x</sub>	PM2.5	NH3
<b>1</b>	2018 Base Year Emissions (tpd)	369.2	370.5	14.0	62.4	73.0
<b>2</b>	2023 Baseline Emissions (tpd)	344.8	276.6	15.2	61.9	71.6
<b>3</b>	Annual Reduction Needed to Show Linear Progress (tpd)	4.9	18.8	-0.2	0.1	0.3
<b>4</b>	2020 Target Needed to Show Linear Progress (tpd)	359.4	332.9	14.5	62.2	72.4
<b>5</b>	2020 Baseline Emissions (tpd)	357.0	338.6	14.9	62.4	72.0
<b>6</b>	2020 Projected Shortfall (tpd)	0	5.68	0.39	0.20	0

**Row Description**

Row 1: The 2018 base year emissions taking into account existing rules and projected growth

Row 2: The 2023 attainment year baseline emissions taking into account existing rules and projected growth

Row 3: [(Row 1 – Row 2) / 5]

Row 4: Row 1 – (Row 3 x 2)

Row 5: Projected 2020 milestone baseline emissions taking into account existing rules and projected growth

Row 6: Row 5 – Row 4; Negative numbers are denoted as zeros, representing no shortfall

As described in Chapter 3 - Base-Year and Future Emissions, the baseline inventory reflects regulations and programs adopted by South Coast AQMD as of December 2015 and by CARB as of November 2015. Regulations reflected in EMFAC2017 are included in the on-road mobile emissions. The rules and regulations incorporated in the baseline emissions have been SIP-approved. Key rules and regulations contributing to the emission reductions in future baseline emissions are used as milestones to track RFP. The RFP milestones for all the required years for PM2.5 and its precursors are also used to address the quantitative milestone requirements, and are described in the next section under “Quantitative Milestone”.

As demonstrated in Table 6-3, the annual reduction needed to demonstrate linear progress is determined based on the difference between baseline emissions in 2018 and 2023. For the milestone year of 2020, the emission targets needed to show linear progress are compared with the 2020 baseline emissions.

For VOC and NH3, 2020 baseline emissions (row 5) are below the 2020 target levels (row 4). The 2020 baseline emissions for VOC and NH3 exceed the target reductions by 24% and 67%, respectively. Therefore, linear progress is achieved for the two PM precursors.

SOx emissions show a marginal increase from 2018 to 2023. However, the small marginal increase in SOx would likely result in only a small increase in sulfate mass. Ambient PM2.5 chemical composition data confirms marginal contribution of sulfate mass to the ambient PM2.5 mass. For the high PM days during winter where PM2.5 levels exceed the 24-hour PM2.5 standard, high fractions of nitrate and organic carbon but small amount of sulfate are observed.<sup>36</sup> Therefore, SOx are expected to have de minimis impacts on ambient 24-hour PM2.5 concentrations in the Basin.

As for NOx, emissions reduce from 370.5 ~~tons per daytpd~~ in 2018 to 276.6 ~~tons per daytpd~~ in 2023. In 2020, baseline NOx emission is 338.6 ~~tons per daytpd~~, which is 5.68 ~~tons per daytpd~~ above the 2020 target level. Nonetheless, NOx has been reduced by 31.9 ~~tons per daytpd~~ between 2018 and 2020, achieving 85% of the linear progress target in 2020, demonstrating significant progress towards attainment. Mobile source accounts for over 80% of NOx emissions in the Basin. CARB’s existing regulations will provide considerable amount of NOx reductions from mobile sources in the next few years. Specifically, CARB’s On-Road Heavy-Duty Diesel Vehicles Regulation (Truck and Bus regulation) and In-Use Off-Road Diesel-Fueled Fleets Regulation will provide significant NOx reductions from the heavy-duty trucks and off-road equipment by 2023. Existing regulations as well as recently adopted regulations, described in Chapter 4 of this Plan, will provide sufficient and surplus NOx reductions for attainment in 2023.

<sup>36</sup> 2016 AQMP, Appendix V, Figures V-7-2 through V-7-5. Available at <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-v.pdf?sfvrsn=10>.

Emissions of directly emitted PM2.5 decrease from 62.4 ~~tons-per-daytpd~~ in 2018 to 61.9 ~~tons-per-daytpd~~ in 2023. In 2020, PM2.5 emissions stayed at the same level as 2018. The majority of the PM2.5 reductions in 2023 come from the Truck and Bus regulation, in which significant reductions are assumed to occur in the last year of its implementation schedule. Nonetheless, some rules and regulations have been adopted / amended recently which provide additional PM2.5 reductions beyond the 2020 baseline emissions. In May 2018, CARB adopted “Amendments To The Heavy-Duty Vehicle Inspection Program And Periodic Smoke Inspection Program”<sup>37</sup>(hereafter, HDVIP and PSIP amendments) which became effective on July 1, 2019. These amendments are expected to achieve additional PM2.5 emission reductions of 0.203 ~~tons-per-daytpd~~<sup>38</sup> in 2020. The HDVIP and PSIP amendments have been submitted to the U.S. EPA for SIP approval, and are currently pending the U. S. EPA’s review and actions. In addition, South Coast AQMD Rule 445 (Wood-Burning Devices) was amended in June 2020 to address the CAA contingency measure requirements for the PM2.5 standards. The 2020 amendments extended the No-Burn day Basin-wide requirement when the daily PM2.5 air quality is forecast to exceed 30 µg/m<sup>3</sup> in any source receptor area, providing additional PM2.5 reduction benefits of 0.035 ~~tons-per-daytpd~~ beyond those incorporated in the 2020 baseline (only half of the reductions are counted given the 2020 curtailment season begins in November 2020). The curtailment threshold will automatically be lowered upon the EPA’s finding of failure to fulfill specific requirements as set forth in 40 CFR § 51.1014(a). Given U.S. EPA’s determination of the Basin’s failure to attain the 2006 PM2.5 standard, the curtailment threshold is lowered from 30 µg/m<sup>3</sup> to 29 µg/m<sup>3</sup> for the upcoming curtailment season in 2020, resulting in 0.029 ~~tons-per-daytpd~~ of reductions in PM2.5. The recent amendments to Rule 445 have been submitted to the U.S. EPA for SIP approval, and are currently pending the U. S. EPA’s review and actions. As such, the amendments of Rule 445 and the HDVIP and PSIP yield approximately 0.27 ~~tons-per-daytpd~~ of PM2.5 reductions, exceeding the required reduction of 0.2 tpd in 2020.

For the 2026 post attainment milestone year, given that the attainment in 2023 was demonstrated using baseline emissions, the baseline emissions (as presented in Table 6-2) are also used to track RFP in 2026. In addition to the SIP-approved rules and regulations reflected in the 2026 baseline emissions, South Coast AQMD’s Rule 445 and CARB’s HDVIP and PSIP, as described in the above paragraph, will provide additional reductions in directly emitted PM2.5 emissions in 2026.

Note that newly adopted rules and regulations, described in greater detail in Chapter 4 under *South Coast AQMD Adopted Rules and Programs Since 2016 AQMP But Not Yet Reflected in the Inventory* and *CARB Recent Regulations Adopted But Not Yet Reflected in the Inventory*, will provide additional emission reduction benefits beyond the baseline emissions, hence providing “surplus” reductions in the milestone year of 2020 and beyond. With the exception of South Coast

<sup>37</sup> Amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program, <https://ww2.arb.ca.gov/rulemaking/2018/heavy-duty-vehicle-inspection-program-and-periodic-smoke-inspection-program>

<sup>38</sup> Staff Report: Initial Statement of Reasons, p. 33, Table 6: Projected Annual PM Emissions Benefits (TPD) for San Joaquin Valley and South Coast Air Basin.

AQMD's Rule 445 and CARB's HDVIP and PSIP, the newly adopted rules and regulations are not relied upon to demonstrate RFP.

### *Quantitative Milestones*

Pursuant to CAA Section 189(c)(1), an attainment Plan must include specific quantitative milestones that demonstrate RFP toward attainment of the applicable PM2.5 NAAQS in the area. Quantitative milestones are designed to track RFP, to track progress in achieving the minimum 5 percent annual emission reductions as well as control measures needed for expeditious attainment. Accordingly, this Plan must include milestones to be achieved by no later than a milestone date of 13.5 years from the date of designation of the area, and every three years thereafter, until the milestone date that falls within three years after the applicable attainment date.<sup>39</sup> At a minimum, each quantitative milestone Plan must include a milestone for tracking progress achieved in implementing the SIP control measures by each milestone date. Since the 2016 AQMP already addressed the quantitative milestone planning requirements for the 2006 PM2.5 standard up to 2020,<sup>40</sup> this quantitative milestone plan continues from the last milestone year of 2020 to the new attainment year of 2023 and the post attainment milestone year of 2026. Table 6-2 provides the baseline emissions for the milestone years of 2020, 2023 and 2026.

Based on the modeling analysis described in Chapter 5 of this Plan, attainment of the 2006 PM2.5 standard is expected in 2023 relying on reductions in baseline emissions. As presented earlier in this Chapter, the 5% annual reductions will be achieved from NOx reductions in baseline emissions. As such, baseline emissions of PM2.5 and all PM2.5 precursors are used to track RFP and baseline emissions of NOx are used to track progress in achieving the minimum 5 percent annual emission reductions requirements.

### *Quantitative Milestones for South Coast AQMD Stationary Source Regulations*

Baseline emissions, as shown in Table 6-3, incorporate emission reductions achieved from control measures that are already adopted as regulations. For example, the 2023 baseline emission is the projection from 2018 and it incorporates population and economic growth as well as all adopted control measures that will be implemented (partially or fully) by December 31, 2023. Table 6-5 provides a list of the South Coast AQMD's adopted rules and regulations for stationary sources that are scheduled to be implemented beyond 2018, accounting for the reductions in the baseline emissions of the future milestone/attainment years. South Coast AQMD will be reporting on the implementation of the rules listed in Table 6-5 as part of the 2020, 2023 and 2026 quantitative milestones.

<sup>39</sup> 40 CFR 51.1013 Quantitative Milestone Requirements.

<sup>40</sup> The quantitative milestone report for 2020 is due March 31, 2021.

### ***Quantitative Milestones for State Mobile Source Regulations***

The RFP and quantitative milestone demonstrations in this Plan rely, in part, on NO<sub>x</sub> reductions from California mobile source regulations. The most significant of these regulations are included as quantitative milestones in 2020, 2023 and 2026.

For the 2020 milestone year, CARB will demonstrate the progress achieved in implementing the following control measures:

1. Implementation of the On-Road Heavy-Duty Diesel Vehicles Regulation through 2020
2. Implementation of the In-Use Off-Road Diesel-Fueled Fleets Regulation through 2020

For the 2023 milestone year, CARB will demonstrate the progress achieved in implementing the following control measures:

1. Implementation of the On-Road Heavy-Duty Diesel Vehicles Regulation through 2023
2. Implementation of the In-Use Off-Road Diesel-Fueled Fleets Regulation through 2023

For the 2026 milestone year, CARB will demonstrate the progress achieved in implementing the following control measures:

1. Implementation of In-Use Off-Road Diesel-Fueled Fleets Regulation between 2023 and 2026. By 2023, the requirements for large and medium fleets in this regulation will be implemented, but deadlines for small fleets continue through 2028. A small fleet is defined as a fleet of off-road diesel vehicles belonging to a municipality whose fleet cumulatively produces less than or equal to 1,500 horsepower (hp), a small business whose fleet

produces less than or equal to 1,500 hp, or a municipality fleet in a low-population county; and

2. Implementation of the Innovative Clean Transit (ICT) regulation. Beginning in 2026, the ICT requires that 50 percent of new buses purchased by large transit agencies are zero-emission buses (ZEBs), and 25 percent of new buses purchased by small transit agencies are ZEBs.

CARB will work closely with South Coast AQMD to report on the milestones identified in this Plan for the applicable milestone years.

### *Transportation Conformity*

Section 176(c) of the Federal CAA establishes transportation conformity requirements which are intended to ensure that transportation activities do not interfere with air quality progress. The CAA requires that transportation plans, programs, and projects that obtain federal funds or approvals *conform to* applicable state implementation plans (SIP) before being approved by a Metropolitan Planning Organization (MPO). Conformity to a SIP means that proposed activities must not:

- (1) Cause or contribute to any new violation of any standard,
- (2) Increase the frequency or severity of any existing violation of any standard in any area, or
- (3) Delay timely attainment of any standard or any required interim emission reductions or other milestones in any area.

A SIP that analyzes the region's total emissions inventory from all sources is necessary for purposes of demonstrating reasonable further progress (RFP)<sup>41</sup>, and attainment.<sup>42</sup> The portion of the total emissions inventory from on-road highway and transit vehicles in these analyses becomes the "motor vehicle emissions budget."<sup>43</sup> Budgets are set for each criteria pollutant or its precursor(s), for all RFP milestone years and the attainment year. Subsequent transportation plans and programs produced by transportation planning agencies are required to conform to the SIP by demonstrating that the emissions from the proposed plan, program, or project do not exceed the budget levels established in the applicable SIP.

<sup>41</sup> RFP is defined as annual incremental reductions in emissions of the relevant air pollutant for ensuring attainment of the applicable National Ambient Air Quality Standard by the region's attainment year.

<sup>42</sup> Areas with concentrations of criteria pollutants that are below the levels established by the National Ambient Air Quality Standards (i.e., 24-hr: 35 µg/m<sup>3</sup>) are considered attainment.

<sup>43</sup> Federal transportation conformity regulations are found in 40 CFR Part 51, subpart T – Conformity to State or Federal Implementation Plans of Transportation Plans, Programs, and Projects Developed, Funded or Approved Under Title 23 U.S.C. of the Federal Transit Laws. Part 93, subpart A of this chapter was revised by the EPA in the August 15, 1997 Federal Register.

### ***PM2.5 Requirements for Conformity***

The U.S. EPA has promulgated separate rule makings addressing the PM2.5 emission categories and precursors that must be considered in PM2.5 transportation conformity determinations.

#### ***PM2.5 Motor Vehicle Emission Category Requirements***

Guidance on the motor vehicle emission categories that must be considered in transportation conformity determinations can be found in the July 1, 2004, Final Rule amending the Transportation Conformity Rule to implement criteria and procedures for the 8-hour ozone and PM2.5 standards;<sup>44</sup>

[A]ll regional emissions analyses in PM2.5 nonattainment and maintenance areas [must] consider directly emitted PM2.5 motor vehicle emissions from the tailpipe, brake wear, and tire wear...Sections IX. and X. [of the Final Rule] provide information on when re-entrained road dust and construction-related dust must also be included in PM2.5 conformity analyses...[T]he analysis for direct PM2.5 must include:

- tailpipe exhaust particles,
- brake and tire wear particles,
- re-entrained road dust, if before a SIP is submitted to U.S. EPA or the state air agency has made a finding of significance or if the applicable or submitted SIP includes re-entrained road dust in the approved or adequate budget, and
- fugitive dust from transportation-related construction activities, if the SIP has identified construction emissions as a significant contributor to the PM2.5 problem.<sup>45</sup>

#### ***PM2.5 Motor Vehicle Emission Precursor Requirements***

Following the July 1, 2004, Final Rule identifying the motor vehicle emission categories that must be considered in transportation conformity determinations, U.S. EPA issued the May 6, 2005, Final Rule<sup>46</sup> amending the Transportation Conformity Regulation. In this Final Rule, U.S. EPA identifies four transportation-related precursors that result in PM2.5 formation—nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOCs), sulfur oxides (SO<sub>x</sub>),<sup>47</sup> and ammonia (NH<sub>3</sub>)—for consideration in the conformity process in PM2.5 nonattainment and maintenance areas.<sup>48</sup> Of these PM2.5 precursors, the Final Rule indicates NO<sub>x</sub> must be included in the regional transportation conformity determination unless it is found to be an insignificant contributor to the formation of PM2.5 in the region, per Section 93.102(f) of the Conformity Regulation.<sup>49</sup>

<sup>44</sup> 69 FR 40004.

<sup>45</sup> 69 FR 40331-40333. Codified in Sections 93.102(b)(1) and (3) and Section 93.122(f) of the Conformity Regulation.

<sup>46</sup> 70 FR 24280.

<sup>47</sup> U.S. EPA revised the transportation conformity rule to revise PM2.5 precursors from SO<sub>x</sub> to SO<sub>2</sub> for consistency with the broader PM2.5 implementation strategy. (73 FR 4435).

<sup>48</sup> 70 FR 24282. Codified in Sections 93.102(b)(2)(iv) and (v) of the Conformity Regulation.

<sup>49</sup> 70 FR 24282. Codified in § 93.119(f)(9) and (10) of the Conformity Regulation.

Conversely, VOCs, SO<sub>2</sub>, and NH<sub>3</sub> are not required unless these precursors are found to be significant contributors to the formation of PM<sub>2.5</sub> in the region. If it is determined through the SIP process that the on-road contribution of a precursor is a significant contributor to the formation of PM<sub>2.5</sub> in the region, then an emissions budget must be prepared for that precursor in the SIP and MPOs are required to provide a conformity determination for each precursor for which there is an adequate or approved budget in the SIP.<sup>50</sup>

### ***Conformity Budgets***

The South Coast AQMD Section 189(d) Plan establishes motor vehicle emission budgets for primary emissions of PM<sub>2.5</sub> from vehicle exhaust, tire and brake wear, and the precursors of VOC and NO<sub>x</sub>. Based on the criteria from Section 93.109(f), SO<sub>2</sub> and NH<sub>3</sub> are not found to be significant. In addition, re-entrained road dust from paved and unpaved road travel and road construction dust are determined to be significant. This section discusses transportation conformity emissions budgets and an emissions trading mechanism for the 24-hour PM<sub>2.5</sub> NAAQS in the South Coast Air Basin. Annual average daily emissions are used in the Plan consistent with the progress and attainment demonstration for the 24-hour PM<sub>2.5</sub> standard. Consequently, conformity budgets have been set for annual average daily emissions in the analysis years 2023 and 2026. The emissions budgets presented below use EMFAC2017 (V.1.0.3) with Southern California Association of Governments (SCAG) activity data (VMT and speed distributions). The activity data are from SCAG's 2016 RTP (adopted by the SCAG Board on April 7, 2016), and are consistent with the RFP and attainment demonstration for the SIP.

The California Air Resources Board (CARB) staff released a revised emission rate program, EMFAC2017, which updates the emission rates and planning assumptions used in calculating conformity budgets. EMFAC2017 was approved for use in SIPs and transportation conformity by U.S. EPA on August 15, 2019.<sup>51</sup> The recently approved Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks,<sup>52</sup> effective June 29, 2020, has impacted some of the underlying assumptions in the EMFAC2017 model. Hence, the emissions output from the EMFAC2017 model were adjusted to account for the emissions impact of the SAFE rule. Emissions for re-entrained paved road dust, re-entrained unpaved road dust, and road construction dust are based on California Emissions Projection Analysis Model (CEPAM).<sup>53</sup>

<sup>50</sup> 70 FR 24287.

<sup>51</sup> U.S. EPA approved EMFAC2017 for use in transportation conformity and SIPs on August 15, 2019.

<https://www.govinfo.gov/content/pkg/FR-2019-08-15/pdf/2019-17476.pdf>.

<sup>52</sup> U.S. EPA, The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks on April 30, 2020 <https://www.epa.gov/regulations-emissions-vehicles-and-engines/safer-affordable-fuel-efficient-safe-vehicles-final-rule>.

<sup>53</sup> CARB, California Emissions Projection Analysis Model.

<https://www.arb.ca.gov/app/emsinv/fcemssumcat/fcemssumcat2016.php? ga=2.3640688.1164753250.1599289357-1384337407.1582433658>.

The transportation conformity budgets presented below were developed in consultation with SCAG, South Coast AQMD, and U.S. EPA. Budgets use emissions for an average annual day, consistent with the on-road emissions inventory and attainment demonstration, using the following method:

- 1) Calculate the on-road motor vehicle emissions totals for the appropriate pollutants (VOC, NOx and PM2.5) from EMFAC2017 and apply adjustments to account for SAFE vehicle rule.
- 2) Combine on-road vehicle emissions with re-entrained paved road dust, re-entrained unpaved road dust, and road construction dust emissions from CEPAM 1.05 and round each total up to the nearest ton

The emission budgets under this Plan for VOC, NOx, and PM2.5 for the attainment year (2023) and the post-attainment year (2026) are summarized in Table 6-6.

**TABLE 6-6**

Draft Transportation Conformity Budgets\* for the 2006 24-hour PM2.5 Standard in the South Coast Air Basin (Annual average tons per day)

<b>DRAFT SCAB PM2.5 Transportation Conformity Budget (annual average tons per day)</b>						
	<b>2023</b>			<b>2026</b>		
	<b>VOC</b>	<b>NOx</b>	<b>PM2.5</b>	<b>VOC</b>	<b>NOx</b>	<b>PM2.5</b>
On-Road Emissions*	57.61	99.90	9.97	49.73	92.64	9.90
Paved Road Dust			7.95			8.06
Unpaved Road Dust			0.59			0.58
Road Construction Dust			0.27			0.28
Total	57.61	99.90	18.78	49.73	92.64	18.83
<b>Conformity Budget<sup>^</sup></b>	<b>58</b>	<b>100</b>	<b>19</b>	<b>50</b>	<b>93</b>	<b>19</b>

\* Includes SAFE Vehicle Rule Adjustments, ^ Rounded to nearest whole integer

Activity data source: SCAG 2016 RTP, adopted by the SCAG Board on April 7, 2016.

Section 93.124(b) of the federal conformity rule allows for the SIP to establish emissions trading mechanisms between budgets for pollutants or precursors, or among budgets allocated to mobile and other sources. The emissions trading mechanism for the 24-hour standard is not being revised from that submitted for the 2016 South Coast AQMP. The trading mechanism established the approximate weighting ratios of the precursor emissions for 24-hour PM2.5 formation in equivalent tons per day of NOx as 0.3 for VOC and 14.8 for PM2.5 as summarized in Table 6-

7. In other words, reducing one ton of VOC is equivalent to reducing 0.3 tons of NOx and reducing one ton of PM2.5 is equivalent to reducing 14.8 tons of NOx. This mechanism allows emissions below the budget for one pollutant to be used to supplement another pollutant exceeding the budget based on the ratios established above. All calculations should be clearly documented when using this trading mechanism to demonstrate a transportation plan, transportation improvement program, or project conforms with the SIP's motor emissions budget.

As outlined in the 2016 AQMP, the trading ratios are defined by the 24-hour PM2.5 regional modeling attainment demonstration. Briefly, NOx emissions reductions are scaled to the reduction of Basin ammonium nitrate (including water bonding). Similarly, reductions of VOC are scaled to changes in the organic carbon species while reductions in directly emitted particulates are scaled to the projected changes in the elemental carbon and "others" portions of the PM2.5 mass. Table 6-7 summarizes the trading equivalencies in tons per day (tpd).

**TABLE 6-7**  
Trading Equivalencies for 24-hour PM2.5 Motor Vehicle Emissions Budgets\*

ONE TON OF	IS EQUIVALENT IN TERMS OF PM2.5 FORMATION TO THIS MANY TONS OF		
	NOx:	VOC:	PM2.5:
NOx	1	3.151	0.067
VOC	0.317	1	0.021
PM2.5	14.833	46.792	1

\*Table is from Table VI-D-5 in the 2016 AQMP

An example of how the trading mechanism would work follows; if the amount of NOx calculated exceeds the budget by 0.75 tpd, then that overage could be offset by trading 2.36 tpd of excess VOC emissions reductions (e.g.  $3.151 \text{ VOC}/1 \text{ ton of NOx} \times 0.75 \text{ tpd NOx required} = 2.36 \text{ tpd VOC}$ ). In this case, "excess" VOC emission reductions would be those beyond what are needed to meet the VOC budget. Similarly 0.050 tpd of directly emitted PM2.5 emissions below the budgeted amount could also be traded to the NOx emissions category and subtracted from the NOx total to allow NOx to meet its budget. In other words, the trading mechanism can be multi-pollutant and multi-directional. It should be noted that the trading calculations are performed prior to the final rounding to demonstrate conformity with the budgets.

### *Fulfillment of New Source Review Requirements*

The CAA requires permits for the construction and operation of new or modified major stationary sources (Title 1, Part D, Subpart 1, Section 172(c)). New Source Review (NSR) for major and in some cases minor sources of PM2.5 and its precursors is presently addressed through the South Coast AQMD's NSR and RECLAIM programs (Regulations XIII and XX, respectively). Both programs are applicable to sources located in the South Coast AQMD jurisdiction, including the

South Coast Air Basin and the Coachella Valley. Regulation XIII establishes the federal and State mandated pre-construction review program for new, modified, or relocated sources. The NSR program is a critical component of the South Coast AQMD's attainment strategy and ensures that all new and modified sources install BACT and their emission increases are fully offset with creditable emission reductions. Rule 1302 specifies the definitions used in Regulation XIII. Rule 1325 was adopted June 3, 2011 to incorporate the U.S. EPA's requirements for PM<sub>2.5</sub> into Regulation XIII. The rule mirrors federal requirements which include the definition of major source, significant emissions rate, offset ratios, and the applicability requirements of Lowest Achievable Emission Rate (LAER), facility compliance, offsets, and control of PM<sub>2.5</sub> precursors. Under existing NSR and RECLAIM programs, major stationary sources of NO<sub>x</sub> and SO<sub>x</sub> are already subject to emission offsets. Both VOC and ammonia emissions are subject to BACT under the existing NSR at a zero threshold. VOC emissions are also required to be offset when a new or modified source has the potential to emit 4 tons per year or more of VOC. Ammonia emission sources have not historically been subject to NSR offset requirements. However, for permitted ammonia sources, South Coast Rule 1303 (NSR Requirements) requires denial of "the Permit to Construct for any relocation, or for any new or modified source which results in an emission increase of any nonattainment air contaminant, any ozone depleting compound, or ammonia, unless BACT is employed for the new or relocated source or for the actual modification to an existing source." BACT shall be at least as stringent as LAER as defined in the federal Clean Air Act Section 171(3) [42 U.S.C. Section 7501(3)].

### ***Major Source Threshold***

The NSR permitting program relies on emissions thresholds to determine when certain requirements apply to new stationary sources and to modifications of existing stationary sources. If a new or modified facility will emit PM<sub>2.5</sub> or PM<sub>2.5</sub> precursor emissions greater than the major source threshold, the facility is considered a major source. Under a Serious nonattainment classification, the major source threshold is defined as a potential to emit 70 or more tons per year of PM<sub>2.5</sub> or PM<sub>2.5</sub> precursors. To comply with federal requirements for Serious nonattainment areas, Rule 1325 has been amended on November 4, 2016 to update the Major Polluting Facility definition to align the associated major source emission threshold at 70 tons per year for PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors. VOC and ammonia were added to the Rule 1325 definition of Precursors and a VOC and ammonia threshold at 40 tons per year was added as part the definition of Significant. The SO<sub>x</sub> Major Polluting Facility threshold identified in Rule 1302 was also lowered from 100 to 70 tons per year.

### ***PM Precursor Requirement in Nonattainment NSR***

CAA Subpart 4 Section 189(e) states that control requirements applicable to plans in effect for major stationary PM sources shall also apply to major stationary sources of PM precursors, except where such sources do not contribute significantly to PM levels which exceed the standard in the area. In August 2016, the U.S. EPA issued the Final Rule of "*Fine Particle Matter National*

*Ambient Air Quality Standards: State Implementation Plan Requirements*” (81 FR 58010) that requires states to evaluate and adopt control measures for direct PM<sub>2.5</sub> and all four PM<sub>2.5</sub> precursors from stationary, mobile and area sources, unless states could make the appropriate precursor demonstration to demonstrate that contribution of a precursor insignificant. Specifically, a “nonattainment new source review (NNSR) demonstration” is required in order to establish that sources of the particular precursors need not be regulated for the purpose of the NNSR permitting program. As discussed previously, Rule 1325 was amended to address all precursors of PM<sub>2.5</sub> including NO<sub>x</sub>, VOC, ammonia and SO<sub>x</sub>.

As such, ~~it is concluded that~~ the South Coast AQMD’s New Source Review Regulations already addressed the NSR requirements for a Serious nonattainment area, and no additional action is needed.

### *Contingency Measures*

Clean Air Act Section 172(c)(9) requires a ~~State Implementation Plan (SIP)~~ to provide for the implementation of specific measures to be undertaken if the nonattainment area fails to make RFP, or to attain the NAAQS by the applicable attainment date. Such contingency measures need to take effect in any such case without further action by the State or the Administrator. The U.S. EPA provides further details in the Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements (81 Fed. Reg. 58010, Aug 24, 2016; hereafter referred as “PM<sub>2.5</sub> Implementation Rule”).<sup>54</sup> According to the PM<sub>2.5</sub> Implementation Rule, contingency measures should provide for emission reductions approximately equivalent to either one (1) year’s worth of air quality improvement or 1 year’s worth of reductions needed for RFP. The following sections describe how South Coast Air Basin satisfies the contingency measure requirements for attainment of the 2006 24-hour PM<sub>2.5</sub> standard. The current demonstration has two parts: 1) a contingency measure that satisfies a ‘triggering mechanism’ requirement set by the U.S. EPA based on the *Bahr* case, and 2) an evaluation of the emission reductions equivalent to 1 year’s worth of progress.

### ***Rule 445 (Wood-Burning Devices)***

To comply with the attainment contingency requirements, South Coast AQMD amended Rule 445 (Wood-Burning Devices) on June 5, 2020. The recent amendment requires the residential wood burning curtailment to be expanded to the entire Basin, compared to the previous rule which mandates a curtailment in a specific Source Receptor Area (SRA) where the SRA is forecast to exceed 30 µg/m<sup>3</sup> of PM<sub>2.5</sub>, or requires a mandatory winter burning curtailment in the entire South Coast Air Basin where PM<sub>2.5</sub> is forecast to be higher than 30 µg/m<sup>3</sup> at a SRA which has recorded a violation of the federal 24-hour PM<sub>2.5</sub> NAAQS for either of the two previous three-year design value (DV) periods. The DV is the three-year average of the annual 98<sup>th</sup> percentile of the 24-hour values of monitored ambient PM<sub>2.5</sub> data. The amendment also contains four contingency

<sup>54</sup> Document available at <https://www.govinfo.gov/content/pkg/FR-2016-08-24/pdf/2016-18768.pdf>.

measures, each of which will impose lower curtailment thresholds to comply with the requirements listed in 40 CFR §51.1014(a). The estimated PM<sub>2.5</sub> emission reductions anticipated from the expansion of the curtailment to the entire Basin is 25.4 tons per year (tpy). The reductions by imposing thresholds of 29, 28, 27 and 26 ug/m<sup>3</sup> are expected to be 20.9, 20.9, 13.9 and 19.1 tpy, respectively. Each subsequent finding by the U.S. EPA will trigger increasingly stringent requirements by lowering the threshold in the rule that will lead to additional emission reductions. Since the U.S. EPA has recently finalized its finding of the South Coast Air Basin's failure to attain the 2006 24-hour PM<sub>2.5</sub> standard in 2019, the curtailment threshold will be lowered to 29 ug/m<sup>3</sup>.

### ***One Year's Worth of Emission Reductions***

While Rule 445 satisfies a 'triggering mechanism' requirement set by the U.S. EPA based on the *Bahr* case, the reductions from the rule alone are not adequate to satisfy the 1-year's worth of progress, which is defined as the total emission reductions to occur from 2018 to 2023 divided by 5 years, as shown in Table 6-8. However, additional surplus reductions available through other regulations and programs in place will ensure that the 1-year's worth of progress is achieved. Table 6-9 presents the emission reductions from recently adopted regulations and programs by CARB and South Coast AQMD, as well as the baseline reductions from 2023 to 2024 which are discussed in this section. The 1-year's worth of reductions applies to PM<sub>2.5</sub> precursors as well as directly emitted PM<sub>2.5</sub>.

**TABLE 6-8**

PM<sub>2.5</sub> and its Precursor Emissions in 2018 and 2023 Baseline and 1-Year's Worth of Emission Reductions. Unit is tons per day (tpd).

	PM <sub>2.5</sub>	VOC	NO <sub>x</sub>	SO <sub>x</sub>	NH <sub>3</sub>

7. Amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program  
<https://ww2.arb.ca.gov/rulemaking/2018/heavy-duty-vehicle-inspection-program-and-periodic-smoke-inspection-program>.

The baseline reductions demonstrate continuous reductions due to the on-going implementation of existing regulations and continuous turnover of old vehicles to newer and cleaner vehicles. The PM<sub>2.5</sub> emission reductions expected from the recent amendment of Rule 445 and lowering a curtailment threshold to 29 ug/m<sup>3</sup> is estimated at 46.3 tons per year or 0.13 ~~tons per day~~tpd. Since the adoption of the 2016 SIP strategy, the CARB has adopted “Amendments To The Heavy-Duty Vehicle Inspection Program And Periodic Smoke Inspection Program”<sup>55</sup>(hereafter, HD Smoke Inspection Program) which became effective on July 1, 2019. These amendments are expected to achieve additional PM<sub>2.5</sub> emission reductions of 0.105 tpd<sup>56</sup> in 2024. Small PM<sub>2.5</sub> reductions are also expected from CARB’s recently adopted Ocean-Going Vessels (OGV) At-Berth and Advanced Clean Truck (ACT) regulations. The PM<sub>2.5</sub> emission reductions from the baseline measures combined with the HD Inspection Program and Rule 445 yield PM<sub>2.5</sub> reductions exceeding the 1-year’s worth of progress.

As for NO<sub>x</sub>, while baseline reductions in 2024 are only 4.28 tpd, additional surplus reductions are expected from the South Coast AQMD’s overall control strategy to meet the 8-hour ozone NAAQSs. The 2016 AQMP includes commitments to reduce NO<sub>x</sub> emissions by 45% and 55% to attain the 1997 and 2008 8-hour ozone standards in 2023 and 2031, respectively. The emission reductions from incentive programs as well as from recently adopted regulations and programs are provided in Table 6-9. While the additional reductions will occur in 2023, the reductions are permanent and surplus to the baseline level, therefore, they are accounted for as 1-year’s progress in 2024. With the combined baseline measures and newly adopted regulations and programs, the amount of NO<sub>x</sub> emission reductions expected in 2024 are larger than the required 1-year’s worth of reduction. The surplus portion of NO<sub>x</sub> is enough to make up the shortfall in VOC based on inter-pollutant precursor trading ratios approved by the U.S. EPA for use in transportation conformity analyses.<sup>57</sup> The PM<sub>2.5</sub> precursor trading ratios, submitted in the 2015 revision to the

<sup>55</sup> Amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program.

<https://ww2.arb.ca.gov/rulemaking/2018/heavy-duty-vehicle-inspection-program-and-periodic-smoke-inspection-program>

<sup>56</sup> Staff Report: Initial Statement of Reasons, p. 33, Table 6: Projected Annual PM Emissions Benefits (TPD) for San Joaquin Valley and South Coast Air Basin.

<sup>57</sup> 84 FR 3305 (February 12, 2019).

South Coast 2012 PM<sub>2.5</sub> SIP<sub>1</sub><sup>58</sup>, show that 1 ton of VOC emissions is approximately equal to 0.3 ton of NO<sub>x</sub> emissions in terms of the potential to form 24-hour average PM<sub>2.5</sub>.

NH<sub>3</sub> can contribute to ambient PM<sub>2.5</sub> concentrations, especially in the areas close to large sources such as dairy farms. There are dairy farm operations in inland valley area near Mira Loma, which has the Basin's highest 24-hour PM<sub>2.5</sub>, except Compton which showed the highest design values in 2017-2019 due to anomalously high PM levels in 2017. However, high PM<sub>2.5</sub> days especially during winter have larger contribution of nitrate and organic carbon, but smaller NH<sub>3</sub> contribution - only about 10 % of the total PM<sub>2.5</sub> mass near Mira Loma area, indicating that other precursors such as NO<sub>x</sub> and VOC and their associated chemical reactions leading to secondary PM<sub>2.5</sub> formation are dominating the mechanisms to drive the high PM episodes in Mira Loma. Details of PM<sub>2.5</sub> chemical composition are discussed in Chapter 5 of this Plan. In terms of NH<sub>3</sub> emissions sources, a single source category, "Domestic Activity" representing sources such as human perspiration, human and pet wastes accounts for 38% of the total NH<sub>3</sub> inventory in 2024. These domestic activities grow with time due to population growth and outweigh emission reductions from other regulated sources such as on-road mobile sources. Therefore, even if NH<sub>3</sub> emissions have a marginal increase, the increase will be mostly occur in highly populated area such as downtown Los Angeles would not contribute to the high DVs in inland Mira Loma area significantly. In all, considering the nature of NH<sub>3</sub> emissions and atmospheric chemistry attributing to Basin's PM<sub>2.5</sub> design values, the slow progress in NH<sub>3</sub> reductions will have de minimis impacts on ambient 24-hour PM<sub>2.5</sub> concentrations in the Basin.

SO<sub>x</sub> emissions show a marginal increase at the rate of 0.24 tpd per year from 2018 to 2024 reflecting growth in point sources and ocean going vessels. The SO<sub>x</sub> emissions increase from 2023 to 2024 is 0.08 tpd. Since SO<sub>x</sub> emissions are marginally increasing and there is no progress in reducing emissions (i.e., reductions from existing regulations are offset by expected growth), the 1-year's worth of progress required for contingency measures does not apply to SO<sub>x</sub> emissions. Nevertheless, ambient PM<sub>2.5</sub> chemical composition data shows marginal contribution of sulfate mass to the ambient PM<sub>2.5</sub> mass, especially on high PM<sub>2.5</sub> days during winter which likely caused by nitrate and organic carbon but contain smaller amount of sulfate. Therefore, even if SO<sub>x</sub> emissions increase, the impact is expected to be de minimis on ambient 24-hour PM<sub>2.5</sub> concentrations in the Basin.

In summary, South Coast Air Basin satisfies the contingency requirement set in Clean Air Act Section 172(c)(9) and the U.S. EPA's PM Implementation Rule<sub>2</sub><sup>59</sup>. South Coast AQMD's Rule 445, Wood Burning Devices, provides a contingency measure to be undertaken if the Basin fails

<sup>58</sup> CARB, 2015. Supplement to 24-hour PM<sub>2.5</sub> State Implementation Plan for South Coast Air Basin. Page C-3. Available at <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2015/2015-feb6-022.pdf?sfvrsn=2>.

<sup>59</sup> 81 Fed. Reg. 58010, Aug 24, 2016. Document available at <https://www.govinfo.gov/content/pkg/FR-2016-08-24/pdf/2016-18768.pdf>.

to attain the 2006 PM<sub>2.5</sub> 24-hour standard by the new attainment date of 2023. The emission reductions anticipated from Rule 445, in conjunction with reductions from existing and newly adopted regulations, are expected to achieve the reductions of directly emitted PM<sub>2.5</sub> and its precursors approximately equivalent to 1-year's worth of progress.

## 7. CALIFORNIA ENVIRONMENTAL QUALITY ACT

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the South Coast Air Basin Attainment Plan for 2006 24-Hour PM2.5 Standard is exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption will be prepared pursuant to CEQA Guidelines Section 15062. If the proposed project is approved, ~~the Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside, and San Bernardino counties. In addition,~~ the Notice of Exemption will be electronically filed with the State Clearinghouse to be posted on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

## 8. PUBLIC PROCESS

Development of the ~~Draft~~ South Coast Air Basin Attainment Plan for the 2006 24-hour PM2.5 Standard is conducted through a public process. The draft Plan was presented to South Coast AQMD Mobile Source Committee on August 21, 2020 and AQMP Advisory Group on September 3, 2020. The updated emissions inventory and modeling was also discussed and presented at the Scientific, Technical, and Modeling Peer Review Group on August 20, 2020. ~~South Coast AQMD staff will hold a~~ The draft Plan was released on September 18, 2020 with a comment period ending October 19, 2020. A Regional Public Hearing was held on October 7, 2020 via video conferencing and by telephone (covering four counties in the Basin) to solicit information, comments, and suggestions from the public, affected businesses and stakeholders. One comment letter was received as of October 19, 2020. Responses to these comments are provided in Chapter 9. A Public hearing ~~Hearing~~ is scheduled at the South Coast AQMD Governing Board Meeting on December 54, 2020. Following approval by the South Coast AQMD Governing Board, the Plan will be submitted for approval by the CARB Board at their Board meeting to be held on December 10-11, 2020, which will then be submitted to the U.S. EPA for inclusion into the SIP.

## 9. PUBLIC COMMENTS AND REPONSES TO COMMENTS

One comment letter was received during the comment period for the South Coast Air Basin Attainment Plan for 2006 24-hour PM2.5 Standard. The comment letter and responses to comments are listed in this section.

EPA comments on South Coast 189(d) plan for the 2006 24-hour PM2.5 Standard

To Kalam Cheung

Cc Vagenas, Ginger; King, Scott@ARB; Sylvia.Vanderspek (Sylvia.Vanderspek@arb.ca.gov); Zorik Pirveysian

You forwarded this message on 10/22/2020 9:57 AM.

Hi Kalam,

Thank you for the opportunity to comment on South Coast's draft 189(d) plan for the 2006 24-hour PM2.5 standard (Plan). Based on our preliminary review of the plan, we have the following comments. Please forward this to others at the District or CARB that I missed, and thank you again for the collaboration and opportunity to comment.

1-1

#### Air Quality

- While the characterization of the status of air quality data waivers and comparability assessment results is consistent with the current waiver request, this request is still under review by the EPA, and we intend to formally respond to the waiver request by the end of October as part of our Annual Network Plan review. The Plan should be updated if necessary to reflect EPA's response to the District's waiver request.
- Tables presenting design values (DVs) should include AQS DVs (i.e. design values that do not exclude possible EE data). If the District wants to include hypothetical design values (i.e., DVs where flagged data that have not yet been concurred on are removed from the calculation), it could include multiple data columns reflecting AQS DVs as well as hypothetical DVs excluding potential EE data.

1-2

1-3

#### Emissions Inventory

- There is a large decrease in NOx emissions between CARB's 2016 emissions inventory and the District's 2018 emissions inventory. What accounts for this decrease?
- The California Air Resources Board (CARB) has recently revised its estimates for locomotive emissions, particularly those associated with freight. (These revisions were discussed in CARB's Public Workshop for 2020 Locomotive Emission Inventory on September 3, 2020.) If the emissions estimates in the draft 189(d) Plan are not consistent with CARB's recent revisions for locomotive emissions, the final plan should include a revised estimate and a discussion of the significance of any change in projected emissions for the attainment demonstration and for the 5% and RFP calculations.

1-4

1-5

#### MVEBs

- There seems to be a sizeable difference in CARB's budget estimates for paved road dust as compared to the South Coast emission inventory. The plan indicates that the same VMT is used in the EI and budgets, so it is unclear why there is a difference. Does the District or CARB know what is causing this? Please reconcile.
- There are small differences between the on-road emissions in the budget tables and the emission inventory. Are these differences (e.g. 57.77 tpd vs 57.61 tpd) due to the application of the SAFE adjustment factors to the budget estimates?
- The Plan will need to establish MVEBs for 2026, which is the last required RFP and quantitative milestone year in this plan (40 CFR 51.1012(a)(2)).

EPA comments on South Coast 189(d) plan for the 2006 24-hour PM2.5 Standard

To Kalam Cheung

Cc Vagenas, Ginger; King, Scott@ARB; Sylvia.Vanderspek (Sylvia.Vanderspek@arb.ca.gov); Zorik Pirveysian

You forwarded this message on 10/22/2020 9:57 AM.

#### Attainment Demonstration

- The plan uses standard modeling techniques (identical to the previous plan) for all monitoring sites (except Compton) and shows attainment at those sites by the attainment date. For Compton, it relies on a weight-of-evidence analysis, including a probabilistic model, to show that the Compton site is unlikely to violate. The Plan also notes that high values at Compton are more influenced by wood burning than other sites.
  - Has the District considered any measures to reduce wood burning emissions around Compton? (e.g., revisions to Rule 445 exemptions, incentive programs, educational outreach, etc).

1-7

#### Attainment Control Strategy

- The draft 189(d) plan (page 4-1.) states that the attainment control strategy “is based on the continued implementation of existing South Coast AQMD and CARB regulations and programs over the next few years” and that “recently adopted regulations... will provide additional emission reductions which will further ensure attainment of the standard before the attainment date.”
  - It is unclear where the District has drawn the line between “baseline” and “control strategy” measures. Note that only those measures that EPA has approved into the SIP may be credited toward the attainment control strategy.

1-8

#### Analysis of Measures in Control Strategy

- The District notes in its control strategy analysis that the 2016 AQMP included a comprehensive BACM demonstration for stationary, area, and mobile sources for the 2006 24-hour standard, which EPA fully approved in February 2019. Although the draft Plan includes a discussion of several source categories for which the State or other districts have implemented additional controls since 2016, the District concludes that no additional measures are feasible.
  - Under the PM2.5 SRR, each 189(d) plan must contain an updated control strategy based on evaluation of all potential control measures for PM2.5 and PM2.5 precursors (40 CFR 51.1010(c)).
  - We’ve previously informed the District about deficiencies in the District’s BACM demonstration for residential wood burning and have recommended additional control options that the District should consider during its next rulemaking process on Rule 445.

1-9

#### RFP and QM

- Note that only those measures that EPA has approved into the SIP may be credited toward the 5% plan and RFP/attainment. We will need the District to distinguish between the rules relied on in the baseline and the rules relied on to provide additional reductions, indicate whether the measures are SIP-approved, and quantify (collectively) the reductions expected from these measures in the milestone years.
- The Plan does not include RFP milestones for all of the required years and pollutants, and does not include a showing of how RFP will be met for all milestone years.
  - The RFP milestones for 2026 may be established by extending the emissions trend lines.

1-10

EPA comments on South Coast 189(d) plan for the 2006 24-hour PM2.5 Standard

To Kalam Cheung

Cc Vagenas, Ginger; King, Scott@ARB; Sylvia.Vanderspek (Sylvia.Vanderspek@arb.ca.gov); Zorik Pirveysian

You forwarded this message on 10/22/2020 9:57 AM.

include a showing of how RFP will be met for all milestone years.

- o The RFP milestones for 2026 may be established by extending the emissions trend lines.
- The Plan must establish quantitative milestones for tracking implementation of SIP control measures and for target emissions levels for each milestone year (2020, 2023, and 2026), for each regulated pollutant. If the 2020 quantitative milestones in the SIP-approved Serious area plan for the 2006 PM2.5 NAAQS have not changed, the State/District may consider identifying these same milestones in the 189(d) plan for the 2020 milestone year and addressing them as appropriate in the quantitative milestone report due March 31, 2021.
- The draft 189(d) plan indicates that projected baseline emissions for NOx, SOx, and PM2.5 will not meet the 2020 RFP targets--this suggests that the plan fails to demonstrate RFP, unless the State/District intend to demonstrate stepwise progress (instead of generally linear) toward attainment. The draft plan also notes that certain rules adopted since the 2016 AQMP will provide additional NOx and direct PM2.5 emission reductions in 2020 and beyond. These additional reductions should be specifically identified and quantified, and should be limited to SIP-approved measures.
- The 2020 quantitative milestones (e.g., the target 2020 emission levels) in the 24-hour PM2.5 Serious area plan differ from those in the draft 189(d) plan. What is the source of the differences?
- On page 6-20, The draft Plan includes a statement that "the annual 5% reductions will be achieved from NOx reductions in baseline emissions. As such, baseline emissions are used to track RFP and to track progress in achieving the minimum 5% annual emission reduction requirement." Please clarify that this statement applies only to NOx, and clarify how you are defining "baseline." Are you referring to the emissions inventory? Does it include reductions that are not reflected in the emissions inventory?
  - o We note that because this plan contains no "precursor demonstration" to exempt a precursor from controls, the RFP and QM requirements apply to direct PM2.5 and all PM2.5 precursors. RFP and QM plans must include both milestones for tracking implementation of SIP control measures and target emissions levels for each milestone year, for each regulated pollutant.

1-11

1-12

#### Contingency Measures

- The Plan relies on Rule 445 as the contingency measure that will be triggered upon notification by EPA, but also relies on baseline measures and additional measures already in place (not in the baseline) to achieve one year's worth of reductions. Table 6-9 lists these measures but does not indicate if they are SIP-approved. We will need the District to confirm whether these measures are SIP-approved and to provide additional information about the emission reductions associated with these measures.

Desk: (415) 972-3958 | Work Cell: (415) 231-4710

Pronouns (she/hers)

Response to Comment 1-1

Thank you for providing comments on the Draft Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin (Plan).

Response to Comment 1-2

South Coast AQMD's Annual Network Plan is currently under review and is expected to be finalized by October 30, 2020. In the event that the waiver requests are denied, supplemental information will be provided to address the potential implications.

Response to Comment 1-3

Staff appreciates the comments and agrees that design values consistent with Air Quality System (AQS) should be included. Table 2-3 has been updated to provide AQS design values. The design values in Table 5-1 include all valid data and are consistent with the U.S. EPA's design values published in <https://www.epa.gov/air-trends/air-quality-design-values>. A paragraph to clarify inclusion of all valid data in the modeling attainment demonstration is added in Chapter 5.

Response to Comment 1-4

The comment compares the 2012 annual average emissions published in CARB's CEPAM website ([https://www.arb.ca.gov/app/emsinv/2017/emssumcat\\_query.php?F\\_YR=2012&F\\_DIV=0&F\\_SEASON=A&SP=SIP105ADJ&F\\_AREA=AB&F\\_AB=SC](https://www.arb.ca.gov/app/emsinv/2017/emssumcat_query.php?F_YR=2012&F_DIV=0&F_SEASON=A&SP=SIP105ADJ&F_AREA=AB&F_AB=SC)) with the 2018 emissions included in the current Plan. The 2018 emissions inventory contains approximately 170 tpd less NOx compared to the 2012 emissions inventory, due to the implementation of various regulations by South Coast AQMD and CARB.

Response to Comment 1-5

CARB is in the process of revising the emission estimates for locomotives. Draft estimates were presented at the September 3, 2020 workshop. CARB staff are still in the process of updating this information. Once the emission estimates are finalized, CARB staff will document the update and include the information in subsequent SIPs. The difference in the total locomotive NOx emissions between the CARB's draft estimates and the emissions included in this Plan is less than 1 ton per day in 2023. Even if the additional NOx emissions were considered, it will not affect attainment of the 2006 24-hour PM2.5 standard by 2023.

Response to Comment 1-6

The differences in paved road dust between the emission inventory and the transportation conformity budgets are entirely due to differences in VMT and travel fractions by roadway class from Highway Performance Monitoring System. The differences in on-road emissions are due to an update in the EMFAC2017 model, which fixed some issues related to speed profiles for multiple years and adjustments made for SAFE Vehicle Rule. These updates have caused the transportation conformity budgets, based on a more accurate estimate of emissions and to be lower than the emission inventory. Otherwise, all other elements including methodology, control measures and

emission rates are consistent between the emission inventory and the transportation conformity budgets.

The plan has already developed transportation conformity budgets for 2026. Please see the “Transportation Conformity” section in Chapter 6 of this Plan.

#### Response to Comment 1-7

As indicated in the Plan, the Compton monitoring station did not attain the 2006 24-hour PM2.5 standard by the 2019 attainment date because of three unusually high PM2.5 measurements in 2017 (January 1, December 24, and December 27). These high readings have not been observed at Compton prior to 2017 or after 2017 which means that they were likely caused by anomalous local human activities (e.g., wood burning). It is also important to note that the Compton monitoring station is located in a parking lot which has public access. The PM2.5 values in Compton have dropped significantly in 2018 and 2019 since the spike in 2017, and Compton is expected to be in full attainment by the end of 2020. Anomalous wood burning may have been the primary cause of the high values in 2017 but since these episodes did not occur before 2017 and have not re-occurred since, a localized wood burning control program may not provide any benefits.

#### Response to Comment 1-8

The attainment demonstration for the 2006 24-hour PM2.5 standard is based on the emission reductions associated with existing regulations and programs which are not yet fully implemented and will result in significant NOx and PM2.5 reductions by 2023 and beyond. Examples of these regulations are CARB’s Truck and Bus Regulation and CARB’s In-Use Off-Road Diesel-Fueled Fleet Regulation. The existing regulations and programs are reflected in the future baseline emissions and have been SIP-approved. There are also a number of recently adopted regulations (identified in Chapter 4) that were not considered in the attainment demonstration but nevertheless these regulations will provide additional reductions by 2023 will further ensure attainment of the standard.

#### Response to Comment 1-9

The analysis of control strategies is included in Chapter 6 of this Plan which includes an evaluation of emissions sources and emissions controls, and demonstrates that best available control measures (BACM) and feasible control measures are in place in the Basin for directly emitted PM2.5 and all PM2.5 precursors namely NOx, SOx, VOC, and ammonia. This analysis is based on the implementation of BACM as approved in the 2016 AQMP and 2016 State SIP Strategy as well as an evaluation of additional feasible measures conducted in this Plan. –This analysis covers stationary, area, and mobile sources as well as transportation control measures. The Evaluation of Additional Feasible Measures section in Chapter 6 includes a detailed evaluation of (i) Residential Fuel Combustion – Wood Combustion, (ii) Residential and Commercial Buildings, (iii) Farming

Operations - Manure Management, and (iv) Farming Operations - Greenwaste Composting, and (v) 2020 Reasonably Available Control Technology Demonstration, which concludes that no additional feasible measures could be identified for PM2.5 and its precursors. Based on this analysis, no additional feasible measures were identified for achieving additional emission reductions for the 2006 24-hour PM2.5 standard. Additional control options for residential wood burning will be further evaluated and considered under amendments to Rule 445 (Wood-Burning Devices).

#### Response to Comment 1-10

This Plan relies on future baseline emissions to demonstrate the 5% annual reductions and attainment in 2023. Baseline emissions consist of adopted rules and regulations (as of December 2015 for District rules, November 2015 for CARB's rules and EMFAC 2017) that have been SIP-approved.

For RFP, in addition to the SIP-approved rules and regulations reflected in the baseline emissions, South Coast AQMD's Rule 445 and CARB's Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program are relied upon for demonstrating RFP. These two measures have been adopted and submitted to the U.S. EPA for SIP approval, and are currently pending the U.S. EPA's review and actions. Clarifications have been added in Chapter 6 to describe the SIP status of South Coast AQMD's Rule 445 and CARB's Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program.

The emission levels for the RFP milestone years (2020, 2023 and 2026) are included in the Appendix I and the RFP analysis for those years is included in Chapter 6 of the Plan. Milestones used to track RFP and track progress in achieving the minimum 5 percent annual emission reductions as well as control measures needed for expeditious attainment are described under the section "Quantitative Milestone". A cross reference has been added to clarify that these quantitative milestones are also used for tracking RFP milestones. As part of the Quantitative Milestone requirement under 40 CFR 51.1013, a quantitative milestone should fall within three years after the applicable attainment date. A milestone for the year 2026 is included in Chapter 6 as the post attainment milestone. Given that the attainment in 2023 was demonstrated using baseline emissions, the baseline emissions are also used to track RFP in 2026. South Coast AQMD's Rule 445 and CARB's Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program will provide additional reductions in directly emitted PM2.5 emissions in 2026. More details on the RFP milestone in 2026 have been added in the "Reasonable Further Progress" section in Chapter 6.

#### Response to Comment 1-11

In the Serious area plan for the 2006 PM2.5 NAAQS included in the 2016 AQMP, year 2020 was included as an RFP and quantitative milestone year. Staff agrees that including a milestone for

year 2020 in this Plan will provide further clarity. Milestones for tracking RFP for the 2020 milestone year has been added.

As presented in Table 6-3 in the Plan, RFP evaluation was performed on PM<sub>2.5</sub> and PM<sub>2.5</sub> precursors. The annual reduction needed to demonstrate linear progress is determined based on the difference between baseline emissions in 2018 and 2023. For the milestone year of 2020, the emission targets needed to show linear progress are compared with the 2020 baseline emissions. For VOC and ammonia, 2020 baseline emissions exceed the target reductions by 124% and 167%, respectively. For NO<sub>x</sub>, 85% of the target reduction levels have been met which demonstrate significant and generally linear progress towards attainment. SO<sub>x</sub> emissions show a marginal increase from 2018 to 2023. However, ambient PM<sub>2.5</sub> chemical composition data indicates that sulfate has marginal contribution to the ambient PM<sub>2.5</sub> mass especially during high PM days during winter, therefore, SO<sub>x</sub> is expected to have de minimis impacts on ambient PM<sub>2.5</sub> concentrations on days that the standard is exceeded in the Basin. For directly emitted PM<sub>2.5</sub>, the baseline emission (62.4 tpd) is 0.2 tpd above the target levels (62.2 tpd) for the 2020 milestone year. As discussed in Response to Comment 1-10 and in the Plan, emissions reductions from South Coast AQMD's Rule 445 and CARB's Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program provide 0.27 tpd of PM<sub>2.5</sub> reductions in 2020. These emission reductions have not yet been incorporated in the baseline emissions and exceed the target reductions of 0.2 tpd needed to achieve linear progress for PM<sub>2.5</sub>. With the exception of the two PM measures described above, newly adopted rules and regulations not yet incorporated in the baseline emissions are not relied upon to demonstrate RFP.

#### Response to Comment 1-12

Please refer to Response to Comment 1-4 for the source of differences between the emissions inventory of the 2016 AQMP and those of this Plan.

To improve clarity on the statement described on page 6-20, it has been modified as below:

*“As such, baseline emissions of PM<sub>2.5</sub> and all PM<sub>2.5</sub> precursors are used to track RFP and baseline emissions of NO<sub>x</sub> are used to track progress in achieving the minimum 5 percent annual emission reductions requirements.”*

Baseline emissions refer to the future emissions inventory which reflects the impact of rules/regulations/programs that have been adopted by December 2015 for the South Coast AQMD's rules and November 2015 for CARB's rules. Regulations included in the EMFAC 2017 are reflected in the baseline as well. More descriptions have been added in Chapter 3 and Chapter 6 to clarify the type of rules and regulations included in baseline emissions.

Please refer to Responses to Comment 1-10 and 1-11 for the clarifications on RFP and Quantitative Milestone.

Response to Comment 1-13

The contingency measure's one year's worth of progress is demonstrated in the Plan based on emission reductions in the 2024 future baseline, one year after attainment, as well as reductions from a list of recently adopted regulations and programs, not reflected in the future baseline inventory (Table 6-9). South Coast AQMD's recently adopted rules include Rule 445 and Facility-Based Mobile Source Measure for Commercial Airports which have been submitted to EPA for inclusion into SIP. Emission reductions from incentive projects are also identified for projects implemented since 2016 AQMP adoption as well as new incentive projects expected to be implemented through 2023 based on existing funding. CARB's recently adopted rules submitted to the U.S. EPA include the South Coast Incentive Measure, CARB's Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program, and Innovative Clean Transit. Other CARB's recently adopted rules will be submitted to the U.S. EPA for inclusion into the SIP. Finally, emissions benefits for Metrolink (conversion to Tier 4 locomotives) will be reflected in the next SIP inventory update.

## Condensable and Filterable Portions of PM<sub>2.5</sub> Emissions

### *Introduction*

Per PM<sub>2.5</sub> NAAQS final implementation rule,<sup>60</sup> the SIP emissions inventory is required to identify the condensable and filterable portions of PM<sub>2.5</sub> separately, in addition to primary PM<sub>2.5</sub> emissions. Primary PM emissions consist of condensable and filterable portions. Condensable PM is the material that is in vapor phase in stack conditions, which condenses and/or reacts upon cooling and dilution in the ambient air to form solid or liquid PM immediately after discharge from the stack. All condensable PM, if present from a source, is typically in the PM<sub>2.5</sub> size fraction. The U.S. EPA's Air Emissions Reporting Requirements (AERR) requires states to report annual emissions of filterable and condensable components of PM<sub>2.5</sub> and PM<sub>10</sub>, "as applicable," for large sources for every inventory year and for all sources every third inventory year, beginning with 2011.<sup>61</sup> Subsequent emissions inventory guidance<sup>62</sup> from the U.S. EPA clarifies the meaning of the phrase "as applicable" by providing a list of source types "for which condensable PM is expected by the AERR." These source types are stationary point and area combustion sources that are expected to generate condensable PM and include sources such as commercial cooking, fuel combustion at electric generating utilities, industrial processes like cement or chemical manufacturing, and flares or incinerators associated with waste disposal. The condensable PM<sub>2.5</sub> from stationary and area sources are estimated using the methodology described below.

Filterable PM comprises "particles that are directly emitted by a source as a solid or liquid [aerosol] at stack or release conditions."<sup>63</sup> Primary PM<sub>2.5</sub> is the sum of condensable and filterable PM<sub>2.5</sub> emissions. Mobile sources emit PM in both filterable and condensable form; however, the AERR does not require states to report filterable and condensable PM separately for mobile sources. Therefore, the condensable and filterable PM<sub>2.5</sub> emissions submitted here include only those from stationary point and area sources.

### *Methodology*

Category specific conversion factors developed by CARB and used in the Imperial County 2018 SIP<sup>64</sup> were applied in the current analysis to estimate condensable PM and then filterable PM was calculated by subtracting the condensable from the total PM<sub>2.5</sub> primary emissions. The baseline

<sup>64</sup> Imperial County 2018 Annual Particulate Matter less than 2.5 microns in Diameter State Implementation Plan, April 2018. Available at [https://ww3.arb.ca.gov/planning/sip/planarea/imperial/final\\_2018\\_ic\\_pm25\\_sip.pdf](https://ww3.arb.ca.gov/planning/sip/planarea/imperial/final_2018_ic_pm25_sip.pdf).

2018, future attainment year 2023, and the RFP milestone years 2020 and 2026 are included in the analysis. Selected list of conversion factors are presented in Table B of this Appendix. The factors are developed for point and area source categories, which were classified by Source Classification Code (SCC). Primary emissions are from all source categories including on-road and off-road mobile sources, while condensable and filterable emissions are only for point and area sources, as described above.

***Base and Future Year Emissions Inventory of Condensable and Filterable Portions of PM<sub>2.5</sub>***

Figure I-1 shows the annual average emissions of primary (or direct) PM<sub>2.5</sub>, condensable PM<sub>2.5</sub> and filterable PM<sub>2.5</sub> for 2018 and 2023. As shown on Figure I-1, total primary PM<sub>2.5</sub> emissions from stationary point and area sources will increase from 44.7 to 46.5 tpd from 2018 to 2023, respectively. The increase appears in both condensable (approximately 0.5 tpd) and filterable (approximately 1.2 tpd) portions of primary PM<sub>2.5</sub> emissions in the Basin. This is consistent with the primary PM<sub>2.5</sub> trend, reflecting fast growth in population and economic activities in the Basin.

Table I-1 presents top five source categories for condensable PM<sub>2.5</sub> for 2018 and 2023. The majority of condensable PM<sub>2.5</sub> is emitted from ‘Cooking’ category, which accounts for 75.5% and 76.6% of the total condensable PM<sub>2.5</sub> in 2018 and 2023, respectively. The sum of the top five condensable PM<sub>2.5</sub> categories represents 95.7% of the total condensable PM<sub>2.5</sub> both in 2018 and 2023.

Tables I-2 shows top five categories for filterable PM<sub>2.5</sub>. “Paved Road Dust” source category is the top emitter of filterable PM<sub>2.5</sub>. Among top five categories, only “Residential Fuel Combustion” category, which ranks as the 2<sup>nd</sup> both in 2018 and 2023, slightly decreases in the future year 2023; all other four categories increased. The top five filterable PM<sub>2.5</sub> emissions categories account for approximately 71.9% (2018) and 72.4% (2023) of the total filterable PM<sub>2.5</sub> emissions. This points to a marginal increase in contribution of top 5 filterable categories to total filterable PM<sub>2.5</sub> emissions in future years.

Detailed emissions by major source category are included in Table C of this Appendix.

## **Appendix III**

### **CARB Existing Regulations**

### Appendix III

#### CARB Existing Regulations

Board Action	Hearing Date
<b>Omnibus Low-NOx Regulation:</b> The Omnibus Regulation establishes new exhaust emission standards, test procedures, and other emission-related requirements for 2024 and subsequent model year California-certified on-road heavy-duty engines.	<u>8/27/20</u>
<b>Control Measure for Ocean-Going Vessels At Berth:</b> The Regulation would take effect in 2021 and is designed to achieve further emissions from vessels at berth to reduce adverse health impacts to communities surrounding ports and terminals throughout California. These benefits would be achieved by including new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals.	<u>8/27/20</u>
<b>Procedures for the Exemption of Add-On and Modified Part(s) for On-Road Vehicles/Engines:</b> The updated aftermarket part procedures incorporate language reflecting current vehicle and engine emissions related technologies and standards. It also clarifies the requirements to improve review, testing, and approval timing to get products to market sooner.	<u>7/23/20</u>
<b>Advanced Clean Trucks Regulation:</b> The requirements for truck manufacturers sell zero-emission trucks in California and a one time requirement for large entities to report about their facilities, types of truck services used, and fleet of vehicles.	<u>6/25/20</u>
<b>Updates to the 2019 Architectural Coatings Suggested Control Measure:</b> The amended 2019 Architectural Coatings Suggested Control Measure to add a new coating category for Photovoltaic Coatings and establish a limit on the volatile organic content of the coatings.	<u>5/28/20</u>
<b>Amendments to the Regulation on the Commercialization of Alternative Diesel Fuels:</b> The amendments to the ADF Regulation to reinforce the emissions certification testing requirements and require biodiesel additives and ADF formulations to be certified according to new certification procedures. The amendments reinforce the originally intended efficacy of additives or alternative diesel formulations certified to mitigate potential oxides of nitrogen (NOx) emissions increases from the use of biodiesel.	<u>4/23/20</u>
<b>San Joaquin Valley Agricultural Equipment Incentive Measure:</b> The San Joaquin Valley Agricultural Equipment Incentive Measure for submission to the United States Environmental Protection Agency as a revision to the California State Implementation Plan (SIP). The measure achieves SIP creditable emission reductions from agricultural equipment incentive projects.	<u>12/13/19</u>
<b>Amendments to the Regulation for Limiting Ozone Emissions from Indoor Air Cleaning Devices:</b> The amendments to the air cleaner regulation, which limits ozone emissions from air cleaning devices.	<u>12/12/19</u>
<b>Amendments to the Low Carbon Fuel Standard:</b> The amendments to the Low Carbon Fuel Standard (LCFS) Regulation, focusing on strengthening the program's cost containment provisions and ensuring that LCFS residential charging credit revenue value benefits disadvantaged and low-income communities.	<u>11/21/19</u>
<b>Zero-Emission Airport Shuttle Regulation:</b> The regulation will transition combustion powered airport shuttles to zero-emission vehicles and will apply to private and public fixed destination shuttles that serve California's commercial airports.	<u>6/27/19</u>
<b>Updates to the Architectural Coatings Suggested Control Measure:</b> The updates to the SCM would reduce volatile organic compound (VOC) limits for several coating categories, create two new coatings categories, and set limits for colorants (tints) added to architectural coatings at the point of sale. The updated SCM would serve as a model rule and assist air districts in their efforts to further reduce VOC emissions to meet ambient air quality standards for ozone.	<u>5/23/19</u>
<b>Amendments to the Regulation for the Certification of Vapor Recovery Systems for Cargo Tanks:</b> The amendments to the Certification of Vapor Recovery Systems on Cargo Tanks Regulation that establish a regulatory mechanism to periodically evaluate program costs and subsequently adjust the certification fee to recover these costs, per the authority under the Health and Safety Code section 41962. In addition, the amendments will establish: (1) a requirement for a public meeting prior to adjusting fees, (2) an effective date of January 1 following a fee revision, (3) the cost of replacement decals, and (4) procedures to request a certification fee refund.	<u>4/25/19</u>
<b>Amendments to the Red Sticker Program for Off-Highway Recreational Vehicles:</b> The amendments to the Red Sticker Program for Off-Highway Recreation Vehicles (OHRV). OHRV are primarily used in public State parks and federally designated lands, as well as on private tracks. The goal of the amendments is to end the current red sticker program which allows for CARB certification of OHRV that do not meet emissions standards. The amendments include provisions that end the certification of new red sticker vehicles, end riding restrictions on public lands for existing red sticker vehicles, establish new OHRV emissions standards, and increase incentives for fleet emissions averaging and zero emission OHRV. The amendments are intended to cause emissions reductions from OHRV in California while ensuring availability for California dealers and riders.	<u>4/25/19</u>

Board Action	Hearing Date
<b>Amendments to the On-Road Heavy-Duty Diesel-Fueled Residential and Commercial Solid Waste Collection Vehicles Regulation to Include Heavy Cranes:</b> The amendments include two distinct changes to the regulation, (1) to ensure that compliant SWCVs do not experience registration delays at the California Department of Motor Vehicles due to recent changes in California law; (2) to provide a more cost-effective compliance option for specialized heavy cranes.	<u>1/24/19</u>
<b>Innovative Clean Transit Regulation, a Replacement of the Fleet Rule for Transit Agencies:</b> The Innovative Clean Transit (ICT) Regulation that requires California transit agencies to gradually transition their buses to zero-emission technologies. The ICT regulation is structured to allow transit agencies to take advantage of incentive programs by acting early and in a manner to implement plans that are best suited for their own situations.	<u>12/14/18</u>
<b>California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation:</b> The Cap-and-Trade Regulation amendments are intended to conform with the requirements in AB 398, respond to Board direction in Resolution 17-21, and enhance program implementation and oversight. The amendments include changes to provisions relating to free allocation for minimizing leakage and transition assistance, offsets usage limits and criteria related to direct environmental benefits in the State, and cost containment.	<u>12/13/18</u>
<b>Amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions:</b> The Mandatory Reporting of Greenhouse Gas Emissions amendments are targeted revisions to clarify the existing regulation related to how entities report their greenhouse gas emissions to support the Cap-and-Trade Program, and to ensure the data that are collected for CARB's climate change programs are complete and accurate.	<u>12/13/18</u>
<b>Revisions to On Board Diagnostic System Requirements, Including the Introduction of Real Emissions Assessment Logging, for Heavy Duty Engines, Passenger Cars, Light-Duty Trucks, and Medium-Duty Vehicles and Engine:</b> The amendments to the heavy-duty (HD) On Board Diagnostic (OBD) and medium-duty OBD II requirements update the monitoring requirements for gasoline and diesel vehicles, to require more data parameters to be tracked and reported by the engine/vehicle, and to clarify and improve the regulation where necessary.	<u>11/15/18</u>
<b>California Certification Procedures for Light-Duty Engine Packages for Use in New Light-Duty Specially-Produced Motor Vehicles for 2019 and Subsequent Model Years:</b> The California Regulation and Certification Procedures for Light-Duty Engine Packages for Use In New Light-Duty Specially-Produced Motor Vehicles for 2019 And Subsequent Model Years.	<u>10/25/18</u>
<b>Amendments to California Specifications for Fill Pipes and Openings of Motor Vehicle Fuel Tanks:</b> The amendments to Vehicle Fill Pipe Specifications to help ensure new motor vehicle fill pipes are compatible and form a good seal with Phase II recovery nozzles that are certified for use at California gasoline stations as a means to reduce overpressure.	<u>10/25/18</u>
<b>Amendments to Enhanced Vapor Recovery Regulations to Standardize Gas Station Nozzle Spout Dimensions to Help Address Storage Tank Overpressure:</b> The amendments to Enhanced Vapor Recovery Regulations to standardize gas station nozzle spout dimensions to improve compatibility with newer motor vehicle fill pipes. This compatibility is necessary to reduce air ingestion at the nozzle, which will help reduce storage tank overpressure conditions.	<u>10/25/18</u>
<b>Amendments to the Low-Emission Vehicle III Greenhouse Gas Emission Regulation:</b> The amendments to the Low-Emission Vehicle III greenhouse gas emission regulation to clarify that the "deemed to comply" option for model years 2021 through 2025 is applicable only if the currently adopted federal regulations remain in effect.	<u>9/27/18</u>
<b>Amendments to the Low Carbon Fuel Standard Regulation and to the Regulation on Commercialization of Alternative Diesel Fuels:</b> The amendments designed to strengthen the Low Carbon Fuel Standard (LCFS) regulation through 2030 in line with the Senate Bill 32 greenhouse gas reduction goals. The amendments would enhance LCFS credit for zero-emission vehicle fueling infrastructure per Governor Brown's Executive Order B-48-18, a protocol to enable credit generation for carbon capture and sequestration projects, expand fuel types and vehicle applications to which the LCFS regulation applies (including adding alternative jet fuel), improve crediting for innovative actions at petroleum refineries, and establish an independent third-party verification and verifier accreditation system to ensure accuracy of LCFS reported data. The amendments also include a number of technical changes to improve, simplify, streamline, and clarify the regulation	<u>9/27/18</u>
<b>Amendments to California Emission Control System Warranty Regulations and Maintenance Provisions for 2022 and Subsequent Model Year On-Road Heavy-Duty Diesel Vehicles with Gross Vehicle Weight Rating Greater Than 14,000 Pounds and Heavy-Duty Diesel Engines in Such Vehicles:</b> The amendments to the California warranty and maintenance provisions for on-road heavy-duty (HD) diesel vehicles, and the engines used in such vehicles. Currently, because the warranty mileage period is disproportionate to the actual service lives of many modern HD vehicles and engines, vehicle owners have no incentive to pay for repairs of emissions-related problems that do not adversely affect fuel economy or performance, which results in additional emissions. The amendments lengthen both the existing warranty periods and minimum maintenance intervals so as to reduce emissions by incentivizing vehicle owners to perform required maintenance and to seek more timely repairs, and to encourage manufacturers to design and produce more durable parts.	<u>6/28/18</u>

Board Action	Hearing Date
<b>Amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program:</b> The amendments lower the allowable opacity limit for HD vehicles operating in California for both the HDVIP and PSIP, establish reporting requirements for the PSIP and smoke tester training requirements, and allow 2013 model year and newer engines to report on-board diagnostic data in lieu of performing the annual PSIP smoke test.	<u>5/25/18</u>
<b>Amendments to the Consumer Products Regulation and Method 310:</b> The amendments to the consumer products regulation established an alternate compliance option for multi-purpose lubricant (MPL) products.	<u>5/25/18</u>
<b>Regulation for Prohibitions on Use of Certain Hydrofluorocarbons in Stationary Refrigeration and Foam End-Uses:</b> The regulation provides prohibitions on the use of certain high-global warming potential hydrofluorocarbons (HFC) in stationary refrigeration and foam end-uses. The objective is to preserve HFC emissions reductions expected from the federal Significant New Alternatives Policy (SNAP) Rules for certain end-uses for which compliance dates have either already passed or are imminent.	<u>3/23/18</u>
<b>Funding Agricultural Replacement Measures for Emission Reductions Program Guidelines:</b> The Guidelines outline the California Air Resources Board's plans for expending these funds in a manner consistent with the legislative direction from two bills, existing statutes, and regulations. The Guidelines describe district funding allocations, eligible project categories and criteria, program implementation details, and the justification for these investments.	<u>3/23/18</u>
<b>California Greenhouse Gas Emissions Standards for Medium- and Heavy-Duty Engines and Vehicles, and Proposed Amendments to the Tractor-Trailer Greenhouse Gas Regulation:</b> The new, more stringent California Phase 2 GHG emission standards are largely harmonize with the federal Phase 2 standards, and proposed amendments to the Tractor-Trailer GHG regulation to harmonize California's Tractor-Trailer GHG regulation with the proposed Phase 2 trailer standards. The California Phase 2 GHG standards are needed to meet the mandates of both AB 32 and of SB 32, and the California HSC.	<u>2/8/18</u>
<b>Amendments to the Airborne Toxic Control Measure For Diesel Particulate Matter from Portable Engines Rated at 50 Horsepower and Greater – and to the Statewide Portable Equipment Registration Program Regulation:</b> The amendments provide more time for cleaner engine replacement while preserving the expected emission reductions, and make other improvements to the ATCM. PERP will have corresponding amendments and make other improvements to the program.	<u>11/16/17</u>
<b>Amendments to California's Evaluation Procedures for New Aftermarket Catalytic Converters:</b> The amendments are for procedures used to evaluate and approve aftermarket catalytic converters designed for use on California passenger cars and trucks to allow them to be used for Low Emission Vehicle III emission standards.	<u>9/28/17</u>
<b>Amendments to the Market-Based Compliance Mechanism Regulation (Cap-and-Trade Regulation):</b> The amendments to the Cap-and-Trade Program extend major provisions of the Program beyond 2020, to broaden the Program through linkage with Ontario, Canada, to prevent emissions leakage in the most cost-effective manner through appropriate allocation to entities, to clarify compliance obligations for certain sectors, and to enhance ARB's ability to implement and oversee the Cap-and-Trade Program.	<u>7/27/17</u>
<b>Amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions:</b> The amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions are to ensure the reported GHG data are accurate and fully support the California Cap-and-Trade Regulation.	<u>6/29/17</u>
<b>Revisions to the Carl Moyer Memorial Air Quality Standards Attainment Program Guidelines:</b> The updated Carl Moyer Memorial Air Quality Standards Attainment Program 2017 Guidelines implement changes directed by Senate Bill 513 and redesign the Program to meet California's need to transition to the very low and zero-emission technologies of the future.	<u>4/27/17</u>
<b>Amendments to the Evaporative Emission Requirements for Small Off-Road Engines:</b> The amendments address to non-compliance of small off-road engines (SORE) with existing evaporative emission standards, as well as amendments to streamline the certification process by harmonizing where feasible with federal requirements.	<u>11/17/16</u>
<b>Regulation to Provide Certification Flexibility for Innovative Heavy-Duty Engine and California Certification and Installation Procedures for Medium and Heavy-Duty Vehicle Hybrid Conversion Systems:</b> This regulation's certification flexibility is tailored to encourage development and market launch of heavy-duty engines meeting California's optional low oxides of oxides of nitrogen emission standards, robust heavy-duty hybrid engines, and high-efficiency heavy-duty engines.	<u>10/20/16</u>
<b>Amendments to the California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulations:</b> The amendments would extend major provisions of the Regulation beyond 2020; link the Regulation with Ontario, Canada; continue cost-effective prevention of emission leakage through allowance allocations to entities; and enhance Program implementation and oversight.	<u>9/22/16</u>
<b>Amendments to the Mandatory Reporting of Greenhouse Gas Emissions:</b> The amendments are to ensure reported GHG data are accurate and fully support the California Cap on Greenhouse Gas Emissions and Market Based Compliance Mechanisms and comply with the U.S. EPA Clean Power Plan.	<u>9/22/16</u>

Board Action	Hearing Date
<b>Amendments to the Large Spark-Ignition Engine Fleet Requirements Regulation:</b> The amendment establish new reporting and labeling requirements and extend existing recordkeeping requirements. The regulatory amendments are expected to improve the reliability of the emission reductions projected for the existing LSI Fleet Regulation by increasing enforcement effectiveness and compliance rates.	<u>7/21/16</u>
<b>Evaluation Procedure for New Aftermarket Diesel Particulate Filters Intended as Modified Parts for 2007 through 2009 Model Year On-Road Heavy-Duty Diesel Engines:</b> The amendment would establish a path for exempting aftermarket modified part DPFs intended for 2007 through 2009 on-road heavy-duty diesel engines from the prohibitions of the current vehicle code. Also, incorporate a new procedure for the evaluation of such DPFs.	<u>4/22/16</u>
<b>Amendments to the Regulation for Small Containers of Automotive Refrigerant:</b> The amendments to the Regulation for Small Containers of Automotive Refrigerant clarify any existing requirement that retailers must transfer the unclaimed consumer deposits to the manufacturers, clarify how the manufacturers spend the money, set the refundable consumer deposit at \$10, and require additional language on the container label.	<u>4/22/16</u>
<b>Amendments to the Portable Fuel Container Regulation:</b> Amendments to the Portable Fuel Container (PFC) regulation, which include requiring certification fuel to contain 10 percent ethanol, harmonizing aspects of the Board's PFC certification and test procedures with those of the U.S. EPA, revising the ARB's certification process, and streamlining, clarifying, and increasing the robustness of ARB's certification and test procedures.	<u>2/18/16</u>
<b>Technical Status and Proposed Revisions to On-Board Diagnostic System Requirements and Associated Enforcement Provisions for Passenger Cars, Light-Duty Trucks, and Medium-Duty Vehicles and Engines (OBD II):</b> Amendments to the OBD II regulations that update requirements to account for LEV III applications and monitoring requirements for gasoline and diesel vehicles, and clarify and improve the regulation; also, updates to the associated OBD II enforcement regulation to align it with the proposed amendments to the OBD II regulations and a minor amendment to the definition of "emissions-related part" in title 13, CCR section 1900.	<u>9/25/15</u>
<b>2015 Low Carbon Fuel Standard (LCFS) Amendments (2 of 2):</b> The Low Carbon Fuel Standard, which includes updates and revisions to the regulation now in effect. The regulation was first presented to the Board at its February 2015 public hearing, at which the Board directed staff to make modifications to the proposal.	<u>9/24/15</u>
<b>Regulation on the Commercialization of Alternative Diesel Fuels (2 of 2):</b> Regulation governing the introduction of alternative diesel fuels into the California commercial market, including special provisions for biodiesel.	<u>9/24/15</u>
<b>CA Cap on GHG Emissions and Market-Based Compliance Mechanisms (2 of 2):</b> Amendments to the Cap and Trade Regulation to include a new Rice Cultivation Compliance Offset Protocol and an update to the United States Forest Compliance Offset Protocol that would include project eligibility in parts of Alaska.	<u>6/25/15</u>
<b>Intermediate Volume Manufacturer Amendments to the Zero Emission Vehicle Regulation (2 of 2):</b> Amendments regarding intermediate volume manufacturer compliance obligations under the Zero Emission Vehicle regulation.	<u>5/21/15</u>
<b>2015 Amendments to Certification Procedures for Vapor Recovery Systems at Gasoline Dispensing Facilities—Aboveground Storage Tanks and Enhanced Conventional Nozzles:</b> Amendments would establish new performance standards and specifications for nozzles used at fleet facilities that exclusively refuel vehicles equipped with onboard vapor recovery systems, would provide regulatory relief for owners of certain existing aboveground storage tanks, and would ensure that mass-produced vapor recovery equipment matches the specifications of equipment evaluated during the ARB certification process.	<u>4/23/15</u>
<b>Proposed Regulation for the Commercialization of Alternative Diesel Fuels (1 of 2):</b> Regulation governing the introduction of alternative diesel fuels into the California commercial market, including special provisions for biodiesel. This is the first of two hearings on the item, and the Board will not take action to approve the proposed regulation.	<u>2/19/15</u>
<b>Evaporative Emission Control Requirements for Spark-Ignition Marine Watercraft:</b> Regulation for controlling evaporative emissions from spark-ignition marine watercraft. The proposed regulation will harmonize, to the extent feasible, with similar federal requirements, while adding specific provisions needed to support California's air quality needs.	<u>2/19/15</u>
<b>2015 Low Carbon Fuel Standard (LCFS) Amendments (1 of 2):</b> The amendments for the Low Carbon Fuel Standard includes a re-adoption of the existing Low Carbon Fuel Standard with updates and revisions. This is the first of two hearings on the item, and the Board will not take action to approve the proposed regulation.	<u>2/19/15</u>
<b>CA Cap on GHG Emissions and Market-Based Compliance Mechanisms to Add the Rice Cultivation Projects and Updated U.S. Forest Projects Protocols (1 of 2):</b> Updates to the Cap and Trade Regulation to include a new Rice Cultivation Compliance Offset Protocol and an update to the United States Forest Compliance Offset Protocol that would include project eligibility in parts of Alaska.	<u>12/18/14</u>
<b>2014 Amendments to ZEV Regulation:</b> Additional compliance flexibility to ZEV manufacturers working to bring advanced technologies to market.	<u>10/23/14</u>

Board Action	Hearing Date
<b>LEV III Criteria Pollutant Requirements for Light- and Medium-Duty Vehicles the Hybrid Electric Vehicle Test Procedures, and the HD Otto-Cycle and HD Diesel Test Procedures:</b> Applies to the 2017 and subsequent model years.	10/23/14
<b>Amendments to Mandatory Reporting Regulation for Greenhouse Gases:</b> Further align reporting methods with USEPA methods and factors, and modify reporting requirements to fully support implementation of California's Cap and Trade program.	9/19/14
<b>Amendments to the California Cap on Greenhouse Gas Emissions and Market Based Compliance Mechanisms:</b> Technical revisions to Mandatory Reporting of Greenhouse Gas Emissions Regulation to further align reporting methods with U.S.EPA update methods and factors, and modify reporting requirements to fully support implementation of California's Cap and Trade program.	9/18/14
<b>Amendments to the AB 32 Cost of Implementation Fee Regulation:</b> Amendments to the regulation to make it consistent with the revised mandatory reporting regulation, to add potential reporting requirements, and to incorporate requirements within the mandatory reporting regulation to streamline reporting.	9/18/14
<b>Revisions to the Carl Moyer Memorial Air Quality Standards Attainment Program Guidelines for On-Road Heavy-Duty Trucks:</b> Revisions to 1) reduce surplus emission reduction period, 2) reduce minimum CA usage requirement, 3) prioritize on-road funding to small fleets, 4) include light HD vehicles 14000-19500 lbs, and 5) clarify program specifications.	7/24/14
<b>Amendments to Enhanced Fleet Modernization (Car Scrap) Program:</b> Amendments consistent with SB 459 which requires ARB to increase benefits for low-income California residents, promote cleaner replacement vehicles, and enhance emissions reductions.	6/26/14
<b>Proposed Approval of Amendments to CA Cap on GHG Emissions and Market-Based Compliance Mechanisms :</b> Second hearing of two, continued from October 2013.	4/24/14
<b>Truck and Bus Rule Update:</b> Amendments to the Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen, and Other Criteria Pollutants From In-Use On-Road Diesel-Fueled Vehicles: increasing low-use vehicle thresholds, allowing owners to newly opt-in to existing flexibility provisions, adjusting "NOx exempt" vehicle provisions, and granting additional time for fleets in certain areas to meet PM filter requirements.	4/24/14
<b>Heavy-Duty GHG Phase I: On-Road Heavy-Duty GHG Emissions Rule, Tractor-Trailer Rule, Commercial Motor Vehicle Idling Rule, Optional Reduced Emission Standards, Heavy-Duty Hybrid-Electric Vehicles Certification Procedure:</b> New GHG standards for MD and HD engines and vehicles identical to those adopted by the USEPA in 2011 for MYs 2014-18.	12/12/13
<b>Agricultural equipment SIP credit rule:</b> Incentive-funded projects must be implemented using Carl Moyer Program Guidelines; must be surplus, quantifiable, enforceable, and permanent, and result in emission reductions that are eligible for SIP credit.	10/25/13
<b>Mandatory Report of Greenhouse Gas Emissions:</b> Approved a regulation that establishes detailed specifications for emissions calculations, reporting, and verification of GHG emission estimates from significant sources.	10/25/13
<b>CA Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms:</b> Technical revisions to the Mandatory Reporting of Greenhouse Gas Emissions Regulation to further align reporting methods with U.S.EPA, update factors, and modify definitions to maintain consistency with the Cap and Trade program.	10/25/13
<b>Zero emission vehicle test procedures:</b> Existing certification test procedures for plug-in hybrid vehicles need to be updated to reflect technology developments. The ZEV regulation will require minor modifications to address clarity and implementation issues.	10/24/13
<b>Consumer Products: Antiperspirants, Deodorants, Test Method 310, Aerosol Coatings, Proposed Repeal of Hairspray Credit):</b> Amendments to require various consumer products to reformulate to reduce VOC or reactivity content to meet specified limits, and to clarify various regulatory provisions, improve enforcement, and add analytical procedures.	9/26/13
<b>Alternative fuel certification procedures:</b> Amendments to current alternative fuel conversion certification procedures for motor vehicles and engines that will allow small volume conversion manufacturers to reduce the upfront demonstration requirements and allow systems to be sold sooner with lower certification costs than with the current process, beginning with MY 2018.	9/26/13
<b>Vapor Recovery for Gasoline Dispensing Facilities:</b> Amendments to certification and test procedures for vapor recovery equipment used on cargo tanks and at gasoline dispensing facilities.	7/25/13
<b>Off-highway recreational vehicle evaporative emission control:</b> Set evaporative emission standards to control hydrocarbon emissions from Off-Highway Recreational Vehicles. The running loss, hot soak, and diurnal performance standards can be met by using proven automobile type control technology.	7/25/13
<b>Gasoline and diesel fuel test standards:</b> The amendments add test standards for the measurement of prohibited oxygenates at trace levels specified in existing regulations.	1/25/13
<b>LEV III and ZEV Programs for Federal Compliance Option:</b> The amendments deem compliance with national GHG new vehicle standards in 2017-2025 as compliance with California GHG standards for the same model years.	11/15/12 12/6/12 EO

Board Action	Hearing Date
<b>Consumer products (automotive windshield washing fluid):</b> The amendments add portions of 14 California counties to the list of areas with freezing temperatures where 25% VOC content windshield washing fluid could be sold.	10/18/2012 EO 03/15/13
<b>GHG mandatory reporting, Fee Regulation, and Cap and Trade 2012:</b> The amendments eliminate emission verification for facilities emitting less than 25,000 MTCO <sub>2</sub> e and make minor changes in definitions and requirements.	9/20/12 11/2/12 EO
<b>Amendments to Verification Procedure, Warranty and In-Use Compliance Requirements for In-Use Strategies to Control Emissions from Diesel Engines:</b> Approved amendments to the verification procedure used to evaluate diesel retrofits through emissions, durability, and field testing. Amendments will lower costs associated with required in-use compliance testing, streamline the in-use compliance process, and will extend time allowed to complete verifications.	8/23/2012 EO 07/02/13
<b>Amendments to On-Board Diagnostics (OBD I and II) Regulations:</b> Approved amendments to the light- and medium-duty vehicle and heavy-duty engine OBD regulations.	8/23/2012 EO 06/26/13
<b>Cap and Trade: Amendments to CA Cap on GHG Emissions and Market-Based Compliance Mechanisms, and Amendments Allowing Use of Compliance Instruments Issued by Linked Jurisdictions:</b> Amends Cap-and-Trade and compliance mechanisms to add security to the market system and to aid in implementation. Amendments include first auction rules, offset registry, market monitoring provisions, and information gathering necessary for the financial services operator.	6/28/12 7/31/12 EO
<b>Vapor recovery defect list:</b> The amendments add defects and verification procedures for equipment approved since 2004, and make minor changes to provide clarity	6/11/12 EO
<b>Tractor-Trailer GHG Regulation: Emergency Amendment:</b> The emergency amendment to correct a drafting error and delay the registration date for participation in the phased compliance option	2/29/2012 2/29/12 EO
<b>Advanced Clean Cars (ACC) Regulation: Low-Emission Vehicles and GHG:</b> The more stringent criteria emission standards for MY 2015-2025 light and medium duty vehicles (LEV III), amended GHG emission standards for model year 2017-2025 light and medium duty vehicles (LEV GHG), amended ZEV Regulation to ensure the successful market penetration of ZEVs in commercial volumes, amended hydrogen fueling infrastructure mandate of the Clean Fuels Outlet regulation, and amended cert fuel for light duty vehicles from an MTBE-containing fuel to an E10 certification fuel.	1/26/12
<b>Zero Emission Vehicle (ZEV):</b> The amendments increase compliance flexibility, add two new vehicle category credits, increase credits for 300 mile FCVs, increase requirements for ZEVs and TZEVs, eliminate credit for PZ expand applicability to smaller manufacturers, base ZEV credits on range, and make other minor changes in cr	1/26/12
<b>Amendments to Low Carbon Fuel Standard Regulation:</b> The amendments address several aspects of the regulation, including: reporting requirements, credit trading, regulated parties, opt-in and opt-out provisions, definitions, and other clarifying language.	12/16/11 10/10/12 EO
<b>Amendments to Small Off-Road Engine and Tier 4 Off-Road Compression-Ignition Engine Regulations And Test Procedures; also "Recreational Marine" Spark-Ignition Marine Engine Amendments (Recreational Boats):</b> Aligns California test procedures with U.S. EPA test procedures and requires off-road CI engine manufacturers to conduct in-use testing of their entire product lines to confirm compliance with previously established Not-To-Exceed emission thresholds.	12/16/2011 10/25/12 EO
<b>Regulations and Certification Procedures for Engine Packages used in Light-Duty Specially Constructed Vehicles (Kit Cars):</b> Ensures that certified engine packages, when placed into any Kit Car, would meet new vehicle emission standards, and be able to meet Smog Check requirements.	11/17/11 9/21/12 EO
<b>Amendments to the California Reformulated Gasoline Regulations:</b> Corrects drafting errors in the predictive model, deletes outdated regulatory provisions, updates the notification requirements, and changes the restrictions on blending CARBOB with other liquids.	10/21/11 8/24/12 EO
<b>Amendments to the In-Use Diesel Transport Refrigeration Units (TRU) ATCM:</b> Mechanisms to improve compliance rates and enforceability.	10/21/11 8/31/12 EO
<b>Amendments to the AB 32 Cost of Implementation Fee Regulation:</b> Clarifies requirements and regulatory language, revises definitions.	10/20/11 8/21/12 EO
<b>Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, Including Compliance Offset Protocols:</b> Greenhouse Gas Emissions Cap-and-Trade Program, including compliance offset protocols and multiple pathways for compliance.	10/21/11 8/21/12 EO
<b>Amendments to the Regulation for Cargo Handling Equipment (CHE) at Ports and Intermodal Rail Yards (Port Yard Trucks Regulation):</b> Provides additional compliance flexibility, and maintains anticipated emissions reductions. As applicable to yard trucks and two-engine sweepers.	9/22/11 8/2/12 EO
<b>Amendments to the Enhanced Vapor Recovery Regulation for Gasoline Dispensing Facilities:</b> New requirement for low permeation hoses at gasoline dispensing facilities.	9/22/11 7/26/12 EO
<b>Amendments to Cleaner Main Ship Engines and Fuel for Ocean-Going Vessels:</b> Adjusts the offshore regulatory boundary. Aligns very low sulfur fuel implementation deadlines with new federal requirements.	6/23/11 9/13/12 EO
<b>Particulate Matter Emissions Measurement Allowance For Heavy-Duty Diesel In-Use Compliance Regulation:</b> Emission measurement allowances provide for variability associated with the field testing required in the regulation.	6/23/11

Board Action	Hearing Date
<b>Low Carbon Fuel Standard Carbon Intensity Lookup Table Amendments:</b> Adds new pathways for vegetation-based fuels	2/24/11
<b>Amendments to Cleaner In-Use Heavy-Duty On-Road Diesel Trucks and LSI Fleets Regulations:</b> Amends five regulations to provide relief to fleets adversely affected by the economy, and take into account the fact that emissions are lower than previously predicted.	12/16/10 9/19/11 EO
<b>Tractor-Trailer GHG Regulation Amendment:</b> Enacts administrative changes to increase compliance flexibility and reduce costs	12/16/10
<b>Amendments to Cleaner In-Use Off-Road Diesel-Fueled Fleets Regulation:</b> Amendments provide relief to fleets adversely affected by the economy, and take into account the fact that emissions are lower than previously predicted.	12/16/10 10/28/11 EO
<b>In-Use On-Road Diesel-Fueled Heavy-Duty Drayage Trucks at Ports and Rail Yard Facilities:</b> Amendments add flexibility to fleets' compliance schedules, mitigate the use of noncompliant trucks outside port and rail properties, and provide transition to the Truck and Bus regulation.	12/16/10 9/19/11 EO
<b>Amendments to the Regulation for Mandatory Reporting of Greenhouse Gas Emissions:</b> Changes requirements to align with federal greenhouse gas reporting requirements adopted by US EPA.	12/16/10 10/28/11 EO
<b>Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation:</b> Establishes framework and requirements for Greenhouse Gas Emissions Cap-and-Trade Program, including compliance offset protocols.	12/16/10 10/26/11 EO
<b>Amendments to the Consumer Products Regulation:</b> The amendments set new or lower VOC limits for some categories, prohibit certain toxic air contaminants, high GWP compounds, and surfactants toxic to aquatic species. Also changes Method 310, used to determine aromatic content of certain products.	11/18/10 9/29/11 EO
<b>Amendment of the ATCM for Diesel Transportation Refrigeration Units (TRU):</b> Amendments expand the compliance options and clarify the operational life of various types of TRUs.	11/18/10 2/2/11 EO
<b>Amendments to the ATCM for Stationary Compression Ignition Engines:</b> The amendments closely align the emission limits for new emergency standby engines in the ATCM with the emission standards required by the federal Standards of Performance.	10/21/10 3/25/11 EO
<b>Diesel Vehicle Periodic Smoke Inspection Program:</b> The amendments exempt medium duty diesel vehicles from smoke inspection requirements if complying with Smog Check requirements.	10/21/10 8/23/11 EO
<b>Renewable Electricity Standard Regulation:</b> The regulation requires electricity providers to obtain at least 33% of their retail electricity sales from renewable energy resources by 2020.	9/23/10
<b>Energy Efficiency at Industrial Facilities:</b> The standards for the reporting of GHG emissions and the feasibility of emissions controls by the largest GHG-emitting stationary sources.	7/22/10 5/9/11 EO
<b>Amendments to Commercial Harbor Craft Regulation:</b> The amendments require the use of cleaner engines in diesel-fueled crew and supply, barge, and dredge vessels.	6/24/10 4/11/11 EO
<b>Accelerated Introduction of Cleaner Line-Haul Locomotives:</b> Agreement with railroads sets prescribed reductions in diesel risk and target years through 2020 at four major railyards.	6/24/10
<b>Amendments to New Passenger Motor Vehicle Greenhouse Gas Emission Standards:</b> The amendments deeming compliance with EPA's GHG standards as compliance with California's standards in 2012 through 2016 model years.	2/25/2010 03/29/10
<b>Sulfur Hexafluoride (SF6) Regulation:</b> The regulation reduces emissions of sulfur hexafluoride (SF6), a high-GWP GHG, from high-voltage gas-insulated electrical switchgear.	2/25/10 12/15/10 EO
<b>Amendments to the Statewide Portable Equipment Registration Regulation and Portable Engine ATCM:</b> The amendments extend the deadline for removal of certain uncertified portable engines for one year.	1/28/10 8/27/10 EO 12/8/10 EO
<b>Diesel Engine Retrofit Control Verification, Warranty, and Compliance Regulation Amendments:</b> The amendments require per-installation compatibility assessment, performance data collection, and reporting of additional information, and enhance enforceability.	1/28/10 12/6/10 EO
<b>Stationary Equipment High-GWP Refrigerant Regulation:</b> The regulation reduces emissions of high-GWP refrigerants from stationary non-residential equipment.	12/1/09 9/14/10 EO
<b>Amendments to Limit Ozone Emissions from Indoor Air Cleaning Devices:</b> The amendments delay the labeling compliance deadlines by one to two years and to make minor changes in testing protocols.	12/9/09
<b>Emission Warranty Information Reporting Regulation Amendments:</b> Repealed the 2007 regulation and readopted the 1988 regulation with amendments to implement adverse court decision.	11/19/09 9/27/10 EO
<b>Amendments to Maximum Incremental Reactivity Tables:</b> Added many new compounds and modified reactivity values for many existing compounds in the tables to reflect new research data.	11/3/09 7/23/10 EO
<b>AB 32 Cost of Implementation Fee Regulation:</b> AB 32 authorizes ARB to adopt by regulation a schedule of fees to be paid by sources of greenhouse gas emissions regulated pursuant to AB 32. Also, a fee regulation to support the administrative costs of AB 32 implementation.	9/24/2009 05/06/10 EO
<b>Passenger Motor Vehicle Greenhouse Gas Limits Amendments:</b> The amendments grant credits to manufacturers for compliant vehicles sold in other states that have adopted California regulations.	9/24/09 2/22/10 EO
<b>Consumer Products Amendments:</b> The amendments set new VOC limits for multi-purpose solvent and paint thinner products and lower the existing VOC limit for double phase aerosol air fresheners.	9/24/09 8/6/10 EO

Board Action	Hearing Date
<b>Amendments to In-Use Off-Road Diesel-Fueled Fleets Regulation:</b> The amendments implement legislatively directed changes and provide additional incentives for early action.	7/23/09 12/2/09 EO 6/3/10 EO
<b>Methane Emissions from Municipal Solid Waste Landfills:</b> The regulation requires smaller and other uncontrolled landfills to install gas collection and control systems, and also requires existing and newly installed systems to operate optimally.	6/25/09 5/5/10 EO
<b>Cool Car Standards:</b> The regulation requires the use of solar management window glass in vehicles up to 10,000 lb GVWR.	6/25/09
<b>Enhanced Fleet Modernization (Car Scrap):</b> The guidelines for a program to scrap up to 15,000 light duty vehicles statewide.	6/25/09 7/30/10 EO
<b>Amendments to Heavy-Duty On-Board Diagnostics Regulations:</b> The amendments to the light and medium-duty vehicle and heavy duty engine OBD regulations.	5/28/2009 4/6/10 EO
<b>Smog Check Improvements:</b> The amendments implement changes in state law and SIP commitments adopted by ARB between 1996 and 2007.	5/7/09 by BAR 6/9/09 EO
<b>AB 118 Air Quality Improvement Program Guidelines:</b> The Air Quality Improvement Program provides for up to \$50 million per year for seven years beginning in 2009-10 for vehicle and equipment projects that reduce criteria pollutants, air quality research, and advanced technology workforce training. The AQIP Guidelines describe minimum administrative, reporting, and oversight requirements for the program, and provide general criteria for how the program shall be implemented.	04/23/09 08/28/09 EO
<b>Pesticide Element:</b> Reduce volatile organic compound (VOC) emissions from the application of agricultural field fumigants in the South Coast, Southeast Desert, Ventura County, San Joaquin Valley, and Sacramento Metro federal ozone nonattainment areas.	4/20/09 10/12/09 EO (2) 8/2/11 EO
<b>Low Carbon Fuel Standard:</b> Approved new standards to lower the carbon content of fuels.	4/20/09 11/25/09 EO
<b>Pesticide Element for San Joaquin Valley:</b> DPR Director approved pesticide ROG emission limit of 18.1 tpd and committed to implement restrictions on non-fumigant pesticide use by 2014 in the San Joaquin Valley.	4/7/09 DPR
<b>Tire Pressure Inflation Regulation:</b> The regulation requires automotive service providers to perform tire pressure checks as part of every service.	3/26/09 2/4/10 EO
<b>Sulfur Hexafluoride from Non-Utility and Non-Semiconductor Applications:</b> The regulation phases out use of Sulfur Hexafluoride over the next several years.	2/26/09 11/12/09 EO
<b>Semiconductor Operations:</b> The regulation to set standards to reduce fluorinated gas emissions from the semiconductor and related devices industry.	2/26/09 10/23/09 EO
<b>Plug-In Hybrid Electric Vehicles Test Procedure Amendments:</b> Amendments to test procedures to address plug-in-hybrid electric vehicles.	1/23/09 12/2/09 EO
<b>In-Use Off-Road Diesel-Fueled Fleets Amendments:</b> Makes administrative changes to recognize delays in the supply of retrofit control devices.	1/22/09
<b>Small Containers of Automotive Refrigerant:</b> The regulation reduces leakage from small containers, a container deposit and return program, and require additional container labeling and consumer education requirements.	1/22/09 1/5/10 EO
<b>Aftermarket Critical Emission Parts on Highway Motorcycles:</b> Allows for the sale of certified critical emission parts by aftermarket manufacturers.	1/22/09 6/19/09 EO
<b>Heavy-Duty Tractor-Trailer Greenhouse Gas (GHG) Reduction:</b> The regulation reduces greenhouse gas emissions by improving long haul tractor and trailer efficiency through use of aerodynamic fairings and low rolling resistance tires.	12/11/08 10/23/09 EO
<b>Cleaner In-Use Heavy-Duty Diesel Trucks (Truck and Bus Regulation):</b> The regulation reduces diesel particulate matter and oxides of nitrogen through fleet modernization and exhaust retrofits. Makes enforceability changes to public fleet, off-road equipment, and portable equipment regulations.	12/11/08 10/19/09 EO 10/23/09 EO
<b>Large Spark-Ignition Engine Amendments:</b> The amendments reduce evaporative, permeation, and exhaust emissions from large spark-ignition (LSI) engines equal to or below 1 liter in displacement.	11/1/08 3/12/09 EO
<b>Small Off-Road Engine (SORE) Amendments:</b> The amendments address the excessive accumulation of emission credits.	11/21/08 2/24/10 EO
<b>Proposed AB 118 Air Quality Guidelines for the Air Quality Improvement Program and the Alternative and Renewable Fuel and Vehicle and Technology Program:</b> The California Alternative and Renewable Fuel, Vehicle Technology, Clean Air, and Carbon Reduction Act of 2007 (AB 118) requires ARB to develop guidelines for both the Alternative and Renewable Fuel and Vehicle Technology Program and the Air Quality Improvement Program to ensure that both programs do not adversely impact air quality.	09/25/08 EO 05/20/09
<b>Portable Outboard Marine Tanks and Components (part of Additional Evaporative Emission Standards):</b> The regulation establishes permeation and emission standards for new portable outboard marine tanks and components.	9/25/08 7/20/09 EO

Board Action	Hearing Date
<b>Cleaner Fuel in Ocean Going Vessels:</b> The regulation requires use of low sulfur fuel in ocean-going ship main engines, and auxiliary engines and boilers.	7/24/08 4/16/09 EO
<b>Spark-Ignition Marine Engine and Boat Amendments:</b> Provides optional compliance path for > 500 hp sterndrive/inboard marine engines.	7/24/08 6/5/09 EO
<b>Consumer Products Amendments:</b> The amendments add volatile organic compound (VOC) limits for seven additional categories and lower limits for twelve previously regulated categories.	6/26/08 5/5/09 EO
<b>Zero emission vehicles:</b> Updated California's ZEV requirements to provide greater flexibility with respect to fuels, technologies, and simplifying compliance pathways. Amendments give manufacturers increased flexibility to comply with ZEV requirements by giving credit to plug-in hybrid electric vehicles and establishing additional ZEV categories in recognition of new developments in fuel cell vehicles and battery electric vehicles.	3/27/08 12/17/08 EO
<b>Amendments to the Verification Procedure, Warranty, and In-Use Compliance Requirements for In-Use Strategies to Control Emissions from Diesel Engines:</b> Adds verification requirements for control technologies that only reduce NOx emissions, new reduction classifications for NOx reducing technologies, new testing requirements, and conditional extensions for verified technologies.	1/24/08 12/4/08 EO
<b>Mandatory Report of Greenhouse Gas Emissions:</b> The regulation establishes detailed specifications for emissions calculations, reporting, and verification of GHG emission estimates from significant sources.	12/6/07 10/12/08 EO
<b>Gaseous Pollutant Measurement Allowances for In-Use Heavy-Duty Diesel Compliance:</b> Measurement accuracy margins are to be determined through an ongoing comprehensive testing program performed by an independent contractor. Amendments include these measurement accuracy margins into the regulation.	12/6/07 10/14/08 EO
<b>Ocean-Going Vessels While at Berth (aka Ship Hoteling) - Auxiliary Engine Cold Ironing and Clean Technology:</b> The regulation reduces emissions from auxiliary engines on ocean-going ships while at-berth.	12/6/07 10/16/08 EO
<b>In-Use On-Road Diesel-Fueled Heavy-Duty Drayage Trucks at Ports and Rail Yard Facilities:</b> The regulation establishes emission standards for in-use, heavy-duty diesel-fueled vehicles that transport cargo to and from California's ports and intermodal rail facilities.	12/6/07 10/12/08 EO
<b>Commercial Harbor Craft:</b> The regulation establishes in-use and new engine emission limits for both auxiliary and propulsion diesel engines on ferries, excursion vessels, tugboats, and towboats.	11/15/07 9/2/08 EO
<b>Suggested Control Measure for Architectural Coatings Amendments:</b> The amendments reduce the recommended VOC content of 19 categories of architectural coatings.	10/26/07
<b>Aftermarket Catalytic Converter Requirements:</b> The amendments establish more stringent emission performance and durability requirements for used and new aftermarket catalytic converters offered for sale in California.	10/25/07 2/21/08 NOD
<b>Limiting Ozone Emissions from Indoor Air Cleaning Devices:</b> The ozone emission limit of 0.050 ppm for portable indoor air cleaning devices in response to requirements of AB 2276 (2006).	9/27/07 8/7/08 EO
<b>Pesticide Commitment for Ventura County in 1994 SIP:</b> The substitution of excess ROG emission reductions from state motor vehicle program for 1994 SIP reduction commitment from pesticide application in Ventura County.	9/27/07 11/30/07 EO
<b>In-Use Off-Road Diesel Equipment:</b> The regulation requires off-road diesel fleet owners to modernize their fleets and install exhaust retrofits.	7/26/07 4/4/08 EO
<b>Emission Control and Environmental Performance Label Regulations:</b> The amendments add a Global Index Label and modify the format of the Smog Index Label on new cars.	6/21/07 5/2/08 EO
<b>Vapor Recovery from Aboveground Storage Tanks:</b> The regulation establish new performance standards and specifications for the vapor recovery systems and components used with aboveground storage tanks.	6/21/07 5/2/08 EO
<b>CaRFG Phase 3 amendments:</b> The amendments mitigate the increases in evaporative emissions from on-road motor vehicles resulting from the addition of ethanol to gasoline.	6/14/07 4/25/08 EO 8/7/08 EO
<b>Formaldehyde from Composite Wood Products:</b> The ATCM limit formaldehyde emissions from hardwood plywood, particleboard, and medium density fiberboard to the maximum amount feasible.	4/26/07 3/5/08 EO
<b>Portable equipment registration program (PERP) and airborne toxic control measure for diesel-fueled portable engines:</b> The amendment allow permitting of Tier 0 portable equipment engines used in emergency or low use duty and to extend permitting of certain Tier 1 and 2 "resident" engines to 1/1/10.	3/22/07 7/31/07 EO
<b>Perchloroethylene Control Measure Amendments:</b> The amendments to the Perchloroethylene ATCM to prohibit new Perc dry cleaning machines beginning 2008 and phase out all Perc machines by 2023.	1/25/07 11/7/07 EO
<b>Amendments to Emission Warranty Information Reporting &amp; Recall Regulations:</b> The amendments tighten the provisions for recalling vehicles for emissions-related failures, helping ensure that corrective action is taken to vehicles with defective emission control devices or systems.	12/7/06 3/22/07 10/17/07 EO
<b>Voluntary accelerated vehicle retirement regulations:</b> The amendments authorize the use of remote sensing to identify light-duty high emitters and that establish protocols for quantifying emissions reductions from high emitters proposed for retirement.	12/7/06
<b>Emergency regulation for portable equipment registration program (PERP), airborne toxic control measures for portable and stationary diesel-fueled engines</b>	12/7/06

Board Action	Hearing Date
<b>Amendments to the Hexavalent Chromium ATCM:</b> The amendments require use of best available control technology on all chrome plating and anodizing facilities.	12/7/06
<b>Consumer Products Regulation Amendments:</b> The amendments set lower emission limits in 15 product categories.	11/17/06 9/25/07 EO
<b>Requirements for Stationary Diesel In-Use Agricultural Engines:</b> The amendments to the stationary diesel engine ATCM which set emissions standards for in-use diesel agricultural engines.	11/16/06 7/3/07 NOD
<b>Ships - Onboard Incineration:</b> The amendments to cruise ship incineration ATCM to include all oceangoing ships of 300 gross registered tons or more.	11/16/06 9/11/07 EO
<b>Zero Emission Bus:</b> The amendments postpone the 15 percent purchase requirement three years for transit agencies in the diesel path and one to two years for transit agencies in the alternative fuel path, in order to keep pace with developments in zero emission bus technology, and adding an Advanced Demonstration requirement to offset emission losses.	10/19/06 8/27/07 EO
<b>Distributed generation certification:</b> The amendments improve the emissions durability and testing requirements, adding waste gas emission standards, and eliminating a redundant PM standard in the current 2007 emission standards.	10/19/06 5/17/07 NOD
<b>Heavy-Duty Diesel In-Use Compliance Regulation:</b> The amendments to the heavy-duty diesel engine regulations and test procedures create a new in-use compliance program conducted by engine manufacturers. The amendments would help ensure compliance with applicable certification standards throughout an engine's useful life.	9/28/06 7/19/07 NOD
<b>Revisions to OBD II and the Emission Warranty Regulations:</b> The amendments to the OBD II regulation provide for improved emission control monitoring including air-fuel cylinder imbalance monitoring, oxygen sensor monitoring, catalyst monitoring, permanent fault codes for gasoline vehicles and new thresholds for diesel vehicles.	9/28/06 8/9/07 EO
<b>Off-Highway Recreational Vehicle Amendments:</b> The amendments to the Off-Highway Recreational Vehicle Regulations including harmonizing evaporative emission standards with federal regulations, expanding the definition of ATVs, modifying labeling requirements, and adjusting riding seasons.	7/20/06 6/1/07 EO
<b>Portable Equipment Registration Program (PERP) Amendments:</b> The amendments to the Statewide Portable Equipment Registration program include installation of hour meters on equipment, and revisions to recordkeeping, reporting, and fees.	6/22/06 11/13/06 NOD
<b>Heavy Duty Vehicle Service Information:</b> The amendments to the Service Information Rule require manufacturers to make available diagnostic equipment and information for sale to the aftermarket.	6/22/06 5/3/07 EO
<b>LEV II technical amendments:</b> The amendments to evaporative emission test procedures, four-wheel drive dynamometer provisions, and vehicle label requirements.	6/22/06 9/27/06 NOD
<b>Dry Cleaning ATCM Amendments:</b> The amendments to the Dry Cleaning ATCM limit siting of new dry cleaners, phase out use of Perc at co-residential facilities, phase out higher emitting Perc sources at other facilities, and require enhanced ventilation at existing and new Perc facilities.	5/25/06
<b>Forklifts and other Large Spark Ignition (LSI) Equipment:</b> The regulation reduces emissions from forklifts and other off-road spark-ignition equipment by establishing more stringent standards for new equipment, and requiring retrofits or engine replacement on existing equipment. Aligns EPA's standards for 2007 and more stringent standards for 2010.	5/25/06 3/2/07 EO
<b>Enhanced Vapor Recovery Amendments:</b> The amendments to the vapor recovery system regulation and revised test procedures.	5/25/06
<b>Diesel Retrofit Technology Verification Procedure:</b> The amendments to the Diesel Emission In-use Control Strategy Verification Procedure to substitute a 30% increase limit in NOx concentration for an 80% reduction requirement from PM retrofit devices.	3/23/06 12/21/06 NOD
<b>Heavy duty vehicle smoke inspection program amendments:</b> The amendments impose a fine on trucks not displaying a current compliance certification sticker.	1/26/06 12/4/06 EO
<b>Ocean-going Ship Auxiliary Engine Fuel:</b> The regulation requires ships to use cleaner marine gas oil or diesel to power auxiliary engines within 24 nautical miles of the California coast.	12/8/05 10/20/06 EO
<b>Diesel Cargo Handling Equipment:</b> The regulation requires new and in-use cargo handling equipment at ports and intermodal rail yards to reduce emissions by utilizing best available control technology.	12/8/05 6/2/06 EO
<b>Public and Utility Diesel Truck Fleets:</b> The regulation reduces diesel particulate matter emissions from heavy duty diesel trucks in government and private utility fleets.	12/8/05 10/4/06 EO
<b>Cruise ships – Onboard Incineration:</b> The Air Toxic Control Measure prohibits cruise ships from conducting onboard incineration within three nautical miles of the California coast.	11/17/05 2/1/06 NOD
<b>Inboard Marine Engine Rule Amendments:</b> The amendments to the 2001 regulation include additional compliance options for manufacturers.	11/17/05 9/26/06 EO
<b>Heavy-Duty Diesel Truck Idling Technology:</b> The regulation limits sleeper truck idling to 5 minutes. Allows alternate technologies to provide cab heating/cooling and power.	10/20/05 9/1/06 EO
<b>Automotive Coating Suggested Control Measure:</b> The SCM for automotive coatings for adoption by air districts. The measure will reduce the VOC content of 11 categories of surface protective coatings.	10/20/05

Board Action	Hearing Date
<b>2007-09 Model-year heavy duty urban bus engines and the fleet rule for transit agencies:</b> The amendments to align urban bus emission limits with on-road heavy duty truck emission limits and allow for the purchase of non-complying buses under the condition that bus turnover increase to offset NOx increases.	10/20/05 10/27/05 7/28/06 EO
<b>Portable fuel containers (part 2 of 2):</b> The amendments revise spout and automatic shutoff design.	9/15/05 7/28/06 EO
<b>Portable Fuel Containers (part 1 of 2):</b> The amendments include kerosene containers in the definition of portable fuel containers.	9/15/05 11/9/05 NOD
<b>2007-09 Model-year heavy duty urban bus engines and the fleet rule for transit agencies:</b> The amendments require all transit agencies in SCAQMD to purchase only alternate fuel versions of new buses.	9/15/05 Superseded by 10/20/05
<b>Reid vapor pressure limit emergency rule:</b> The amendments relax Reid vapor pressure limit to accelerate fuel production for Hurricane Katrina victims.	9/8/05 Operative for September and October 2005 only
<b>Heavy-Duty Truck OBD:</b> The regulation requires on-board diagnostic (OBD) systems for new gas and diesel trucks, similar to the systems on passenger cars.	7/21/05 12/28/05 EO
<b>Definition of Large Confined Animal Facility:</b> The regulation defines the size of a large CAF for the purposes of air quality permitting and reduction of ROG emissions to the extent feasible.	6/23/05 4/13/06 EO
<b>ATCM for stationary compression ignition engines:</b> The emergency amendments (3/17/05) and permanent amendments (5/26/05) relax the diesel PM emission limits on new stationary diesel engines to current off-road engine standards to respond to the lack of availability of engines meeting the original ATCM standard.	3/17/05 5/26/05 7/29/05 EO
<b>Transit Fleet Rule:</b> The amendments add emission limits for non-urban bus transit agency vehicles, require lower bus and truck fleet-average NOx and PM emission limits, and clarify emission limits for CO, NMHC, and formaldehyde.	2/24/05 10/19/05 NOD
<b>Thermal Spraying ATCM:</b> The regulation reduces emissions of hexavalent chromium and nickel from thermal spraying operations.	12/9/04 7/20/05 EO
<b>Tier 4 Standards for Small Off-Road Diesel Engines (SORE):</b> The new emission standards for off-road diesel engines are phased in between 2008 and 2015.	12/9/04 10/21/05 EO
<b>Emergency Regulatory Amendment Delaying the January 1, 2005 Implementation Date for the Diesel Fuel Lubricity Standard:</b> The emergency regulation delays the lubricity standard compliance deadline by five months to respond to fuel pipeline contamination problems.	11/24/04 12/10/04 EO
<b>Enhanced vapor recovery compliance extension:</b> The amendments to the EVR regulation extend the compliance date for onboard refueling vapor recovery compatibility to the date of EVR compliance.	11/18/04 2/11/05 EO
<b>CaRFG Phase 3 amendments:</b> The amendments correcting errors and streamlining requirements for compliance and enforcement of CaRFG Phase 3 regulations from 1999.	11/18/04
<b>Clean diesel fuel for harbor craft and intrastate locomotives:</b> The regulation requires harbor craft and locomotives operating solely within California to use clean diesel fuel.	11/18/04 3/16/05 EO
<b>Nonvehicular Source, Consumer Product, and Architectural Coating Fee Regulation Amendment:</b> The amendments to fee regulations to collect supplemental fees when authorized by the Legislature.	11/18/04
<b>Greenhouse gas limits for motor vehicles:</b> The regulation sets the first ever greenhouse gas emission standards on light and medium duty vehicles starting with the 2009 model year.	9/24/04 8/4/05 EO
<b>Gasoline vapor recovery system equipment defects list:</b> The addition of defects to the VRED list for use by compliance inspectors.	8/24/04 6/22/05 EO
<b>Unihose gasoline vapor recovery systems:</b> The emergency regulation and an amendment delay the compliance date for unihose installation to the date of dispenser replacement.	7/22/04 11/24/04 EO
<b>General Idling Limits for Diesel Trucks:</b> The regulation limits idling of heavy-duty diesel trucks operating in California to five minutes, with exceptions for sleeper cabs.	7/22/04
<b>Consumer Products:</b> The regulation reduces ROG emissions from 15 consumer products categories, prohibit the use of 3 toxic compounds in consumer products, ban the use of PDCB in certain products, allow for the use of Alternative Control Plans, and revise Test Method 310.	6/24/04 5/6/05 EO
<b>Urban bus engines/fleet rule for transit agencies:</b> The amendments allow for the purchase of hybrid diesel buses and revise the zero emission bus demonstration and purchase timelines.	6/24/04
<b>Engine Manufacturer Diagnostics:</b> The regulation would require model year 2007 and later heavy duty truck engines to be equipped with engine diagnostic systems to detect malfunctions of the emission control system.	5/20/04
<b>Chip Reflash:</b> The voluntary program and a backstop regulation reduce heavy duty truck NOx emissions through the installation of new software in the engine's electronic control module.	3/25/04 3/21/05 EO
<b>Portable equipment registration program (PERP):</b> The amendments allow uncertified engines to be registered until December 31, 2005, to increase fees, and to modify administrative requirements.	2/26/04 1/7/05 EO 6/21/05 EO

Board Action	Hearing Date
<b>Portable Diesel Engine ATCM:</b> The regulation reduces diesel PM emissions from portable engines through a series of emission standards that increase in stringency through 2020.	2/26/04 1/4/05 EO
<b>California motor vehicle service information rule:</b> The amendments allow for the purchase of heavy duty engine emission-related service information and diagnostic tools by independent service facilities and aftermarket parts manufacturers.	1/22/04 5/20/04
<b>Transportation Refrigeration Unit ATCM:</b> The regulation reduces diesel PM emissions from transport refrigeration units by establishing emission standards and facility reporting requirements to streamline inspections.	12/11/03 2/26/04 11/10/04 EO
<b>Diesel engine verification procedures:</b> The amendments reduced warranty coverage to the engine only, delayed the NOx reduction compliance date to 2007, added requirements for proof-of-concept testing for new technology, and harmonized durability requirements with those of U.S. EPA.	12/11/03 2/26/04 10/17/04
<b>Chip Reflash:</b> The voluntary program and a backstop regulation reduce heavy duty truck NOx emissions through the installation of new software in the engine's electronic control module.	12/11/03 3/27/04 3/21/05 EO
<b>Revised tables of maximum incremental reactivity values:</b> The addition of 102 more chemicals with associated maximum incremental reactivity values to existing regulation allowing these chemicals to be used in aerosol coating formulations.	12/3/03
<b>Stationary Diesel Engines ATCM:</b> The regulation reduces diesel PM emissions from stationary diesel engines through the use of clean fuel, lower emission standards, operational practices.	11/20/03 12/11/03 2/26/2004 9/27/04 EO
<b>Solid waste collection vehicles:</b> The regulation reduces toxic diesel particulate emissions from solid waste collection vehicles by over 80 percent by 2010. This measure is part of ARB's plan to reduce the risk from a wide range of diesel engines throughout California.	9/25/03 5/17/04 EO
<b>Small off-road engines (SORE):</b> The more stringent emission standards for the engines used in lawn and garden and industrial equipment, such as string trimmers, leaf blowers, walk-behind lawn mowers, generators, and lawn tractors.	9/25/03 7/26/04 EO
<b>Off-highway recreational vehicles:</b> Changes to riding season restrictions.	7/24/03
<b>Clean diesel fuel:</b> The regulation reduces sulfur levels and set a minimum lubricity standard in diesel fuel used in vehicles and off-road equipment in California, beginning in 2006.	7/24/03 5/28/04 EO
<b>Ozone Transport Mitigation Amendments:</b> The amendments require upwind districts to (1) have the same no-net-increase permitting thresholds as downwind districts, and (2) Implement "all feasible measures."	5/22/03 10/2/03 NOD
<b>Zero emission vehicles:</b> The Updated California's ZEV requirements support the fuel cell car development and expand sales of advanced technology partial ZEVs (like gasoline-electric hybrids) in the near-term, while retaining a role for battery electric vehicles.	3/27/03 12/19/03 EO
<b>Heavy duty gasoline truck standards:</b> Aligned its existing rules with new, lower federal emission standards for gasoline-powered heavy-duty vehicles starting in 2008.	12/12/02 9/23/03 EO
<b>Low emission vehicles II:</b> Minor administrative changes.	12/12/02 9/24/03 EO
<b>Gasoline vapor recovery systems test procedures:</b> The amendments add advanced vapor recovery technology certification and testing standards.	12/12/02 7/1/03 EO 10/21/03 EO
<b>CaRFG Phase 3 amendments:</b> The amendments allow for small residual levels of MTBE in gasoline while MTBE is being phased out and replaced by ethanol.	12/12/02 3/20/03 EO
<b>School bus Idling:</b> The measure requires school bus drivers to turn off the bus or vehicle engine upon arriving at a school and restart it no more than 30 seconds before departure in order to limit children's exposure to toxic diesel particulate exhaust.	12/12/02 5/15/03 EO
<b>California Interim Certification Procedures for 2004 and Subsequent Model Year Hybrid-Electric Vehicles in the Urban Transit Bus and Heavy-Duty Vehicle Classes Regulation Amendment:</b> The amendments allow diesel-path transit agencies to purchase alternate fuel buses with higher NOx limits, establish certification procedures for hybrid buses, and require lower fleet-average PM emission limits.	10/24/02 9/2/03 EO
<b>CaRFG Phase 3 amendments:</b> The amendments delay removal of MTBE from gasoline by one year to 12/31/03.	7/25/02 11/8/02 EO
<b>Diesel retrofit verification procedures, warranty, and in-use compliance requirements:</b> The regulations specify test procedures, warranty, and in-use compliance of diesel engine PM retrofit control devices.	5/16/02 3/28/03 EO
<b>On-board diagnostics for cars:</b> The changes to the On-Board Diagnostic Systems (OBD II) regulation to improve the effectiveness of OBD II systems in detecting motor vehicle emission-related problems.	4/25/02 3/7/03 EO
<b>Voluntary accelerated light duty vehicle retirement regulations:</b> Establishes standards for a voluntary accelerated retirement program.	2/21/02 11/18/02 EO

Board Action	Hearing Date
<b>Residential burning:</b> The measure reduces emissions of toxic air contaminants from outdoor residential waste burning by eliminating the use of burn barrels and the outdoor burning of residential waste materials other than natural vegetation.	2/21/02 12/18/02 EO
<b>California motor vehicle service information rule:</b> The regulation requires light- and medium-duty vehicle manufacturers to offer for sale emission-related service information and diagnostic tools to independent service facilities and aftermarket parts manufacturers.	12/13/01 7/31/02 EO
<b>Vapor recovery regulation amendments:</b> The amendments expand the list of specified defects requiring equipment to be removed from service.	11/15/01 9/27/02 EO
<b>Distributed generation guidelines and regulations:</b> The regulations require the permitting by ARB of distributed generation sources that are exempt from air district permitting and approved guidelines for use by air districts in permitting non-exempt units.	11/15/01 7/23/02 EO
<b>Low emission vehicle regulations (LEV II):</b> The amendments apply PM emission limits to all new gasoline vehicles, extend gasoline PZEV emission limits to all fuel types, and streamline the manufacturer certification process.	11/15/01 8/6/02 EO
<b>Gasoline vapor recovery systems test methods and compliance procedures:</b> The amendments add test methods for new technology components, streamline test methods for liquid removal equipment, and***.	10/25/01 7/9/02 EO
<b>Heavy-duty diesel trucks:</b> The amendments to emissions standards harmonize with EPA regulations for 2007 and subsequent model year new heavy-duty diesel engines.	10/25/01
<b>Automotive coatings:</b> The Air Toxic Control Measure which prohibits the sale and use in California of automotive coatings containing hexavalent chromium or cadmium.	9/20/01 9/2/02 EO
<b>Inboard and sterndrive marine engines:</b> The lower emission standards for 2003 and subsequent model year inboard and sterndrive gasoline-powered engines in recreational marine vessels.	7/26/01 6/6/02 EO
<b>Asbestos from construction, grading, quarrying, and surface mining:</b> The Airborne Toxic Control Measure for construction, grading, quarrying, and surface mining operations requiring dust mitigation for construction and grading operations, road construction and maintenance activities, and quarries and surface mines to minimize emissions of asbestos-laden dust.	7/26/01 6/7/02 EO
<b>Zero emission vehicle infrastructure and standardization of electric vehicle charging equipment:</b> The amendments to the ZEV regulation alter the method of quantifying production volumes at joint-owned facilities and to add specifications for standardized charging equipment.	6/28/01 5/10/02 EO
<b>Pollutant transport designation:</b> The amendments add two transport couples to the list of air basins in which upwind areas are required to permit thresholds no less stringent than those in downwind areas.	4/26/01
<b>Zero emission vehicle regulation amendments:</b> The amendments reduce the numbers of ZEVs required in future years, add a PZEV category and grant partial ZEV credit, modify the ZEV range credit, allow hybrid-electric vehicles partial ZEV credit, grant ZEV credit to advanced technology vehicles, and grant partial ZEV credit for several other minor new programs.	1/25/01 12/7/01 EO 4/12/02 EO
<b>Heavy duty diesel engines supplemental test procedures:</b> The amendments extend "Not-To-Exceed" and EURO III supplemental test procedure requirements through 2007 when federal requirements will include these tests.	12/7/00
<b>Light and medium duty low emission vehicle alignment with federal standards:</b> The amendments require light and medium duty vehicles sold in California to meet the more restrictive of state or federal emission standards.	12/7/00 12/27/00 EO
<b>Exhaust emission standards for heavy duty gas engines:</b> The amendments establish 2005 emission limits for heavy duty gas engines that are equivalent to federal limits.	12/7/00 12/27/00 EO
<b>CaRFG Phase 3 amendments:</b> The amendments regulate the replacement of MTBE in gasoline with ethanol.	11/16/00 4/25/01 EO
<b>CaRFG Phase 3 test methods:</b> The amendments to gasoline test procedures quantify the olefin content and gasoline distillation temperatures.	11/16/00 7/11/01 EO 8/28/01 EO
<b>Antiperspirant and deodorant regulations:</b> The amendments relax a 0% VOC limit to 40% VOC limit for aerosol antiperspirants.	10/26/00
<b>Diesel risk reduction plan:</b> The plan to reduce toxic particulate from diesel engines through retrofits on existing engines, tighter standards for new engines, and cleaner diesel fuel.	9/28/00
<b>Conditional rice straw burning regulations:</b> The regulations limit rice straw burning to fields with demonstrated disease rates reducing production by more than 5 percent.	9/28/00
<b>Asbestos from unpaved roads:</b> Tightened an existing Air Toxic Control Measure to prohibit the use of rock containing more than 0.25% asbestos on unsurfaced roads.	7/20/00
<b>Aerosol Coatings:</b> The amendments replace mass-based VOC limits with reactivity-based limits, add a table of Maximum Incremental Reactivity values, add limits for polyolefin adhesion promoters, prohibit use of certain toxic solvents, and make other minor changes.	6/22/00 5/1/01 EO
<b>Consumer products aerosol adhesives:</b> The amendments delete a 25% VOC limit by 2002, add new VOC limits for six categories of adhesives, prohibit the use of toxic solvents, and add new labeling and reporting requirements.	5/25/00 3/14/01 EO

Board Action	Hearing Date
<b>Automotive care products:</b> The Air Toxic Control Measure eliminate use of perchloroethylene, methylene chloride, and trichloroethylene in automotive products such as brake cleaners and degreasers.	4/27/00 2/28/01 EO
<b>Enhanced vapor recovery emergency regulation:</b> A four-year term for equipment certifications.	5/22/01 EO
<b>Enhanced vapor recovery:</b> The amendments require the addition of components to reduce spills and leakage, adapt to onboard vapor recovery systems, and continuously monitor system operation and report equipment leaks immediately.	3/23/00 7/25/01 EO
<b>Agricultural burning smoke management:</b> The amendments add marginal burn day designations, require day-specific burn authorizations by districts, and smoke management plans for larger prescribed burn projects.	3/23/00 1/22/01 EO
<b>Urban transit buses:</b> The public transit bus fleet rule and emissions standards for new urban buses that mandates a lower fleet-average NOx emission limit, PM retrofits, lower sulfur fuel use, and purchase of specified percentages of zero emission buses in future years.	1/27/00 2/24/00 11/22/00 EO 5/29/01 EO
<b>Small Off-Road (diesel) Equipment (SORE):</b> The amendments conform with new federal requirements for lower and engine power-specific emission limits, and for the averaging, banking, and trading of emissions among SORE manufacturers.	1/28/00
<b>CaRFG Phase 3 MTBE phase out:</b> The regulations enable refiners to produce gasoline without MTBE while preserving the emissions benefits of Phase 2 cleaner burning gasoline.	12/9/99 6/16/00 EO
<b>Consumer products – mid-term measures II:</b> The regulation which adds emission limits for 2 new categories and tightens emission limits for 15 categories of consumer products.	10/28/99
<b>Portable fuel cans:</b> The regulation requiring that new portable fuel containers, used to refuel lawn and garden equipment, motorcycles, and watercraft, be spill-proof beginning in 2001.	9/23/99 7/6/00 EO
<b>Clean fuels at service stations:</b> The amendments rescinding requirements applicable to SCAB in 1994-1995, modifying the formula for triggering requirements, and allowing the Executive Officer to make adjustments to the numbers of service stations required to provide clean fuels.	7/22/99
<b>Gasoline vapor recovery:</b> The amendments certification and test methods.	6/24/99
<b>Reformulated gasoline oxygenate:</b> The amendments rescind the requirement for wintertime oxygenate in gasoline sold in the Lake Tahoe Air Basin and requiring the statewide labeling of pumps dispensing gasoline containing MTBE.	6/24/99
<b>Marine pleasurecraft:</b> The regulation controls emissions from spark-ignition marine engines, specifically, outboard marine engines and personal watercraft.	12/11/98 2/17/00 EO 6/14/00 EO
<b>Voluntary accelerated light duty vehicle retirement:</b> The regulation sets standards for voluntary accelerated retirement program.	12/10/98 10/22/99 EO
<b>Off-highway recreational vehicles and engines:</b> The amendments allow non-complying vehicles to operate in certain seasons and in certain ORV-designated areas.	12/10/98 10/22/99 EO
<b>On-road motorcycles:</b> Amended on-road motorcycle regulations, to lower the tailpipe emission standards for ROG and NOx.	12/10/98
<b>Portable equipment registration program (PERP):</b> The amendments exclude non-dredging equipment operating in OCS areas and equipment emitting hazardous pollutants, include NSPS Part 000 rock crushers, require SCR emission limits and onshore emission offsets from dredging equipment operating in OCS areas, set catalyst emission limits for gasoline engines, and relieve certain retrofitted engines from periodic source testing.	12/10/98
<b>Liquid petroleum gas motor fuel specifications:</b> The amendment rescinds 5% propene limit and extending 10% limit indefinitely.	12/11/98
<b>Reformulated gasoline:</b> The amendments rescind the RVP exemption for fuel with 10% ethanol and allow for oxygen contents up to 3.7% if the Predictive Model weighted emissions do not exceed original standards.	12/11/98
<b>Consumer products:</b> The amendments add new VOC test methods, to modify Method 310 to quantify low vapor pressure VOC (LVP-VOC) constituents, and to exempt LVP-VOC from VOC content limits	11/19/98
<b>Consumer products:</b> The amendments extend the 1999 VOC compliance deadline for several aerosol coatings, antiperspirants and deodorants, and other consumer products categories to 2002, to exempt methyl acetate from the VOC definition, and make other minor changes.	11/19/98
<b>Low-emission vehicle program (LEV II):</b> The regulations add exhaust emission standards for most sport utility vehicles, pick-up trucks and mini-vans, lowering tailpipe standards for cars, further reducing evaporative emission standards, and providing additional means for generating zero-emission vehicle credits.	11/5/98 9/17/99 EO
<b>Off-road engine aftermarket parts:</b> The implementation of a new program to test and certify aftermarket parts in gasoline and diesel, light-duty through heavy duty, engines used in off-road vehicles and equipment.	11/19/98 10/1/99 EO 7/18/00 EO
<b>Off-road spark ignition engines:</b> The new emission standards for small and large spark ignition engines for off-road equipment, a new engine certification program, an in-use compliance testing program, and a three-year phase-in for large LSI.	10/22/98

Board Action	Hearing Date
<b>Gasoline deposit control additives:</b> The amendments decertify pre-RFG additives, tighten the inlet valve deposit limits, add a combustion chamber deposit limit, and modify the test procedures to align with the characteristics of reformulated gasoline formulations.	9/24/98 4/5/99 EO
<b>Stationary source test methods:</b> The amendments to stationary source test methods align better with federal methods.	8/27/98 7/2/99 EO
<b>Locomotive MOA for South Coast:</b> The Memorandum of agreement (MOA) signed by ARB, U.S. EPA and major railroads to concentrate cleaner locomotives in the South Coast by 2010 and fulfill 1994 ozone SIP commitment.	7/2/98
<b>Gasoline vapor recovery:</b> The amendments to certification and test methods add methods for onboard refueling vapor recovery, airport refuelers, and underground tank interconnections, and make minor changes to existing methods.	5/21/98 8/27/98
<b>Reformulated gasoline:</b> The amendments rescind the wintertime oxygenate requirement, allow for sulfur content averaging, and make other minor technical amendments.	8/27/98
<b>Ethylene oxide sterilizers:</b> The amendments to the ATCM streamline source testing requirements, add EtO limits in water effluent from control devices, and make other minor changes.	5/21/98
<b>Chrome platers:</b> The amendments to ATCM harmonize with requirements of federal NESHAP standards for chrome plating and chromic acid anodizing facilities.	5/21/98
<b>On-road heavy-duty vehicles:</b> The amendments align on-road heavy duty vehicle engine emission standards with EPA's 2004 standards and align certification, testing, maintenance, and durability requirements with those of U.S. EPA.	4/23/98 2/26/99 EO
<b>Small off-road engines (SORE):</b> The amendments grant a one-year delay in implementation, relaxation of emissions standards for non-handheld engines, emissions durability requirements, averaging/banking/trading, harmonization with the federal diesel engine regulation, and modifications to the production line testing requirements.	3/26/98
<b>Heavy duty vehicle smoke inspection program:</b> The amendments require annual smoke testing, set opacity limits, and exempt new vehicles from testing for the first four years.	12/11/97 3/2/98 EO
<b>Consumer products (hairspray credit program):</b> The standards for the granting of tradable emission reduction credits achieved by sales of hairspray products having VOC contents less than required limits.	11/13/97
<b>Light-duty vehicle off-cycle emissions:</b> The standards to control excess emissions from aggressive driving and air conditioner use in light duty vehicles and added two light duty vehicle test methods for certification of new vehicles under these standards.	7/24/97 3/19/98 EO
<b>Consumer products:</b> The amendments add VOC limits to 18 categories of consumer products used in residential and industrial cleaning, automobile maintenance, and commercial poisons.	7/24/97
<b>Enhanced evaporative emissions standards:</b> The amendments extend the compliance date for ultra-small volume vehicle manufacturers by one year.	5/22/97
<b>Emission reduction credit program:</b> The standards for District establishment of ERC programs including certification, banking, use limitation, and reporting requirements.	5/22/97
<b>Lead as a toxic air contaminant:</b> The amendment designates inorganic lead as a toxic air contaminant.	4/24/97
<b>Consumer products (hair spray):</b> The amendments (1) delay a January 1, 1998, compliance deadline to June 1, 1999, (2) require progress plans from manufacturers, and (3) authorize the Executive Officer to require VOC mitigation when granting variances from the June 1, 1999 deadline.	3/27/97
<b>Portable engine registration program (PERP):</b> The standards for (1) the permitting of portable engines by ARB and (2) District recognition and enforcement of permits.	3/27/97
<b>Liquefied petroleum gas:</b> The amendments extend the compliance deadline from January 1, 1997, to January 1, 1999, for the 5% propene limit in liquefied petroleum gas used in motor vehicles.	3/27/97
<b>Onboard diagnostics, phase II:</b> The amendments extend the phase-in of enhanced catalyst monitoring, modify misfire detection requirements, add PVC system and thermostat monitoring requirements, and require manufacturers to sell diagnostic tools and service information to repair shops.	12/12/96
<b>Consumer products:</b> The amendments delay 25% VOC compliance date for aerosol adhesives, clarify portions of the regulation, exempt perchloroethylene from VOC definition, extend the sell-through time to three years, and add perchloroethylene reporting requirements.	11/21/96
<b>Consumer products (test method):</b> The amendment adds Method 310 for the testing of VOC content in consumer products.	11/21/96
<b>Pollutant transport designation:</b> The amendments modify transport couples from the Broader Sacramento area and add couples to the newly formed Mojave Desert and Salton Sea Air Basins.	11/21/96
<b>Diesel fuel certification test methods:</b> The amendments specify the test methods used for quantifying the constituents of diesel fuel.	10/24/96 6/4/97 EO
<b>Wintertime requirements for utility engines &amp; off-highway vehicles :</b> The Optional hydrocarbon and NOx standards for snow throwers and ice augers, raising CO standard for specialty vehicles under 25hp.	9/26/96
<b>Large off-road diesel Statement of Principles:</b> National agreement between ARB, U.S. EPA, and engine manufacturers to reduce emissions from heavy-duty off-road diesel equipment four years earlier than expected in the 1994 SIP for ozone.	9/13/96

Board Action	Hearing Date
<b>Regulatory improvement initiative:</b> Rescinded two regulations relating to fuel testing in response to Executive Order W-127-95.	5/30/96
<b>Zero emission vehicles:</b> The amendments eliminate zero emission vehicle quotas between 1998 and 2002, and approved MOUs with seven automobile manufacturers to accelerate release of lower emission "49 state" vehicles.	3/28/96 7/24/96 EO
<b>CaRFG variance requirements:</b> The amendments add a per gallon fee on non-compliant gasoline covered by a variance and to made administrative changes in variance processing and extension.	1/25/96 2/5/96 EO 4/2/96 EO
<b>Utility and lawn and garden equipment engines:</b> The amendment relaxes the CO standard from 300 to 350 ppm for Class I and II utility engines.	1/25/96
<b>National security exemption of military tactical vehicles:</b> Such vehicles would not be required to adhere to exhaust emission standards.	12/14/95
<b>CaRFG regulation amendments:</b> The amendments allow for downstream addition of oxygenates and expansion of compliance options for gasoline formulation.	12/14/95
<b>Required additives in gasoline (deposit control additives):</b> Terms, definitions, reporting requirements, and test procedures for compliance are to be clarified.	11/16/95
<b>CaRFG test method amendments:</b> The amendments designate new test methods for benzene, aromatic hydrocarbon, olefin, and sulfur content of gasoline.	10/26/95
<b>Motor vehicle inspection and maintenance program:</b> Handled by BAR.	10/19/95 by BAR
<b>Antiperspirants and deodorants, consumer products, and aerosol coating products:</b> Ethanol exemption for all products, modifications to aerosol special requirements, modifications for regulatory language consistency, modifications to VOC definition.	9/28/95
<b>Low emission vehicle (LEV III) standards:</b> Reactivity adjustment factors, introduction of medium-duty ULEVs, window labels, and certification requirements and test procedures for LEVs.	9/28/95
<b>Medium- and heavy-duty gasoline trucks:</b> Expedited introduction of ultra-low emission medium-duty vehicles and lower NOx emission standards for heavy-duty gasoline trucks to fulfill a 1994 ozone SIP commitment.	9/1/95
<b>Retrofit emission standards:</b> all vehicle classes to be included in the alternate durability test plan, kit manufacturers to be allowed two years to validate deterioration factors under the test plan, update retrofit procedures allowing manufacturers to disable specific OBDs if justified by law.	7/27/95
<b>Gasoline vapor recovery systems:</b> Revised certification and test procedures.	6/29/95
<b>Onboard refueling vapor recovery standards:</b> 1998 and subsequent MY engine cars, LD trucks, and MD trucks less than 8500 GVWR.	6/29/1995 4/24/96 EO
<b>Heavy duty vehicle exhaust emission standards for NOx:</b> Amendments to standards and test procedures for 1985 and subsequent MY HD engines, amendments to emission control labels, amendments to Useful Life definition and HD engines and in-use vehicle recalls.	6/29/95
<b>Aerosol coatings regulation:</b> The regulation meets California Clean Air Act requirements and a 1994 ozone SIP commitment.	3/23/95
<b>Periodic smoke inspection program:</b> Delays start of PSIP from 1995 to 1996.	12/8/94
<b>Onboard diagnostics phase II:</b> The Amendments clarify regulation language, ensure maximum effectiveness, and address manufacturer concerns regarding implementation.	12/8/94
<b>Alternative control plan (ACP) for consumer products:</b> A voluntary, market-based VOC emissions cap upon a grouping of consumer products, flexible by manufacturer that will minimize overall costs of emission reduction methods and programs.	9/22/94
<b>Diesel fuel certification:</b> new specifications for diesel engine certification fuel, amended oxygen specification for CNG certification fuel, and amended commercial motor vehicle liquefied petroleum gas regulations.	9/22/94
<b>Utility and lawn and garden equipment (UGLE) engines:</b> Modification to emission test procedures, ECLs, defects warranty, quality-audit testing, and new engine compliance testing.	7/28/94
<b>Evaporative emissions standards and test procedures:</b> The evaporative emissions standards for medium-duty vehicles.	2/10/94
<b>Off-road recreational vehicles:</b> The emission control regulations for off-road motorcycles, all-terrain vehicles, go-karts, golf carts, and specialty vehicles.	1/1/94
<b>Perchloroethylene from dry cleaners:</b> The measure to control perchloroethylene emissions from dry cleaning operations.	10/1/93
<b>Wintertime oxygenate program:</b> The Amendments to the control time period for San Luis Obispo County, exemption for small retailers bordering Nevada, flexibility in gasoline delivery time, calibration of ethanol blending equipment, gasoline oxygen content test method.	9/9/93
<b>Onboard diagnostic phase II</b>	7/9/93
<b>Urban transit buses:</b> The amended regulation to tighten state NOx and particulate matter (PM) standards for urban transit buses beyond federal standards beginning in 1996.	6/10/93

<b>Board Action</b>	<b>Hearing Date</b>
<b>1-year implementation delay in emission standards for utility engines</b>	4/8/93
<b>Non-ferrous metal melting:</b> The Air Toxic Control Measure for emissions of cadmium, arsenic, and nickel from non-ferrous metal melting operations.	1/1/93
<b>Certifications requirements for low emission passenger cars, light-duty trucks &amp; medium duty vehicles</b>	1/14/93
<b>Airborne toxic control measure for emissions of toxic metals from non-ferrous metal melting</b>	12/10/92
<b>Periodic self-inspection program:</b> Implemented state law establishing a periodic smoke self-inspection program for fleets operating heavy-duty diesel-powered vehicles.	12/10/92
<b>Notice of general public interest for consumer products</b>	11/30/92
<b>Substitute fuel or clean fuel incorporated test procedures</b>	11/12/92
<b>New vehicle testing using CaRFG Phase 2 gasoline:</b> The amendments require the use of CaRFG Phase 2 gasoline in the certification of exhaust emissions in new vehicle testing.	8/13/92
<b>Standards and test procedures for alternative fuel retrofit systems</b>	5/14/92
<b>Alternative motor vehicle fuel certification fuel specification</b>	3/12/92
<b>Heavy-duty off-road diesel engines:</b> The first exhaust emission standards and test procedures for heavy-duty off-road diesel engines beginning in 1996.	1/9/92
<b>Consumer Products - Tier II:</b> Tier II of regulations to reduce emissions from consumer products.	1/9/92
<b>Wintertime oxygen content of gasoline:</b> The regulation requiring the addition of oxygenates to gasoline during winter to satisfy federal Clean Air Act mandates for CO nonattainment areas.	12/1/91
<b>CaRFG Phase 2:</b> The CaRFG phase 2 specifications including lowering vapor pressure, reducing the sulfur, olefin, aromatic, and benzene content, and requiring the year-round addition of oxygenates to achieve reductions in ROG, NOx, CO, oxides of sulfur (SOx) and toxics.	11/1/91
<b>Low emissions vehicles amendments revising reactivity adjust factor (RAF) provisions and a RAF for M85 transitional low emission vehicles</b>	11/14/91
<b>Onboard diagnostic, phase II</b>	11/12/91
<b>Onboard diagnostics for light-duty trucks and light &amp; medium-duty motor vehicles</b>	9/12/91
<b>Utility and lawn &amp; garden equipment:</b> The first off-road mobile source controls under the California Clean Air Act regulating utility, lawn and garden equipment.	12/1/90
<b>Control for abrasive blasting</b>	11/8/90
<b>Roadside smoke inspections of heavy-duty vehicles:</b> The regulations implementing state law requiring a roadside smoke inspection program for heavy-duty vehicles.	11/8/90
<b>Consumer Products Tier I:</b> Tier I of standards to reduce emissions from consumer products.	10/11/90
<b>CaRFG Phase I:</b> CaRFG Phase I reformulated gasoline regulations to phase-out leaded gasoline, reduce vapor pressure, and require deposit control additives.	9/1/90
<b>Low-emission vehicle (LEV) and clean fuels:</b> The landmark LEV/clean fuel regulations which called for the gradual introduction of cleaner cars in California. The regulations also provided a mechanism to ensure the availability of alternative fuels when a certain number of alternative fuel vehicles are sold.	9/1/90
<b>Evaporative emissions from vehicles:</b> Modified test procedure to include high temperatures (up to 105 F) and ensure that evaporative emission control systems function properly on hot days.	8/9/90
<b>Dioxins from medical waste incinerators:</b> The Airborne Toxic Control Measure to reduce dioxin emissions from medical waste incinerators.	7/1/90
<b>CA Clean Air Act guidance for permitting:</b> Approved California Clean Air Act permitting program guidance for new and modified stationary sources in nonattainment areas.	7/1/90
<b>Consumer products BAAQMD</b>	6/14/90
<b>Medium duty vehicle emission standards:</b> The three new categories of low emission MDVs, required minimum percentages of production, and established production credit and trading.	6/14/90
<b>Medium-duty vehicles:</b> The test procedures for medium-duty vehicles to require whole-vehicle testing instead of engine testing. This modification allowed enforcement of medium-duty vehicle standards through testing and recall.	6/14/90
<b>Ethylene oxide sterilizers:</b> Airborne Toxic Control Measure to reduce ethylene oxide emissions from sterilizers and aerators.	5/10/90
<b>Asbestos in serpentine rock:</b> Airborne Toxic Control Measure for asbestos-containing serpentine rock in surfacing applications.	4/1/90
<b>Certification procedure for aftermarket parts</b>	2/8/90
<b>Antiperspirants and deodorants:</b> First consumer products regulation, setting standards for antiperspirants and deodorants.	11/1/89
<b>Residential woodstoves:</b> Suggested control measure for the control of emissions from residential wood combustion.	11/1/89
<b>On-Board Diagnostic Systems II:</b> The regulations implement the second phase of on-board diagnostic requirements which alert drivers of cars, light-trucks and medium-duty vehicles when the emission control system is not functioning properly.	9/1/89

<b>Board Action</b>	<b>Hearing Date</b>
<b>Cars and light-duty trucks:</b> The regulations reduce ROG and CO emissions from cars and light trucks by 35 percent.	6/1/89
<b>Architectural coatings:</b> Suggested control measure to reduce ROG emissions from architectural coatings.	5/1/89
<b>Chrome from cooling towers:</b> Airborne Toxic Control Measure to reduce hexavalent chromium emissions from cooling towers.	3/1/89
<b>Reformulated Diesel Fuel:</b> Regulations requiring the use of clean diesel fuel with lower sulfur and aromatic hydrocarbons beginning in 1993.	11/1/88
<b>Vehicle Recall:</b> The regulations implement a recall program which requires auto manufacturers to recall and fix vehicles with inadequate emission control systems (Vehicles are identified through in-use testing conducted by the ARB).	9/1/88
<b>Suggested control measure for oil sumps:</b> Suggested control measure to reduce emissions from sumps used in oil production operations.	8/1/88
<b>Chrome platers:</b> Airborne Toxic Control Measure to reduce emissions of hexavalent chromium emissions from chrome plating and chromic acid anodizing facilities.	2/1/88
<b>Suggested control measure for boilers:</b> Suggested control measure to reduce NOx emissions from industrial, institutional, and commercial boilers, steam generators and process heaters.	9/1/87
<b>Benzene from service stations:</b> The Airborne Toxic Control Measure to reduce benzene emissions from retail gasoline service stations (Also known as Phase II vapor recovery).	7/1/87
<b>Agricultural burning guidelines:</b> Amended existing guidelines to add provisions addressing wildland vegetation management.	11/1/86
<b>Heavy-duty vehicle certification:</b> Amended certification of heavy-duty diesel and gasoline-powered engines and vehicles to align with federal standards.	4/1/86
<b>Cars and light-duty trucks:</b> The regulations reduce NOx emissions from passenger cars and light-duty trucks by 40 percent.	4/1/86
<b>Sulfur in diesel fuel:</b> Removed exemption for small volume diesel fuel refiners.	6/1/85
<b>On-Board Diagnostics I:</b> The regulations require the use of on-board diagnostic systems on gasoline-powered vehicles to alert the driver when the emission control system is not functioning properly.	4/1/85
<b>Suggested control measure for wood coatings:</b> Suggested control measure to reduce emissions from wood furniture and cabinet coating operations.	3/1/85
<b>Suggested control measure for resin manufacturing:</b> Suggested control measure to reduce ROG emissions from resin manufacturing.	1/1/85

## **Appendix IV**

### **Future Air Quality: PM<sub>2.5</sub> Composition and Unmonitored Area Analysis**

## Introduction

This appendix contains supporting information for Chapter 5, including: 1) details on the method used to determine PM<sub>2.5</sub> composition, and 2) the unmonitored area analysis. PM<sub>2.5</sub> chemical speciation measurements were adjusted based on the U.S. EPA's recommended method, Sulfate, Adjusted Nitrate, Derived Water, Inferred Carbon Hybrid (SANDWICH). The details of this and the resulting speciation profiles for Chemical Speciation Network (CSN) sites are presented below. Also presented is a thorough analysis of the future air quality at all locations in the Basin. This unmonitored area analysis is needed due to the relatively sparse PM<sub>2.5</sub> measurement network and the U.S. EPA's requirement that attainment must be demonstrated across the entire Basin.

## PM<sub>2.5</sub> Composition

When determining PM<sub>2.5</sub> composition, a significant source of uncertainty lies in the measurement of Organic Carbon (OC). OC as measured by a Speciation Air Sampling System (SASS) is believed to be highly uncertain with a mostly positive sampling artifact. The 6.7 Liter Per Minute (LPM) flow rate of the SASS used to collect OC is approximately 2.5 times lower than that of the FRM sampling system (16.7 LPM), which provides the official PM<sub>2.5</sub> mass measurement. The slower flow rate in the SASS reduces the pressure drop across the filter and increases the adsorption of organic vapor on the quartz filter. The FRM sampler uses a Teflon filter for mass measurements which is much less subject to organic vapor adsorption. Therefore, for the same air mass, more OC can be collected by the SASS than the FRM sampler, often leading to an overbalance in the sum of the PM<sub>2.5</sub> species relative to FRM mass. There are uncertainties in the measurements and the speciation analyses for all species; however, the greatest uncertainty in species concentration is generally associated with the measurement and analysis of OC.

The U.S. EPA recommends estimating uncertain OC concentrations through the SANDWICH material balance method (Frank, 2006).<sup>65</sup> According to the SANDWICH method, OC is estimated by mass balance, defined as the difference between the measured mass and the sum of all inorganic species, water and a filter blank of 0.2 µg/m<sup>3</sup>. The OC derived by mass balance is further constrained by a floor and a ceiling. The floor value is equal to the measured OC mass, except when the speciation mass exceeds FRM mass. In this case, the measured OC is scaled by the ratio of the FRM to speciation mass; this value then defines the OC floor. While the U.S. EPA's guidance recommends setting the ceiling to 0.8 times the FRM mass, this resulted in large OC

fractions that were not supported by the literature (Hayes et al., 2013).<sup>66</sup> Thus, the OC ceiling was lowered to 0.5 times the FRM mass, which is consistent with a previous study (Hayes et al., 2013). Figures IV-1 through IV-6 depict the species fractional splits for the 6 primary components and water vapor for the CSN sites, except Rubidoux, in 2018 after SANDWICH was applied. The corresponding figures for Rubidoux are presented in Chapter 5.

### Unmonitored Area Analysis

The U.S. EPA modeling guidance recommends that the attainment demonstration include a formal analysis to confirm that all grid cells in the modeling domain meet the federal standard. Figure IV-7 presents the 24-hour PM<sub>2.5</sub> base year design values interpolated to the spatial extent of the Basin. Monitoring sites are denoted by black dots. Several areas around Compton, the northwestern portion of Riverside County, and the southwestern portion of San Bernardino County depict grid cells exceeding 35  $\mu\text{g}/\text{m}^3$ . Figure IV-8 shows an interpolated spatial representation of future model-predicted 24-hour design values in 2023. By 2023, Mira Loma, the PM<sub>2.5</sub> 24-hour design station, will attain the federal standard. Attainment of the standard in other areas, however, cannot be ascertained simply by examining these interpolated fields.

**FIGURE IV-7**  
2018 Baseline 24-Hour PM<sub>2.5</sub> Design Concentrations ( $\mu\text{g}/\text{m}^3$ )

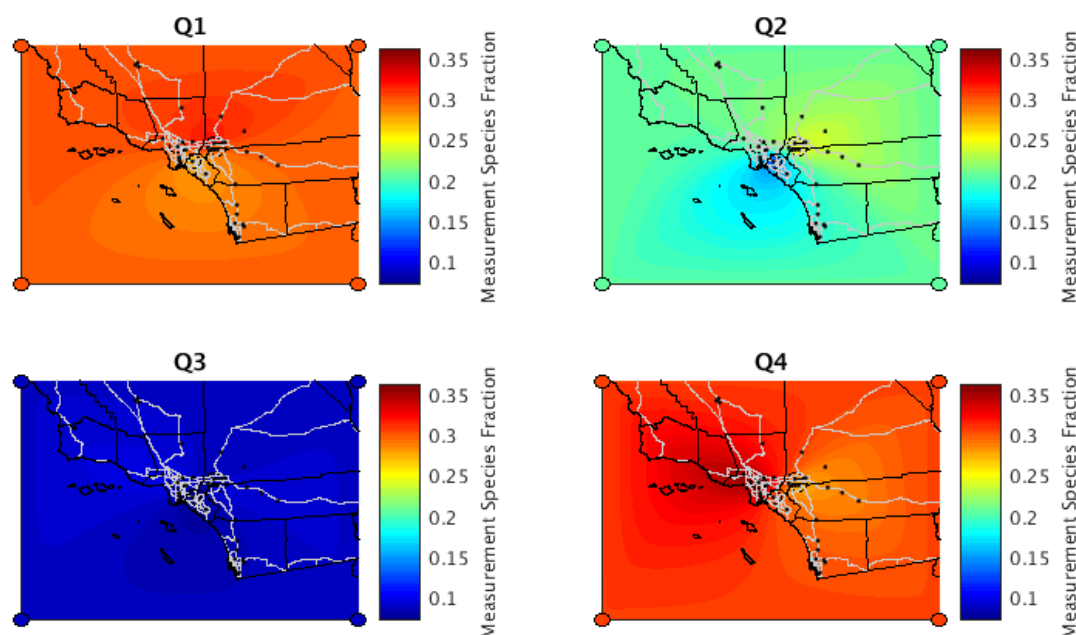

**FIGURE IV-8**  
2023 Baseline 24-Hour PM<sub>2.5</sub> Design Concentrations ( $\mu\text{g}/\text{m}^3$ )

The unmonitored area attainment test requires assessing the impacts for 32 days per year, for five years, at each unmonitored grid cell, following the RRF method described in the U.S. EPA guidance (U.S. EPA, 2018).<sup>67</sup> The methodology used to assess the unmonitored grid cell impact is as follows. The speciation fractions throughout the Basin for each relevant species, except particle bound water, were estimated with a natural neighbor interpolation for each quarter based on the

<sup>67</sup> U.S. EPA, (2018). Modeling Guidance for Demonstrating Air Quality Goals for Ozone, PM<sub>2.5</sub>, and Regional Haze. [https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling\\_Guidance-2018.pdf](https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling_Guidance-2018.pdf).

2016-2018 speciation period. Natural neighbor is an interpolation method based on Voronoi tessellation.<sup>68</sup> While the four CSN sites encompass all areas of high PM concentrations in the Basin, it was necessary to create “pseudo stations” at the corners of the modelling domain to aid in extrapolation. Pseudo stations are fake monitoring stations placed outside the analysis boundary to reduce extrapolation uncertainties in the areas without monitoring stations. The species fractions at these pseudo stations were equivalent to the average fraction for each species. Speciation within the Basin was not appreciably affected by the pseudo stations, due to the CSN sites carrying greater weight in the natural neighbor interpolation. This interpolation method was selected as it has been shown to reproduce ozone concentrations in the Basin more accurately than an inverse distance weighted, inverse distance weight squared, nearest neighbor, or linear interpolation scheme (see Appendix 5, Chapter 5 of the 2016 AQMP, South Coast AQMD, 2017).<sup>69</sup> Figure IV-9 depicts the interpolated nitrate species fractions in quarters 1-4. The same interpolation method was applied to other PM components as well (not shown).

**FIGURE IV-9**

Interpolated Measurement Species Fractions for Nitrate (FRM Locations are Illustrated with Black Dots. CSN and Pseudo Stations are Illustrated with Circles)

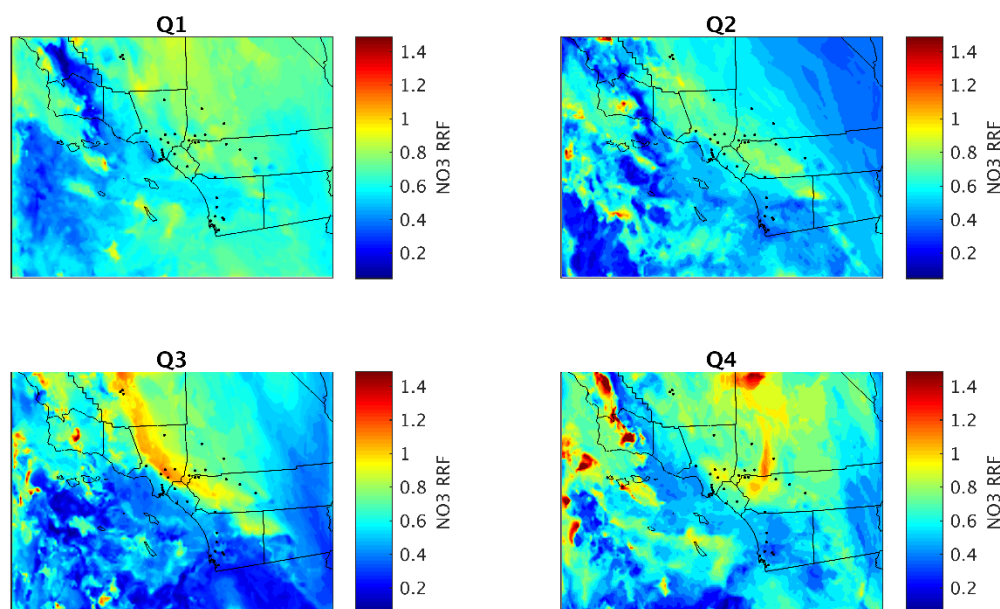

<sup>68</sup> Sibson, R. (1981). "A brief description of natural neighbor interpolation (Chapter 2)". In V. Barnett (ed.). *Interpreting Multivariate Data*. Chichester: John Wiley. pp. 21–36.

<sup>69</sup> South Coast AQMD (2017), 2016 Air Quality Management Plan, Appendix V, Modeling and Attainment Demonstration. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-v.pdf?sfvrsn=10>.

FRM data from 33 monitoring sites within the modeling domain were extracted from the U.S. EPA's AQS database for each year of the 5-year period. Data from stations without daily sampling were adjusted to simulate a daily sampling rate by filling in missing days with the nearest measured value. Therefore, the 8<sup>th</sup> highest value in each year represented the 98<sup>th</sup> percentile measurement for each station, regardless of the sampling frequency. The highest eight concentrations sampled in each quarter in each of the five years were selected to generate the data set. This resulted in  $8 \times 4 \times 5 = 160$  days of data for each of the 33 FRM stations. The quarterly interpolated species fractions were then applied to these days.

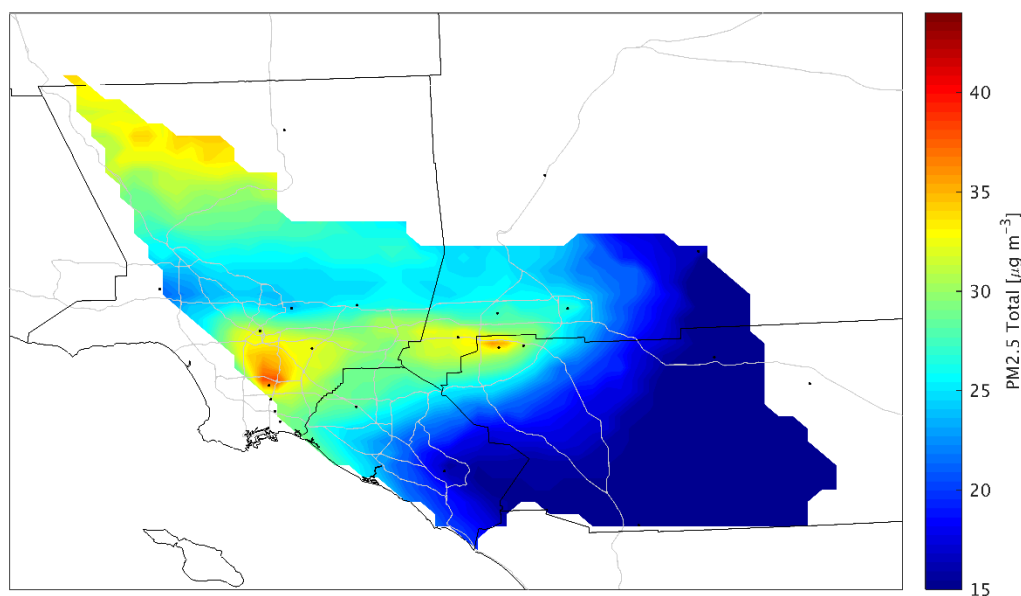

RRFs were calculated from the model output at each cell in the Basin using the same strategy employed for the station-specific analysis. However, the absence of measurement data between the stations did not allow for the use of selection criteria to filter out days where model performance was inadequate. Quarterly RRFs for nitrate are presented in Figure IV-10. RRFs for all other species are presented in Attachment 1. Future 24-hr PM<sub>2.5</sub> species concentrations for each of the five years were derived by multiplying the interpolated species concentrations by the quarterly RRFs.

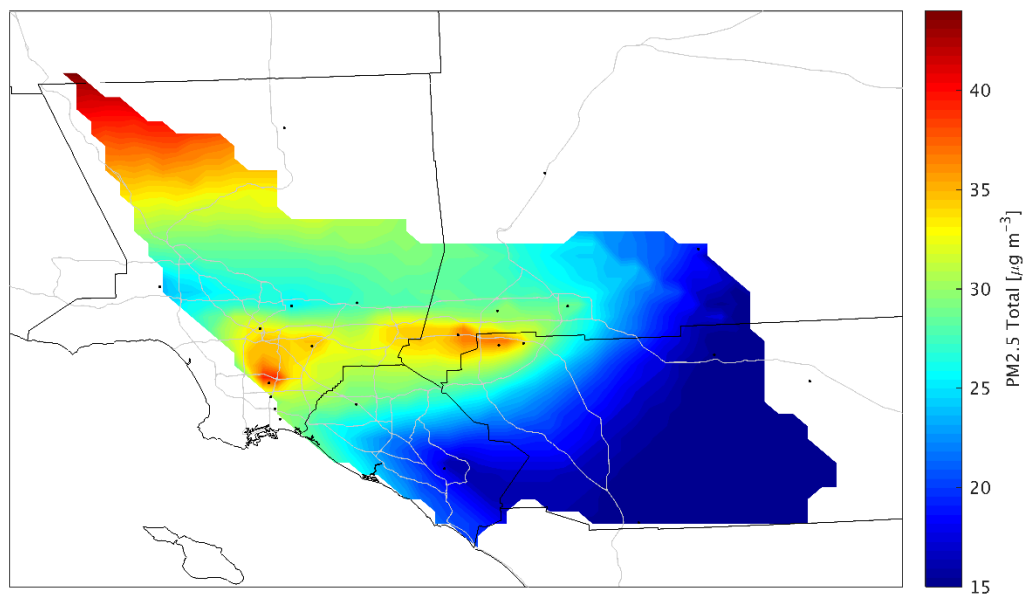

**FIGURE IV-10**  
2023 RRFs for Nitrate

Particle-bound water was calculated and then summed along with all species concentrations and a filter blank to generate total PM<sub>2.5</sub> mass for each of the 160 days. The eighth-highest value at each

grid cell was then selected for each year and a 5-year weighted-average was applied to generate a projected 24-hour design value at each grid-cell within the Basin. The projected 24-hour design values for 2023 are presented in Figure IV-11. Figure IV-12 presents the 2018 base-year design values for comparison. As expected, the design concentrations in 2023 are much lower across the Basin. Excluding the area surrounding Compton, the highest 24-hour PM<sub>2.5</sub> design concentration is predicted in the grid cell immediately north of the Mira Loma monitoring station. Thus, the entire Basin is anticipated to achieve attainment in 2023 except for Compton using a regional photochemical modeling and unmonitored area analysis. The attainment of Compton is addressed in Chapter 5 and Appendix V using the supplemental weight of evidence approach. Therefore, the entire Basin including Compton is expected to attain the 2006 24-hour PM<sub>2.5</sub> standard in 2023.

**Appendix V**

**Compton PM2.5 Attainment Demonstration**

## Introduction

As detailed in Chapter 5, Compton does not show attainment in 2023 with the chemical transport modeling-based attainment demonstration. However, a suite of technical analyses using ambient measurements strongly suggests that Compton will attain in 2023, if not earlier. In such instances, where the model and prevailing evidence do not align, U.S. EPA guidance allows for a “weight of evidence” assessment in order to project attainment (U.S. EPA, 2018).<sup>[70]</sup> Several analyses are presented herein which demonstrate that Compton’s base year design value was anomalous and that attainment by 2023 is highly probable. Consistent with U.S. EPA guidance for attainment dates in the near future, ambient data and emissions trends carry the most weight in the analysis. Additional analyses, focusing on meteorological factors and localized emission sources, are presented. Chapter V provides a high-level summary of the results of these analyses whereas Appendix V provides a more comprehensive description of the established methodologies, results, and supplementary details.

## PM<sub>2.5</sub> trends measured at Compton

The FRM PM<sub>2.5</sub> measurements at Compton began on Dec. 23, 2008. All PM<sub>2.5</sub> three-year design values recorded at Compton are shown in Figure V-1. All design values recorded before 2017 were below the PM<sub>2.5</sub> 24-hour federal standard, while PM<sub>2.5</sub> design values in 2017, 2018, and 2019 exceed the PM<sub>2.5</sub> 24-hour federal standard.

The PM<sub>2.5</sub> exceedances during 2017-2019 were caused by the remarkably high annual 98<sup>th</sup> percentile daily FRM PM<sub>2.5</sub> measured in 2017. The annual 98<sup>th</sup> percentile daily FRM PM<sub>2.5</sub> data during 2009-2019 are presented in Figure V-2. For all years except 2017, the value ranges from between 24.0 to 37.7 µg/m<sup>3</sup>, either below or very close to the 24-hour federal standard. The annual 98<sup>th</sup> percentile daily FRM PM<sub>2.5</sub> in 2017 was 53.4 µg/m<sup>3</sup>, which is 69% higher than the average of the 98<sup>th</sup> percentile values in all other years.

The high value for the annual 98<sup>th</sup> percentile daily FRM PM<sub>2.5</sub> in 2017 was driven by three unusually high daily FRM PM<sub>2.5</sub> concentrations. All daily FRM PM<sub>2.5</sub> concentrations measured in Dec. 2008-Jun. 2020 are shown in Figure V-3. The overall 98<sup>th</sup> percentile of these data is 32.7 µg/m<sup>3</sup>, which is below the 24-hour federal PM<sub>2.5</sub> standard. In April 2019, the FRM PM<sub>2.5</sub> at Compton changed from a one-in-three-days sampling schedule to a daily sampling schedule. Therefore, in 2017, the annual 98<sup>th</sup> percentile daily FRM PM<sub>2.5</sub> relies on the third highest value recorded in that year. The three highest daily PM<sub>2.5</sub> concentrations measured in 2017 are highlighted with red circles in the figure. They were recorded on Dec. 24<sup>th</sup>, Dec. 27<sup>th</sup>, and Jan. 1<sup>st</sup>, 2017 with values of 66.7, 57.6, and 53.4 µg/m<sup>3</sup>, respectively. With the exception of the FRM PM<sub>2.5</sub> measured on Jan 1<sup>st</sup>, 2009, these three values are the three highest daily FRM PM<sub>2.5</sub>

<sup>70</sup> U.S. EPA, (2018). Modeling Guidance for Demonstrating Air Quality Goals for Ozone, PM<sub>2.5</sub>, and Regional Haze. [https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling\\_Guidance-2018.pdf](https://www3.epa.gov/ttn/scram/guidance/guide/O3-PM-RH-Modeling_Guidance-2018.pdf).

concentrations ever recorded at the Compton station—66 to 103% higher than the overall 98<sup>th</sup> percentile of all PM<sub>2.5</sub> concentrations measured at the Compton station.

**FIGURE V-1**  
PM<sub>2.5</sub> Design Values Measured at the Compton Station

**FIGURE V-2**  
Annual 98th Percentile Daily FRM PM<sub>2.5</sub> Concentrations Measured at the Compton Station

**FIGURE V-3**

Daily FRM PM<sub>2.5</sub> Concentrations Measured at the Compton Station. The three highest PM<sub>2.5</sub> concentrations in 2017 are highlighted with red circles. The 98th percentile of all historical PM<sub>2.5</sub> measurements at Compton is shown on the plot.

FRM PM<sub>2.5</sub> concentrations measured at all stations in the South Coast AQMD's jurisdiction on Jan. 1<sup>st</sup>, Dec. 24<sup>th</sup>, and Dec. 27<sup>th</sup>, 2017 are presented in Figure V-4. Since daily sampling is not conducted at every station, the number of stations that have FRM PM<sub>2.5</sub> measurements available vary by date. On Jan. 1<sup>st</sup>, 2017, as shown in Figure V-4(a), the highest PM<sub>2.5</sub> concentration was shown in Compton, which is about 51% higher than the second highest PM<sub>2.5</sub> concentration measured in the Basin (at the Long Beach – Route 710 Near Road station). Except for these two stations, PM<sub>2.5</sub> concentrations at all other stations in the South Coast AQMD jurisdiction were below 25 µg/m<sup>3</sup>. This indicates that the high PM<sub>2.5</sub> concentration at Compton on Jan 1<sup>st</sup>, 2017 was likely caused by a local emission source. On Dec 24<sup>th</sup>, concentrations in Compton were significantly higher than any other stations in the region, indicating the presence of a localized PM<sub>2.5</sub> event. The high PM<sub>2.5</sub> concentrations at Compton on Dec. 27<sup>th</sup>, 2017 was likely caused by regional events, such as unfavorable meteorological conditions or widespread residential wood burning as concentrations in Compton were similar to recorded values in nearby Long Beach stations. Subsequent analyses presented in this document provide additional evidence to support these assertions.

**FIGURE V -4**

FRM PM<sub>2.5</sub> Concentrations Measured at All Stations in the South Coast AQMD's Jurisdiction on (A) Jan. 1<sup>st</sup>, 2017, (B) Dec. 24<sup>th</sup>, 2017, And (C) Dec. 27<sup>th</sup>, 2017

***Meteorology on Dec. 24<sup>th</sup> and Dec. 27<sup>th</sup>, 2017 was unusual and highly favorable for accumulating PM<sub>2.5</sub>***

The meteorological potential to accumulate PM<sub>2.5</sub> was evaluated using North American Mesoscale (NAM) forecast products. (National Centers for Environmental Information, 2020) 12 Universal Time Coordinate (UTC) forecast cycle with 12 km grid resolution forecasts were coupled with PM<sub>2.5</sub> measurements at Compton between 2009-2020. Only cold months (October through March) were employed in the analysis. The goal of this effort is to evaluate the typicality of the meteorology associated with the three highest PM days in 2017. In addition to the three 2017 days of interest, December 16, 2018 is included as a benchmark case for wood smoke influence, since the day had an anomalously high wood smoke presence as marked by high levels of levoglucosan, a by-product of wood burning.

Table V-1 shows the meteorological variables that were analyzed. We used correlations between PM<sub>2.5</sub> measurements at Compton and each meteorological variable and percentile calculations to define a weather influence 'wxInfluence' score. This score indicates the extent to which the set of meteorological conditions is favorable for the accumulation of PM<sub>2.5</sub>, with higher numbers indicating more favorable conditions. Since the NAM model has a 12 km resolution, this analysis will not capture any micrometeorological effects, but the relationship between the weather

variables and PM2.5 is specific to patterns at Compton. Note that ‘SameDay’ in the variable name indicates that the variable represents the day of the observations and ‘PreviousEve’ represents the weather the evening before the observation. Weather data was aggregated this way because weather and PM2.5 concentrations from one day can influence the PM2.5 concentrations on the following day. Similarly, ‘ThreeDay’ variables are aggregations of weather variables for the day of the observation and the two prior days.

**TABLE V-1**  
Weather variables initially included in analysis

Aggregated Variable	Units	Aggregation	Hours	NAM Variable
PreviousEve10mWindspeed (Windspeed at 10 m height)	m/s	mean	16 to 23	UGRD_10maboveground, VGRD_10maboveground

SameDayUwind850mb (East-west component of wind at 850 mb)	m/s	mean	0 to 23	GRD_850mb

The Spearman rho (a non-parametric measure of correlation) was calculated between PM2.5 at Compton and each of the variables in Table V-1. The Spearman rho is the Pearson correlation coefficient computed using the ranks of the data instead of the numerical values. The Spearman rho reflects the strength of monotonic relationships, including linear and non-linear relationships (Wilks, 2011). The variables were ranked by the absolute value of the Spearman rho. The ten most-correlated weather variables from Table V-1 are shown in Table V-2. Figure V-7 show scatter density plots of each of these variables with PM2.5.

**TABLE V-2**

Ten weather variables most strongly correlated with PM2.5 (sample size of 741 observations).  
See Table V-1 for more detailed descriptions of the variables.

Weather Variable	Abs(Spearman rho)	Spearman rho	Spearman P value	r <sup>2</sup>	slope	intercept
SameDayVent	0.63	-0.63	0.00	0.17	-74.17	2269.62

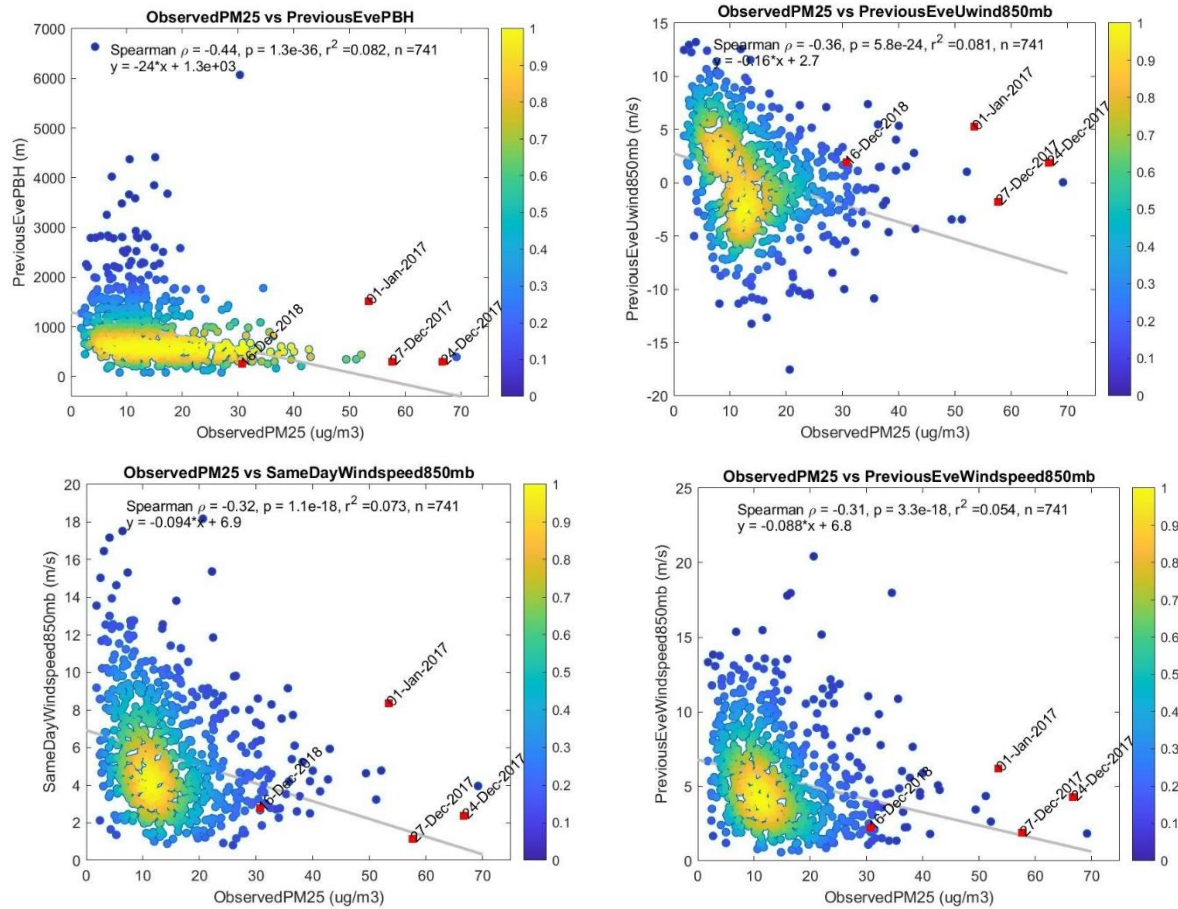

FIGURE V-7

Density Scatter Plots of PM2.5 and the Weather Variables in Table V-2. The color bars indicate the relative density of data points next to each other, as data can be plotted on top of each other in scatter plots.

A weighted score representing the favorability for high PM2.5 ( $Favorability_{date\ i, weather\ variable\ j}$ ) was created for each variable for each day during October-March from 2009 through March of 2020. A total of 741 days were included in this analysis, since scores were not able to be calculated for 42 days that had missing NAM data. For variables with a positive Spearman rho ( $\rho_{weather\ variable\ j}$ ), we multiplied the percentile of the weather variable within its distribution for all days (excluding the three dates of interest and December 16<sup>th</sup>, 2018) by the Spearman rho. For variables with a negative Spearman rho, the score of favorability for high PM2.5 was created by multiplying 100 minus the percentile by the absolute value of the Spearman rho.

For  $\rho_{weather\ variable\ j} \geq 0$ :

$$Favorability_{date\ i, weather\ variable\ j} = \rho_{weather\ variable\ j} * percentile_{date\ i, weather\ variable\ j}$$

For  $\rho_{weather\ variable\ j} < 0$ :

$$Favorability_{date\ i, weather\ variable\ j}$$

$$= abs(\rho_{weather\ variable\ j}) * (100 - percentile_{date\ i, weather\ variable\ j})$$

The variables with negative Spearman rho were calculated with this method so that a larger score of favorability consistently indicates that PM2.5 is more likely to be higher, regardless of the sign of the correlation. An overall favorability score variable 'wxInfluence' for a given day was calculated by adding up the favorability score for each variable in Table V-2 for that day. The hypothetical upper bound of the wxInfluence value on any given day is 1000 and would only happen if all variables in Table V-2 had Spearman rho's with an absolute value of 1 and each weather variable in Table V-2 was at its extreme percentile that favored PM2.5 accumulation.

$wxInfluence_{date\ i} = \sum_{weather\ variable\ j=1}^{10} Favorability_{date\ i, weather\ variable\ j}$  December 27, 2017, December 16, 2018, and December 24, 2017 have percentile values of 99.81, 97.91, and 94.98, respectively, indicating that meteorological conditions on these days were unusually favorable for the accumulation of high concentrations of PM2.5. In other words, the weather influence score was higher on December 27, 2017 than 99.81% of days between 2009 and 2020. Figure V-5 shows the density scatter plot of wxInfluence versus PM2.5 concentration (including only the days that have PM2.5 observations). Note that the weather influence score was calculated for days even without PM2.5 observations. The Spearman rho correlation of wxInfluence and PM2.5 is 0.69 and is statistically significant.

**FIGURE V -5**

Density Scatter Plot of Observed PM2.5 and Wxinfluence Score. The red squares indicate the values for the dates of interest. The dates of interest and all dates with PM2.5 concentrations above 45  $\mu\text{g}/\text{m}^3$  are individually labeled. The color bar indicates the relative density of data points next to each other, as data can be plotted on top of each other in scatter plots.

Figure V-6 shows the distribution of the wxInfluence variable with the four dates of interest overlaid on the distribution. This figure indicates that the high PM on December 27, 2017 was likely driven by meteorology, but the high PM on Jan. 1 was not likely to be driven by meteorology. High concentrations recorded on December 24<sup>th</sup> were likely partially driven by meteorology, as indicated by its weather influence score being in the top 5%. However, the contribution from local emissions on December 24<sup>th</sup> was also significant, as it was the second highest PM2.5 value ever recorded at Compton.

**FIGURE V -6**

Distribution of Wxinfluence Score with Dates of Interest Overlaid.

***A model developed to predict PM2.5 at Compton suggests that remarkably high PM2.5 concentrations in Compton on Jan 1st, Dec. 24th, and Dec 27th, 2017 were caused by unusual or atypical sources***

Machine learning techniques were used to create a backcasting model for PM2.5 at Compton using the record of Compton PM2.5 observations during 2009-2020 as training data, with meteorological and calendar parameters along with traffic flow data as predictor variables. The model was restricted to the months of October through March. The influence of meteorology on PM2.5 concentrations is represented in the model by meteorological forecast data from the North American Mesoscale (NAM) model (National Centers for Environmental Information, 2020). The influence of human behavior on PM2.5 concentrations is represented in the model by calendar-based patterns such as day of week and proximity to holidays. We used the Matlab Regression

Learner® software to train the machine learning model. This software allows many predictor variables to be included and removed to allow the user to find combinations of predictor variables that improve the model performance and provides a comprehensive set of machine learning model techniques.

A list of all dates from January 1, 2009 through March 31, 2020 occurring during the months of October through March define the period of interest for this model (2095 dates). The three dates of interest in 2017 and December 16<sup>th</sup>, 2018 were removed, leaving 2091 dates. Of the remaining dates, 20% (418 dates) were randomly selected as the validation set, i.e., held out. All remaining dates (1673 dates) were designated as potential training dates. Dates with either missing NAM or PM2.5 data or indications of wildfire smoke (via the Hazard Mapping System and South Coast AQMD wildfire smoke advisory records) were removed, leaving a training data set of 584 dates. The Spearman rho correlation was calculated between observed PM2.5 in the training data and each of the variables in Table V-1. Of the 27 weather variables considered for training the machine learning model, 21 had a statistically significant Spearman rho correlation coefficients. For each of these 21 variables, an additional ‘Favorability’ variable was calculated for each day, which was the absolute value of the Spearman rho multiplied by the percentile of the weather variable value within the distribution of the training data. For variables with a negative Spearman rho, 100 minus the percentile was used instead of the percentile so that larger values always indicate conditions that are more favorable for higher PM2.5 concentrations. Several calendar parameters were used as predictor variables, such as year, month name (categorical variable), holidays, etc. CalTrans Performance measurement system (PeMS) traffic data for a monitor on the I-710 freeway near the Compton site for November 15, 2019 through February 14, 2020 were used to calculate day-of-week average truck flow and non-truck vehicle flow values. Vehicle flow values for each day of week during non-holiday periods, on holidays, and near holidays were calculated separately. These vehicle flow averages were then assigned by day of week and near-holiday status for the full time period of the training data.

Several machine learning algorithms were initially tested, and the Exponential Gaussian Process Regression algorithm consistently performed best for both the Compton PM2.5 model and the levoglucosan model (detailed below). An Exponential Gaussian Process Regression model was tested using several combinations of predictor variables. The final model includes the variables listed in Table V-3.

The model was used to predict PM2.5 for the 418 held-out dates as well as the three 2017 dates of interest and December 16, 2018, the day with the extremely high levoglucosan concentration. A scatter plot of observations versus predictions is given in Figure V-8. For the held-out dates (excluding the dates of interest), the RMSE is 4.76 with an  $r^2$  of 0.70. These held-out dates were not used to train the model so they are an independent dataset for validation purposes. Figure V-9 is a plot of the residuals as a function of measured PM2.5 concentration. Figure V-9 indicates that

the residual generally increases with concentration and the residuals for the 2017 dates of interest are larger than any of the held-out data. The model performed well in predicting the PM<sub>2.5</sub> concentration on December 16, 2018—the day with extremely high levoglucosan concentration; the residual for this date was relatively small, while the residuals are quite large for the three 2017 dates of interest. All of the December dates of interest had similar weather in terms of favorability for high PM<sub>2.5</sub> accumulation. This suggests that even if we take meteorology and calendar parameters into account, the model still underpredicts these high values, which suggests that unusual or unaccounted emission sources are influencing concentrations on exceedance days.

In conclusion, the machine learning model predicts PM levels that are in reasonable agreement with measurements (Figure V-8), however, it failed to reproduce the three high PM days in question. This indicates that typical meteorology and seasonality represented by day of a year did not drive the exceptionally high concentrations recorded in Compton, and it is likely that local episodic emissions contributed to the high PM levels in Compton on the three highest days in 2017.

**TABLE V-3**  
Final variables included in model

Variable	Description
SameDay10mWindspeed	Average windspeed at a height of 10 m on the date of the observation.
PreviousEveWindspeed850mb	Average windspeed at 850 mb the evening before the date of the observation.
SameDayWindspeed850mb	Average windspeed at 850 mb on the date of the observation.
PreviousEveMinTemp	Minimum temperature the evening before the date of the observation.
PreviousEveVwind	Average north/south component of the wind the evening before the date of the observation.
SameDayVwind	Average north/south component of the wind on the date of the observation.
SameDayRH	Average relative humidity on the date of the observation.
SameDayDSWRF	Average downwelling shortwave radiation flux on the date of the observation.
PreviousEveUwind850mb	Average east/west component of the wind at 850 mb the evening before the date of the observation.
PreviousEve10mWindspeedFavorability	Average ‘favorability’ of windspeed at a height of 10 m the evening before the date of the observation.

	See text for explanation of ‘favorability’ calculation.
SameDayWindspeed850mbFavorability	Average ‘favorability’ of windspeed at 850 mb on the date of the observation.
SameDayPrecipFavorability	Average ‘favorability’ of precipitation on the date of the observation.
SameDayVentFavorability	Average ‘favorability’ of ventilation on the date of the observation.
ThreeDayVentFavorability	Average ‘favorability’ of ventilation on the date of the observation and the two prior days.
PreviousEvePBHFavorability	Average ‘favorability’ of planetary boundary height the evening before the observation.
SameDayPBHFavorability	Average ‘favorability’ of planetary boundary height on the date of the observation.
SameDayVwindFavorability	Average ‘favorability’ of north/south component of wind at a height of 10 m on the date of the observation.
Year	Year
Weekend	1 on Saturday and Sundays; 0 otherwise.
HolidayTypeCode	0 on non-holidays, 2 on Thanksgiving, December 25, and January first. 1 on all other holidays.
ProximityToMajorHoliday	0 on holidays, -4 if 4 or more days before or after major holidays. -1 if the day before or after a major holiday, and so on.
Eve	Binary variable = 1 for December 24 and December 31, 0 otherwise.
TruckFlow	Truck Flow from PEMS data for a monitor near Compton Site. Averages calculated by day-of-week and near-holiday status.
NonTruckFlow	Non-Truck Vehicle Flow from PEMS data for a monitor near Compton Site. Averages calculated by day-of-week and near-holiday status.

**FIGURE V -7**

Comparison of Observations and Model Predictions for PM<sub>2.5</sub> at Compton. The dates of interest were not used to determine the fit and statistical values in the figure.

**FIGURE V -8**

Residuals of Model Predictions as A Function of Observations of PM<sub>2.5</sub> at Compton.

***Fireworks contributed to the high PM<sub>2.5</sub> concentration on Jan 1<sup>st</sup>, 2017***

To show the potential impact of fireworks on high PM<sub>2.5</sub> in Compton on Jan 1<sup>st</sup>, 2017, we analyzed PM<sub>2.5</sub> FRM filter samples using X-Ray Fluorescence (XRF) for concentrations of 50 inorganic and metal species. All species analyzed by the XRF are listed in Table V-5. We analyzed PM<sub>2.5</sub> FRM filters collected during July 4<sup>th</sup> and 5<sup>th</sup>, 2017 and 2018, and the PM<sub>2.5</sub> FRM filter collected at Compton on Jan 1<sup>st</sup>, 2017. A complete list of sampling dates and stations of all FRM filters analyzed with XRF can be found in Table V-4.

**TABLE V-4**

List of sampling dates and stations of all FRM filters analyzed with XRF.

Metals are a major chemical component of firework smoke. For example, potassium nitrate, a major component in fireworks, is mixed with sulfur and charcoal to create an explosion. Also, metals such as copper, barium, strontium, titanium, and aluminum are often added to fireworks to produce distinct colors upon detonation. In the South Coast Air Basin, the highest PM<sub>2.5</sub> concentrations in the summer months have always been recorded on July 4<sup>th</sup> and 5<sup>th</sup> because of Independence Day fireworks celebrations. There are also some fireworks events on New Year's Eve and widespread use of consumer-grade fireworks. However, fireworks activities on New Year's Eve are usually less intensive than the fireworks activities on Independence Day.

To quantify the contribution of fireworks on PM2.5 in Compton on Jan. 1<sup>st</sup>, 2017, We define the following ratio “R” as:

$$R = \frac{\Delta XRF}{\Delta PM25}$$

Where  $\Delta XRF$  is the increased metallic PM2.5 concentrations on fireworks days measured by the XRF.  $\Delta PM25$  is the PM2.5 caused specifically by fireworks emissions. This value is not unity because fireworks also emit non-metallic PM2.5 species. We rely on the following assumptions for the analysis:

- 1) R was the same on July 4<sup>th</sup>-5<sup>th</sup> and New Year’s Day meaning that the enhancement in total PM2.5 mass relative to the enhancement in metallic PM2.5 is consistent.
- 2) The increased PM2.5 mass ( $\Delta PM25$ ) on July 4<sup>th</sup>-5<sup>th</sup> was solely caused by fireworks emissions. Summertime PM2.5 concentrations are typically consistent day to day as the meteorology is persistent in the South Coast Air Basin in the summer months. It is reasonable to assign any significant increases in PM2.5 during these months to changes in emission and not meteorology as the increased mass from fireworks is typically much larger than the mass on previous days.
- 3) The increased XRF mass ( $\Delta XRF$ ) on both July 4<sup>th</sup>-5<sup>th</sup> and New Year’s Day were solely caused by fireworks emissions. As in (2), summertime XRF mass is typically consistent day to day as the meteorology is persistent in the South Coast Air Basin in the summer months. It is reasonable to assign any significant increases in XRF mass during these months to changes in emission and not meteorology.

To calculate  $\Delta PM25$  on July 4<sup>th</sup>-5<sup>th</sup>, we subtracted the averaged FRM PM2.5 concentration measured in June and July from PM2.5 mass measured on July 4<sup>th</sup> and 5<sup>th</sup>. PM2.5 mass measured on July 4<sup>th</sup> and 5<sup>th</sup> were removed when calculating the June and July average.

To calculate  $\Delta XRF$  on both July 4<sup>th</sup>-5<sup>th</sup> and New Year’s Day, we estimated the XRF mass from fireworks emissions using either total PM2.5 speciation mass measured by XRF (metals + S, Cl, Si, and P), total metal concentration measured by XRF, or total concentrations of metals that are related to fireworks emissions (Na, Mg, Al, K, Ti, Cu, Sr, and Ba) measured by XRF. The long-term PM2.5 speciation data measured at the Los Angeles-North Main Street station were used to estimate the ambient background of the inorganic and metal species measured by the XRF.

Therefore, since R can be calculated using XRF and PM2.5 data on July 4<sup>th</sup>-5<sup>th</sup>, and the  $\Delta XRF$  in Compton on Jan 1<sup>st</sup>, 2017 can be calculated with the methods shown above, the  $\Delta PM25$  in Compton on Jan 1<sup>st</sup>, 2017 can then be estimated using  $\Delta XRF/R$ . Results are shown in Table V-6. Using different assumptions for calculating  $\Delta XRF$ , the PM2.5 caused by fireworks in Compton on Jan 1<sup>st</sup>, 2017 was estimated to be between 7.84 to 12.47  $\mu\text{g}/\text{m}^3$ , which is 14.7 – 23.4% of the total PM2.5 mass measured in Compton on Jan 1<sup>st</sup>, 2017.

**TABLE V-6**

Estimation of the concentration of the PM<sub>2.5</sub> caused by fireworks in Compton on Jan 1<sup>st</sup>, 2017.

	higher estimate of PM <sub>2.5</sub> caused by fireworks, µg/m <sup>3</sup>	lower estimate of PM <sub>2.5</sub> caused by fireworks, µg/m <sup>3</sup>
Using increased total XRF mass	12.47	8.38
Using increased total metal mass	10.3	7.84
Using increased fireworks metal mass	11.14	8.42

While this increased mass from fireworks on Jan 1<sup>st</sup>, 2017 was not large enough to give an exceptional event demonstration regulatory significance, this analysis shows that fireworks did play an important role in driving the atypically high concentrations on that day.

***Residential wood burning likely contributed to high PM<sub>2.5</sub> concentrations on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017***

Carbon Monoxide (CO) concentrations measured at Compton and other air quality monitoring stations in the South Coast AQMD's jurisdiction indicate that residential wood burning contributed to high PM<sub>2.5</sub> concentrations on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017. CO is a criteria pollutant that is measured continuously across the region and is a commonly used tracer for incomplete combustions. Gasoline vehicles are a major contributor to CO in urban environments, but residential wood burning activities also emit a large amount of CO, especially in the fall and winter months.

CO concentrations measured at Compton on Jan 1<sup>st</sup> and Dec 24<sup>th</sup>, 2017 are significantly higher than other stations in the South Coast Air Basin. CO concentrations measured at all stations in the South Coast Air Basin from Dec 27<sup>th</sup>, 2016 – Jan 4<sup>th</sup>, 2017 and Dec 21<sup>st</sup>, 2017 – Jan 2<sup>nd</sup>, 2018 are shown in Figure V-10. CO concentrations measured at Compton are shown in blue, while CO concentrations measured at other stations are shown in gray. As shown in the figure, CO concentrations usually show two peaks around morning and afternoon rush-hour, which are driven by vehicle traffic. However, on Jan 1<sup>st</sup> and Dec 24<sup>th</sup>, 2017, the highest CO concentration appeared at midnight on the following day. Since traffic are typically low during the overnight hours, these profiles suggest that residential wood burning was the dominant source of CO. Additionally, the peak CO concentration at Compton was roughly twice as high as the peak CO concentration measured at the second highest station on Jan 1<sup>st</sup> and Dec 24<sup>th</sup>, 2017, which suggests that there was more residential wood burning activity in or upwind of Compton than other regions of the South Coast Air Basin. On Dec 27<sup>th</sup>, 2017, the CO concentrations measured at Compton were also the highest in the region, but were not significantly higher than the other stations.

**FIGURE V-9**

CO Concentrations Measured at All Stations in the South Coast AQMD's Jurisdiction in (A) Dec 27<sup>th</sup>, 2016 – Jan 4<sup>th</sup>, 2017, and (B) Dec 21<sup>st</sup>, 2017 – Jan 2<sup>nd</sup>, 2018.

To further demonstrate that the CO concentrations measured on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017 in Compton are abnormally high, we compared the CO diurnal profile measured on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017 in Compton with the CO diurnal profile measured on all days between 2016 and 2019 (See Figure V-11). CO concentrations measured in each hour of all days in 2016-2019 are presented using a box-whisker plot. On Dec 24<sup>th</sup> and 27<sup>th</sup>, 2017, CO concentrations measured at almost all hours are in the range of the outliers, which are higher than the 99.65<sup>th</sup> percentile of all CO concentrations measured in each hour. On Jan 1<sup>st</sup>, 2017, with the exception of 9:00 am – 6:00 pm and 11:00 pm measurements, CO concentrations measured at all nighttime hours are either in the outlier range or higher than the 75<sup>th</sup> percentile of all CO concentrations measured in each hour.

**FIGURE V -10**

Diurnal Profile of CO Concentrations Measured at Compton in 2016-2019. CO concentrations measured are presented using the box-whisker plot. The red line in the middle of the box represents the median value. The ends of the box represent the first and third quartiles. The length of the whiskers covers 99.3% assuming the data are normally distributed. Outliers are presented with red crosses. Note that the ordinate uses a logarithmic scale.

In Figure V-12, we presented the distribution of the daily average CO and the nighttime (midnight to 6:00 am and 6:00 pm to midnight) average CO measured in Compton in 2016-2019. Daily average measurements on Dec 24<sup>th</sup> and Dec 27<sup>th</sup>, 2017 are higher than the 98<sup>th</sup> percentile of all daily average CO measured in the 2016-2019 period while daily average CO measured on Jan 1<sup>st</sup>, 2017 is higher than the 90<sup>th</sup> percentile. For the nighttime average CO, measurements on Dec 24<sup>th</sup> and Dec 27<sup>th</sup>, 2017 are higher than the 98<sup>th</sup> percentile of all nighttime average CO measured in 2016-2019. The nighttime average CO measured on Jan 1<sup>st</sup>, 2017 was below but very close to the 98<sup>th</sup> percentile. The fact that CO concentrations were abnormally high on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017 in Compton suggests that elevated residential wood burning activity contributed to the high PM<sub>2.5</sub> concentrations measured on these days.

**FIGURE V -11**

***PM<sub>2.5</sub> precursors, NO<sub>x</sub> and VOCs, have decreased over the past decade in Compton***

Concentrations of PM<sub>2.5</sub> precursors, NO<sub>x</sub> and VOCs, have both decreased over the past decade. Daily average NO<sub>x</sub> concentrations measured at the Compton station from Feb. 2009 to Aug. 2020 are presented in Figure V-10. The blue line is the linear trendline of all data, which illustrates a long-term declining trend. The annual NO<sub>x</sub> concentration in Compton decreased at an average rate of 1.39 ppb/year between 2009 and 2019. This trend in NO<sub>x</sub> concentrations suggest that NO<sub>x</sub> emission in Compton and its nearby areas have declined at a similar rate.

**Figure V -12**

Daily Average NO<sub>x</sub> Concentrations Measured in Compton

To show the long-term trend of the VOC concentration in Compton, we present the total speciated VOC concentrations measured in Compton during several periodic Multiple Air Toxics Exposure Studies (MATES) conducted by South Coast AQMD (Figure V-11). MATES are a series of year-long monitoring, modeling, and evaluation studies conducted in the South Coast Air Basin. The

main purpose of MATES is to characterize the risk from exposure to air toxics across the South Coast Air Basin. Air toxics monitoring conducted for the three most recent MATES iterations, MATES III, MATES IV, and MATES V, occurred between Apr. 2004 – Mar. 2006, Jul. 2012 – Jun. 2013, May 2018 – Apr. 2019, respectively. Note that MATES V data is still preliminary. VOC samples were collected every 3 days during MATES III, and every 6 days during MATES IV and MATES V. Only VOC species that are measured in all three recent MATES are included to calculate the trends in total speciated VOC in Figure V-11. These VOC species are listed in Table V-7. The mean concentration of each VOC species was calculated using the Kaplan Meier Mean (KM mean) with Efron's bias correction to account for data below the method detection limit (MDL) (Helsel, 2012; Singh, Maichle, & Lee, 2006; Klein & Moeschberger, 2003). KM means of all speciated VOC concentrations are added together to calculate the total speciated VOC concentrations in Figure V-11. As shown in the figure, VOC concentrations measured in Compton have decreased from 2004 to 2019, indicating that the VOC emission in Compton have likely decreased over the same time period.

**FIGURE V -13**

Total Speciated Volatile Organic Compounds (VOCs) Concentrations Measured in Compton During the Multiple Air Toxics Exposure Studies (Mates). Mates V Data is Preliminary.

**TABLE V-7**

Key VOC species measured in MATES III, MATES IV, and MATES V.

VOC Species	CAS Number	MATES III number of valid samples	MATES IV number of valid samples	MATES V number of valid samples
1,3 Butadiene	106-99-0	69	48	51
Methylene Chloride	75-09-2	225	57	60
Methyl Ethyl Ketone	78-93-3	157	57	43
Benzene	71-43-2	237	57	61
Carbon Tetrachloride	56-23-5	235	51	61
Toluene	108-88-3	237	57	61
Ethyl Benzene	100-41-4	221	48	58
Xylene (m-, p-)	1330-20-7	237	56	57
Styrene	100-42-5	110	16	36
Xylene (o-)	95-47-6	129	36	58

***PM<sub>2.5</sub> design value is unlikely to exceed the PM<sub>2.5</sub> 24-hour federal standards in 2020-2023***

To determine the likelihood of future PM<sub>2.5</sub> design value exceedances in Compton during 2020 – 2023, we developed a statistical Monte Carlo technique to estimate future concentrations based on past measurements. We first start with the conservative assumption that PM<sub>2.5</sub> precursor emissions and meteorology in future years will remain at 2009-2019 levels. We estimated the PM<sub>2.5</sub> concentration on a given future day during 2020-2023 by randomly sampling one daily averaged PM<sub>2.5</sub> concentration from PM<sub>2.5</sub> concentrations measured on days near the same day of the year in the 2009-2019 period. This analysis assumes that emissions of PM<sub>2.5</sub>, including primary emissions and the emission of secondary PM precursors along with the resulting chemistry, are constant from 2009 to future years. This is a conservative assumption given that concentrations of PM<sub>2.5</sub> precursors, NO<sub>x</sub> and VOCs, have decreased over the past decade (Figure V-10 and Figure V-11). Therefore, the actual PM<sub>2.5</sub> design values in the future years are likely to be lower than the estimated design values with the assumption of constant emissions. This analysis also assumes that the meteorological conditions near the same day of the year in different years are similar.

Specifically, to estimate the PM<sub>2.5</sub> concentrations measured in each future day during July 2020 – Dec. 2023, we set the sampling time window,  $N_{\text{days}}$ , as 7 days. The PM<sub>2.5</sub> concentration in each

future day is estimated as a random sample of all PM<sub>2.5</sub> concentrations measured before and after  $N_{\text{days}} = 7$  days of the same day of the year in 2009-2019. The PM<sub>2.5</sub> concentration range for the random sampling of days during 2020 – 2023 is shown in Figure V-12. Since FRM PM<sub>2.5</sub> data are available from Jan – Jun. 2020, the FRM PM<sub>2.5</sub> measurements were directly used to estimate the design value. For July 2020 – Dec. 2023, the sampling range of PM<sub>2.5</sub> in summer months is much smaller than in winter months, and the higher ends of the PM<sub>2.5</sub> range in winter months are about 30-50  $\mu\text{g}/\text{m}^3$  higher than the higher ends of the PM<sub>2.5</sub> range in summer months. After the estimation of the PM<sub>2.5</sub> concentration in each future day, the annual 98<sup>th</sup> percentile daily PM<sub>2.5</sub> concentrations in 2020-2023 were calculated as the 8<sup>th</sup> highest value of each year. The annual 98<sup>th</sup> percentile daily PM<sub>2.5</sub> concentrations in 2018 and 2019 were calculated using the available FRM PM<sub>2.5</sub> data. Then the PM<sub>2.5</sub> design values for 2020, 2021, 2022, and 2023 were estimated using the three-year average of the annual 98<sup>th</sup> percentile daily PM<sub>2.5</sub> concentrations. The whole process was iterated 10,000 times to get a distribution of estimated design values for each year between 2020 and 2023. For each year, the final design value was estimated as the average of the design value estimations from all iterations, and the uncertainty was estimated as the standard deviation of design value estimations from all iterations. The probability that the design value will exceed the 24-hour PM<sub>2.5</sub> federal standard ( $P_{\text{ex}}$ ) was estimated as:

$$P_{\text{ex}} = \frac{N_{\text{DV}>\text{S}}}{N_{\text{iteration}}}$$

Where  $N_{\text{DV}>\text{S}}$  is the number of iterations that yield a design value estimation exceeding the PM<sub>2.5</sub> 24-hour federal standard, and  $N_{\text{iteration}}$  is the total number of iterations.

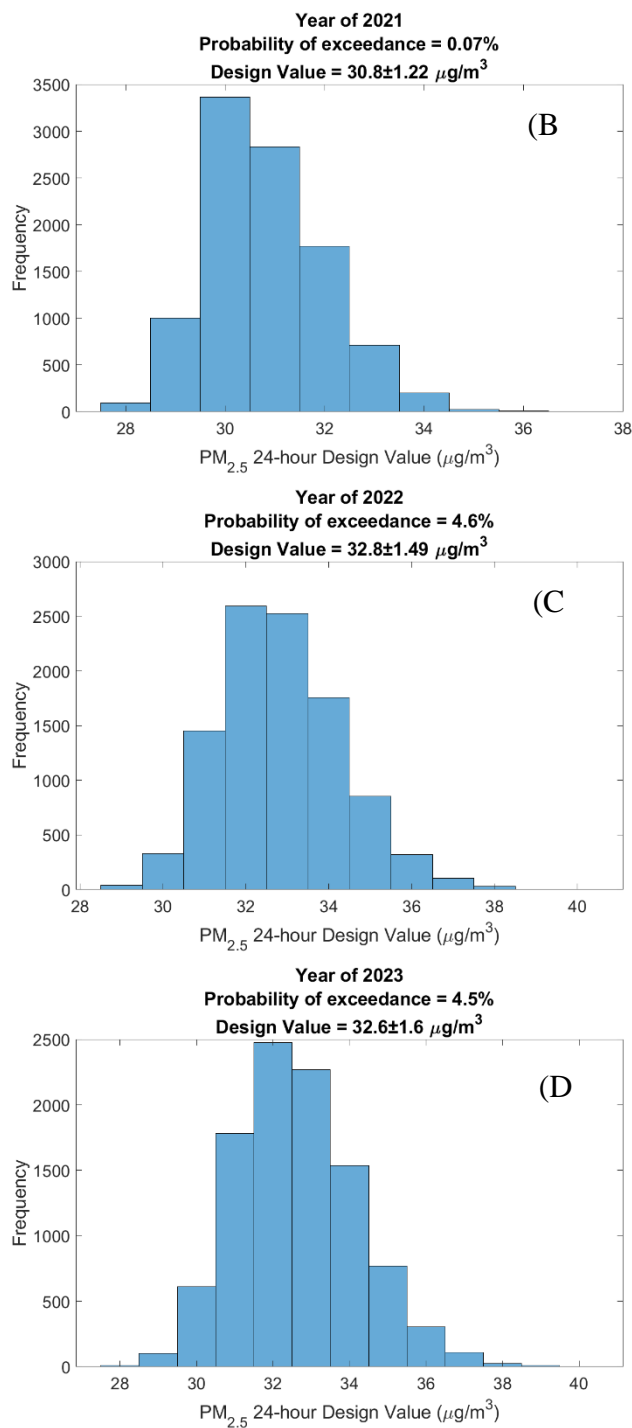

Distributions of estimated design values for each year between 2020 and 2023 are shown in Figure V-13. The estimated design values for the year 2020, 2021, 2022, and 2023 are  $31.4 \pm 0.8 \mu\text{g}/\text{m}^3$ ,  $30.8 \pm 1.2 \mu\text{g}/\text{m}^3$ ,  $32.8 \pm 1.5 \mu\text{g}/\text{m}^3$ , and  $32.6 \pm 1.6$  respectively. All of these design values are below the PM<sub>2.5</sub> 24-hour federal standards. The probabilities that the PM<sub>2.5</sub> design value for the year 2020, 2021, and 2022 will exceed the 24-hour federal standard are 0, 0.07%, 4.6%, and 4.5%, respectively. This suggests that it is very unlikely that the design value for the year 2020, 2021, 2022, and 2023 will exceed the 24-hour standard even with the conservative assumption that PM<sub>2.5</sub> emissions and emission precursors will remain constant.

The selection of the sampling time window,  $N_{\text{days}}$ , and the iteration times,  $N_{\text{iteration}}$ , may potentially impact the distribution of the estimated design values. To test the sensitivity of the estimated design value on the selection of  $N_{\text{days}}$  and  $N_{\text{iteration}}$ , we varied the  $N_{\text{days}}$  from 3 to 15 days and varied  $N_{\text{iteration}}$  from 1000 times to 20000 times to calculate the  $P_{\text{ex}}$  and design values. Results are shown in Table V-8 through Table V-11. As shown in tables,  $P_{\text{ex}}$  and design values remain almost the same as  $N_{\text{days}}$  and  $N_{\text{iteration}}$  vary. Therefore, the estimated design value in 2020-2023 are not sensitive to the selection of  $N_{\text{days}}$  and  $N_{\text{iteration}}$ .

Distribution of The Estimated Design Values in the Year of (A) 2020, (B) 2021, (C) 2022, and (D) 2023.

**TABLE V-8**

The probability of PM<sub>2.5</sub> design values exceeding the PM<sub>2.5</sub> federal 24-hour standard estimated using several iteration numbers,  $N_{\text{iteration}}$ . Sample time window,  $N_{\text{day}}$ , was held at 7 days.

Probability (%) that the design value will exceed the 24-hour standard:					
Year	1000 iterations	2000 iterations	6000 iterations	10000 iterations	20000 iterations
2020	0.00	0.00	0.00	0.00	0.00
2021	0.00	0.00	0.07	0.07	0.07
2022	5.10	4.50	4.50	4.60	4.50
2023	4.70	4.70	4.50	4.50	4.60

**TABLE V-9**

The probability of PM<sub>2.5</sub> design values exceeding the PM<sub>2.5</sub> federal 24-hour standard estimated using different sample time windows,  $N_{\text{day}}$ . Number of iterations,  $N_{\text{iteration}}$ , was held at 10000 iterations.

Probability (%) that the design value will exceed the 24-hour standard:				
Year	3 days	7 days	10 days	15 days
2020	0.00	0.00	0.00	0.00
2021	0.03	0.07	0.08	0.05
2022	4.20	4.60	3.90	4.30
2023	4.40	4.50	4.30	4.60

**TABLE V-10**

PM2.5 design values estimated using several iteration numbers,  $N_{\text{iteration}}$ . Sample time window,  $N_{\text{day}}$ , was held at 7 days.

Design value ( $\mu\text{g}/\text{m}^3$ ) mean $\pm$ standard deviation:					
Year	1000 iterations	2000 iterations	6000 iterations	10000 iterations	20000 iterations
2020	$31.5 \pm 0.8$	$31.5 \pm 0.8$	$31.5 \pm 0.8$	$31.4 \pm 0.8$	$31.5 \pm 0.8$
2021	$30.8 \pm 1.2$	$30.8 \pm 1.2$	$30.8 \pm 1.2$	$30.8 \pm 1.2$	$30.8 \pm 1.2$
2022	$32.9 \pm 1.5$	$32.9 \pm 1.5$	$32.9 \pm 1.5$	$32.8 \pm 1.5$	$32.8 \pm 1.5$
2023	$32.6 \pm 1.6$	$32.6 \pm 1.6$	$32.6 \pm 1.6$	$32.6 \pm 1.6$	$32.6 \pm 1.6$

**TABLE V-11**

PM2.5 design values estimated using different sample time window,  $N_{\text{day}}$ . Number of iterations,  $N_{\text{iteration}}$ , was held at 10000 iterations.

Design value ( $\mu\text{g}/\text{m}^3$ ) mean $\pm$ standard deviation:				
Year	3 days	7 days	10 days	15 days
2020	$31.5 \pm 0.8$	$31.4 \pm 0.8$	$31.4 \pm 0.8$	$31.4 \pm 0.8$
2021	$30.8 \pm 1.2$	$30.8 \pm 1.2$	$30.8 \pm 1.2$	$30.8 \pm 1.2$
2022	$32.8 \pm 1.5$	$32.8 \pm 1.5$	$32.8 \pm 1.5$	$32.8 \pm 1.5$
2023	$32.6 \pm 1.6$	$32.6 \pm 1.6$	$32.6 \pm 1.6$	$32.6 \pm 1.6$

***High PM<sub>2.5</sub> concentrations measured during wintertime in Compton are heavily influenced by residential wood burning***

The weekly pattern of the PM<sub>2.5</sub> measured in Compton during the winter months (Nov. – Feb.) in 2009-2019 is shown in Figure V-14. Average PM<sub>2.5</sub> concentrations measured on weekends are about 8-18% higher than the PM<sub>2.5</sub> concentrations measured on weekdays. This is despite the fact that traffic and industrial emissions are typically higher during the week. Since residential wood burning activities are more intensive on weekends and holidays, the higher PM<sub>2.5</sub> concentrations on weekends in winter months are likely caused by residential wood burning.

**FIGURE V -16**

Weekly Pattern of PM<sub>2.5</sub> Measured in Compton in Winter Months (Nov. – Feb.). Black dots and line are average daily values. The blue shaded area represents the range of average values plus/minus standard deviations.

To better quantify the impact of residential wood burning on PM<sub>2.5</sub> in Compton, we created a forecasting tool specifically tailored to residential woodburning patterns in the South Coast Air Basin. Machine learning techniques were used to create a forecasting model for residential wood smoke based on levoglucosan observations during MATES V. The levoglucosan observations are referred to as the ‘training data’ for the model. The model relies on the fact that residential wood smoke concentrations are influenced by the selected predictor variables. The influence of meteorology on wood smoke concentrations is represented in the model by meteorological forecast data from the North American Mesoscale (NAM) model (National Centers for Environmental Information, 2020). The influence of human behavior on wood smoke concentrations is represented in the model by calendar-based patterns such as day of week and holidays and meteorological variables such as evening temperature. Levoglucosan concentrations are modeled and then conversion factors are used to estimate the PM<sub>2.5</sub> concentrations due to wood smoke. This forecast tool can be used to estimate wood smoke concentrations on days without

levoglucosan measurements based on a training data set of 854 measurements during 2018-2019 at 10 stations. Note that this model assumes that the measurements in 2018 capture the behavior in adjacent years. It estimates wood smoke concentrations based on “typical” behavior as a function of meteorology and calendar parameters and therefore, cannot accurately simulate wood smoke concentrations on days outside of the measurement period where wood burning behavior was atypical for the conditions.

We calculated the fraction of PM<sub>2.5</sub> from wood smoke using the wood smoke PM<sub>2.5</sub> concentrations estimated by the levoglucosan model divided by the total PM<sub>2.5</sub> concentration measured on corresponding days (See Figure V-15). A comprehensive literature review was performed to determine a range of how much wood smoke PM<sub>2.5</sub> should be expected for a given levoglucosan concentration. The mid-range estimate of this factor is used for the analysis. Wood smoke simulations and FRM PM<sub>2.5</sub> data from 2009 to 2019 were used to create the figure. As shown in the figure, the fraction of PM<sub>2.5</sub> from wood smoke has a clear seasonal cycle, which peaks in winter months and is lowest in summer months. In winter months, from Nov. to Feb., wood smoke fractions are in general higher than 10%, while in summer months, from Apr. to Sept., wood smoke fractions are in general lower than 10%.

The correlation between simulated PM<sub>2.5</sub> concentrations from wood smoke and FRM PM<sub>2.5</sub> concentrations in Compton is shown in Figure V-16. They are weakly correlated, with a correlation coefficient  $R^2 = 0.19$ . The data presented in Figure V-16 only include winter months, Nov. – Feb., during 2009-2019.

In Figure V-17, we compared the average fraction of PM<sub>2.5</sub> from wood smoke in monitoring stations across the South Coast Air Basin in winter months (Nov.- Feb.) during 2016-2019. As shown in the figure, the average fraction of PM<sub>2.5</sub> from wood smoke in Compton in the winter months is 7%, which is the highest among all the stations presented in Figure V-17. As discussed above, the CO concentrations measured in Compton on Jan 1<sup>st</sup>, Dec 24<sup>th</sup>, and Dec 27<sup>th</sup>, 2017 were significantly higher than CO concentrations measured in other regions and in other time periods, which also suggests that there were excessive wood burning activities in Compton on these three days. As shown in Figure V -10, the CO concentrations measured at Compton are almost always the highest among all stations in the South Coast Air Basin, further supporting the hypothesis that there are more wood burning activities in and upwind of Compton than in other areas. Therefore, it is likely that atypically high concentrations recorded on Dec. 24<sup>th</sup>, Dec. 27<sup>th</sup>, and Jan. 1<sup>st</sup>, 2017 were influenced by excess wood smoke concentrations.

**FIGURE V -17**

Fraction of PM<sub>2.5</sub> from Wood Smoke in Compton in 2009-2019. Data in each month are presented using box-whisker plot. The red line in the middle of the box represents the median value. the ends of the box represent the first and third quartiles. The length of the whiskers covers 99.3% assuming the data are normally distributed. Outliers are presented with red crosses.

Note that the ordinate uses a logarithmic scale.

**FIGURE V -18**

Correlation Between Simulated PM<sub>2.5</sub> Concentrations from Wood Smoke and PM<sub>2.5</sub> Concentrations in Compton in Winter Months (Nov. – Feb.) in 2009-2019.

**FIGURE V -19**

Average Fraction of PM<sub>2.5</sub> from Wood Smoke in Monitoring Stations Across the South Coast Air Basin in Winter Months (Nov.- Feb.) During 2016-2019. Only stations with FRM PM<sub>2.5</sub> measurements are included in this figure.

### Conclusions

A weight-of-evidence approach using supplemental analyses was employed to demonstrate future attainment of the 2006 24-hr PM<sub>2.5</sub> NAAQS in Compton. Together, the supplemental analyses demonstrate attainment of the 2006 24-hour PM<sub>2.5</sub> standard in Compton by 2023. Key findings are summarized below:

- Since PM<sub>2.5</sub> FRM measurements began in 2008, all DVs were below 35 ug/m<sup>3</sup>, the 2006 24-hour PM<sub>2.5</sub> standard, until 2017. The unusually high PM<sub>2.5</sub> levels that caused the exceedance in 2017 did not recur. Ambient monitoring data from 2018 to the 1<sup>st</sup> half of 2020 indicates that it is highly likely that Compton will attain the standard by December 31, 2020.
- Three dates in 2017 (Jan. 1, Dec. 24 and 27) had remarkably high PM<sub>2.5</sub> concentrations at Compton. These dates represent 3 out of the 4 highest 24-hour PM<sub>2.5</sub> concentrations ever recorded at Compton since measurements began in Dec. 2008. Prior to 2017, the PM<sub>2.5</sub> 24-hour Design Value had consistently been below the 24-hour federal PM<sub>2.5</sub> standard, and these three measurements caused the design value to be above the 24-hour federal PM<sub>2.5</sub> standard for 2017, 2018, and 2019.

- While the high PM<sub>2.5</sub> days in 2017 were influenced by a combination of woodsmoke, fireworks and adverse meteorology, custom-built tools using statistical algorithms indicated that the observed high PM levels cannot be explained by solely by business-as-usual emissions or meteorology. Therefore, the 2017 high PM days in question were likely driven by episodic and localized emissions, which have not recurred.
- An analysis comparing the metal composition on the sample filters collected on Jan. 1, 2017 with those collected at multiple stations on Jul. 4 and 5 of 2017 and 2018 found that 14.7-23.4% of the PM<sub>2.5</sub> on Jan. 1, 2017 was likely due to fireworks.
- An analysis of meteorological conditions found that Dec. 24 and 27 had conditions that were rare and highly favorable to the accumulation of high PM<sub>2.5</sub> concentrations, while results of a PM<sub>2.5</sub> model using machine learning techniques shows that meteorological conditions and calendar parameters were not sufficient to explain the exceptionally high concentrations on those days meaning that atypical episodic emissions likely also contributed to the high PM<sub>2.5</sub> concentrations.
- A statistical Monte Carlo model of the PM<sub>2.5</sub> 24-hour design value shows that the design value is unlikely to exceed the PM<sub>2.5</sub> 24-hour federal standard during 2020-2023, assuming that NO<sub>x</sub> and VOC concentrations are constant at 2009-2019 levels. NO<sub>x</sub> and VOC concentrations are decreasing over time, making it even less likely that the design values during 2020-2023 will exceed the federal standard.

1 WEDNESDAY, OCTOBER 7, 2020

2 - oOo -

3  
4 MS. REES: All right. So good afternoon,  
5 everybody. Thank you so much for joining us this  
6 afternoon. Again, as you can see, we're having some  
7 technology issues. We think it is a Zoom problem, but  
8 we're going to try to see if we can go ahead with this.  
9 If you get dropped out of the meeting, you should get  
10 reconnected by Zoom, and if this becomes too  
11 problematic, we'll figure out a Plan B, but for now we  
12 want to proceed.

13 So first, maybe I'll start with some  
14 introductions. My name is Sarah Rees. I'm an Assistant  
15 Deputy Executive Officer at the District in Planning.  
16 I'm also joined by Zorik Pirveysian, who is our Planning  
17 and Rules Manager, Dr. Kalam Cheung, who is a Program  
18 Supervisor, Dr. Sang-Mi Lee, who is also a Program  
19 Supervisor. We have Dr. Scott Epstein also Program  
20 Supervisor, and we have our legal counsel Catherine  
21 Roberts and also legal counsel Barbara Baird.

22 So with that, maybe I will read off some  
23 housekeeping remarks prior to us getting into our  
24 presentation.

25 Our agenda today is we're going to present to

1     you information on our Plan Attainment Plan for the 2006  
2     24-hour PM2.5 Standard, so we'll proceed with that and  
3     then we'll have a period for public comments and  
4     questions at the end.

5             So pursuant to Governor Newsom's Executive  
6     Orders N-2520 and N-2920, this regional public hearing  
7     will only be conducted by videoconferencing and by  
8     telephone. We will do our best to facilitate a smooth  
9     meeting with public participation, Zoom problems  
10    notwithstanding. We ask that everybody be patient as we  
11    navigate this together. We have two formats for  
12    preservation, the Zoom web application as well as  
13    teleconference.

14            Before we begin, I want to review some  
15    guidelines and general instructions for the meeting.  
16    These are very important so I ask that you pay close  
17    attention. Please silence your phone and other  
18    communication devices. This will ensure that we are not  
19    having any feedback or causing interruption during the  
20    meeting.

21            During the meeting all participants on Zoom,  
22    except for the South Coast AQMD Staff, will be placed on  
23    mute by the host. That means you will not be able to  
24    mute or unmute your lines manually.

25            After the Staff presentation, we will ask for

1 public comments. Right now, we're going to be limiting  
2 public comment to three minutes per person, but if we  
3 have some additional time and there are other comments,  
4 we might allow that.

5 For those on Zoom, if you would like to make a  
6 public comment on the Zoom screen, please click on the  
7 "Raise Hand" button. This will signal to the host that  
8 you would like to provide public comments and you will  
9 be added to the list. If you're using Zoom on your  
10 smart phone, please tap the "Raise Hand" button at the  
11 bottom of the screen. For those calling in using the  
12 phone line only, you can dial star nine on your key pad  
13 to signal that you would like to comment. Your name  
14 will be called when it is turn to comment and the host  
15 will unmute your line automatically. Please note you  
16 can hang up and/or leave the Zoom meeting at any time.

17 I will now review some meeting conduct  
18 guidelines. Please treat others with courtesy and  
19 civility, and respect the public meeting process. Rules  
20 prohibiting the use of signs or posters remain in effect  
21 for video participation. Profanity, discriminatory  
22 comments or obscene gestures are prohibited.  
23 Disorderly, unruly or aggressive behavior that infringes  
24 upon the rights of others or disrupts the goodwill order  
25 of the meeting are also prohibited. Any violation of

1 the above rules can result in your mic being muted, your  
2 video feed being shut off or your being dropped from the  
3 phone or Zoom meeting lines.

4 So with that, let's get underway with our  
5 presentation. I'll turn it over to Zorik Pirveysian.

6 MR. PIRVEYSIAN: Good afternoon, everyone. My  
7 name is Zorik Pirveysian. I'm Planning and Rules  
8 Manager with the South Coast Area Quality Management  
9 District. If we can have the presentation, please?

10 There is a possibility that we may get  
11 disconnected, and if we do, please be patient, we will  
12 come right back, hopefully.

13 So I'll provide a presentation on the South  
14 Coast Air Basin Draft Attainment Plan for the 2006  
15 24-hour PM2.5 Standard.

16 As a way of background, PM2.5 refers to fine  
17 particles that are less than 2.5 microns. For  
18 comparison, fine beach sand is about 90 microns in  
19 diameter. Human hair is about 50 to 70 microns in  
20 diameter. PM10, which is particles that are less than  
21 10 microns, are things like dust, pollen and mold.  
22 Those are less than 10 microns. And PM2.5 particles are  
23 even smaller, less than 2.5 microns, come from sources  
24 such combustion particles, organic compounds, metals and  
25 other sources.

1           There are significant health impacts with  
2   PM2.5 emissions including cardiovascular and respiratory  
3   asthma, lung cancer and even premature death.

4           Next slide, please.

5           There are several factors that influence the  
6   PM2.5 levels in the atmosphere. PM2.5 emissions come  
7   from a variety of NOX and VOC sources, and other PM2.5  
8   sources that we'll discuss in the next slide.

9           Wildfires and fireworks also contribute to  
10  PM2.5 formation, and meteorology plays a significant  
11  role in PM2.5 levels.

12          And mixing and ventilation are critical,  
13  especially in certain days when the warm inversion  
14  layers trap the cool air near the surface causing PM2.5  
15  to rise because of lack of atmospheric mixing.

16          Sunlight is also important because the  
17  majority of PM2.5 is formed in the atmosphere through  
18  photochemical reactions in the presence of sunlight.

19          Fog and humidity are also important because of  
20  the presence of water, for example, or droplets, which  
21  also contribute to the formation of PM2.5.

22          Storms and rainfalls are generally good for  
23  PM2.5 because of atmospheric mixing, and water droplets  
24  are extremely effective in clearing the air from fine  
25  particles.

1 I lost the presentation. Maybe Kalam or  
2 Sang-Mi, you can bring it up again.

3 Okay. It's coming up. Our apologies for  
4 that. The presentation should be coming back on.

5 DR. CHEUNG: I'm currently sharing my screen.  
6 I'm on slide 3. Are you able to see that?

7 MR. PIRVEYSIAN: No, I don't see the  
8 presentation. Does anybody else see it?

9 MS. REES: No, I don't see it.

10 MR. HENNINGER: Not yet. Kalam, maybe e-mail  
11 me the presentation, and I can try to --

12 DR. CHEUNG: Sure.

13 MR. HENNINGER: Now, we have Paul back. Paul,  
14 can you hear me? Do you have the presentation? You're  
15 muted, by the way.

16 MR. WRIGHT: I don't.

17 MR. HENNINGER: Okay.

18 MR. WRIGHT: I just heard that one sentence  
19 and I don't, but if somebody e-mails it to me --

20 MR. HENNINGER: I can send it to you.

21 MR. PIRVEYSIAN: Yeah, I just sent it to Mark  
22 and Paul.

23 MS. REES: Again, for those tuning in, we  
24 appreciate your patience as we go through --

25 MR. WRIGHT: Sarah, if you want to e-mail it

1 to me, I can do it.

2 Is this the correct slide?

3 MS. REES: I think we were on slide 3.

4 MR. HENNINGER: Am I on slide 3? I think I  
5 am. I think we may have lost Zorik.

6 It looks like we did.

7 MS. REES: Oh, boy.

8 MR. PIRVEYSIAN: I'm back.

9 MS. REES: Okay.

10 MR. PIRVEYSIAN: I think we covered this  
11 slide. Let's go to the next slide, please.

12 MR. HENNINGER: You may want to turn off your  
13 video if you don't need it to be on. That might help.

14 MR. PIRVEYSIAN: Okay. Let's continue. Our  
15 apologies.

16 So in terms of PM2.5, PM2.5 is either directly  
17 emitted, which we call primary PM2.5 sources. Examples  
18 of primary PM2.5 are exhaust from trucks, cars, buses,  
19 aircraft, ships, locomotives, as well as stationary  
20 sources such as power plants, refineries, wood smoke and  
21 meat cooking.

22 PM2.5 can also form in the atmosphere, which  
23 we call secondary PM2.5. Pollutants such as VOCs, which  
24 stands for volatile organic compounds, NOX, which stands  
25 for nitrogen oxides, ammonia that can come from

1 industrial sources and mobile sources: These all react  
2 in the atmosphere to form secondary PM2.5 which accounts  
3 for the majority of the PM2.5 in the atmosphere.

4 Next slide, please.

5 MR. HENNINGER: It looks like Zorik might be  
6 frozen.

7 MR. PIRVEYSIAN: Can you hear me?

8 MS. REES: Yes.

9 MR. HENNINGER: Yes.

10 MR. PIRVEYSIAN: Okay. So in order to protect  
11 the public health and the environment from the harmful  
12 effects of air pollutants, the U.S. EPA has established  
13 National Ambient Air Quality Standards for six criteria  
14 air pollutants, namely ozone, lead, nitrogen dioxide  
15 sulfur dioxide, carbon monoxide and two forms of PM,  
16 PM2.5 and PM10. These standards are periodically  
17 reviewed and revised based on the latest scientific  
18 information.

19 Next slide, please.

20 But there are four PM2.5 National Ambient Air  
21 Quality Standards: The 1997 annual (inaudible) PM2.5  
22 standards were actually achieved in 2013, two years  
23 ahead of the 2015 attainment deadline, which is  
24 obviously good news.

25 For the 2006 24-hour PM2.5 standards, which is

1 the subject of this presentation that we prepared a  
2 draft plan which we are presenting today, the attainment  
3 date for the standard is 2019 and South Coast Air Basin  
4 has a classification of serious non-attainment. And  
5 then the 2012 annual PM2.5 standard has an attainment  
6 date of 2025.

7 Next slide, please.

8 In order to determine whether an area meets  
9 the standard, there is a metric called design value  
10 based on EPA's guidelines that is used to be calculated  
11 and compared with the standard, so design value is a  
12 three-year average of 98 percentile of daily  
13 concentrations of PM2.5 at each monitoring site, and the  
14 98 percentile depends on the sampling frequency. So if  
15 there are everyday samplings and 98 percentile becomes  
16 the eighth highest reading, if the frequency of sampling  
17 is every third day, the 98 percentile becomes the third  
18 highest readings. So the 98 percentile of 24-hour  
19 concentrations are calculated for every year averaged  
20 over three years, and then that represents a design  
21 value which is compared with the standard to see whether  
22 we meet the standard or not.

23 Next slide, please. Are we --

24 MS. REES: There you go.

25 MR. HENNINGER: Slide 8.

1 MR. PIRVEYSIAN: Slide 8. So here are the  
2 2017 to 2019 three-year design values for all stations  
3 in the South Coast Air Basin, so these are values that  
4 are the standard to see whether we are meeting the  
5 standards in all stations, which is a requirement.

6 (Zoom disruption)

7 I'm not sure how much of our video you heard,  
8 but I'll just go over the slide one more time. So this  
9 is the three-year design values for all stations based  
10 on the 2017 to 2019 values. As you can see, all  
11 stations are below the standard except for Compton in LA  
12 County and Mira Loma in Riverside County. And because  
13 these standards are exceeding the design values for the  
14 three-year 2017 to 2019 period, the Basin did not meet  
15 the standard by the required 2019 deadline.

16 Next slide, please.

17 However, if you look at the two-year average  
18 values over the last two years in 2018 and 2019, we can  
19 see that all stations are actually going to be below the  
20 standard. Again, if you use the 98 percentile for those  
21 two years, an average value for two years, this  
22 basically indicates that we had good overall PM2.5 air  
23 quality over the last two years, and it was only those  
24 high readings -- high measurements that we had in 2017  
25 which caused the Basin not to meet the standard by the

1 required deadline.

2 Next slide, please.

3 Looking at the all-over trend in PM2.5  
4 concentrations, as you can see, we made significant  
5 process in using the PM2.5 concentrations in the last 20  
6 years and, in fact, we were close to meeting the  
7 standard in the 2012, 2013 time frame, but then we had  
8 the draught conditions and low rainfalls which caused  
9 the PM2.5 concentrations to increase, but then after  
10 that in 2017 onward, we saw a downward trend again  
11 continuing approaching the attainment. And, in fact, if  
12 you look at the 2020 design value to date, we will meet  
13 the standard in 2020.

14 Next slide, please.

15 So in terms of our attainment status, as I  
16 mentioned since 2001, the Basin's 98 percentile  
17 concentrations of PM2.5 have decreased by 51 percent,  
18 which is great progress. This is again because of the  
19 impact of existing regulations; however, because of the  
20 design value for 2017 and '19, showing two standards,  
21 two stations exceeding the standard, the Basin failed to  
22 meet the standard by the required December 31st, 2019  
23 deadline.

24 Mira Loma actually had the highest PM2.5  
25 concentration since 2008, but in the time period of 2017

1 to 2019 Compton became the highest site because of three  
2 abnormally high PM2.5 episodes that were measured on  
3 January 1st and late December of 2017. The likely  
4 causes of these high episodes are anomalous human  
5 activities, such as wood-burning or fireworks, adverse  
6 meteorology and other potential local sources. And it's  
7 important to note that these high levels were not  
8 observed before or after 2017, again highly indicating  
9 that there were some unusual and abnormal anomalous  
10 human activities that occurred in those three days.

11 Next slide, please.

12 Looking at the progress in Mira Loma -- as you  
13 can see, PM2.5 concentrations in Mira Loma have also  
14 decreased significantly, and we were close to attainment  
15 in the 2011, 2012 time frame and then there were the  
16 drought conditions, but after that we show the  
17 concentrations approaching the attainment levels.

18 And, in fact, we are very close to at  
19 attending the standard and based on the preliminary 2020  
20 design values to date, Mira Loma will attain by the end  
21 of 2020 if there are no more than four days above the  
22 standard for the rest of the year.

23 Next slide, please.

24 In terms of progress we've seen in Compton,  
25 for the most part when you look at the graph here, based

1 on the monitoring data in Compton PM2.5 levels have  
2 either been below the standard or slightly above the  
3 standard since 2009 and then we saw that spike in 2017  
4 because of those three unusually high days that we  
5 measured in 2017. And then after that, we've seen a  
6 drop in PM2.5 concentrations, below the standard in  
7 2018, and even lower in 2019. And the preliminary 2020  
8 design to date shows that we are well below the standard  
9 and will attain the standard by the end of 2020. And  
10 Compton could have up to seven days above the 45  
11 microgram per cubic meter for the rest of the year and  
12 still meet the standard.

13 Next slide, please.

14 So what are the implications of  
15 non-attainment? EPA last month issued their final  
16 determination on the Basin's failure to attain the  
17 standard in the Federal Register, which means that we  
18 are required to develop an air quality plan by the end  
19 of this year to show attainment of the standard.

20 Also because we failed to meet the standard,  
21 contingency provisions will be triggered in Rule 445,  
22 our wood-burning devices rule, which will lower the  
23 curtailment threshold from 30 to 29 micrograms per cubic  
24 meter essentially requiring additional no burn days in  
25 the South Coast Air Basin.

1                   Next slide, please.

2                   So we have prepared the Draft Attainment Plan  
3                   for the standard to show attainment of these standards,  
4                   and the plan also addresses several key requirements  
5                   that are incorporated into the plan.

6                   We need to show a five percent reduction of  
7                   PM2.5 or one of its precursors, namely NOX or VOC. We  
8                   met this requirement based on the NOX reductions that  
9                   are expected to be achieved from existing regulations.  
10                  When we say existing regulations, we're referring to the  
11                  regulations that have already been adopted and are not  
12                  fully implemented. And an example of these regulations  
13                  would be CARB's truck and bus regulations that will  
14                  achieve significant NOX and PM reductions by  
15                  January 1st, 2023. Another example is CARB's in use  
16                  off-road diesel equipment that will also result in  
17                  additional NOX and PM reductions over the next few  
18                  years.

19                  The plan also includes updated emissions  
20                  inventory and modeling analysis and shows expeditious  
21                  attainment by 2023 based on emission reductions from  
22                  existing regulations.

23                  The plan also includes an analysis of  
24                  controlled strategies, which is essentially based on  
25                  implementation of the strategies that were included in

1 the 2016 ATMP as well as (inaudible) in the plan.

2 The plan also addresses the requirement for  
3 reasonable further progress which is a requirement to  
4 show linear progress in reducing emissions as well as  
5 quantitative milestone, and these are addressed again  
6 based on reductions that we are getting from existing  
7 regulations and also recently adopted PM regulations,  
8 namely Rule 445 and CARB's heavy duty smoke inspection  
9 regulation.

10 There's also a requirement for contingency  
11 measures to make sure that measures are in place in the  
12 event that we fail to meet the standard or we don't make  
13 enough progress as far as reducing emissions. And this  
14 requirement is addressed in the contingency provisions  
15 that were recently adopted in Rule 445, wood-burning  
16 devices. That was adopted last June.

17 Next slide, please.

18 So in terms of attainment demonstration, we  
19 have a hybrid approach. For Compton, we're relying on  
20 supplemental weight of evidence and air quality trend  
21 analysis based on monitoring data because the  
22 traditional approach modeling and attainment  
23 demonstration is not appropriate for Compton. The  
24 reason for that is because the high episodes that were  
25 observed in 2017 were likely driven by anomalous human

1 activities which were not reflected in the emissions  
2 inventory. And if they're not reflected in the  
3 inventory, it's very difficult to develop an effective  
4 strategy.

5 And if you were to use the traditional control  
6 strategy for Compton, that would require unrealistic  
7 levels of emission reductions in the entire Basin and  
8 may not each be effective in Compton. But as I  
9 mentioned, Compton is very close to attaining the  
10 standard and will be likely in attainment before EPA  
11 even considers this plan.

12 Next slide, please.

13 So for Mira Loma and all other locations, we  
14 are relying on the traditional, of course, which is  
15 based on updated emissions inventory and regional air  
16 quality modeling. So based on our modeling analysis,  
17 the Basin will be in attainment of the standard by '23,  
18 2023, based on emission reductions from existing  
19 regulations.

20 And in addition to that, there's been a number  
21 of regulations that have been adopted since the last  
22 AQMD people by CARB and AQMD. These regulations will  
23 provide additional emissions reductions that will  
24 provide further assurance that we will meet the standard  
25 by 2023 or even earlier. And because of that, we do not

1 need any additional regulations or measures to meet the  
2 standard.

3 Next slide, please.

4 So in terms of our paths forward, we have  
5 developed a required plan which addresses all the  
6 requirements that need to be included in this plan. It  
7 includes an attainment strategy based on Mira Loma,  
8 which relies on emission reductions from existing  
9 regulations, and an alternative approach for Compton,  
10 which is based on weight of evidence and air quality  
11 trend analysis, and it addressed all the other  
12 requirements that are mentioned. However, the plan will  
13 be moot if all the sites meet the standard by the end of  
14 2020.

15 We are closely monitoring the PM2.5 the rest  
16 of the year. We will be working closely with CARB and  
17 EPA to exclude exception events, such as wildfires and  
18 fireworks, which can be excluded from design value  
19 calculations, and it's very possible that EPA can make a  
20 clean determination if the 2020 design values are below  
21 the standard, and because of that, the attainment plan  
22 may not be needed any more.

23 Next slide, please.

24 So in terms of our public process, we  
25 presented a proposed approach for attaining the standard

1 to the (inaudible) system in August. We also discussed  
2 this plan and the proposed approach and all the analysis  
3 that we conducted in this plan to our advisory groups,  
4 the scientific technical modeling and peer review, and  
5 the air quality management plan advisory groups in  
6 August and September. We released a draft plan on  
7 September 18. We are holding a regional public hearing  
8 today, October 7. Public comments are due October 19.  
9 We are asking comments to be provided by then so that we  
10 can properly address them and include them in our final  
11 panel. Set hearing is November 6, and we will be  
12 presenting this draft plan for our board's consideration  
13 on December 4. And CARB will also consider the plan  
14 following our board approval on December 10 or 11. And  
15 following CARB board's approval, it will be submitted to  
16 EPA for inclusion into the SEP.

17 Next slide, please.

18 So the supporting documents are available  
19 including the notice of regional public hearing, the  
20 draft plan that we released last month, a fact sheet  
21 which is a two-pager which provides a summary of the  
22 background as well as a brief summary of the plan and  
23 its conclusions, and it's available on our AQMD website.

24 Final slide.

25 Obviously today we are asking if you have any

1     comments or questions that you can present to us today,  
2     but if you have additional questions or comments or have  
3     documents, please provide the relevant information to  
4     Kalam Cheung by e-mail or by phone. We are asking all  
5     the written comments to be submitted no latter than  
6     Monday, October 19.

7             That concludes my presentation. I'll turn it  
8     back over to Sarah.

9             MS. REES: Thanks, Zorik.

10            Before we get into public comments, I just  
11     wanted to check with our attendees to make sure that  
12     they were able to hear the presentation. I got some  
13     comments from Staff who are panelists here that the  
14     audio wasn't that great, so maybe if you had problems  
15     hearing us, could you put your hand up?

16            It looks like we had some audio issues. I'm  
17     going to -- great.

18            MR. PIRVEYSIAN: We can go over the  
19     presentation quickly.

20            MS. REES: If you didn't hear or had  
21     difficulties hearing us, could you put your hand up  
22     again? We'll unmute you just because we want to  
23     understand how extensive the problem was.

24            Okay. Could you unmute Shannon?

25            Okay. Shannon, go ahead.

1                   Go ahead, Shannon.

2                   Shannon, are you able to hear us?

3                   MR. WRIGHT: You may need to unmute yourself,  
4                   Shannon.

5                   MR. HENNINGER: Shannon is unmuted. Would you  
6                   want to try someone else?

7                   MS. REES: Would another volunteer help us to  
8                   understand the audio problems?

9                   MR. HENNINGER: Alec.

10                  MS. REES: Okay. Alec, go ahead.

11                  ALEC: Can you hear me?

12                  MS. REES: Yes.

13                  MR. WRIGHT: Is this general questions, Sarah,  
14                  or public comments?

15                  MS. REES: I'm asking -- this is not public  
16                  comment. I'm just asking about the audio.

17                  MR. WRIGHT: Okay.

18                  ALEC: Yeah, I was just going to say the audio  
19                  was pretty clear other than the times when we all knew  
20                  that Zorik cut out, I understood everything.

21                  MS. REES: Okay. Great. I appreciate that.  
22                  Thank you, Alec.

23                  ALEC: Uh-huh.

24                  MS. REES: Okay. At this point let's turn to  
25                  public comments. Again, for those who are on Zoom, if

1     you want to make a public comment, please raise your  
2     hands on the "Raise Hand" button, and I will put you on  
3     the list for public comment. If you're on your smart  
4     phone, there is a "Raise Hand" button at the bottom of  
5     the screen, and then if you're calling in, you can dial  
6     star nine and that will add you to the list.

7             We are going to be limiting public comment to  
8     three minutes, although if there isn't much public  
9     comments and there is time at the end, we will consider  
10    adding some additional time if there are more comments  
11    to be made.

12            So with that, if there are any public  
13    comments, please raise your hand or dial star nine and  
14    we can begin.

15            I'm not seeing any hands raised so far, but,  
16    you know, we'll give it a couple minutes.

17            MR. PIRVEYSIAN: So if there was anything that  
18    wasn't clear and, you know, you'd like additional  
19    clarification, please feel free to ask. We can clarify  
20    it for you. Of course the presentation was so  
21    beautifully done that there are no questions, of course,  
22    but there could always be questions.

23            MS. REES: Okay. I'm still not seeing any  
24    raised hands. We'll maybe give it another minute or  
25    two, but, you know, again we encourage you that if there

1 are points of clarification or other things, you know,  
2 this is your time with us.

3 MR. WRIGHT: So Sarah, this is Mark.

4 MS. REES: Yes.

5 MR. WRIGHT: It's highly likely that the  
6 issues we were seeing with the meeting were related to  
7 AQMD Staff primarily, because there's also -- or there  
8 is an issue with the Office 365 that is going on right  
9 now. It's kind of healing itself as we speak, but there  
10 was a problem with Office 365, and I don't know if  
11 you're aware, but we use Office 365 log-ins to log into  
12 Zoom.

13 MS. REES: Got it.

14 MR. HENNINGER: So that very likely could have  
15 been the issue and that's kind of why the strange  
16 behavior.

17 MS. REES: Okay.

18 MR. HENNINGER: So participants may not have  
19 been affected at all other than not being able to hear  
20 because of Staff going in and out.

21 MS. REES: Okay. Got it.

22 Well, last call for questions or comments.

23 MR. PIRVEYSIAN: Yeah, the only thing I would  
24 add, Sarah, is if you have any questions or comments as  
25 mentioned, please contact us right away by phone or by

1 e-mail. And if you have written comments, please submit  
2 them to us by October 19th and thanks again for everyone  
3 participating.

4 MS. REES: At this point I think this  
5 concludes our public hearing. Again, thank you for  
6 bearing with us during our challenges. You know, we are  
7 living in interest times and we're all adapting to new  
8 things, so appreciate your patience and, again, if you  
9 have any comments on this, feel free to contact us.  
10 Have a good afternoon, everybody.

11 MR. PIRVEYSIAN: Thanks, everyone.

12 (At 1:39 p.m., the meeting ended)

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA  
ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: ATTAINMENT PLAN FOR 2006 24-HOUR PM<sub>2.5</sub> STANDARD  
FOR THE SOUTH COAST AIR BASIN**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

**To:** Governor's Office of Planning and Research - State  
Clearinghouse  
1400 Tenth St, Suite 222  
Sacramento, CA 95814-5502

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

**Project Title:** Attainment Plan for 2006 24-hour PM2.5 Standard for the South Coast Air Basin

**Project Location:** The project is located in the four-county South Coast Air Basin portion of the South Coast Air Quality Management District (South Coast AQMD) jurisdiction. The South Coast Air Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside and San Bernardino counties.

**Description of Nature, Purpose, and Beneficiaries of Project:** The South Coast Air Basin (Basin) is designated as a Serious nonattainment area for the 2006 24-hour PM2.5 National Ambient Air Quality Standard (standard). The United States Environmental Protection Agency issued a final determination that the Basin failed to achieve the standard (35 micrograms per cubic meter) by the December 31, 2019 attainment deadline triggering the requirement for the South Coast AQMD to revise its State Implementation Plan by December 31, 2020. To demonstrate how attainment of the standard will be achieved, South Coast AQMD has developed an attainment plan for the Basin which addresses directly-emitted PM2.5 and PM2.5 precursors (e.g., nitrogen oxides (NOx), sulfur oxides (SOx), volatile organic compounds (VOC), and ammonia) by: 1) updating the 2018 base year and 2023 future year emission inventories; 2) demonstrating a five percent annual reduction of NOx emissions based on continued implementation of existing regulations; 3) updating the air quality modeling analysis and providing supplemental weight of evidence analysis for demonstrating attainment; 4) evaluating control strategies and emission reductions needed for attainment including potential feasible measures and the impact of existing and recently adopted rules and regulations by South Coast AQMD and California Air Resources Board (CARB); 5) including contingency measures; and 6) addressing other federal Clean Air Act requirements such as a Reasonable Further Progress demonstration. The Basin is expected to attain the 2006 24-hour PM2.5 standard in 2023 based on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB.

**Public Agency Approving Project:**  
South Coast Air Quality Management District

**Agency Carrying Out Project:**  
South Coast Air Quality Management District

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

**Reasons why project is exempt:** South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Since the proposed project relies on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB to reduce emissions without proposing new requirements that would involve physical changes, it can be seen with certainty that there is no possibility that the proposed project may have a significant adverse effect on the environment. Therefore, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. The proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment by demonstrating how attainment with the 2006 24-hour PM2.5 standard in the Basin will be achieved. Further, there is no substantial evidence indicating that any of the exceptions to the categorical exemption pursuant to CEQA Guidelines Section 15300.2 apply to the proposed project.

**Date When Project Will Be Considered for Approval (subject to change):**

# **South Coast Air Basin Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard**

**Board Meeting**

December 4, 2020

# PM<sub>2.5</sub> National Ambient Air Quality Standards

## National Ambient Air Quality Standards

Standard	Level	Attainment Deadline	South Coast Attainment Status
1997 Annual PM <sub>2.5</sub>	15 µg/m <sup>3</sup>	2015	Attained in 2013
1997 24-hour PM <sub>2.5</sub>	65 µg/m <sup>3</sup>	2015	Attained in 2013
<b>2006 24-hour PM<sub>2.5</sub></b>	<b>35 µg/m<sup>3</sup></b>	<b>2019</b>	<b>Serious Nonattainment</b>
2012 Annual PM <sub>2.5</sub>	12 µg/m <sup>3</sup>	2025	Serious Nonattainment

# 2017-2019 3-year Design Values\*

■ Los Angeles County    
 ■ Orange County    
 ■ Riverside County    
 ■ San Bernardino County

\* Data likely to be approved as exceptional events by U.S. EPA removed from analysis

# Overall Progress towards Attainment

\* Likely exceptional events are removed ^ Preliminary 2020 Jan-Jun Data

# Attainment Status

---

- Based on the design value for 2017-2019, South Coast Air Basin failed to attain the 2006 24-hour PM<sub>2.5</sub> standard by December 31, 2019
  - Both the Mira Loma and Compton sites exceeded the standard
- For 2017-2019, Compton became the highest site, due to three abnormally high PM<sub>2.5</sub> episodes measured on January 1st and late December 2017
  - Likely causes are anomalous human activities such as wood burning and fireworks, adverse meteorology and other local sources
  - High levels at Compton were not observed before and after 2017

# Progress at Mira Loma

- Mira Loma, the highest site since 2008, is impacted by secondary PM formation as well as local sources
- Mira Loma is very close to attainment
- Preliminary 2020 design value (years 2018-2020) to date shows that Mira Loma will attain by the end of 2020, if there are no more than 4 days above the standard for rest of year\*

# Progress at Compton

- Monitoring data in Compton shows lower PM<sub>2.5</sub> levels prior to 2017 and a sharp increase in 2017 only
- Preliminary 2020 design value (years 2018-2020) to date is well below the standard, indicating Compton will attain the standard by the end of 2020
- Compton could have up to 7 days above 45 ug/m<sup>3</sup> for rest of year and still meet the standard\*

# Implications of Nonattainment

## EPA Notice of Failure to Attain

- Final rule published in Federal Register on September 16, 2020

## Contingency Measures

- Contingency provisions triggered in Rule 445-Wood Burning Devices
  - Curtailment threshold lowered from 30 to 29  $\mu\text{g}/\text{m}^3$

## State Implementation Plan (SIP) Revision

- Due to EPA on December 31, 2020

# PM<sub>2.5</sub> Plan Revision – Key Requirements

## 5% Reduction of PM<sub>2.5</sub> or One of Its Precursors (NO<sub>x</sub>, NH<sub>3</sub>, SO<sub>x</sub>, and VOC)

- ⑩ NO<sub>x</sub> emissions reduced by more than 5% per year from existing regulations

## Emission Inventory and Attainment Demonstration

- ⑩ Updated emissions inventory; expeditious attainment expected in 2023 based on emission reductions from existing regulations

## Control Strategy Analysis

- ⑩ Continued implementation of Serious area plan control strategy included in 2016 AQMP
- ⑩ Analysis of other feasible measures

## Reasonable Further Progress and Quantitative Milestone

- ⑩ Demonstrated based on reductions from existing regulations and recently adopted PM regulations

## Contingency Measures

- ⑩ Contingency provisions already included in Rule 445 – Wood-Burning Devices

# Attainment Demonstration

- **Compton** – Supplemental weight of evidence and air quality trend analysis based on monitoring data
  - Traditional attainment demonstration using chemical transport modeling is not appropriate for Compton
    - High PM episodes observed in 2017 were likely driven by anomalous human activities which are not reflected in the emissions inventory
    - If local emissions causing non-attainment are unknown, difficult to develop an effective control strategy
    - Traditional control strategy for Compton would require unrealistic levels of emissions reductions in the entire Basin and may not be effective
  - Compton will very likely be in attainment before U.S. EPA considers plan
- **Mira Loma and Other Stations**– Traditional Approach - Updated emissions inventory and regional air quality modeling
  - Attainment expected with baseline emissions (existing regulations) by 2023 with recently adopted regulations providing further assurances

# Path Forward

## Submit Required Plan

- Attainment strategy based on Mira Loma, with alternate approach for Compton
- Ongoing emission reductions from adopted rules and regulations
- Demonstrate annual reduction of 5% until attainment
- Plan may be moot if all sites attain by end of 2020 (probability of ~50%)

## Clean Data Determination

- Closely monitor PM<sub>2.5</sub> levels in 2020 (Dec)
- Possible exceptional events such as wildfire and fireworks to be addressed promptly working with CARB and EPA; these exceedances are excluded in design value calculations
- Potential Clean Data Determination by U.S. EPA if 2020 design values are below standard, attainment plan not needed

# Public Process

# Key Public Comments

Comments		Staff Responses
1	<b>Evaluation of all potential control measures for PM2.5 and PM2.5 precursors</b>	<ul style="list-style-type: none"><li>• Control strategy analysis includes an evaluation of emissions controls for directly emitted PM2.5 and all PM2.5 precursors (NOx, SOx, VOC, and ammonia)<ul style="list-style-type: none"><li>• Implementation of Best Available Control Measures (BACM) as approved in the 2016 AQMP and 2016 State SIP Strategy as well as an evaluation of additional feasible measures</li><li>• Covers point, area, mobile sources as well as transportation control measures</li><li>• No additional feasible measures were identified</li></ul></li></ul>
2	<b>Local control strategies to reduce emissions from wood burning</b>	<ul style="list-style-type: none"><li>• Anomalous wood burning may be the primary cause of high PM levels at Compton in 2017 but since these episodes have not occurred before or after 2017, a localized wood burning control program may not provide any benefits</li><li>• Additional control options for residential wood burning will be further evaluated under amendments to Rule 445 (Wood-Burning Devices)</li></ul>

- **Adopt the Resolution**
  - **Determining that the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin is exempt from the requirements of the California Environmental Quality Act**
  - **Approving the Attainment Plan for 2006 24-hour PM<sub>2.5</sub> Standard for the South Coast Air Basin and directing staff to forward the Attainment Plan to CARB for approval and submission to U.S. EPA for inclusion in the SIP**

BOARD MEETING DATE: December 4, 2020

AGENDA NO. 31

**PROPOSAL:** Determine That Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard Is Exempt from CEQA and Approve Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard

**SYNOPSIS:** On July 10, 2019, the Coachella Valley was reclassified from Severe-15 to Extreme nonattainment for the 1997 8-hour ozone National Ambient Air Quality Standard (standard) with an attainment date of June 15, 2024. A revision to the SIP is required to be submitted to U.S. EPA by February 14, 2021. The Coachella Valley Extreme Area Plan has been developed to demonstrate attainment of the 1997 8-hour ozone standard and to address the applicable federal Clean Air Act requirements for Extreme nonattainment areas. The Coachella Valley is expected to attain the 1997 ozone standard in 2023 based on the continued implementation of existing regulations and programs.

**COMMITTEE:** Mobile Source, September 18, 2020; Reviewed

**RECOMMENDED ACTIONS:**

Adopt the attached Resolution:

1. Determining that the Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone Standard is exempt from the requirements of the California Environmental Quality Act; and
2. Approving the Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone Standard and directing staff to forward the Coachella Valley Extreme Area Plan to CARB for approval and submission to U.S. EPA for inclusion in the SIP.

Wayne Nasti  
Executive Officer

## **Background**

The Coachella Valley was classified as a Severe-15 nonattainment area for the 1997 8-hour ozone National Ambient Air Quality Standard (standard) in 2010 with an attainment deadline of June 15, 2019. Over the last two decades, ozone levels in the Coachella Valley have steadily improved because of the implementation of regulations and programs by South Coast AQMD and CARB. The Coachella Valley is downwind of the South Coast Air Basin (Basin) and the ozone levels in the Coachella Valley are primarily impacted by direct transport of ozone and ozone precursors from the Basin. As a result, the majority of the ozone in the Coachella Valley is due to emissions from the Basin, and local sources have limited impact on these levels. In 2017 and 2018, unusually high ozone levels were experienced in the Coachella Valley which were also observed in the Basin, the State of California, and the Western United States primarily due to higher temperatures and stagnant weather conditions. As a result of the high ozone levels in 2017 and 2018, the Coachella Valley failed to meet the standard by the 2019 attainment deadline.

In June 2019, the South Coast AQMD submitted a formal request to the U.S. EPA through CARB to reclassify Coachella Valley from a Severe-15 to an Extreme nonattainment area. In July 2019, the reclassification request was granted, and the Coachella Valley was reclassified to an Extreme nonattainment area for the 1997 8-hour ozone standard with an attainment date of June 15, 2024. Under the new Extreme nonattainment classification, a revision to the State Implementation Plan (SIP) is required to be submitted to the U.S. EPA by February 14, 2021 for inclusion into the SIP.

## **Proposal**

The attached Coachella Valley Extreme Area Plan (Plan) has been developed to demonstrate attainment of the 1997 8-hour ozone standard before the required deadline of June 15, 2024 and to address the new federal Clean Air Act (CAA) requirements for Extreme nonattainment areas. The Plan includes new information on key elements such as current air quality, updated emission inventories and air quality modeling, attainment demonstration, reasonable further progress (RFP) demonstration, supplemental reasonably available control technology and reasonably available control measures (RACT/RACM) demonstration, an overall control strategy, and contingency measures for meeting RFP and attainment targets.

Based on the updated emissions inventory and regional air quality modeling presented in the Plan, the Coachella Valley is expected to attain the 1997 8-hour ozone standard by the end of 2023. The 2023 projected attainment date is based on the continued implementation of existing regulations and programs by South Coast AQMD and CARB which are incorporated in the future baseline emissions. These regulations and programs are expected to provide significant NO<sub>x</sub> reductions over the next few years. With Coachella Valley being close to attainment, the emission reductions associated

with these measures are expected to provide the needed reductions in advance of the June 15, 2024 attainment deadline. Recently adopted rules and regulations not reflected in the future baseline emissions (i.e., rules and regulations adopted since 2016 AQMP adoption) will also provide further reductions to ensure that Coachella Valley will attain the standard in or before 2023.

The CAA also establishes emission thresholds for the definition of major stationary sources. Under the Coachella Valley's Extreme nonattainment area classification, the major stationary source thresholds for VOC and NO<sub>x</sub> will both be reduced from 25 to 10 tons per year. These requirements are currently being addressed in proposed amendments to Regulation XIII – New Source Review, Regulation XX – RECLAIM, and Regulation XXX – Title V. In addition, the threshold for a major modification under New Source Review will be reduced from 25 tons per year to 1 pound per day. Two facilities have been identified as having a permit limit for VOC or NO<sub>x</sub> between 10 to 25 tons per year. Both facilities have approached staff to reduce their permitted levels to below the new thresholds since their actual emissions are much lower than their current permit limits. The contingency measure requirements for RFP and attainment goals will be addressed in the amendments to Rule 445 – Wood-Burning Devices. These requirements are consequences of the Coachella Valley's Extreme nonattainment area classification and are not consequences of the proposed Plan.

### **Public Process**

The draft Plan was presented to the AB 617 East Coachella Valley Community Steering Committee on August 26, 2020, the AQMP Advisory Group on September 3, 2020, the South Coast AQMD Mobile Source Committee on September 18, 2020, and the Local Government and Small Business Assistance Advisory Group on October 9, 2020. The updated emissions inventory and modeling was also discussed and presented at the Scientific, Technical, and Modeling Peer Review Group on August 20, 2020.

The draft Plan was released on September 11, 2020 for public review and a Public Consultation Meeting was held on September 25, 2020 to solicit information, comments, and suggestions from the public, affected businesses and stakeholders. Key comments made at the Public Consultation Meeting included the applicability and impacts on tribal lands, pollution around the Salton Sea area, and the impacts of lowering the major source threshold on local businesses. Two written public comments were received as of October 13, 2020. The comments covered projected locomotive emissions impact on attainment demonstration, impact of climate change on local ozone levels, control strategies to reduce local emissions, need for additional air monitoring stations and additional incentive funding for the Coachella Valley. Responses to these comments are included in the draft final Plan, which was released on November 3, 2020. A 30-day public hearing notice was published for the Coachella Valley Extreme Area Plan.

### **Resource Impacts**

The Coachella Valley Extreme Area Plan will have minimal impact on South Coast AQMD resources.

### **California Environmental Quality Act**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption has been prepared pursuant to CEQA Guidelines Section 15062 and is included as Attachment C to this Board letter. If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **AQMP and Legal Mandates**

The Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is consistent with the federal CAA and the U.S. EPA's guidelines and is required as part of the SIP revision to address the federal CAA requirements for Extreme nonattainment areas.

### **RESOLUTION NO. 20-\_\_\_\_\_**

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board approving the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard and directing staff to forward to California Air Resources Board (CARB) for approval and submission to United State Environmental Protection Agency (U.S. EPA) for inclusion in the State Implementation Plan (SIP).**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that, because the proposed project relies on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB to reduce emissions without proposing new requirements that would involve physical changes, it can be seen with certainty that there is no possibility that the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard may have any significant adverse effects on the environment, and is therefore exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for the Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemption apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, South Coast AQMD staff has prepared a Notice of Exemption for the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard and other supporting documentation, including, but not limited to the Notice of Exemption, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, and has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, the ozone air quality in the Coachella Valley is primarily impacted by transport of ozone and ozone precursors from the South Coast Air Basin (Basin); and

**WHEREAS**, the Coachella Valley was classified as a Severe-15 nonattainment area for the 1997 8-hour ozone National Ambient Air Quality Standard (standard) in 2010 with an attainment deadline of June 15, 2019; and

**WHEREAS**, despite significant improvements in ozone air quality in the Coachella Valley over the last two decades, in 2017 and 2018, unusually high ozone levels were experienced in the Coachella Valley which were also observed in the Basin, the State of California, and the Western United States primarily due to higher temperatures and stagnant weather conditions. As a result of the high ozone levels in 2017 and 2018, the Coachella Valley failed to meet the standard by the 2019 attainment deadline; and

**WHEREAS**, the South Coast AQMD submitted a formal request to the U.S. EPA through CARB in June 2019 to reclassify Coachella Valley from a Severe-15 to an Extreme nonattainment area; and

**WHEREAS**, the U.S. EPA granted the reclassification request on July 10, 2019, and accordingly, the South Coast AQMD was required to submit a revision to the SIP by February 14, 2021 to the U.S. EPA for inclusion into the SIP; and

**WHEREAS**, the Coachella Valley Extreme Area Plan was developed to demonstrate attainment of the 1997 8-hour ozone standard as expeditiously as possible and before the attainment date of June 2024, and to address the applicable federal Clean Air Act requirements for Extreme nonattainment areas; and

**WHEREAS**, the Coachella Valley Extreme Area Plan includes new information on key elements such as: current air quality; updated emission inventories and air quality modeling; attainment demonstration; reasonable further progress (RFP) and emission reduction requirements; Reasonably Available Control Technology and Reasonably Available Control Measures (RACT/RACM); an overall control strategy; and contingency measures; and

**WHEREAS**, the draft Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard was released on September 11, 2020 with a comment period from September 11, 2020 to October 13, 2020; and

**WHEREAS**, a public consultation meeting was held on September 25, 2020 to solicit information, comments, and suggestions from the public, affected businesses and stakeholders; and

**WHEREAS**, the draft final Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard was released on November 3, 2020; and

**WHEREAS**, the Coachella Valley is expected to attain the 1997 ozone standard in 2023 based on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB; and

**WHEREAS**, under the Coachella Valley's Extreme nonattainment area classification, the major polluting facility thresholds for VOC and NO<sub>x</sub> will be reduced from 25 to 10 tons per year, respectively, which will be reflected in amendments to Regulation XIII – New Source Review, Regulation XX – RECLAIM, and Regulation XXX – Title V. In addition, the threshold for a major modification under New Source Review will be reduced from 25 tons per year to 1 pound per day under these amendments. These amendments are currently underway and are addressed through a separate public process; and

**WHEREAS**, the contingency measures for Coachella Valley designated as an Extreme nonattainment area will be developed under amendments to Rule 445 – Wood-Burning Devices; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that a Socioeconomic Impact Assessment is not required, pursuant to Health and Safety Code Section 40440.8 or 40728.5, because these sections apply only to rules; and

**WHEREAS**, the public hearing has been properly noticed in accordance with all provisions regarding notice of revisions to the State Implementation Plan in Code of Federal Regulations (CFR) Title 40, Section 51.102; and

**WHEREAS**, the South Coast AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

**WHEREAS**, the South Coast AQMD specifies that the Planning and Rules Manager of the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is based, which are located at the South Coast AQMD, 21865 Copley Drive, Diamond Bar, California; and

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption and CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for the Protection of the Environment. No exceptions to the application of the categorical exemption set forth in CEQA Guidelines Section 15300.2 – Exceptions, including the “unusual circumstances” exception, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby approve, pursuant to the authority granted by law, the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard as set forth in the attached, and incorporated herein by this reference; and

**BE IT FURTHER RESOLVED**, that the Executive Officer is hereby directed to forward a copy of this Resolution and the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard to the CARB for approval and subsequent submittal to the U.S. EPA for inclusion into the SIP.

## EXECUTIVE SUMMARY

The Coachella Valley was classified as a Severe-15 nonattainment area for the 1997 8-hour ozone national ambient air quality standard (standard) in 2010 with an attainment deadline of June 15, 2019. Over the past 16 years, ozone levels in the Coachella Valley have steadily improved because of the implementation of regulations and programs by South Coast Air Quality Management District (South Coast AQMD) and the California Air Resources Board (CARB). Ozone levels in the Coachella Valley are impacted primarily by ozone directly transported from the South Coast Air Basin as well as ozone formed secondarily through photochemical reactions from ozone precursors emitted upwind. As a result, the bulk of the ozone in the Coachella Valley is due to emissions from the South Coast Air Basin, and local sources have limited impact on these levels. However, in 2017 and 2018, unusually high ozone levels were experienced in the Coachella Valley as well as in the South Coast Air Basin, across the State of California and the Western United States primarily due to higher temperatures and stagnant weather conditions. As a result of the high ozone levels in 2017 and 2018, the Coachella Valley failed to meet the standard by the 2019 attainment deadline.

The Clean Air Act (CAA) allows regions that could not attain the standards by the required deadline to request a voluntary bump-up to be reclassified to the next classification of ozone nonattainment. This reclassification provides additional time for the region to attain the standard, but also requires stricter permitting requirements on large stationary sources. In June 2019, South Coast AQMD submitted a formal request to the United States Environmental Protection Agency (U.S. EPA) to reclassify Coachella Valley from a Severe-15 to an Extreme nonattainment area with a new attainment date of June 15, 2024. On July 10, 2019, the U.S. EPA granted the reclassification request, and accordingly, under the new Extreme nonattainment classification, a revision to the State Implementation Plan (SIP) is required to be submitted to the U.S. EPA by February 14, 2021.

The proposed draft Coachella Valley Extreme Area Plan (Plan) has been developed to demonstrate attainment of the 1997 8-hour ozone standard before the required deadline of June 15, 2024 and to address the new federal CAA requirements for extreme nonattainment areas. The Plan includes an updated emissions inventory and modeling analysis, an evaluation of control strategies and emission reductions needed for attainment, reasonable further progress (RFP) to ensure progress in reducing emissions and contingency measures that take effect if RFP and attainment goals are not met. Based on the updated inventory and modeling analysis in this Plan, the Coachella Valley is expected to attain the 1997 8-hour ozone standard by the end of 2023 based on the continued implementation of existing regulations and programs by South Coast AQMD and CARB. These existing regulations provide a significant amount of future reductions in nitrogen oxides (NO<sub>x</sub>) emissions, which is the pollutant largely responsible for generating ozone. With Coachella Valley

being close to attainment, the emissions reductions associated with these measures are expected to provide the needed reductions well in advance of the June 15, 2024 attainment deadline.

The 2023 projected attainment date is based on the emission reductions from existing regulations and programs. The recently adopted regulations by South Coast AQMD and CARB, described in this Plan, will provide further reductions to ensure that Coachella Valley will attain the standard in or before 2023. The earlier attainment of the standard was also evaluated. However, given the time it takes to adopt and implement new regulations, and given that the 2022 ozone season begins less than 18 months from the date of Plan adoption, no new feasible measures were identified which could be adopted and implemented in time to provide additional reductions to further accelerate the attainment.

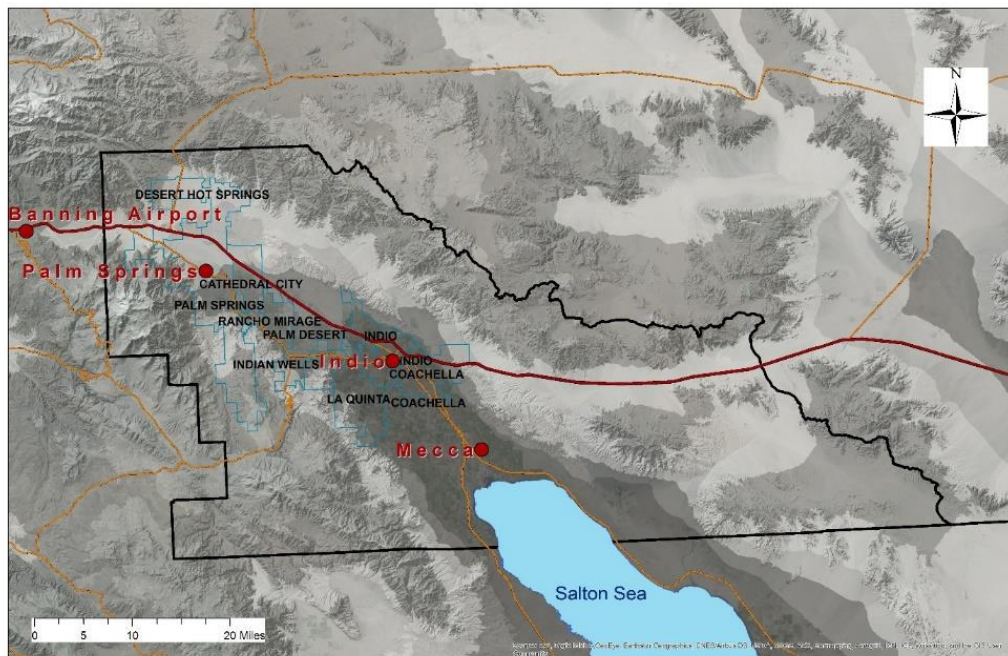

In addition to this Plan, the CAA also requires revised thresholds for classifying stationary sources as major sources and for when modifications of these sources trigger federal requirements. Since volatile organic compounds (VOC) and NO<sub>x</sub> emissions are precursors for ozone, emission thresholds for these two pollutants are affected. Under the Coachella Valley's Extreme nonattainment area classification, the major polluting facility thresholds for VOC and NO<sub>x</sub> will both be reduced from 25 to 10 tons per year, which will be reflected in amendments to Regulation XIII – New Source Review, Regulation XX – RECLAIM, and Regulation XXX – Title V. In addition, the threshold for a major modification under New Source Review will be reduced from 25 tons per year to 1 pound per day.

The contingency measures for RFP and attainment goals are currently being developed under amendments to Rule 445 (Wood-Burning Devices). These requirements are being addressed through separate parallel rulemaking activities.

## 1. INTRODUCTION

The Coachella Valley Planning Area (Coachella Valley) is defined as the desert portion of Riverside County in the Salton Sea Air Basin, and is under the jurisdiction of the South Coast Air Quality Management District (South Coast AQMD). The Coachella Valley excludes the tribal lands which are under the jurisdiction of the U.S. EPA. The Coachella Valley is the most populated area in this desert region, which encompasses several communities, including Palm Springs, Desert Hot Springs, Cathedral City, Rancho Mirage, Palm Desert, Indian Wells, La Quinta, Indio, Coachella, Thermal, and Mecca. Figure 1-1 provides a map of the area and the surrounding topography.

The Coachella Valley is located downwind of the South Coast Air Basin (Basin), which is also under the jurisdiction of the South Coast AQMD. The topography and climate of Southern California coupled with dense population and significant emission sources make the Basin an area with the worst ozone pollution in the nation. Ozone levels in the Coachella Valley are typically less than those in the Basin but are impacted by pollutants directly transported from the Basin, including pollutants such as ozone which is formed in the atmosphere through photochemical reactions of precursor pollutants emitted upwind. Given this transport from the Basin and the atmospheric chemistry of ozone, there is very little impact from local emission sources on ozone levels in Coachella Valley. Therefore, the area must rely on emission controls being implemented upwind in the Basin to demonstrate improved air quality and attainment of the federal ozone standard.

**FIGURE 1-1**

Location and Topography of the Coachella Valley Planning Area

### *Attainment Status for Ozone National Ambient Air Quality Standards*

In 1979, the U.S. EPA established primary and secondary National Ambient Air Quality Standards (NAAQS or standards) for ozone at 0.12 parts per million (ppm) averaged over a 1-hour period.<sup>1</sup> On July 18, 1997, the U.S. EPA revised the primary and secondary standards for ozone to 0.08 ppm, averaged over an 8-hour period (“1997 8-hour ozone standard”). The 1997 8-hour ozone standard was lowered to 0.075 ppm in 2008, and to 0.070 ppm in 2015. The U.S. EPA classifies areas of ozone nonattainment (i.e., Extreme, Severe, Serious, Moderate, or Marginal) based on the extent to which an area exceeds the standard. The higher the exceedance level at the time of classification, the more time is provided to demonstrate attainment in recognition of the greater challenge involved. However, nonattainment areas with higher classifications are also subject to more stringent requirements.

The Coachella Valley attained the 1-hour ozone standard in 2013 but does not meet the other three 8-hour ozone standards. For the 2015 and 2008 8-hour ozone standards, the Coachella Valley is classified as a Severe and Severe-15 ozone nonattainment area, respectively. For the 1997 8-hour ozone NAAQS, the Coachella Valley was originally classified as a Serious nonattainment area<sup>2</sup> effective June 15, 2004. On November 28, 2007, South Coast AQMD requested that the U.S. EPA reclassify the Coachella Valley nonattainment area from Serious to Severe-15. This reclassification was granted effective June 4, 2010 and established an attainment date of June 15, 2019.<sup>3</sup> Implementation of the South Coast AQMD and the California Air Resources Board (CARB) emissions control measures over the past several decades have resulted in demonstrable progress in reducing ozone levels and significant reductions in ozone precursor emissions such as NO<sub>x</sub> and VOCs. As a result, air quality in the Coachella Valley has steadily improved, as demonstrated by the ambient air quality data. However, in 2017 and 2018, the State of California and other western states experienced a series of high ozone episodes primarily driven by unexpected changes in meteorology including warm and stagnant weather conditions. Consequently, the ozone levels in 2017 and 2018 were higher than the previous years and the Coachella Valley did not attain the 1997 standard by the June 2019 attainment date (refer to Chapter 2 for more details on air quality trends). As a result, South Coast AQMD requested that the U.S. EPA reclassify the area from Severe-15 to Extreme ozone nonattainment.<sup>4</sup> Effective July 10, 2019, the U.S. EPA approved the voluntary “bump-up” request<sup>5</sup> and the Coachella Valley is currently classified as an Extreme nonattainment area for the 1997 8-hour ozone standard with a new attainment date of June 15, 2024. Table 1-1 summarizes the attainment date and the attainment status for each of the federal ozone standard for Coachella Valley.

---

<sup>1</sup> U.S. EPA revoked the 1-hour ozone standard entirely in 2005. However, U.S. EPA regulations require the continuation of certain control measures in areas that were formerly in nonattainment for the 1-hour Standard.

<sup>2</sup> 69 FR 23858 (April 30, 2004).

<sup>3</sup> 75 FR 24409 (May 5, 2010).

<sup>4</sup> 42 U.S.C. 7511(b)(3).

<sup>5</sup> 84 FR 32841 (July 10, 2019).

**TABLE 1-1**  
Attainment Status of the Federal Ozone NAAQS of the  
Coachella Valley Planning Area

Year	Averaging Time	Standard	Designation	Attainment Date
1979	1-hour	0.12 ppm	Attainment	11/15/2007 (Attained in 2013)
1997	8-hour	0.08 ppm	Nonattainment (Extreme)	6/15/2024
2008	8-hour	0.075 ppm	Nonattainment (Severe-15)	7/20/2027
2015	8-hour	0.070 ppm	Nonattainment (Severe)	8/3/2033

### *History of Air Quality Planning for the 1997 8-Hour Ozone Standard*

The federal Clean Air Act (CAA) requires nonattainment areas to develop and implement an emission reduction strategy that will bring the area into attainment in a timely manner by the required attainment dates. The Air Quality Management Plan (AQMP) is the regional blueprint for achieving air quality standards and designed to meet both federal and state CAA planning requirements. The AQMP is jointly developed by South Coast AQMD, CARB, and Southern California Association of Governments (SCAG), and is submitted as part of the State Implementation Plan (SIP) to the U.S. EPA for evaluation and approval. The following SIP submittals addressed the CAA planning requirements for attaining the 1997 8-hour ozone NAAQS for the Coachella Valley:

1. “Final 2007 Air Quality Management Plan,” South Coast Air Quality Management District, June 2007 (2007 AQMP); and “2007 State Strategy for the California State Implementation Plan,” September 2007 (2007 State Strategy).

The 2007 AQMP addressed attainment of the 1997 ozone standard for both the South Coast Air Basin and Coachella Valley including the following components:

- Emissions estimates, reasonable further progress (RFP) demonstrations, and motor vehicle emission budgets in Chapters 6 and 8;
- Base and future emission inventories in Chapters 3 and 8 and Appendix III;
- Modeling for the attainment demonstration in Chapters 5 and 8, and Appendix V;
- Control strategy in Chapter 4 and Implementation in Chapter 7; and
- Reasonably Available Control Measures (RACM) discussion in Chapter 6 and Appendix VI.

The 2007 State Strategy, as amended by the 2009 State Strategy Status Report<sup>6</sup> and 2011 State Strategy Progress Report,<sup>7</sup> provided a RACM demonstration for mobile sources (Chapter 3, Chapter 5, Appendix A, etc.). Appendix F of the 2011 State Strategy Progress Report provided revised control measure commitments and a revised rule implementation schedule for the 2007 AQMP.

Based on the 2007 AQMP and the 2007 State Strategy, the Coachella Valley was projected to attain the 1997 8-hour ozone standard (0.08 ppm) by 2018.

2. “Proposed Updates to the 1997 8-Hour Ozone Standard, State Implementation Plans; Coachella Valley and Western Mojave Desert,” CARB, October 2014 (2014 SIP Update).

The 2014 SIP Update, which covered both the Coachella Valley and Western Mojave Desert 1997 8-hour ozone nonattainment areas, reflected the new U.S. EPA guidance<sup>8</sup> for the RFP demonstration and updated emission inventories. The 2014 SIP Update included updated emissions inventories, RFP demonstration, vehicle miles travelled (VMT) offset demonstration, motor vehicle emissions budgets and revision to the attainment targets for NO<sub>x</sub> and VOC emissions. The 2014 Update demonstrated that the adopted regulations would provide the emission reductions necessary to achieve attainment of the 0.08 ppm 8-hour ozone standard in the Coachella Valley by the attainment date and meet RFP requirements in the milestone years.

While the 2007 AQMP and the 2014 SIP Update addressed and satisfied the CAA planning requirements for the Coachella Valley, the 2012 AQMP provided the projections of future ozone levels based on the updated emissions inventories and modeling efforts for informational purposes.

The 2016 AQMP outlined the strategy to attain the 2008 8-hour ozone standard (0.075 ppm) for the Coachella Valley Planning Area and discussed the attainment status towards the 1997 8-hour ozone standard (0.08 ppm). The 2016 AQMP overall ozone control strategy included stationary and mobile source NO<sub>x</sub> emissions reduction strategies by South Coast AQMD and CARB, supplemented by additional strategic and concurrent VOC emission reductions, by focusing on maximizing the use of zero and near-zero emission control technologies. A combination of strong

---

<sup>6</sup> “Status Report on the State Strategy for California’s 2007 State Implementation Plan (SIP) and Proposed Revision to the SIP Reflecting Implementation of the 2007 State Strategy,” CARB, Release Date: March 24, 2009 (2009 State Strategy Status Report).

<sup>7</sup> “Progress Report on Implementation of PM<sub>2.5</sub> State Implementation Plans (SIP) for the South Coast and San Joaquin Valley Air Basins and Proposed SIP Revisions,” CARB, Release Date: March 29, 2011 (2011 State Strategy Progress Report).

<sup>8</sup> Since the submission of the 2007 AQMP, U.S. EPA determined it was no longer appropriate to include emissions from sources outside the nonattainment area in the RFP demonstration and revised its RFP policy to limit emission reductions to sources within the nonattainment area.

regulatory actions and effective incentive programs was deemed the most effective means of achieving the emission reductions needed for attaining the ozone standards.

The attainment demonstration for the 8-hour ozone standard is based on the 99<sup>th</sup> percentile highest value, which is the fourth highest value each year. The 2016 AQMP evaluated the number of days exceeding the 1997 standard at the monitoring station with the highest ozone in the Coachella Valley from 1990 through 2015. The ozone levels showed progressive improvement, from 18 exceedance days in 2012 base year to only 6 days in 2015. As such, it was expected that Coachella Valley would attain the 1997 ozone standard by the end of 2018, corroborating the ozone SIP attainment demonstration in the 2007 AQMP and the CARB 2014 SIP Update.

However, as mentioned in the previous section, because of unexpectedly high ozone levels in 2017 and 2018, Coachella Valley did not meet the 1997 8-hour ozone standard by the Severe area attainment date of June 15, 2019. The new Extreme nonattainment area status, approved by the U.S. EPA, provides more time to attain the standard by extending the attainment date to June 2024.

### *Purpose of this Plan*

On July 10, 2019, the U.S. EPA granted a voluntary reclassification of the Coachella Valley Planning Area from Severe-15 to Extreme nonattainment for the 1997 8-hour ozone NAAQS. This reclassification triggered the need to revise the SIP to address new requirements associated with the reclassification. The Coachella Valley Extreme Area Plan is developed to outline the strategy to bring the area into attainment as expeditiously as practicable and by the required attainment date of June 2024. Chapter 2 of this document presents the ozone air quality trends. Chapter 3 describes the base-year emissions inventory and future projected emissions. Chapter 4 describes the overall control strategy based on the continued implementation of regional and statewide control measures for attaining the 1997 8-hour ozone standard in the Coachella Valley. Chapter 5 presents the attainment demonstration and future air quality. Other federal CAA requirements are discussed in Chapter 6.

## 2. AIR QUALITY TRENDS

The South Coast AQMD currently monitors Coachella Valley ozone concentrations at Indio and Palm Springs. The Palm Springs air monitoring station is located closer to the San Geronio Pass (also known as the Banning Pass), predominantly downwind of the densely populated South Coast Air Basin. The Indio station is located further east in the Coachella Valley, on the predominant downwind side of the main population areas of the Coachella Valley. Both of these sites routinely measure ozone, particulate matter with a diameter less than 10 micron (PM<sub>10</sub>), particulate matter with a diameter less than 2.5 micron (PM<sub>2.5</sub>), sulfates (from PM<sub>10</sub>), and several meteorological parameters. The Palm Springs station also measures carbon monoxide (CO), and nitrogen dioxide (NO<sub>2</sub>). This chapter summarizes recent and historic ozone air pollution data collected in the Coachella Valley.

### *Factors that Influence Ozone Concentrations*

Ozone (O<sub>3</sub>) is not emitted directly into the atmosphere; near-surface ozone, in contrast to stratospheric ozone, is formed by the reaction of volatile organic compounds (VOCs) with oxides of nitrogen (NO<sub>x</sub>) in the presence of sunlight. Figure 2-1 illustrates the processes influencing ozone concentrations in the Coachella Valley. NO<sub>x</sub> is generated from combustion processes whereas VOCs are emitted from a wide variety of sources such as consumer products, mobile sources, and vegetation. Wildfires generate both NO<sub>x</sub> and VOCs. The chemical reactions that form ozone are highly complex and depend not only on NO<sub>x</sub> and VOC levels, but also on the ratio of VOC to NO<sub>x</sub> concentrations, temperature, the amount of sunlight, and other meteorological conditions. NO<sub>x</sub> emissions can even reduce ozone concentrations in the immediate vicinity of an emission source, but will contribute to more ozone formation downwind. In our region, NO<sub>x</sub> emissions typically drive ozone levels, and NO<sub>x</sub> control measures are the most effective mechanisms for controlling ozone to meet federal standards.

Atmospheric ozone in the Coachella Valley is both directly transported from the Basin and formed photochemically from precursors emitted upwind and within the Coachella Valley. The precursors are emitted in the greatest quantity in the coastal and central Los Angeles County areas of the Basin. The Basin's prevailing sea breeze causes polluted air to be transported inland. As the air is being transported inland, ozone is formed, with peak concentrations occurring in the inland valleys of the Basin, extending from eastern San Fernando Valley through the San Gabriel Valley into the Riverside-San Bernardino area and the adjacent mountains. As the air is transported further inland into the Coachella Valley through the San Geronio Pass, ozone concentrations typically decrease due to dilution, although ozone standards can still be exceeded – wind speed and wind direction further influence ozone concentrations throughout the Coachella Valley.

**FIGURE 2-1**

Schematic of Processes Influencing Ozone Concentrations in the Coachella Valley

Ozone concentrations are also heavily dependent on meteorological conditions. Concentrations in the Coachella Valley, and the number of days exceeding the federal ozone standards, are greatest in the late spring and summer months, with no exceedances during the winter. Ozone concentrations are a strong function of season for several reasons. The rate of reactions that produce ozone in the atmosphere proceeds faster at higher temperatures. In addition, elevated temperatures lead to increased ozone precursor concentrations by hastening the evaporation of VOCs into the air. Ozone concentrations are also dependent on sunlight intensity, which is stronger during the summer months. The stability of the atmosphere also influences ozone concentrations. Strong inversions inhibit mixing with the upper atmosphere, leading to ozone accumulation near the surface.

### *Ozone Monitoring Data*

Several metrics are used to quantify progress towards attaining the ozone standards in the Coachella Valley. The number of days exceeding the 1997 8-hour ozone standard anywhere in the Coachella Valley is a basic, yet useful tool for assessing progress. This metric has decreased markedly over the past few decades. However, year-to-year variabilities are evident throughout the historical record. Figure 2-2 shows the trend in Coachella Valley ozone exceedance days for the 1979 1-hour standard and the 1997 8-hour standard. Note that the Coachella Valley attained the 1-hour standard in 2013.

**FIGURE 2-2**

Trends in Ozone Exceedance Days in the Coachella Valley, 1990–2018

The Coachella Valley exceeded the 1997 standard on four days in 2016, 15 days in 2017, 13 days in 2018, and two days in 2019. This increase in exceedance days in 2017 and 2018 was not unique to the area. Similar increases in ozone concentrations occurred in the South Coast Air Basin and other areas in California and the Western United States. Figure 2-3 shows the trend in ozone exceedance days in both the South Coast Air Basin and the Coachella Valley.

**FIGURE 2-3**

Trends in Ozone Exceedance Days in the Coachella Valley and the South Coast Air Basin, 1990–2019

The similarity in the trends in ozone exceedances seen in Figure 2-3 is expected due to typical transport patterns of ozone precursors and ozone from the South Coast Air Basin to the Coachella Valley. In addition, while there are differences in meteorological conditions between the two areas, regional meteorological trends influence conditions in both areas.

The CAA requires attainment of the ozone standard at the most polluted ozone monitoring station, which for the case of the Coachella Valley, is in Palm Springs. The 8-hour ozone design value is based on the 99<sup>th</sup> percentile highest value (4<sup>th</sup> highest daily maximum of 8-hour-average concentrations) in a year, averaged over a three-year period. Therefore the 4<sup>th</sup> highest 8-hour daily max value is a useful metric to assess yearly progress towards attainment of the standard. The 4<sup>th</sup> highest 8-hour daily max value in 2019 was 0.084 ppm, which is the lowest concentration on record in the Coachella Valley. Unfortunately, the Coachella Valley did not attain the 8-hour standard by 2019 due to elevated 4<sup>th</sup> highest 8-hour daily max values in 2017 and 2018.

### *Factors Leading to High Ozone Levels in 2017 and 2018*

Elevated ozone concentrations recorded in 2017 and 2018 in the Coachella Valley and the South Coast Air Basin were also seen throughout California (Figure 2-4) and the Western United States (Figure 2-5).

**FIGURE 2-4**

Fourth Highest Daily Maximum Ozone Values in Several Nearby California Air Basins from 2008 to 2019

**FIGURE 2-5**

Fourth Highest 8-Hour Daily Maximum Ozone Values at the Most Polluted Monitoring Site in Several Designated Areas in Western States from 2008 to 2019

South Coast AQMD staff and other researchers in the air quality and meteorology communities are still investigating the reasons for the increase in ozone concentrations starting in 2017 throughout the Western United States. However, the fact that these increases were seen over wide areas can help explain the elevated ozone concentrations which was likely caused by adverse meteorology and changes in emissions such as biogenic VOC emissions in response to the warmer temperatures. The year-to-year variability in ozone is not uncommon in the historical record and a temporary increase in ozone is not necessarily reflective of a long-term trend.

### **Wildfires**

The U.S. EPA's Exceptional Events Rule allows air authorities to exclude monitoring data in calculating design values if the data was influenced by an event that is not reasonably controllable nor preventable. There must also be a clear causal relationship between the exceedance and the event. For example, under the Exceptional Events Rule, the U.S. EPA may approve the exclusion of ozone exceedances caused by wildfires in calculating attainment status upon successful demonstration by states or local air districts. While there are some exceedances that may be smoke-influenced due to the presence of satellite-detected smoke and/or an active smoke advisory, even if the U.S. EPA approved all of these as exceptional events, the Coachella Valley would still would not be in attainment of the 1997 8-hour ozone standard.

While local wildfires cannot explain all exceedances in the 2017–2019 period in the Coachella Valley, it is possible that wildfire emissions from distant fires could have influenced ozone precursor or ozone concentrations throughout the West. 2017 and 2018 were particularly active wildfire seasons in California (Figure 2-6), with total acreage burned surpassing all years since 2008.

**FIGURE 2-6**

Total Acres Burned by Year within California. Data from the National Interagency Fire Center

### ***Biogenic Emissions of Ozone Precursors***

Biogenic VOC emissions (those deriving from vegetation) may also exhibit large year-to-year variations. Vegetation is a large source of VOCs, especially during summer months. Vegetative growth is highly dependent on rainfall during the growing season, which exhibits significant year-to-year variations throughout California.

### ***Anthropogenic Emissions of Ozone Precursors***

While it is difficult to measure anthropogenic emissions (emissions from human activity) of NO<sub>x</sub> and VOCs directly, emission inventory projections indicate that emissions from anthropogenic sources in the South Coast Air Basin have declined and will continue to decline due to the continued implementation of air quality regulations and programs (Figure 2-7). Emissions in the South Coast Air Basin are the primary contributor to ozone concentrations in the Coachella Valley.

**FIGURE 2-7**

Emission Inventory Projections in the South Coast Air Basin

Nitrogen dioxide (NO<sub>2</sub>) concentration is measured hourly throughout the South Coast AQMD boundaries and can be used as a surrogate for NO<sub>x</sub> emissions. An analysis of monitoring data between 1990 and 2019 indicate that NO<sub>2</sub> concentration have been reduced by approximately 65 percent and have continued to decline year-to-year since 1999, including in 2017 and 2018 (Figure 2-8).

**FIGURE 2-8**

NO<sub>2</sub> Concentrations at Monitors in the South Coast Air Basin and the Coachella Valley. Only Monitors with Data in At Least 75 Percent of the Years are Included in This Analysis

## Meteorology

Meteorology is also an important factor governing ozone concentrations. Year-to-year changes in meteorology can alter transport patterns, leading to changes in precursors and upwind ozone entering the Coachella Valley. Elevated temperatures and reduced atmospheric mixing can also contribute to additional ozone formation. In addition, the North American Monsoon, which can bring an increase in humidity and afternoon thunderstorms into the Coachella Valley between July and September can also affect ozone concentrations.

## Ozone Attainment Status

Trends in the 8-hour ozone design value and the 1-hour ozone design value are plotted in Figure 2-9.

**FIGURE 2-9**

Coachella Valley 3-Year Design Value Trends of Ozone, 1992–2019  
(The Year Plotted is the End Year of the 3-Year Design Value)

While the Coachella Valley attains the former 1-hour federal ozone standard, the area exceeds the 8-hour NAAQS. In 2016, the 3-year design value (2014–2016 average) for the Coachella Valley was 0.087 ppm. The 2017 and 2018 design value increased to 0.088 ppm and 0.091 ppm, respectively. The 2019 design value then decreased to 0.089 ppm due to a relatively clean 2019 ozone season, but it still exceeds the 1997 8-hour standard. In each of these cases, the Palm Springs monitoring station had the highest design value, and therefore the Palm Springs measurement data reflects the design location for the Coachella Valley. The standard is met if the design value is less than or equal to 0.084 ppm, due to rounding conventions associated with the 0.08 ppm standard.

In summary, the Coachella Valley has experienced a multi-decadal trend of steady reduction in ozone concentration over the years and is very close to achieving the 1997 8-hour ozone standard. However, additional emission reductions are needed to attain this standard.

### 3. BASE-YEAR AND FUTURE EMISSIONS

#### *Introduction*

This chapter summarizes ozone precursor emissions (VOC and NO<sub>x</sub>) in the Coachella Valley for the 2018 baseline year and the 2023 attainment year for the 1997 8-hour ozone NAAQS. Baseline emissions data presented in this chapter are based on seasonally adjusted summer planning inventory emissions which are developed to capture the emission levels during the high ozone season and are used to perform the ozone modeling attainment demonstration and to report emission reduction progress as required by the federal CAA requirements.

#### *Emissions Inventory Methodology*

Emissions inventories can be grouped into four source categories: point, area, on-road and off-road mobile sources. Emissions from each category are estimated using source-specific methodologies described briefly in the next sections. The methodologies used in this Plan are generally consistent with those employed in the 2016 AQMP. While more detailed information regarding the emissions inventory development for the base and future years is available in Chapter 3 and Appendix III of the 2016 AQMP,<sup>9</sup> a brief description for the four groups of emissions is provided below. The two main changes to the emissions inventory introduced in this plan compared to the 2016 AQMP are: 1) point source emissions for the baseline year 2018 are based on actual reported emissions obtained from the South Coast AQMD's Annual Emissions Reporting (AER) system, and 2) on-road emissions are estimated using EMFAC 2017, compared to the previous version, EMFAC 2014, used in the 2016 AQMP.

#### *Point Sources*

Point sources generally correspond to permitted facilities with one or more emission sources at an identified location (e.g., power plants, refineries). The larger point source facilities with annual emissions of 4 tons per year or more of either Volatile Organic Compounds (VOC), Nitrogen Oxide (NO<sub>x</sub>), Sulfur Oxide (SO<sub>x</sub>), or total Particulate Matter (PM), or annual emissions of over 100 tons of Carbon Monoxide (CO) are required to report their criteria pollutant emissions and selected air toxics, pursuant to Rule 301, through the AER Program. These facilities need to report emissions on an annual basis and are subject to emission audits. This Plan uses the 2018 annual reported emissions for the 2018 baseline, as opposed to the 2018 projected emissions from 2012 baseline that were used in the 2016 AQMP.

<sup>9</sup> South Coast AQMD (2017), 2016 Air Quality Management Plan, Appendix III, Base and future year emission inventory. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iii.pdf?sfvrsn=6>.

### ***Area Sources***

Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, and permitted sources that are smaller than the above thresholds) which are distributed across the region and are not required to individually report their annual emissions. There are about 400 area source categories for which emission estimates are jointly developed by CARB and the South Coast AQMD. The emissions from these sources are estimated using specific activity information and emission factors. Activity data are usually obtained from survey data or scientific reports, e.g., Energy Information Administration (EIA) reports for fuel consumption other than natural gas fuel, Southern California Gas Company for natural gas consumption, paint supplier data under Rule 314 and District databases. Emission factors are based on rule compliance factors, source tests, manufacturer's product or technical specification data, default factors (mostly from AP-42, U.S. EPA's published emission factor compilation), or weighted emission factors derived from the point source facilities' annual emissions reports. The overall methodology for area sources is described in Appendix III of the 2016 AQMP.<sup>10</sup> The area source emissions in this Plan are based on the emissions projections included in the 2016 AQMP for 2018 and 2023, using growth and control factors derived from regulatory and socio-economic data.

### ***On-Road Sources***

On-road sources include motor vehicles such as passenger cars, buses, and trucks that regularly travel on roads. Emissions from on-road sources are calculated using travel activity and vehicle-specific emission factors that depend on temperature and relative humidity. This Plan uses the same travel activity data from SCAG's 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) that was used in the 2016 AQMP. The 2016 RTP is the latest approved available platform providing traffic activity data during the development of this Plan. The on-road emission factors are updated based on CARB's EMFAC 2017 model, which is an update to the EMFAC 2014 model was used in the 2016 AQMP. In addition, the Emission Spatial and Temporal Allocator (ESTA, <https://github.com/mmb-carb/ESTA>) tool developed by CARB is also used to distribute the emissions spatially and temporally to generate inputs to the air quality model used in the attainment demonstration air quality simulations.

CARB's EMFAC 2017 model has undergone revisions from the previous version (EMFAC 2014), which include changes in emission rates for light-, medium- and heavy-duty vehicles. More

Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iii.pdf?sfvrsn=6>.

detailed information on the changes incorporated in EMFAC 2017 can be found in EMFAC 2017 Technical Documentation.<sup>11</sup>

Figure 3-1 compares the Coachella Valley on-road emissions estimated using EMFAC2014 in the 2016 AQMP and EMFAC 2017 used in the in this Plan, for milestone years of 2018 and 2023. In general, EMFAC 2017 tends to estimate lower VOC emissions and higher NO<sub>x</sub> emissions, compared to EMFAC 2014. The difference is specifically pronounced in future NO<sub>x</sub> emissions, in which EMFAC 2017 yields larger amount of NO<sub>x</sub> than EMFAC 2014, which was in part driven by revised higher NO<sub>x</sub> emissions rates from Heavy Duty vehicle model years of 2010 and newer.

**FIGURE 3-1**

Comparison of Coachella Valley On-Road Emissions Estimated using EMFAC 2014 in the 2016 AQMP and EMFAC 2017 in the Current Plan. VOC and NO<sub>x</sub> Emissions Represent Summer Planning Inventory

<sup>11</sup> <https://ww2.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/road-documentation/msei-modeling-tools-emfac>.

### ***Off-Road Sources***

The off-road mobile category includes construction and mining equipment, industrial and commercial equipment, lawn and garden equipment, agricultural equipment, ocean-going vessels, commercial harbor craft, locomotives, aircraft, cargo handling equipment, pleasure craft, and recreational vehicles. The off-road mobile emissions included in the 2016 AQMP were used in this plan except for ocean going vessels for which emissions were updated in the 2018 Updates to the California State Implementation Plan.<sup>12</sup> There are no ocean-going vessel emissions in the Coachella Valley, so this update is irrelevant for the emissions inventory in this plan. However, ocean-going vessel emissions affect upwind air pollutant concentrations, and hence, the updated emissions are included in modeling the attainment demonstration, which takes into consideration the upwind emissions that impact the air quality in Coachella Valley. The modeling approach for the attainment demonstration is presented in Chapter 5. Both 2018 and 2023 emissions were projected from the 2012 baseline emissions specified in the 2016 AQMP.

### ***Base Year (2018) Emission Inventory***

The summer planning emissions inventory for 2018 broken down by major source category is provided in Table 3-1. A more detailed breakdown of emissions is included in Appendix I. Figure 3-2 characterizes the relative contributions by stationary and mobile source categories. On-road and off-road mobile sources are major contributors for NO<sub>x</sub> and VOC in the Coachella Valley. Overall, total mobile source emissions account for 50 percent of the VOC and 91 percent of the NO<sub>x</sub> emissions for these two ozone-forming pollutants. The on-road mobile source category alone contributes over 27 percent of the VOC and 61 percent of the NO<sub>x</sub> emissions. Area sources contribute to 49 percent of the VOC emissions, with consumer products and cleaning and surface coatings being the major sources.

Figure 3-3 shows the fraction of the 2018 inventory by responsible agency for VOC and NO<sub>x</sub>. U.S. EPA and CARB have primary authority to regulate emissions from mobile sources. The U.S. EPA's authority primarily applies to aircraft, locomotives, ocean going vessels, and some categories of off-road mobile equipment. CARB has authority over the remainder of the mobile sources, and consumer products. South Coast AQMD has authority over most area sources and all point sources. As can be seen in Figure 3-3, 92 percent of the NO<sub>x</sub> emissions in the Coachella Valley are from sources that fall under the primary jurisdiction of CARB and the U.S. EPA. The largest share of VOC emissions is under CARB jurisdiction, 66 percent, with a small contribution of VOC from sources under the U.S. EPA's jurisdiction. This illustrates that continued actions at the local, State, and federal level are all needed to ensure the region attains the federal ambient air quality standards.

***Future Emissions***

The 2023 future emission inventory in this Plan were projected from the 2012 base year using growth and control factors developed for the 2016 AQMP for point, area and off-road sources. As described in the previous section, on-road mobile sources are projected using projected vehicle activity from SCAG's 2016 RTP/SCS for 2023 and emission factors projected for 2023 by the EMFAC 2017 model.

Table 3-2 presents the summer planning inventory of ozone precursors in 2023, the new attainment year of the 1997 8-hour ozone NAAQS for the Coachella Valley. A more detailed breakdown of emissions by major source categories is included in Appendix I. NO<sub>x</sub> emissions continue to decrease due to existing regulations for mobile and stationary sources. However, the total VOC emissions in Coachella Valley are expected to slightly increase due to increase in population and economic and industrial activities. Emissions from on-road and off-road sources are projected to decline for both NO<sub>x</sub> and VOC from 2018 to 2023 based on the continued implementation of existing regulations with future effective dates or as new, cleaner vehicles and equipment replaces older, higher-emitting sources.

Figure 3-4 illustrates the relative contribution to the 2023 inventory by source category. A comparison of Figures 3-2 and 3-4 indicates that the on-road mobile category continues to be a major contributor to NO<sub>x</sub> emissions. However, on-road mobile sources contribute less to the overall VOC and NO<sub>x</sub> emissions in 2023, indicating the effectiveness of current on-road mobile sources regulations to reduce emissions in the Coachella Valley. Figure 3-5 shows the comparison of the summer planning inventory in 2018 and 2023 by the four major source categories. The actual expected reductions in NO<sub>x</sub> in mobile sources is 4.3 tpd, which represents a 39 percent decrease. On-road mobile sources account for 20 percent of total VOC emissions compared to 27 percent in 2018, and 55 percent of total NO<sub>x</sub> emissions compared to 61 percent in 2018. See Figures 3-6 through 3-9 for the highest-ranking source categories for 2018 and 2023 in Coachella Valley.

### *Top Five Source Categories (2018 and 2023)*

The top five sources of ozone precursor emissions are presented in this section based on the summer planning inventory for 2018 and 2023.

Figures 3-6 and 3-7 provide the top five categories for VOCs for the years 2018 and 2023, respectively. Consumer products, off-road equipment and the coatings and related processes category are the largest contributors to VOC emissions, and are expected to continue to grow through 2023, due to the projected growth in population and economic activity. In contrast, on-road emissions from light duty vehicles decline from 2018 to 2023 as a result of existing regulations. The top five categories account for 55 percent of the total VOC inventory in 2018 and 58 percent in 2023.

Figures 3-8 and 3-9 show the top five categories for NO<sub>x</sub> emissions for 2018 and 2023, respectively. Mobile source categories remain the predominant contributor to NO<sub>x</sub> emissions. Heavy-duty diesel trucks, off-road equipment, and trains are the top three emitters on the list for both years. NO<sub>x</sub> from all top emitters are projected to decline from 2018 to 2023 because of the impact of existing regulations. The top five categories account for 74 percent of the total NO<sub>x</sub> inventory in 2018 and 2023.

### *Emissions of the South Coast Air Basin*

While a full inventory of Coachella Valley emissions is a required element of this plan, the ozone air quality in the Coachella Valley is primarily due to the transport of ozone and its precursor pollutants from the South Coast Air Basin. Table 3.3 presents the total VOC and NO<sub>x</sub> emissions in the South Coast Air Basin compared to the emissions in the Coachella Valley. As shown, the total VOC and NO<sub>x</sub> emissions emitted locally within the Coachella Valley are about 4 percent and 5 percent the total VOC and NO<sub>x</sub> emissions in the South Coast Air Basin, respectively. The Basin emissions are estimated based on the same methodology presented above.

**TABLE 3-3**

<b>Total</b>	<b>390.3</b>	<b>369.5</b>	<b>14.4</b>	<b>18.3</b>

### *Uncertainties in the Emissions Inventory*

An effective AQMP/State Implementation Plan relies on a complete and accurate emissions inventory. Over the years, significant improvements have been made to quantify emission sources for which control measures are developed. Increased use of continuous monitoring and source testing has contributed to the improvements in point source inventories. Technical assistance provided to facilities and auditing of reported emissions by the South Coast AQMD have also improved the accuracy of the emissions inventory. Area source inventories that rely on average emission factors and regional activity data have inherent uncertainties. Industry-specific surveys and source-specific studies during rule development have also provided a certain degree of refinement to these emissions estimates. Mobile source inventories are also continuously updated and improved. As described earlier, many improvements are included in the on-road mobile source model EMFAC 2017, which estimates emissions from trucks, automobiles, and buses. Improvements and updates are also included in the methodologies for off-road mobile sources. Overall, the emissions inventory in this Plan is based on the most current data and methodologies, resulting in the most accurate inventory available.

Relative to future growth, there are many challenges inherent in making accurate projections, such as where vehicle trips will occur, distribution between various modes of transportation (such as

trucks and trains) as well as estimates for population growth and the number and type of jobs. Forecasts are made with the best information available; nevertheless, there is uncertainty in emissions projections. AQMP updates are generally developed every three to four years, thereby allowing for frequent updates and improvements to the inventories. In sum, the future emission projections in this Plan are a reasonable forecast with the latest updates to on-road sectors accounting for the majority of emissions.

## 4. CONTROL STRATEGY

The overall control strategy for meeting the 1997 8-hour ozone standard in Coachella Valley is based on the continued implementation of existing South Coast AQMD and CARB regulations and programs over the next few years. With Coachella Valley being close to attainment, the emissions reductions associated with these measures are expected to provide the needed reductions. Also, recently adopted regulations, discussed in this section, will provide additional emission reductions which will further ensure attainment of the standard by the attainment date. Chapter 5 presents future air quality and provides details on the air quality modeling analysis and attainment demonstration.

The regional air quality modeling in the 2016 AQMP indicated that significant NO<sub>x</sub> reductions with additional strategic, limited VOC reductions will lead to attainment of the ozone standards. The NO<sub>x</sub> control path was identified as the most effective strategy in meeting the 8-hour ozone standards in the South Coast Air Basin and the Coachella Valley. The updated modeling analysis described in Chapter 5 further confirms this conclusion. Since the 0.08 ppm ozone standard was promulgated in 1997, CARB and South Coast AQMD have made great progress in reducing NO<sub>x</sub> emissions over the last several decades. NO<sub>x</sub> emissions in the South Coast Air Basin have been reduced by approximately 76 percent through existing regulations and programs. Significant NO<sub>x</sub> controls have been implemented in stationary sources, including emission standards, retrofitting existing sources with add-on controls (e.g., selective catalytic reduction), equipment modification (e.g., low-NO<sub>x</sub> burners), and replacement of old high-emitting equipment with new and cleaner units. VOC reductions have also been achieved through reformulations in consumer products, solvents, adhesives, and coatings. With mobile sources responsible for over 80 percent of regional NO<sub>x</sub> emissions, reducing mobile source emissions is key to attaining the federal ozone standards. Aggressive NO<sub>x</sub> controls have also been implemented for mobile sources including engine standards, fleet requirements, alternative fuels, repowering with cleaner engines, and incentive programs. As Coachella Valley is close to attaining the 1997 8-hour ozone standard, emission reductions from continued implementation of existing regulations for stationary and mobile sources would provide the needed reductions for attainment in 2023.

Since the transport of ozone and its precursors from the South Coast Air Basin is the primary cause of the ozone exceedances in Coachella Valley, the NO<sub>x</sub> strategies implemented in the South Coast Air Basin will provide further improvement of ozone air quality in the Coachella Valley. This chapter describes existing regulations and programs providing emission reductions for the attainment of the 1997 8-hour ozone NAAQS by 2023. In addition, this chapter describes the recently adopted regulations and programs since the adoption of the 2016 AQMP. These newly adopted measures will provide additional reductions beyond the existing regulations and give further assurance for meeting the 1997 8-hour ozone standard by the 2023 attainment date.

### *South Coast AQMD Existing Regulations and Programs Providing Emission Reductions in Future Baseline Emissions*

South Coast AQMD has implemented aggressive NO<sub>x</sub> and VOC emission reduction strategies in the past several decades to attain the federal ozone standards in the South Coast Air Basin and Coachella Valley. The emissions benefit of these regulations and programs are reflected in the future baseline emissions which are used for air quality modeling and attainment demonstration purposes. These emissions reflect the specific control requirements in existing rules and regulations as well as the natural turnover of engines, equipment, and appliances. Appendix II provides a complete list of the South Coast AQMD's existing NO<sub>x</sub> and VOC rules and regulations. The existing South Coast AQMD rules which are not fully implemented and will provide further emission reductions in 2023 are briefly described below:

- **RECLAIM Program (Regulation XX)**  
The NO<sub>x</sub> RECLAIM regulation, a cap-and-trade program first adopted in 1993, has been revised several times to reduce NO<sub>x</sub> emissions from the largest NO<sub>x</sub> emitting stationary sources within the South Coast AQMD's jurisdictional boundary. It has promoted additional NO<sub>x</sub> reductions by allocating and re-assessing RECLAIM Trading Credits (RTC) which periodically decline based on periodic assessments of Best Available Retrofit Control Technology (BARCT) for a wide range of NO<sub>x</sub>-emitting equipment, such as boilers, heaters, furnaces, ovens, kilns, coke calciner, fluid catalytic cracking units, internal combustion engines, and turbines. In 1994, the initial RECLAIM RTC allocation was 110 tpd of NO<sub>x</sub>, which will be reduced to 14.5 tpd in 2022. NO<sub>x</sub> RECLAIM is currently transitioning to a command-and-control regulatory structure to achieve source-specific and/or industry-specific BARCT level of NO<sub>x</sub> controls, which will provide further emission reductions (more details are provided in the next section under South Coast AQMD's Adopted Rules and Programs Since 2016 AQMP).
- **Rule 1111 (Reduction of NO<sub>x</sub> Emissions from Natural-Gas-Fired, Fan-Type Central Furnaces) and CLEANair Furnace Rebate Program**  
Rule 1111 was originally adopted in 1978 to reduce NO<sub>x</sub> emissions from natural-gas-fired, fan-type central furnaces used for residential and commercial space heating. Rule 1111 was amended in 2009 to lower the NO<sub>x</sub> emission limit from 40 to 14 nanograms per Joule (ng/J), and was again amended in 2014 to include a mitigation fee option where manufacturers can pay a per-unit fee in lieu of meeting the Ultra Low-NO<sub>x</sub> emission limit of 14 ng/J. In addition, through the CLEANair Furnace Rebate Program, South Coast AQMD provides an incentive to residents who purchase and install a compliant furnace that meets Rule 1111 NO<sub>x</sub> emission limit. Emission reduction benefits from implementation of Rule 1111 will continue until 2035.

- Rule 1146.2 (Large Water Heater, Small Boilers and Process Heaters)  
The 1998 adoption of Rule 1146.2 established NO<sub>x</sub> emission limits for large water heaters and small boilers ranging from 75,000 Btu/hr up to and including 2 million Btu/hr (MMBtu/hr). New water heaters or boilers greater than 0.4 MMBtu/hr and less than or equal to 2 MMBtu/hr were required to meet an emission limit of 30 ppm of NO<sub>x</sub>. New units from 75,000 Btu/hr to 0.4 MMBtu/hr were required to meet a NO<sub>x</sub> emission limit of 55. Rule 1146.2 was amended in May 2006 to address NO<sub>x</sub> emission limits for new equipment. With the exception for small pool heaters rated less than or equal to 400,000 Btu/hr, new manufactured units greater than 400,000 Btu/hr must meet a NO<sub>x</sub> emission limit of 20 ppm starting January 1, 2010. Most new manufactured units less than or equal to 400,000 Btu/hr must meet a 20 ppm NO<sub>x</sub> limit by January 1, 2012. Pool heaters rated less than or equal to 400,000 Btu/hr, will continue to meet the existing limit of 55 ppm. Emission reduction benefits from implementation of Rule 1146.2 will continue until 2020.
- Rule 1147 (NO<sub>x</sub> Reductions from Miscellaneous Sources)  
Under Rule 1147, equipment requiring South Coast AQMD permits that are not regulated by other NO<sub>x</sub> rules must meet an emission limit of 30 or 60 parts per million (ppm) of NO<sub>x</sub> depending upon equipment type and process temperature. Compliance dates for emission limits are based on the date of equipment manufacture and emission limits are applicable to older equipment first. Owners of existing equipment are provided at least 15 years of use before they must meet rule emission limits. Specific categories of newer units have later compliance dates. Smaller and low emission units get more time to comply with emission limits than larger units. These small sources are not subject to rule emission limits until they are at least 20 years old. These units are required to demonstrate compliance with rule emission limits starting July 1, 2017. Rule 1147 was amended in September 2011 to delay implementation dates up to two years, remove a requirement for fuel or time meters and provide compliance flexibility for small and large sources. Emission reduction benefits from implementation of Rule 1147 will continue until 2023.

In addition to the regulatory approach, South Coast AQMD has also implemented incentive funding programs to encourage the immediate use of commercially available, low, near-zero and zero emissions mobile and stationary technologies. These incentive programs provide ongoing emission reductions from a variety of source categories. Examples of those incentive programs include:

- Carl Moyer Memorial Air Quality Standards Attainment Program for heavy-duty diesel engines retrofit and replacement with cleaner technologies;
- Clean School Buses Incentives for public school districts to purchase new alternative fuel school buses in order to retire their older polluting diesel buses and to replace expired alternative fuel bus tanks;

- Electric Lawn and Garden Equipment Program cleans the air through the replacement of gasoline-powered residential lawn mowers and commercial lawn and garden equipment with lower emission models at substantial discounts;
- Surplus Off-Road Opt-In for NO<sub>x</sub> (SOON) Program for the purchase of low-emission heavy-duty engines for off-road diesel fleet vehicles;
- Proposition 1B – Goods Movement Emissions Reduction Program to reduce diesel air pollution from goods movement operations;
- Enhanced Fleet Modernization Program (EFMP) for retirement of older higher polluting vehicles;
- Volkswagen Environmental Mitigation Trust that provides funding to mitigate excess emissions from the heavy-duty sector through the replacement or repower of older, heavy-duty vehicles, engines and equipment with zero emission and other clean technologies; and
- Mobile Source Air Pollution Review Committee (MSRC) Clean Transportation Initiative that the MSRC is partnering with South Coast AQMD to enhance the initiatives available under the On-Road Heavy-Duty Voucher Incentive Program (VIP). The VIP provides funding to owners/operators with fleets of 10 or fewer vehicles to replace older vehicles with engine models that are 2013 emissions-compliant or newer to help clean up emissions from older, more polluting vehicles.

These incentive programs have resulted in early emission reductions of NO<sub>x</sub> from on-road and off-road mobile sources beyond existing regulations.

### ***South Coast AQMD Adopted Rules and Programs Since 2016 AQMP But Not Yet Reflected in the Inventory***

Since the adoption of the 2016 AQMP, South Coast AQMD has adopted several rules and programs to further reduce NO<sub>x</sub> and VOC emissions. While emissions reductions from existing regulations and programs are expected to provide the needed reductions for attaining the 1997 8-hour ozone standard, the recently adopted rules and regulations would provide additional emission reductions benefits and assurances towards attainment. Table 4-1 summarizes NO<sub>x</sub> and VOC rules that have been adopted or amended by the South Coast AQMD since the 2016 AQMP. Pursuant to directives listed in control measure CMB-05 of the 2016 AQMP and in recently adopted state statute (AB 617), RECLAIM facilities are subject to an expedited schedule to implement additional BARCT no later than December 31, 2023. As a result, Rules 1110.2, 1117, 1134, 1135, and 1146 series have been adopted and/or amended in the 2018–2020 timeframe to implement CMB-05 and AB 617. Rule 1110.2 (Emissions from Gaseous- and Liquid-Fueled Engines) reduces emissions of NO<sub>x</sub>, VOC, and CO from all stationary and portable engines rated over 50 rated brake

horsepower (bhp). Rule 1117 (Emissions of Oxides of Nitrogen from Glass Melting Furnaces) establishes NO<sub>x</sub> and SO<sub>x</sub> emission standards for container glass melting and sodium silicate furnaces, including NO<sub>x</sub> emission limits for auxiliary combustion equipment associated with container glass melting operations. Rules 1134 (Emissions of Oxides of Nitrogen from Stationary Gas Turbines) and 1135 (Emissions of Oxides of Nitrogen from Electricity Generating Facilities) apply to RECLAIM and non-RECLAIM facilities. Both rules include more stringent NO<sub>x</sub> emission limits to reflect current BARCT and provide implementation timeframes to facilitate the transition of the NO<sub>x</sub> RECLAIM program to a command-and-control regulatory structure. Rule 1146 series (1146, 1146.1, and 1146.2) update the NO<sub>x</sub> emission limits for boilers, heaters, and steam generators covered under these rules. The revised NO<sub>x</sub> emission limits represent BARCT and apply to RECLAIM and non-RECLAIM facilities. The implementation of all these rule amendments will result in approximately 5.7 tpd of NO<sub>x</sub> reductions.

The 2016 AQMP also includes Facility-Based Mobile Source Measures covering marine ports (MOB-01), railyards (MOB-02), warehouse/distribution centers (MOB-03), commercial airports (MOB-04), and new development and redevelopment projects (EGM-01). These measures are intended to help achieve the emission reductions attributed to CARB's Further Deployment of Cleaner Technology measures by reducing emissions from these facilities through South Coast AQMD actions. In May 2018, the South Coast AQMD Governing Board directed staff to pursue various approaches for reducing emissions from these large indirect sources: a voluntary Memorandum of Understanding (MOU) approach with marine ports and commercial airports, and regulatory approaches for warehouses/distribution centers, railyards and new developments and re-development projects. In December 2019, the Facility-Based Mobile Source Control Measure for Commercial Airports (in the form of MOUs with the five commercial airports) was adopted with an expected reduction of 0.52 tpd of NO<sub>x</sub> emissions in 2023. This measure implements the 2016 AQMP Control Measure MOB-04, Emission Reductions at Commercial Airports and applies to Los Angeles International Airport, John Wayne Airport, Hollywood Burbank Airport, Ontario International Airport, and Long Beach Airport.

Additional NO<sub>x</sub> emission reductions are anticipated from continued implementation of existing incentive programs with future funding. Finally, additional reductions are anticipated from deployment of Metrolink's Tier 4 locomotives, which were not included in the 2016 AQMP emissions inventory. The majority of emission reductions benefits in Table 4-1 are expected to occur in the South Coast Air Basin. However, because the ozone levels in the Coachella Valley are mostly due to emissions in the South Coast Air Basin, these reductions will result in reduced ozone in the Coachella Valley.

**TABLE 4-1**

Rules and Programs Adopted or Amended by South Coast AQMD since 2016 AQMP (January 2016 to August 2020)

Source	Rule No – Rule Title	Adoption Date	Implementation End Date	VOC Reductions (tons per day)	NOx Reductions (tons per day)	2016 AQMP Control Measure No.

\* 2012 AQMP Control Measure

### ***CARB Key Mobile Source Regulations and Programs Providing Emission Reductions in Future Baseline Emissions***

Given the severity of California's air quality challenges and the need for ongoing emission reductions, the CARB has implemented the most comprehensive mobile source emissions control program in the nation. CARB's comprehensive program relies on four fundamental approaches:

- Stringent emissions standards that minimize emissions from new vehicles and equipment;
- In-use programs that target the existing fleet and require the use of the cleanest vehicles and emissions control technologies;
- Cleaner fuels that minimize emissions during combustion; and
- Incentive programs that remove older, dirtier vehicles and equipment and replace those vehicles with the cleanest technologies.

This multi-faceted approach has spurred the development of increasingly cleaner technologies and fuels and achieved significant emission reductions across all mobile source sectors that go far beyond national programs or programs in other states. These efforts extend back to the first mobile source regulations adopted in the 1960s, and pre-date the federal CAA of 1970, which established the basic national framework for controlling air pollution. In recognition of the pioneering nature of CARB's efforts, the CAA provides California unique authority to regulate mobile sources more stringently than the federal government by providing a waiver of preemption for its new vehicle emission standards under Section 209(b). This waiver provision preserves a pivotal role for California in the control of emissions from new motor vehicles, recognizing that California serves as a laboratory for setting motor vehicle emission standards. Since then, the CARB has consistently sought and obtained waivers and authorizations for its new motor vehicle and off-road regulations. CARB's history of progressively strengthening standards as technology advances, coupled with the waiver process requirements, ensures that California's regulations remain the most stringent in the nation. A list of regulatory actions CARB has taken since 1985 is provided at the end of this analysis to highlight the scope of CARB's actions to reduce mobile source emissions.

Since 2000, CARB adopted numerous regulations aimed at reducing exposure to diesel PM and NO<sub>x</sub>. These regulations are aimed at freight transport sources such as heavy-duty diesel trucks, transportation sources such as passenger cars and buses, and off-road sources such as large construction equipment. Phased implementation of these regulations will produce increasing emission reduction benefits through 2023 and beyond, as the regulated fleets are retrofitted, and as older and dirtier portions of the fleets are replaced with newer and cleaner models at an accelerated pace.

Further, CARB and South Coast AQMD staff work closely on identifying and distributing incentive funds to accelerate cleanup of engines. Key incentive programs include: Low Carbon Transportation, Air Quality Improvement Program, Volkswagen Mitigation Trust, Community Air Protection, Carl Moyer Program, Goods Movement Program, and Funding Agricultural Replacement Measures for Emission Reductions (FARMER). These incentive-based programs work in tandem with regulations to accelerate deployment of cleaner technology.

### ***I) Light-Duty Vehicles***

NOx emissions from light-duty vehicles and key programs contributing to those reductions in the Coachella Valley have been reduced significantly since 1990 and will continue to go down through 2023 due to the benefits of CARB's longstanding light-duty mobile source program. Key light-duty programs include the Advanced Clean Cars program (ACC), On-Board Diagnostics (OBD), Reformulated Gasoline (RFG), Incentive Programs, and the Enhanced Smog Check Program.

Since setting the nation's first motor vehicle exhaust emission standards in 1966 that led to the first pollution controls, California has dramatically tightened emission standards for light-duty vehicles. California is unique in that it is the only state authorized under the Clean Air Act to set more stringent mobile source standards than the federal standards. Through CARB regulations, today's new cars pollute 99 percent less than their predecessors did thirty years ago. In 1970, CARB required auto manufacturers to meet the first standards to control NOx emissions along with hydrocarbon emissions. The simultaneous control of emissions from motor vehicles and fuels led to the use of cleaner-burning RFG that has removed the emissions equivalent of 3.5 million vehicles from California's roads. Since CARB first adopted it in 1990, the Low-Emission Vehicle Programs (LEV and LEV II) and Zero-Emission Vehicle (ZEV) Program have resulted in the production and sales of hundreds of thousands of ZEVs in California.

#### ***i. Advanced Clean Cars***

CARB's groundbreaking ACC program is now providing the next generation of emission reductions in California, and ushering in a new zero emission passenger transportation system. The success of these programs is evident: California is the world's largest market for ZEVs, with over 21 models available today, and a wide variety are now available at lower price points, attracting new consumers. As of October 2019, Californians drive nearly 50 percent of all ZEVs on the road in the United States, while the U.S. makes up about half of the world market. This movement towards commercialization of advanced clean cars has occurred due to CARB's ZEV regulation, part of ACC, which affects passenger cars and light-duty trucks.

CARB's ACC Program, approved in January 2012, is a pioneering approach of a 'package' of regulations that – although separate in construction – are related in terms of the synergy developed to address both ambient air quality needs and climate change. The ACC program combines the control of smog, soot causing pollutants and greenhouse gas emissions into a single coordinated

package of requirements for model years 2015 through 2025. The program assures the development of environmentally superior cars that will continue to deliver the performance, utility, and safety vehicle owners have come to expect.

The ACC program approved by CARB in January 2012 also included amendments affecting the current ZEV regulation through the 2017 model year in order to enable manufacturers to successfully meet 2018 and subsequent model year requirements. These ZEV amendments are intended to achieve commercialization through simplifying the regulation and pushing technology to higher volume production in order to achieve cost reductions. The ACC Program benefits will increase over time as new cleaner cars enter the fleet displacing older and dirtier vehicles. However, in 2019, the federal government finalized Part 1 of the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which revoked California's authority to set more stringent standards for light duty vehicles. In 2020, Part 2 of that rule was finalized, rolling back previously adopted vehicle standards. These rules threaten the ACC Program and clean air quality progress made in California.

ii. On Board Diagnostics

California's first OBD regulation required manufacturers to monitor some of the emission control components on vehicles starting with the 1988 model year. In 1989, CARB adopted OBD II, which required 1996 and subsequent model year passenger cars, light-duty trucks, and medium-duty vehicles and engines to be equipped with second generation OBD systems. OBD systems are designed to identify when a vehicle's emission control systems or other emission-related computer-controlled components are malfunctioning, causing emissions to be elevated above the vehicle manufacturer's specifications. CARB subsequently strengthened OBD II requirements and added OBD II specific enforcement requirements for 2004 and subsequent model year passenger cars, light-duty trucks, and medium-duty vehicles and engines.

iii. Reformulated Gasoline

Since 1996, CARB has been regulating the formulation of gasoline resulting in California gasoline being the cleanest in the world. California's cleaner-burning gasoline regulation is one of the cornerstones of the State's efforts to reduce air pollution and cancer risk. RFG is fuel that meets specifications and requirements established by CARB. The specifications reduced motor vehicle toxics by about 40 percent and reactive organic gases by about 15 percent. The results from cleaning up fuel can have an immediate impact as soon as it is sold in the State. Vehicle manufacturers design low-emission emission vehicles to take full advantage of cleaner-burning gasoline properties.

iv. Incentive Programs

There are a number of different incentive programs focusing on light-duty vehicles that produce extra emission reductions beyond traditional regulations. The incentive programs work in two ways, encouraging the retirement of dirty older cars and encouraging the purchase of a cleaner vehicle.

Voluntary accelerated vehicle retirement or “car scrap” programs provide monetary incentives to vehicle owners to retire older, more polluting vehicles. The purpose of these programs is to reduce fleet emissions by accelerating the turnover of the existing fleet and subsequent replacement with newer, cleaner vehicles. Both State and local vehicle retirement programs are available.

California’s voluntary vehicle retirement program is administered by the Bureau of Automotive Repair (BAR) and provides \$1,000 per vehicle and \$1,500 for low-income consumers for unwanted vehicles that have either failed or passed their last Smog Check Test and that meet certain eligibility guidelines. This program is referred to as the Consumer Assistance Program.

In recent years, the California Legislature has allocated significant funding increases towards incentive-based programs. In fiscal year 2019-20, the Clean Vehicle Rebate Project (CVRP) was allocated \$238 million. CVRP is designed to offer vehicle rebates on a first-come, first-serve basis for light-duty ZEVs, plug-in hybrid electric vehicles, and zero-emission motorcycles. Through March 2019, CVRP has provided rebates for nearly 320,000 vehicles at a total of just over \$720 million since the project’s launch in 2010.

Clean Cars 4 All (formerly known as the Enhanced Fleet Modernization Program Plus-Up Pilot Project) provides incentives for lower-income consumers living in and near disadvantaged communities who scrap their old vehicles and purchase new or used hybrid, plug-in hybrid, or zero-emission vehicle replacement vehicles. Since fiscal year 2014–2015, CARB has allocated \$112 million for Clean Cars 4 All.

v. California Enhanced Smog Check Program

BAR is the State agency charged with administration and implementation of the Smog Check Program. The Smog Check Program is designed to reduce air pollution from California registered vehicles by requiring periodic inspections for emission-control system problems, and by requiring repairs for any problems found. In 1998, the Enhanced Smog Check program began in which Smog Check stations relied on the BAR-97 Emissions Inspection System (EIS) to test tailpipe emissions with either a Two-Speed Idle (TSI) or Acceleration Simulation Mode (ASM) test depending on where the vehicle was registered. For instance, vehicles registered in urbanized areas received an ASM test, while vehicles in rural areas or received a TSI test.

In 2009, the following requirements were added in to improve and enhance the Smog Check Program, making it more inclusive of motor vehicles and effective on smog reductions:

- Low pressure evaporative test;
- More stringent pass/fail cutpoints;
- Visible smoke test; and
- Inspection of light- and medium-duty diesel vehicles.

The next major change was due to AB 2289, adopted in October 2010, a new law restructuring California's Smog Check Program, streamlining and strengthening inspections, increasing penalties for misconduct, and reducing costs to motorists. This new law sponsored by CARB and BAR, promised faster and less expensive Smog Check inspections by taking advantage of OBD software installed on all vehicles since 2000. The new law also directs vehicles without this equipment to high-performing stations, helping to ensure that these cars comply with current emission standards. This program will reduce consumer costs by having stations take advantage of diagnostic software that monitors pollution-reduction components and tailpipe emissions. Beginning mid-2013, testing of passenger vehicles using OBD was required on all vehicles model years 2000 or newer.

## ***II) Heavy-Duty Trucks***

NO<sub>x</sub> emissions from heavy-duty vehicles and key programs contributing to those reductions in the Coachella Valley have decreased significantly since 1990 and will continue to decrease through 2023 due to the benefits of CARB's long-standing heavy-duty mobile source program. Key programs include Heavy-Duty Engine Standards, Clean Diesel Fuel, the Truck and Bus Regulation and Incentive Programs.

### *i. Heavy-Duty Engine Standards*

Since 1990, heavy-duty engine NO<sub>x</sub> emission standards have become dramatically more stringent, dropping from 6 grams per brake horsepower-hour (g/bhp-hr) in 1990 down to the current 0.2 g/bhp-hr standard, which took effect in 2010. In addition to mandatory NO<sub>x</sub> standards, there have been several generations of optional lower NO<sub>x</sub> standards put in place over the past 15 years. Most recently in 2015, engine manufacturers can certify in California to three optional NO<sub>x</sub> emission standards of 0.1 g/bhp-hr, 0.05 g/bhp-hr, and 0.02 g/bhp-hr (i.e., 50 percent, 75 percent, and 90 percent lower than the current mandatory standard of 0.2 g/bhp-hr). The optional standards allow local air districts and CARB to preferentially provide incentive funding to buyers of cleaner trucks, to encourage the development of cleaner engines.

### *ii. Clean Diesel Fuel*

Since 1993, CARB has required that diesel fuel have a limit on the aromatic hydrocarbon content and sulfur content of the fuel. Diesel powered vehicles account for a disproportionate amount of

the diesel PM, which is considered a toxic air contaminant. In 2006, CARB required a low-sulfur diesel fuel to be used not only by on-road diesel vehicles but also for off-road engines. The diesel fuel regulation allows alternative diesel formulations as long as emission reductions are equivalent to the CARB formulation.

iii. *Cleaner In-Use Heavy-Duty Trucks (Truck and Bus Regulation)*

The Truck and Bus Regulation was first adopted in December 2008. This rule represents a multi-year effort to turn over the legacy fleet of engines and replace them with the cleanest technology available. In December 2010, CARB revised specific provisions of the in-use heavy-duty truck rule, in recognition of the deep economic effects of the recession on businesses and the corresponding decline in emissions.

Starting in 2012, the Truck and Bus Regulation phases in requirements applicable to an increasingly larger percentage of the truck and bus fleet over time, so that by 2023 nearly all older vehicles will be upgraded to have exhaust emissions meeting 2010 model year engine emissions levels while continuing to lower NO<sub>x</sub> levels through 2023. The regulation applies to nearly all diesel-fueled trucks and buses with a GVWR greater than 14,000 pounds that are privately or federally owned, including on-road and off-road agricultural yard goats, and privately and publicly owned school buses. Moreover, the regulation applies to any person, business, school district, or federal government agency that owns, operates, leases or rents affected vehicles. The regulation also establishes requirements for any in-state or out-of-state motor carrier, California-based broker, or any California resident who directs or dispatches vehicles subject to the regulation. Finally, California sellers of a vehicle subject to the regulation would have to disclose the regulation's potential applicability to buyers of the vehicles. Approximately 170,000 businesses in nearly all industry sectors in California, and almost a million vehicles that operate on California roads each year are affected. Some common industry sectors that operate vehicles subject to the regulation include: for-hire transportation, construction, manufacturing, retail and wholesale trade, vehicle leasing and rental, bus lines, and agriculture.

In 2017, California passed legislation ensuring compliance with the Truck and Bus Regulation through the California Department of Motor Vehicles (DMV) vehicle registration program. Starting January 1, 2020, DMV will verify compliance to ensure that vehicles subject to the Truck and Bus Regulation meet the requirements prior to obtaining DMV vehicle registration. The law requires the DMV to deny registration for any vehicle that is non-compliant or has not reported to CARB as compliant or exempt from the Truck and Bus Regulation.

CARB compliance assistance and outreach activities that are key in support of the Truck and Bus Regulation include:

- The Truck Regulations Upload and Compliance Reporting System, an online reporting tool developed and maintained by CARB staff;

- The Truck and Bus regulation's fleet calculator, a tool designed to assist fleet owners in evaluating various compliance strategies;
- Targeted training sessions all over the State; and
- Out-of-state training sessions conducted by a contractor.

CARB staff also develops regulatory assistance tools, conducts and coordinates compliance assistance and outreach activities, administers incentive programs, and actively enforces the entire suite of regulations. Accordingly, CARB's approach to ensuring compliance is based on a comprehensive outreach and education effort.

*iv. Incentive Programs*

There are a number of different incentive programs focusing on heavy-duty vehicles that produce extra emission reductions beyond traditional regulations. The incentive programs encourage the purchase of cleaner trucks.

Several State and local incentive funding pools have been used historically, and remain available, to fund the accelerated turnover of on-road heavy-duty vehicles. Since the Carl Moyer Memorial Air Quality Standards Attainment Program (Moyer Program) began in 1998 nearly \$1 billion in Moyer Program incentive grants have been used to clean up over 60,000 older engines in California. This has reduced NO<sub>x</sub> and ROG emissions by more than 183,000 tons, and particulate matter by more than 6,700 tons statewide.

Beginning in 2008, the Goods Movement Emission Reduction Program funded by Proposition 1B has funded cleaner trucks for the region's transportation corridors; the final increment of funds will implement projects through 2020.

The California Legislature has recently allocated significant funding increases towards heavy-duty vehicle incentive-based programs. The Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP) is the cornerstone of advanced technology heavy-duty incentives, providing funding since 2010 to support the long-term transition to zero-emission vehicles in the heavy-duty market. Since its inception in 2009, HVIP has been allocated over \$447 million. HVIP has supported the purchase of 2,559 zero-emission trucks and buses, 2,631 hybrid trucks, 2,068 low NO<sub>x</sub> engines, and 195 trucks with electric power take off systems by California fleets through June 30, 2019.

CARB has also administered a Truck Loan Assistance Program since 2009. As of June 30, 2019, about \$113.2 million in Truck Loan Assistance Program funding has been expended to provide about \$1.5 billion in financing to small-business truckers for the purchase of approximately 26,000 cleaner trucks, exhaust retrofits, and trailers throughout California.

### ***III) Off-Road Sources***

Off-road sources encompass equipment powered by an engine that does not operate on the road. Sources vary from ships to lawn and garden equipment and for example, include sources like locomotives, aircraft, tractors, harbor craft, off-road recreational vehicles, construction equipment, forklifts, and cargo handling equipment.

NOx emissions from off-road equipment and key programs contributing to those reductions have decreased significantly in the Coachella Valley since 1990 and will continue to decrease through 2023 due to the benefits of CARB's and U.S. EPA long-standing programs. Key programs include Off-Road Engine Standards, Locomotive Engine Standards, Clean Diesel Fuel, Cleaner In-Use Off-Road Regulation and In-Use Large Spark Ignition (LSI) Fleet Regulation.

#### *i. Off-Road Engine Standards*

The Clean Air Act preempts states, including California, from adopting requirements for new off-road engines less than 175 HP used in farm or construction equipment. California may adopt emission standards for in-use off-road engines pursuant to Section 209(e)(2), but must receive authorization from U.S. EPA before it may enforce the adopted standards.

CARB first approved regulations to control exhaust emissions from small off-road engines (SORE) such as lawn and garden equipment in December 1990 with amendments in 1998, 2003, 2010, 2011, and 2016. These regulations were implemented through three tiers of progressively more stringent exhaust emission standards that were phased in between 1995 and 2008.

Manufacturers of forklift engines are subject to new engine standards for both diesel and large spark ignition (LSI) engines. Off-road diesel engines were first subject to engine standards and durability requirements in 1996 while the most recent Tier 4 Final emission standards were phased in starting in 2013. Tier 4 emission standards are based on the use of advanced after-treatment technologies such as diesel particulate filters and selective catalytic reduction. LSI engines have been subject to new engine standards that include both criteria pollutant and durability requirements since 2001 with the cleanest requirements phased-in starting in 2010.

#### *ii. Locomotive Engine Standards*

The Act and the U.S. EPA national locomotive regulations expressly preempt states and local governments from adopting or enforcing "any standard or other requirement relating to the control of emissions from new locomotives and new engines used in locomotives" (U.S. EPA interpreted new engines in locomotives to mean remanufactured engines, as well). U.S. EPA has approved two sets of national locomotive emission regulations (1998 and 2008). In 1998, U.S. EPA approved the initial set of national locomotive emission regulations. These regulations primarily emphasized NOx reductions through Tier 0, 1, and 2 emission standards. Tier 2 NOx emission

standards reduced older uncontrolled locomotive NO<sub>x</sub> emissions by up to 60 percent, from 13.2 to 5.5 g/bhp-hr.

In 2008, U.S. EPA approved a second set of national locomotive regulations. Older locomotives upon remanufacture are required to meet more stringent particulate matter (PM) emission standards which are about 50 percent cleaner than Tier 0–2 PM emission standards. U.S. EPA refers to the PM locomotive remanufacture emission standards as Tier 0+, Tier 1+, and Tier 2+. The new Tier 3 PM emission standard (0.1 g/bhp-hr), for model years 2012-2014, is the same as the Tier 2+ remanufacture PM emission standard. The 2008 regulations also included new Tier 4 (2015 and later model years) locomotive NO<sub>x</sub> and PM emission standards. The U.S. EPA Tier 4 NO<sub>x</sub> and PM emission standards further reduced emissions by approximately 95 percent from uncontrolled levels.

In April 2017, CARB petitioned U.S. EPA for rulemaking, seeking the amendment of emission standards for newly built locomotives and locomotive engines and lower emission standards for remanufactured locomotives and locomotive engines. The petition asks U.S. EPA to update its standards to take effect for remanufactured locomotives in 2023 and for newly built locomotives in 2025. The new emission standards would provide critical criteria pollutant reductions, particularly in the disadvantaged communities that surround railyards.

*iii. Clean Diesel Fuel*

Since 1993, CARB has required that diesel fuel have a limit on the aromatic hydrocarbon content and sulfur content of the fuel. Diesel powered vehicles account for a disproportionate amount of the diesel particulate matter which is considered a toxic air contaminant. In 2006, CARB required a low-sulfur diesel fuel to be used not only by on-road diesel vehicles but also for off-road engines. The diesel fuel regulation allows alternative diesel formulations as long as emission reductions are equivalent to the CARB formulation.

*iv. Cleaner In-Use Off-Road Equipment (Off-Road Regulation)*

The Off-Road Regulation which was first approved in 2007 and subsequently amended in 2010 in light of the impacts of the economic recession. These off-road vehicles are used in construction, manufacturing, the rental industry, road maintenance, airport ground support and landscaping. In December 2011, the Off-Road Regulation was modified to include on-road trucks with two diesel engines.

The Off-Road Regulation will significantly reduce emissions of diesel PM and NO<sub>x</sub> through 2023 from the over 150,000 in-use off-road diesel vehicles that operate in California. The regulation affects dozens of vehicle types used in thousands of fleets by requiring owners to modernize their fleets by replacing older engines or vehicles with newer, cleaner models, retiring older vehicles or using them less often, or by applying retrofit exhaust controls.

The Off-Road Regulation imposes idling limits on off-road diesel vehicles, requires a written idling policy, and requires a disclosure when selling vehicles. The regulation also requires that all vehicles be reported to CARB and labeled, restricts the addition of older vehicles into fleets, and requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing verified exhaust retrofits. The requirements and compliance dates of the Off-Road Regulation vary by fleet size.

Fleets are subject to increasingly stringent restrictions on adding older vehicles. The regulation also sets performance requirements. While the regulation has many specific provisions, in general by each compliance deadline, a fleet must demonstrate that it has either met the fleet average target for that year, or has completed the Best Available Control Technology requirements. The performance requirements of the Off-Road Regulation were phased in from January 1, 2014 through January 1, 2019.

Compliance assistance and outreach activities in support of the Off-Road Regulation include the following activities.

The Diesel Off-road On-line Reporting System, an online reporting tool developed and maintained by CARB staff.

The Diesel Hotline (866-6DIESEL), which provides the regulated public with questions about the regulations and access to CARB staff. Staff is able to respond to questions in English, Spanish and Punjabi.

The Off-road Listserv, providing equipment owners and dealerships with timely announcement of regulatory changes, regulatory assistance documents, and reminders for deadlines.

v. LSI In-Use Fleet Regulation

Forklift fleets can be subject to either the LSI fleet regulation, if fueled by gasoline or propane, or the off-road diesel fleet regulation. Both regulations require fleets to retire, repower, or replace higher-emitting equipment in order to maintain fleet average standards. The LSI fleet regulation was originally adopted in 2007 with requirements beginning in 2009. While the LSI fleet regulation applies to forklifts, tow tractors, sweeper/scrubbers, and airport ground support equipment, it maintains a separate fleet average requirement specifically for forklifts. The LSI fleet regulation requires fleets with four or more LSI forklifts to meet fleet average emission standards.

vi. Incentive Programs

There are a number of different incentive programs focusing on off-road mobile sources that increase the penetration of cleaner technologies into the market. The incentive programs encourage the purchase of cleaner diesel engines.

The Clean Off-Road Equipment Voucher Incentive Project (CORE) is a voucher project similar to HVIP, but for advanced technology off-road equipment. The fiscal year 2017–2018 Funding Plan allocated \$40 million to support zero-emission freight equipment through CORE. CARB launched CORE at the end of 2019.

California’s agricultural industry consists of approximately 77,500 farms and ranches, providing over 400 different commodities, making agriculture one of the State’s most diverse industries. In recognition of the strong need and this industry’s dedication to reducing their emissions, the State Legislature has allocated over \$330 million towards the FARMER Program since 2017. CARB staff developed the FARMER Program to meet the State Legislature’s objectives and help meet the State’s criteria, toxic, and greenhouse gas emission reduction goals. As of September 30, 2019, the FARMER Program has spent \$97 million on over 2,500 pieces of agricultural equipment and will reduce 250 tons of PM<sub>2.5</sub> and 4,200 tons of NO<sub>x</sub> over the lifetime of the projects.

A complete listing of CARB’s existing regulations and the adoption dates are provided in Appendix III.

### *CARB Recent Regulations Adopted But Not Yet Reflected in the Inventory*

Recent regulations have been adopted for on-road and off-road mobile sources since the release of the 2016 AQMP. The emissions inventory and attainment demonstration included in this Plan reflect all on-road regulations incorporated in EMFAC 2017 and off-road regulations included in the 2016 AQMP. While the emissions benefits from these newly adopted programs are not yet reflected in the base or future inventories, the emissions reductions will support monitored attainment of the 0.08 ppm 8-hour ozone standard in the Coachella Valley. These programs are listed below.

- **Innovative Clean Transit** – The Innovative Clean Transit (ICT) Regulation seeks to transition buses in California to zero-emission by 2040. The ICT regulation requires California transit agencies to gradually transition their buses to zero-emission technologies beginning with a requirement that only zero emission buses can be purchased starting in 2029. The ICT regulation is structured to allow transit agencies to take advantage of incentive programs by acting early and, also implementing plans that are best suited to their unique situation.
- **Zero-Emission Airport Shuttle Bus** – The Zero-Emission Airport Shuttle Regulation (Shuttle Regulation) will transition combustion-powered vehicles that serve California's commercial airports to zero-emission vehicles (ZEVs). Specifically, the Shuttle Regulation requires fixed route airport shuttles serving California’s 13 largest airports to transition to 100 percent ZEVs by 2035. The Shuttle Regulation applies to public and private fleets, including operators of parking facilities, rental car agencies, and hotels.

- The Advanced Clean Truck (ACT) regulation adopted by the Board on June 25, 2020 will accelerate the widespread adoption of zero-emission vehicles (ZEVs) in the medium-and heavy-duty truck sector and reduce the amount of harmful emissions generated from on-road mobile sources. The ACT regulation requires truck manufacturers to sell increasing numbers of zero-emission trucks (ZEVs) in California annually. Medium- and heavy-duty vehicle manufacturers must produce and sell ZEVs beginning with the 2024 model year with increasing sales annually through the 2035 model year when 55 percent of annual Class 2b-3 vehicle sales, including pickup trucks, must be ZEVs, 75 percent of annual Class 4-8 vehicle sales must be ZEVs, and 40 percent of Class 7-8 Tractor sales must be ZEVs.
- Ocean Going Vessels-At Berth – The Control Measure for Ocean-Going Vessels at Berth (At Berth Regulation) is designed to achieve added public health and air quality benefits by requiring emission controls at additional ports and terminals, including marine terminals that operate independently from a port or port authority, and vessels not covered by the previous ocean-going vessel regulation.
- Omnibus Low-NOx Regulation – The Heavy-Duty Engine and Vehicle Omnibus Regulation (Omnibus Regulation) establishes new exhaust emission standards, test procedures, and other emission-related requirements for 2024 and subsequent model year California-certified on-road heavy-duty engines. The Omnibus Regulation implements two measures included within CARB’s 2016 State Strategy for the State Implementation Plan: a “Low-NOx Engine Standard” which will significantly reduce NOx emissions from new engines during certification; and a “Lower In Use Emission Performance Level,” which will ensure in-use heavy-duty vehicles continue to control emissions throughout their useful lives.

As described above, there are several new programs that will provide significant reductions of NOx between now and 2023 and beyond 2023. Most notably, of the already approved regulations, are the Truck and Bus regulation and the Off-Road regulation. In addition to these approved regulations, the Board is considering measures that will provide further reductions in 2023.

The 2023 projected attainment date is based on the emission reductions from existing regulations and programs. The recently adopted regulations by South Coast AQMD and CARB, described in this Chapter, will provide further reductions to ensure that Coachella Valley will attain the standard in or before 2023. The earlier attainment of the standard was also evaluated. However, given the time it takes to adopt and implement new regulations, and given that the 2022 ozone season begins less than 18 months from the date of Plan adoption, no new feasible measures were identified which could be adopted and implemented in time to provide additional reductions to further accelerate the attainment.

## 5. FUTURE AIR QUALITY

### *Ozone Modeling Approach*

The Coachella Valley Planning Area is defined, for the purposes of this Plan, as the desert portion of Riverside County in the Salton Sea Air Basin (SSAB), and is part of the South Coast AQMD, which also includes the Basin. The Coachella Valley is the most populated area in this desert region, which encompasses several communities, including Palm Springs, Desert Hot Springs, Cathedral City, Rancho Mirage, Palm Desert, Indian Wells, La Quinta, Indio, Coachella, Thermal, and Mecca. In February 2020, the U.S. EPA reclassified Coachella Valley to an extreme nonattainment area from a severe-15 nonattainment area for the 1997 8-hour ozone NAAQS. As a result, the new attainment deadline for the region is June 15, 2024, 20 years from the date of the original designation, which requires an attainment demonstration in 2023. In this attainment demonstration, ozone concentrations are simulated for the 2018 base year and the future attainment year of 2023 to demonstrate that the Coachella Valley will attain the 1997 8-hour ozone standard in 2023.

### *Design Values*

While 3-year design values (DVs), defined as the 3-year averages of the fourth highest daily max 8-hour average ozone in each year, are used to determine attainment status of an air basin, the 5-year weighted design values are used in the modeled attainment demonstration per the U.S. EPA's guidance.<sup>13</sup> This is calculated based on the average of three 3-year design values. The U.S. EPA guidance<sup>1</sup> recommends the use of multiple year averages of design values, where appropriate, to dampen the effects of single year anomalies in the air quality trend due to factors such as adverse or favorable meteorology or radical changes in the local emissions profile. In the current attainment demonstration, three 3-year design values, 2015–2017, 2016–2018 and 2017–2019 were used. 2019 is the latest available measurement data for this Plan.

The trend of 3-year DV in Coachella Valley are presented in Figure 5-1. While the ozone air quality has improved substantially in the Coachella Valley over the past 30 years, the most recent 8-hour design value indicates that the area is still in nonattainment of the ozone NAAQSs. The design value for the 2017–2019 period is 89 parts per billion (ppb), which exceeds the 1997 8-hour ozone standard (84 ppb) by 6 percent.

Table 5-1 presents the 5-year weighted DVs used in the 2016 AQMP and updated values representing the 2015–2019 time period used for the current attainment demonstration. Compared to the 2016 AQMP DVs, the new values show progress in ozone air quality in the Coachella Valley.

Palm Springs	92	89.3
Indio	85	84.3

### *Ozone Modeling*

The ozone modeling employs a similar approach as described in the 2016 AQMP attainment demonstrations<sup>14</sup> with updates in the modeling platform, input databases, and emissions inventory. The year 2018 was used as baseline year to develop meteorological conditions and an emissions inventory that are used as an anchor year to project future emissions and design values. While the U.S. EPA's guidance recommends to use the center year of the five years (2015 to 2019) for the weighted design value as the baseline year for the modeling and emissions inventory, the guidance states that any one of the five years can be used as the baseline year. Year 2018 was chosen to avoid unusual meteorological conditions, which occurred with the high frequency of stagnant

<sup>14</sup> South Coast AQMD (2017), 2016 Air Quality Management Plan, Appendix V, Modeling and Attainment Demonstration. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-v.pdf?sfvrsn=10>.

dispersion conditions observed during the ozone season in 2017. In addition, choosing 2018 as baseline modeling year takes advantage of the rich measurement dataset collected during the Multiple Air Toxics Exposure Study V (MATES V), which was conducted from May 2018 to April 2019.

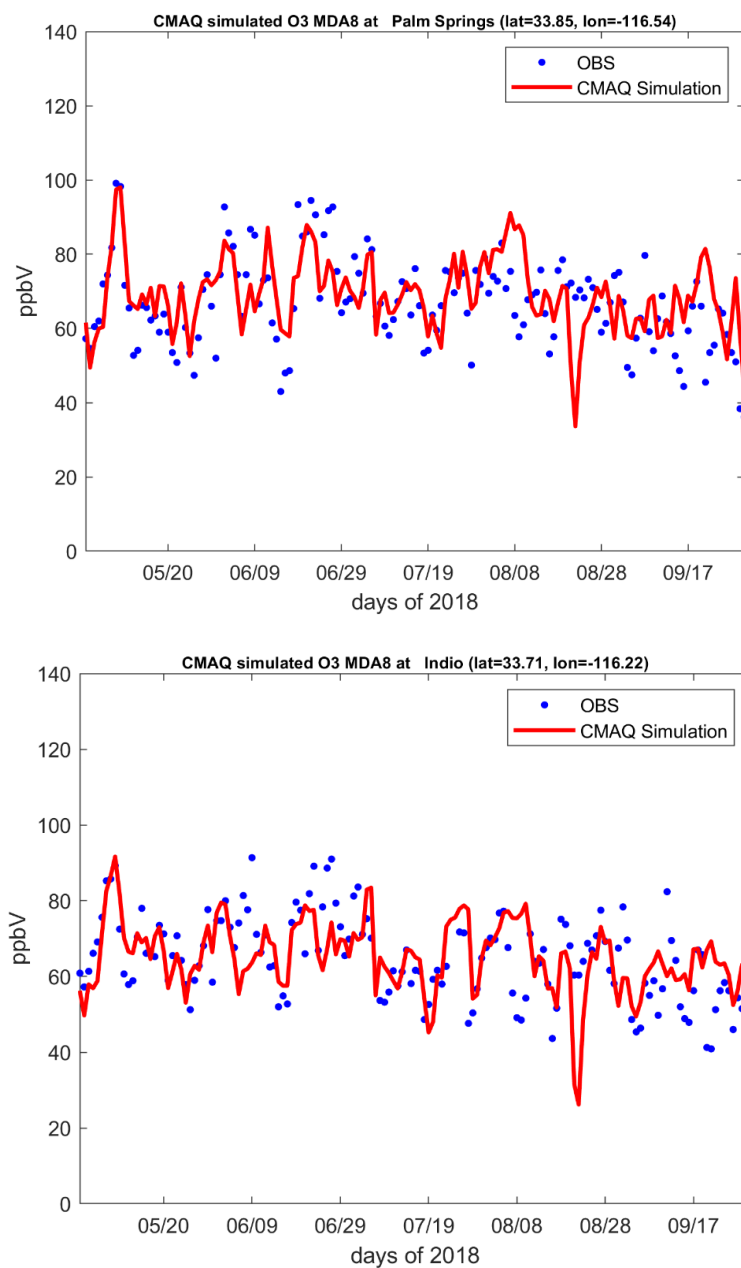

The Community Multiscale Air Quality (CMAQ) model, version 5.0.2, was employed to simulate the ozone season that spanned from May 1 through September 30, 2018. The latest available CMAQ model, version 5.3.1 was used as weight of evidence and discussed in Weight of Evidence section of this Chapter. Meteorological inputs were generated using the Weather Research Forecast (WRF) model version 4.0.3, and biogenic VOC emissions were estimated using MEGANv3. The simulations included 3672 consecutive hours from which daily max 8-hour average ozone concentrations were calculated.

### ***Model Performance Evaluation***

Model performance was evaluated against the measured ozone concentrations. Figure 5-2 depicts the comparison of daily maximum 8-hour ozone for Palm Springs and Indio stations. In general, the model prediction shows good agreement with measurements, with a slight tendency to underestimate the peak ozone days but with overall insignificant positive bias during the May to September ozone season. Statistics for both sites are presented in Table 5-2. The U.S. EPA guidance<sup>15</sup> requires that the model predictions be applied in a relative rather than absolute sense using Relative Reduction Factor (RRF). With this approach, potential biases present in model prediction are less likely transferred to future design values.

### *Future Ozone Air Quality*

The CMAQ-WRF modeling system was used to predict future design values in the 2023 attainment year. The 2023 baseline emissions reflect the impact of adopted regulations. These include both South Coast AQMD and CARB's regulations as reflected in the 2016 AQMP and CARB's EMFAC 2017 model. The 2016 AQMP used EMFAC 2014 to develop the on-road mobile source emissions. Future year design values are determined using site-specific RRFs applied to the 5-year weighted ozone design values per the U.S. EPA guidance. A set of RRFs were generated using the average of the top 10 high days in the base year, taking corresponding future year concentrations of the 10 days, and calculating the ratio of the future top 10-day concentration to the base year top 10-day concentration. The resulting RRFs were applied to the current 5-year weighted ozone design values to calculate future design values. Results presented in Table 5-3 show that the Coachella Valley is projected to attain the 1997 federal 8-hour ozone standard in 2023 without any additional controls beyond the existing regulations reflected in the 2016 AQMP for stationary and off-road mobile sources and in the EMFAC 2017 for on-road mobile sources.

A sensitivity simulation was conducted for 2022 to test the possibility of early ozone attainment in Coachella Valley. The modeling results suggested that the Coachella Valley might achieve early attainment with the existing regulations – one year ahead of the 2023 attainment year deadline. However, the year 2023 is being retained as the attainment year given uncertainties in meteorology, the emission inventory and the modeling approach.

**TABLE 5-3**  
Eight-Hour Average 5-Year Weighted Ozone Concentrations (ppb)

Station	2018	2023
Palm Springs	89.3	83.2
Indio	84.3	79.1

### *Unmonitored Area Analysis*

The U.S. EPA modeling guidance recommends that the attainment demonstration include a formal analysis to confirm that all modeling grid cells within a nonattainment area meet the federal standard. This analysis uses both measured design values and modelled ozone concentrations throughout the modelling domain to estimate design values at unmonitored locations. Five-year weighted design values are calculated for all monitoring stations within the modelling domain for the 2015 to 2019 period. These measured design values are then interpolated spatially using a natural-neighbor algorithm based on Voronoi tessellation. Only stations that meet the U.S. EPA's data completeness requirement for each of the 5 years are included in the analysis. The unmonitored area analysis followed the same procedure of calculating RRFs as in the attainment demonstration, except that all grid cells within the Coachella Valley were considered. The RRFs were then applied to the interpolated measurement field to calculate future year design values.

When all valid ozone design values were interpolated, they were too sparsely populated near the boundary of Coachella Valley to reasonably guide design value contours in the areas furthest from the Palm Springs and Indio stations. If only the monitors with valid design values are used in the spatial interpolation, the unmonitored area analysis produces unreasonably high ozone design concentrations in the northwestern portion of Coachella Valley. This was primarily due to higher ozone design values observed in the South Coast Air Basin (Basin), which unduly influenced the interpolated concentrations in the Coachella Valley. In light of this, a couple of modifications were implemented to minimize the impact of Basin monitors and place greater weight on monitors within or near the Coachella Valley. First, the Morongo monitor was excluded in favor of the monitor located at Banning Airport, which is operated and maintained by South Coast AQMD. Second, a pseudo-monitor was placed halfway between Banning and Big Bear, and its design value was set equal to that of the Joshua Tree – Black Rock monitor. This pseudo-monitor, marked with black dot and orange circle in Figures 5-3 and 5-4 is an arbitrary location added in the spatial interpolation with the intention to capture the expected ozone concentration in the mountains north of Banning, where no monitoring data is available. Two additional pseudo-monitors, with design values equal to that of Joshua Tree – Pinto Wells, were located east of Coachella Valley in order to guide the interpolation. Figures 5-3 and 5-4 provide the resulting 8-hour ozone design concentrations in the base and future years for all grid cells within the Coachella Valley.

High ozone levels are anticipated to persist in 2023 in the area northwest of Palm Springs, while the eastern portion of the Coachella Valley will see design concentrations drop significantly below the 0.08 ppm standard. Nevertheless, while recognizing significant uncertainty embedded in the unmonitored area analysis, the entire Coachella Valley is expected to attain the 1997 8-hour ozone standard in 2023.

**FIGURE 5-3**

2018 Baseline 8-Hour Ozone Design Concentrations (ppb). Monitoring Stations with Valid Design Values and Pseudo-Stations are Denoted by Black Dots and Orange Circles, Respectively

**FIGURE 5-4**

### *Ozone Sensitivity to NO<sub>x</sub> and VOC Emission Reductions*

Ozone sensitivity to NO<sub>x</sub> and VOC emissions is analyzed using ozone isopleth plots. Isopleth plots show ozone concentrations resulting from parametrically changing NO<sub>x</sub> and VOC emissions in regular increments across the Basin. Each point in the isopleth plot shows the ozone design value as a result to setting the total basin-wide emissions denoted by NO<sub>x</sub> and VOC emissions. Namely, each point is the result of simulating the entire ozone season with specific NO<sub>x</sub> and VOC emissions, requiring large computational resources. Figure 5-5 shows the isopleth plot for the Palm Springs monitoring station, which is the design value station for the Coachella Valley. The isopleth was generated running a total of 36 simulations, spanning emissions perturbations in the 2023 baseline emissions from 0 percent to 100 percent in increments of 20 percent of both NO<sub>x</sub> and VOC emissions. Figure 5-5 was presented in Appendix V of the 2016 AQMP,<sup>16</sup> and while baseline emissions in this Plan differ from the ones presented in the 2016 AQMP due to emission updates, the fundamental chemistry of ozone sensitivity has not changed. Hence, the overall ozone sensitivity should remain similar to Figure 5-5. The ozone isopleth for the Indio monitoring station, which can be found in Appendix V of the 2016 AQMP, shows a similar shape indicating similar sensitivity of ozone to changes in precursor emissions. As shown in Figure 5-5, ozone concentration in Palm Springs is much more sensitive to changes in NO<sub>x</sub> emissions than to changes in VOC emissions, and indicates that NO<sub>x</sub> emission reduction is key for ozone attainment in the Coachella Valley.

**FIGURE 5-5**  
2023 8-Hour Ozone Isopleth for Palm Springs

Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-v.pdf?sfvrsn=10>.

### *Weight of Evidence*

The ozone concentrations in the Coachella Valley have significantly decreased as shown by trends of the fourth highest 8-hr ozone concentrations at the monitoring stations in the area (Figure 5-1). Even though there was an increase in 2017 and 2018, ozone concentrations have experienced an overall downward trend over the last three decades, and there is confidence that this downward trend will continue, and the area will attain the ozone standard by the 2023 deadline. In fact, a sensitivity simulation using 2022 baseline emissions shows earlier ozone attainment in Coachella Valley in 2022. However, considering the potential uncertainties in meteorology, emission inventory and modeling approach, the year 2023 is retained as the attainment year. Moreover, additional emission controls in the South Coast Air Basin that result from the implementation of the recently adopted regulations since the 2016 AQMP will further ensure the attainment of the Coachella Valley.<sup>17</sup>

Because emission projections in this Plan are consistent with the modeling set-up of the 2016 AQMP, the attainment demonstration presented here is also based on the same CMAQ version (version 5.0.2). The latest version of CMAQ (version 5.3.1, released in December 2019) includes several improvements with respect to version 5.0.2. Sensitivity runs using the latest version of CMAQ were conducted to determine the effect of model versions on attainment demonstration results. CMAQ 5.3.1 produced very similar results compared with the ones obtained using CMAQ 5.0.2. Model performance with the latest version is comparable to the one presented in this report, and future design values have a minor difference, which does not change the results in the attainment demonstration. With the latest version, the Coachella Valley is also expected to attain the 8-hour ozone standard which provides additional weight of evidence for the modeling of the attainment demonstration.

### *Conclusion*

Recent air quality trends and the updated modeling analysis in this Plan indicate that the Coachella Valley is on track to attain the ozone air quality standard by the new attainment year of 2023 based on the ongoing implementation of already adopted regulations for stationary and on-road/off-road mobile sources in the South Coast Air Basin and the Coachella Valley. The Coachella Valley located downwind of the South Coast Air Basin will continue to benefit from the rigorous control programs and associated emission reductions in the South Coast Air Basin. Regional modeling results indicate that reducing NO<sub>x</sub> emissions in the Basin is the most effective way to improve ozone air quality in Coachella Valley. The continued implementation of the 2016 AQMP control measures to attain the 1997 and 2008 ozone NAAQS in the South Coast air basin (including recently adopted regulations since the 2016 AQMP) will continue to bring substantial ozone air quality benefits to the Coachella Valley.

## 6. OTHER FEDERAL CLEAN AIR ACT REQUIREMENTS

Additional Clean Air Act (CAA) requirements were triggered by the Coachella Valley's recent reclassification from Severe to Extreme nonattainment area for the 1997 8-hour ozone standard. The earlier chapters (Chapters 3–5) fulfill the requirements related to emissions inventory, control strategy, and attainment demonstration. This chapter addresses the other CAA requirements for Coachella Valley as an Extreme nonattainment area.

### *Reasonable Further Progress*

The CAA requires that SIPs for most nonattainment areas demonstrate reasonable further progress (RFP) towards attainment through emission reductions phased in from the time of the SIP submission until the attainment date. The RFP requirements in the CAA are intended to ensure that there are sufficient emission reductions in each nonattainment area to attain the NAAQS by the applicable attainment date. Per CAA Section 171(1), RFP is defined as:

*“such annual incremental reductions in emissions of the relevant air pollutant as are required by this part or may reasonably be required by the Administrator for the purpose of ensuring attainment of the applicable national ambient air quality standard by the applicable date.”*

As stated in subsequent federal regulation, the goal of the RFP requirements is for areas to achieve generally linear progress toward attainment. To determine RFP for the attainment date, the U.S. EPA guidance states that the plan should rely only on emission reductions achieved from sources within the nonattainment area. Section 172(c)(2) of the CAA requires that nonattainment area plans show ongoing annual incremental emissions reductions toward attainment, which is commonly expressed in terms of benchmark emissions levels or air quality targets to be achieved by certain interim milestone years.

Clean Air Act Subpart 2 Sections 182 (b)(1) and 182(c)(2)(B) contain specific emission reduction targets to ensure that each ozone nonattainment area provides for sufficient precursor emission reductions to attain the ozone NAAQS. Section 182(b)(1)(A) requires that each Moderate or above area provide for VOC reductions of at least 15 percent from baseline emissions within six years after November 15, 1990. Furthermore, Section 182(c)(2)(B) requires that Serious and above areas provide VOC and/or NO<sub>x</sub> reductions of an additional 3 percent per year starting at the end of the baseline year and out to their attainment year. The 2007 AQMP, the initial SIP designed to address the 1997 8-hour ozone standard, included the RFP demonstration for the Coachella Valley. It showed that from 2002 to 2008, a 15 percent VOC-only reduction was achieved through reductions in baseline emissions. It also provided for VOC and/or NO<sub>x</sub> reductions of 3 percent per year from the 2002 baseline year averaged over each consecutive three-year period beginning in 2008 until the Coachella Valley's then attainment year of 2018.

Given Coachella Valley's new attainment date of June 2024 as an Extreme nonattainment area, the RFP analysis continues from the last RFP milestone year of 2017 to the new attainment year of 2023. The baseline year used to evaluate the RFP emissions reduction requirement was 2002, which was the baseline year used in the 2007 AQMP. For this plan, the 2002 emissions were estimated (backcasted) with the methodology described in Chapter 3. The 2002 summer planning emissions for Coachella Valley are 22.85 and 54.24 tpd for VOC and NO<sub>x</sub>, respectively. As such, the 3 percent annual reduction required is 0.686 tpd. Since the 2007 AQMP already addressed the RFP requirements up to 2017, this RFP demonstration will include the RFP analysis for the milestone year of 2020 and the attainment year of 2023.

Tables 6-1 and 6-2 summarize the RFP calculations for VOC and NO<sub>x</sub>, respectively. For each of the milestone year, the baseline emission levels are compared to the CAA target levels. The required progress (3 percent reduction per year) is met based on reductions from existing regulatory programs (baseline emissions) using a combination of VOC and NO<sub>x</sub> reductions. For the milestone years 2020 and the attainment year 2023, the baseline VOC emissions are higher than the target (Figure 6-1), and NO<sub>x</sub> baseline reductions are used to compensate the VOC shortfall (Table 6-2). CAA Section 182(c)(2)(C) allows NO<sub>x</sub> reductions to substitute VOC shortfall for RFP target. This RFP demonstration shows compliance with RFP requirements by combining VOC and NO<sub>x</sub> reductions. A more detailed breakdown of the emission inventory by major source category can be found in Appendix I of this Plan.

**TABLE 6-1**  
Summary of Reasonable Further Progress Calculation – VOC

ROW	CALCULATION STEP <sup>a</sup>	2002 <sup>b</sup>	2020	2023 <sup>c</sup>
1	Baseline VOC Emissions (tpd)	22.85	14.30	14.44
2	Required Percent Reduction from Base Year (%)		51	60
3	Target VOC Level (tpd)		11.2	9.1
4	Cumulative Milestone Year Shortfall (tpd)		3.1	5.3
5	Cumulative Shortfall in VOC (%)		13.6	37.1
6	Incremental Milestone Year Shortfall (%)		13.6	23.5

<sup>a</sup> Units are in tons per day (summer planning) unless otherwise noted

<sup>b</sup> Base Year (2002)

<sup>c</sup> Attainment Year

**Row Description**

Row 1: Baseline emissions taking into account existing rules and projected growth

Row 2: Required 15% VOC reduction six years after base year; and 3% per year thereafter (total VOC reductions from 2002 baseline year)

Row 3:  $[(1 - \text{Row 2}/100) \times (\text{Row 1 Base Year})]$

Row 4:  $[(\text{Row 1}) - (\text{Row 3})]$  or  $(\text{Baseline} - \text{Target})$  - negative number meets target level and positive number is shortfall of target level

Row 5:  $[(\text{Row 4}) / (\text{Row 1 Base Year}) \times 100]$

Row 6: Negative (Row 5) is zero shortfall; positive number is a shortfall. Incremental milestone year shortfall is determined by subtracting the previous year's shortfall from the cumulative

<sup>b</sup> Base Year (2002)

<sup>c</sup> Attainment Year

#### **Row Description**

Row 1: Baseline emissions taking into account existing rules and projected growth

Row 2: Reductions achieved in Baseline: [(Row 1 Base Year) – (Row 1 Milestone Year)]

Row 3: % Reductions achieved since Base Year: [(Row 2) / (Row 1 Base Year)] × 100

Row 4: Reserves 3% (1 year worth of CAA RFP reductions) for contingency measure implementation plus the previous year(s)'s incremental milestone year VOC shortfall from Table 6-1

Row 5: [(Row 3) – (Row 4)]

Row 6: Incremental milestone year VOC shortfall from Table 6-1

Row 7: Surplus reductions achieved [(Row 5) – (Row 6)]

Row 8: Positive number in Row 7 is percent surplus for each milestone year, thus meeting RFP target levels

Row 9: Surplus includes 3% contingency carryover and VOC shortfall, and still meets RFP target levels

### ***Milestones for South Coast AQMD Stationary Source Regulations***

Baseline emissions, as shown in Tables 6-1 and 6-2, incorporate emission reductions achieved from control measures that are already adopted as regulations. For example, the 2020 baseline emission is the projection from 2018 and it incorporates population and economic growth as well as all adopted control measures that will be implemented (partially or fully) by December 31, 2020. Table 6-3 provides a list of the South Coast AQMD's adopted rules and regulations for stationary sources that are scheduled to be implemented beyond 2018, accounting for the reductions in the baseline emissions of the future milestone/attainment years.

**TABLE 6-3**  
Implementation Schedule of South Coast AQMD Adopted Rules and Regulations  
for Reasonable Further Progress per Milestone/Attainment Year

	2020 Milestone Year	2023 Attainment Year
NO <sub>x</sub>	Rule 1146.2 <sup>a</sup>	
	Rule 1147 <sup>b</sup>	<u>Rule 1147 <sup>b</sup></u>
	RECLAIM Rule 2002 <sup>c</sup>	<u>RECLAIM Rule 2002 <sup>c</sup></u>
	Rule 1111 <sup>d</sup>	Rule 1111 <sup>d</sup>

<sup>a</sup> Full implementation achieved in 2020

<sup>b</sup> Full implementation achieved in 2023

<sup>c</sup> Full implementation achieved in 2022

<sup>d</sup> Reductions achieved annually with full implementation in 2035

### ***Milestones for State Mobile Source Regulations***

The RFP demonstration in the Coachella Valley Extreme Area Plan relies, in part, on NO<sub>x</sub> reductions from California mobile source regulations. Specifically, the following two mobile source regulations are key for reducing emissions in future milestone years.

- Milestone 1. Implementation of the On-Road Heavy-Duty Diesel Vehicles Regulation in 2020 through 2023
- Milestone 2. Implementation of the In-Use Off-Road Diesel-Fueled Fleets Regulation in 2020 through 2023

### ***RFP Demonstration for Milestone Year 2020***

This section describes the progress of meeting the 2020 milestone and verifies that the emissions reductions needed to demonstrate RFP for 2020 have been achieved, and that ongoing progress is being made to meet the 1997 8-hour ozone standard by 2023.

### ***Milestones for South Coast AQMD Stationary Source Regulations***

As demonstrated in Tables 6-1 and 6-2, baseline inventory (existing regulatory programs) is used to meet the RFP requirement. The 2020 baseline inventory is 14.3 and 15.8 tpd for VOC and NO<sub>x</sub> respectively. Four South Coast AQMD rules, namely Rule 1146.2, Rule 1147, RECLAIM (Reg

XX), and Rule 1111 impact NO<sub>x</sub> baseline emissions in 2020 (Table 6-3). Two of these four rules (Rule 1146.2 – Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters and RECLAIM) have been implemented as anticipated, and the emission reductions associated with Rule 1146.2 and RECLAIM have been achieved for the milestone year of 2020. It should be noted that Rule 1146.2 was amended in December 2018 as part of the RECLAIM transition. However, under this amendment, the NO<sub>x</sub> emission limit remains unchanged, and the amendment has no impacts on the 2020 baseline emissions. A technology assessment will be conducted to evaluate the feasibility of lowering the NO<sub>x</sub> concentration limit for units regulated under Rule 1146.2 no later than January 1, 2022.

The other two rules (Rule 1111 and Rule 1147) were amended after the submittal of the 2016 AQMP, resulting in minor changes to the baseline emissions that have not yet been reflected in the current emission inventory. They are discussed below.

- Rule 1111 – Reduction of NO<sub>x</sub> Emissions from Natural-Gas-Fired, Fan-Type Central Furnaces

Rule 1111 was amended three times after the 2016 AQMP submittal. The amendment on March 2, 2018 increases and extends the mitigation fee compliance option until 2021; provides an exemption from the mitigation fee increase for units already committed in a contractual agreement; and prevents the installation of propane furnaces in the South Coast AQMD that are capable of being operated on natural gas, without proper certification. The March 2018 amendment results in an emission reduction delay of up to 0.29 tpd in 2023. Rule 1111 was amended again in July 2018 to add a Consumer Notification Requirement on distributed or published informative materials. There are no NO<sub>x</sub> emission impacts related to this amendment. In December 2019, Rule 1111 was amended to provide a limited exemption to manufacture, distribute, sell, and install low NO<sub>x</sub> furnaces (40 ng/J) in higher altitudes until October 1, 2020. It is estimated that this amendment will result in a minimal emission reduction delay (< 0.001 tpd).

- Rule 1147 – NO<sub>x</sub> Reductions from Miscellaneous Sources

Rule 1147 was amended after the 2016 AQMP submittal and resulted in minor changes to the baseline emissions that were not reflected in the current emission inventory. Rule 1147 was amended in July 2017 to reflect the recommendations made in the Final Rule 1147 Technology Assessment and also to allow in-use equipment with NO<sub>x</sub> emissions less than one pound per day to defer compliance. The 2017 amendment also increased the NO<sub>x</sub> emission limit for certain equipment categories and exempted new and existing equipment rated at less than 325,000 Btu per hour. The 2017 amendment is expected to result in a NO<sub>x</sub> emissions reduction delay of up to 0.9 tpd. However, the emission reductions began to be recaptured in 2017 as the existing units are

regularly replaced and upgraded over time, leaving less than 0.03 tpd of forgone NO<sub>x</sub> emissions reductions associated with the exemption for equipment less than 325,000 Btu per hour.

Overall, the amendments of Rule 1111 and 1147 resulted in small amounts of delayed/forgone emission reductions (up to 1.2 tpd of NO<sub>x</sub>). However, given that the 2020 baseline emissions are significantly below the RFP targets for NO<sub>x</sub> (Table 6-2, surplus NO<sub>x</sub> reduction is 58.5 percent), the impacts of the amendments will not interfere with the RFP demonstration in 2020 and the attainment of the standard by 2023.

#### Milestones for CARB's Mobile Source Regulations

CARB is reporting on the implementation of the *On-Road Heavy-Duty Diesel Vehicles Regulation* (Truck and Bus Regulation) and implementation of *In-Use Off-Road Diesel-Fueled Fleets Regulation* (Off-Road Regulation).

#### *Milestone 1. Implementation of the On-Road Heavy-Duty Diesel Vehicles Regulation through 2020*

CARB implementation of the Truck and Bus Regulation provided NO<sub>x</sub> emission benefits in 2020. The 2010 model-year engine requirement in the Truck and Bus Regulation provides NO<sub>x</sub> reductions beginning in 2015 and continuing through 2020 (Table 6-4).

**TABLE 6-4**  
Truck and Bus Regulation Implementation through 2020<sup>18</sup>

<b>2010 Engine Deadline</b>	<b>Vehicle Weight</b>	<b>Required Engine Turnover</b>
January 1, 2015	Heavier Trucks and Buses	Pre-1994
	Light-Duty Trucks and Buses	1995 and older
January 1, 2016	Heavier Trucks and Buses	1994-1995
	Light-Duty Trucks and Buses	1996
January 1, 2017	Heavier Trucks and Buses	1997
	Light-Duty Trucks and Buses	1997
January 1, 2018	Light-Duty Trucks and Buses	1998
January 1, 2019	Light-Duty Trucks and Buses	1999
January 1, 2020	Heavier Trucks and Buses	2000 & older
	Light-Duty Trucks and Buses	2003 & older

<sup>18</sup> Truck and Bus Regulation: <https://www.arb.ca.gov/regact/2014/truckbus14/tb14appa.pdf>.

*Milestone 2. Implementation of the In-Use Off-Road Diesel-Fueled Fleets Regulation through 2020*

The Off-Road Regulation requires owners to modernize their fleets by replacing older engines or vehicles with newer, cleaner models; retiring older vehicles or using them less often; or by applying retrofit exhaust controls. Beginning on July 1, 2014 the Off-Road Regulation<sup>19</sup> required Off-Road diesel-fueled fleets to meet increasingly stringent fleet average emission target rates based on the size of the fleet's horsepower (hp) (Table 6-5).

**TABLE 6-5**  
Off-Road Regulation Implemented through 2020

<b>Implementation Deadline</b>	<b>Fleet Size (total fleet hp)</b>	<b>Implementation Requirement</b>
2014–2020	Large (> 5000)	Met Annual Fleet Average Target
2017–2020	Medium (> 2500)	Met Annual Fleet Average Target
2019–2020	Small (< 2500)	Met Annual Fleet Average Target

CARB met the 2020 quantitative milestones. CARB's mobile source program will continue to provide emission reductions beyond 2020, ultimately contributing to attainment of the standard in 2023.

*Conclusion*

Overall, for the 2020 milestone year, RFP is achieved based on baseline emissions, which incorporate emission reductions achieved from control measures that are already adopted, as well as growth factors projected for each sector. South Coast AQMD and CARB have verified that the emissions reductions needed to demonstrate RFP for 2020 milestone year have been achieved, and that ongoing progress is being made to meet the 1997 8-hour ozone standard by 2023.

*Supplemental RACT Demonstration*

The CAA requires that areas classified as moderate nonattainment and higher must develop and submit a demonstration that their current air pollution regulations and emissions sources fulfill the Reasonably Available Control Technology (RACT) requirements. The threshold for defining stationary sources as major sources differs between the Severe and Extreme nonattainment areas. The major source threshold for Severe nonattainment areas is 25 tons per year (tpy) of VOC or NO<sub>x</sub>, whereas the threshold is 10 tpy for Extreme nonattainment areas. With reclassification of the Coachella Valley to an Extreme nonattainment area, the major stationary source threshold is lowered from 25 tpy to 10 tpy of VOC and NO<sub>x</sub> emissions. Pursuant to the requirements of CAA Section 182(e), the South Coast AQMD staff conducted an evaluation to demonstrate that all major

<sup>19</sup> Regulation for In-Use Off-Road Diesel-Fueled Fleets. Available at: <https://ww2.arb.ca.gov/sites/default/files/classic/msprog/ordiesel/documents/finalregorder-dec2011.pdf>.

stationary sources emitting 10 or more tpy of VOC or NO<sub>x</sub> emissions meet RACT in Coachella Valley.

South Coast AQMD staff has developed RACT demonstrations with respect to the 1997 8-hour ozone standard in 2006, and subsequently in 2014 with respect to the 2008 8-hour ozone standard for both South Coast Air Basin and Coachella Valley. The 2014 RACT Demonstration provided a comprehensive assessment of the South Coast AQMD's rules and regulations as part of the 2016 AQMP RACM analysis and control measure development. In 2017, the U.S. EPA fully approved the 2014 RACT Demonstration.<sup>20</sup> In 2020, a RACT Demonstration was conducted for Coachella Valley based on its Severe nonattainment classification of the 2015 8-hour ozone standard (herein refers as 2020 RACT<sup>21</sup>). The 2020 RACT Demonstration addressed both Control Techniques Guidelines (CTG) and non-CTG major<sup>22</sup> sources in the Coachella Valley emitting the 25 or more tpy of VOC and NO<sub>x</sub>. The 2020 RACT Demonstration evaluated over 48 of the U.S. EPA's CTG sources as well as 70 rules, regulations or guidelines adopted from March 2014 to February 2020 by other air districts, state air agencies, and the U.S. EPA. These rules and regulations were compared with the corresponding South Coast AQMD rules and regulations. The 2020 RACT Demonstration concluded that, with the exception of Rule 1115 (Motor Vehicle Assembly Line Coating Operations), South Coast AQMD's current rules for the applicable sources of VOC and NO<sub>x</sub> meet or exceed the federal RACT requirements. South Coast AQMD Rule 1115 is currently not as stringent as the U.S. EPA's CTG (Automobile and Light-Duty Truck Assembly Coatings) for several coatings and products for facilities emitting greater than 15 pounds per day. In addition, the VOC emission limits in Rule 1115 for several coating types are less stringent than those in the corresponding Antelope Valley Air Quality Management District and San Joaquin Valley Air Pollution Control District's rules. Therefore, South Coast AQMD has committed to amend Rule 1115 to address these deficiencies. It should be noted that all facilities subject to Rule 1115 and the corresponding CTG are located in the South Coast Air Basin and none are within Coachella Valley. Thus, all the applicable sources in Coachella Valley were determined to be subject to RACT level of control in the 2020 RACT analysis. The 2020 RACT Demonstration was submitted to the U.S. EPA for inclusion into SIP in August 2020.

Since the 2020 RACT Demonstration covered facilities emitting 25 or more tpy of VOC and NO<sub>x</sub> emissions and it included an evaluation of rules and regulations up to February 2020, a supplemental RACT analysis is conducted here to address the 1997 8-hour ozone NAAQS Extreme nonattainment area requirement for Coachella Valley building upon the 2020 RACT Demonstration. The supplemental RACT Demonstration provides updates for (1) RACT analysis

---

<sup>20</sup> 82 FR 43850 (October 20, 2017).

<sup>21</sup> Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, South Coast AQMD, May 2020. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>.

<sup>22</sup> Major sources that are not covered by the U.S. EPA CTGs are called non-CTG major sources.

for facilities with Potential to Emit (PTE) emissions between 10 and 25 tpy of VOC or NO<sub>x</sub> and (2) rules and regulations adopted in other air agencies from March 2020 to June 2020.

To identify the major stationary source facilities of VOC and NO<sub>x</sub>, a search was conducted of the South Coast AQMD's permit database. Two facilities, namely Armtec Defense Production Co. and Eisenhower Medical Center, were found to have PTE emissions between 10 and 25 tpy of NO<sub>x</sub> or VOC. Armtec Defense Production Co. is subject to and compliant with the VOC and NO<sub>x</sub> emission limits of South Coast AQMD Rules 442 – Usage of Solvents (amended December 15, 2000), 1171 – Solvent Cleaning Operations (amended May 1, 2009), and 1147 – NO<sub>x</sub> Reductions from Miscellaneous Sources (amended July 7, 2017). Eisenhower Medical Center is subject to and compliant with NO<sub>x</sub> emissions requirements in South Coast AQMD Rule 1110.2 – Emissions from Gaseous- and Liquid-Fueled Engines (amended November 1, 2019) and Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters (amended December 7, 2018). Based on the 2014 and 2020 RACT analyses, these rules represent RACT level of controls for VOC and NO<sub>x</sub>. Thus, these two major source facilities are subject to RACT level of control.

Building upon the 2020 RACT analysis which covers updates up to February 2020, a detailed evaluation was conducted between newly adopted or amended rules by other ozone nonattainment air districts from March 2020 to June 2020 and the applicable South Coast AQMD's VOC and NO<sub>x</sub> rules. Table 6-6 lists the five VOC rules adopted by other air districts between March and June 2020. Table 6-7 summarizes the evaluation of South Coast AQMD rules for RACT. Overall, the applicable South Coast AQMD VOC rules meet RACT and are as stringent as or more stringent than other districts' rules. No NO<sub>x</sub> rules were adopted or amended by other air districts and agencies from March 2020 to June 2020 and thus, no further evaluation was conducted against South Coast AQMD's NO<sub>x</sub> rules beyond those already incorporated in the 2014 and 2020 RACT Demonstrations.

**TABLE 6-6**  
Recently Adopted (March 2020 to June 2020) Rules and Regulations Evaluated for  
Supplemental RACT Demonstration

<b>AGENCY</b>	<b>RULE NUMBER (TITLE)</b>
Antelope Valley Air Quality Management District	Rule 1107 (Coating of Metal Parts and Products)
Mojave Desert Air Quality Management District	Rule 1115 (Metal Parts & Products Coating Operations); Rule 1118 (Aerospace Assembly, Rework and Component Manufacturing Operations); Rule 1168 (Adhesive and Sealant Applications)
San Joaquin Valley Air Pollution Control District	Rule 4601 (Architectural Coatings)

**TABLE 6-7**  
Evaluation of Applicable South Coast AQMD Rules and Regulations

<b>RULE NO</b>	<b>RULE TITLE</b>	<b>CURRENT RULE REQUIREMENTS</b>	<b>OTHER AGENCIES' RULES AND FEDERAL GUIDANCE THAT ARE MORE STRINGENT</b>	<b>RACT EVALUATION</b>
1107	Coating of Metal Parts and Products (Amended 2/7/20)	Coating-specific emission limits from 2.3–3.5 lbs/gal. In lieu of complying with specific emission limits, operators can use air pollution control system with at least 95% control efficiency (or 5 ppmv outlet) and 90% capture efficiency. Solvent cleaning operations must comply with Rule 1171.1	<p>Antelope Valley Rule 1107 (Amended 4/21/20) generally has the similar coating-specific VOC limits and requirements as in South Coast Rule 1107, except for the following category: At least 95% reduction efficiency (or 50 ppmv outlet from air pollution control device) and 90% collection efficiency are required.</p> <p>Mojave Desert Rule 1115 (Amended 6/8/20) generally has similar coating-specific limits as in South Coast Rule 1107 such as coating limits (2.3–4.2 lbs/gal) for other new categories such as Drum and Chemical Agent Resistance. At least a 90% combined capture and control system efficiency is required.</p>	<p>Rule 1107 meets or exceeds EPA CTG requirements.</p> <p>For almost all categories, South Coast Rule 1107 is as stringent as or more stringent requirements than the other Districts' rules and provides RACT level of control for this source category.</p>
1113	Architectural Coatings (Amended 2/5/16)	The VOC content for Industrial Maintenance Coatings for color indicating safety coatings limit of 480 g/L, which is created to address hydrogen fluoride indicating paint use at refineries.	<p>San Joaquin Valley Rule 4601 (Amended 4/16/20) limits the VOC contents for Industrial Maintenance Coating to 250 g/L.</p> <p>Sacramento Metro Reg 4 Rule 442 limits the VOC contents for Industrial Maintenance Coating to 250 g/L.</p>	<p>Rule 1113 allows refineries that use hydrofluoric acid to use the higher VOC coatings on color indicating safety coatings provided that they are in one-liter containers or smaller. For San Joaquin Valley APCD and Sacramento Metro AQMD, there is no such refinery source. Overall, Rule 1113 requirements are as stringent as or more stringent than those in other districts for the applicable sources, and Rule 1113 meets RACT.</p>

**TABLE 6-7 (Concluded)**  
Evaluation of Applicable South Coast AQMD Rules and Regulations

<b>RULE NO</b>	<b>RULE TITLE</b>	<b>CURRENT RULE REQUIREMENTS</b>	<b>OTHER AGENCIES' RULES AND FEDERAL GUIDANCE THAT ARE MORE STRINGENT</b>	<b>RACT EVALUATION</b>
1124	Aerospace Assembly and Component Manufacturing Operations (Amended 9/21/01)	Coating-specific emission limits from 160–1,000 g/L. Specific high transfer coating applications (e.g., HVLP spray). In lieu of complying with specific emission limits, operator can use air pollution control system with at least 95% control efficiency for 50 ppm outlet and 90% capture efficiency.  Solvent cleaning operations must comply with Rule 1171.	Mojave Desert Rule 1118 (Amended 6/8/20) has the following limits that are more stringent than those in Rule 1124: <ul style="list-style-type: none"> <li>• Clear Topcoat (520 vs 420 g/L)</li> <li>• Other Topcoat (420 vs 340 g/L)</li> <li>• High-Temperature Coating (850 vs 720 g/L)</li> <li>• Rain Erosion-Resistant Coating (800 vs 600 g/L)</li> <li>• Non-Autoclavable Structural Adhesive (850 vs 700 g/L)</li> </ul>	Rule 1124 meets or exceeds the CTG requirements.  The categories with lower limits in Mojave Desert are low usage categories. South Coast AQMD Rule 1124 varies in stringency when compared to the other District's requirements. For almost all categories, Rule 1124 is as stringent as the other District's rule, and provides RACT level of control for this source category.
1168	Adhesive and Sealant Application (Amended 10/6/17)	VOC content limits for <ul style="list-style-type: none"> <li>• Select Architectural Adhesives: 50–250 g/L with future limits of 20–50 g/L in 2023.</li> <li>• Plastic Welding Cements: 490–510 g/L with future limits of 400–425 g/L in 2023.</li> <li>• Select Roofing Sealants: 300–450 g/L with future limits of 250 g/L in 2023.</li> </ul>	n/a*	Meets RACT.

\* There are no analogous requirements in other air agencies that are more stringent than the South Coast AQMD rule being evaluated.

### ***RACM Demonstration***

As an Extreme nonattainment area, a Reasonably Available Control Measures (RACM) Demonstration is required as part of the attainment plan. The CAA, Section 172(c)(1), sets the overall framework for the RACM analysis. The CAA requires the nonattainment air districts to:

*“provide for the implementation of all reasonably available control measures as expeditiously as practicable (including such reductions in emissions from existing sources in the area as may be obtained through the adoption, at a minimum, of reasonably available control technology) and shall provide for attainment of the national primary ambient air quality standards.”*

RACM is applicable to a wide range of sources (stationary, area, and mobile), and should include measures that are technologically and economically feasible. RACM should also include RACT, which applies to stationary sources and represents the lowest emission limitation that a particular source is capable of meeting by the application of control technology that is reasonably available considering technological and economical feasibility.<sup>23</sup> The U.S. EPA’s long-standing interpretation of the RACM provision is that the nonattainment air districts should consider all available control measures, including those being implemented in other areas, and that a state must adopt measures for an area only if those measures are economically and technologically feasible and will advance the attainment date or are necessary for reasonable further progress (RFP).

The purpose of the RACM analysis is to determine whether any feasible measures are available for inclusion in the 1997 8-hour ozone NAAQS Extreme Area Plan for Coachella Valley. As a component of the 2016 AQMP, South Coast AQMD conducted a comprehensive RACM/RACT analysis for the 2008 8-hour ozone standard. A 7-step analysis was conducted to identify potential control measures from various sources including an Air Quality Technology Symposium, preceding RACT/Best Available Control Technology (BACT) analysis, the U.S. EPA Technical Support Documents, other air districts’ control measures, control measures beyond RACM in the 2012 AQMP, the U.S. EPA Menu of Control Measures, and the U.S. EPA guidance documents. The potential control measures are then evaluated in the Control Measure Assessment section for feasibility. The RACM/RACT analysis provides a comparison of the South Coast AQMD rules and regulations governing precursor emission limits to those established by the U.S. EPA guidance and representative agencies within California and elsewhere throughout the U.S. The 2016 AQMP RACM Demonstration was approved by the U.S. EPA in 2017.<sup>24</sup> In addition to the 2016 AQMP RACM/RACT analysis, as mentioned earlier, a RACT Demonstration was recently conducted for the 2015 8-hour ozone NAAQS. The 2020 RACT Demonstration was submitted to the U.S. EPA for inclusion into the SIP in August 2020. Additional RACT analysis for the 1997 8-hour ozone NAAQS for Extreme nonattainment area has also been conducted, presented earlier in this chapter.

---

<sup>23</sup> 44 FR 53762 (September 17, 1979).

<sup>24</sup> 82 FR 26854 (June 12, 2017).

This Coachella Valley Extreme Area Plan RACM analysis builds upon the 2016 AQMP RACM Demonstration and the 2020 RACT Demonstration to review and where applicable update the South Coast AQMD control measures to advance emissions controls to meet the current state of the science.

The RACM evaluation is broken down into the following emission source categories:

- I. South Coast AQMD Stationary and Area Sources
- II. CARB Mobile and Area sources
- III. Transportation Control Strategies and Transportation Control Measures

### ***I. South Coast AQMD Stationary and Area Sources***

As part of the 2020 RACT Demonstration for the 2015 8-hour ozone NAAQS, as well as the Supplemental RACT Demonstration section presented earlier in this chapter, the evaluation of feasible measures has already been conducted for stationary sources. As such, this section focuses on the area sources. To identify emission sources with significant VOC or NO<sub>x</sub> emissions, the 2018 baseline planning emission inventory, segregated by the 3-digit Equipment Identification Code (EIC), was used. As presented in Table 6-8, the area sources account for 43 percent of VOC emissions and 3 percent of NO<sub>x</sub> emissions in the Coachella Valley. South Coast AQMD rules and regulations applicable to these area sources are also listed in Table 6-3. These rules and regulations had been evaluated as part of the 2012 AQMP RACM, 2016 AQMP RACM, and 2020 RACT Demonstrations. To capture all potential emission reduction opportunities for area sources, a supplemental RACM evaluation has also been conducted for this Plan by evaluating the rules and regulations adopted from February 2016 to August 2020 in other air quality agencies in ozone nonattainment areas. These air districts and state agencies are selected based on the severity of the ozone pollution, and they are listed below:

- Sacramento Metropolitan Air Quality Management District (Sacramento Metro AQMD)
- San Joaquin Valley Air Pollution Control District (San Joaquin Valley APCD)
- Ventura County Air Pollution Control District (Ventura County APCD)
- Antelope Valley Air Quality Management District (Antelope Valley AQMD)
- Mojave Desert Air Quality Management District (Mojave Desert AQMD)
- Delaware Natural Resources and Environmental Control
- Texas Commission on Environmental Quality

The recently adopted rules and regulations in other air agencies, listed in Table 6-9, represent control measures that are technologically feasible and cost effective which have been implemented in other ozone nonattainment areas.

**TABLE 6-8**  
2018 Area Source Emissions Inventory, Tons per Day

<b>EIC</b>	<b>Description</b>	<b>VOC</b>	<b>NOx</b>	<b>South Coast AQMD Rules and Regulations</b>
060	Service and Commercial	0.12	0.3	Rule 1110.2 (Emissions from Gaseous - and Liquid-Fueled Engines); Rule 1146 (Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters); Rule 1146.1 (Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters); Rule 1146.2 (Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters)
199	Waste Disposal	0.96	0.00	Rule 1133.3 (Emission Reductions from Greenwaste Composting Operations)
220	Degreasing	0.26	0.00	Rule 1122 (Solvent Degreasers)
230	Coatings and Related Process Solvents	1.28	0.00	Rule 442 (Usage of Solvents); Rule 1104 (Wood Flat Stock Coating Operations); Rule 1106 (Marine and Pleasure Craft Coatings); Rule 1106.1 (Pleasure Craft Coating Operations); Rule 1107 (Coating of Metal Parts and Products); Rule 1125 (Metal Container, Closure, and Coil Coating Operations); Rule 1126 (Magnet Wire Coating Operations); Rule 1128 (Paper, Fabric, and Film Coating Operations); Rule 1145 (Plastic, Rubber, Leather, and Glass Coatings); Rule 1151 (Motor Vehicle and Mobile Equipment Non-Assembly Line Coating Operations); Rule 1171 (Solvent Cleaning Operations)
250	Sealants and Adhesives	0.23	0.00	Rule 1168 (Adhesive and Sealant Applications)

	<b>Total Sources</b>	<b>14.38</b>	<b>18.33</b>	

**TABLE 6-9**

**Rules and Regulations Adopted from February 2016 to August 2020 for VOC and NOx Area Sources in Selected Air Agencies**

<b><u>AGENCY</u></b>	<b><u>RULE NUMBER (TITLE)</u></b>
<u>Sacramento Metro AQMD</u>	<u>Rule 414 (Water Heaters, Boilers and Process Heaters Rated Less Than 1,000,000 Btu Per Hour); Rule 468 (Surface Coating of Plastic Parts and Products)</u>
<u>San Joaquin Valley APCD</u>	<u>Rule 4307 (Boilers, Steam Generators, and Process Heaters); Rule 4601 (Architectural Coatings); Rule 4692 (Commercial Charbroiling); Rule 4905 (Natural Gas-Fired, Fan-Type Central Furnaces)</u>
<u>Ventura County APCD</u>	<u>Rule 7420 (Adhesives and Sealants)</u>
<u>Antelope Valley AQMD</u>	<u>Rule 1107 (Coating of Metal Parts and Products); Rule 1171 (Solvent Cleaning Operations)</u>
<u>Mojave Desert AQMD</u>	<u>Rule 461 (Gasoline Transfer and Dispensing); Rule 462 (Organic Liquid Loading); Rule 463 (Storage of Organic Liquids); Rule 1104 (Organic Solvent Degreasing Operations); Rule 1106 (Marine Coating Operations); Rule 1114 (Wood Products Coating Operations); Rule 1115 (Metal Parts &amp; Products Coating Operations); Rule 1117 (Graphic Arts and Paper, Film, Foil and Fabric Coatings); Rule 1162 (Polyester Resin Operations); Rule 1168 (Adhesive and Sealant Applications)</u>
<u>Texas Commission on Environmental Quality</u>	<u>30 TAC Chapter 115 (Control of Air Pollution from Volatile Organic Compounds (VOCs)); 30 TAC Chapter 334 (Underground and Aboveground Storage Tanks)</u>
<u>Delaware Natural Resources and Environmental Control</u>	<u>7 DE Admin. Code 1124 (Control of Volatile Organic Compound Emissions, Sections 26.0 – Gasoline Dispensing Facility Stage I Vapor Recovery and 36.0 – Vapor Emission Control at Gasoline Dispensing Facilities); 7 DE Admin. Code 1141 (Limited Emissions of Volatile Organic Compounds from Consumer and Commercial Products, Section 1.0 – Architectural and Industrial Maintenance Coatings)</u>

Tables 6-10 and 6-11 include a detailed evaluation of the applicable South Coast AQMD VOC and NOx rules that correspond to the rules in other air districts/agencies adopted from February 2016 to August 2020 listed in Table 6-9. For example, for the Antelope Valley AQMD's recently amended Rule 1107 in April 2020, an evaluation of the corresponding South Coast AQMD rule (i.e., Rule 1107) was performed and included in Table 6-10. As demonstrated in the 2016 AQMP RACM and this supplemental RACM evaluation, the requirements in South Coast AQMD rules and regulations are generally as stringent as, or more stringent than, the requirements in other air districts/agencies.

**TABLE 6-10**  
**Evaluation of Applicable South Coast AQMD Rules and Regulations for RACM Demonstration – VOC Rules**

<b><u>RULE NO</u></b>	<b><u>RULE TITLE</u></b>	<b><u>CURRENT RULE REQUIREMENTS</u></b>	<b><u>OTHER AGENCIES' RULES THAT ARE MORE STRINGENT<sup>#</sup></u></b>	<b><u>RACM EVALUATION</u></b>
461 <sup>^</sup>	Gasoline Transfer and Dispensing (Amended 4/6/12)	For Phase I, underground storage tanks: an enhanced vapor recovery system having 98% control efficiency and emission factor not exceeding 0.15 lbs/1,000 gallons; aboveground storage tanks: a vapor recovery system having 95% control efficiency. For Phase II, a vapor recovery system having 95% efficiency and emission factor not exceeding 0.38 lbs/1,000 gallons.	n/a*	Meets RACM.
462 <sup>^</sup>	Organic Liquid Loading (Amended 5/14/99)	Class B facilities loading organic liquids with a true vapor pressure of 1.5 psi or greater: a CARB certified vapor recovery system with 90% recovery efficiency.	Mojave Desert Rule 462 (Amended 1/22/18) requires a CARB certified vapor recovery and/or disposal system with 95% recovery efficiency for Class B facilities.	For a subcategory of applicable sources (Class B facilities), South Coast AQMD rule is not as stringent as Mojave Desert AQMD Rule 462 (90 vs. 95% of minimum vapor recovery efficiency required to obtain a CARB certification). However, compliance records indicate that the actual control efficiency exceeds 95%. Together with other requirements in Rule 462, Rule 462 meets the RACM requirements.
463 <sup>^</sup>	Organic Liquid Storage (Amended 11/4/11)	Aboveground organic liquids storage tanks with 9,630 gallons or greater, a minimum true vapor pressure is 0.5 psia; tanks with 19,815 gallons or greater, a minimum true vapor pressure is 1.5 psia. The minimum control efficiency of a vapor recovery system is at 95%.	Texas Rule Chapter 115 (Amended 1/5/17) requires 95% control efficiency for aboveground or underground storage tanks storing VOC with a true vapor pressure of 1.5 psia. Exempted tank capacity varies by region ranging from 1,000 to 210,000 gallons.  Mojave Desert Rule 463 (Amended 1/22/18) applies to aboveground and underground storage tanks with a capacity of 39,630 gallons or greater storing organic liquids with a true vapor pressure of 0.5 psia or greater.	Based on staff's evaluation, there are seven underground storage tanks storing organic liquids other than gasoline in South Coast AQMD. These storage tanks are either below the tank capacity threshold or store organic liquids that are below the vapor pressure threshold in other districts or agencies' rules. Therefore, the applicable sources in South Coast AQMD meet RACM level of control.
1106 <sup>^</sup>	Marine and Pleasure Craft Coatings (Amended 5/3/19)	VOC contents of marine coating categories range 340–730 g/L and VOC contents of pleasure craft coating categories range 330–780 g/L. For pleasure craft coatings, clear wood coatings-sealers emission limit 550 g/L.	Mojave Desert Rule 1106 (Amended 10/24/16) generally has the same limits as South Coast Rule 1106, except it has lower limit for clear wood finishes – sealers at 340 g/L (550 g/L in Rule 1106).	Rule 1106 varies in stringency when compared to other agencies' requirements. For almost all categories, Rule 1106 is as stringent as or more stringent than the other Agencies' rules and provides RACM level of control for this source category.

<sup>#</sup> Rules and regulations amended/adopted between February 2016 and August 2020 are included in this supplemental evaluation.

<sup>^</sup> This evaluation was conducted as part of the 2020 RACT (Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, May 2020. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>), and is included here for completeness.

\* There are no analogous requirements in other air agencies that are more stringent than the South Coast AQMD rule being evaluated.

**Table 6-10 (Continued)**  
**Evaluation of Applicable South Coast AQMD Rules and Regulations for RACM Demonstration – VOC Rules**

<b><u>RULE NO</u></b>	<b><u>RULE TITLE</u></b>	<b><u>CURRENT RULE REQUIREMENTS</u></b>	<b><u>OTHER AGENCIES' RULES THAT ARE MORE STRINGENT<sup>#</sup></u></b>	<b><u>RACM EVALUATION</u></b>
1107	Coating of Metal Parts and Products (Amended 2/7/20)	Coating-specific emission limits of 2.3–3.5 lbs/gal. Air pollution control system is required at least 95% control efficiency (or 5 ppmv outlet of emission control system). At least 90% emission collection efficiency is required from the sources of VOC emissions. Solvent cleaning operations must comply with Rule 1171.	Antelope Valley Rule 1107 (Amended 4/21/20) and Mojave Desert Rule 1115 (Amended 6/8/20) generally have the similar coating-specific limits as South Coast Rule 1107. Overall minimum control efficiency is 90%.	Rule 1107 meets or exceeds RACM requirements. For example, Prefabricated Architectural Component VOC limits are 2.3–2.8 lbs/gal for Air-Dried coating, whereas similar rules at Antelope Valley and Mojave Desert have VOC limits of 3.5 lbs/gal for the same category.  For almost all coating-specific categories, Rule 1107 is as stringent as or more stringent than the other districts' rules, and provides RACM level of control for this source category.
1113 <sup>^</sup>	Architectural Coatings (Amended 2/5/16)	Coating-specific VOC emission limits of 50–730 g/L. VOC limits for Colorants range from 50–600 g/L of colorant.	n/a*	Meets RACM.
1122 <sup>^</sup>	Solvent Degreasers (Amended 5/1/09)	Contain various work practice and design requirements.	n/a*	Meets RACM.
1128 <sup>^</sup>	Paper, Fabric and Film Coating Operations (Amended 3/8/96)	For Paper, fabric, and film coating and wash primers, VOC emission limit is less than 265 g/L. For plastisol, VOC emission limit is less than 20 g/L. Control system with at least 95% control efficiency (or 50 ppmv outlet) and 90% capture efficiency.	n/a*	Meets RACM.
1136	Wood Products Coatings (Amended 6/14/96)	VOC limit for wood products coatings is in the range of 120–750 g/L. A VOC limit for high-solid stains is 350 g/L.	Mojave Desert Rule 1114 (Amended 8/24/20) has the similar VOC limits for wood products coatings and a VOC limit for high-solid stains is 240 g/L.	Rule 1136 varies in stringent when compared to other agencies' requirements. For almost all categories, Rule 1136 is as stringent as the other agency's rule and provides RACM level of control for this source category.
1138 <sup>^</sup>	Control of Emissions from Restaurant Operations (Adopted 11/14/97)	Pursuant to the Protocol Determination of PM and VOC Emissions from Restaurant Operations of Rule 1138, 83% reduction of VOC emissions from chain-driven charbroilers are required.	San Joaquin Valley Rule 4692 (Amended 6/21/18) requires 86% reduction of VOC emissions from chain-driven charbroilers.	Rule 1138 is primarily intended to reduce PM emissions. However, existing controls are expected to achieve similar level of VOC reductions because San Joaquin Valley requires chain-driven charbroilers/catalytic oxidizers combinations be certified by South Coast AQMD test protocol that are deemed compliant with their Rule 4692. South Coast AQMD Rule 1138 VOC control requirements are similar to San Joaquin Valley Rule 4692 and meet RACM.

<sup>#</sup> Rules and regulations amended/adopted between February 2016 and August 2020 are included in this supplemental evaluation.

<sup>^</sup> This evaluation was conducted as part of the 2020 RACT (Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, May 2020. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>), and is included here for completeness.

\* There are no analogous requirements in other air agencies that are more stringent than the South Coast AQMD rule being evaluated.

**Table 6-10 (Concluded)**  
**Evaluation of Applicable South Coast AQMD Rules and Regulations for RACM Demonstration – VOC Rules**

<b><u>RULE NO</u></b>	<b><u>RULE TITLE</u></b>	<b><u>CURRENT RULE REQUIREMENTS</u></b>	<b><u>OTHER AGENCIES' RULES THAT ARE MORE STRINGENT<sup>#</sup></u></b>	<b><u>RACM EVALUATION</u></b>
1143 <sup>^</sup>	Consumer Paint Thinners and Multi-purpose Solvents (Amended 12/3/10)	Set VOC content of 25 g/l for consumer paint thinner and multi-purpose solvent beginning 1/1/2011	n/a*	Meets RACM.
1145 <sup>^</sup>	Plastic, Rubber, Leather and Glass Coatings (Amended 12/4/2009)	VOC limits: 50–800 g/L (0.4–6.7 lbs/gal). Average provisions and add-on control at 95% control efficiency (50 ppmv outlet), 90% capture efficiency. High transfer coating equipment (e.g. HVLP). Solvent cleaning operations must comply with Rule 1171.	n/a*	Meets RACM.
1162 <sup>^</sup>	Polyester Resin Operations (Amended 7/8/05)	VOC limits (monomer content) from 10-48% by weight or alternatively 90% control efficiency for add-on control.	Mojave Desert Rule 1162 (Amended 4/23/18) VOC limit: <ul style="list-style-type: none"> <li>Tooling Resin Atomized (spray) is 30% weight average monomer (South Coast AQMD Rule 1162's limit for Other Polyester Resin Materials is 35% monomer by weight as applied)</li> <li>Mojave Desert limits the weighted average monomer VOC content for fiberglass boat manufacturing operations (South Coast AQMD has no limits specifically for boat manufacturing operations).</li> </ul>	Rule 1162 varies in stringency when compared to other agencies' requirements. For almost all categories, Rule 1162 is as stringent as the other agency's rule, and provides RACM level of control for this source category.
1168 <sup>^</sup>	Adhesive and Sealant Applications (Amended 10/6/17)	VOC content limit for Foam Insulation Sealants is 250 g/L with a future VOC limit of 50 g/L in 2023.	n/a*	Meets RACM.
1171 <sup>^</sup>	Solvent Cleaning Operations (Amended 5/1/09)	VOC content limit in a solvent for general solvent cleaning operations is 25 g/L.	n/a*	Meets RACM.

<sup>#</sup> Rules and regulations amended/adopted between February 2016 and August 2020 are included in this supplemental evaluation.

<sup>^</sup> This evaluation was conducted as part of the 2020 RACT (Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, May 2020. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>), and is included here for completeness.

\* There are no analogous requirements in other air agencies that are more stringent than the South Coast AQMD rule being evaluated.

<b><u>RULE NO</u></b>	<b><u>RULE TITLE</u></b>	<b><u>CURRENT RULE REQUIREMENTS</u></b>	<b><u>OTHER AGENCIES' RULES THAT ARE MORE STRINGENT<sup>#</sup></u></b>	<b><u>RACM EVALUATION</u></b>
1111	Reduction of NOx Emissions from Natural-Gas-Fired, Fan-Type Central Furnaces (Amended 9/4/20)	For mobile home furnaces, NOx emission limits: 14 ng/J For condensing, non-condensing, and weatherized home furnaces, NOx limits: 14 ng/J	n/a*	Meets RACM.
1121	Control of Nitrogen Oxides from Residential Type, Natural Gas-Fired Water Heaters (Amended 9/3/04)	For natural gas-fired water heaters rated < 75,000 Btu/hr, NOx emission limits: <ul style="list-style-type: none"> <li>• 55 ppmv for mobile home</li> <li>• 30 ppmv for residential home</li> <li>• 15 ppmv for water heaters ≤ 50 gallons</li> </ul>	n/a*	Meets RACM.
1146 <sup>^</sup> 1146.1 <sup>^</sup> 1146.2 <sup>^</sup>	<p>Rule 1146 - Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters (Amended 12/7/18)</p> <p>Rule 1146.1 - Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters (Amended 12/7/18)</p> <p>Rule 1146.2 - Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters (Amended 12/7/18)</p>	<p>Rule 1146 - For industrial and commercial boilers, steam generators, and process heaters &gt; 5 MMBtu/hr:</p> <ul style="list-style-type: none"> <li>• Gaseous fuel: 30 ppm</li> <li>• Non-gaseous fuel: 40 ppm</li> <li>• Landfill gas: 25 ppm</li> <li>• Digester gas: 15 ppm</li> <li>• Atmospheric units: 12 ppm</li> <li>• Group I units, natural gas ≥ 75 MMBtu/hr: 5 ppm</li> <li>• Group II units, gaseous fuels ≥ 20 and &lt; 70 MMBtu/hr: 5–9 ppm</li> <li>• Group III units, gaseous fuels ≥ 5 and &lt; 20 MMBtu/hr: 7–9 ppm</li> <li>• Thermal fluid heaters: 12 ppm</li> </ul> <p>Rule 1146.1 - For industrial and commercial boilers, steam generators, and process heaters between 2 and 5 MMBtu/hr using the following fuels:</p> <ul style="list-style-type: none"> <li>• Landfill gas: 25 ppm</li> <li>• Digester gas: 15 ppm</li> <li>• Natural gas using non-fire-tube boilers: 9 ppm</li> <li>• Natural using fire-tube boilers: 7 ppm</li> <li>• Thermal fluid heaters: 12 ppm</li> <li>• All other units: 30 ppm</li> </ul> <p>Rule 1146.2 - For water heaters, small boilers, and process heaters &lt; 2 MMBtu/hr using natural gas: NOx emission limit 20 ppm.</p>	n/a*	Meets RACM.

<sup>#</sup> Rules and regulations amended/adopted between February 2016 and August 2020 are included in this supplemental evaluation.

<sup>^</sup> This evaluation was conducted as part of the 2020 RACT (Draft Final Staff Report for 2015 8-Hour Ozone Standard Reasonably Available Control Technology (RACT) Demonstration, May 2020. Available at: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/ract-draft-final-staff-report.pdf?sfvrsn=23>), and is included here for completeness.

\* There are no analogous requirements in other air agencies that are more stringent than the South Coast AQMD rule being evaluated.

In addition to the supplemental RACM evaluation, an evaluation was also conducted for the following area source categories to identify potential control measures. Since the adoption of the 2016 AQMP, several air districts have revised their wood-burning rules to incorporate more stringent requirements. In addition, California has passed a suite of bills that seek to reduce greenhouse gas emissions from various sectors including electricity generation, as well as residential and commercial buildings. Hence, a further evaluation of feasible measures is warranted for these source categories. The following section provides an update of these regulations and policies, and an assessment of whether they could be considered RACM for these source categories for Coachella Valley.

*i. Residential and Commercial Buildings*

The South Coast Air Basin and the Coachella Valley are home to more than 17 million residents, representing approximately 44 percent of the population in California, who reside in about 6 million housing units and utilize commercial space for shopping, entertainment, and places of employment. The energy consumption in the residential and commercial buildings is a direct and indirect source of criteria pollutants and greenhouse gas emissions. In 2018, residential and commercial fuel combustion accounted for 21.4 tpd of NO<sub>x</sub> in the South Coast Air Basin and 0.51 tpd of NO<sub>x</sub> in Coachella Valley. The majority of NO<sub>x</sub> emissions within the residential and commercial buildings are from water heating and space heating. In South Coast AQMD, Rule 1111 reduces NO<sub>x</sub> emissions from residential and commercial gas-fired fan-type residential space heating furnaces. The rule applies to manufacturers, distributors, sellers, and installers of such furnaces. Rule 1111 was amended in 2009 to require Ultra-Low NO<sub>x</sub> furnaces (14 ng/J) by 2014, and was subsequently amended to extend the compliance date with a mitigation fee option. The current NO<sub>x</sub> emission limit is set at 14 ng/J, which is the most stringent emission limit in California. NO<sub>x</sub> emissions from residential natural-gas fired water heaters are regulated by Rule 1121. The rule was amended in December 1999 to lower the emission limit from 40 ng/J to 20 ng/J on July 1, 2002 and 10 ng/J on January 1, 2005. In 2004, the implementation date of the final rule limit of 10 ng/J was delayed to 2006-2008 as more time was needed because a number of national safety, energy and environmental standards were delayed and needed to be met concurrently with the Rule 1121 final limit. The existing NO<sub>x</sub> limit of 10 ng/J is still the most stringent emission limit for natural gas fired water heaters in California.

For the residential and commercial buildings, there are opportunities to require and accelerate the replacement of existing equipment with cleaner zero- or near-zero emissions alternatives. The 2016 AQMP includes control measures for the applications of zero or near-zero NO<sub>x</sub> emissions appliances in the residential and commercial sectors (CMB-02), additional enhancement in reducing energy use in existing residential buildings (ECC-03), and co-benefits from existing residential and commercial building energy efficiency mandates (ECC-02). These three control measures combined are anticipated to achieve 2.6 tpd of NO<sub>x</sub> reductions by 2023. A key element of the 2016 AQMP is to use private and public funding to help further the development and

deployment of the advanced cleaner technologies such as zero emission and near-zero emission technologies, and also identify co-benefits from existing programs (e.g., climate and energy efficiency). In January 2019, the South Coast AQMD Governing Board awarded 26 emission reduction incentive projects, totaling over \$47 million from several South Coast AQMD mitigation and penalty funds, to support the 2016 AQMP's goals. Of the 26 projects, 15 were selected to implement commercially available zero or near-zero control technologies as well as to support infrastructure for implementation of cleaner fuels. These projects are anticipated to result in approximately 88 tpy of NO<sub>x</sub> and 2 tpy of PM<sub>2.5</sub> emissions reductions, with the majority of the projects implemented in environmental justice communities. Additionally, 11 stationary and mobile source technology demonstration projects were funded. Upon successful demonstration and deployment, these projects have the potential to provide additional long-term NO<sub>x</sub> and VOC emission reductions. The awarded projects are consistent with the commitments in various 2016 AQMP control measures including MOB-14, CMB-02, CMB-04, and ECC-03.

Since the adoption of the 2016 AQMP, California Legislature passed a suite of bills that seek to reduce greenhouse gas emissions from various sectors including electricity generation as well as residential and commercial buildings. In 2018, California passed SB 100 (California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases), which sets new standards to California's renewable portfolio by requiring the state to use 50 percent renewable electricity by 2026, 60 percent renewable electricity by 2030, and 100 percent carbon-free electricity by 2045. In addition, two new laws directed towards the state's building sector, AB 3232 (Zero-emissions Buildings and Sources of Heat Energy) and SB 1477 (Low-emissions Buildings and Sources of Heat Energy), were signed in 2018. AB 3232 requires the California Energy Commission (CEC) to assess, by January 1, 2021, the potential for reducing GHG emissions from California's residential and commercial buildings to 40 percent below 1990 levels by 2030. The assessment will identify key options and policies for increasing heating efficiency while reducing carbon emissions from the state's commercial and residential buildings. SB 1477 helps promote and implement clean heating technology in the state by providing \$50 million per year through 2023 to encourage market-based development and adoption of low-emission, clean heating technologies for buildings. In 2018, Governor Brown also signed Executive Order B-55-18, committing California to total, economy-wide carbon neutrality by 2045.

Overall, California sets ambitious goals to promote clean technologies and decrease energy use in California's existing and new building stock. Reducing, managing, and changing the way energy is used in the commercial and residential sectors can provide additional emission reductions, reduce energy costs, and provide multiple environmental benefits. These state climate policies will result in NO<sub>x</sub> reduction co-benefits in the mid to long term time frame. An evaluation of the benefits of these existing and emerging energy programs to NO<sub>x</sub> reduction will be included in the 2022 AQMP. South Coast AQMD will continue to evaluate opportunities for additional feasible

NO<sub>x</sub> reductions in existing and new residential and commercial buildings through regulatory or incentive-based programs.

Based on the above analysis, we conclude that for this source category, no other feasible measures would result in additional emission reductions for the 1997 ozone standard.

*ii. Residential Fuel Combustion – Wood Combustion*

Residential wood combustion is an area source category with significant PM<sub>2.5</sub> emissions and considerable VOC emissions. Most wood-burning devices in the South Coast AQMD are fireplaces or wood stoves (or wood-burning heaters). Since the 2016 AQMP, other California air districts and another state agency have revised their wood-burning rules to incorporate more stringent requirements. Hence, a further evaluation of feasible measures is warranted for this source category.

South Coast AQMD Rule 445 (Wood-Burning Devices) was adopted in March 2008 to implement the PM<sub>2.5</sub> Control Measure BCM-03 of the 2007 AQMP to reduce PM<sub>2.5</sub> emissions from wood-burning devices. Rule provisions apply to manufacturers, vendors, commercial firewood sellers, and persons owning or operating a wood-burning device. The rule prohibits burning of products not intended for use as fuel, the sale of unseasoned wood (currently from July 1 through the end of February), and mandates curtailment of wood-burning on “No-Burn” days. Wood-burning curtailment is mandatory on No-Burn days when ambient PM<sub>2.5</sub> concentration is forecast to exceed a threshold limit. Exemptions are included for low income households, where the device is the sole source of heating or no natural gas service is available within 150 feet of the property line, geographic elevations 3,000 feet or higher above mean sea level, and ceremonial fires. The rule was amended in May 2013 to implement Control Measure BCM-01 in the 2012 AQMP. The 2013 amendments expanded the wood-burning curtailment or No-Burn day restrictions by lowering the curtailment threshold from 35 to 30 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ), establishing criteria for Basin-wide curtailment, and also setting standards for commercially sold solid-fuel labeling. In June 2020, Rule 445 was amended to implement the backstop Contingency Control Measure BCM-09 in the 2016 AQMP and to address the CAA contingency measure requirements for the PM<sub>2.5</sub> standards. The 2020 amendments extended the No-Burn day requirement Basin-wide when the daily PM<sub>2.5</sub> air quality is forecast to exceed 30  $\mu\text{g}/\text{m}^3$  in any source receptor area and would also automatically lower the No-Burn day thresholds subject to specific contingency measure triggers as set forth in 40 CFR Section 51.1014(a).

The following section provides an evaluation of recently adopted rules and regulations by other agencies for residential wood burning.

*San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) Rule 4901  
(Wood Burning Fireplaces and Wood Burning Heaters, Amended 6/20/2019)*

SJVUAPCD Rule 4901 includes a tiered mandatory curtailment program that establishes different curtailment thresholds for each county based on the type of devices. During a level one episodic woodburning curtailment, operation of wood burning fireplaces and unregistered wood burning heaters is prohibited, but properly operated, registered wood burning devices may be used. During a level two episodic woodburning curtailment, operation of any wood burning device is prohibited. In the “hot spot” counties of Madera, Fresno, and Kern, the level one PM<sub>2.5</sub> threshold is 12 µg/m<sup>3</sup>, and the level two PM<sub>2.5</sub> threshold is 35 µg/m<sup>3</sup>. In the remaining counties in the District (San Joaquin, Stanislaus, Merced, Kings, and Tulare), the level one PM<sub>2.5</sub> threshold is 20 µg/m<sup>3</sup>, and the level two PM<sub>2.5</sub> threshold is 65 µg/m<sup>3</sup>. In addition, Rule 4901 prohibits the sale or transfer any real property which contains a wood burning heater without first assuring that each wood burning heater included in the real property is EPA Phase II Certified or has a more stringent certification for wood-burning devices under the New Source Performance Standards (NSPS) at the time of purchase or installation, as well as removal or installation of an EPA certified wood-burning heater that meets the requirements of NSPS at the time of installation during a major fireplace remodel which also requires a building permit. South Coast AQMD Rule 445 prohibits remodeling of fireplaces. Existing fireplaces constructed prior the effective date of the rule may be repaired within the existing footprint where there is a health/safety issue.

*Bay Area Air Quality Management District (BAAQMD) Regulation 6 Rule 3 (Wood-Burning Devices, Amended 11/20/2019)*

Under BAAQMD Rule 6-3, the Air District can issue a Winter Spare the Air Alert and require a Mandatory Burn Ban when air quality is forecast to be unhealthy due to elevated levels of fine particulate matter with some exemptions that allow wood burning. The rule provides for limited exemptions in the following areas: (i) sole source of heat, (ii) non-functional, permanently installed heater, and (iii) loss of natural gas and/or electric power. In 2019, BAAQMD revised its wood-burning rule to provide for curtailments year-round. When the air quality is forecasted to be unhealthy due to ambient levels of particulate matter exceeding 35 µg/m<sup>3</sup>, burning wood or any solid fuels is prohibited in the Bay Area.

*Utah Administrative Code R307-302-3 (No-Burn Periods for Particulates, Effective 2/1/2017)*

Under Utah Administrative Code R307-302-3, when the ambient concentration of PM<sub>2.5</sub> measured by monitors in Box Elder, Cache, Davis, Salt Lake, Tooele, Utah or Weber counties are forecasted to reach or exceed 25 µg/m<sup>3</sup>, a mandatory no-burn period for solid fuel burning devices goes into effect. The mandatory no-burn periods will only apply to those counties identified by the director. A person within the geographical boundaries is prohibited from using a solid fuel burning device unless it is the sole source of heat for an entire residence and registered with the director.

*Analysis of Feasible Measures for Residential Fuel Combustion (South Coast AQMD Rule 445)*

Currently, South Coast AQMD Rule 445 applies to the South Coast Air Basin only. South Coast Air Basin is in Serious nonattainment with respect to both the 2006 24-hour PM<sub>2.5</sub> standard and 2012 annual PM<sub>2.5</sub> standard. In contrast, Coachella Valley is in attainment of both PM<sub>2.5</sub> standards. Since Rule 445 primarily targets to reduce PM<sub>2.5</sub> emissions, the existing curtailment program is implemented during cooler months (November 1 to end of February) when PM<sub>2.5</sub> levels are high and “No-Burn” days are called based on a PM<sub>2.5</sub> threshold. Given high ozone days occur during warmer months and the PM<sub>2.5</sub> levels in Coachella Valley are typically low, extending the existing Rule 445 requirements for the cooler months to Coachella Valley would not result in “No-Burn” days in Coachella Valley nor quantifiable emission reduction benefits for the 1997 ozone standard. The requirements in Rule 445 – Wood-Burning Device will be further evaluated during the rule amendment process currently underway to address the CAA requirements for contingency measures in the event of failure to attain an ozone standard or meet a significant milestone demonstrating progress towards attainment.

## ***II. CARB Mobile and Area Sources***

The CAA requires ozone SIPs to include a RACM demonstration. This section demonstrates that California’s mobile source and consumer products measures meet RACM.

### ***RACM Requirements***

Section 172(c)(1) of the CAA requires SIPs to provide for the implementation of RACM as expeditiously as practicable. The U.S. EPA has interpreted RACM to be those emission control measures that are technologically and economically feasible and when considered in aggregate, would advance the attainment date by at least one year.

Given the severity of California’s air quality challenges, CARB has implemented the most stringent mobile source emissions control program in the nation. CARB’s comprehensive strategy to reduce emissions from mobile sources includes stringent emissions standards for new vehicles, in-use programs to reduce emissions from existing vehicle and equipment fleets, cleaner fuels that minimize emissions, and incentive programs to accelerate the penetration of the cleanest vehicles beyond that achieved by regulations alone. Taken together, California’s mobile source program meets RACM requirements in the context of ozone nonattainment.

To meet RACM requirements and achieve its emissions reductions goals, California continues to develop new programs to strengthen its overall mobile source program and to achieve new emissions reductions from mobile sources. CARB developed its *2016 State Strategy for the State Implementation Plan*<sup>25</sup> (State SIP Strategy) through a multi-step measure development process, including extensive public consultation, to develop and evaluate potential strategies for mobile

---

<sup>25</sup> CARB State SIP Strategy.

source categories under CARB's regulatory authority that could contribute to expeditious attainment of the standard.

First, CARB developed a series of technology assessments for heavy-duty mobile source applications and the fuels necessary to power them<sup>26</sup> along with ongoing review of advanced vehicle technologies for the light-duty sector in collaboration with U.S. EPA and the National Highway Traffic Safety Administration (NHTSA). CARB staff then used a scenario planning tool to examine the magnitude of technology penetration necessary, as well as how quickly technologies need to be introduced to meet attainment of the standard.

CARB staff released a discussion draft Mobile Source Strategy<sup>27</sup> for public comment in October 2015. This strategy specifically outlined a coordinated suite of proposed actions to not only meet federal air quality standards, but also achieve greenhouse gas emission reduction targets, reduce petroleum consumption, and decrease health risk from transportation emissions over the next 15 years. CARB staff held a public workshop on October 16, 2015 in Sacramento, and on October 22, 2015, CARB held a public Board meeting to update the Board and solicit public comment on the Mobile Source Strategy in Diamond Bar.

Staff continued to work with stakeholders to refine the measure concepts for incorporation into related planning efforts including the 75 ppb 8-hour ozone SIPs. On May 16, 2016, CARB released an updated Mobile Source Strategy and on May 17, 2016 CARB released the proposed State SIP strategy for a 45-day public comment period. The mobile source emissions reductions commitments included in the Coachella Valley ozone SIP represent the emissions reductions achieved through the measures in the State SIP Strategy that are relevant in Coachella Valley.

The current mobile source program and proposed measures included in the State SIP Strategy provide attainment of the 75 ppb and 70 ppb 8-hour ozone standards as expeditiously as practicable and meet RFP requirements. Moving forward, CARB staff is working to evaluate further potential emission reduction strategies. On March 25, 2020, CARB held a public webinar to discuss the development of the 2020 Mobile Source Strategy which takes an integrated planning approach to identify the regulatory and programmatic strategies needed to achieve all of California's targets.

### *RACM For Mobile Sources*

#### *Waiver Approvals*

While the Act preempts most states from adopting emission standards and other emission-related requirements for new motor vehicles and engines, it allows California to seek a waiver or

---

<sup>26</sup> CARB Technology and Fuel Assessments webpage (<http://www.arb.ca.gov/msprog/tech/tech.htm>).

<sup>27</sup> CARB 2016 Mobile Source Strategy webpage (<https://ww2.arb.ca.gov/resources/documents/2016-mobile-source-strategy>).

authorization from the federal preemption to enact emission standards and other emission-related requirements for new motor vehicles and engines and new and in-use off-road vehicles and engines that are at least as protective as applicable federal standards, except for locomotives and engines used in farm and construction equipment which are less than 175 hp.

Over the years, California has received waivers and authorizations for over 100 regulations. The most recent California standards and regulations that have received waivers and authorizations are Advanced Clean Cars (including ZEV and LEV III) for Light-Duty vehicles, and On-Board Diagnostics, Heavy-Duty Idling, Malfunction and Diagnostics System, In-Use Off-Road Diesel Fleets, Large Spark Ignition Fleet, Mobile Cargo Handling Equipment for Heavy-Duty engines. Other Authorizations include Off-Highway Recreational Vehicles and the Portable Equipment Registration Program.

Finally, CARB obtained an authorization from U.S. EPA to enforce adopted emission standards for off-road engines used in yard trucks and two-engine sweepers. CARB adopted the off-road emission standards as part of its “Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use Heavy-Duty Diesel-Fueled Vehicles” (Truck and Bus Regulation). The bulk of the regulation applies to in-use heavy-duty diesel on-road motor vehicles with a gross vehicle weight rating in excess of 14,000 pounds, which are not subject to preemption under Section 209(a) of the Act and do not require a waiver under Section 209(b).

The waiver and authorizations California has received are integral to this successful mobile source program. However, recent U.S. EPA action threatens this success and California’s ability to achieve emissions reductions needs to meet the NAAQs. In September 2019, the U.S. Department of Transportation’s NHTSA and U.S. EPA took action to provide nationwide uniform fuel economy and greenhouse gas emission standards for automobile and light duty trucks and withdrew the waiver granted to California in January 2013 as it relates to California’s GHG and ZEV programs.<sup>28</sup>

#### *Light- and Medium-Duty Vehicles*

Light- and medium-duty vehicles are currently regulated under California’s ACC program including the Low-Emission Vehicle III (LEV III) and ZEV programs. Other California programs such as the 2012 Governor’s Executive Order to put 1.5 million zero-emission vehicles on the road by 2025,<sup>29</sup> and California’s Reformulated Gasoline program (CaRFG) will produce substantial and cost-effective emission reductions from gasoline-powered vehicles. CARB is also active in implementing programs for owners of older dirtier vehicles to retire them early. The “car scrap”

---

<sup>28</sup> U.S. EPA One National Program Rule webpage (<https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-one-national-program-federal-preemption-state>).

<sup>29</sup> Executive Order B-16-2012.

programs, like the Enhanced Fleet Modernization Program, and Clean Vehicle Rebate Project provide monetary incentives to replace old vehicles with zero-emission vehicles. The Air Quality Improvement Program (AQIP), is a voluntary incentive program to fund clean vehicle.

Taken together, California's emission standards, fuel specifications, and incentive programs for on-road light- and medium-duty vehicles represent all measures that are technologically and economically feasible within California.

#### *Heavy-Duty Vehicles*

California's heavy-duty vehicle emissions control program includes requirements for increasingly tighter new engine standards and address vehicle idling, certification procedures, on-board diagnostics, emissions control device verification, and in-use vehicles. This program is designed to achieve an on-road heavy-duty diesel fleet with 2010 engines emitting 98 percent less NOx and PM2.5 than trucks sold in 1986. Most recently in the ongoing efforts to go beyond federal standards and achieve further reductions, CARB adopted the Optional Reduced Emissions Standards for Heavy-Duty Engines regulation in 2014 that establishes the new generation of optional NOx emission standards for heavy-duty engines.

The recent in-use control measures include On-Road Heavy-Duty Diesel Vehicle (In-Use) Regulation, Drayage (Port or Rail Yard) Regulation, Public Agency and Utilities Regulation, Solid Waste Collection Vehicle Regulation, Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling, Heavy-Duty Diesel Vehicle Inspection Program, Periodic Smoke Inspection Program, Fleet Rule for Transit Agencies, Lower-Emission School Bus Program, and Heavy-Duty Truck Idling Requirements. In addition, CARB's significant investment in incentive programs provides an additional mechanism to achieve maximum emission reductions from this source sector.

Taken together, California's emission standards, fuel specifications, and incentive programs for heavy-duty vehicles represent all measures that are technologically and economically feasible within California.

#### *Off-Road Vehicles and Engines*

California regulations for off-road equipment include not only increasingly stringent standards for new off-road diesel engines, but also in-use requirements and idling restrictions. The Off-Road Regulation is an extensive program designed to accelerate the penetration of the cleanest equipment into California's fleets, and impose idling limits on off-road diesel vehicles. The program goes beyond emission standards for new engines through comprehensive in-use requirements for legacy fleets. Engines and equipment used in agricultural processes are unique to each process and are often re-designed and tailored to their particular use. Fleet turnover to cleaner engines is the focus for these engines.

Taken together, California's comprehensive suite of emission standards, fuel specifications, and incentive programs for off-road vehicles and engines represent all measures that are technologically and economically feasible within California and when considered in aggregate, would advance the attainment date by at least one year.

#### *Other Sources and Fuels*

The emission limits established for other mobile source categories, coupled with U.S. EPA waivers and authorization of preemption establish that California's programs for motorcycles, recreational boats, off-road recreational vehicles, cargo handling equipment, and commercial harbor craft sources meet the requirements for RACM. Cleaner burning fuels also play an important role in reducing emissions from motor vehicles and engines as CARB has adopted a number of more stringent standards for fuels sold in California, including the Reformulated Gasoline program, low sulfur diesel requirements, and the Low Carbon Fuel Standard. These fuel standards, in combination with engine technology requirements, ensure that California's transportation system achieves the most effective emission reductions possible.

Taken together, California's emission standards, fuel specifications, and incentive programs for other mobile sources and fuels represent all measures that are technologically and economically feasible within California.

#### *Mobile Source Summary for RACM*

California's long history of comprehensive and innovative emissions control has resulted in the most stringent mobile source control program in the nation. U.S. EPA has previously acknowledged the strength of the program in their approval of CARB's regulations and through the waiver process. In its 2019 approval<sup>30</sup> of the South Coast's 8-hour ozone plan which included the State's current program and new measure commitments, U.S. EPA found that there were no further reasonably available control measures that would advance attainment of the standard in South Coast. Since then, CARB has continued to substantially enhance and accelerate reductions from our mobile source control programs through the implementation of more stringent engine emissions standards, in-use requirements, incentive funding, and other policies and initiatives as described in the preceding sections.

The CARB process for developing the proposed State measures included an extensive public process and is consistent with the U.S. EPA RACM guidance. Through this process CARB found that with the current mobile source control program and proposed measures, there are no additional reasonable available control measures that would advance attainment of the 2008 8-hour ozone standard in Coachella Valley. There are no reasonable regulatory control measures excluded from use in this plan; therefore, there are no emissions reductions associated with unused regulatory

---

<sup>30</sup> 84 FR 52005 (October 1, 2019).

control measures. As a result, California's mobile source control programs fully meet the requirements for RACM.

#### *RACM for Consumer Products*

Consumer products are defined as chemically formulated products used by household and institutional consumers. For 30 years, CARB has taken actions pertaining to the regulation of consumer products. Three regulations have set VOC limits for 129 consumer product categories. These regulations, referred to as the Consumer Product Program, have been amended frequently, and progressively stringent VOC limits and reactivity limits have been established. These are Regulation for Reducing VOC Emissions from Antiperspirants and Deodorants; Regulation for Reducing Emissions from Consumer Products; and Regulation for Reducing the Ozone Formed from Aerosol Coating Product Emissions, and the Tables of Maximum Incremental Reactivity Values. Additionally, a voluntary regulation, the Alternative Control Plan has been adopted to provide compliance flexibility to companies. The program's most recent rulemaking occurred in 2018 with amends to Consumer Products Regulation and Method 310 to include an alternate compliance option and updated dates of test procedures.

U.S. EPA also regulates consumer products. U.S. EPA's consumer products regulation was promulgated in 1998, however, federal consumer products VOC limits have not been revised since their adoption. U.S. EPA also promulgated reactivity limits for aerosol coatings. As with the general consumer products, California's requirements for aerosol coatings are more stringent than the U.S. EPA's requirements. Other jurisdictions, such as the Ozone Transport Commission states, have established VOC limits for consumer products which are modeled after the California program. However, the VOC limits in those states typically lag those applicable in California.

In summary, California's Consumer Products Program, with the most stringent VOC requirements applicable to consumer products, meets RACM.

### ***III. Transportation Control Strategies and Transportation Control Measures***

By listing them separately, the CAA Section 182(d)(1)(A) differentiates between Transportation Control Strategies (TCS) and transportation control measures (TCM), and thus provides for a wide range of strategies and measures as options to offset growth in emissions from VMT growth.

CARB's motor vehicle control program includes a variety of strategies and measures including new engine standards and in-use programs (e.g., smog check, vehicle scrap, fleet rules, and idling restrictions).

SCAG is responsible for developing and implementing TCMs. However, there are no TCMs in the ozone SIP for the Coachella Valley because upwind emissions from the South Coast Air Basin largely influence air quality in the Coachella Valley. It is important to note that all reasonably

available TCMs have been implemented by SCAG in the South Coast Air Basin as documented and approved by U.S. EPA in the 2016 AQMP Appendix IV-C Regional Transportation Strategy and Control Measures.

Based on the provisions in Section 182(d)(1)(A) and the clarifications provided in the U.S. EPA guidance, any combination of TCSs and TCMs may be used to meet the requirement to offset growth in emissions resulting from VMT growth. Since 1990 when this requirement was established, California has adopted more than sufficient enforceable transportation control strategies and measures to meet the requirement to offset the growth in emissions from VMT growth.

### *Contingency Measures*

Clean Air Act Sections 172(c)(9) and 182(c)(9) require contingency measures if an ozone nonattainment area fails to meet the RFP milestones or attain the national primary ambient air quality standard by the attainment date. A rule amendment to Rule 445, Wood-burning Devices, is underway to include potential contingency provisions for Coachella Valley as an Extreme nonattainment area.

### *VMT Offset*

For areas designated as Severe or Extreme, the CAA requires states to submit enforceable transportation control strategies (TCSs) and transportation control measures (TCMs) to offset any growth in emissions from growth in vehicle miles travelled (VMT) or numbers of vehicle trips.

For Coachella Valley, in its Severe nonattainment plan for the 1997 ozone standard, a VMT offset demonstration was conducted for the attainment year of 2018. This demonstration was part of the 2007 AQMP, which was approved by the U.S. EPA in 2017.<sup>31</sup> The U. S. EPA has also proposed approval of the VMT offset demonstration for the 2008 ozone NAAQS for Coachella Valley, which has an attainment year of 2026.

As an Extreme nonattainment area for the 1997 ozone standard, a new VMT offset demonstration is required for the attainment year of 2023. ~~A VMT offset demonstration is currently being developed and will be included in the Draft Final Extreme Area Plan. The VMT offset demonstration will be addressed through a separate public process through CARB.~~

### *Revised Major Stationary Source Definition*

Under the Severe nonattainment designation, the definition of major stationary sources (also referred to as major polluting facility in South Coast AQMD rules) includes facilities with a PTE of 25 tons per year or higher of VOC or NOx. Following reclassification to an Extreme nonattainment area, the threshold for major stationary sources in Coachella Valley will be lowered

---

<sup>31</sup> 82 FR 26854.

to include facilities with a PTE of 10 tons per year or higher of VOC or NO<sub>x</sub> since VOC and NO<sub>x</sub> are precursors for ozone. This change makes the definition stricter and will potentially cause two existing and any new facilities to be subject to more stringent permitting requirements. Amendments to Regulations XIII – New Source Review, XX – Regional Clean Air Incentives Market, and XXX - Title V are currently underway to address the major polluting threshold and the major modification threshold for New Source Review and RECLAIM New Source Review, and the applicability threshold for Title V permits. Proposed amendments for these three regulations and are tentatively scheduled to be considered at the Governing Board Hearing in December 2020.

### *Offset Requirement*

Clean Air Act Section 182(e)(1) requires a modified offset ratio of 1.5 to 1 of total emission reductions of VOCs to total increased VOC emissions of each air pollutant (due to permit modifications), unless federal best available control technology (BACT) is required for all new or modified existing major sources. The Federal NSR requirements are reflected in South Coast AQMD Regulation XIII – New Source Review. South Coast AQMD's regulations implement best available control technology (BACT) which is the equivalent of federal Lowest Achievable Emission Reduction (LAER) for major and non-major sources, and therefore an offset ratio of 1.2 to 1 is used for NSR offset requirements for all nonattainment criteria air contaminants (Rule 1303). South Coast AQMD's New Source Review Regulations already include these requirements for VOC and NO<sub>x</sub> sources, however, amendments are proposed to existing Regulation XIII provisions to change the offset ratio for CO from 1 to 1 in Coachella Valley to 1.2 to 1, making it consistent with the South Coast Air Basin.

### *Modifications at Major Stationary Sources*

Clean Air Act Section 182(e)(2) requires any increase of emissions at a major stationary source to be considered as a modification and subject to NSR requirements. South Coast AQMD Regulation XIII requires any new or modified source that results in an emissions increase of any nonattainment air contaminant to be subject to NSR. Therefore, the modification requirement is already addressed in existing NSR rules. Regulation XIII major polluting facility and major modification threshold definitions for Coachella Valley are, however, proposed to be revised to be consistent with requirements for Extreme ozone nonattainment areas and federal NSR requirements.

### *Use of Clean Fuels or Advanced Control Technology for Boilers*

Clean Air Act Section 182(e)(3) requires each new, modified, and existing electric utility and industrial and commercial boiler that emits more than 25 tpy of NO<sub>x</sub> to burn a low polluting fuel or use advanced NO<sub>x</sub> control technology. Existing boilers are already subject to South Coast AQMD Rule 1146 (Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters) and Rule 1135 (Emissions of Oxides of Nitrogen from Electricity Generating Facilities), which reflects BARCT for existing equipment. Any new

or modified sources with emission increases are also subject to California BACT (federal lowest achievable emission rate (LAER) for the case of major sources) requirements. As such, the implementation of existing California BARCT and BACT already require new, modified, and existing electric utility and industrial and commercial boilers to use advanced NO<sub>x</sub> control technology, and therefore, no additional action is needed upon reclassification.

### ***Traffic Control Measures during Heavy Traffic Hours***

Clean Air Act Section 182(e)(4) allows for control measure programs to reduce use of high polluting or heavy-duty vehicles during heavy traffic hours. These are not required measures and no additional actions are required upon reclassification.

### ***New Technologies***

Clean Air Act Section 182(e)(5) allows for Extreme nonattainment area attainment demonstrations to be based on the anticipated development of new technologies or improvement of existing control technologies. These long-term control measures are often referred to as “black box” measures and go beyond the short-term control measures that are based on known and demonstrated technologies. For Extreme nonattainment areas, the “black box” measures may be used as part of the attainment strategy. The ability to use 182(e)(5), however, ceases three years prior to the attainment date. As presented in Chapter 4 and 5 of this Plan, existing rules and regulations provide the needed reductions for attainment in 2023, and the use of these long-term measures is not needed for attainment demonstration.

### ***NO<sub>x</sub> Requirements***

Pursuant to CAA Section 182(f), all provisions required for major stationary sources of VOC shall also apply to major stationary sources of NO<sub>x</sub> as defined in 182(e)(1), including the modified offset ratio. Since the offset requirement for an Extreme nonattainment area has already been incorporated into South Coast AQMD’s existing NSR rules, there will not be any additional offset requirements due to reclassification of Coachella Valley to Extreme nonattainment.

## 7. CALIFORNIA ENVIRONMENTAL QUALITY ACT

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard is exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption will be prepared pursuant to CEQA Guidelines Section 15062. If the proposed project is approved, ~~the Notice of Exemption will be filed with the county clerks of Los Angeles, Orange, Riverside, and San Bernardino counties. In addition,~~ the Notice of Exemption will be electronically filed with the State Clearinghouse to be posted on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

## 8. PUBLIC PROCESS

The ~~Draft~~ Coachella Valley Extreme Area Plan was developed through a public process. The ~~Draft~~ Plan was presented to the AB 617 East Coachella Valley Community Steering Committee on August 26, 2020, ~~and the AQMP Advisory Group on September 3, 2020, and. It will be presented~~ to the South Coast AQMD's Mobile Source Committee on September 18, 2020, and the Local Government and Small Business Assistance Advisory Group on October 9, 2020. The updated emissions inventory and modeling was also discussed and presented at the Scientific, Technical, and Modeling Peer Review Group on August 20, 2020. The Draft Plan was released on September 11, 2020 for public review. South Coast AQMD staff ~~will hold~~ held a Public Consultation Meeting on September 25, 2020 to solicit information, comments, and suggestions from the public, affected businesses and stakeholders. Key comments made at the Public Consultation Meeting included the applicability and impacts on tribal lands, pollution around the Salton Sea area, and the impacts of lowering the major source threshold on local businesses. Two comment letters were also received as of October 13, 2020. Key comments included projected locomotive emissions impact on attainment demonstration, impact of climate change on local ozone levels, control strategies to reduce local emissions, need for additional air monitoring stations, and additional incentive funding for the Coachella Valley. Responses to these comments are provided in Chapter 9 of this Plan. A ~~Public hearing~~ Hearing is scheduled at the South Coast AQMD Governing Board Meeting on December 4, 2020. Following approval by the South Coast AQMD Governing Board, the Plan will be submitted for approval by the CARB Board at their Board meeting to be held on December 10–11, 2020, which will then be submitted to the U.S. EPA for inclusion into the SIP.

## **9. PUBLIC COMMENTS AND RESPONSES TO COMMENTS**

Two comments letters were received during the comment period for the Draft Coachella Valley Extreme Area Ozone Plan. The comment letters and responses to comments are listed in this section.

**Comment Letter #1**  
**Anita Lee, U.S. EPA**  
**October 13, 2020**

Subject: Coachella Valley Attainment Plan for 1997 Ozone NAAQS

Hi Kalam,

I think you may have already received this . . .

Thank you for the opportunity to comment on the Draft Coachella Valley Extreme Area Plan for the 1997 8-hour Ozone Standard (Draft Extreme Area Plan). The Draft Extreme Area Plan shows that NO<sub>x</sub> emissions from trains will be cut from 2.4 tons per day (tpd) in 2018 to 1.7 tpd in 2023 (see Figures 3-8 and 3-9). The California Air Resources Board (CARB) has recently revised its estimates for locomotive emissions, particularly those associated with freight. (These revisions were discussed in CARB's Public Workshop for 2020 Locomotive Emission Inventory on September 3, 2020.) If the emissions estimates in the Draft Extreme Area Plan are not consistent with CARB's recent revisions for locomotive emissions, the final plan should include a revised estimate and a discussion of the significance of any change in projected emissions for the attainment demonstration.

1-1

Please let me know if you have any questions or concerns.

Thank you!

Anita

Anita Lee, PhD

Manager | Planning Office (ARD-2) | Air and Radiation Division | US EPA - Region 9

Pronouns (she/hers)

Response to Comment 1-1

CARB is in the process of revising the emission estimates for locomotives. Draft estimates were presented at the September 3, 2020 workshop. CARB staff are still in the process of updating this information. Once the emission estimates are finalized, CARB staff will document the update and include the information in subsequent SIPs. The difference in the total locomotive NOx emissions between the CARB's draft estimates and the emissions included in this Plan is approximately 2.3 tons per day in 2023. Even if these increased emissions were considered, it will not affect the attainment of the 1997 8-hour ozone standard by 2023.

**Comment Letter #2**

**RE: Draft Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone National Ambient Air Quality Standard**

Dear Program Supervisor Cheung:

On behalf of Leadership Counsel for Justice and Accountability (Leadership Counsel), we thank you for the opportunity to provide comments on the Draft Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone National Ambient Air Quality Standard (draft Plan). Leadership Counsel has engaged in the Eastern Coachella Valley (ECV) on several environmental justice and public health issues for over seven years. Since 2017, we have been extremely active within the AB 617 implementation process both at the state and local levels. Below we outline the concerns and recommendations that we have regarding the draft Plan.

2-1

**Climate Change**

According to the draft Plan, one of the primary causes of unusually high ozone levels in the Coachella Valley were due to “higher temperatures and stagnant weather conditions” (ES-1). This is an ongoing concern for the Coachella Valley, especially due to the increasingly hotter summer months, but also because of how rising temperatures are connected to climate change. We understand that the growing number of extreme heat days and hotter temperatures in recent years has contributed to the Coachella Valley’s inability to meet attainment. However, the draft Plan does not outline steps to address the impacts of climate change on local ozone levels. It is crucial for the air district to expand its mitigation and adaptation efforts within the Coachella Valley, particularly in the communities of Coachella, Thermal, Oasis, Mecca, and North Shore.

2-2

**Control Strategy**

Since the reclassification was presented to the community in 2019, Leadership Counsel has continuously expressed our concerns with the draft Plan's Control Strategy of focusing the implementation of emission reduction strategies primarily in the South Coast Air Basin in order to reduce ozone levels in the Coachella Valley. While we understand the amount of emissions originating in the South Coast Air Basin contributes to non-attainment in the Coachella Valley, South Coast AQMD must take action within the Coachella Valley to improve air quality and public health.

In previous comments and through our participation in the public Consultation meetings, we have elevated the need for South Coast AQMD to enhance its mitigation and adaptation strategies that will simultaneously help reduce emissions locally and reduce the impacts that residents in the Coachella Valley will feel until attainment is reached. Developing and implementing diverse mitigation and adaptation strategies will help create healthier living conditions for residents in the Coachella Valley. These strategies, as have been discussed in AB 617 meetings, include air filtration in homes, schools, and workplaces; enhanced greening near sensitive receptors; and other protective measures that can block emissions from reaching residents.

2-3

The draft Plan also identifies that CARB and the U.S. EPA have primary jurisdiction over sources that contribute to 92% of the NO<sub>x</sub> emissions in the Coachella Valley. Given overlapping jurisdiction considerations, South Coast AQMD should also include coordination and collaboration strategies in the draft Plan to ensure emission sources are reduced.

2-4

In addition, we urge South Coast AQMD to strengthen its enforcement and regulatory actions on emission sources that are contributing to high ozone levels in the Coachella Valley. These actions should be implemented in the South Coast Air Basin, but also locally in the Coachella Valley. The draft Plan should include these actions and detail how South Coast AQMD plans on strengthening those even after attainment is reached. One strategy includes limiting indirect emissions from development sources and strengthening South Coast AQMD's Indirect Source Rule. This can be addressed by promoting more effective and enforceable emission reduction measures, as well as implementing a fee mechanism for pollution not mitigated on-site.

2-5

In terms of the Eastern Coachella Valley, the draft Plan must also make the distinction between Thermal, Oasis, Mecca, and North Shore. Although the communities share zip codes, it's important to identify them by name as they also have varying differences and experiences to air pollution exposure.

2-6

### **AB 617 and Air Monitoring**

Another deficiency that affects our knowledge and understanding of ozone pollution and other air quality concerns in the Coachella Valley is the limited air monitoring. South Coast AQMD's ozone monitoring is done in Palm Springs and Indio. As a result, the draft Plan identifies these two areas as having the highest concentration of ozone levels in the region. As part of the AB 617 program implementation in the ECV, we recommend that the Community Air Monitoring Plan expand the district's ozone monitors to reach this region, especially the unincorporated communities.

2-6  
(continued)

### **Incentive Funding**

The draft Plan also outlines the opportunities of incentive funding as a way to reduce emissions. Recently, South Coast AQMD staff also announced that they would be receiving \$70 million in AB 617 incentive funding that can be used throughout the different AB 617 communities within their jurisdiction. In conjunction with CARB's other incentive funding, South Coast AQMD should enhance its partnership efforts with local businesses and residents to encourage and ensure that these incentive funding programs are being used. In the past, we have not seen these programs used and South Coast AQMD should develop a tracking and evaluation system for how these funds are being used and what benefits they bring after implementation.

2-7

South Coast AQMD has a great opportunity to be proactive in its mission to protect our air quality and public health in all its jurisdiction, but particularly to increase its presence and efficacy in efforts within the Coachella Valley. Whether emissions are higher in urban areas, South Coast AQMD must also be providing mitigation and adaptation support to the region that's being equally exposed to these emissions. Climate change is already having a strong impact on vulnerable populations and South Coast AQMD's planning towards emission reduction should include ways of addressing the impacts of climate change.

Sincerely,

Rebecca Zaragoza  
Senior Policy Advocate  
Leadership Counsel for Justice and Accountability

#### Response to Comment 2-1

Thank you for your active participation and for providing comments on the Draft Coachella Valley Extreme Area Ozone Plan (Plan).

#### Response to Comment 2-2

As noted in the Plan, the unusually high ozone levels in 2017 and 2018, which were attributed to meteorological factors such as higher temperatures and stagnant weather conditions, were observed not only in the Coachella Valley, but also in the South Coast Air Basin, across California, and the Western United States. These conditions were conducive to the increased ozone concentrations because of higher rate of photochemical reactions in the atmosphere and/or changes in emissions (e.g., biogenic VOC emissions) associated with higher temperatures. The year-to-year variability in ozone is not uncommon in the historical record and a temporary increase in ozone is not necessarily reflective of a long-term trend. In fact, in 2019, the ozone concentrations were lower compared to 2017 and 2018. Also, despite the high temperatures observed in the Coachella Valley this year, the preliminary three-year averaged design value<sup>32</sup> in 2020 is at 88 ppb, slightly lower than the 2019 design value (89 ppb), indicating that the Coachella Valley is on a downward trend toward attaining the 1997 8-hour ozone standard.

In order to evaluate the impact of meteorological factors and trends contributing to poor air quality, the South Coast AQMD initiated a study in 2019, which is currently underway and will hopefully advance our understanding of recent weather trends and their impact on air quality.

#### Response to Comment 2-3

Regional air quality modeling confirms that the high ozone levels observed in Coachella Valley are primarily attributed to the direct transport of ozone and its precursors (VOC and NOx) from the South Coast Air Basin (Basin) to the Coachella Valley and that the impact of local emission sources are not significant. Our recent modeling sensitivity analysis has also demonstrated that the Coachella Valley would not meet the 1997 8-hour ozone standard even if all local anthropogenic emissions were completely eliminated. Therefore, measures reducing local emissions would have very limited impact on ozone levels in the Coachella Valley.

The anticipated emission reductions from the existing (and recently adopted) rules and regulations adopted by South Coast AQMD and CARB with future effective dates will ensure that the Coachella Valley will meet the 1997 8-hour ozone standard in or before 2023.

With respect to local air quality issues associated with other pollutants, South Coast AQMD has been working to reduce exposure to harmful air pollutants in the Coachella Valley area. The local air quality improvement efforts will be further evaluated as part of the AB 617 Community Emission Reduction Plans (CERPs). South Coast AQMD staff will continue to consider and implement feasible mitigation measures and control strategies to help reduce local emissions and to minimize impact to the residents.

#### Response to Comment 2-4

The Plan reflects already adopted mobile and stationary source programs and regulations to meet the 8-hour ozone standard in Coachella Valley by 2023. Existing rules and regulations adopted by

---

<sup>32</sup> Design value is defined as the 3-year average of the fourth highest daily max 8-hour average ozone in each year.

South Coast AQMD and CARB, as well as recently adopted regulations, will continue to reduce emissions in both the South Coast Air Basin and the Coachella Valley until and beyond the attainment year of 2023. Examples of existing mobile source regulations include CARB's On-Road Heavy-Duty Diesel Vehicles Regulation (also known as the Truck and Bus regulation) and Off-Road Diesel-Fueled Fleets Regulation which will result in significant reduction of NOx and PM2.5 emissions in both the Basin and the Coachella Valley. Refer to Chapter 4 of this Plan for more details on the existing and recently adopted rules and regulations. On-going additional emission reductions from mobile sources will be critical for meeting the 2008 8-hour ozone standards in the Basin and the Coachella Valley. As part of the development of 2022 AQMP, South Coast AQMD staff will continue to work with state and federal agencies to identify and implement new mobile source strategies.

#### Response to Comment 2-5

South Coast AQMD develops regional air quality management plans (AQMPs) that provide the blueprint to achieve the federal ambient air quality standards. The 2016 AQMP is the most recently adopted plan developed to provide a pathway to attain the 2008 ozone standard in the Coachella Valley by 2026 and in the South Coast Air Basin by 2031. The emission reduction strategies included in the 2016 AQMP go beyond the attainment year of 2023 and continue to 2031 and beyond, providing continued emission reductions in Coachella Valley. With respect to indirect mobile sources, the 2016 AQMP included five facility-based mobile source control measures targeting warehouse distribution centers, commercial airports, new or redevelopment projects, commercial marine ports, and railyard and intermodal facilities. The Proposed Rule 2305 (Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program), currently under development, will benefit both the South Coast Air Basin and the Coachella Valley. Mitigation fees are among the strategies that are being considered in the proposed rule.

#### Response to Comment 2-6

As discussed previously and also in this Plan, ozone is a regional pollutant and the high ozone levels observed in Coachella Valley are primarily attributed to regional transport. The Palm Springs and Indio air monitoring stations are strategically situated predominantly downwind of the densely populated Basin and predominantly downwind of the populated areas of the Coachella Valley, respectively, to represent the Coachella Valley's ozone air quality. Due to meteorology and close proximity to South Coast Air Basin, peak ozone levels occur in the northern and western Coachella Valley with concentrations lower further south and east. Palm Springs, located further west in the Coachella Valley, consistently shows higher levels of ozone than Indio, which is located southeast of Palm Springs, consistent with the results from air quality modeling. Locations even further east are expected to experience lower ozone levels than Indio. Therefore, the two existing monitors capture the highest ozone levels in Coachella Valley. However, additional air monitoring efforts are being considered as part of the AB 617 Eastern Coachella Valley CERPs.

#### Response to Comment 2-7

Incentive funding programs are extremely effective in accelerating the implementation of cleaner technologies and achieving emission reductions faster than regulations can achieve. The air quality benefits resulting from major incentive programs, such as the Carl Moyer program, the lawnmower and leaf blower exchange programs, and the Surplus Off-Road Opt-in (SOON) program, have been

quantified and described in the 2016 AQMP. As part of the Community Air Protection Program (CAPP), incentives program projects have been implemented in the Eastern Coachella Valley. AB 617 funding used for incentive projects for the Eastern Coachella Valley in 2018 and 2019 have been quantified and tracked, resulting in the emission reductions in the table below.

	<u>Estimated Annual Emission Reduction (tpy)</u>			<u>Total CAPP Year 1 &amp; Year 2 Funds</u>
	<u>NOx</u>	<u>Diesel PM</u>	<u>VOC</u>	
<u>Eastern Coachella Valley</u>	<u>63.1</u>	<u>5.3</u>	<u>7.5</u>	<u>\$ 13,696,476.03</u>

A list of projects selected through the CAPP Incentives Program are available at <http://www.aqmd.gov/home/programs/business/community-air-protection-incentives#>. As incentive projects continue to be implemented, they will continue to be tracked as part of the AB 617 program. Additionally, new CAPP incentive funds will be available (i.e., Year 3 CAPP incentives). The AB 617 Eastern Coachella Valley CERP is still under development and will likely include incentive strategies as part of the CERP.

In addition, the South Coast AQMD has designated \$966,667 in Governing Board approved mitigation funding, along with additional co-funding from contractor obtained partnerships, to provide energy efficiency enhancement upgrades for residential homes within designated Environmental Justice areas in Indio and in the Coachella Valley. These upgrades will result in less energy required to cool and heat homes and less emissions from fuel combustion.

South Coast AQMD currently offers several financial incentives and programs for implementing new clean air technologies. For details of these programs, please visit our website at: <http://www.aqmd.gov/home/programs>. South Coast AQMD will continue to enhance its partnership efforts with local businesses and residents to encourage and ensure that the incentive funding programs are being used. In terms of climate change, as described in Response to Comment 2-2, a comprehensive meteorological study is currently underway to evaluate the impact of meteorological factors and trends conducive to poor air quality.

## **Appendix III**

### **CARB Existing Regulations**

### Appendix III

#### CARB Existing Regulations

Board Action	Hearing Date
<b>Procedures for the Exemption of Add-On and Modified Part(s) for On-Road Vehicles/Engines:</b> The updated aftermarket part procedures incorporate language reflecting current vehicle and engine emissions related technologies and standards. It also clarifies the requirements to improve review, testing, and approval timing to get products to market sooner.	7/23/20
<b>Advanced Clean Trucks Regulation:</b> The requirements for truck manufacturers sell zero-emission trucks in California and a one time requirement for large entities to report about their facilities, types of truck services used, and fleet of vehicles.	6/25/20
<b>Updates to the 2019 Architectural Coatings Suggested Control Measure:</b> The amended 2019 Architectural Coatings Suggested Control Measure to add a new coating category for Photovoltaic Coatings and establish a limit on the volatile organic content of the coatings.	5/28/20
<b>Amendments to the Regulation on the Commercialization of Alternative Diesel Fuels:</b> The amendments to the ADF Regulation to reinforce the emissions certification testing requirements and require biodiesel additives and ADF formulations to be certified according to new certification procedures. The amendments reinforce the originally intended efficacy of additives or alternative diesel formulations certified to mitigate potential oxides of nitrogen (NOx) emissions increases from the use of biodiesel.	4/23/20
<b>San Joaquin Valley Agricultural Equipment Incentive Measure:</b> The San Joaquin Valley Agricultural Equipment Incentive Measure for submission to the United States Environmental Protection Agency as a revision to the California State Implementation Plan (SIP). The measure achieves SIP creditable emission reductions from agricultural equipment incentive projects.	12/13/19
<b>Amendments to the Regulation for Limiting Ozone Emissions from Indoor Air Cleaning Devices:</b> The amendments to the air cleaner regulation, which limits ozone emissions from air cleaning devices.	12/12/19
<b>Control Measure for Ocean-Going Vessels At Berth:</b> The Regulation would take effect in 2021 and is designed to achieve further emissions from vessels at berth to reduce adverse health impacts to communities surrounding ports and terminals throughout California. These benefits would be achieved by including new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals.	12/5/19
<b>Amendments to the Low Carbon Fuel Standard:</b> The amendments to the Low Carbon Fuel Standard (LCFS) Regulation, focusing on strengthening the program's cost containment provisions and ensuring that LCFS residential charging credit revenue value benefits disadvantaged and low-income communities.	11/21/19
<b>Zero-Emission Airport Shuttle Regulation:</b> The regulation will transition combustion powered airport shuttles to zero-emission vehicles and will apply to private and public fixed destination shuttles that serve California's commercial airports.	6/27/19
<b>Updates to the Architectural Coatings Suggested Control Measure:</b> The updates to the SCM would reduce volatile organic compound (VOC) limits for several coating categories, create two new coatings categories, and set limits for colorants (tints) added to architectural coatings at the point of sale. The updated SCM would serve as a model rule and assist air districts in their efforts to further reduce VOC emissions to meet ambient air quality standards for ozone.	5/23/19
<b>Amendments to the Regulation for the Certification of Vapor Recovery Systems for Cargo Tanks:</b> The amendments to the Certification of Vapor Recovery Systems on Cargo Tanks Regulation that establish a regulatory mechanism to periodically evaluate program costs and subsequently adjust the certification fee to recover these costs, per the authority under the Health and Safety Code section 41962. In addition, the amendments will establish: (1) a requirement for a public meeting prior to adjusting fees, (2) an effective date of January 1 following a fee revision, (3) the cost of replacement decals, and (4) procedures to request a certification fee refund.	4/25/19
<b>Amendments to the Red Sticker Program for Off-Highway Recreational Vehicles:</b> The amendments to the Red Sticker Program for Off-Highway Recreation Vehicles (OHRV). OHRV are primarily used in public State parks and federally designated lands, as well as on private tracks. The goal of the amendments is to end the current red sticker program which allows for CARB certification of OHRV that do not meet emissions standards. The amendments include provisions that end the certification of new red sticker vehicles, end riding restrictions on public lands for existing red sticker vehicles, establish new OHRV emissions standards, and increase incentives for fleet emissions averaging and zero emission OHRV. The amendments are intended to cause emissions reductions from OHRV in California while ensuring availability for California dealers and riders.	4/25/19
<b>Amendments to the On-Road Heavy-Duty Diesel-Fueled Residential and Commercial Solid Waste Collection Vehicles Regulation to Include Heavy Cranes:</b> The amendments include two distinct changes to the regulation, (1) to ensure that compliant SWCVs do not experience registration delays at the California Department of Motor Vehicles due to recent changes in California law; (2) to provide a more cost-effective compliance option for specialized heavy cranes.	1/24/19

Board Action	Hearing Date
<b>Innovative Clean Transit Regulation, a Replacement of the Fleet Rule for Transit Agencies:</b> The Innovative Clean Transit (ICT) Regulation that requires California transit agencies to gradually transition their buses to zero-emission technologies. The ICT regulation is structured to allow transit agencies to take advantage of incentive programs by acting early and in a manner to implement plans that are best suited for their own situations.	12/14/18
<b>California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation:</b> The Cap-and-Trade Regulation amendments are intended to conform with the requirements in AB 398, respond to Board direction in Resolution 17-21, and enhance program implementation and oversight. The amendments include changes to provisions relating to free allocation for minimizing leakage and transition assistance, offsets usage limits and criteria related to direct environmental benefits in the State, and cost containment.	12/13/18
<b>Amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions:</b> The Mandatory Reporting of Greenhouse Gas Emissions amendments are targeted revisions to clarify the existing regulation related to how entities report their greenhouse gas emissions to support the Cap-and-Trade Program, and to ensure the data that are collected for CARB's climate change programs are complete and accurate.	12/13/18
<b>Revisions to On Board Diagnostic System Requirements, Including the Introduction of Real Emissions Assessment Logging, for Heavy Duty Engines, Passenger Cars, Light-Duty Trucks, and Medium-Duty Vehicles and Engine:</b> The amendments to the heavy-duty (HD) On Board Diagnostic (OBD) and medium-duty OBD II requirements update the monitoring requirements for gasoline and diesel vehicles, to require more data parameters to be tracked and reported by the engine/vehicle, and to clarify and improve the regulation where necessary.	11/15/18
<b>California Certification Procedures for Light-Duty Engine Packages for Use in New Light-Duty Specially-Produced Motor Vehicles for 2019 and Subsequent Model Years:</b> The California Regulation and Certification Procedures for Light-Duty Engine Packages for Use In New Light-Duty Specially-Produced Motor Vehicles for 2019 And Subsequent Model Years.	10/25/18
<b>Amendments to California Specifications for Fill Pipes and Openings of Motor Vehicle Fuel Tanks:</b> The amendments to Vehicle Fill Pipe Specifications to help ensure new motor vehicle fill pipes are compatible and form a good seal with Phase II recovery nozzles that are certified for use at California gasoline stations as a means to reduce overpressure.	10/25/18
<b>Amendments to Enhanced Vapor Recovery Regulations to Standardize Gas Station Nozzle Spout Dimensions to Help Address Storage Tank Overpressure:</b> The amendments to Enhanced Vapor Recovery Regulations to standardize gas station nozzle spout dimensions to improve compatibility with newer motor vehicle fill pipes. This compatibility is necessary to reduce air ingestion at the nozzle, which will help reduce storage tank overpressure conditions.	10/25/18
<b>Amendments to the Low-Emission Vehicle III Greenhouse Gas Emission Regulation:</b> The amendments to the Low-Emission Vehicle III greenhouse gas emission regulation to clarify that the "deemed to comply" option for model years 2021 through 2025 is applicable only if the currently adopted federal regulations remain in effect.	9/27/18
<b>Amendments to the Low Carbon Fuel Standard Regulation and to the Regulation on Commercialization of Alternative Diesel Fuels:</b> The amendments designed to strengthen the Low Carbon Fuel Standard (LCFS) regulation through 2030 in line with the Senate Bill 32 greenhouse gas reduction goals. The amendments would enhance LCFS credit for zero-emission vehicle fueling infrastructure per Governor Brown's Executive Order B-48-18, a protocol to enable credit generation for carbon capture and sequestration projects, expand fuel types and vehicle applications to which the LCFS regulation applies (including adding alternative jet fuel), improve crediting for innovative actions at petroleum refineries, and establish an independent third-party verification and verifier accreditation system to ensure accuracy of LCFS reported data. The amendments also include a number of technical changes to improve, simplify, streamline, and clarify the regulation	9/27/18
<b>Amendments to California Emission Control System Warranty Regulations and Maintenance Provisions for 2022 and Subsequent Model Year On-Road Heavy-Duty Diesel Vehicles with Gross Vehicle Weight Rating Greater Than 14,000 Pounds and Heavy-Duty Diesel Engines in Such Vehicles:</b> The amendments to the California warranty and maintenance provisions for on-road heavy-duty (HD) diesel vehicles, and the engines used in such vehicles. Currently, because the warranty mileage period is disproportionate to the actual service lives of many modern HD vehicles and engines, vehicle owners have no incentive to pay for repairs of emissions-related problems that do not adversely affect fuel economy or performance, which results in additional emissions. The amendments lengthen both the existing warranty periods and minimum maintenance intervals so as to reduce emissions by incentivizing vehicle owners to perform required maintenance and to seek more timely repairs, and to encourage manufacturers to design and produce more durable parts.	6/28/18
<b>Amendments to the Heavy-Duty Vehicle Inspection Program and Periodic Smoke Inspection Program:</b> The amendments lower the allowable opacity limit for HD vehicles operating in California for both the HDVIP and PSIP, establish reporting requirements for the PSIP and smoke tester training requirements, and allow 2013 model year and newer engines to report on-board diagnostic data in lieu of performing the annual PSIP smoke test.	5/25/18
<b>Amendments to the Consumer Products Regulation and Method 310:</b> The amendments to the consumer products regulation established an alternate compliance option for multi-purpose lubricant (MPL) products.	5/25/18

Board Action	Hearing Date
<b>Regulation for Prohibitions on Use of Certain Hydrofluorocarbons in Stationary Refrigeration and Foam End-Uses:</b> The regulation provides prohibitions on the use of certain high-global warming potential hydrofluorocarbons (HFC) in stationary refrigeration and foam end-uses. The objective is to preserve HFC emissions reductions expected from the federal Significant New Alternatives Policy (SNAP) Rules for certain end-uses for which compliance dates have either already passed or are imminent.	3/23/18
<b>Funding Agricultural Replacement Measures for Emission Reductions Program Guidelines:</b> The Guidelines outline the California Air Resources Board's plans for expending these funds in a manner consistent with the legislative direction from two bills, existing statutes, and regulations. The Guidelines describe district funding allocations, eligible project categories and criteria, program implementation details, and the justification for these investments.	3/23/18
<b>California Greenhouse Gas Emissions Standards for Medium- and Heavy-Duty Engines and Vehicles, and Proposed Amendments to the Tractor-Trailer Greenhouse Gas Regulation:</b> The new, more stringent California Phase 2 GHG emission standards are largely harmonize with the federal Phase 2 standards, and proposed amendments to the Tractor-Trailer GHG regulation to harmonize California's Tractor-Trailer GHG regulation with the proposed Phase 2 trailer standards. The California Phase 2 GHG standards are needed to meet the mandates of both AB 32 and of SB 32, and the California HSC.	2/8/18
<b>Amendments to the Airborne Toxic Control Measure For Diesel Particulate Matter from Portable Engines Rated at 50 Horsepower and Greater – and to the Statewide Portable Equipment Registration Program Regulation:</b> The amendments provide more time for cleaner engine replacement while preserving the expected emission reductions, and make other improvements to the ATCM. PERP will have corresponding amendments and make other improvements to the program.	11/16/17
<b>Amendments to California's Evaluation Procedures for New Aftermarket Catalytic Converters:</b> The amendments are for procedures used to evaluate and approve aftermarket catalytic converters designed for use on California passenger cars and trucks to allow them to be used for Low Emission Vehicle III emission standards.	9/28/17
<b>Amendments to the Market-Based Compliance Mechanism Regulation (Cap-and-Trade Regulation):</b> The amendments to the Cap-and-Trade Program extend major provisions of the Program beyond 2020, to broaden the Program through linkage with Ontario, Canada, to prevent emissions leakage in the most cost-effective manner through appropriate allocation to entities, to clarify compliance obligations for certain sectors, and to enhance ARB's ability to implement and oversee the Cap-and-Trade Program.	7/27/17
<b>Amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions:</b> The amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions are to ensure the reported GHG data are accurate and fully support the California Cap-and-Trade Regulation.	6/29/17
<b>Revisions to the Carl Moyer Memorial Air Quality Standards Attainment Program Guidelines:</b> The updated Carl Moyer Memorial Air Quality Standards Attainment Program 2017 Guidelines implement changes directed by Senate Bill 513 and redesign the Program to meet California's need to transition to the very low and zero-emission technologies of the future.	4/27/17
<b>Amendments to the Evaporative Emission Requirements for Small Off-Road Engines:</b> The amendments address to non-compliance of small off-road engines (SORE) with existing evaporative emission standards, as well as amendments to streamline the certification process by harmonizing where feasible with federal requirements.	11/17/16
<b>Regulation to Provide Certification Flexibility for Innovative Heavy-Duty Engine and California Certification and Installation Procedures for Medium and Heavy-Duty Vehicle Hybrid Conversion Systems:</b> This regulation's certification flexibility is tailored to encourage development and market launch of heavy-duty engines meeting California's optional low oxides of oxides of nitrogen emission standards, robust heavy-duty hybrid engines, and high-efficiency heavy-duty engines.	10/20/16
<b>Amendments to the California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulations:</b> The amendments would extend major provisions of the Regulation beyond 2020; link the Regulation with Ontario, Canada; continue cost-effective prevention of emission leakage through allowance allocations to entities; and enhance Program implementation and oversight.	9/22/16
<b>Amendments to the Mandatory Reporting of Greenhouse Gas Emissions:</b> The amendments are to ensure reported GHG data are accurate and fully support the California Cap on Greenhouse Gas Emissions and Market Based Compliance Mechanisms and comply with the U.S. EPA Clean Power Plan.	9/22/16
<b>Amendments to the Large Spark-Ignition Engine Fleet Requirements Regulation:</b> The amendment establish new reporting and labeling requirements and extend existing recordkeeping requirements. The regulatory amendments are expected to improve the reliability of the emission reductions projected for the existing LSI Fleet Regulation by increasing enforcement effectiveness and compliance rates.	7/21/16
<b>Evaluation Procedure for New Aftermarket Diesel Particulate Filters Intended as Modified Parts for 2007 through 2009 Model Year On-Road Heavy-Duty Diesel Engines:</b> The amendment would establish a path for exempting aftermarket modified part DPFs intended for 2007 through 2009 on-road heavy-duty diesel engines from the prohibitions of the current vehicle code. Also, incorporate a new procedure for the evaluation of such DPFs.	4/22/16

Board Action	Hearing Date
<b>Amendments to the Regulation for Small Containers of Automotive Refrigerant:</b> The amendments to the Regulation for Small Containers of Automotive Refrigerant clarify any existing requirement that retailers must transfer the unclaimed consumer deposits to the manufacturers, clarify how the manufacturers spend the money, set the refundable consumer deposit at \$10, and require additional language on the container label.	4/22/16
<b>Amendments to the Portable Fuel Container Regulation:</b> Amendments to the Portable Fuel Container (PFC) regulation, which include requiring certification fuel to contain 10 percent ethanol, harmonizing aspects of the Board's PFC certification and test procedures with those of the U.S. EPA, revising the ARB's certification process, and streamlining, clarifying, and increasing the robustness of ARB's certification and test procedures.	2/18/16
<b>Technical Status and Proposed Revisions to On-Board Diagnostic System Requirements and Associated Enforcement Provisions for Passenger Cars, Light-Duty Trucks, and Medium-Duty Vehicles and Engines (OBD II):</b> Amendments to the OBD II regulations that update requirements to account for LEV III applications and monitoring requirements for gasoline and diesel vehicles, and clarify and improve the regulation; also, updates to the associated OBD II enforcement regulation to align it with the proposed amendments to the OBD II regulations and a minor amendment to the definition of "emissions-related part" in title 13, CCR section 1900.	9/25/15
<b>2015 Low Carbon Fuel Standard (LCFS) Amendments (2 of 2):</b> The Low Carbon Fuel Standard, which includes updates and revisions to the regulation now in effect. The regulation was first presented to the Board at its February 2015 public hearing, at which the Board directed staff to make modifications to the proposal.	9/24/15
<b>Regulation on the Commercialization of Alternative Diesel Fuels (2 of 2):</b> Regulation governing the introduction of alternative diesel fuels into the California commercial market, including special provisions for biodiesel.	9/24/15
<b>CA Cap on GHG Emissions and Market-Based Compliance Mechanisms (2 of 2):</b> Amendments to the Cap and Trade Regulation to include a new Rice Cultivation Compliance Offset Protocol and an update to the United States Forest Compliance Offset Protocol that would include project eligibility in parts of Alaska.	6/25/15
<b>Intermediate Volume Manufacturer Amendments to the Zero Emission Vehicle Regulation (2 of 2):</b> Amendments regarding intermediate volume manufacturer compliance obligations under the Zero Emission Vehicle regulation.	5/21/15
<b>2015 Amendments to Certification Procedures for Vapor Recovery Systems at Gasoline Dispensing Facilities—Aboveground Storage Tanks and Enhanced Conventional Nozzles:</b> Amendments would establish new performance standards and specifications for nozzles used at fleet facilities that exclusively refuel vehicles equipped with onboard vapor recovery systems, would provide regulatory relief for owners of certain existing aboveground storage tanks, and would ensure that mass-produced vapor recovery equipment matches the specifications of equipment evaluated during the ARB certification process.	4/23/15
<b>Proposed Regulation for the Commercialization of Alternative Diesel Fuels (1 of 2):</b> Regulation governing the introduction of alternative diesel fuels into the California commercial market, including special provisions for biodiesel. This is the first of two hearings on the item, and the Board will not take action to approve the proposed regulation.	2/19/15
<b>Evaporative Emission Control Requirements for Spark-Ignition Marine Watercraft:</b> Regulation for controlling evaporative emissions from spark-ignition marine watercraft. The proposed regulation will harmonize, to the extent feasible, with similar federal requirements, while adding specific provisions needed to support California's air quality needs.	2/19/15
<b>2015 Low Carbon Fuel Standard (LCFS) Amendments (1 of 2):</b> The amendments for the Low Carbon Fuel Standard includes a re-adoption of the existing Low Carbon Fuel Standard with updates and revisions. This is the first of two hearings on the item, and the Board will not take action to approve the proposed regulation.	2/19/15
<b>CA Cap on GHG Emissions and Market-Based Compliance Mechanisms to Add the Rice Cultivation Projects and Updated U.S. Forest Projects Protocols (1 of 2):</b> Updates to the Cap and Trade Regulation to include a new Rice Cultivation Compliance Offset Protocol and an update to the United States Forest Compliance Offset Protocol that would include project eligibility in parts of Alaska.	12/18/14
<b>2014 Amendments to ZEV Regulation:</b> Additional compliance flexibility to ZEV manufacturers working to bring advanced technologies to market.	10/23/14
<b>LEV III Criteria Pollutant Requirements for Light- and Medium-Duty Vehicles the Hybrid Electric Vehicle Test Procedures, and the HD Otto-Cycle and HD Diesel Test Procedures:</b> Applies to the 2017 and subsequent model years.	10/23/14
<b>Amendments to Mandatory Reporting Regulation for Greenhouse Gases:</b> Further align reporting methods with USEPA methods and factors, and modify reporting requirements to fully support implementation of California's Cap and Trade program.	9/19/14

Board Action	Hearing Date
<b>Amendments to the California Cap on Greenhouse Gas Emissions and Market Based Compliance Mechanisms:</b> Technical revisions to Mandatory Reporting of Greenhouse Gas Emissions Regulation to further align reporting methods with U.S.EPA update methods and factors, and modify reporting requirements to fully support implementation of California's Cap and Trade program.	9/18/14
<b>Amendments to the AB 32 Cost of Implementation Fee Regulation:</b> Amendments to the regulation to make it consistent with the revised mandatory reporting regulation, to add potential reporting requirements, and to incorporate requirements within the mandatory reporting regulation to streamline reporting.	9/18/14
<b>Revisions to the Carl Moyer Memorial Air Quality Standards Attainment Program Guidelines for On-Road Heavy-Duty Trucks:</b> Revisions to 1) reduce surplus emission reduction period, 2) reduce minimum CA usage requirement, 3) prioritize on-road funding to small fleets, 4) include light HD vehicles 14000-19500 lbs, and 5) clarify program specifications.	7/24/14
<b>Amendments to Enhanced Fleet Modernization (Car Scrap) Program:</b> Amendments consistent with SB 459 which requires ARB to increase benefits for low-income California residents, promote cleaner replacement vehicles, and enhance emissions reductions.	6/26/14
<b>Proposed Approval of Amendments to CA Cap on GHG Emissions and Market-Based Compliance Mechanisms :</b> Second hearing of two, continued from October 2013.	4/24/14
<b>Truck and Bus Rule Update:</b> Amendments to the Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen, and Other Criteria Pollutants From In-Use On-Road Diesel-Fueled Vehicles: increasing low-use vehicle thresholds, allowing owners to newly opt-in to existing flexibility provisions, adjusting "NOx exempt" vehicle provisions, and granting additional time for fleets in certain areas to meet PM filter requirements.	4/24/14
<b>Heavy-Duty GHG Phase I: On-Road Heavy-Duty GHG Emissions Rule, Tractor-Trailer Rule, Commercial Motor Vehicle Idling Rule, Optional Reduced Emission Standards, Heavy-Duty Hybrid-Electric Vehicles Certification Procedure:</b> New GHG standards for MD and HD engines and vehicles identical to those adopted by the USEPA in 2011 for MYs 2014-18.	12/12/13
<b>Agricultural equipment SIP credit rule:</b> Incentive-funded projects must be implemented using Carl Moyer Program Guidelines; must be surplus, quantifiable, enforceable, and permanent, and result in emission reductions that are eligible for SIP credit.	10/25/13
<b>Mandatory Report of Greenhouse Gas Emissions:</b> Approved a regulation that establishes detailed specifications for emissions calculations, reporting, and verification of GHG emission estimates from significant sources.	10/25/13
<b>CA Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms:</b> Technical revisions to the Mandatory Reporting of Greenhouse Gas Emissions Regulation to further align reporting methods with U.S.EPA, update factors, and modify definitions to maintain consistency with the Cap and Trade program.	10/25/13
<b>Zero emission vehicle test procedures:</b> Existing certification test procedures for plug-in hybrid vehicles need to be updated to reflect technology developments. The ZEV regulation will require minor modifications to address clarity and implementation issues.	10/24/13
<b>Consumer Products: Antiperspirants, Deodorants, Test Method 310, Aerosol Coatings, Proposed Repeal of Hairspray Credit):</b> Amendments to require various consumer products to reformulate to reduce VOC or reactivity content to meet specified limits, and to clarify various regulatory provisions, improve enforcement, and add analytical procedures.	9/26/13
<b>Alternative fuel certification procedures:</b> Amendments to current alternative fuel conversion certification procedures for motor vehicles and engines that will allow small volume conversion manufacturers to reduce the upfront demonstration requirements and allow systems to be sold sooner with lower certification costs than with the current process, beginning with MY 2018.	9/26/13
<b>Vapor Recovery for Gasoline Dispensing Facilities:</b> Amendments to certification and test procedures for vapor recovery equipment used on cargo tanks and at gasoline dispensing facilities.	7/25/13
<b>Off-highway recreational vehicle evaporative emission control:</b> Set evaporative emission standards to control hydrocarbon emissions from Off-Highway Recreational Vehicles. The running loss, hot soak, and diurnal performance standards can be met by using proven automobile type control technology.	7/25/13
<b>Gasoline and diesel fuel test standards:</b> The amendments add test standards for the measurement of prohibited oxygenates at trace levels specified in existing regulations.	1/25/13
<b>LEV III and ZEV Programs for Federal Compliance Option:</b> The amendments deem compliance with national GHG new vehicle standards in 2017-2025 as compliance with California GHG standards for the same model years.	11/15/12 12/6/12 EO
<b>Consumer products (automotive windshield washing fluid):</b> The amendments add portions of 14 California counties to the list of areas with freezing temperatures where 25% VOC content windshield washing fluid could be sold.	10/18/2012 EO 03/15/13
<b>GHG mandatory reporting, Fee Regulation, and Cap and Trade 2012:</b> The amendments eliminate emission verification for facilities emitting less than 25,000 MTCO <sub>2</sub> e and make minor changes in definitions and requirements.	9/20/12 11/2/12 EO

Board Action	Hearing Date
<b>Amendments to Verification Procedure, Warranty and In-Use Compliance Requirements for In-Use Strategies to Control Emissions from Diesel Engines:</b> Approved amendments to the verification procedure used to evaluate diesel retrofits through emissions, durability, and field testing. Amendments will lower costs associated with required in-use compliance testing, streamline the in-use compliance process, and will extend time allowed to complete verifications.	8/23/2012 EO 07/02/13
<b>Amendments to On-Board Diagnostics (OBD I and II) Regulations:</b> Approved amendments to the light- and medium-duty vehicle and heavy-duty engine OBD regulations.	8/23/2012 EO 06/26/13
<b>Cap and Trade: Amendments to CA Cap on GHG Emissions and Market-Based Compliance Mechanisms, and Amendments Allowing Use of Compliance Instruments Issued by Linked Jurisdictions:</b> Amends Cap-and-Trade and compliance mechanisms to add security to the market system and to aid in implementation. Amendments include first auction rules, offset registry, market monitoring provisions, and information gathering necessary for the financial services operator.	6/28/12 7/31/12 EO
<b>Vapor recovery defect list:</b> The amendments add defects and verification procedures for equipment approved since 2004, and make minor changes to provide clarity	6/11/12 EO
<b>Tractor-Trailer GHG Regulation: Emergency Amendment:</b> The emergency amendment to correct a drafting error and delay the registration date for participation in the phased compliance option	2/29/2012 2/29/12 EO
<b>Advanced Clean Cars (ACC) Regulation: Low-Emission Vehicles and GHG:</b> The more stringent criteria emission standards for MY 2015-2025 light and medium duty vehicles (LEV III), amended GHG emission standards for model year 2017-2025 light and medium duty vehicles (LEV GHG), amended ZEV Regulation to ensure the successful market penetration of ZEVs in commercial volumes, amended hydrogen fueling infrastructure mandate of the Clean Fuels Outlet regulation, and amended cert fuel for light duty vehicles from an MTBE-containing fuel to an E10 certification fuel.	1/26/12
<b>Zero Emission Vehicle (ZEV):</b> The amendments increase compliance flexibility, add two new vehicle category credits, increase credits for 300 mile FCVs, increase requirements for ZEVs and TZEVs, eliminate credit for PZ expand applicability to smaller manufacturers, base ZEV credits on range, and make other minor changes in cr	1/26/12
<b>Amendments to Low Carbon Fuel Standard Regulation:</b> The amendments address several aspects of the regulation, including: reporting requirements, credit trading, regulated parties, opt-in and opt-out provisions, definitions, and other clarifying language.	12/16/11 10/10/12 EO
<b>Amendments to Small Off-Road Engine and Tier 4 Off-Road Compression-Ignition Engine Regulations And Test Procedures; also “Recreational Marine” Spark-Ignition Marine Engine Amendments (Recreational Boats):</b> Aligns California test procedures with U.S. EPA test procedures and requires off-road CI engine manufacturers to conduct in-use testing of their entire product lines to confirm compliance with previously established Not-To-Exceed emission thresholds.	12/16/2011 10/25/12 EO
<b>Regulations and Certification Procedures for Engine Packages used in Light-Duty Specially Constructed Vehicles (Kit Cars):</b> Ensures that certified engine packages, when placed into any Kit Car, would meet new vehicle emission standards, and be able to meet Smog Check requirements.	11/17/11 9/21/12 EO
<b>Amendments to the California Reformulated Gasoline Regulations:</b> Corrects drafting errors in the predictive model, deletes outdated regulatory provisions, updates the notification requirements, and changes the restrictions on blending CARBOB with other liquids.	10/21/11 8/24/12 EO
<b>Amendments to the In-Use Diesel Transport Refrigeration Units (TRU) ATCM:</b> Mechanisms to improve compliance rates and enforceability.	10/21/11 8/31/12 EO
<b>Amendments to the AB 32 Cost of Implementation Fee Regulation:</b> Clarifies requirements and regulatory language, revises definitions.	10/20/11 8/21/12 EO
<b>Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, Including Compliance Offset Protocols:</b> Greenhouse Gas Emissions Cap-and-Trade Program, including compliance offset protocols and multiple pathways for compliance.	10/21/11 8/21/12 EO
<b>Amendments to the Regulation for Cargo Handling Equipment (CHE) at Ports and Intermodal Rail Yards (Port Yard Trucks Regulation):</b> Provides additional compliance flexibility, and maintains anticipated emissions reductions. As applicable to yard trucks and two-engine sweepers.	9/22/11 8/2/12 EO
<b>Amendments to the Enhanced Vapor Recovery Regulation for Gasoline Dispensing Facilities:</b> New requirement for low permeation hoses at gasoline dispensing facilities.	9/22/11 7/26/12 EO
<b>Amendments to Cleaner Main Ship Engines and Fuel for Ocean-Going Vessels:</b> Adjusts the offshore regulatory boundary. Aligns very low sulfur fuel implementation deadlines with new federal requirements.	6/23/11 9/13/12 EO
<b>Particulate Matter Emissions Measurement Allowance For Heavy-Duty Diesel In-Use Compliance Regulation:</b> Emission measurement allowances provide for variability associated with the field testing required in the regulation.	6/23/11
<b>Low Carbon Fuel Standard Carbon Intensity Lookup Table Amendments:</b> Adds new pathways for vegetation-based fuels	2/24/11
<b>Amendments to Cleaner In-Use Heavy-Duty On-Road Diesel Trucks and LSI Fleets Regulations:</b> Amends five regulations to provide relief to fleets adversely affected by the economy, and take into account the fact that emissions are lower than previously predicted.	12/16/10 9/19/11 EO

Board Action	Hearing Date
<b>Tractor-Trailer GHG Regulation Amendment:</b> Enacts administrative changes to increase compliance flexibility and reduce costs	12/16/10
<b>Amendments to Cleaner In-Use Off-Road Diesel-Fueled Fleets Regulation:</b> Amendments provide relief to fleets adversely affected by the economy, and take into account the fact that emissions are lower than previously predicted.	12/16/10 10/28/11 EO
<b>In-Use On-Road Diesel-Fueled Heavy-Duty Drayage Trucks at Ports and Rail Yard Facilities:</b> Amendments add flexibility to fleets' compliance schedules, mitigate the use of noncompliant trucks outside port and rail properties, and provide transition to the Truck and Bus regulation.	12/16/10 9/19/11 EO
<b>Amendments to the Regulation for Mandatory Reporting of Greenhouse Gas Emissions:</b> Changes requirements to align with federal greenhouse gas reporting requirements adopted by US EPA.	12/16/10 10/28/11 EO
<b>Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation:</b> Establishes framework and requirements for Greenhouse Gas Emissions Cap-and-Trade Program, including compliance offset protocols.	12/16/10 10/26/11 EO
<b>Amendments to the Consumer Products Regulation:</b> The amendments set new or lower VOC limits for some categories, prohibit certain toxic air contaminants, high GWP compounds, and surfactants toxic to aquatic species. Also changes Method 310, used to determine aromatic content of certain products.	11/18/10 9/29/11 EO
<b>Amendment of the ATCM for Diesel Transportation Refrigeration Units (TRU):</b> Amendments expand the compliance options and clarify the operational life of various types of TRUs.	11/18/10 2/2/11 EO
<b>Amendments to the ATCM for Stationary Compression Ignition Engines:</b> The amendments closely align the emission limits for new emergency standby engines in the ATCM with the emission standards required by the federal Standards of Performance.	10/21/10 3/25/11 EO
<b>Diesel Vehicle Periodic Smoke Inspection Program:</b> The amendments exempt medium duty diesel vehicles from smoke inspection requirements if complying with Smog Check requirements.	10/21/10 8/23/11 EO
<b>Renewable Electricity Standard Regulation:</b> The regulation requires electricity providers to obtain at least 33% of their retail electricity sales from renewable energy resources by 2020.	9/23/10
<b>Energy Efficiency at Industrial Facilities:</b> The standards for the reporting of GHG emissions and the feasibility of emissions controls by the largest GHG-emitting stationary sources.	7/22/10 5/9/11 EO
<b>Amendments to Commercial Harbor Craft Regulation:</b> The amendments require the use of cleaner engines in diesel-fueled crew and supply, barge, and dredge vessels.	6/24/10 4/11/11 EO
<b>Accelerated Introduction of Cleaner Line-Haul Locomotives:</b> Agreement with railroads sets prescribed reductions in diesel risk and target years through 2020 at four major railyards.	6/24/10
<b>Amendments to New Passenger Motor Vehicle Greenhouse Gas Emission Standards:</b> The amendments deeming compliance with EPA's GHG standards as compliance with California's standards in 2012 through 2016 model years.	2/25/2010 03/29/10
<b>Sulfur Hexafluoride (SF6) Regulation:</b> The regulation reduces emissions of sulfur hexafluoride (SF6), a high-GWP GHG, from high-voltage gas-insulated electrical switchgear.	2/25/10 12/15/10 EO
<b>Amendments to the Statewide Portable Equipment Registration Regulation and Portable Engine ATCM:</b> The amendments extend the deadline for removal of certain uncertified portable engines for one year.	1/28/10 8/27/10 EO 12/8/10 EO
<b>Diesel Engine Retrofit Control Verification, Warranty, and Compliance Regulation Amendments:</b> The amendments require per-installation compatibility assessment, performance data collection, and reporting of additional information, and enhance enforceability.	1/28/10 12/6/10 EO
<b>Stationary Equipment High-GWP Refrigerant Regulation:</b> The regulation reduces emissions of high-GWP refrigerants from stationary non-residential equipment.	12/1/09 9/14/10 EO
<b>Amendments to Limit Ozone Emissions from Indoor Air Cleaning Devices:</b> The amendments delay the labeling compliance deadlines by one to two years and to make minor changes in testing protocols.	12/9/09
<b>Emission Warranty Information Reporting Regulation Amendments:</b> Repealed the 2007 regulation and readopted the 1988 regulation with amendments to implement adverse court decision.	11/19/09 9/27/10 EO
<b>Amendments to Maximum Incremental Reactivity Tables:</b> Added many new compounds and modified reactivity values for many existing compounds in the tables to reflect new research data.	11/3/09 7/23/10 EO
<b>AB 32 Cost of Implementation Fee Regulation:</b> AB 32 authorizes ARB to adopt by regulation a schedule of fees to be paid by sources of greenhouse gas emissions regulated pursuant to AB 32. Also, a fee regulation to support the administrative costs of AB 32 implementation.	9/24/2009 05/06/10 EO
<b>Passenger Motor Vehicle Greenhouse Gas Limits Amendments:</b> The amendments grant credits to manufacturers for compliant vehicles sold in other states that have adopted California regulations.	9/24/09 2/22/10 EO
<b>Consumer Products Amendments:</b> The amendments set new VOC limits for multi-purpose solvent and paint thinner products and lower the existing VOC limit for double phase aerosol air fresheners.	9/24/09 8/6/10 EO
<b>Amendments to In-Use Off-Road Diesel-Fueled Fleets Regulation:</b> The amendments implement legislatively directed changes and provide additional incentives for early action.	7/23/09 12/2/09 EO 6/3/10 EO

Board Action	Hearing Date
<b>Methane Emissions from Municipal Solid Waste Landfills:</b> The regulation requires smaller and other uncontrolled landfills to install gas collection and control systems, and also requires existing and newly installed systems to operate optimally.	6/25/09 5/5/10 EO
<b>Cool Car Standards:</b> The regulation requires the use of solar management window glass in vehicles up to 10,000 lb GVWR.	6/25/09
<b>Enhanced Fleet Modernization (Car Scrap):</b> The guidelines for a program to scrap up to 15,000 light duty vehicles statewide.	6/25/09 7/30/10 EO
<b>Amendments to Heavy-Duty On-Board Diagnostics Regulations:</b> The amendments to the light and medium-duty vehicle and heavy duty engine OBD regulations.	5/28/2009 4/6/10 EO
<b>Smog Check Improvements:</b> The amendments implement changes in state law and SIP commitments adopted by ARB between 1996 and 2007.	5/7/09 by BAR 6/9/09 EO
<b>AB 118 Air Quality Improvement Program Guidelines:</b> The Air Quality Improvement Program provides for up to \$50 million per year for seven years beginning in 2009-10 for vehicle and equipment projects that reduce criteria pollutants, air quality research, and advanced technology workforce training. The AQIP Guidelines describe minimum administrative, reporting, and oversight requirements for the program, and provide general criteria for how the program shall be implemented.	04/23/09 08/28/09 EO
<b>Pesticide Element:</b> Reduce volatile organic compound (VOC) emissions from the application of agricultural field fumigants in the South Coast, Southeast Desert, Ventura County, San Joaquin Valley, and Sacramento Metro federal ozone nonattainment areas.	4/20/09 10/12/09 EO (2) 8/2/11 EO
<b>Low Carbon Fuel Standard:</b> Approved new standards to lower the carbon content of fuels.	4/20/09 11/25/09 EO
<b>Pesticide Element for San Joaquin Valley:</b> DPR Director approved pesticide ROG emission limit of 18.1 tpd and committed to implement restrictions on non-fumigant pesticide use by 2014 in the San Joaquin Valley.	4/7/09 DPR
<b>Tire Pressure Inflation Regulation:</b> The regulation requires automotive service providers to perform tire pressure checks as part of every service.	3/26/09 2/4/10 EO
<b>Sulfur Hexafluoride from Non-Utility and Non-Semiconductor Applications:</b> The regulation phases out use of Sulfur Hexafluoride over the next several years.	2/26/09 11/12/09 EO
<b>Semiconductor Operations:</b> The regulation to set standards to reduce fluorinated gas emissions from the semiconductor and related devices industry.	2/26/09 10/23/09 EO
<b>Plug-In Hybrid Electric Vehicles Test Procedure Amendments:</b> Amendments to test procedures to address plug-in-hybrid electric vehicles.	1/23/09 12/2/09 EO
<b>In-Use Off-Road Diesel-Fueled Fleets Amendments:</b> Makes administrative changes to recognize delays in the supply of retrofit control devices.	1/22/09
<b>Small Containers of Automotive Refrigerant:</b> The regulation reduces leakage from small containers, a container deposit and return program, and require additional container labeling and consumer education requirements.	1/22/09 1/5/10 EO
<b>Aftermarket Critical Emission Parts on Highway Motorcycles:</b> Allows for the sale of certified critical emission parts by aftermarket manufacturers.	1/22/09 6/19/09 EO
<b>Heavy-Duty Tractor-Trailer Greenhouse Gas (GHG) Reduction:</b> The regulation reduces greenhouse gas emissions by improving long haul tractor and trailer efficiency through use of aerodynamic fairings and low rolling resistance tires.	12/11/08 10/23/09 EO
<b>Cleaner In-Use Heavy-Duty Diesel Trucks (Truck and Bus Regulation):</b> The regulation reduces diesel particulate matter and oxides of nitrogen through fleet modernization and exhaust retrofits. Makes enforceability changes to public fleet, off-road equipment, and portable equipment regulations.	12/11/08 10/19/09 EO 10/23/09 EO
<b>Large Spark-Ignition Engine Amendments:</b> The amendments reduce evaporative, permeation, and exhaust emissions from large spark-ignition (LSI) engines equal to or below 1 liter in displacement.	11/1/08 3/12/09 EO
<b>Small Off-Road Engine (SORE) Amendments:</b> The amendments address the excessive accumulation of emission credits.	11/21/08 2/24/10 EO
<b>Proposed AB 118 Air Quality Guidelines for the Air Quality Improvement Program and the Alternative and Renewable Fuel and Vehicle and Technology Program:</b> The California Alternative and Renewable Fuel, Vehicle Technology, Clean Air, and Carbon Reduction Act of 2007 (AB 118) requires ARB to develop guidelines for both the Alternative and Renewable Fuel and Vehicle Technology Program and the Air Quality Improvement Program to ensure that both programs do not adversely impact air quality.	09/25/08 EO 05/20/09
<b>Portable Outboard Marine Tanks and Components (part of Additional Evaporative Emission Standards):</b> The regulation establishes permeation and emission standards for new portable outboard marine tanks and components.	9/25/08 7/20/09 EO
<b>Cleaner Fuel in Ocean Going Vessels:</b> The regulation requires use of low sulfur fuel in ocean-going ship main engines, and auxiliary engines and boilers.	7/24/08 4/16/09 EO

Board Action	Hearing Date
<b>Spark-Ignition Marine Engine and Boat Amendments:</b> Provides optional compliance path for > 500 hp sterndrive/inboard marine engines.	7/24/08 6/5/09 EO
<b>Consumer Products Amendments:</b> The amendments add volatile organic compound (VOC) limits for seven additional categories and lower limits for twelve previously regulated categories.	6/26/08 5/5/09 EO
<b>Zero emission vehicles:</b> Updated California's ZEV requirements to provide greater flexibility with respect to fuels, technologies, and simplifying compliance pathways. Amendments give manufacturers increased flexibility to comply with ZEV requirements by giving credit to plug-in hybrid electric vehicles and establishing additional ZEV categories in recognition of new developments in fuel cell vehicles and battery electric vehicles.	3/27/08 12/17/08 EO
<b>Amendments to the Verification Procedure, Warranty, and In-Use Compliance Requirements for In-Use Strategies to Control Emissions from Diesel Engines:</b> Adds verification requirements for control technologies that only reduce NOx emissions, new reduction classifications for NOx reducing technologies, new testing requirements, and conditional extensions for verified technologies.	1/24/08 12/4/08 EO
<b>Mandatory Report of Greenhouse Gas Emissions:</b> The regulation establishes detailed specifications for emissions calculations, reporting, and verification of GHG emission estimates from significant sources.	12/6/07 10/12/08 EO
<b>Gaseous Pollutant Measurement Allowances for In-Use Heavy-Duty Diesel Compliance:</b> Measurement accuracy margins are to be determined through an ongoing comprehensive testing program performed by an independent contractor. Amendments include these measurement accuracy margins into the regulation.	12/6/07 10/14/08 EO
<b>Ocean-Going Vessels While at Berth (aka Ship Hoteling) - Auxiliary Engine Cold Ironing and Clean Technology:</b> The regulation reduces emissions from auxiliary engines on ocean-going ships while at-berth.	12/6/07 10/16/08 EO
<b>In-Use On-Road Diesel-Fueled Heavy-Duty Drayage Trucks at Ports and Rail Yard Facilities:</b> The regulation establishes emission standards for in-use, heavy-duty diesel-fueled vehicles that transport cargo to and from California's ports and intermodal rail facilities.	12/6/07 10/12/08 EO
<b>Commercial Harbor Craft:</b> The regulation establishes in-use and new engine emission limits for both auxiliary and propulsion diesel engines on ferries, excursion vessels, tugboats, and towboats.	11/15/07 9/2/08 EO
<b>Suggested Control Measure for Architectural Coatings Amendments:</b> The amendments reduce the recommended VOC content of 19 categories of architectural coatings.	10/26/07
<b>Aftermarket Catalytic Converter Requirements:</b> The amendments establish more stringent emission performance and durability requirements for used and new aftermarket catalytic converters offered for sale in California.	10/25/07 2/21/08 NOD
<b>Limiting Ozone Emissions from Indoor Air Cleaning Devices:</b> The ozone emission limit of 0.050 ppm for portable indoor air cleaning devices in response to requirements of AB 2276 (2006).	9/27/07 8/7/08 EO
<b>Pesticide Commitment for Ventura County in 1994 SIP:</b> The substitution of excess ROG emission reductions from state motor vehicle program for 1994 SIP reduction commitment from pesticide application in Ventura County.	9/27/07 11/30/07 EO
<b>In-Use Off-Road Diesel Equipment:</b> The regulation requires off-road diesel fleet owners to modernize their fleets and install exhaust retrofits.	7/26/07 4/4/08 EO
<b>Emission Control and Environmental Performance Label Regulations:</b> The amendments add a Global Index Label and modify the format of the Smog Index Label on new cars.	6/21/07 5/2/08 EO
<b>Vapor Recovery from Aboveground Storage Tanks:</b> The regulation establish new performance standards and specifications for the vapor recovery systems and components used with aboveground storage tanks.	6/21/07 5/2/08 EO
<b>CaRFG Phase 3 amendments:</b> The amendments mitigate the increases in evaporative emissions from on-road motor vehicles resulting from the addition of ethanol to gasoline.	6/14/07 4/25/08 EO 8/7/08 EO
<b>Formaldehyde from Composite Wood Products:</b> The ATCM limit formaldehyde emissions from hardwood plywood, particleboard, and medium density fiberboard to the maximum amount feasible.	4/26/07 3/5/08 EO
<b>Portable equipment registration program (PERP) and airborne toxic control measure for diesel-fueled portable engines:</b> The amendment allow permitting of Tier 0 portable equipment engines used in emergency or low use duty and to extend permitting of certain Tier 1 and 2 "resident" engines to 1/1/10.	3/22/07 7/31/07 EO
<b>Perchloroethylene Control Measure Amendments:</b> The amendments to the Perchloroethylene ATCM to prohibit new Perc dry cleaning machines beginning 2008 and phase out all Perc machines by 2023.	1/25/07 11/7/07 EO
<b>Amendments to Emission Warranty Information Reporting &amp; Recall Regulations:</b> The amendments tighten the provisions for recalling vehicles for emissions-related failures, helping ensure that corrective action is taken to vehicles with defective emission control devices or systems.	12/7/06 3/22/07 10/17/07 EO
<b>Voluntary accelerated vehicle retirement regulations:</b> The amendments authorize the use of remote sensing to identify light-duty high emitters and that establish protocols for quantifying emissions reductions from high emitters proposed for retirement.	12/7/06
<b>Emergency regulation for portable equipment registration program (PERP), airborne toxic control measures for portable and stationary diesel-fueled engines</b>	12/7/06
<b>Amendments to the Hexavalent Chromium ATCM:</b> The amendments require use of best available control technology on all chrome plating and anodizing facilities.	12/7/06

Board Action	Hearing Date
<b>Consumer Products Regulation Amendments:</b> The amendments set lower emission limits in 15 product categories.	11/17/06 9/25/07 EO
<b>Requirements for Stationary Diesel In-Use Agricultural Engines:</b> The amendments to the stationary diesel engine ATCM which set emissions standards for in-use diesel agricultural engines.	11/16/06 7/3/07 NOD
<b>Ships - Onboard Incineration:</b> The amendments to cruise ship incineration ATCM to include all oceangoing ships of 300 gross registered tons or more.	11/16/06 9/11/07 EO
<b>Zero Emission Bus:</b> The amendments postpone the 15 percent purchase requirement three years for transit agencies in the diesel path and one to two years for transit agencies in the alternative fuel path, in order to keep pace with developments in zero emission bus technology, and adding an Advanced Demonstration requirement to offset emission losses.	10/19/06 8/27/07 EO
<b>Distributed generation certification:</b> The amendments improve the emissions durability and testing requirements, adding waste gas emission standards, and eliminating a redundant PM standard in the current 2007 emission standards.	10/19/06 5/17/07 NOD
<b>Heavy-Duty Diesel In-Use Compliance Regulation:</b> The amendments to the heavy-duty diesel engine regulations and test procedures create a new in-use compliance program conducted by engine manufacturers. The amendments would help ensure compliance with applicable certification standards throughout an engine's useful life.	9/28/06 7/19/07 NOD
<b>Revisions to OBD II and the Emission Warranty Regulations:</b> The amendments to the OBD II regulation provide for improved emission control monitoring including air-fuel cylinder imbalance monitoring, oxygen sensor monitoring, catalyst monitoring, permanent fault codes for gasoline vehicles and new thresholds for diesel vehicles.	9/28/06 8/9/07 EO
<b>Off-Highway Recreational Vehicle Amendments:</b> The amendments to the Off-Highway Recreational Vehicle Regulations including harmonizing evaporative emission standards with federal regulations, expanding the definition of ATVs, modifying labeling requirements, and adjusting riding seasons.	7/20/06 6/1/07 EO
<b>Portable Equipment Registration Program (PERP) Amendments:</b> The amendments to the Statewide Portable Equipment Registration program include installation of hour meters on equipment, and revisions to recordkeeping, reporting, and fees.	6/22/06 11/13/06 NOD
<b>Heavy Duty Vehicle Service Information:</b> The amendments to the Service Information Rule require manufacturers to make available diagnostic equipment and information for sale to the aftermarket.	6/22/06 5/3/07 EO
<b>LEV II technical amendments:</b> The amendments to evaporative emission test procedures, four-wheel drive dynamometer provisions, and vehicle label requirements.	6/22/06 9/27/06 NOD
<b>Dry Cleaning ATCM Amendments:</b> The amendments to the Dry Cleaning ATCM limit siting of new dry cleaners, phase out use of Perc at co-residential facilities, phase out higher emitting Perc sources at other facilities, and require enhanced ventilation at existing and new Perc facilities.	5/25/06
<b>Forklifts and other Large Spark Ignition (LSI) Equipment:</b> The regulation reduces emissions from forklifts and other off-road spark-ignition equipment by establishing more stringent standards for new equipment, and requiring retrofits or engine replacement on existing equipment. Aligns EPA's standards for 2007 and more stringent standards for 2010.	5/25/06 3/2/07 EO
<b>Enhanced Vapor Recovery Amendments:</b> The amendments to the vapor recovery system regulation and revised test procedures.	5/25/06
<b>Diesel Retrofit Technology Verification Procedure:</b> The amendments to the Diesel Emission In-use Control Strategy Verification Procedure to substitute a 30% increase limit in NOx concentration for an 80% reduction requirement from PM retrofit devices.	3/23/06 12/21/06 NOD
<b>Heavy duty vehicle smoke inspection program amendments:</b> The amendments impose a fine on trucks not displaying a current compliance certification sticker.	1/26/06 12/4/06 EO
<b>Ocean-going Ship Auxiliary Engine Fuel:</b> The regulation requires ships to use cleaner marine gas oil or diesel to power auxiliary engines within 24 nautical miles of the California coast.	12/8/05 10/20/06 EO
<b>Diesel Cargo Handling Equipment:</b> The regulation requires new and in-use cargo handling equipment at ports and intermodal rail yards to reduce emissions by utilizing best available control technology.	12/8/05 6/2/06 EO
<b>Public and Utility Diesel Truck Fleets:</b> The regulation reduces diesel particulate matter emissions from heavy duty diesel trucks in government and private utility fleets.	12/8/05 10/4/06 EO
<b>Cruise ships – Onboard Incineration:</b> The Air Toxic Control Measure prohibits cruise ships from conducting onboard incineration within three nautical miles of the California coast.	11/17/05 2/1/06 NOD
<b>Inboard Marine Engine Rule Amendments:</b> The amendments to the 2001 regulation include additional compliance options for manufacturers.	11/17/05 9/26/06 EO
<b>Heavy-Duty Diesel Truck Idling Technology:</b> The regulation limits sleeper truck idling to 5 minutes. Allows alternate technologies to provide cab heating/cooling and power.	10/20/05 9/1/06 EO
<b>Automotive Coating Suggested Control Measure:</b> The SCM for automotive coatings for adoption by air districts. The measure will reduce the VOC content of 11 categories of surface protective coatings.	10/20/05
<b>2007-09 Model-year heavy duty urban bus engines and the fleet rule for transit agencies:</b> The amendments to align urban bus emission limits with on-road heavy duty truck emission limits and allow for the purchase of non-complying buses under the condition that bus turnover increase to offset NOx increases.	10/20/05 10/27/05 7/28/06 EO

Board Action	Hearing Date
<b>Portable fuel containers (part 2 of 2):</b> The amendments revise spout and automatic shutoff design.	9/15/05 7/28/06 EO
<b>Portable Fuel Containers (part 1 of 2):</b> The amendments include kerosene containers in the definition of portable fuel containers.	9/15/05 11/9/05 NOD
<b>2007-09 Model-year heavy duty urban bus engines and the fleet rule for transit agencies:</b> The amendments require all transit agencies in SCAQMD to purchase only alternate fuel versions of new buses.	9/15/05 Superceded by 10/20/05
<b>Reid vapor pressure limit emergency rule:</b> The amendments relax Reid vapor pressure limit to accelerate fuel production for Hurricane Katrina victims.	9/8/05 Operative for September and October 2005 only
<b>Heavy-Duty Truck OBD:</b> The regulation requires on-board diagnostic (OBD) systems for new gas and diesel trucks, similar to the systems on passenger cars.	7/21/05 12/28/05 EO
<b>Definition of Large Confined Animal Facility:</b> The regulation defines the size of a large CAF for the purposes of air quality permitting and reduction of ROG emissions to the extent feasible.	6/23/05 4/13/06 EO
<b>ATCM for stationary compression ignition engines:</b> The emergency amendments (3/17/05) and permanent amendments (5/26/05) relax the diesel PM emission limits on new stationary diesel engines to current off-road engine standards to respond to the lack of availability of engines meeting the original ATCM standard.	3/17/05 5/26/05 7/29/05 EO
<b>Transit Fleet Rule:</b> The amendments add emission limits for non-urban bus transit agency vehicles, require lower bus and truck fleet-average NOx and PM emission limits, and clarify emission limits for CO, NMHC, and formaldehyde.	2/24/05 10/19/05 NOD
<b>Thermal Spraying ATCM:</b> The regulation reduces emissions of hexavalent chromium and nickel from thermal spraying operations.	12/9/04 7/20/05 EO
<b>Tier 4 Standards for Small Off-Road Diesel Engines (SORE):</b> The new emission standards for off-road diesel engines are phased in between 2008 and 2015.	12/9/04 10/21/05 EO
<b>Emergency Regulatory Amendment Delaying the January 1, 2005 Implementation Date for the Diesel Fuel Lubricity Standard:</b> The emergency regulation delays the lubricity standard compliance deadline by five months to respond to fuel pipeline contamination problems.	11/24/04 12/10/04 EO
<b>Enhanced vapor recovery compliance extension:</b> The amendments to the EVR regulation extend the compliance date for onboard refueling vapor recovery compatibility to the date of EVR compliance.	11/18/04 2/11/05 EO
<b>CaRFG Phase 3 amendments:</b> The amendments correcting errors and streamlining requirements for compliance and enforcement of CaRFG Phase 3 regulations from 1999.	11/18/04
<b>Clean diesel fuel for harbor craft and intrastate locomotives:</b> The regulation requires harbor craft and locomotives operating solely within California to use clean diesel fuel.	11/18/04 3/16/05 EO
<b>Nonvehicular Source, Consumer Product, and Architectural Coating Fee Regulation Amendment:</b> The amendments to fee regulations to collect supplemental fees when authorized by the Legislature.	11/18/04
<b>Greenhouse gas limits for motor vehicles:</b> The regulation sets the first ever greenhouse gas emission standards on light and medium duty vehicles starting with the 2009 model year.	9/24/04 8/4/05 EO
<b>Gasoline vapor recovery system equipment defects list:</b> The addition of defects to the VRED list for use by compliance inspectors.	8/24/04 6/22/05 EO
<b>Unihose gasoline vapor recovery systems:</b> The emergency regulation and an amendment delay the compliance date for unihose installation to the date of dispenser replacement.	7/22/04 11/24/04 EO
<b>General Idling Limits for Diesel Trucks:</b> The regulation limits idling of heavy-duty diesel trucks operating in California to five minutes, with exceptions for sleeper cabs.	7/22/04
<b>Consumer Products:</b> The regulation reduces ROG emissions from 15 consumer products categories, prohibit the use of 3 toxic compounds in consumer products, ban the use of PDCB in certain products, allow for the use of Alternative Control Plans, and revise Test Method 310.	6/24/04 5/6/05 EO
<b>Urban bus engines/fleet rule for transit agencies:</b> The amendments allow for the purchase of hybrid diesel buses and revise the zero emission bus demonstration and purchase timelines.	6/24/04
<b>Engine Manufacturer Diagnostics:</b> The regulation would require model year 2007 and later heavy duty truck engines to be equipped with engine diagnostic systems to detect malfunctions of the emission control system.	5/20/04
<b>Chip Reflash:</b> The voluntary program and a backstop regulation reduce heavy duty truck NOx emissions through the installation of new software in the engine's electronic control module.	3/25/04 3/21/05 EO
<b>Portable equipment registration program (PERP):</b> The amendments allow uncertified engines to be registered until December 31, 2005, to increase fees, and to modify administrative requirements.	2/26/04 1/7/05 EO 6/21/05 EO
<b>Portable Diesel Engine ATCM:</b> The regulation reduces diesel PM emissions from portable engines through a series of emission standards that increase in stringency through 2020.	2/26/04 1/4/05 EO

Board Action	Hearing Date
<b>California motor vehicle service information rule:</b> The amendments allow for the purchase of heavy duty engine emission-related service information and diagnostic tools by independent service facilities and aftermarket parts manufacturers.	1/22/04 5/20/04
<b>Transportation Refrigeration Unit ATCM:</b> The regulation reduces diesel PM emissions from transport refrigeration units by establishing emission standards and facility reporting requirements to streamline inspections.	12/11/03 2/26/04 11/10/04 EO
<b>Diesel engine verification procedures:</b> The amendments reduced warranty coverage to the engine only, delayed the NOx reduction compliance date to 2007, added requirements for proof-of-concept testing for new technology, and harmonized durability requirements with those of U.S. EPA.	12/11/03 2/26/04 10/17/04
<b>Chip Reflash:</b> The voluntary program and a backstop regulation reduce heavy duty truck NOx emissions through the installation of new software in the engine's electronic control module.	12/11/03 3/27/04 3/21/05 EO
<b>Revised tables of maximum incremental reactivity values:</b> The addition of 102 more chemicals with associated maximum incremental reactivity values to existing regulation allowing these chemicals to be used in aerosol coating formulations.	12/3/03
<b>Stationary Diesel Engines ATCM:</b> The regulation reduces diesel PM emissions from stationary diesel engines through the use of clean fuel, lower emission standards, operational practices.	11/20/03 12/11/03 2/26/2004 9/27/04 EO
<b>Solid waste collection vehicles:</b> The regulation reduces toxic diesel particulate emissions from solid waste collection vehicles by over 80 percent by 2010. This measure is part of ARB's plan to reduce the risk from a wide range of diesel engines throughout California.	9/25/03 5/17/04 EO
<b>Small off-road engines (SORE):</b> The more stringent emission standards for the engines used in lawn and garden and industrial equipment, such as string trimmers, leaf blowers, walk-behind lawn mowers, generators, and lawn tractors.	9/25/03 7/26/04 EO
<b>Off-highway recreational vehicles:</b> Changes to riding season restrictions.	7/24/03
<b>Clean diesel fuel:</b> The regulation reduces sulfur levels and set a minimum lubricity standard in diesel fuel used in vehicles and off-road equipment in California, beginning in 2006.	7/24/03 5/28/04 EO
<b>Ozone Transport Mitigation Amendments:</b> The amendments require upwind districts to (1) have the same no-net-increase permitting thresholds as downwind districts, and (2) Implement "all feasible measures."	5/22/03 10/2/03 NOD
<b>Zero emission vehicles:</b> The Updated California's ZEV requirements support the fuel cell car development and expand sales of advanced technology partial ZEVs (like gasoline-electric hybrids) in the near-term, while retaining a role for battery electric vehicles.	3/27/03 12/19/03 EO
<b>Heavy duty gasoline truck standards:</b> Aligned its existing rules with new, lower federal emission standards for gasoline-powered heavy-duty vehicles starting in 2008.	12/12/02 9/23/03 EO
<b>Low emission vehicles II:</b> Minor administrative changes.	12/12/02 9/24/03 EO
<b>Gasoline vapor recovery systems test procedures:</b> The amendments add advanced vapor recovery technology certification and testing standards.	12/12/02 7/1/03 EO 10/21/03 EO
<b>CaRFG Phase 3 amendments:</b> The amendments allow for small residual levels of MTBE in gasoline while MTBE is being phased out and replaced by ethanol.	12/12/02 3/20/03 EO
<b>School bus Idling:</b> The measure requires school bus drivers to turn off the bus or vehicle engine upon arriving at a school and restart it no more than 30 seconds before departure in order to limit children's exposure to toxic diesel particulate exhaust.	12/12/02 5/15/03 EO
<b>California Interim Certification Procedures for 2004 and Subsequent Model Year Hybrid-Electric Vehicles in the Urban Transit Bus and Heavy-Duty Vehicle Classes Regulation Amendment:</b> The amendments allow diesel-path transit agencies to purchase alternate fuel buses with higher NOx limits, establish certification procedures for hybrid buses, and require lower fleet-average PM emission limits.	10/24/02 9/2/03 EO
<b>CaRFG Phase 3 amendments:</b> The amendments delay removal of MTBE from gasoline by one year to 12/31/03.	7/25/02 11/8/02 EO
<b>Diesel retrofit verification procedures, warranty, and in-use compliance requirements:</b> The regulations specify test procedures, warranty, and in-use compliance of diesel engine PM retrofit control devices.	5/16/02 3/28/03 EO
<b>On-board diagnostics for cars:</b> The changes to the On-Board Diagnostic Systems (OBD II) regulation to improve the effectiveness of OBD II systems in detecting motor vehicle emission-related problems.	4/25/02 3/7/03 EO
<b>Voluntary accelerated light duty vehicle retirement regulations:</b> Establishes standards for a voluntary accelerated retirement program.	2/21/02 11/18/02 EO
<b>Residential burning:</b> The measure reduces emissions of toxic air contaminants from outdoor residential waste burning by eliminating the use of burn barrels and the outdoor burning of residential waste materials other than natural vegetation.	2/21/02 12/18/02 EO

Board Action	Hearing Date
<b>California motor vehicle service information rule:</b> The regulation requires light- and medium-duty vehicle manufacturers to offer for sale emission-related service information and diagnostic tools to independent service facilities and aftermarket parts manufacturers.	12/13/01 7/31/02 EO
<b>Vapor recovery regulation amendments:</b> The amendments expand the list of specified defects requiring equipment to be removed from service.	11/15/01 9/27/02 EO
<b>Distributed generation guidelines and regulations:</b> The regulations require the permitting by ARB of distributed generation sources that are exempt from air district permitting and approved guidelines for use by air districts in permitting non-exempt units.	11/15/01 7/23/02 EO
<b>Low emission vehicle regulations (LEV II):</b> The amendments apply PM emission limits to all new gasoline vehicles, extend gasoline PZEV emission limits to all fuel types, and streamline the manufacturer certification process.	11/15/01 8/6/02 EO
<b>Gasoline vapor recovery systems test methods and compliance procedures:</b> The amendments add test methods for new technology components, streamline test methods for liquid removal equipment, and***.	10/25/01 7/9/02 EO
<b>Heavy-duty diesel trucks:</b> The amendments to emissions standards harmonize with EPA regulations for 2007 and subsequent model year new heavy-duty diesel engines.	10/25/01
<b>Automotive coatings:</b> The Air Toxic Control Measure which prohibits the sale and use in California of automotive coatings containing hexavalent chromium or cadmium.	9/20/01 9/2/02 EO
<b>Inboard and sterndrive marine engines:</b> The lower emission standards for 2003 and subsequent model year inboard and sterndrive gasoline-powered engines in recreational marine vessels.	7/26/01 6/6/02 EO
<b>Asbestos from construction, grading, quarrying, and surface mining:</b> The Airborne Toxic Control Measure for construction, grading, quarrying, and surface mining operations requiring dust mitigation for construction and grading operations, road construction and maintenance activities, and quarries and surface mines to minimize emissions of asbestos-laden dust.	7/26/01 6/7/02 EO
<b>Zero emission vehicle infrastructure and standardization of electric vehicle charging equipment:</b> The amendments to the ZEV regulation alter the method of quantifying production volumes at joint-owned facilities and to add specifications for standardized charging equipment.	6/28/01 5/10/02 EO
<b>Pollutant transport designation:</b> The amendments add two transport couples to the list of air basins in which upwind areas are required to permit thresholds no less stringent than those in downwind areas.	4/26/01
<b>Zero emission vehicle regulation amendments:</b> The amendments reduce the numbers of ZEVs required in future years, add a PZEV category and grant partial ZEV credit, modify the ZEV range credit, allow hybrid-electric vehicles partial ZEV credit, grant ZEV credit to advanced technology vehicles, and grant partial ZEV credit for several other minor new programs.	1/25/01 12/7/01 EO 4/12/02 EO
<b>Heavy duty diesel engines supplemental test procedures:</b> The amendments extend "Not-To-Exceed" and EURO III supplemental test procedure requirements through 2007 when federal requirements will include these tests.	12/7/00
<b>Light and medium duty low emission vehicle alignment with federal standards:</b> The amendments require light and medium duty vehicles sold in California to meet the more restrictive of state or federal emission standards.	12/7/00 12/27/00 EO
<b>Exhaust emission standards for heavy duty gas engines:</b> The amendments establish 2005 emission limits for heavy duty gas engines that are equivalent to federal limits.	12/7/00 12/27/00 EO
<b>CaRFG Phase 3 amendments:</b> The amendments regulate the replacement of MTBE in gasoline with ethanol.	11/16/00 4/25/01 EO
<b>CaRFG Phase 3 test methods:</b> The amendments to gasoline test procedures quantify the olefin content and gasoline distillation temperatures.	11/16/00 7/11/01 EO 8/28/01 EO
<b>Antiperspirant and deodorant regulations:</b> The amendments relax a 0% VOC limit to 40% VOC limit for aerosol antiperspirants.	10/26/00
<b>Diesel risk reduction plan:</b> The plan to reduce toxic particulate from diesel engines through retrofits on existing engines, tighter standards for new engines, and cleaner diesel fuel.	9/28/00
<b>Conditional rice straw burning regulations:</b> The regulations limit rice straw burning to fields with demonstrated disease rates reducing production by more than 5 percent.	9/28/00
<b>Asbestos from unpaved roads:</b> Tightened an existing Air Toxic Control Measure to prohibit the use of rock containing more than 0.25% asbestos on unsurfaced roads.	7/20/00
<b>Aerosol Coatings:</b> The amendments replace mass-based VOC limits with reactivity-based limits, add a table of Maximum Incremental Reactivity values, add limits for polyolefin adhesion promoters, prohibit use of certain toxic solvents, and make other minor changes.	6/22/00 5/1/01 EO
<b>Consumer products aerosol adhesives:</b> The amendments delete a 25% VOC limit by 2002, add new VOC limits for six categories of adhesives, prohibit the use of toxic solvents, and add new labeling and reporting requirements.	5/25/00 3/14/01 EO
<b>Automotive care products:</b> The Air Toxic Control Measure eliminate use of perchloroethylene, methylene chloride, and trichloroethylene in automotive products such as brake cleaners and degreasers.	4/27/00 2/28/01 EO
<b>Enhanced vapor recovery emergency regulation:</b> A four-year term for equipment certifications.	5/22/01 EO

Board Action	Hearing Date
<b>Enhanced vapor recovery:</b> The amendments require the addition of components to reduce spills and leakage, adapt to onboard vapor recovery systems, and continuously monitor system operation and report equipment leaks immediately.	3/23/00 7/25/01 EO
<b>Agricultural burning smoke management:</b> The amendments add marginal burn day designations, require day-specific burn authorizations by districts, and smoke management plans for larger prescribed burn projects.	3/23/00 1/22/01 EO
<b>Urban transit buses:</b> The public transit bus fleet rule and emissions standards for new urban buses that mandates a lower fleet-average NOx emission limit, PM retrofits, lower sulfur fuel use, and purchase of specified percentages of zero emission buses in future years.	1/27/00 2/24/00 11/22/00 EO 5/29/01 EO
<b>Small Off-Road (diesel) Equipment (SORE):</b> The amendments conform with new federal requirements for lower and engine power-specific emission limits, and for the averaging, banking, and trading of emissions among SORE manufacturers.	1/28/00
<b>CaRFG Phase 3 MTBE phase out:</b> The regulations enable refiners to produce gasoline without MTBE while preserving the emissions benefits of Phase 2 cleaner burning gasoline.	12/9/99 6/16/00 EO
<b>Consumer products – mid-term measures II:</b> The regulation which adds emission limits for 2 new categories and tightens emission limits for 15 categories of consumer products.	10/28/99
<b>Portable fuel cans:</b> The regulation requiring that new portable fuel containers, used to refuel lawn and garden equipment, motorcycles, and watercraft, be spill-proof beginning in 2001.	9/23/99 7/6/00 EO
<b>Clean fuels at service stations:</b> The amendments rescinding requirements applicable to SCAB in 1994-1995, modifying the formula for triggering requirements, and allowing the Executive Officer to make adjustments to the numbers of service stations required to provide clean fuels.	7/22/99
<b>Gasoline vapor recovery:</b> The amendments certification and test methods.	6/24/99
<b>Reformulated gasoline oxygenate:</b> The amendments rescind the requirement for wintertime oxygenate in gasoline sold in the Lake Tahoe Air Basin and requiring the statewide labeling of pumps dispensing gasoline containing MTBE.	6/24/99
<b>Marine pleasurecraft:</b> The regulation controls emissions from spark-ignition marine engines, specifically, outboard marine engines and personal watercraft.	12/11/98 2/17/00 EO 6/14/00 EO
<b>Voluntary accelerated light duty vehicle retirement:</b> The regulation sets standards for voluntary accelerated retirement program.	12/10/98 10/22/99 EO
<b>Off-highway recreational vehicles and engines:</b> The amendments allow non-complying vehicles to operate in certain seasons and in certain ORV-designated areas.	12/10/98 10/22/99 EO
<b>On-road motorcycles:</b> Amended on-road motorcycle regulations, to lower the tailpipe emission standards for ROG and NOx.	12/10/98
<b>Portable equipment registration program (PERP):</b> The amendments exclude non-dredging equipment operating in OCS areas and equipment emitting hazardous pollutants, include NSPS Part OOO rock crushers, require SCR emission limits and onshore emission offsets from dredging equipment operating in OCS areas, set catalyst emission limits for gasoline engines, and relieve certain retrofitted engines from periodic source testing.	12/10/98
<b>Liquid petroleum gas motor fuel specifications:</b> The amendment rescinds 5% propene limit and extending 10% limit indefinitely.	12/11/98
<b>Reformulated gasoline:</b> The amendments rescind the RVP exemption for fuel with 10% ethanol and allow for oxygen contents up to 3.7% if the Predictive Model weighted emissions to not exceed original standards.	12/11/98
<b>Consumer products:</b> The amendments add new VOC test methods, to modify Method 310 to quantify low vapor pressure VOC (LVP-VOC) constituents, and to exempt LVP-VOC from VOC content limits	11/19/98
<b>Consumer products:</b> The amendments extend the 1999 VOC compliance deadline for several aerosol coatings, antiperspirants and deodorants, and other consumer products categories to 2002, to exempt methyl acetate from the VOC definition, and make other minor changes.	11/19/98
<b>Low-emission vehicle program (LEV II):</b> The regulations add exhaust emission standards for most sport utility vehicles, pick-up trucks and mini-vans, lowering tailpipe standards for cars, further reducing evaporative emission standards, and providing additional means for generating zero-emission vehicle credits.	11/5/98 9/17/99 EO
<b>Off-road engine aftermarket parts:</b> The implementation of a new program to test and certify aftermarket parts in gasoline and diesel, light-duty through heavy duty, engines used in off-road vehicles and equipment.	11/19/98 10/1/99 EO 7/18/00 EO
<b>Off-road spark ignition engines:</b> The new emission standards for small and large spark ignition engines for off-road equipment, a new engine certification program, an in-use compliance testing program, and a three-year phase-in for large LSI.	10/22/98
<b>Gasoline deposit control additives:</b> The amendments decertify pre-RFG additives, tighten the inlet valve deposit limits, add a combustion chamber deposit limit, and modify the test procedures to align with the characteristics of reformulated gasoline formulations.	9/24/98 4/5/99 EO

Board Action	Hearing Date
<b>Stationary source test methods:</b> The amendments to stationary source test methods align better with federal methods.	8/27/98 7/2/99 EO
<b>Locomotive MOA for South Coast:</b> The Memorandum of agreement (MOA) signed by ARB, U.S. EPA and major railroads to concentrate cleaner locomotives in the South Coast by 2010 and fulfill 1994 ozone SIP commitment.	7/2/98
<b>Gasoline vapor recovery:</b> The amendments to certification and test methods add methods for onboard refueling vapor recovery, airport refuelers, and underground tank interconnections, and make minor changes to existing methods.	5/21/98 8/27/98
<b>Reformulated gasoline:</b> The amendments rescind the wintertime oxygenate requirement, allow for sulfur content averaging, and make other minor technical amendments.	8/27/98
<b>Ethylene oxide sterilizers:</b> The amendments to the ATCM streamline source testing requirements, add EtO limits in water effluent from control devices, and make other minor changes.	5/21/98
<b>Chrome platers:</b> The amendments to ATCM harmonize with requirements of federal NESHAP standards for chrome plating and chromic acid anodizing facilities.	5/21/98
<b>On-road heavy-duty vehicles:</b> The amendments align on-road heavy duty vehicle engine emission standards with EPA's 2004 standards and align certification, testing, maintenance, and durability requirements with those of U.S. EPA.	4/23/98 2/26/99 EO
<b>Small off-road engines (SORE):</b> The amendments grant a one-year delay in implementation, relaxation of emissions standards for non-handheld engines, emissions durability requirements, averaging/banking/trading, harmonization with the federal diesel engine regulation, and modifications to the production line testing requirements.	3/26/98
<b>Heavy duty vehicle smoke inspection program:</b> The amendments require annual smoke testing, set opacity limits, and exempt new vehicles from testing for the first four years.	12/11/97 3/2/98 EO
<b>Consumer products (hairspray credit program):</b> The standards for the granting of tradable emission reduction credits achieved by sales of hairspray products having VOC contents less than required limits.	11/13/97
<b>Light-duty vehicle off-cycle emissions:</b> The standards to control excess emissions from aggressive driving and air conditioner use in light duty vehicles and added two light duty vehicle test methods for certification of new vehicles under these standards.	7/24/97 3/19/98 EO
<b>Consumer products:</b> The amendments add VOC limits to 18 categories of consumer products used in residential and industrial cleaning, automobile maintenance, and commercial poisons.	7/24/97
<b>Enhanced evaporative emissions standards:</b> The amendments extend the compliance date for ultra-small volume vehicle manufacturers by one year.	5/22/97
<b>Emission reduction credit program:</b> The standards for District establishment of ERC programs including certification, banking, use limitation, and reporting requirements.	5/22/97
<b>Lead as a toxic air contaminant:</b> The amendment designates inorganic lead as a toxic air contaminant.	4/24/97
<b>Consumer products (hair spray):</b> The amendments (1) delay a January 1, 1998, compliance deadline to June 1, 1999, (2) require progress plans from manufacturers, and (3) authorize the Executive Officer to require VOC mitigation when granting variances from the June 1, 1999 deadline.	3/27/97
<b>Portable engine registration program (PERP):</b> The standards for (1) the permitting of portable engines by ARB and (2) District recognition and enforcement of permits.	3/27/97
<b>Liquefied petroleum gas:</b> The amendments extend the compliance deadline from January 1, 1997, to January 1, 1999, for the 5% propene limit in liquefied petroleum gas used in motor vehicles.	3/27/97
<b>Onboard diagnostics, phase II:</b> The amendments extend the phase-in of enhanced catalyst monitoring, modify misfire detection requirements, add PVC system and thermostat monitoring requirements, and require manufacturers to sell diagnostic tools and service information to repair shops.	12/12/96
<b>Consumer products:</b> The amendments delay 25% VOC compliance date for aerosol adhesives, clarify portions of the regulation, exempt perchloroethylene from VOC definition, extend the sell-through time to three years, and add perchloroethylene reporting requirements.	11/21/96
<b>Consumer products (test method):</b> The amendment adds Method 310 for the testing of VOC content in consumer products.	11/21/96
<b>Pollutant transport designation:</b> The amendments modify transport couples from the Broader Sacramento area and add couples to the newly formed Mojave Desert and Salton Sea Air Basins.	11/21/96
<b>Diesel fuel certification test methods:</b> The amendments specify the test methods used for quantifying the constituents of diesel fuel.	10/24/96 6/4/97 EO
<b>Wintertime requirements for utility engines &amp; off-highway vehicles :</b> The Optional hydrocarbon and NOx standards for snow throwers and ice augers, raising CO standard for specialty vehicles under 25hp.	9/26/96
<b>Large off-road diesel Statement of Principles:</b> National agreement between ARB, U.S. EPA, and engine manufacturers to reduce emissions from heavy-duty off-road diesel equipment four years earlier than expected in the 1994 SIP for ozone.	9/13/96
<b>Regulatory improvement initiative:</b> Rescinded two regulations relating to fuel testing in response to Executive Order W-127-95.	5/30/96

Board Action	Hearing Date
<b>Zero emission vehicles:</b> The amendments eliminate zero emission vehicle quotas between 1998 and 2002, and approved MOUs with seven automobile manufacturers to accelerate release of lower emission "49 state" vehicles.	3/28/96 7/24/96 EO
<b>CaRFG variance requirements:</b> The amendments add a per gallon fee on non-compliant gasoline covered by a variance and to made administrative changes in variance processing and extension.	1/25/96 2/5/96 EO 4/2/96 EO
<b>Utility and lawn and garden equipment engines:</b> The amendment relaxes the CO standard from 300 to 350 ppm for Class I and II utility engines.	1/25/96
<b>National security exemption of military tactical vehicles:</b> Such vehicles would not be required to adhere to exhaust emission standards.	12/14/95
<b>CaRFG regulation amendments:</b> The amendments allow for downstream addition of oxygenates and expansion of compliance options for gasoline formulation.	12/14/95
<b>Required additives in gasoline (deposit control additives):</b> Terms, definitions, reporting requirements, and test procedures for compliance are to be clarified.	11/16/95
<b>CaRFG test method amendments:</b> The amendments designate new test methods for benzene, aromatic hydrocarbon, olefin, and sulfur content of gasoline.	10/26/95
<b>Motor vehicle inspection and maintenance program:</b> Handled by BAR.	10/19/95 by BAR
<b>Antiperspirants and deodorants, consumer products, and aerosol coating products:</b> Ethanol exemption for all products, modifications to aerosol special requirements, modifications for regulatory language consistency, modifications to VOC definition.	9/28/95
<b>Low emission vehicle (LEV III) standards:</b> Reactivity adjustment factors, introduction of medium-duty ULEVs, window labels, and certification requirements and test procedures for LEVs.	9/28/95
<b>Medium- and heavy-duty gasoline trucks:</b> Expedited introduction of ultra-low emission medium-duty vehicles and lower NOx emission standards for heavy-duty gasoline trucks to fulfill a 1994 ozone SIP commitment.	9/1/95
<b>Retrofit emission standards:</b> all vehicle classes to be included in the alternate durability test plan, kit manufacturers to be allowed two years to validate deterioration factors under the test plan, update retrofit procedures allowing manufacturers to disable specific OBDs if justified by law.	7/27/95
<b>Gasoline vapor recovery systems:</b> Revised certification and test procedures.	6/29/95
<b>Onboard refueling vapor recovery standards:</b> 1998 and subsequent MY engine cars, LD trucks, and MD trucks less than 8500 GVWR.	6/29/1995 4/24/96 EO
<b>Heavy duty vehicle exhaust emission standards for NOx:</b> Amendments to standards and test procedures for 1985 and subsequent MY HD engines, amendments to emission control labels, amendments to Useful Life definition and HD engines and in-use vehicle recalls.	6/29/95
<b>Aerosol coatings regulation:</b> The regulation meets California Clean Air Act requirements and a 1994 ozone SIP commitment.	3/23/95
<b>Periodic smoke inspection program:</b> Delays start of PSIP from 1995 to 1996.	12/8/94
<b>Onboard diagnostics phase II:</b> The Amendments clarify regulation language, ensure maximum effectiveness, and address manufacturer concerns regarding implementation.	12/8/94
<b>Alternative control plan (ACP) for consumer products:</b> A voluntary, market-based VOC emissions cap upon a grouping of consumer products, flexible by manufacturer that will minimize overall costs of emission reduction methods and programs.	9/22/94
<b>Diesel fuel certification:</b> new specifications for diesel engine certification fuel, amended oxygen specification for CNG certification fuel, and amended commercial motor vehicle liquefied petroleum gas regulations.	9/22/94
<b>Utility and lawn and garden equipment (UGLE) engines:</b> Modification to emission test procedures, ECLs, defects warranty, quality-audit testing, and new engine compliance testing.	7/28/94
<b>Evaporative emissions standards and test procedures:</b> The evaporative emissions standards for medium-duty vehicles.	2/10/94
<b>Off-road recreational vehicles:</b> The emission control regulations for off-road motorcycles, all-terrain vehicles, go-karts, golf carts, and specialty vehicles.	1/1/94
<b>Perchloroethylene from dry cleaners:</b> The measure to control perchloroethylene emissions from dry cleaning operations.	10/1/93
<b>Wintertime oxygenate program:</b> The Amendments to the control time period for San Luis Obispo County, exemption for small retailers bordering Nevada, flexibility in gasoline delivery time, calibration of ethanol blending equipment, gasoline oxygen content test method.	9/9/93
<b>Onboard diagnostic phase II</b>	7/9/93
<b>Urban transit buses:</b> The amended regulation to tighten state NOx and particulate matter (PM) standards for urban transit buses beyond federal standards beginning in 1996.	6/10/93
<b>1-year implementation delay in emission standards for utility engines</b>	4/8/93

<b>Board Action</b>	<b>Hearing Date</b>
<b>Non-ferrous metal melting:</b> The Air Toxic Control Measure for emissions of cadmium, arsenic, and nickel from non-ferrous metal melting operations.	1/1/93
<b>Certifications requirements for low emission passenger cars, light-duty trucks &amp; medium duty vehicles</b>	1/14/93
<b>Airborne toxic control measure for emissions of toxic metals from non-ferrous metal melting</b>	12/10/92
<b>Periodic self-inspection program:</b> Implemented state law establishing a periodic smoke self-inspection program for fleets operating heavy-duty diesel-powered vehicles.	12/10/92
<b>Notice of general public interest for consumer products</b>	11/30/92
<b>Substitute fuel or clean fuel incorporated test procedures</b>	11/12/92
<b>New vehicle testing using CaRFG Phase 2 gasoline:</b> The amendments require the use of CaRFG Phase 2 gasoline in the certification of exhaust emissions in new vehicle testing.	8/13/92
<b>Standards and test procedures for alternative fuel retrofit systems</b>	5/14/92
<b>Alternative motor vehicle fuel certification fuel specification</b>	3/12/92
<b>Heavy-duty off-road diesel engines:</b> The first exhaust emission standards and test procedures for heavy-duty off-road diesel engines beginning in 1996.	1/9/92
<b>Consumer Products - Tier II:</b> Tier II of regulations to reduce emissions from consumer products.	1/9/92
<b>Wintertime oxygen content of gasoline:</b> The regulation requiring the addition of oxygenates to gasoline during winter to satisfy federal Clean Air Act mandates for CO nonattainment areas.	12/1/91
<b>CaRFG Phase 2:</b> The CaRFG phase 2 specifications including lowering vapor pressure, reducing the sulfur, olefin, aromatic, and benzene content, and requiring the year-round addition of oxygenates to achieve reductions in ROG, NO <sub>x</sub> , CO, oxides of sulfur (SO <sub>x</sub> ) and toxics.	11/1/91
<b>Low emissions vehicles amendments revising reactivity adjust factor (RAF) provisions and a RAF for M85 transitional low emission vehicles</b>	11/14/91
<b>Onboard diagnostic, phase II</b>	11/12/91
<b>Onboard diagnostics for light-duty trucks and light &amp; medium-duty motor vehicles</b>	9/12/91
<b>Utility and lawn &amp; garden equipment:</b> The first off-road mobile source controls under the California Clean Air Act regulating utility, lawn and garden equipment.	12/1/90
<b>Control for abrasive blasting</b>	11/8/90
<b>Roadside smoke inspections of heavy-duty vehicles:</b> The regulations implementing state law requiring a roadside smoke inspection program for heavy-duty vehicles.	11/8/90
<b>Consumer Products Tier I:</b> Tier I of standards to reduce emissions from consumer products.	10/11/90
<b>CaRFG Phase I:</b> CaRFG Phase I reformulated gasoline regulations to phase-out leaded gasoline, reduce vapor pressure, and require deposit control additives.	9/1/90
<b>Low-emission vehicle (LEV) and clean fuels:</b> The landmark LEV/clean fuel regulations which called for the gradual introduction of cleaner cars in California. The regulations also provided a mechanism to ensure the availability of alternative fuels when a certain number of alternative fuel vehicles are sold.	9/1/90
<b>Evaporative emissions from vehicles:</b> Modified test procedure to include high temperatures (up to 105 F) and ensure that evaporative emission control systems function properly on hot days.	8/9/90
<b>Dioxins from medical waste incinerators:</b> The Airborne Toxic Control Measure to reduce dioxin emissions from medical waste incinerators.	7/1/90
<b>CA Clean Air Act guidance for permitting:</b> Approved California Clean Air Act permitting program guidance for new and modified stationary sources in nonattainment areas.	7/1/90
<b>Consumer products BAAQMD</b>	6/14/90
<b>Medium duty vehicle emission standards:</b> The three new categories of low emission MDVs, required minimum percentages of production, and established production credit and trading.	6/14/90
<b>Medium-duty vehicles:</b> The test procedures for medium-duty vehicles to require whole-vehicle testing instead of engine testing. This modification allowed enforcement of medium-duty vehicle standards through testing and recall.	6/14/90
<b>Ethylene oxide sterilizers:</b> Airborne Toxic Control Measure to reduce ethylene oxide emissions from sterilizers and aerators.	5/10/90
<b>Asbestos in serpentine rock:</b> Airborne Toxic Control Measure for asbestos-containing serpentine rock in surfacing applications.	4/1/90
<b>Certification procedure for aftermarket parts</b>	2/8/90
<b>Antiperspirants and deodorants:</b> First consumer products regulation, setting standards for antiperspirants and deodorants.	11/1/89
<b>Residential woodstoves:</b> Suggested control measure for the control of emissions from residential wood combustion.	11/1/89
<b>On-Board Diagnostic Systems II:</b> The regulations implement the second phase of on-board diagnostic requirements which alert drivers of cars, light-trucks and medium-duty vehicles when the emission control system is not functioning properly.	9/1/89
<b>Cars and light-duty trucks:</b> The regulations reduce ROG and CO emissions from cars and light trucks by 35 percent.	6/1/89

<b>Board Action</b>	<b>Hearing Date</b>
<b>Architectural coatings:</b> Suggested control measure to reduce ROG emissions from architectural coatings.	5/1/89
<b>Chrome from cooling towers:</b> Airborne Toxic Control Measure to reduce hexavalent chromium emissions from cooling towers.	3/1/89
<b>Reformulated Diesel Fuel:</b> Regulations requiring the use of clean diesel fuel with lower sulfur and aromatic hydrocarbons beginning in 1993.	11/1/88
<b>Vehicle Recall:</b> The regulations implement a recall program which requires auto manufacturers to recall and fix vehicles with inadequate emission control systems (Vehicles are identified through in-use testing conducted by the ARB).	9/1/88
<b>Suggested control measure for oil sumps:</b> Suggested control measure to reduce emissions from sumps used in oil production operations.	8/1/88
<b>Chrome platers:</b> Airborne Toxic Control Measure to reduce emissions of hexavalent chromium emissions from chrome plating and chromic acid anodizing facilities.	2/1/88
<b>Suggested control measure for boilers:</b> Suggested control measure to reduce NOx emissions from industrial, institutional, and commercial boilers, steam generators and process heaters.	9/1/87
<b>Benzene from service stations:</b> The Airborne Toxic Control Measure to reduce benzene emissions from retail gasoline service stations (Also known as Phase II vapor recovery).	7/1/87
<b>Agricultural burning guidelines:</b> Amended existing guidelines to add provisions addressing wildland vegetation management.	11/1/86
<b>Heavy-duty vehicle certification:</b> Amended certification of heavy-duty diesel and gasoline-powered engines and vehicles to align with federal standards.	4/1/86
<b>Cars and light-duty trucks:</b> The regulations reduce NOx emissions from passenger cars and light-duty trucks by 40 percent.	4/1/86
<b>Sulfur in diesel fuel:</b> Removed exemption for small volume diesel fuel refiners.	6/1/85
<b>On-Board Diagnostics I:</b> The regulations require the use of on-board diagnostic systems on gasoline-powered vehicles to alert the driver when the emission control system is not functioning properly.	4/1/85
<b>Suggested control measure for wood coatings:</b> Suggested control measure to reduce emissions from wood furniture and cabinet coating operations.	3/1/85
<b>Suggested control measure for resin manufacturing:</b> Suggested control measure to reduce ROG emissions from resin manufacturing.	1/1/85

**South Coast  
Air Quality Management District**

21865 Copley Drive, Diamond Bar, CA 91765-4178  
(909) 396-2000 • [www.aqmd.gov](http://www.aqmd.gov)

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA  
ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: COACHELLA VALLEY EXTREME AREA PLAN FOR 1997 8-  
HOUR OZONE STANDARD**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

**To:** Governor's Office of Planning and Research - State  
Clearinghouse  
1400 Tenth St, Suite 222  
Sacramento, CA 95814-5502

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

**Project Title:** Coachella Valley Extreme Area Plan for 1997 8-Hour Ozone Standard

**Project Location:** The proposed project is located in the Coachella Valley portion, excluding tribal lands, of the South Coast Air Quality Management District (South Coast AQMD) jurisdiction. The Coachella Valley consists of the Riverside County portion of the Salton Sea Air Basin.

**Description of Nature, Purpose, and Beneficiaries of Project:** The Coachella Valley was reclassified from Severe-15 to Extreme nonattainment for the 1997 8-hour ozone National Ambient Air Quality Standard (standard) with an attainment date of June 15, 2024. To address the requirement by the United States Environmental Protection Agency to submit a revised State Implementation Plan by February 14, 2021, South Coast AQMD has developed the Coachella Valley Extreme Area Plan to demonstrate how attainment of 1997 8-hour ozone standard will be achieved as expeditiously as possible and by June 15, 2024 by: 1) including new information on the current air quality status; 2) updating the emissions inventory and the air quality modeling analysis for demonstrating attainment; 3) evaluating control strategies and emission reductions needed for attainment including Reasonably Available Control Technology and Reasonably Available Control Measures and the impact of existing and recently adopted rules and regulations by South Coast AQMD and California Air Resources Board (CARB); and 4) addressing other federal Clean Air Act requirements such as a Reasonable Further Progress demonstration. The Coachella Valley is expected to attain the 1997 8-hour ozone standard in 2023 based on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB.

**Public Agency Approving Project:**  
South Coast Air Quality Management District

**Agency Carrying Out Project:**  
South Coast Air Quality Management District

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

**Reasons why project is exempt:** South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Since the proposed project relies on the continued implementation of existing regulations and programs by the South Coast AQMD and CARB to reduce emissions without proposing new requirements that would involve physical changes, it can be seen with certainty that there is no possibility that the proposed project may have a significant adverse effect on the environment. Therefore, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. The proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment by demonstrating how attainment with the 1997 8-hour ozone standard for the Coachella Valley will be achieved. Further, there is no substantial evidence indicating that any of the exceptions to the categorical exemption pursuant to CEQA Guidelines Section 15300.2 apply to the proposed project.

**Date When Project Will Be Considered for Approval (subject to change):**

South Coast AQMD Governing Board Hearing: December 4, 2020

# **Coachella Valley Extreme Area Plan for 1997 8-hour Ozone Standard**

**Board Meeting  
December 4, 2020**

# Ozone National Ambient Air Quality Standards

## Coachella Valley Attainment Status

Criteria Pollutant	Averaging Time	Designation	Attainment Date
Ozone (O <sub>3</sub> )	(1979) 1-Hour (0.12 ppm)	Attainment	11/15/2007 (attained 12/31/2013)
	(1997) 8-Hour (0.08 ppm)	Nonattainment (Extreme)	6/15/2024
	(2008) 8-Hour (0.075 ppm)	Nonattainment (Severe)	7/20/2027
	(2015) 8-Hour (0.070 ppm)	Nonattainment (Severe)	8/3/2033

# Air Quality Setting

- Ozone exceedances in Coachella Valley are primarily due to the direct transport of ozone and its precursors from the South Coast Air Basin

# Ozone Trend in Coachella Valley (Design Value)

# 1997 8-hour Ozone Attainment Status

---

- Coachella Valley was previously classified as a “Severe” nonattainment area, with an attainment date of June 15, 2019
  - Monitoring data (2016-2018) showed that the area did not attain the standard by the deadline
- In July 2019, Coachella Valley was granted a voluntary reclassification from “Severe” to “Extreme” by the U.S. EPA
  - New attainment date is June 15, 2024
  - Stricter permitting requirements on stationary sources (lower major source threshold)
  - A revision to the State Implementation Plan (SIP) is required (due February 2021)

# Extreme Area Plan – Key Requirements

## Emission Inventory and Attainment Demonstration

- ⑩ Updated emissions inventory;
- ⑩ Expeditious attainment expected by 2023 based on baseline emissions (existing regulations)

## Control Strategy Analysis

- ⑩ Continued implementation of control strategy in 2016 Air Quality Management Plan
- ⑩ Analysis of Reasonably Available Control Technology / Reasonably Available Control Measures (RACT/RACM)

## Reasonable Further Progress

- ⑩ Achieved based on reductions in baseline emissions

## Change Major Source and Major Modification Thresholds for Both NO<sub>x</sub> and VOC

- ⑩ Amendments to New Source Review, RECLAIM, and Title V Programs underway

## Contingency Measures

- ⑩ Contingency provisions to be included in a rule

# Local Emissions Trends in Coachella Valley

# Emissions in South Coast Air Basin and Coachella Valley

2018 summer planning emission inventory  
for South Coast Air Basin and Coachella Valley

# Pathway to Attainment

- Attainment is expected to be achieved by 2023 based on emission reductions from existing regulations and programs
- Recently adopted regulations since 2016 AQMP provide further assurance for attainment by 2023

Station	2018 Base Year Design Values (ppb)	2023 Future Year Design value (ppb)*
Palm Springs	89.3	83.2
Indio	84.3	79.1

\* Based on modeling analysis, 2022 design value is also expected to be below the standard.

# Key Public Comments

Comments		Staff Responses
1	<b>Impact of locomotive emissions update on attainment demonstration</b>	<ul style="list-style-type: none"><li>• CARB is currently updating the emissions inventory for locomotives</li><li>• Potential increase in total locomotive NOx emissions will not affect 2023 attainment</li></ul>
2	<b>Impact of climate change on local ozone levels; control strategies to reduce local emissions; need for additional air monitoring stations; and additional incentive funding for the Coachella Valley</b>	<ul style="list-style-type: none"><li>• Coachella Valley is very close to attainment despite recent higher temperatures; a study is currently evaluating the impact of meteorological factors and trends contributing to poor air quality</li><li>• Attainment demonstrated based on emission reductions from existing regulations and programs; local emissions have very limited impact on ozone levels in Coachella Valley</li><li>• Two existing monitors (Palm Springs and Indio) capture the highest ozone levels in Coachella Valley; additional air monitoring efforts are part of the AB 617 Eastern Coachella Valley Community Emission Reduction Plan (CERP) and Community Air Monitoring Plan (CAMP)</li><li>• Incentive projects are implemented in Coachella Valley; AB 617 ECV CERP identifies opportunities for incentive projects</li></ul>

# Public Process

# Recommended Actions

---

- **Adopt the Resolution**
  - **Determining that the Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone Standard is exempt from the requirements of the California Environmental Quality Act**
  - **Approving the Coachella Valley Extreme Area Plan for the 1997 8-Hour Ozone Standard and directing staff to forward the Plan to CARB for approval and submission to U.S. EPA for inclusion in the SIP**

BOARD MEETING DATE: December 4, 2020

AGENDA NO. 32

**PROPOSAL:** Determine That Amendments to Regulation XIII - New Source Review, Regulation XX - Regional Clean Air Incentives Market and Regulation XXX - Title V Permits, Are Exempt from CEQA and Amend Regulations XIII, XX and XXX

**SYNOPSIS:** Coachella Valley was recently reclassified from Severe-15 to Extreme nonattainment for the federal 1997 8-hour ozone standard, with a new attainment date of June 15, 2024. Under the federal Clean Air Act, the reclassification for Coachella Valley requires revisions to Regulations XIII – New Source Review, XX - Regional Clean Air Incentives Market, and XXX - Title V Permits to reduce the Major Polluting Facility thresholds and the thresholds for federal Major Modifications for VOC and NO<sub>x</sub> which are ozone precursors. Additional amendments are proposed to remove outdated rule provisions, correct rule references, and improve rule clarity.

**COMMITTEE:** Stationary Source, October 16, 2020, Reviewed

**RECOMMENDED ACTIONS:**

Adopt the attached Resolution:

1. Determining that the proposed amendments to Regulations XIII, XX and XXX are exempt from the requirements of the California Environmental Quality Act; and
2. Amending Regulations XIII, XX and XXX.

Wayne Nastri  
Executive Officer

SN:JW:ML:TT

---

**Background**

South Coast AQMD has jurisdiction over the South Coast Air Basin, the Riverside County portion of the Salton Sea Air Basin (referred to as Coachella Valley), and the non-Palo Verde portion of the Mojave Desert Air Basin. On July 10, 2019, U.S. EPA granted the South Coast AQMD's request to voluntarily reclassify the Coachella Valley

from Severe-15 to Extreme for the 1997 8-hour Ozone National Ambient Air Quality Standard (NAAQS), extending the attainment date from June 15, 2019 to June 15, 2024. Ozone levels in Coachella Valley are primarily impacted by pollutants transported from the South Coast Air Basin and while air quality has steadily improved, parts of California experienced a series of high ozone episodes in 2017 and 2018 due to unexpected changes in meteorology, including warm and stagnant weather conditions.

The Coachella Valley reclassification from Severe-15 to Extreme requires administrative changes to Regulation XIII – New Source Review, Regulation XX - RECLAIM, and Regulation XXX - Title V Permits to lower the Major Polluting Facility and Major Modification thresholds for the ozone precursors of VOC and NO<sub>x</sub>. The federal Clean Air Act establishes lower thresholds for a Major Polluting Facility and Major Modification based on the attainment status of the air basin. A facility that is above the Major Polluting Facility and Major Modification threshold for VOC or NO<sub>x</sub> will be subject to certain federal permitting requirements.

### **Proposed Amendments**

Within Regulation XIII – NSR, proposed amendments to Rule 1302 would lower the threshold for a Major Polluting Facility from 25 to 10 tons per year of VOC or NO<sub>x</sub> emissions and lower the Major Modification threshold from 25 tons per year to 1 pound per day of VOC or NO<sub>x</sub> emissions. Additionally, definitions of the Riverside County portion of the Salton Sea Air Basin and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin have been updated to reference the California Code of Regulations for added clarity.

Within Regulation XX – RECLAIM, proposed amendments to Rule 2000 would change the definition of a Major Modification in the Coachella Valley from 25 tons per year to one pound per day for NO<sub>x</sub> emissions.

Within Regulation XXX – Title V Permits, Rule 3001 establishes an applicability threshold to Title V permitting based on a facility's Potential to Emit. Proposed amendments will lower the applicability thresholds for Coachella Valley facilities from 25 to 10 tons per year of VOC or NO<sub>x</sub> emissions.

### **Public Process**

The development of proposed amendments to Regulations XIII, XX, and XXX was conducted through a public process. Staff presented the proposed rule amendments to the Regulation XIII Working Group on September 10, 2020. The Public Workshop was held virtually through a webinar on September 25, 2020. The Set Hearing was held virtually online over a webinar on November 6, 2020.

### **Key Issues**

The South Coast AQMD staff is not aware of any key issues with the proposed amendments and no public comments have been received.

### **California Environmental Quality Act**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the proposed amendments to Regulations XIII, XX, and XXX are exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption has been prepared pursuant to CEQA Guidelines Section 15062. If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research for posting on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **Socioeconomic Assessment**

No substantial socioeconomic impacts are anticipated for the lowering the Major Polluting Facility threshold as only two facilities have been identified as having a permit limit for VOC or NOx between 10 and 25 tons per year, and both facilities have approached staff to reduce their permitted levels to below the new threshold since their actual emissions are much lower than their current permit limits. Additionally, no substantial impacts are anticipated from lowering the Major Modification threshold since facilities in Coachella Valley are presently subject to a modification threshold of one pound per day as part of South Coast AQMD permitting requirements to comply with state NSR requirements. Since no socioeconomic impacts will result from the reclassification of Coachella Valley for the 1997 8-hour ozone NAAQS, a socioeconomic assessment is not required under Health and Safety Code Section 40440.8(a).

### **AQMP and Legal Mandates**

Pursuant to Health & Safety Code Section 40460(a), the South Coast AQMD is required to adopt an Air Quality Management Plan (AQMP) demonstrating compliance with all federal regulations and standards. The South Coast AQMD is required to adopt rules and regulations that carry out the objectives of the AQMP but the proposed amendments to Regulations XIII, XX, and XXX are not the result of an AQMP control measure. Proposed amendments to Regulations XIII, XX, and XXX are necessary as a result of the Coachella Valley reclassification as an Extreme nonattainment for ozone standards and implement federal Clean Air Act requirements for areas classified as Extreme ozone nonattainment. Proposed Amendments to Regulations XIII and XX will be submitted to CARB and to U.S. EPA for approval into the State Implementation Plan for Coachella

Valley. Proposed Amendments to Regulation XXX will be submitted to CARB and U.S. EPA as program revisions to the approved Title V program.

### **Implementation and Resource Impact**

Existing South Coast AQMD resources are adequate to implement the proposed amended rules.

**ATTACHMENT A**  
**SUMMARY OF PROPOSAL**

**Proposed Amended Regulation XIII – New Source Review**

**PAR 1302 – Definitions**

- Updates references to California Code of Regulations sections for air basins
- Lowers the Major Polluting Facility threshold definition from 25 to 10 tons per year of VOC or NOx emissions for the Coachella Valley
- Lowers the Major Modification threshold definition from 25 tons per year to one pound per day for VOC or NOx emissions for the Coachella Valley

**Proposed Amended Regulation XX – Regional Clean Air Incentives Market**

**PAR 2000 – Definitions**

- Lowers the Major Modification threshold definition from 25 tons per year to one pound per day for VOC or NOx emissions for the Coachella Valley

**Proposed Amended Regulation XXX – Title V Permits**

**PAR 3001 – Applicability**

- Lowers applicability thresholds based on a facility's Permit to Emit for Coachella Valley sources from 25 to 10 tons per year for VOC or NOx emissions

**ATTACHMENT B**  
**KEY ISSUES AND RESPONSES**

RESOLUTION NO. 20-\_\_\_\_\_

**A Resolution of the South Coast Air Quality Management District (South Coast AQMD) Governing Board determining that the proposed amendments to Regulation XIII – New Source Review, Regulation XX – Regional Clean Air Incentives Market, and Regulation XXX – Title V Permits, are exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board Amending Regulation XIII – New Source Review, Regulation XX – Regional Clean Air Incentives Market, and Regulation XXX – Title V Permits.**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX are considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD has had its regulatory program certified pursuant to Public Resources Code Section 21080.5 and CEQA Guidelines Section 15251(l), and has conducted CEQA review and analysis of the proposed project pursuant to such program (South Coast AQMD Rule 110); and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002 (k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 - Review for Exemption, procedures for determining if a project is exempt from CEQA, that the proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX are exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that it can be seen with certainty that there is no possibility that the proposed project may have any significant adverse effects on the environment, and is therefore exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical

exemption apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, South Coast AQMD staff has prepared a Notice of Exemption for the proposed project, that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX and supporting documentation, including but not limited to, the Notice of Exemption, the Final Staff Report, and the Board Letter were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered the entirety of this information, and has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines, taking into consideration the factors in Section (d)(4)(D) of the Governing Board Procedures (codified as Section 30.5(4)(D)(i) of the Administrative Code), that there were no modifications to the proposed amendments to Regulations XIII, XX, or XXX since the Notice of Public Hearing was published that are so substantial as to significantly affect the meaning of the proposed amended rules within the meaning of Health and Safety Code Section 40726 because: (a) the changes do not impact emission reductions, (b) the changes do not affect the number or type of sources regulated by the rule, (c) the changes are consistent with the information contained in the notice of public hearing, and (d) the consideration of the range of CEQA alternatives is not applicable because the proposed project is exempt from CEQA; and

**WHEREAS**, proposed amendments to Regulation XIII and Regulation XX will be submitted for inclusion into the State Implementation Plan and proposed amendments to Regulation XXX will be submitted as program revisions to the approved Title V program; and

**WHEREAS**, the South Coast AQMD staff conducted a Public Workshop regarding proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX on September 25, 2020; and

**WHEREAS**, Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the Final Staff Report; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that a need exists to amend Regulation XIII, Regulation XX, and Regulation XXX based on the reclassification of Coachella Valley from a Severe-15 to an Extreme nonattainment area for the 1997 8 Hour Ozone standards and correct rule references and improve rule clarity; and

**WHEREAS**, the South Coast AQMD Governing Board obtains its authority to amend these regulations from Sections 39002, 40000, 40001, 40440, 40702, 41508, and 42300 et seq. of the Health and Safety Code; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Regulation XIII, Regulation XX, and Regulation XXX, as proposed to be amended, are written or displayed so that the meaning can be easily understood by the persons directly affected by the proposed amendments; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Regulation XIII, Regulation XX, and Regulation XXX, as proposed to be amended, are in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or State or federal regulations; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Regulation XIII, Regulation XX, and Regulation XXX, as proposed to be amended, do not impose the same requirements as any existing state or federal regulation and the proposed rule amendments are necessary and proper to execute the powers and duties granted to, and imposed upon, the District; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is a problem with existing regulatory requirements not meeting Clean Air Act requirements for Extreme nonattainment areas for the 1997 1-hour ozone standard that Regulation XIII, Regulation XX, and Regulation XXX, as proposed to be amended, will alleviate pursuant to Health and Safety Code Section 40001(c); and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Regulation XIII, Regulation XX, and Regulation XXX, as proposed to be amended, references the following statutes which the South Coast AQMD hereby implements, interprets or makes specific; Health and Safety Code 40001, 40440, 40702, 41508, and 42300 et seq. (adoption of rules and regulations); Clean Air Act Sections 172, 173, and 182(e), (Extreme ozone areas) and 502 et. seq. (Title V requirements); and

**WHEREAS**, a written analysis pursuant to Health and Safety Code Section 40727.2 has been prepared and is included in the Final Staff Report that identifies all existing federal air pollution control requirements, all South Coast AQMD existing and proposed rules and regulations, and all pollution control requirements and guidelines that apply to the same equipment or source type as the proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX; and

**WHEREAS**, a public hearing has been properly noticed in accordance with the provisions of Health and Safety Code Section 40725; and

**WHEREAS**, the South Coast AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

**WHEREAS**, the South Coast AQMD Governing Board specifies the Manager of the proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX, as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of these proposed amendments are based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX, should be amended for the reasons contained in the Final Staff Report; and

**NOW, THEREFORE, BE IT RESOLVED** that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the proposed amendments to Regulation XIII – New Source Review, Regulation XX – Regional Clean Air Incentives Market, and Regulation XXX – Title V Permits are exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption and CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment. No exceptions to the application of the categorical exemption set forth in CEQA Guidelines Section 15300.2 – Exceptions, including the “unusual circumstances” exception, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members exercised their independent judgement and reviewed, considered and approved the information therein prior to acting on the proposed amendments to Regulation XIII – New Source Review, Regulation XX – Regional Clean Air Incentives Market, and Regulation XXX – Title V Permits; and

**BE IT FURTHER RESOLVED**, that the Executive Officer is hereby directed to forward a copy of this Resolution and proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX to the California Air Resources Board for approval and subsequent submittal to the U.S. Environmental Protection Agency for inclusion into the State Implementation Plan or as program revisions to the Title V program; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby adopt, pursuant to the authority granted by law, proposed amendments to Regulation XIII, Regulation XX, and Regulation XXX, as set forth in the attached and incorporated herein by reference.

## ATTACHMENT F1

(Adopted October 5, 1979)(Amended March 7, 1980)(Amended July 11, 1980)  
(Amended September 10, 1982)(Amended July 12, 1985)(Amended August 1, 1986)  
(Amended December 2, 1988)(Amended June 28, 1990)(Amended May 3, 1991)  
(Amended December 7, 1995)(Amended June 13, 1997)(Amended October 20, 2000)  
(Amended December 6, 2002)(Amended November 4, 2016)  
(PAR 1302 December 4, 2020)

### **PROPOSED**

### **AMENDED**

### **RULE 1302. DEFINITIONS**

- (a) ACTUAL EMISSIONS means the emissions of a pollutant from an affected source determined by taking into account actual emission rates and actual or representative production rates (i.e., capacity utilization and hours of operation).
- (b) AIR CONTAMINANT means any air pollutant for which there is a national ambient air quality standard, or precursor to such air pollutant, including but not limited to: carbon monoxide, sulfur dioxide, nitrogen oxides, particulate matter, lead compounds and volatile organic compounds.
- (c) ALLOCATION means emissions offsets issued from the Priority Reserve.
- (d) ALLOWABLE EMISSIONS means the emissions rate of a stationary source calculated using the maximum rated capacity of the source, unless the source is subject to federally enforceable limits which restrict the operation rate, or hours of operation, or both, and the most stringent of the following: (1) the applicable standards set forth in 40 CFR Part 60 or 61; (2) any applicable SIP emissions limitation including those with a future compliance date; or (3) the emissions rate specified as federally enforceable permit conditions including those with a future compliance date.
- (e) AREA SOURCE EMISSIONS REDUCTION CREDIT (ASERC) means any credit for emissions reduction generated pursuant to a state and federally approved area source credit generation rule for stationary source use as an offset under Regulation XIII.
- (f) BANKING means the process of recognizing and certifying emission reductions and the registering transaction involving Emission Reduction Credits.

- (g) BASIN means the South Coast Air Basin (~~SOCAB~~) as defined by California Code of Regulations, Section 60104 of Title 17, or the Riverside County portion of the Salton Sea Air Basin (~~SSAB~~) as defined by California Code of Regulations, Section 60114 of Title 17 and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (~~MDAB~~) as defined by California Code of Regulations, Section 60109 of Title 17. ~~The boundaries of each air basin shall be as defined by California Code of Regulations, Section 60104 Title 17.~~
- (h) BEST AVAILABLE CONTROL TECHNOLOGY (BACT) means the most stringent emission limitation or control technique which:
- (1) has been achieved in practice for such category or class of source; or
  - (2) is contained in any state implementation plan (SIP) approved by the United States Environmental Protection Agency (EPA) for such category or class of source. A specific limitation or control technique shall not apply if the owner or operator of the proposed source demonstrates to the satisfaction of the Executive Officer or designee that such limitation or control technique is not presently achievable; or
  - (3) is any other emission limitation or control technique, found by the Executive Officer or designee to be technologically feasible for such class or category of sources or for a specific source, and cost-effective as compared to measures as listed in the Air Quality Management Plan (AQMP) or rules adopted by the District Governing Board.
- (i) BEST AVAILABLE RETROFIT CONTROL TECHNOLOGY means an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source.
- (j) COGENERATION PROJECT means a project which:
- (1) makes sequential use of exhaust steam, waste steam, heat or resultant energy from an industrial, commercial, or manufacturing plant or process for the generation of electricity; or
  - (2) makes sequential use of exhaust steam, waste steam, or heat from a thermal power plant, in an industrial, commercial, or manufacturing plant or process.

For the purposes of this definition, the "industrial, commercial or manufacturing plant or process" shall not be a thermal power plant or portion thereof. A

cogeneration project shall not consist of steam or heat developed solely for electrical power generation. To qualify as a cogeneration project, the processes listed in paragraphs (j)(1) and (j)(2) above must meet the conditions specified in Public Resources Code Section 25134.

- (k) EMISSION LIMITATION is a federally enforceable permit condition limiting emissions from a discrete operation, unit or other pollutant emitting source.
- (l) EMISSION REDUCTION CREDIT (ERC) means the amount of emissions reduction which is verified and determined to be eligible for credit at a facility in accordance with all District rules and regulations. An ERC represents final eligible emission reductions and may be used as such, in accordance with the provisions of Regulation XIII.
- (m) ESSENTIAL PUBLIC SERVICE includes:
  - (1) sewage treatment facilities, which are publicly owned or operated, and consistent with an approved regional growth plan;
  - (2) prisons;
  - (3) police facilities;
  - (4) fire fighting facilities;
  - (5) schools;
  - (6) hospitals;
  - (7) construction and operation of a landfill gas control or processing facility;
  - (8) water delivery operations; and
  - (9) public transit.
- (n) EXEMPT COMPOUNDS are as defined in Rule 102.
- (o) EXPIRED PERMIT SOURCE SHUTDOWN CREDITS (EPSSC) means any source for which permits have expired and cannot be reactivated or re-instated, and for which the District claims the emission credits.
- (p) FACILITY means any source or group of sources or other air contaminant-emitting activities which are located on one or more contiguous properties within the District, in actual physical contact or separated solely by a public roadway or other public right-of-way, and are owned or operated by the same person (or by persons under common control), or an outer continental shelf (OCS) source as determined in 40 CFR Section 55.2. Such above-described groups, if noncontiguous, but

connected only by land carrying a pipeline, shall not be considered one facility. Sources or installations involved in crude oil and gas production in Southern California Coastal or OCS Waters and transport of such crude oil and gas in Southern California Coastal or OCS Waters shall be included in the same facility which is under the same ownership or use entitlement as the crude oil and gas production facility on-shore.

- (q) **FEDERALLY ENFORCEABLE** means all permit limitations and conditions which are enforceable by the EPA Administrator.
- (r) **MAJOR MODIFICATION** means any modification, as specified in subdivision ~~(s)~~ (x), at an existing major polluting facility, as specified in subdivision (s), that will cause;
- (1) an increase of one pound per day or more, of the facility's potential to emit oxides of nitrogen (NO<sub>x</sub>) or volatile organic compounds (VOCs), provided the facility is located in the South Coast Air Basin ~~(SOCAB)~~ or the Riverside County portion of the Salton Sea Air Basin, or
  - (2) an increase of 40 tons per year or more, of the facility's potential to emit oxides of sulfur (SO<sub>x</sub>), or
  - (3) an increase of 15 tons per year or more, of the facility's potential to emit particulate matter with an aerodynamic diameter of less than or equal to a nominal ten microns (PM<sub>10</sub>); or,
  - (4) an increase of 50 tons per year or more, of the facility's potential to emit carbon monoxide (CO).

For an existing major polluting facility located in the ~~Riverside County portion of the Salton Sea Air Basin (SSAB) and the Riverside County~~ Riverside County portion area of the Mojave Desert Air Basin ~~(MDAB)~~, major modification means any modification that will cause an increase of 25 tons per year or more, of the facility's potential to emit NO<sub>x</sub> or VOC; whereas the requirements for SO<sub>x</sub>, PM<sub>10</sub>, and CO are as specified above in paragraphs ~~(e)(2)(r)(2)~~, ~~(e)(3)(r)(3)~~, and ~~(e)(4)(r)(4)~~.

- (s) **MAJOR POLLUTING FACILITY** means any facility located in the South Coast Air Basin ~~(SOCAB)~~ which emits or has the potential to emit the following amounts or more:

Volatile Organic Compounds (VOC)                      (10) tons per year

Nitrogen Oxides (NO <sub>x</sub> )	(10) tons per year
Sulfur Oxides (SO <sub>x</sub> )	(70) tons per year
Particulate Matter (PM <sub>10</sub> )	(70) tons per year
Carbon Monoxide (CO)	(50) tons per year

For any facility located in the Riverside County portion of the Salton Sea Air Basin (~~SSAB~~), major polluting facility means any facility which emits or has the potential to emit the following amounts or more:

Volatile Organic Compounds (VOC)	<del>(25)</del> (10) tons per year
Nitrogen Oxides (NO <sub>x</sub> )	<del>(25)</del> (10) tons per year
Sulfur Oxides (SO <sub>x</sub> )	(70) tons per year
Particulate Matter (PM <sub>10</sub> )	(70) tons per year
Carbon Monoxide (CO)	(100) tons per year

For any facility located in the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (~~MDAB~~), major polluting facility means any facility which emits or has the potential to emit the following amounts or more:

Volatile Organic Compounds (VOC)	(100) tons per year
Nitrogen Oxides (NO <sub>x</sub> )	(100) tons per year
Sulfur Oxides (SO <sub>x</sub> )	(100) tons per year
Particulate Matter (PM <sub>10</sub> )	(100) tons per year
Carbon Monoxide (CO)	(100) tons per year

- (t) MINOR FACILITY means any facility that is not a major polluting facility.
- (u) MOBILE SOURCE means a device by which any person or property may be propelled, moved, or drawn upon a roadway, stationary rails or tracks, waterways, or through the atmosphere, and which emits air contaminants.
- (v) MOBILE SOURCE EMISSION REDUCTION CREDIT (MSERC) means any credit for emission reductions generated pursuant to a state and federally approved mobile source credit generation rule for stationary source use as an offset under Regulation XIII.

- (w) MODELING means using an air quality simulation model, based on specified assumptions and data, and which model is approved by the EPA and has been approved in writing by the Executive Officer or designee.
- (x) MODIFICATION means any physical change in equipment, change in method of operation, or an addition to an existing facility, which may cause the issuance of air contaminants. Routine maintenance and/or repair shall not be considered a physical change. A change in the method of operation of equipment, unless previously limited by an enforceable permit condition, shall not include:
  - (1) an increase in the production rate, unless such increase will cause the maximum design capacity of the equipment to be exceeded.
  - (2) an increase in the hours of operation.
  - (3) a change in operator of a facility.
- (y) NEW SOURCE REVIEW (NSR) BALANCE means the sum of the emission increases, decreases, and offsets as listed in District records, and approved by the Executive Officer or designee that has been determined at a facility pursuant to the District's New Source Review rules since October 8, 1976 to December 7, 1995. Under no circumstances shall the New Source Review Balance be greater than the facility's potential to emit or less than zero.
- (z) NONATTAINMENT AIR CONTAMINANT means any air contaminant for which there is a national or state ambient air quality standard, or precursor to such air contaminant, which:
  - (1) has been designated "nonattainment" pursuant to the California Air Resources Board in accordance with Section 39607 of California Health & Safety Code; or
  - (2) has been designated "nonattainment" pursuant to final rulemaking by the EPA as published in the Federal Register.
- (aa) OZONE DEPLETING COMPOUNDS (ODCs) are as defined in Rule 102.
- (ab) PERMANENT means that emission reductions used to offset emission increases are assured for the life of the corresponding increase, whether unlimited or limited in duration.

- (ac) PERMIT UNIT means any article, machine, equipment, or other contrivance, or combination thereof, which may cause or control the issuance of air contaminants that is not exempt from permit requirements.
- (ad) POTENTIAL TO EMIT means the amount of pollutants calculated (1) using a calendar monthly average, and, (2) on a pound-per-day basis from permit conditions which directly limit the emissions, or, when no such conditions are imposed, from:
- (1) the maximum rated capacity; and
  - (2) the maximum daily hours of operation; and
  - (3) the physical characteristics of the materials processed.
- Fugitive emissions associated with the source shall be included in the potential to emit.
- (ae) PM<sub>10</sub> means particulate matter with aerodynamic diameter of less than or equal to a nominal 10 microns as measured by an applicable reference test method.
- (af) PRECURSOR means a substance that, when released to the atmosphere, forms or causes to be formed or contributes to the formation of another or secondary air contaminant for which a national ambient air quality standard has been adopted, or whose presence in the atmosphere will contribute to the violation of one or more national ambient air quality standards. Precursors and secondary pollutants include:

**PRECURSORS**

Volatile Organic Compounds (VOC)

Nitrogen Oxides (NO<sub>x</sub>)

Sulfur Oxides (SO<sub>x</sub>)

**SECONDARY POLLUTANTS**

- a) photochemical oxidant (ozone)
- b) the organic fraction of suspended particulate matter
- a) nitrogen dioxide (NO<sub>2</sub>)
- b) the nitrate fraction of suspended particulate matter
- c) photochemical oxidant (ozone)
- a) Sulfur dioxide (SO<sub>2</sub>)
- b) sulfates (SO<sub>4</sub>)
- c) the sulfate fraction of suspended particulate matter

- (ag) QUALIFYING FACILITY means a power generating facility which:

- (1) produces electric energy solely by the use, as a primary energy source, of biomass, waste, renewable resources, geothermal resources, or any combination thereof; and
  - (2) has a power production capacity which, together with any other facilities located at the same site, is not greater than 80 megawatts; and
  - (3) is determined by the Federal Energy Regulatory Commission (FERC), by rule, to meet such requirements (including fuel use, fuel efficiency, and reliability) as the Commission may, by rule, prescribe; and
  - (4) is owned by a person not primarily engaged in the generation or sale of electric power, other than electric power solely from cogeneration facilities or facilities meeting the provisions of subparagraphs (ag)(1) and (ag)(2).
- (ah) QUANTIFIABLE EMISSIONS means that the emission reductions eligible for ERCs were calculated both before and after the reduction using the same method and averaging time
- (ai) RELOCATED MINOR FACILITY means, for the purposes of BACT applicability pursuant to Rule 1306, paragraph (d)(3), any facility, that is undergoing or has undergone a relocation of all its permitted sources and associated operations and, that has been under the same ownership for two or more years at the same location, as demonstrated to the satisfaction of the Executive Officer. A relocated minor facility shall be a minor facility at the relocated site, in accordance with the provisions of subdivisions (p) and (t).
- (aj) RELOCATION means the removal of an existing source from one parcel of land in the District and installation on another parcel of land where the two parcels are not in actual physical contact and are not separated solely by a public roadway or other public right-of-way.
- (ak) RESOURCE RECOVERY PROJECT means a project which uses municipal waste, refuse-derived, biomass-derived or other nonfossil fuels for useful energy generation within the same basin that the fuel was generated.
- (al) SHORT TERM CREDIT (STC) means any credit for emission reductions that is valid only during specific years and for specific quantities. STCs consist of Short Term ERCs (STERCs), Mobile Source ERCs (MSERCs) and Area Source ERCs (ASERCs).

- (am) SHORT TERM EMISSION REDUCTION CREDIT (STERC) means any ERC which has been divided in whole or part, for a period of no more than seven years and is issued in one year increments for use as a STC.
- (an) SMALL BUSINESS means for BACT determination purposes only, any business which meets all of the following criteria:
- (1) the number of employees is 100 or less;
  - (2) the total gross annual receipts are \$2,000,000 or less;
  - (3) be privately held and not publicly traded;
  - (4) not be a major stationary source;
  - (5) be subject to Regulation XIII and not Rule 2005(RECLAIM); and
  - (6) if legally affiliated with another business, the combined activities shall meet the above requirements.
- A facility is a major stationary source if it is subject to Regulation XXX - Title V Permits based on subdivision (a) of Rule 3001 - Applicability or is a major polluting facility as determined in this regulation.
- (ao) SOURCE means any permitted individual unit, piece of equipment, article, machine, process, contrivance, or combination thereof, which may emit or control an air contaminant. This includes any permit unit at any non-RECLAIM facility and any device at a RECLAIM facility.
- (ap) VOLATILE ORGANIC COMPOUNDS (VOCs) are as defined in Rule 102.

## ATTACHMENT F2

(Adopted October 15, 1993)(Amended December 7, 1995)(Amended February 14, 1997)  
(Amended April 11, 1997)(Amended October 20, 2000)(Amended May 11, 2001)  
(Amended May 6, 2005)(PAR 2000 December 4, 2020)

### **PROPOSED**

### **AMENDED**

### **RULE 2000. GENERAL**

(a) Program Objective

RECLAIM is a market incentive program designed to allow facilities flexibility in achieving emission reduction requirements for Oxides of Nitrogen (NO<sub>x</sub>), and Oxides of Sulfur (SO<sub>x</sub>) under the Air Quality Management Plan using methods which include, but are not limited to: add-on controls, equipment modifications, reformulated products, operational changes, shutdowns, and the purchase of excess emission reductions.

(b) Purpose

This rule provides the definitions for terms found in Regulation XX - RECLAIM. Any identical term found elsewhere in District Rules and Regulations with a conflicting definition shall be superseded, for the purposes of this regulation, by the definition provided in this rule.

(c) Definitions

- (1) ACTUAL EMISSIONS means the emissions of a pollutant from an affected source determined by taking into account, actual emission rates and actual or representative production rates (i.e., capacity utilization and hours of operation).
- (2) AIR CONTAMINANT means any air pollutant for which there is a national ambient air standard, or precursor to such air pollutant, including but not limited to: carbon monoxide, sulfur dioxide, nitrogen oxides, particulate matter, lead compounds and volatile organic compounds.
- (3) ALLOCATION is the number of RECLAIM Trading Credits (RTCs) [as defined in paragraph (c)(63)] a RECLAIM facility holds for a specific compliance year, as referenced in the Facility Permit.

- (4) ALLOWABLE EMISSIONS means the emissions rate of a stationary source calculated using the maximum rated capacity of the sources (unless the source is subject to federally enforceable limits which restrict the operating rate or hours of operation, or both) and the most stringent of the following:
  - (A) the applicable standards set forth in 40 CFR part 60 or 61;
  - (B) any applicable State Implementation Plan emissions limitation, including those with a future compliance date; or
  - (C) the emissions rate specified as a federally enforceable permit condition, including those with a future compliance date.
- (5) ALTERNATIVE EMISSION FACTOR is a SO<sub>x</sub> emission value in units of pounds per million standard cubic feet or pounds per thousand gallons derived using the methodology specified in Appendix A, Protocols for Monitoring, Reporting, and Recordkeeping for Oxides of Sulfur (SO<sub>x</sub>) Emissions, Chapters 3 and 4.
- (6) ANNUAL PERMIT EMISSIONS PROGRAM (APEP) is the annual Facility Permit compliance reporting, review, and fee reporting program.
- (7) BASIN means the South Coast Air Basin as defined by the California Air Resources Board.
- (8) BEST AVAILABLE RETROFIT CONTROL TECHNOLOGY (BARCT) means an emission limitation that is based on the minor source criteria and methodology specified in the most current version of the District's BACT Guidelines. Parameters used for cost-effectiveness, such as equipment life less than ten years or operating conditions, except for hours of operation for gas turbines used as peaking units at Power Producing Facilities, shall be included as Facility Permit conditions.
- (9) BEST AVAILABLE CONTROL TECHNOLOGY (BACT) means the most stringent emission limitation or control technique which:
  - (A) has been achieved in practice for such category or class of source; or
  - (B) is contained in any state implementation plan (SIP) approved by the Environmental Protection Agency (EPA) for such category or class of source; or

- (C) is any other emission limitation or control technique, including process and equipment changes of basic or control equipment which is technologically feasible for such class or category of source or for a specific source, and cost-effective as compared to AQMP measures or adopted District rules.

A specific limitation or control technique shall not apply if the Facility Permit holder demonstrates that such limitation or control technique is not presently achievable. BACT shall be at least as stringent as Standards of Performance for New Stationary Sources (40 CFR Part 60).

BACT for sources located at major polluting facilities shall be at least as stringent as Lowest Achievable Emissions Rate (LAER) as defined in the federal Clean Air Act Section 171(3) [42 U.S.C. Section 7501(3)].

BACT for sources not located at major polluting facilities shall be as specified in the BACT Guidelines for such source categories, unless the BACT specified in the Guidelines is less stringent than required by state law in which case BACT shall be as defined in state law considering economic and technical feasibility.

When updating the BACT Guidelines to become more stringent for sources not located at major polluting facilities, economic and technical feasibility shall be considered in establishing the class or category of sources and the applicable requirements.

- (10) BREAKDOWN means a condition caused by circumstances beyond the Facility Permit holder's control which result in fire, or mechanical or electrical failure. If the breakdown causes an emission increase at a RECLAIM facility in excess of emissions under normal operating conditions, determined pursuant to Rules 2011 - Requirements for Monitoring, Reporting and Recordkeeping for Oxides of Sulfur (SO<sub>x</sub>) Emissions, and 2012 - Requirements for Monitoring, Reporting and Recordkeeping for Oxides of Nitrogen (NO<sub>x</sub>) Emissions, and Appendices A of Rules 2011 and 2012, the excess emissions from such breakdown are not counted in determining compliance with the RECLAIM facility's annual allocation if all criteria specified in Rule 2004 (i)(2)(A) are met. Malfunctions in monitoring, reporting, and recordkeeping equipment as

required by Rule 2011 and Rule 2012 shall not be considered to be a breakdown under Rule 2004 (i).

- (11) BUYER is any person who acquires RTCs from another person through purchase, trade or other means of transfer.
- (12) CEMENT KILN is a device for the calcining and clinkering of limestone, clay and other raw materials, and recycle dust in the dry-process manufacture of cement.
- (13) CERTIFIED REPORT means there has been a reasonable and diligent inquiry into the accuracy of the report by the certifying official and that the contents of the report are true and accurate to the best of his or her knowledge.
- (14) CLINKER is a mass of fused material produced in a cement kiln from which the finished cement is manufactured by milling and grinding.
- (15) COMBUSTION EQUIPMENT is any equipment that burns fuel, including but not limited to natural gas or fuel oil in order to operate. Combustion equipment includes, but is not limited to, boilers, turbines, heaters, engines, kilns, furnaces, ovens, dryers, flares, and afterburners.
- (16) COMPLIANCE YEAR is the twelve-month period beginning on January 1 and ending on December 31 for Cycle 1 facilities, and beginning on July 1 and ending on June 30 for Cycle 2 facilities.
- (17) CONCENTRATION LIMIT is a value expressed in ppmv, is measured over any continuous 60 minutes, is elected by the Facility Permit holder for a large NO<sub>x</sub> source or a super compliant SO<sub>x</sub> major source which has been reclassified as a SO<sub>x</sub> process unit, and is specified in the Facility Permit.
- (18) CONTINUOUS EMISSIONS MONITORING SYSTEM (CEMS) means the equipment required by the Protocols for Monitoring, Reporting and Recordkeeping for Oxides of Sulfur (SO<sub>x</sub>) and Oxides of Nitrogen (NO<sub>x</sub>) Emissions used to continuously measure all parameters necessary to determine mass emissions expressed in pounds per hour (lb/hr) for SO<sub>x</sub> and NO<sub>x</sub>. A CEMS includes, but is not limited to, the following component parts and systems:
  - (A) sulfur dioxide pollutant concentration monitor;
  - (B) flow monitor;
  - (C) nitrogen oxides pollutant concentration monitor;
  - (D) diluent gas monitor (oxygen or carbon dioxide);

- (E) a data acquisition and handling system;
  - (F) moisture monitor, as applicable; and
  - (G) sample acquisition, conditioning, and transport system, as applicable.
- (19) CONTINUOUS PROCESS MONITORING SYSTEM (CPMS) is equipment that measures process parameters including, but not limited to, fuel usage rate, oxygen content of stack gas, or process weight, and meets all performance standards for CPMS set forth in the Protocol for Monitoring, Reporting and Recordkeeping for Oxides of Nitrogen (NO<sub>x</sub>) Emissions. Such CPMS data will be used in conjunction with the concentration limit or emission rate, as stated in the Facility Permit, to determine mass NO<sub>x</sub> emissions.
- (20) CONTINUOUSLY MEASURE means to measure at least once every 15 minutes except during periods of routine maintenance and calibration, or as otherwise specified in the Protocols for Monitoring, Reporting, and Recordkeeping Oxides of Nitrogen (NO<sub>x</sub>) and Oxides of Sulfur (SO<sub>x</sub>) Emissions.
- (21) CONTRACTOR means a person, other than the facility permit holder and its employees, who operates equipment at a RECLAIM facility.
- (22) DAILY means occurring once between 12 midnight and 24 hours later at midnight.
- (23) DIRECT MONITORING DEVICE is a device that measures the emissions of NO<sub>x</sub> or SO<sub>x</sub> or fuel sulfur content and all other variables as specified in Rules and Protocols for Monitoring, Reporting, and Recordkeeping for Oxides of Nitrogen (NO<sub>x</sub>) and Oxides of Sulfur (SO<sub>x</sub>) Emissions.
- (24) DISTRICT CENTRAL NO<sub>x</sub> STATION is the District's designated computer system for NO<sub>x</sub> emission monitoring.
- (25) DISTRICT CENTRAL SO<sub>x</sub> STATION is the District's designated computer system for SO<sub>x</sub> emission monitoring.
- (26) ELECTRIC UTILITY is all in-Basin facilities which generate power and are owned or operated by any one of the following: Southern California Edison, Los Angeles Department of Water and Power, City of Burbank, City of Glendale, City of Pasadena, or any of their successors.
- (27) ELECTRONICALLY REPORT means transmitting measured data between the point of measurement and the point of receipt of the transmission, as specified in Rules 2011 and 2012 and their Appendices.

- (28) EMERGENCY STANDBY EQUIPMENT is equipment solely used on a standby basis in cases of emergency and is listed as emergency equipment on the Facility Permit; or is equipment that does not operate more than 200 hours per compliance year and is listed as emergency equipment in the Facility Permit.
- (29) EMISSION FACTOR is the applicable value specified in Tables 1 or 2 of Rule 2002.
- (30) EMISSION RATE is a value expressed in terms of NO<sub>x</sub> mass emissions per unit of heat input, is derived using the methodology specified in the Protocol for Monitoring, Reporting and Recordkeeping for Oxides of Nitrogen (NO<sub>x</sub>) Emissions, and is used to calculate NO<sub>x</sub> mass emissions on an average basis.
- (31) EMISSION REDUCTION CREDIT (ERC) means the amount of credit for emission reductions verified and determined by the Executive Officer pursuant to Regulation XIII - New Source Review.
- (32) ENTRY is the process by which a facility not included in the RECLAIM program pursuant to Rule 2001 - Applicability, can enter the program pursuant to conditions established in Rule 2001.
- (33) EXTERNAL OFFSET means an emission reduction determined pursuant to Rule 1309(b)(1) and approved by the Executive Officer for use to mitigate an emission increase, where the emission reduction is made at a facility other than the facility creating the emission increase.
- (34) EXISTING EQUIPMENT is any equipment operating at a RECLAIM facility for which there was a District Permit to Construct, temporary Permit to Operate, or Permit to Operate, or equipment which existed but was exempt pursuant to Rule 219 - Equipment Not Requiring a Written Permit Pursuant to Regulation II, before October 15, 1993.
- (35) EXISTING FACILITY is any facility that submitted Emission Fee Reports pursuant to Rule 301- Permit Fees, for 1992 or earlier years, or with valid District Permits to Operate issued prior to October 15, 1993, and continued to be in operation or possess valid District permits on October 15, 1993.
- (36) EXPIRATION DATE is the last date a pollutant can be emitted under the authority conveyed by a Facility Permit specifying allowable emissions based upon the amount of RTCs held by a Facility Permit holder.

- (37) FACILITY means any source or grouping of sources or other air contaminant-emitting activities which are located on one or more contiguous properties within the Basin in actual physical contact, or separated solely by a public roadway or other public right-of-way, and are owned or operated by the same person (or by persons under common control) or an Outer Continental Shelf (OCS) source as defined in 40 CFR Section 55.2. Such above-described groupings, if on noncontiguous properties, connected only by land carrying a pipeline, shall not be considered one facility. Equipment or installations involved in crude oil and gas production in Southern California Coastal or OCS waters and transport of such crude oil and gas in Southern California Coastal or OCS waters shall be included in the same facility which is under the same ownership or use entitlement as the crude oil and gas facility on-shore.
- (38) FACILITY PERMIT is a permit which consolidates permits for existing equipment, a permit for previously non-permitted NO<sub>x</sub> and/or SO<sub>x</sub> emitting Rule 219 equipment, and permits for any new equipment, into a single permit. A Facility Permit shall serve as a Permit to Construct new or altered equipment, pursuant to Rule 201 and a Permit to Operate, pursuant to Rules 202(a), 202(b) and 203, for all equipment at a RECLAIM facility. Requirements for non-RECLAIM pollutants shall also be included in the Facility Permit.
- (39) FEDERALLY ENFORCEABLE means all permit limitations and conditions which are enforceable by the EPA Administrator.
- (40) FUNCTIONALLY IDENTICAL SOURCE REPLACEMENT is the replacement of an existing source with another source that performs the same function, and has a maximum rated capacity less than or equal to the source being replaced.
- (41) GASEOUS FUELS include, but are not limited to, any natural, process, synthetic, landfill, sewage digester or waste gases with a gross heating value of 300 Btu per cubic foot or higher, at standard conditions.
- (42) HIGH EMPLOYMENT/LOW EMISSIONS FACILITY (HILO) is a new facility which has a high employment to pollution ratio. A HILO Facility has an emission rate for NO<sub>x</sub>, SO<sub>x</sub>, ROC, and PM<sub>10</sub>, per full-time manufacturing employee, that is equal to or less than one-half (1/2) of any estimate stated in the AQMP for emissions per full-time manufacturing employee by industry class in the year 2010.

- (43) ISSUE DATE is the first date a pollutant can be emitted under the authority conveyed by a Facility Permit specifying allowable emissions based upon the amount of RTCs held by a Facility Permit holder.
- (44) MAJOR MODIFICATION means any modification, at an existing major polluting facility that will cause:
  - (A) an increase of one or more pounds per day, of the facility's potential to emit oxides of nitrogen (NO<sub>x</sub>) or volatile organic compounds (VOCs) provided the facility is located in the South Coast Air Basin or the Riverside County portion of the Salton Sea Air Basin,  
or
  - (B) an increase of 40 tons per year or more, of the facility's potential to emit oxides of sulfur (SO<sub>x</sub>); or
  - (C) an increase of 15 tons per year or more, of the facility's potential to emit particulate matter with an aerodynamic diameter of less than or equal to a nominal ten microns (PM<sub>10</sub>); or
  - (D) an increase of 100 tons per year or more, of the facility's potential to emit carbon monoxide (CO).

For an existing major polluting facility located in the ~~Riverside County portion of the Salton Sea Air Basin (SSAB) and the Riverside County non-Palo Verde, Riverside County~~ portion area of the Mojave Desert Air Basin ~~(MDAB)~~, major modification means any modification that will cause an increase of 25 tons per year or more, of the facility's potential to emit NO<sub>x</sub> or VOC; whereas the requirements for SO<sub>x</sub>, PM<sub>10</sub> and CO are as specified above in paragraphs (44)(B), (44)(C), and (44)(D).

- (45) MAJOR STATIONARY SOURCE means any facility which emits, or has the potential to emit 10 tons per year or more of NO<sub>x</sub> or 100 tons per year or more of SO<sub>x</sub>.
- (46) MANUFACTURING EMPLOYEES are those full-time employees directly involved in the manufacture or sale of the product created by a RECLAIM facility.
- (47) MITIGATION FEE PROGRAM means a program where power producing facilities that exceed annual allocations and meet specified applicability requirements in Rule 2004 subdivision (o), pay a participation fee to the District for generation of NO<sub>x</sub> emission reductions by the District to mitigate emission exceedances.

- (48) MODIFICATION means any physical change or change in the method of operation of a source. The following shall not be considered a modification: (A) routine maintenance and repair; (B) any change in operator or ownership of the facility; (C) use of an alternative fuel as required by District rule or federal or state statute, regulation or law; and, (D) an increase in the hours of operation or in the production rate, unless a permit condition limiting hours of operation, throughput or mass emissions would be exceeded.
- (49) MONTHLY EMISSIONS REPORT is a report which takes inventory of all RECLAIM pollutant emissions at a facility during a calendar month, submitted by the Facility Permit holder to the Executive Officer, within 30 days of the close of each month.
- (50) NATURAL GAS is a mixture of gaseous hydrocarbons, with at least 80 percent methane (by volume), and of pipeline quality, such as the gas sold or distributed by any utility company regulated by the California Public Utilities Commission.
- (51) NEW FACILITY is any facility which has received all District Permits to Construct on or after October 15, 1993.
- (52) NON-RECLAIM POLLUTANTS are those pollutants other than RECLAIM NO<sub>x</sub> and SO<sub>x</sub>.
- (53) NORMAL OPERATING CONDITION means the condition that conforms with the established norm or standard prescribed in Rule 2011 - Requirements for Monitoring, Reporting and Recordkeeping for Oxides of Sulfur (SO<sub>x</sub>) Emissions and Rule 2012 - Requirements for Monitoring, Reporting, and Recordkeeping for Oxides of Nitrogen (NO<sub>x</sub>) Emissions, and the Appendices thereto.
- (54) NO<sub>x</sub> EMISSIONS means the sum of nitric oxides and nitrogen dioxides emitted, calculated as nitrogen dioxide.
- (55) ON-SITE, OFF-ROAD MOBILE SOURCES means non-stationary devices powered by an internal combustion engine or motor of 50 horsepower or greater, used off public roads and solely at the facility to propel, move, or draw persons or property. Such devices include, but are not limited to: forklifts, aerial lifts, motor graders, backhoes, excavators, dozers, trenchers, and tractors.

- (56) POWER PRODUCING FACILITY is an electric utility as defined in (c)(26), operated as of May 11, 2001, which has a generation capacity of 50 megawatts or more of electrical power.
- (57) QUARTER is a three-month period from January 1 to March 31, April 1 to June 30, July 1 to September 30, or October 1 to December 31, inclusive.
- (58) QUARTERLY CERTIFICATION OF EMISSIONS is a certified report inventorying all RECLAIM pollutant emissions at a facility during a quarter.
- (59) RATED BRAKE HORSEPOWER (bhp) is the maximum rating specified by the manufacturer and listed on the nameplate.
- (60) RECLAIM is the Regional Clean Air Incentives Market established by this Regulation.
- (61) RECLAIM AIR QUALITY INVESTMENT PROGRAM (RECLAIM AQIP) is a voluntary emission reduction compliance option for RECLAIM facilities pursuant to Rule 2004 subdivision (p), where a participation fee is paid by the RECLAIM facility to the District for generation of NO<sub>x</sub> emission reductions by the District.
- (62) RECLAIM POLLUTANTS are NO<sub>x</sub> emissions and SO<sub>x</sub> emissions at a facility subject to RECLAIM requirements excluding any NO<sub>x</sub> or SO<sub>x</sub> emissions from on-site, off-road mobile sources and any SO<sub>x</sub> emissions from equipment burning natural gas exclusively, unless the emissions are SO<sub>x</sub> emissions at a facility that elected to enter RECLAIM pursuant to Rule 2001 (i)(2)(A) and including NO<sub>x</sub> and SO<sub>x</sub> emissions:
  - (A) from rental equipment as required to be reported by the Facility Permit holder pursuant to Rule 2011, Appendix A, Chapter 1 or Rule 2012, Appendix A, Chapter 1;
  - (B) from equipment operated by a contractor as required to be reported by the Facility Permit holder pursuant to Rule 2011, Appendix A, Chapter 1 or Rule 2012, Appendix A, Chapter 1;
  - (C) from ships during the loading or unloading of cargo and while at berth at a RECLAIM facility which was required to provide offsets pursuant to Rule 2005 paragraph (b)(2) and subdivision (f) for these emissions; and

- (D) from non-propulsion equipment on ships within Coastal Waters under District jurisdiction and from ships destined for or traveling from a RECLAIM facility which was required to provide offsets pursuant to Rule 2005 paragraph (b)(2) and subdivision (f) for these emissions.
- (63) RECLAIM TRADING CREDIT (RTC) is a limited authorization to emit a RECLAIM pollutant in accordance with the restrictions and requirements of District rules and state and federal law. Each RTC has a denomination of one pound of RECLAIM pollutant and a term of one year, and can be held as part of a facility's Allocation or alternatively may be evidenced by an RTC Certificate.
- (64) RECLAIM TRADING CREDIT LISTING is maintained by the Executive Officer and is the official and controlling record of RTCs held by any person.
- (65) REMOTE TERMINAL UNIT (RTU) is a data collection and transmitting device used to transmit data and calculated results to the District Central Station Computer.
- (66) RENTAL EQUIPMENT is equipment which is rented or leased for operation by someone other than the owner of the equipment.
- (67) REPORTED VALUE, for the purpose of developing Allocations, means the emissions data provided to the District by the facility representative, pursuant to Rule 301.
- (68) RTC CERTIFICATES are issued by the District and constitute evidence of RTCs held by any person and are used for information only. The official and controlling record of RTCs held by any person is the RTC listing maintained by the Executive Officer.
- (69) RESEARCH OPERATIONS are those operations the sole purpose of which is to permit investigation of experimental research to advance the state of knowledge or state-of-the-art technology.
- (70) SELLER is any person who transfers RTCs to another person through sale, trade or other means of transfer.
- (71) SOURCE is any individual unit, piece of equipment or process which may emit an air contaminant and which is identified, or required to be identified, in the RECLAIM Facility Permit.
- (72) SO<sub>x</sub> EMISSIONS means sulfur dioxides emitted.

- (73) STANDARD INDUSTRIAL CODE (SIC) is the classification number assigned to a facility based on its primary economic activity as specified in the "Standard Industrial Classification Manual," published by the Office of Management and Budget, dated 1987.
- (74) STRUCTURAL BUYER is any RECLAIM facility which has not sold RTCs as of May 1, 2000 for any compliance year during which the RECLAIM AQIP is requested and meets one of the following criteria:
  - (A) was or is initially totally permitted for construction of new equipment on or after October 15, 1993; or
  - (B) emitted 6 tons or less of NO<sub>x</sub> in the 1999 compliance year, provided:
    - (i) all equipment requiring a permit at the facility is equipped with a minimum of BARCT as defined in paragraph (c)(8); and
    - (ii) the emission reductions requested through RECLAIM AQIP do not exceed 50 percent of the facility's emissions in compliance year 1999.
- (75) THROUGHPUT means a measure of activity including, but not limited to: weight of glass pulled for a glass melting furnace, weight of clinker for cement kilns, amount of nitric acid used in metal stripping processes, amount of nitric or sulfuric acid manufactured for nitric or sulfuric acid manufacturing processes, weight of aluminum produced for aluminum production and/or fuel usage for all other sources as reported pursuant to Rule 301.
- (76) TRADING ZONE is one of two areas delineated in Rule 2005 - New Source Review for RECLAIM, Map 1.
- (77) ZONE OF ORIGINATION is the trading zone or Regulation XIII zone in which an RTC is originally assigned by the District.

## ATTACHMENT F3

(Adopted October 8, 1993)(Amended August 11, 1995)  
(Amended November 14, 1997)(Amended November 5, 2010)  
(PAR 3001 December 4, 2020)

### **PROPOSED**

### **AMENDED**

### **RULE 3001.      APPLICABILITY**

(a)      Phase One Title V Permits

Prior to [Date of Adoption], Operators of facilities that have, in 1992 or later, reported annual emissions equal to or greater than any of the threshold amounts shown in Table 1 shall submit initial Title V applications to the Executive Officer and obtain Title V permits in accordance with the timelines specified in Rule 3003 - Applications.

TABLE 1

Emission Threshold Levels for Facilities During Phase One

Based on Actual Reported Emissions in tons per year (tpy) per Facility Location

Pollutant	Actual Reported Emission Threshold Levels Per Facility Location		
	South Coast Air Basin ( <del>SOCAB</del> )  (tpy)	Riverside County Portion of Salton Sea Air Basin ( <del>SSAB</del> ) and Los Angeles County Portion of Mojave Desert Air Basin ( <del>MDAB</del> )  (tpy)	<u>Non-Palo Verde,</u> Riverside County Portion of Mojave Desert Air Basin ( <del>MDAB</del> )  (tpy)
VOC	8	20	80
NO <sub>x</sub>	8	20	80
SO <sub>x</sub>	80	80	80
CO	40	80	80
PM-10	56	56	80
Single HAP	8	8	8
Combination of HAPs	20	20	20

(b)      Phase Two Title V Permits

**Proposed Amended Rule 3001 (Cont.)** ~~(Amended November 5, 2010)~~**(December 4, 2020)**

- (1) Operators of facilities, not subject to the provisions of subdivision (a) of this rule, with the potential to emit any regulated air pollutant at, or greater than, any of the threshold amounts shown in Table 2 shall submit to the Executive Officer applications for initial Title V permits in accordance with the timelines specified in Rule 3003 - Applications, and obtain Title V permits within five years after the effective date, as defined in paragraph (b)(8) of Rule 3000.
- (2) For the purpose of this subdivision, the potential to emit for a RECLAIM pollutant from a RECLAIM facility is the higher of:
  - (A) the starting allocation plus nontradeable credits; or
  - (B) RECLAIM Trading Credits (RTC) held in the allocation account after any trading.

RTCs held in the certificate account are not part of the allocation.

**TABLE 2**

Emission Threshold Levels for Facilities During Phase Two

Based on Potential to Emit in tons per year (tpy) per Facility Location

Pollutant	Potential to Emit Emission Threshold Levels Per Facility Location		
	South Coast Air Basin <del>(SOCAB)</del>	Riverside County Portion of Salton Sea Air Basin <del>(SSAB)</del> and Los Angeles County Portion of Mojave Desert Air Basin <del>(MDAB)</del>	<u>Non-Palo Verde,</u> Riverside County Portion of Mojave Desert Air Basin <del>(MDAB)</del>
	(tpy)	(tpy)	(tpy)
VOC	10	<del>25</del> <u>10</u>	100
NO <sub>x</sub>	10	<del>25</del> <u>10</u>	100

CO	50	100	100
PM-10	70	70	100
Single HAP	10	10	10
Combination of HAPs	25	25	25

- (c) Additional Facilities Requiring Title V Permits

In addition to subdivisions (a) and (b) of this rule, operators of the following facilities shall submit applications to the Executive Officer to obtain Title V permits in accordance with the timelines specified in Rule 3003 - Applications, or with federal regulations:

- (1) All new facilities that have a potential to emit any regulated air pollutant at, or greater than, any of the levels specified in Table 2 of subdivision (b) of this rule, and for which applications for permits to construct and permits to operate are deemed complete after March 31, 2000;
- (2) All facilities initially not subject to Title V requirements, that after installation or modification of equipment would have a potential to emit any regulated air pollutant at, or greater than, any of the levels specified in Table 2 of subdivision (b) of this rule, and for which applications for permits to construct or permits to operate are deemed complete after March 31, 2000;
- (3) All "affected sources" as defined under the acid rain provisions of Title IV of the federal Clean Air Act and 40 CFR Part 70, Section 70.2;
- (4) Solid waste incineration units required to obtain a permit pursuant to Section 129(e) of the federal Clean Air Act;
- (5) All facilities subject to a standard, limitation, or other requirement of the New Source Performance Standards in 40 CFR Part 60 or National Emission Standards for Hazardous Air Pollutants in 40 CFR Part 61 or Part 63 that are specifically required by federal regulation to obtain a Title V permit; and,
- (6) All other facilities so designated by the EPA by future amendments to 40 CFR Part 70, Section 70.3.
- (7) All facilities that have obtained a District facility permit with a condition limiting facility emissions for the purpose of being exempt from Title V permit requirements pursuant to paragraph (d)(2) of this rule, and that have reported annual emissions, calculated in accordance with permit terms and conditions under normal operating conditions, equal to or greater than any of the threshold amounts specified in Table 2 of subdivision (b) of this rule.
- (8) On and after January 2, 2011, applicable requirements for greenhouse gases shall be included in Title V permits for any facility that is otherwise required, after that date, to obtain a new, renewed, or revised Title V permit pursuant to subdivision (a) of this rule.
- (9) On and after July 1, 2011, any facility with a potential to emit  $\geq 100,000$  tpy CO<sub>2e</sub>, on a CO<sub>2e</sub> basis (Global Warming Potential applied) and a

Potential to Emit GHGs > 100 tpy GHGs on a mass basis (no Global Warming Potential applied) shall apply for a Title V permit within 180 days after July 1, 2011, unless a Title V permit has already been applied for.

(d) Exemptions

- (1) Notwithstanding subdivision (b) of this rule, facilities that would be required to obtain a Title V permit solely because they are subject to one or more of the following regulations are exempt from Title V permit requirements:
  - (A) 40 CFR Part 60, subpart AAA - Standards of Performance for New Residential Wood Heaters;
  - (B) 40 CFR Part 61, subpart M - National Emission Standard for Hazardous Air Pollutants for Asbestos, Section 61.145 - Standard for Demolition and Renovation.
- (2) Facilities subject to the requirements of subdivision (a) (b) or (c) of this rule, that demonstrate to the satisfaction of the Executive Officer that the facility's potential to emit has been reduced, either through a facility modification or by accepting an enforceable condition in the District facility permit, to less than the levels for all air contaminants specified in Table 2 of subdivision (a) of this rule, and the PTE is less than 100,000 tpy CO<sub>2e</sub> GHGs, are exempt from Title V permit requirements.

(e) Phase One Exclusions

- (1) Except in the case of an affected source under the acid rain program, an applicant may request, and the Executive Officer may grant an exclusion from subdivision (a) of this rule, Phase One Title V Permits, provided that the facility can demonstrate to the satisfaction of the Executive Officer that:
  - (A) the most recent, validated, reported emissions are less than the thresholds in subdivision (a); and
  - (B) a permanent change has occurred at the facility to explain the reduction in reported emissions.
- (2) All requests for exclusion shall be in a form specified by the Executive Officer, shall include copies of reported emissions data and are subject to approval by the Executive Officer.

EXECUTIVE SUMMARY

INTRODUCTION

ATTAINMENT STATUS FOR OZONE FEDERAL AIR QUALITY  
STANDARDS

REGULATORY HISTORY

PUBLIC PROCESS

## EXECUTIVE SUMMARY

On July 10, 2019, U.S. EPA granted the South Coast Air Quality Management District's (South Coast AQMD) request to voluntarily reclassify the Coachella Valley from Severe-15 to Extreme for the 1997 8-hour Ozone National Ambient Air Quality Standard (NAAQS), with a new attainment date of June 15, 2024. Under the Clean Air Act, the reclassification requires a reduction in the Major Polluting Facility<sup>1</sup> and Major Modification thresholds for volatile organic compounds (VOC) and oxides of nitrogen (NOx) emissions as these pollutants are precursors for ozone. For the Coachella Valley, amendments are proposed to individual rules within Regulation XIII – New Source Review (NSR), Regulation XX – Regional Clean Air Incentives Market (RECLAIM), and Regulation XXX – Title V Permits (Title V) to lower the Major Polluting Facility thresholds for VOC or NOx emissions from 25 tons per year for a Severe-15 nonattainment area, to 10 tons per year for an Extreme nonattainment area. The reclassification also requires rule amendments to lower the Coachella Valley Major Modification threshold from 25 tons per year to 1 pound per day for VOC or NOx emissions. Other administrative changes are proposed to Regulations XIII, XX, and XXX to remove outdated rule provisions and to improve rule clarity. The Preliminary Draft Staff Report included proposed amendments to remove Rule 3001 Phase One applicability thresholds which are based on actual reported emissions, as new or modified stationary sources are currently subject to Rule 3001 Phase Two applicability thresholds which are based on Potential to Emit (PTE) emissions. The current proposal, however, maintains Phase One applicability thresholds to the time of rule adoption since this was the primary approach to initially identify Title V facilities and should continue to apply to those facilities. Therefore, the only programmatically meaningful amendment to Regulation XXX is an update to Rule 3001 Phase Two VOC and NOx applicability thresholds for the Coachella Valley based on the Extreme ozone nonattainment area reclassification.

Under the new lower thresholds, existing and new stationary sources in Coachella Valley with a PTE of at least 10 tons per year of either VOC or NOx emissions would be subject to the applicable permitting requirements for Major Polluting Facilities and Major Modifications at a Major Polluting Facility. Based on staff's analyses, only two existing facilities in Coachella Valley may potentially be subject to new permitting requirements. Additionally, South Coast AQMD staff is unaware of any applications for new facilities that would exceed the new Major Polluting Facility thresholds. Existing and new facilities can also take a cap on total facility VOC or NOx emissions or make concurrent facility emission reductions to avoid triggering the additional permitting requirements.

## INTRODUCTION

The Coachella Valley consists of the Riverside County portion of the Salton Sea Air Basin. The region is under the jurisdiction of the South Coast AQMD, excluding tribal lands. Communities included within the area include Palm Springs, Desert Hot Springs, Cathedral City, Rancho Mirage, Palm Desert, Indian Wells, La Quinta, Indio, Coachella, Thermal,

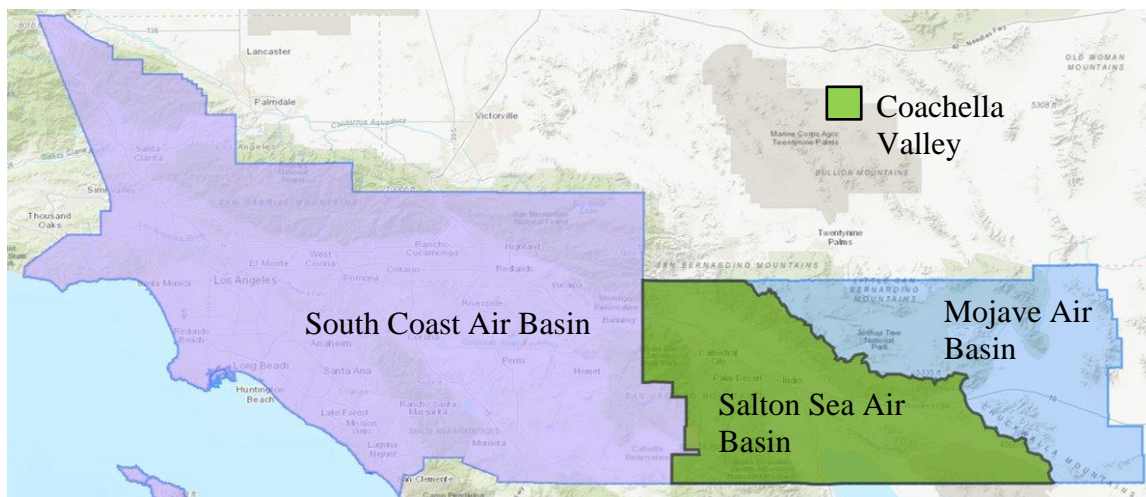

---

<sup>1</sup> For the purposes of the proposed amendments to Regulations XIII, XX, and XXX related to the Coachella Valley Extreme area ozone reclassification, the terms "Major Source", "Major Stationary Source", and "Major Polluting Facility" have the same meaning and are interchangeable.

and Mecca. The Coachella Valley is located downwind of the South Coast Air Basin (Basin), which is also under the jurisdiction of the South Coast AQMD. Figure 1 shows the boundaries of the Coachella Valley and the Basin.

The topography and climate of Southern California, coupled with a dense population and significant emission sources, make the Basin an area with the worst ozone pollution in the nation. Ozone levels in the Coachella Valley are impacted by pollutants directly transported from the Basin as well as pollutants formed secondarily through photochemical reactions from precursors emitted upwind with limited impact from local emission sources. While local emission controls benefit Coachella Valley's air quality, the area must rely on emission controls being implemented upwind to demonstrate attainment of the federal ozone standard.

**Figure 1 - Air Basins Within South Coast AQMD's Jurisdiction**

## ATTAINMENT STATUS FOR OZONE FEDERAL AIR QUALITY STANDARDS

In 1979, the U.S. EPA established primary and secondary NAAQS (or standards) for ozone at 0.12 parts per million (ppm) averaged over a 1-hour period.<sup>2</sup> On July 18, 1997, the U.S. EPA revised the primary and secondary standards for ozone to 0.08 ppm, averaged over an 8-hour period ("1997 8-hour ozone standard"). The 1997 8-hour ozone standard was lowered to 0.075 ppm in 2008, and to 0.070 ppm in 2015. The U.S. EPA classifies areas of ozone nonattainment (i.e., Extreme, Severe, Serious, Moderate, or Marginal) based on the extent to which an area exceeds the standard. The higher the current exceedance level, the more time is provided to demonstrate attainment in recognition of the more significant challenge involved. However, nonattainment areas with higher classifications are also subject to more stringent requirements.

On November 28, 2007, the South Coast AQMD requested that the U.S. EPA reclassify the Coachella Valley nonattainment area from Serious to Severe-15. This reclassification

---

<sup>2</sup> U.S. EPA revoked the 1-hour ozone standard entirely in 2005. However, U.S. EPA regulations require the continuation of certain control measures in areas that were formerly in nonattainment for the 1-hour Standard.

was granted effective June 4, 2010, and established an attainment date of June 15, 2019.<sup>3</sup> Implementation of the South Coast AQMD and the California Air Resources Board (CARB) emission control measures over the past several decades have resulted in demonstrable progress in reducing ozone levels and significant reductions in ozone precursor emissions such as NO<sub>x</sub> and VOCs. As a result, air quality in the Coachella Valley has steadily improved, as demonstrated by the ambient air quality data. However, in 2017 and 2018, the State of California experienced a series of high ozone episodes primarily driven by unexpected changes in meteorology, including warm and stagnant weather conditions.

Consequently, the ozone levels in 2017 and 2018 were higher than the previous years, and the Coachella Valley did not attain the 1997 standard by the June 2019 attainment date. NAAQS are typically described by the design value, which is used to determine the attainment status of an area. Figure 2 depicts the trend in the 8-hour ozone design value and the 1-hour ozone design value. As a result, the South Coast AQMD requested that the U.S. EPA reclassify the area from Severe-15 to Extreme ozone nonattainment.<sup>4</sup> The 8-hour ozone design value is the annual fourth-highest daily maximum 8-hour ozone concentration averaged over three years.

**Figure 2 - Coachella Valley Ozone 3-year Design Value Trends**

**Note:**

The year indicated on the x-axis represents the last year of the 3-year design value. Although the 1997 8-hour ozone standard is 0.08 ppm, the blue line is located at 0.084 ppm, which is the level needed to attain the standard due to rounding.

<sup>3</sup> 75 FR 24409 (May 5, 2010).

<sup>4</sup> 42 U.S.C. 7511(b)(3).

On July 10, 2019, U.S. EPA granted the South Coast AQMD's request to voluntarily reclassify the Coachella Valley from Severe-15 to Extreme for the 1997 8-hour ozone NAAQS with a new attainment date of June 15, 2024.<sup>5</sup> In a subsequent action, U.S. EPA approved a deadline for submittal of revised NSR and Title V regulations of February 14, 2021.<sup>6</sup>

## **REGULATORY HISTORY**

Regulation XIII – New Source Review (NSR) establishes the federal and state mandated pre-construction review program for new, modified, or relocated sources in the South Coast AQMD's jurisdiction. The NSR program is a critical component of the South Coast AQMD's attainment strategy and ensures that all new and modified sources install Best Available Control Technology (BACT), and their emission increases are fully offset with creditable emission reductions. Regulation XIII currently consists of 13 rules. Rule 1302 specifies the definitions used in Regulation XIII and is the only rule that is proposed to be amended.

Regulation XX – Regional Clean Air Incentives Market (RECLAIM) is a market incentive program that establishes NO<sub>x</sub> and SO<sub>x</sub> thresholds and includes NSR requirements for RECLAIM facilities. Facilities in the RECLAIM program that have new, modified, or relocated equipment must follow requirements set forth in Rule 2005 – RECLAIM NSR as opposed to Regulation XIII which applies to all non-RECLAIM facilities. Regulation XX currently consists of 13 rules. Rule 2000 specifies the definitions used in Regulation XX and is the only rule within Regulation XX that is proposed to be amended.

Regulation XXX – Title V Permits (Title V) complies with federal requirements to standardize air quality permits and the permitting process for Major Polluting Facilities. Per Regulation XXX, facilities above specified pollutant thresholds are subject to additional permitting requirements including public noticing, U.S. EPA approvals, and enhanced monitoring recordkeeping, and reporting. Regulation XXX includes provisions to exempt facilities with either actual emissions below specific pollutant thresholds or the permitted limits below specific pollutant thresholds from Title V permit requirements. Regulation XXX currently consists of nine rules and amendments are proposed to Rule 3001.

More information on the proposed amendments is included in Chapter 2.

## **PUBLIC PROCESS**

Development of proposed amendments to Regulations XIII, XX, and XXX was conducted through a public process. Staff presented the proposed rule amendments to the Regulation XIII Working Group on September 10, 2020. The Public Workshop was held virtually online through a webinar on September 25, 2020 to present the proposed amendments and to receive public comments.

<sup>6</sup> 85 FR 2311 (January 15, 2020)

## **CHAPTER 2: SUMMARY OF PROPOSED AMENDMED RULES**

---

INTRODUCTION

REGULATION XIII – NSR

REGULATION XX – RECLAIM

REGULATION XXX – TITLE V PERMITS

## **INTRODUCTION**

Regulations XIII, XX, and XXX currently establish Major Polluting Facility and Major Modification thresholds based on the previous classification of Coachella Valley as Severe-15 nonattainment for the 1997 8-hour ozone standard. The reclassification of the Coachella Valley as an Extreme nonattainment area requires amendments to Regulations XIII, XX, and XXX Major Polluting Facility and Major Modification thresholds. Federal NSR and Title V requirements require lower thresholds for defining a Major Polluting Facility for Extreme nonattainment areas. South Coast AQMD Regulations XIII and XX require applicants to use Best Available Control Technology (BACT) [referred to as Lowest Achievable Emission Rate (LAER) for Major Polluting Sources] for new sources, relocated sources, or modifications to existing sources that may result in an emissions increase. The South Coast AQMD has developed BACT Guidelines which include threshold definitions for Major Polluting Facilities based on the attainment or nonattainment status of each air basin. The BACT Guidelines Major Polluting Facility emission thresholds for VOC and NOx emissions will need to be updated to reflect the Coachella Valley Extreme ozone reclassification. These BACT Guideline updates will occur after adoption of proposed amendments to Regulation XIII and XX.

Table 1 presents a summary of the proposed amendments to South Coast AQMD Regulations XIII, XX, and XXX rules that are associated with the reclassification of the Coachella Valley from Severe-15 to Extreme ozone nonattainment.

## **REGULATION XIII – NEW SOURCE REVIEW (NSR)**

### **Proposed Amended Rule 1302 – Definitions**

Rule 1302 establishes the definitions for Regulation XIII. Proposed Amended Rule 1302 (PAR 1302) includes revisions to the definition of BASIN under subdivision (g), MAJOR MODIFICATION under subdivision (r), and MAJOR POLLUTING FACILITY under subdivision (s). For specific proposed amendments, please refer to PAR 1302.

### **Definition of BASIN - Subdivision (g)**

The current definition of Basin includes the South Coast Air Basin (SOCAB) or the Riverside County portion of the Salton Sea Air Basin (SSAB) and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin (MDAB), and currently only references the California Code of Regulations for the South Coast Air Basin. PAR 1302 will add references to the California Code of Regulations sections of Section 60114 of Title 17 for the Riverside County portion of the Salton Sea Air Basin and Section 60109 of Title 17 for the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin. Additionally, the acronyms SOCAB, SSAB, and MDAB are proposed to be removed as they are not used.

**Table 1 - Summary of Proposed Amendments to Regulations XIII, XX, and XXX**

Rule #	Title	Proposed Amendment
<b>Regulation XIII – NSR</b>		
<b>1302</b>	Definitions	<ul style="list-style-type: none"> <li>• Update references to California Code of Regulation sections for air basins</li> <li>• Update thresholds for Major Polluting Facility and Major Modification for VOC and NOx for Coachella Valley</li> </ul>
<b>Regulation XX – RECLAIM</b>		
<b>2000</b>	Definitions	<ul style="list-style-type: none"> <li>• Update thresholds for Major Modification for VOC and NOx for Coachella Valley</li> </ul>
<b>Regulation XXX – Title V</b>		
<b>3001</b>	Applicability	<ul style="list-style-type: none"> <li>• Clarify Phase One applicability timeframe</li> <li>• Update Potential to Emit thresholds for VOC and NOx for Coachella Valley</li> </ul>

**Definition of MAJOR MODIFICATION - Subdivision (r)**

To provide clarity, PAR 1302 will specify that subdivision (x) references the definition of modification while subdivision (s) references the definition of a Major Polluting Facility.

The reclassification of Coachella Valley to Extreme nonattainment for ozone will require that the VOC and NOx thresholds for a Major Modification at an existing Major Polluting Facility in the Coachella Valley be lowered to reflect the Extreme nonattainment standards for ozone. PAR 1302 paragraph (r)(1) will lower the threshold for a Major Modification at a Major Polluting Facility from 25 tons per year to 1 pound per day for VOC or NOx emissions for Coachella Valley.

**Definition of MAJOR POLLUTING FACILITY - Subdivision (s)**

The reclassification of Coachella Valley to Extreme nonattainment for ozone will require that the VOC and NOx thresholds for a Major Polluting Facility in the Coachella Valley be lowered to reflect the Extreme nonattainment standards for ozone. PAR 1302 subdivision (s) will lower the threshold for a Major Polluting Facility from 25 tons per year to 10 tons per year of VOC or NOx emissions for Coachella Valley.

## **REGULATION XX – REGIONAL CLEAN AIR INCENTIVES MARKET (RECLAIM)**

### **Proposed Amended Rule 2000 – General**

Rule 2000 establishes the definitions for Regulation XX. Rule 2000 presently includes a threshold definition for a Major Modification in Coachella Valley based on the previous Severe-15 ozone nonattainment classification.

### **Definition of MAJOR MODIFICATION - Paragraph (c)(44)**

The reclassification of Coachella Valley to Extreme nonattainment for ozone will require that the VOC and NO<sub>x</sub> thresholds for a Major Modification at a Major Polluting Facility for RECLAIM facilities in the Coachella Valley be lowered to reflect the Extreme nonattainment standards for ozone. Proposed Amended Rule 2000 (PAR 2000) paragraph (c)(44) will lower the threshold for a Major Modification at a Major Polluting Facility from 25 tons per year to 1 pound per day for NO<sub>x</sub> emissions. As previously mentioned, the Major Polluting Facility threshold in the Coachella Valley will be reduced from 25 to 10 tons per year for NO<sub>x</sub> emissions based on the reclassification.

## **REGULATION XXX – TITLE V PERMITS**

### **Proposed Amended Rule 3001- Applicability**

Rule 3001 establishes pollutant-specific applicability thresholds based on the attainment status for geographic areas within the South Coast AQMD. Currently, the Rule includes Phase One and Phase Two applicability thresholds. Phase One [subdivision (a) – Table 1] applicability thresholds, based on the facility's reported annual emissions, were used to begin implementation of the Title V program. Phase Two [subdivision (b) – Table 2] applicability thresholds are based on Potential to Emit (PTE) emission levels and began in the fourth year after EPA's interim approval of the Title V program. Proposed amendments to remove Phase One provisions from Rule 3001 were included in the Preliminary Draft Staff Report, because, at the time, it was believed that facilities initially brought into the Title V program under Phase One applicability thresholds would also be subject to Title V requirements under Phase Two applicability thresholds. Staff decided to maintain Phase One applicability thresholds since this was the primary approach to initially identify Title V facilities. Staff is concerned that removal of the Phase One thresholds would mean a facility that is currently subject to Title V requirements because of the Phase One applicability thresholds will no longer be subject to Title V requirements.

Accordingly, Proposed Amended Rule 3001 (PAR 3001) maintains the separate Phase One and Phase Two provisions. The proposed amendments include a clarification that Phase One provisions are applicable prior to the date of adoption of the proposed amendments (scheduled for December 4, 2020) and the Coachella Valley Phase Two applicability thresholds for VOC and NO<sub>x</sub> are proposed to be reduced based on the Extreme ozone nonattainment area reclassification. Specifically, under PAR 3001, the Coachella Valley Phase Two applicability thresholds included in Table 2 would be lowered from 25 to 10 tons per year for VOC or NO<sub>x</sub> emissions. These are the same applicability thresholds as

the South Coast Air Basin, also classified as an Extreme ozone nonattainment area. New or modified stationary sources would continue to be evaluated under Rule 3001 Phase Two applicability thresholds.

## IMPACTS OF PROPOSED RULE AMENDMENTS

### Review of Facilities Potentially Affected by Proposed Amendments

As part of the Coachella Valley reclassification request, a preliminary assessment<sup>1</sup> was conducted to identify Coachella Valley facilities with a PTE for VOC or NOx above 10 tons per year. Based on this preliminary assessment, eight Coachella Valley facilities (Facility A through H in Table 2) were identified with a PTE of at least 10 tons per year of VOC or NOx emissions and might be affected by the proposed amendments. However, three of the eight facilities (Facility A, B, and C) have a PTE of at least 25 tons per year and would not be affected by the proposed amendments to lower the threshold from 25 to 10 tons per year. A more detailed discussion of the five remaining facilities (Facilities D through H) and the impacts of the proposed amendments are described below.

**Table 2 - Summary and List of Potentially Impacted Facilities Proposed Amendments to Regulations XIII, XX, and XXX**

Facility	City	Potential Impacts from Proposed Reg. XIII Amendments	Potential Impacts from Proposed Reg. XX Amendments	Potential Impacts from Proposed Reg. XXX Amendments
A*	Coachella	No	No	No
B*#	North Palm Springs	No	No	No
C*#	North Palm Springs	No	No	No
D	Coachella	Possible	No	Possible
E	Rancho Mirage	Possible	No	Possible
F	Palm Springs	No	No	No
G	Indio	No	No	No
H	Palm Springs	No	No	No

\*Existing South Coast AQMD Title V Facility

#Existing South Coast AQMD RECLAIM Facility

### Potential Regulation XIII (NSR) Impacts to Facilities

Staff analyzed impacts from three areas where facilities could be impacted: 1) Permitting actions from changes to the Major Modification threshold; 2) Permitting actions from facilities with a PTE currently at or above 10 tons per year and below 25 tons per year; 3) Permitting actions from facilities with a PTE currently below 10 tons per year. Potential Regulation XIII impacts only occur if a facility is installing, modifying, or replacing equipment as discussed below.

<sup>1</sup> South Coast AQMD, 2019. South Coast Air Quality Management District Preliminary Draft Staff Report Request for Reclassification of Coachella Valley for the 1997 8-Hour Ozone Standard; May 2019.

### ***Impacts from Changes to the Major Modification Threshold***

The modification threshold is used to determine if a permitting action for a new, modified, or relocated source is applicable to NSR requirements under Regulation XIII and Rule 2005 – RECLAIM NSR. If a permitting action is subject to NSR, the equipment must meet Best Available Control Technology (BACT) and the emission increase must be offset. Pursuant to the South Coast AQMD’s BACT Guidelines, an increase of 1 pound per day of VOC or NOx emissions is currently used as the applicability threshold for modifications under NSR for all sources. The 1 pound per day threshold is used to ensure that there is no net increase in emissions of pollutants that are not in attainment of state air quality standards.

### ***Impacts from Facilities with a PTE Currently Between 10 and 25 tons per year***

Lowering the Regulations XIII and XX thresholds for a Major Modification from 25 tons per year to 1 pound per day for VOC or NOx emissions will have no impact on permitting projects in Coachella Valley since the current threshold for modifications is 1 pound per day. The thresholds of 25 tons per year for Severe-15 nonattainment areas and 1 pound per day for Extreme nonattainment areas are consistent with the federal definitions for Major Modifications under federal NSR. Since the federal threshold will now be consistent with the current threshold for modifications at 1 pound per day for VOC or NOx, no additional impacts are anticipated for new, modified and relocated permitting actions in Coachella Valley.

Proposed amendments to Regulation XIII would also lower the threshold for defining a Major Polluting Facility from 25 to 10 tons per year for VOC or NOx emissions for facilities in Coachella Valley. Lowering this threshold means that for a facility now defined as a Major Polluting Facility, permitting projects that trigger NSR would be subject to major source BACT. According to the South Coast AQMD’s BACT Guidelines<sup>2</sup>, Major Source BACT is generally the same as the federal Lowest Achievable Emission Rate (LAER). The primary difference between Major Source BACT and BACT for facilities that are not Major Polluting Facilities is that BACT requirements consider economic and technical feasibility.

Staff has identified two facilities in Coachella Valley that fall under the proposed definition of Major Polluting Facility and have a PTE between 10 and 25 tons per year of VOC or NOx emissions (Facilities D and E in Table 2). If these facilities have a permit action for a new, modified, or relocated source that results in an emission increase of one pound per day, the permitting action could be subject to Major Source BACT. Additionally, facilities have the option to apply for permit changes to reduce their PTE emissions below the Major Polluting Facility threshold. If the facility reduces the PTE to less than 10 tons per year, there would be no change in NSR requirements for the facility and the permitting action would be subject to BACT not Major Source BACT. It is expected that both facilities would take a permit limit to reduce their PTE as their actual emissions are much lower.

---

<sup>2</sup> South Coast AQMD, 2000. South Coast Air Quality Management District Best Available Control Technology Guidelines; February 2018.

***Impacts from Facilities with a PTE Currently Below 10 tons per year***

Any existing non-major facilities that would become a Major Polluting Facility under the updated and amended thresholds would also be subject to NSR permitting requirements for a Major Polluting Facility. Staff performed a detailed analysis of the emissions and PTE at each of the five remaining facilities in Table 2 using updated information and found that three of the five facilities would have a PTE of less than 10 tons per year of VOC or NOx (Facilities F, G, and H). Although initially considered potentially impacted, these three facilities have a PTE below the lower Major Polluting Facility threshold and would not be subject to any additional permitting requirements under the proposed amendments.

**Potential Regulation XX (RECLAIM) Impacts to Facilities**

New facilities are not being added to the RECLAIM program so the proposed amendments would only affect existing RECLAIM facilities. Existing facilities B and C in Table 2 are currently in the RECLAIM program. Staff does not foresee any impacts to facilities from this proposed rule amendment as a threshold of 1 pound per day is already being used to comply with state NSR requirements for RECLAIM facilities in Coachella Valley.

**Potential Regulation XXX (Title V) Impacts to Facilities**

Regulation XXX was adopted to comply with a federal program to standardize air quality permits and the permitting process for Major Polluting Facilities. Proposed amendments to Regulation XXX would lower the PTE applicability threshold from 25 to 10 tons per year for VOC or NOx emissions. New or existing facilities above the pollutant threshold would be subject to Title V permit requirements. A facility can lower their PTE through enforceable permit conditions below the Title V pollutant thresholds to avoid Title V permit requirements. Additionally, Rule 3001 includes provisions whereby a facility can be exempt from Title V permit requirements through either facility modifications or through enforceable permit conditions which demonstrate the facility is below Title V permit applicability thresholds.

Currently, Title V applicability thresholds are based on a facility's PTE. New or existing facilities above PAR 3001 applicability thresholds (PTE of at least 10 tons per year of VOC or NOx emissions) could be subject to Title V permitting requirements. These additional permitting requirements include a consolidation of all previously issued air permits for individual pieces of equipment into one Title V permit as well as requirements for public noticing, U.S. EPA approvals, and enhanced monitoring recordkeeping and reporting. Staff is not aware of any applications for new facilities which would exceed the proposed Title V applicability thresholds.

As previously mentioned, three of the facilities in Table 2 (Facility A, B and C) are existing Title V facilities and would not be impacted by the new lower Title V applicability thresholds. Staff performed a detailed analysis of the emissions and PTE at each of the remaining five facilities identified in Table 2 using updated information and found that three of the five facilities would have a PTE of less than 10 tons per year of VOC or NOx and would not be impacted by amended Title V requirements while two of the five facilities (Facility D and E) would have a PTE between 10 and 25 tons per year for VOC or NOx. The actual reported emissions at these two facilities are lower than their PTE. Facilities

with low actual emissions have the ability under Rule 3008 provisions to be exempted from Title V permitting requirements. Additionally, facilities can also be exempted from Title V permits through either facility modifications or enforceable permit conditions to reduce their PTE below the thresholds. One of these facilities previously had a PTE exceeding the previous threshold and modified their permit to keep their PTE below the threshold. Both of these facilities have initiated discussions with staff to work on reducing their facility PTE below the thresholds for a Major Polluting Facility.

### **CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the proposed amendments to Regulations XIII, XX, and XXX are exempt from CEQA pursuant to CEQA Guidelines Sections 15061(b)(3) and 15308. Further, there is no substantial evidence indicating that any of the exceptions in CEQA Guidelines Section 15300.2 apply to the proposed project. A Notice of Exemption will be prepared pursuant to CEQA Guidelines Section 15062. If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research for posting on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notice/ceqa-notice/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **SOCIOECONOMIC ASSESSMENT**

No socioeconomic impact will result from the reclassification of Coachella Valley for the 1997 8-hour ozone NAAQS, and no socioeconomic assessment is required under Health and Safety Code Section 40440.8(a).

### **DRAFT FINDINGS UNDER CALIFORNIA HEALTH AND SAFETY CODE SECTION 40727**

#### **Requirements to Make Findings**

California Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the staff report.

#### **Necessity**

Amendments to Regulations XIII, XX and XXX are needed to meet federal CAA requirements because of the Coachella Valley's reclassification from a Severe-15 to an Extreme ozone nonattainment area for the 1997 8 Hour Ozone standards and to remove outdated rule provisions, correct rule references, and improve rule clarity.

### **Authority**

The South Coast AQMD Governing Board has authority to amend Regulations XIII, XX, and XXX pursuant to the California Health and Safety Code Sections 39002, 40000, 40001, 40440, 40441, 40702 and 41508.

### **Clarity**

Proposed amended Regulations XIII, XX, and XXX are written and displayed so that the meaning can be easily understood by persons directly affected by them.

### **Consistency**

Proposed amended Regulations XIII, XX, and XXX are in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, federal or state regulations.

### **Non-Duplication**

Proposed amended Regulations XIII, XX, and XXX will not impose the same requirements as or in conflict with any existing state or federal regulations. The proposed amendments are necessary and proper to execute the powers and duties granted to, and imposed upon, the South Coast AQMD.

### **Reference**

In adopting these amended regulations, the South Coast AQMD Governing Board references the following statutes which the South Coast AQMD hereby implements, interprets or makes specific: California Health and Safety Code sections 40001, 40440, and 40702, 42300 et seq., and Clean Air Act sections 172, 173, 182(e), (Extreme ozone areas) and 502 et. seq. (Title V requirements).

## **COMPARATIVE ANALYSIS**

Under California Health and Safety Code Section 40727.2, the South Coast AQMD is required to perform a comparative written analysis when adopting, amending, or repealing a rule or regulation. The comparative analysis is intended to identify all existing federal air pollution control requirements that apply to the same equipment or source type as the proposed rules. The analysis is also to identify any of an air district's existing or proposed rules and regulations that apply to the same equipment or source type, and all air pollution control requirements and guidelines that apply to the same equipment or source type.

The federal CAA establishes emission-based thresholds to define a major polluting source and major modifications based on the attainment status for individual areas. The Coachella Valley was reclassified as an Extreme nonattainment area for the 1997 8 Hour Ozone standard in 2019. Amendments to Regulations XIII, XX, and XXX to lower the Major Polluting Facility (i.e., Major Source) and Major Modification thresholds are required based on the reclassification of the Coachella Valley as an Extreme ozone nonattainment area. Proposed Amended Regulations XIII, XX, and XXX are directly implementing federal CAA requirements for Extreme ozone nonattainment areas. The proposed amendments to Regulations XIII, XX, and XXX do not conflict or overlap with existing federal requirements. Reducing the Major Modification threshold to 1 pound per day is the

same as the current state threshold of 1 pound per day to ensure no net increase of any nonattainment pollutant or its precursor. There are no state or local air district programs that conflict or overlap with the proposed amendments.

## ATTACHMENT H

# South Coast Air Quality Management District

21865 Copley Drive, Diamond Bar, CA 91765-4178

(909) 396-2000 • [www.aqmd.gov](http://www.aqmd.gov)

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: PROPOSED AMENDED REGULATION XIII – NEW SOURCE REVIEW, REGULATION XX – REGIONAL CLEAN AIR INCENTIVES MARKET, AND REGULATION XXX – TITLE V PERMITS**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

**To:** Governor's Office of Planning and Research -  
State Clearinghouse  
1400 Tenth St, Suite 222  
Sacramento, CA 95814-5502

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

**Project Title:** Proposed Amended Regulation XIII – New Source Review, Regulation XX – Regional Clean Air Incentives Market, and Regulation XXX – Title V Permits

**Project Location:** The proposed project is located in the Coachella Valley portion, excluding tribal lands, of the South Coast Air Quality Management District (South Coast AQMD) jurisdiction. The Coachella Valley consists of the Riverside County portion of the Salton Sea Air Basin.

**Description of Nature, Purpose, and Beneficiaries of Project:** Due to the reclassification of the Coachella Valley from Severe to Extreme nonattainment for the 1997 8-hour ozone standard, South Coast AQMD is required to amend rules within Regulation XIII, Regulation XX and Regulation XXX to reflect the Coachella Valley's new attainment status. The proposed amendments to Regulations XIII, XX, and XXX would lower the major source thresholds for volatile organic compound (VOC) and nitrogen oxides (NOx), which are ozone precursors, in the Coachella Valley from 25 tons per year to 10 tons per year and lower the major modification thresholds for VOC and NOx in the Coachella Valley from 25 tons per year to one pound per day. This would make the thresholds in the Coachella Valley and consistent with the South Coast Air Basin. Additional amendments are proposed to correct rule references and improve rule clarity such as adding California Code of Regulation references for the definitions of the Riverside County portion of the Salton Sea Air Basin and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin.

**Public Agency Approving Project:**  
South Coast Air Quality Management District

**Agency Carrying Out Project:**  
South Coast Air Quality Management District

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

**Reasons why project is exempt:** South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Lowering the major source threshold would only affect two facilities. Since these facilities' actual emissions are much lower than the thresholds, they are anticipated to reduce their permit limits to stay below the thresholds and no physical facility modifications are necessary. Currently, state regulations require the use of a one pound per day threshold for major modification, therefore, lowering the federal major modification threshold to that same level would not have any impacts on facilities. Since the proposed project would not cause any physical changes that would adversely affect any environmental topic area, it can be seen with certainty that there is no possibility that the proposed project may have a significant adverse effect on the environment. Therefore, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. The proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project establishes more stringent emission thresholds for facilities located in the Coachella Valley. Further, there is no substantial evidence indicating that any of the exceptions to the categorical exemption pursuant to CEQA Guidelines Section 15300.2 apply to the proposed project.

**Date When Project Will Be Considered for Approval (subject to change):**

Planning, Rule Development, and Area Sources

# Proposed Rule Amendments for Coachella Valley:

## Regulation XIII – New Source Review

## Regulation XX – RECLAIM

## Regulation XXX – Title V Permits

Board Meeting

December 4, 2020

# Background – Coachella Valley 8-hour Ozone (1997) Nonattainment Reclassification

- Coachella Valley was previously classified as a Severe-15 nonattainment area for the 1997 8-hour ozone NAAQS with an attainment date of June 15, 2019
- Despite improvements in ozone air quality, higher ozone levels were experienced 2017 and 2018, primarily due to warm and stagnant weather conditions
- In 2019, U.S. EPA granted the South Coast AQMD's request to voluntarily reclassify the Coachella Valley from Severe-15 to Extreme for the 1997 8-hour ozone NAAQS
- Coachella Valley is anticipated to attain the standard earlier than the attainment deadline of June 15, 2024

# Regulatory Changes Needed

- Reclassification of Coachella Valley requires amendments to:
  - Regulation XIII - NSR
  - Regulation XX - RECLAIM
  - Regulation XXX - Title V Permits
- Amendments will lower VOC and NOx<sup>1</sup> thresholds for defining a Major Polluting Facility and a Major Modification<sup>2</sup> for Coachella Valley

Threshold	Pollutants	Current Threshold	Proposed Threshold
Major Polluting Facility	VOC or NOx	≥ 25 tons per year	≥10 tons per year
Major Modification	VOC or NOx	≥ 25 tons per year	≥1 pound per day

<sup>1</sup> VOC and NOx are ozone precursors

<sup>2</sup> Consistent with federal major source and modification definitions for “Extreme” ozone nonattainment areas

# Proposed Amendments to Regulations XIII, XX, and XXX

- Reducing the Major Polluting Facility thresholds will affect the applicability requirements for New Source Review, RECLAIM New Source Review, and Title V facilities
- Reducing the Major Modification thresholds will change the federal thresholds under New Source Review for non-RECLAIM and RECLAIM (NO<sub>x</sub> only) facilities
- A facility that is above the Major Polluting Facility and Major Modification thresholds for VOC or NO<sub>x</sub> will be subject to certain federal permitting requirements

# Potential Impacts to Facilities in Coachella Valley

- Two facilities in Coachella Valley were identified that have permitted levels above 10 tons per year of VOC or NOx emissions
  - Actual emissions at both facilities are well below their permitted levels
  - Both facilities have initiated discussions with staff to lower their permitted levels to below proposed Major Polluting Facility threshold of 10 tons per year
- Lowering the federal Major Modification thresholds will not impact facilities in Coachella Valley since a 1 pound per day threshold is currently used for all new and modified sources, consistent with state law

# Recommendations

- Adopt Resolution:
  - Determining that the proposed amendments to Regulation XIII - New Source Review, Regulation XX - Regional Clean Air Incentives Market, and Regulation XXX - Title V Permits Are Exempt from the Requirements of CEQA
  - Amending Regulations XIII, XX, and XXX

BOARD MEETING DATE: December 4, 2020

AGENDA NO. 33

**PROPOSAL:** Determine that Proposed Amendments to Rule 1146 - Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters are Exempt from CEQA; and Amend Rule 1146

**SYNOPSIS:** Rule 1146 establishes an ammonia slip limit for new and modified pollution control equipment with ammonia emissions, such as Selective Catalytic Reduction (SCR). Proposed Amended Rule 1146 will remove the ammonia slip limit, which is currently addressed under Regulation XIII - New Source Review.

**COMMITTEE:** Stationary Source, October 16, 2020, Reviewed

**RECOMMENDED ACTIONS:**

Adopt the attached Resolution:

1. Determining that proposed amendments to Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters are exempt from the requirements of the California Environmental Quality Act; and
2. Amending Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional and Commercial Boilers, Steam Generators, and Process Heaters

Wayne Nastri  
Executive Officer

PF:SN:MK:HF:ZB

---

**Background**

Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters was adopted on September 9, 1988 to reduce NOx emissions from boilers, steam generators, and process heaters with heat input capacity equal to or greater than 5 million Btu per hour used in industrial, institutional, and commercial operations. Rule 1146 was amended on December 7, 2018 to update the NOx emission limits to reflect BARCT and to expand the applicability to facilities with units in or formerly in the RECLAIM program. The December 7, 2018 amendments updated the NOx emission limits to reflect BARCT and included a concentration limit for ammonia for new and modified air pollution control equipment with ammonia emissions in the exhaust.

**Proposed Amendment**

Proposed Amended Rule 1146 (PAR 1146) removes the ammonia concentration limit of 5 ppm for new and modified pollution controls with ammonia emissions in the exhaust to prevent conflicts with implementing Regulation XIII - New Source Review.

Currently, if pollution control equipment, such as selective catalytic reduction (SCR), is installed to meet a BARCT NO<sub>x</sub> limit and the SCR results in increased ammonia emissions of one pound per day or more, Rule 1303 - Requirements requires BACT for the ammonia emissions. Under New Source Review, for SCR installations the BACT ammonia emission limit is 5 ppm, the same ammonia emission limit in Rule 1146. Staff believes it is more appropriate to address the ammonia emission limit for new and modified pollution controls, such as SCR, through Regulation XIII during the permitting process, rather than in Rule 1146. This allows permit engineers to evaluate the ammonia limit for new and modified SCRs on a case-by-case basis to ensure that the NO<sub>x</sub> limit in Rule 1146 can be achieved.

PAR 1146 retains the compliance demonstration requirements under paragraph (d)(3) for new, replaced, or modified air pollution control equipment with ammonia emissions in the exhaust. Since the ammonia limits in PAR 1146 are removed, the compliance demonstration under paragraph (d)(3) are required when the owner or operator installs, replaces, or modifies air pollution control equipment with ammonia emissions in the exhaust that is subject to an ammonia emission limit in a South Coast AQMD permit. The compliance demonstration requirements include quarterly source tests for the first year of operation and annual source tests requirements thereafter or utilizing an ammonia Continuous Emissions Monitoring System (CEMS) certified under an approved South Coast AQMD protocol.

**Public Process**

PAR 1146 was presented to the RECLAIM Working Group and a separate Public Workshop was held on October 8, 2020.

**Public Comments**

Staff received two comments at the Public Workshop regarding the current implementation dates of Rule 1146 and if there would be an increase in ammonia emissions. There are no proposed changes to the implementation dates for Rule 1146 and there are no expected increases in ammonia emissions since the ammonia limit in Rule 1146 and BACT are the same.

**Key Issues**

Staff is not aware of any key issues.

**California Environmental Quality Act**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15002(k) and 15061, the proposed project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3). A Notice of Exemption has been prepared pursuant to CEQA Guidelines Section 15062, and is included as Attachment F to this Board Letter.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal, which may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/publicnotices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

### **Socioeconomic Impact Assessment**

The proposed amendment is exempt from the requirement to prepare a socioeconomic assessment because the proposed amendment will not have a significant effect on emissions limitations or air quality, which are required to trigger Health & Safety Code § 40440.8.

### **Comparative Analysis**

Health and Safety Code Section 40727.2(g) is not applicable because the proposed amended rule does not impose a new or more stringent emissions limit or standard, or other air pollution control monitoring, reporting, or recordkeeping requirements. As a result, a comparative analysis is not required.

### **AQMP and Legal Mandates**

Health and Safety Code Section 40460(a) requires the South Coast AQMD to adopt an AQMP to meet state and federal ambient air quality standards in the South Coast Air Basin. In addition, the Health and Safety Code requires the South Coast AQMD to adopt rules and regulations that carry out the objectives of the AQMP. Rule 1146 is part of a control measure (CMB-05) in the 2016 AQMP which will reduce NO<sub>x</sub> emissions and facilitate the transition of the NO<sub>x</sub> RECLAIM program to a command-and-control regulatory structure, but the ammonia limit was not addressed by a control measure.

### **Resource Impacts**

Existing staff resources are adequate to implement the proposed amendments.

RESOLUTION NO. 20-\_\_\_\_\_

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that Proposed Amended Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board amending Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters.**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that Proposed Amended Rule 1146 is considered a “project” as defined by CEQA; and

**WHEREAS**, the South Coast AQMD has had its regulatory program certified pursuant to Public Resources Code Section 21080.5 and CEQA Guidelines Section 15251(l), and has conducted a CEQA review and analysis of Proposed Amended Rule 1146 pursuant to such program (South Coast AQMD Rule 110); and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that Proposed Amended Rule 1146 is exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that, because the proposed project relies on the continued implementation of the existing ammonia emission limits in Regulation XIII – New Source Review during the permitting process as part of implementing equipment-specific Best Available Control Technology (BACT) requirements and removing the identical ammonia concentration limit requirement in Rule 1146 would alleviate any potential conflicts with implementing Regulation XIII; it can be seen with certainty that there is no possibility that Proposed Amended Rule 1146 may have any significant effects on the environment, and is therefore, exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD staff has prepared a Notice of Exemption for Proposed Amended Rule 1146 that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, Proposed Amended Rule 1146 and the December 4, 2020 South Coast AQMD Governing Board letter, including the Notice of Exemption and other supporting documentation, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, as well as has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines, taking into consideration the factors in Section (d)(4)(D) of the Governing Board Procedures (codified as Section 30.5(4)(D)(i) of the Administrative Code), that there were no modifications to Proposed Amended Rule 1146 since the Notice of Public Hearing was published that are so substantial as to significantly affect the meaning of the proposed amended rule within the meaning of Health and Safety Code Section 40726 because: (a) the changes do not impact emission reductions, (b) the changes do not affect the number or type of sources regulated by the rule, (c) the changes are consistent with the information contained in the notice of public hearing, and (d) the consideration of the range of CEQA alternatives is not applicable because the proposed project is exempt from CEQA; and

**WHEREAS**, Proposed Amended Rule 1146 will be submitted for inclusion into the State Implementation Plan; and

**WHEREAS**, Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the Board Letter (that serves as the Staff Report); and

**WHEREAS**, the South Coast AQMD Governing Board has determined that a need exists to amend Rule 1146 to remove the ammonia concentration limit for new and modified pollution controls to prevent conflicts with implementing Regulation XIII - New Source Review; and

**WHEREAS**, the South Coast AQMD Governing Board obtains its authority to adopt, amend, or repeal rules and regulations from Sections 39002, 40000, 40001, 40440, 40702, 40725 through 40728, 41508, and 41700 of the Health and Safety Code; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Rule 1146, as proposed to be amended, is written and displayed so that its meaning can be easily understood by persons directly affected by it; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Rule 1146, as proposed to be amended, is in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that Rule 1146, as proposed to be amended, does not impose the same requirements as any existing state or federal regulations, and the proposed amended rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the South Coast AQMD; and

**WHEREAS**, the South Coast AQMD Governing Board, in amending the regulation, references the following statute which the South Coast AQMD hereby implements, interprets or makes specific: Health and Safety Code Section 40440 (c) (adoption of rules and regulations to assure efficiency of administrative practice); and

**WHEREAS**, the South Coast AQMD Governing Board has determined that a Socioeconomic Impact Assessment is not required, pursuant to Health and Safety Code Section 40440.8 or 40728.5, because Proposed Amended Rule 1146 will not have a significant impact on air quality or emissions limitations; and

**WHEREAS**, the South Coast AQMD staff conducted a Public Workshop regarding Proposed Amended Rule 1146 on October 8, 2020; and

**WHEREAS**, the public hearing has been properly noticed in accordance with all provisions of Health and Safety Code Section 40725; and

**WHEREAS**, the South Coast AQMD Governing Board has held a public hearing in accordance with all provisions of law; and

**WHEREAS**, the South Coast AQMD specifies that the Planning and Rules Manager of Rule 1146 is the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of the proposed amendments is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that Proposed Amended Rule 1146 is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. This information has been presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on Proposed Amended Rule 1146; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby adopt, pursuant to the authority granted by law, Proposed Amended Rule 1146 as set forth in the attached, and incorporated herein by this reference.

**BE IT FURTHER RESOLVED**, that the Executive Officer is hereby directed to forward a copy of this Resolution and Proposed Amended Rule 1146 to the California Air Resources Board for approval and subsequent submittal to the U.S. Environmental Protection Agency for inclusion into the State Implementation Plan.

# South Coast Air Quality Management District

21865 Copley Drive, Diamond Bar, CA 91765-4178  
(909) 396-2000 • [www.aqmd.gov](http://www.aqmd.gov)

**SUBJECT: NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT**

**PROJECT TITLE: PROPOSED AMENDED RULE 1146 – EMISSIONS OF OXIDES OF NITROGEN FROM INDUSTRIAL, INSTITUTIONAL, AND COMMERCIAL BOILERS, STEAM GENERATORS, AND PROCESS HEATERS**

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, the South Coast Air Quality Management District (South Coast AQMD), as Lead Agency, has prepared a Notice of Exemption pursuant to CEQA Guidelines Section 15062 – Notice of Exemption for the project identified above.

If the proposed project is approved, the Notice of Exemption will be electronically filed with the State Clearinghouse of the Governor's Office of Planning and Research to be posted on their CEQAnet Web Portal which, upon posting, may be accessed via the following weblink: <https://ceqanet.opr.ca.gov/search/recent>. In addition, the Notice of Exemption will be electronically posted on the South Coast AQMD's webpage which can be accessed via the following weblink: <http://www.aqmd.gov/nav/about/public-notices/ceqa-notices/notices-of-exemption/noe---year-2020>. The electronic filing and posting of the Notice of Exemption is being implemented in accordance with Governor Newsom's Executive Orders N-54-20 and N-80-20 issued on April 22, 2020 and September 23, 2020, respectively, for the State of Emergency in California as a result of the threat of COVID-19.

**NOTICE OF EXEMPTION FROM THE  
CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)**

---

<b>To:</b> Governor's Office of Planning and Research - State Clearinghouse 1400 Tenth St, Suite 222 Sacramento, CA 95814-5502	<b>From:</b> South Coast Air Quality Management District 21865 Copley Drive Diamond Bar, CA 91765
---	--

---

**Project Title:** Proposed Amended Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters

---

**Project Location:** The project is located within the South Coast Air Quality Management District's (South Coast AQMD) jurisdiction, which includes the four-county South Coast Air Basin (all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties), and the Riverside County portion of the Salton Sea Air Basin and the non-Palo Verde, Riverside County portion of the Mojave Desert Air Basin.

---

**Description of Nature, Purpose, and Beneficiaries of Project:** To prevent conflicts with applying the existing ammonia emission limits in Regulation XIII – New Source Review during the permitting process, amendments to Rule 1146 are proposed that would remove the ammonia concentration limit of five parts per million (ppm). Based on a review of recently approved permits, an ammonia concentration limit of five ppm has been imposed as Best Available Control Technology (BACT); therefore, removal of the five ppm limit from Rule 1146 is not expected to cause any significant adverse impacts.

---

<b>Public Agency Approving Project:</b> South Coast Air Quality Management District	<b>Agency Carrying Out Project:</b> South Coast Air Quality Management District
--	--

---

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

---

**Reasons why project is exempt:** South Coast AQMD, as Lead Agency, has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Since the proposed project relies on the continued implementation of the existing ammonia emission limits in Regulation XIII during the permitting process as part of implementing equipment-specific BACT requirements and removing the ammonia concentration limit in Rule 1146 would alleviate any potential conflicts with implementing Regulation XIII, it can be seen with certainty that there is no possibility that the proposed project may have a significant adverse effect on the environment. Therefore, the project is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption.

---

**Date When Project Will Be Considered for Approval (subject to change):**

South Coast AQMD Governing Board Public Hearing: December 4, 2020

(Adopted September 9, 1988)(Amended January 6, 1989)(Amended May 13, 1994)  
(Amended June 16, 2000)(Amended November 17, 2000)(Amended September 5, 2008)  
(Amended November 1, 2013)(Amended December 7, 2018)  
(Proposed Amended Rule 1146 December 4, 2020)

**PROPOSED AMENDED RULE 1146. EMISSIONS OF OXIDES OF  
NITROGEN FROM INDUSTRIAL,  
INSTITUTIONAL, AND COMMERCIAL  
BOILERS, STEAM GENERATORS,  
AND PROCESS HEATERS**

(a) Applicability

This rule applies to boilers, steam generators, and process heaters of equal to or greater than 5 million Btu per hour rated heat input capacity used in all industrial, institutional, and commercial operations.

(b) Definitions

- (1) ADSORPTION CHILLER UNIT means any natural gas fired unit that captures and uses waste heat to provide cold water for air conditioning and other process requirements.
- (2) ANNUAL HEAT INPUT means the total heat input to a unit during a calendar year.
- (3) ATMOSPHERIC UNIT means any natural gas fired unit with a heat input less than or equal to 10 million Btu per hour with a non-sealed combustion chamber in which natural draft is used to exhaust combustion gases.
- (4) BOILER or STEAM GENERATOR means any combustion equipment fired with liquid and/or gaseous (including landfill and digester gas) and/or solid fossil fuel and used to produce steam or to heat water, and that is not used exclusively to produce electricity for sale. Boiler or Steam Generator does not include any open heated tank, adsorption chiller unit, or waste heat recovery boiler that is used to recover sensible heat from the exhaust of a combustion turbine or any unfired waste heat recovery boiler that is used to recover sensible heat from the exhaust of any combustion equipment.
- (5) BTU means British thermal unit(s).
- (6) COMMERCIAL OPERATION means any office building, lodging place, or similar location designed for tenancy by one or more business entities or residential occupants.
- (7) FIRE-TUBE BOILER means any boiler that passes hot gases from a fire box through one or more tubes running through a sealed container of water. The

heat of the gases is transferred through the walls of the tubes by thermal conduction, heating the water and ultimately creating steam.

- (8) FORMER RECLAIM FACILITY means a facility, or any of its successors, that was in the Regional Clean Air Incentives Market as of January 5, 2018, as established in Regulation XX – Regional Clean Air Incentives Market (RECLAIM), that has received a final determination notification, and is no longer in the RECLAIM program.
- (9) GROUP I UNIT means any unit burning natural gas with a rated heat input capacity greater than or equal to 75 million Btu per hour, excluding thermal fluid heaters and units operated at schools and universities.
- (10) GROUP II UNIT means any unit burning gaseous fuels, excluding digester and landfill gases, with a rated heat input capacity less than 75 million Btu per hour down to and including 20 million Btu per hour, excluding thermal fluid heaters and units operated at schools and universities.
- (11) GROUP III UNIT means any unit burning gaseous fuels, excluding digester and landfill gases, with a rated heat input capacity less than 20 million Btu per hour down to and including 5 million Btu per hour, and all units operated at schools and universities greater than or equal to 5 million Btu per hour, excluding atmospheric units and thermal fluid heaters.
- (12) HEALTH FACILITY has the same meaning as defined in Section 1250 of the California Health and Safety Code.
- (13) HEAT INPUT means the chemical heat released due to assumed complete combustion of fuel in a unit, using the higher heating value of the fuel. This does not include the sensible heat of incoming combustion air.
- (14) INDUSTRIAL OPERATION means any entity engaged in the production and/or provision of chemicals, foods, textiles, fabricated metal products, real estate, personal services or other kindred or allied products or services.
- (15) INSTITUTIONAL OPERATION means any public or private establishment constituted to provide medical, educational, governmental, or other similar services to promote safety, order, and welfare.
- (16) MODIFICATION means any physical change that meets the criteria set forth in Rule 1302 – Definitions.
- (17) MUNICIPAL SANITATION SERVICES means basic sanitation services provided to the residents of a municipality by sewage treatment plants and municipal solid waste landfills.

- (18) NON-RECLAIM FACILITY means a facility, or any of its successors, that was not in the Regional Clean Air Incentives Market as of January 5, 2018, as established in Regulation XX.
- (19) NO<sub>x</sub> EMISSIONS means the sum of nitric oxides and nitrogen dioxides emitted, calculated as nitrogen dioxide.
- (20) OPEN HEATED TANK means a non-pressurized self-heated tank that may include a cover or doors that can be opened or detached to put in or remove parts, components or other material for processing in the tank. Tanks heated solely by an electric heater, boiler, thermal fluid heater or heat recovered from another process using heat exchangers are excluded from this definition.
- (21) PROCESS HEATER means any combustion equipment fired with liquid and/or gaseous (including landfill and digester gas) and/or solid fossil fuel and which transfers heat from combustion gases to water or process streams. Process Heater does not include any kiln or oven used for drying, curing, baking, cooking, calcining, or vitrifying; or any unfired waste heat recovery heater that is used to recover sensible heat from the exhaust of any combustion equipment.
- (22) RATED HEAT INPUT CAPACITY means the heat input capacity as specified by the permit issued by the Executive Officer, or if not specified on the permit, as specified on the nameplate of the combustion unit. If the combustion unit has been altered or modified such that its maximum heat input is different than the heat input capacity specified on the nameplate, the new maximum heat input shall be considered as the rated heat input capacity.
- (23) RECLAIM FACILITY means a facility, or any of its successors, that was in the Regional Clean Air Incentives Market as of January 5, 2018, as established in Regulation XX.
- (24) SCHOOL means any public or private school, including juvenile detention facilities with classrooms, used for purposes of the education of more than 12 children at the school, including in kindergarten and grades 1 to 12, inclusive, but does not include any private school in which education is primarily conducted in private homes. The term includes any building or structure, playground, athletic field, or other area of school property, but does not include unimproved school property.
- (25) THERM means 100,000 Btu.

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

- (26) THERMAL FLUID HEATER means a natural gas fired process heater in which a process stream is heated indirectly by a heated fluid other than water.
- (27) UNIT means any boiler, steam generator, or process heater as defined in paragraph (b)(4) or (b)(21) of this subdivision.

(c) Requirements

Notwithstanding the exemptions contained in Rule 2001 – Applicability, Table 1 – Rules Not Applicable to RECLAIM Facilities for Requirements Pertaining to NOx Emissions If Rule Was Adopted or Amended Prior to October 5, 2018, the owner or operator of any unit(s) subject to this rule shall not operate the unit in a manner that exceeds the applicable emission limits specified in paragraphs (c)(1), (c)(2), and (c)(3), and ~~(c)(4)~~ shall comply with the applicable requirements in paragraphs (c)(4) to (c)(10).

- (1) The owner or operator shall subject all of the units within the facility to comply with the applicable NOx emission limits specified in Table 1146-1:

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

**Table 1146-1 – NO<sub>x</sub> Emission Limits and Compliance Schedule**

<b>Rule Reference</b>	<b>Category</b>	<b>Limit<sup>1</sup></b>	<b>Compliance Schedule for Non-RECLAIM Facilities</b>	<b>Compliance Schedule for RECLAIM and Former RECLAIM Facilities</b>
(c)(1)(A)	All Units Fired on Gaseous Fuels	30 ppm or for natural gas fired units 0.036 lbs/10 <sup>6</sup> Btu	September 5, 2008	See Rule 1100 – Implementation Schedule for NO <sub>x</sub> Facilities
(c)(1)(B)	Any Units Fired on Non-gaseous Fuels	40 ppm	September 5, 2008	
(c)(1)(C)	Any Units Fired on Landfill Gas	25 ppm	January 1, 2015	
(c)(1)(D)	Any Units Fired on Digester Gas	15 ppm	January 1, 2015	
(c)(1)(E)	Atmospheric Units	12 ppm or 0.015 lbs/10 <sup>6</sup> Btu	January 1, 2014	
(c)(1)(F)	Group I Units	5 ppm or 0.0062 lbs/10 <sup>6</sup> Btu	January 1, 2013	
(c)(1)(G)	Group II Units (Fire-tube boilers with a previous NO <sub>x</sub> limit less than or equal to 9 ppm and greater than 5 ppm prior to December 7, 2018)	7 ppm or 0.0085 lbs/10 <sup>6</sup> Btu	See (c)(76)(A)	
(c)(1)(H)	Group II Units (All others with a previous NO <sub>x</sub> limit less than or equal to 12 ppm and greater than 5 ppm prior to December 7, 2018)	9 ppm or 0.011 lbs/10 <sup>6</sup> Btu	January 1, 2014	
(c)(1)(I)	Group II Units (All others)	5 ppm or 0.0062 lbs/10 <sup>6</sup> Btu	December 7, 2018	
(c)(1)(J)	Group III Units (Fire-tube boilers, excluding units with a previous NO <sub>x</sub> limit less than or equal to 12 ppm and greater than 9 ppm prior to December 7, 2018)	7 ppm or 0.0085 lbs/10 <sup>6</sup> Btu	December 7, 2018 or See (c)(76)(B) for units with a previous NO <sub>x</sub> limit less than or equal to 9 ppm prior to December 7, 2018	
(c)(1)(K)	Group III Units (All others)	9 ppm or 0.011 lbs/10 <sup>6</sup> Btu	January 1, 2015 or See (c)(87) for units with a previous NO <sub>x</sub> limit less than or equal to 12 ppm prior to September 5, 2008	
(c)(1)(L)	Thermal Fluid Heaters	12 ppm or 0.015 lbs/10 <sup>6</sup> Btu	December 7, 2018 or See (c)(76)(C) for units with a previous NO <sub>x</sub> limit less than or equal to 20 ppm prior to December 7, 2018 or See (e)(2) for units with a previous NO <sub>x</sub> limit greater than 20 ppm prior to December 7, 2018	

<sup>1</sup>All parts per million (ppm) emission limits are referenced at 3 percent volume stack gas oxygen (O<sub>2</sub>) on a dry basis averaged over a period of 15 consecutive minutes or pounds per million Btu (lbs/10<sup>6</sup> Btu).

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

- (2) ~~The owner or operator of any unit(s) operating with air pollution control equipment that results in ammonia emissions in the exhaust shall not discharge into the atmosphere ammonia emissions in excess of 5 ppm (referenced at 3 percent volume stack gas oxygen on a dry basis averaged over a period of 60 consecutive minutes), except for units complying with paragraph (c)(9).~~
- (32) For dual fuel co-fired combustion units a weighted average emission limit calculated by Equation 1146-1 may be used in lieu of the emission limits of Table 1146-1 provided a totalizing fuel flow meter is installed pursuant to paragraph (c)(408), for units burning a combination of both fuels.

$$\text{Weighted Limit} = \frac{(\text{CL}_A \times \text{Q}_A) + (\text{CL}_B \times \text{Q}_B)}{\text{Q}_A + \text{Q}_B} \quad \text{Equation 1146-1}$$

**Where:**

$\text{CL}_A$  = compliance limit for fuel A

$\text{CL}_B$  = compliance limit for fuel B

$\text{Q}_A$  = heat input from fuel A

$\text{Q}_B$  = heat input from fuel B

- (43) The owner or operator of any unit(s) with a rated heat input capacity greater than or equal to 5 million Btu per hour shall not discharge into the atmosphere carbon monoxide (CO) emissions in excess of 400 ppm (referenced at three3 percent volume stack gas oxygen on a dry basis averaged over a period of 15 consecutive minutes) or for natural gas fired units 0.30 lbs/10<sup>6</sup> Btu.
- (54) In lieu of complying with the applicable emission limits specified in paragraphs (c)(1), (c)(2), (c)(3), ~~(c)(4)~~, (e)(1), and (e)(2), the owner or operator of any unit(s) in operation prior to September 5, 2008 at non-RECLAIM facilities, or in operation prior to December 7, 2019 at RECLAIM or former RECLAIM facilities with an annual heat input less than or equal to 9.0 x 10<sup>9</sup> Btu (90,000 therms) per year, shall:
- (A) ~~o~~Operate the unit(s) in a manner that maintains stack gas oxygen concentrations at less than or equal to three3 percent on a dry basis for any 15-consecutive-minute averaging period; or

- (B) ~~†~~Tune the unit(s) at least twice per year, (at intervals from ~~4~~four to ~~8~~eight months apart) in accordance with the procedure described in Attachment 1 or the unit manufacturer's specified tune-up procedure. If a different tune-up procedure from that described in Attachment 1 is used, then a copy of this procedure shall be kept on site. The owner or operator of any unit(s) selecting the tune-up option shall maintain records for a rolling ~~twenty-four~~24-month period verifying that the required tune-ups have been performed. If the unit does not operate throughout a continuous six-month period within a ~~twelve~~12-month period, only one tune-up is required for the ~~twelve~~12-month period that includes the entire period of non-operation. For this case, the tune-up shall be conducted within ~~thirty~~(30) days of start-up. No tune-up is required during a rolling ~~twelve~~12-month period for any unit that is not operated during that rolling ~~twelve~~12-month period; this unit may be test fired to verify availability of the unit for its intended use but once the test firing is completed the unit shall be shutdown. Records of test firings shall be maintained for a rolling ~~twenty-four~~24-month period; and shall be made accessible to ~~an authorized District representative~~the Executive Officer upon request.
- (65) Notwithstanding the exemptions contained in Rule 2001 – Applicability, Table 1 – Rules Not Applicable to RECLAIM Facilities for Requirements Pertaining to NOx Emissions If Rule Was Adopted or Amended Prior to October 5, 2018, an owner or operator of any unit(s) with a rated heat input capacity greater than or equal to 40 million Btu per hour and an annual heat input greater than  $200 \times 10^9$  Btu per year shall have a continuous in-stack nitrogen oxides monitor or equivalent verification system in compliance with Rule 218 – Continuous Emission Monitoring, Rule 218.1 – Continuous Emission Monitoring Performance Specifications, and 40 Code of Federal Regulations (CFR) Part 60 Appendix B Specification 2. Maintenance and emission records shall be maintained and made accessible for a period of two years to the Executive Officer.
- (76) Notwithstanding paragraph (c)(1), an owner or operator that has installed, modified, or has been issued a South Coast AQMD Permit to Construct or Permit to Operate for the following units prior to December 7, 2018, at a non-RECLAIM facility, shall meet the NOx emission limit specified in

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

Table 1146-1 by December 7, 2033 or when 50 percent or more of the unit's burners are replaced, whichever is earlier:

- (A) Group II fire-tube boilers subject to subparagraph (c)(1)(G) complying with a previous NOx emission limit that is less than or equal to 9 ppm and greater than 5 ppm; or
- (B) Group III fire-tube boilers subject to subparagraph (c)(1)(J) complying with a previous NOx emission limit that is less than or equal to 9 ppm; or
- (C) Thermal fluid heaters subject to subparagraph (c)(1)(L) complying with a previous NOx emission limit that is less than or equal to 20 ppm.

(87) Notwithstanding the NOx emission limit specified in Table 1146-1 of paragraph (c)(1), by December 7, 2033 or when 50 percent or more of the unit's burners are replaced, whichever is earlier, the owner or operator that has installed, modified, or has been issued a South Coast AQMD Permit to Operate prior to September 5, 2008 for a Group III natural gas fired unit complying with a previous NOx emission limit of 12 ppm or less and greater than 9 ppm shall not operate in a manner that discharges NOx emissions (reference at 3 percent volume stack gas oxygen on a dry basis averaged over a period of 15 consecutive minutes) in excess of 9 ppm.

~~(98) An owner or operator that has installed, modified, or has been issued a SCAQMD Permit to Construct or Permit to Operate prior to December 7, 2018 for any unit(s) operating with air pollution control equipment that results in ammonia emissions in the exhaust complying with an ammonia emission limit greater than 5 ppm, when the air pollution control equipment is replaced or modified, the owner or operator shall:~~

- ~~(A) Meet the ammonia emission limit in specified in (c)(2); and~~
- ~~(B) During the first 12 months of operation, demonstrate compliance according to the schedule specified in paragraph (d)(3).~~

(108) Any owner or operator who chooses the pound per million Btu compliance option specified in paragraph(s) (c)(1) or (c)(43) or chooses the weighted average emission limit using Equation 1146-1 under paragraph (c)(32) shall install a non-resettable totalizing fuel meter to measure the total of each fuel used by each individual unit, as approved by the Executive Officer.

(149) An owner or operator of any landfill or digester gas (biogas) unit co-fired with natural gas shall not operate the unit in a manner that exceeds the

emission concentration limits specified in subparagraphs (c)(1)(C) or (c)(1)(D), provided that the facility monthly average biogas usage by the biogas units is 90% percent or more, based on the higher heating value of the fuels used.

(A) The Executive Officer may approve the burning of more than 10% percent natural gas up to:

- (i) 25% percent natural gas in a biogas fired unit at the 15 ppm (digester gas) or 25 ppm (landfill gas) NOx level, when it is necessary, if the only alternative to limiting natural gas to 10% percent would be shutting down the unit and flaring more biogas.
- (ii) 50% percent natural gas in a digester gas-fired unit at the 15 ppm NOx level, when it is necessary as specified in clause (c)(449)(A)(i) and for any units installed on or after September 5, 2008 provided the unit has demonstrated compliance with the NOx limits in paragraph (c)(1) applicable to units fired exclusively on natural gas.

For any units subject to this subparagraph, the percent natural gas usage shall be based on the facility monthly average biogas usage by the biogas units and the higher heating value of the fuels used.

(B) Any biogas-fired unit burning more than the approved percent natural gas as determined under subparagraph (c)(449)(A) shall comply with the weighted average NOx limit specified in paragraph (c)(32).

(4210) Notwithstanding the NOx emission limits specified in Table 1146-1 of paragraph (c)(1) and paragraph (e)(3), and until a Regulation XI rule referenced in paragraph (f)(5) is adopted or amended and that rule compliance date occurs, an owner or operator shall not operate units at a municipal sanitation service facility in a manner that discharges NOx emissions (referenced at 3 percent volume stack gas oxygen on a dry basis averaged over a period of 15 consecutive minutes) in excess of:

- (A) 9 ppm for Group II and Group III units; or
- (B) 9 ppm, upon burner replacement, for Group III units that were installed or modified prior to September 5, 2008 complying with a previous NOx emission limit of 12 ppm or less; or
- (C) 30 ppm for thermal fluid heaters; or

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

- (D) 30 ppm, upon burner replacement, for any low-fuel use unit complying with paragraph (c)(~~54~~).

(d) Compliance Determination

The owner or operator of any unit(s) subject to this rule shall meet the following requirements for determining compliance:

- (1) An owner or operator of any unit(s) shall have the option of complying with either the pound per million Btu or parts per million emission limits specified in paragraphs (c)(1), (c)(~~32~~), and (c)(~~43~~).

- (2) All emission determinations shall be made in the as-found operating condition, except no compliance determination shall be established during start-up, shutdown, or under breakdown conditions. Start-up and shutdown intervals shall not last longer than is necessary to reach stable conditions. Compliance determination as specified in paragraph (d)(6) shall be conducted at least 250 operating hours, or at least ~~thirty~~30 days subsequent to the tuning or servicing of any unit, unless it is an unscheduled repair.

- (3) An owner or operator ~~of a unit that installs, replaces, or modifies air pollution control equipment with ammonia emissions in the exhaust that is subject to the~~ an ammonia emission limit in a South Coast AQMD permit specified in paragraph (c)(2) shall:

- (A) Conduct quarterly a source test to demonstrate compliance with the ammonia emission limit, according to the procedures in District Source Test Method 207.1 for Determination of Ammonia Emissions from Stationary Sources, during the first 12 months of unit operation and thereafter, except that source tests may be conducted annually within 12 months thereafter when four consecutive quarterly source tests demonstrate compliance with the ammonia emission limit. If an annual test is failed, four consecutive quarterly source tests must demonstrate compliance with the ammonia emissions limits prior to resuming annual source tests; or

- (B) Utilize an ammonia Continuous Emissions Monitoring System (CEMS) certified under an approved South Coast AQMD protocol to demonstrate compliance with the ammonia emission limit.

- (4) Compliance with the NO<sub>x</sub> and CO emission requirements of paragraphs (c)(1), (c)(~~32~~), and (c)(~~43~~) and the stack-gas oxygen concentration requirement ~~in~~ of subparagraph (c)(~~54~~)(A) shall be determined using a

**Proposed Amended Rule 1146 (Cont.)**

**(Amended December 7, 2018December 2020)**

~~District~~South Coast AQMD approved contractor under the Laboratory Approval Program according to the following procedures:

- (A) ~~District~~South Coast AQMD Source Test Method 100.1 - Instrumental Analyzer Procedures for Continuous Gaseous Emission Sampling (March 1989), or
- (B) ~~District~~South Coast AQMD Source Test Method 7.1 - Determination of Nitrogen Oxide Emissions from Stationary Sources (March 1989) and ~~District~~South Coast AQMD Source Test Method 10.1 - Carbon Monoxide and Carbon Dioxide by Gas Chromatograph/Non-Dispersive Infrared Detector (GC/NDIR) - Oxygen by Gas Chromatograph-Thermal Conductivity (GC/TCD) (March 1989); or
- (C) United States Environmental Protection Agency (U.S. EPA) Conditional Test Method CTM-030, Determination of Nitrogen Oxides, Carbon Monoxide, and Oxygen Emissions from Natural Gas-Fired Engines, Boilers and Process Heaters Using Portable Analyzers; or
- (D) ASTM D6522-00(2005) Standard Test Method for Determination of Nitrogen Oxides, Carbon Monoxide, and Oxygen Concentrations in Emissions from Natural Gas-Fired Reciprocating Engines, Combustion Turbines, Boilers, and Process Heaters Using Portable Analyzers
- (E) ~~a~~Any other test method determined to be alternative and approved before the test in writing by the Executive Officers of the ~~District~~South Coast AQMD and the California Air Resources Board and the Regional Administrator of the ~~United States Environmental Protection Agency~~U.S. EPA, Region IX; or
- (F) ~~a~~A continuous in-stack nitrogen oxide monitor or equivalent verification system as specified in paragraph (c)(~~65~~).

Records of all source tests shall be made available to ~~District~~South Coast AQMD personnel upon request. Emissions determined to exceed any limits established by this rule through the use of any of the above-referenced test methods shall constitute a violation of this rule.

- (5) For any owner or operator who chooses the pound per million Btu of heat input compliance option of paragraph (c)(1), (c)(~~32~~), or (c)(~~43~~), NO<sub>x</sub> emissions in pounds per million Btu of heat input shall be calculated using

procedures in 40 CFR Part 60, Appendix A, Method 19, Sections 2 and 3 and CO emissions in pounds per million Btu of heat input shall be calculated according to the Protocol for the Periodic Monitoring of Nitrogen Oxides, Carbon Monoxide, and Oxygen from Units Subject to South Coast Air Quality Management District AQMD Rules 1146 and 1146.1.

- (6) Compliance determination with the NO<sub>x</sub> emission requirements in paragraph (d)(4) shall be conducted once:
  - (A) ~~e~~Every three years for units with a rated heat input capacity greater than or equal to 10 million Btu per hour, except for units subject to paragraph (c)(6~~5~~).
  - (B) ~~e~~Every five years for units with a rated heat input capacity less than 10 million Btu per hour down to and including 5 million Btu per hour.
- (7) Provided the emissions test is conducted within the same calendar year as the test required in paragraph (d)(6), an owner or operator may use the following emissions tests to comply with paragraph (d)(6):
  - (A) Periodic monitoring or testing of a unit as required in a Title V permit pursuant to Regulation XXX – Title V Permits, or
  - (B) Relative accuracy testing for continuous emissions monitoring verification pursuant to Rule 218.1 or 40 CFR Part 60 Appendix B Specification 2.
- (8) Except for units subject to paragraph (c)(6~~5~~), any owner or operator of units subject to this rule shall perform diagnostic emission checks of NO<sub>x</sub> emissions with a portable NO<sub>x</sub>, CO, and oxygen analyzer according to the Protocol for the Periodic Monitoring of Nitrogen Oxides, Carbon Monoxide, and Oxygen from Units Subject to South Coast Air Quality Management District AQMD Rules 1146 and 1146.1 – Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters according to the following schedule:
  - (A) The owner or operator of units subject to paragraphs (c)(1), (c)(3~~2~~), or (c)(4~~3~~) shall check NO<sub>x</sub> emissions at least monthly or every 750 ~~\_~~unit operating hours, whichever occurs later. If a unit is in compliance for three consecutive diagnostic emission checks, without any adjustments to the oxygen sensor set points, then the unit may be checked quarterly or every 2,000 unit operating hours,

- whichever occurs later, until the resulting diagnostic emission check exceeds the applicable limit specified in paragraphs (c)(1) or (c)(32).
- (B) The owner or operator of units subject to the requirements specified in paragraph (c)(54) shall check NO<sub>x</sub> emissions according to the tune-up schedule specified in subparagraph (c)(54)(B).
- (C) Records of all monitoring data required under subparagraphs (d)(8)(A) and (d)(8)(B) shall be maintained for a rolling twelve month period of two years (~~5~~five years for Title V facilities) and shall be made available to ~~District~~South Coast AQMD personnel upon request.
- (D) The portable analyzer diagnostic emission checks required under subparagraphs (d)(8)(A) and (d)(8)(B) shall only be conducted by a person who has completed an appropriate ~~District~~South Coast AQMD-approved training program in the operation of portable analyzers and has received a certification issued by the ~~District~~South Coast AQMD.
- (9) An owner or operator shall comply with the requirements as applied to CO emissions specified in paragraph (d)(8) and subparagraph:
- (A) (d)(6)(A) for units greater than or equal to 10 million Btu per hour, or
- (B) (d)(6)(B) for units less than 10 million Btu per hour.
- (10) A diagnostic emission check conducted under the requirements specified in paragraph (d)(8) that finds emissions in excess of those allowed by this rule or a permit condition shall not constitute a violation of this rule if the owner or operator corrects the problem and demonstrate compliance with another emission check within 72 hours from the time the owner or operator knew of excess emissions, or reasonably should have known, or shutdown the unit by the end of an operating cycle, whichever is sooner.
- (11) Notwithstanding the requirements specified in paragraph (d)(10) any diagnostic emission check conducted by ~~District~~South Coast AQMD staff that finds emissions in excess of those allowed by this rule or a permit condition is a violation.
- (12) An owner or operator may opt to lower the unit's rated heat input capacity. The lowered rated heat input capacity shall not be less than or equal to 2 million Btu per hour and shall be based on manufacturer's identification or rating plate or permit condition.

(e) Compliance Schedule

- (1) The owner or operator of any unit(s) at a RECLAIM or former RECLAIM facility subject to paragraph (c)(1) shall meet the applicable NOx emission limit in Table 1146-1 in accordance with the schedule specified in Rule 1100 – Implementation Schedule for NOx Facilities.
- (2) An owner or operator of a non-RECLAIM facility with any thermal fluid heaters with a NOx emission limit greater than 20 ppm shall:
  - (A) On or before December 7, 2019, submit a complete South Coast AQMD permit application for each thermal fluid heater that does not currently meet the limit specified in subparagraph (c)(1)(L); and
  - (B) On or before January 1, 2022, meet the applicable NOx emission limit in Table 1146-1 for thermal fluid heaters subject to subparagraph (c)(1)(L).
- (3) By December 7, 2033 or when 50 percent or more of the unit's burners are replaced, whichever is earlier, no person shall operate in the ~~District~~South Coast AQMD any unit subject to paragraph (c)(~~54~~) that discharges into the atmosphere NOx emissions in excess of 12 ppm (referenced at 3 percent volume stack gas oxygen on a dry basis averaged over a period of 15 consecutive minutes).
- (4) ~~a~~Any unit subject to the requirements specified in paragraph (c)(~~54~~) that exceeds 90,000 therms of annual heat input from all fuels used shall constitute a violation of this rule. In addition, the owners or operators shall:
  - (A) ~~w~~Within 4four months after exceeding 90,000 therms of annual heat input, submit required applications for permits to construct and operate; and
  - (B) ~~w~~Within 18 months after exceeding 90,000 therms of annual heat input, demonstrate and maintain compliance with all applicable requirements of paragraphs (c)(1), (c)(2), (c)(3), and (c)(~~45~~), ~~and~~ (e)(~~6~~) for the life of the unit.
- (5) The Executive Officer shall grant in writing a time extension to the full compliance date with the applicable NOx compliance limits specified in subparagraphs (c)(1)(E) through (c)(1)(K) for any health facility as defined in Section 1250 of the California Health and Safety Code that can demonstrate that the Office of Statewide Health Planning and Development has approved an extension of time to comply with seismic safety requirements pursuant to Health and Safety Code Sections 130060 and

130061.5. The extension of time granted by the Executive Officer shall be consistent with the time extension granted pursuant to Health and Safety Code Section 130060 but not to exceed January 1, 2015 and shall be consistent with the time extension granted pursuant to Health and Safety Code Section 130061.5 but not to exceed January 1, 2020. Those health facilities granted a time extension shall submit a compliance plan to the Executive Officer on or before January 1, 2010.

(f) Exemptions

The provisions of this rule shall not apply to:

- (1) ~~b~~Boilers used by electric utilities to generate electricity; or
- (2) ~~b~~Boilers and process heaters with a rated heat input capacity greater than 40 million Btu per hour that are used in petroleum refineries; or
- (3) ~~s~~Sulfur plant reaction boilers; or
- (4) ~~a~~Any unit at a RECLAIM or former RECLAIM facility that is subject to a NO<sub>x</sub> emission limit in a different rule for an industry-specific category defined in Rule 1100 – Implementation Schedule for NO<sub>x</sub> Facilities; or
- (5) ~~a~~Any unit at a municipal sanitation service facility that is subject to a NO<sub>x</sub> emission limit in a Regulation XI rule adopted or amended after December 7, 2018.

**ATTACHMENT 1**

**A. Equipment Tuning Procedure<sup>1</sup> for Forced-Draft Boilers, Steam Generators, and Process Heaters**

Nothing in this Equipment Tuning Procedure shall be construed to require any act or omission that would result in unsafe conditions or would be in violation of any regulation or requirement established by Factory Mutual, Industrial Risk Insurers, National Fire Prevention Association, the California Department of Industrial Relations (Occupational Safety and Health Division), the Federal Occupational Safety and Health Administration, or other relevant regulations and requirements.

Should a different tuning procedure be used, a copy of this procedure should be kept with the unit records for two years and made available to the ~~District~~South Coast AQMD personnel on request.

1. Operate the unit at the firing rate most typical of normal operation. If the unit experiences significant load variations during normal operation, operate it at its average firing rate.
2. At this firing rate, record stack gas temperature, oxygen concentration, and CO concentration (for gaseous fuels) or smoke-spot number<sup>2</sup> (for liquid fuels), and observe flame conditions after unit operation stabilizes at the firing rate selected. If the excess oxygen in the stack gas is at the lower end of the range of typical minimum values<sup>3</sup>, and if CO emissions are low and there is not smoke, the unit is probably operating at near optimum efficiency - at this particular firing rate.

However, complete the remaining portion of this procedure to determine whether still lower oxygen levels are practical.

---

<sup>1</sup> This tuning procedure is based on a tune-up procedure developed by KVB, Inc. for the United States EPA.

<sup>2</sup> The smoke-spot number can be determined with ASTM Test Method D-2156 or with the Bacharach method. -ASTM Test Method D-2156 is included in a tuneup kit that can be purchased from the Bacharach Company.

<sup>3</sup> Typical minimum oxygen levels for boilers at high firing rates are:

1. For natural gas: 0.5% - 3% percent
2. For liquid fuels: 2% - 4% percent

3. Increase combustion air flow to the furnace until stack gas oxygen levels increase by one to two percent over the level measured in Step 2. As in Step 2, record the stack gas temperature, CO concentration (for gaseous fuels) or smoke-spot number (for liquid fuels), and observe flame conditions for these higher oxygen levels after boiler operation stabilizes.
4. Decrease combustion air flow until the stack gas oxygen concentration is at the level measured in Step 2. From this level gradually reduce the combustion air flow, in small increments. After each increment, record the stack gas temperature, oxygen concentration, CO concentration (for gaseous fuels) and smoke-spot number (for liquid fuels). Also observe the flame and record any changes in its condition.
5. Continue to reduce combustion air flow stepwise, until one of these limits is reached:
  - a. Unacceptable flame conditions - such as flame impingement on furnace walls or burner parts, excessive flame carryover, or flame instability.
  - b. Stack gas CO concentrations greater than 400 ppm.
  - c. Smoking at the stack.
  - d. Equipment-related limitations - such as low windbox/furnace pressure differential, built in air-flow limits, etc.
6. Develop an O<sub>2</sub>/CO curve (for gaseous fuels) or O<sub>2</sub>/smoke curve (for liquid fuels) similar to those shown in Figures 1 and 2 using the excess oxygen and CO or smoke-spot number data obtained at each combustion air flow setting.

**Figure 1** Oxygen/CO Characteristic Curve

**Figure 2** Oxygen/Smoke Characteristic Curve

7. From the curves prepared in Step 6, find the stack gas oxygen levels where the CO emissions or smoke-spot number equal the following values:

<u>Fuel</u>	<u>Measurement</u>	<u>Value</u>
Gaseous	CO Emissions	400 ppm
#1 and #2 oils	smoke-spot number	number 1

#4 oil	smoke-spot number	number 2
#5 oil	smoke-spot number	number 3
Other oils	smoke-spot number	number 4

The above conditions are referred to as the CO or smoke thresholds, or as the minimum excess oxygen level.

Compare this minimum value of excess oxygen to the expected value provided by the combustion unit manufacturer. If the minimum level found is substantially higher than the value provided by the combustion unit manufacturer, burner adjustments can probably be made to improve fuel and air mixing, thereby allowing operation with less air.

8. Add 0.5 to 2.0 percent O<sub>2</sub> to the minimum excess oxygen level found in Step 7 and reset burner controls to operate automatically at this higher stack gas oxygen level. This margin above the minimum oxygen level accounts for fuel variations, variations in atmospheric conditions, load changes, and nonrepeatability or play in automatic controls.
9. If the load of the combustion unit varies significantly during normal operation, repeat Steps 1-8 for firing rates that represent the upper and lower limits of the range of the load. Because control adjustments at one firing rate may affect conditions at other firing rates, it may not be possible to establish the optimum excess oxygen level at all firing rates. If this is the case, choose the burner control settings that give best performance over the range of firing rates. If one firing rate predominates, settings should optimize conditions at that rate.
10. Verify that the new settings can accommodate the sudden load changes that may occur in daily operation without adverse effects. Do this by increasing and decreasing load rapidly while observing the flame and stack. If any of the conditions in Step 5 result, reset the combustion controls to provide a slightly higher level of excess oxygen at the affected firing rates. Next, verify these new settings in a similar fashion. Then make sure that the final control settings are recorded at steady-state operating conditions for future reference.
11. When the above checks and adjustments have been made, record data and attach combustion analysis data to boiler, steam generator, or heater records indicating name and signature of person, title, and date the tune-up was performed.

**B. Equipment Tuning Procedure for Natural Draft-Fired Boilers, Steam Generators, and Process Heaters.**

Nothing in this Equipment Tuning Procedure shall be construed to require any act or omission that would result in unsafe conditions or would be in violation of any regulation or requirement established by Factory Mutual, Industrial Risk Insurers, National Fire Prevention Association, the California Department of Industrial Relations (Occupational Safety and Health Division), the Federal Occupational Safety and Health Administration, or other relevant codes, regulations, and equipment manufacturers specifications and operating manuals.

Should a different tuning procedure be used, a copy of this procedure should be kept with the unit records for two years and made available to the ~~District~~South Coast AQMD personnel on request.

**1. PRELIMINARY ANALYSIS**

**a. CHECK THE OPERATING PRESSURE OR TEMPERATURE.**

Operate the boiler, steam generator, or heater at the lowest acceptable pressure or temperature that will satisfy the load demand. This will minimize heat and radiation losses. Determine the pressure or temperature that will be used as a basis for comparative combustion analysis before and after tune-up.

**b. CHECK OPERATING HOURS.**

Plan the workload so that the boiler, steam generator, or process heater operates only the minimum hours and days necessary to perform the work required. Fewer operating hours will reduce fuel use and emissions. For units requiring a tune-up to comply with the rule, a totalizing non-resettable fuel meter will be required for each fuel used and for each boiler, steam generator, and heater to prove fuel consumption is less than the heat input limit in therms per year specified in the rule.

**c. CHECK AIR SUPPLY.**

Sufficient fresh air supply is essential to ensure optimum combustion and the area of air supply openings must be in compliance with applicable codes and regulations. Air openings must be kept wide open when the burner is firing and clear from restriction to flow.

**d. CHECK VENT.**

Proper venting is essential to assure efficient combustion. Insufficient draft or overdraft promotes hazards and inefficient burning. Check to be sure that vent is in good condition, sized properly and with no obstructions.

e. **COMBUSTION ANALYSIS.**

Perform an "as is" combustion analysis (CO, O<sub>2</sub>, etc.) with a warmed-up unit at high and low fire, if possible. In addition to data obtained from combustion analysis, also record the following:

- i. Inlet fuel pressure at burner (at high & low fire)
- ii. Draft at inlet to draft hood or barometric damper
  - 1) Draft hood: high, medium, and low
  - 2) Barometric Damper: high, medium, and low
- iii. Steam pressure, water temperature, or process fluid pressure or temperature entering and leaving the boiler, steam generator, or process heater.
- iv. Unit rate if meter is available.

With above conditions recorded, make the following checks and corrective actions as necessary:

2. **CHECKS & CORRECTIONS**

a. **CHECK BURNER CONDITION.**

Dirty burners or burner orifices will cause boiler, steam generator, or process heater output rate and thermal efficiency to decrease. Clean burners and burner orifices thoroughly. Also, ensure that fuel filters and moisture traps are in place, clean, and operating properly, to prevent plugging of gas orifices. Confirm proper location and orientation of burner diffuser spuds, gas canes, etc. Look for any burned-off or missing burner parts; and replace as needed.

b. **CHECK FOR CLEAN BOILER, STEAM GENERATOR, OR PROCESS HEATER TUBES & HEAT TRANSFER SURFACES.**

External and internal build-up of sediment and scale on the heating surfaces creates an insulating effect that quickly reduces unit efficiency. Excessive fuel cost will result if the unit is not kept clean. Clean tube surfaces, remove scale and soot, assure proper process fluid flow and flue gas flow.

c. **CHECK WATER TREATMENT & BLOWDOWN PROGRAM.**

Soft water and the proper water or process fluid treatment must be uniformly used to minimize scale and corrosion. Timely flushing and periodic blowdown must be employed to eliminate sediment and scale build-up on a boiler, steam generator or process heater.

d. **CHECK FOR STEAM, HOT WATER OR PROCESS FLUID LEAKS.**

Repair all leaks immediately since even small high-pressure leaks quickly lead to considerable fuel, water and steam losses. Be sure there are no leaks through the blow-off, drains, safety valve, by-pass lines or at the feed pump, if used.

3. **SAFETY CHECKS**

- a. Test primary and secondary low water level controls.
- b. Check operating and limit pressure and temperature controls.
- c. Check pilot safety shut off operation.
- d. Check safety valve pressure and capacity to meet boiler, steam generator or process heater requirements.
- e. Check limit safety control and spill switch.

**4. ADJUSTMENTS**

While taking combustion readings with a warmed-up boiler, steam generator, or process heater at high fire perform checks and adjustments as follows:

- a. Adjust unit to fire at rate; record fuel manifold pressure.
- b. Adjust draft and/or fuel pressure to obtain acceptable, clean combustion at both high, medium and low fire. Carbon Monoxide (CO) value should always be below 400 parts per million (PPM) at ~~3% percent~~  $\theta O_2$ . If CO is high make necessary adjustments.

Check to ensure boiler, steam generator, or process heater light offs are smooth and safe. A reduced fuel pressure test at both high and low fire should be conducted in accordance with the manufacturer's instructions and maintenance manuals.

- c. Check and adjust operation of modulation controller. Ensure proper, efficient and clean combustion through range of firing rates.

When above adjustments and corrections have been made, record all data.

**5. FINAL TEST**

Perform a final combustion analysis with a warmed-up boiler, steam generator, or process heater at high, medium and low fire, whenever possible. In addition to data from combustion analysis, also check and record:

- a. Fuel pressure at burner (High, Medium, and Low).
- b. Draft above draft hood or barometric damper (High, Medium and Low).
- c. Steam pressure or water temperature entering and leaving boiler, steam generator, or process heater.
- d. Unit rate if meter is available.

When the above checks and adjustments have been made, record data and attach combustion analysis data to boiler, steam generator, or process heater records indicating name and signature of person, title, company name, company address and date the tune-up was performed.

# **Proposed Amended Rule 1146 – Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters**

---

**BOARD MEETING**

**DECEMBER 4, 2020**

# Rule 1146 Background

- Adopted on September 9, 1988
- Establishes NOx emission limits for boilers, steam generators, and process heaters  $\geq 5$  million BTU per hour
- Last amended on December 7, 2018
  - Expanded applicability to include RECLAIM facilities
  - Updated NOx limits to reflect Best Available Retrofit Control Technology (BARCT)
  - Included an ammonia limit for new and modified air pollution control equipment with ammonia emissions such as Selective Catalytic Reduction (SCR)

# Regulation XIII - New Source Review Requirements for Ammonia Emissions

- Ammonia emissions from new and modified SCRs will trigger Regulation XIII – New Source Review during the permitting process
- Under Regulation XIII the increased ammonia emissions must meet a Best Available Control Technology limit of 5 ppm
  - Rule 1146 ammonia limit for new and modified SCRs is also 5 ppm
- Based on evaluation of Regulation XIII and Rule 1146, staff concluded that the ammonia emission limit is a Regulation XIII issue and should be evaluated in the permitting process rather than Rule 1146
  - Allows permit engineers to evaluate the ammonia limit for new and modified SCRs on a case-by-case basis to ensure the Rule 1146 NOx limit can be achieved

# Proposed Amendments

<i>September 2020</i>	
(Adopted September 9, 1988)(Amended January 6, 1989)(Amended May 13, 1994) (Amended June 16, 2000)(Amended November 17, 2000)(Amended September 5, 2008) (Amended November 1, 2013)(Amended December 7, 2018) <i>(Proposed Amended Rule 1146 December 2020)</i>	
<b>PROPOSED AMENDED RULE 1146.</b>	<b>EMISSIONS OF OXIDES OF NITROGEN FROM INDUSTRIAL, INSTITUTIONAL, AND COMMERCIAL BOILERS, STEAM GENERATORS, AND PROCESS HEATERS</b>
(a) Applicability	This rule applies to boilers, steam generators, and process heaters of equal to or greater than 5 million Btu per hour rated heat input capacity used in all industrial, institutional, and commercial operations.
(b) Definitions	
(1) ADSORPTION CHILLER UNIT	means any natural gas fired unit that captures and uses waste heat to provide cold water for air conditioning and other process requirements.
(2) ANNUAL HEAT INPUT	means the total heat input to a unit during a calendar year.
(3) ATMOSPHERIC UNIT	means any natural gas fired unit with a heat input less than or equal to 10 million Btu per hour with a non-sealed combustion chamber in which natural draft is used to exhaust combustion gases.
(4) BOILER or STEAM GENERATOR	means any combustion equipment fired with liquid and/or gaseous (including landfill and digester gas) and/or solid fossil fuel and used to produce steam or to heat water, and that is not used exclusively to produce electricity for sale. Boiler or Steam Generator does not include any open heated tank, adsorption chiller unit, or waste heat recovery boiler that is used to recover sensible heat from the exhaust of a combustion turbine or any unfired waste heat recovery boiler that is used to recover sensible heat from the exhaust of any combustion equipment.
(5) BTU	means British thermal unit(s).
(6) COMMERCIAL OPERATION	means any office building, lodging place, or similar location designed for tenancy by one or more business entities or residential occupants.
(7) FIRE-TUBE BOILER	means any boiler that passes hot gases from a fire box through one or more tubes running through a sealed container of water. The
1146 – 1	

- Removes ammonia limit of 5 ppm for new and modified pollution controls with ammonia emissions
  - Ammonia limits will be addressed under Regulation XIII
  - Prevents conflicts with implementing Regulation XIII
- Retains compliance demonstration requirements for new, replaced and modified pollution control equipment with ammonia limits

# Staff Recommendation

- Recommendation is to adopt the Resolution:
  - Determining PAR 1146 is exempt from CEQA, and
  - Adopting PAR 1146
