THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 3a: Community Profile

### Information on the Best Available Retrofit Control Technology and AB 2588 Program

AB 617 requires air districts to implement Best Available Retrofit Control Technology (BARCT) for facilities in the state greenhouse gas cap-and-trade program by December 31, 2023. The Wilmington, Carson, West Long Beach community has facilities that are subject to BARCT, specifically larger facilities that are in the REgional CLean Air Incentives Market (RECLAIM) program. In addition, CARB's Blueprint states that facilities located within the community with Risk Reduction Plans under the Assembly Bill (AB) 2588 program must be identified. Descriptions of the facilities that are subject to BARCT (specifically RECLAIM facilities) and the AB 2588 program are provided below.

### Best Available Retrofit Control Technology (BARCT)

#### *RECLAIM facilities*

Facilities within the RECLAIM program are typically larger facilities that have NO<sub>x</sub> emissions greater than four tons per year. The RECLAIM program<sup>1</sup> uses a market-based approach to achieve emission reductions from facilities for nitrogen oxides (NO<sub>x</sub>) and sulfur oxides (SO<sub>x</sub>) in the aggregate. However, an analysis of the RECLAIM program has shown that the ability to achieve NO<sub>x</sub> emission reductions using a market-based approach has diminished; therefore, pursuant to Board direction, RECLAIM NO<sub>x</sub> facilities will transition<sup>i</sup> to a command-and-control regulatory structure to ensure facilities meet BARCT. RECLAIM facilities that are also in the State greenhouse gas cap-and-trade program are subject to the BARCT requirements of AB 617. South Coast AQMD staff completed an analysis of the equipment at each RECLAIM facility, giving higher priority to older, higher polluting units that will need to install retrofit controls. The higher polluting units at RECLAIM facilities will be or have been evaluated for BARCT and will be subject to the following South Coast AQMD rules: Rules 1109.1,<sup>2</sup> 1110.2,<sup>3</sup> 1117,<sup>4</sup> 1118.1,<sup>5</sup> 1134,<sup>6</sup> 1135,<sup>7</sup> 1146, 1146.1, 1146.2,<sup>8</sup> 1147, 1147.1,<sup>9</sup> and 1147.2.<sup>10</sup> A BARCT assessment includes an evaluation of emission limits for existing units, South Coast AQMD regulatory requirements, other regulatory requirements, and pollution control technologies. Table Appendix 3a-1 lists the RECLAIM facilities that may be subject to BARCT and whether they are in the State cap-and-trade program.

---

<sup>i</sup> For more information on the RECLAIM transition please see: <http://www.aqmd.gov/home/rules-compliance/reclaim-transition>.

Table Appendix 3a-1: List of NO<sub>x</sub> RECLAIM facilities within the Wilmington, Carson, Long Beach community

RECLAIM Facility Name	Facility Address	Cap-and-Trade Facility (Yes/No)
AIR PROD & CHEM INC	23300 S ALAMEDA ST., CARSON	No

PLAINS WEST COAST TERMINALS LLC	2500 E VICTORIA ST., COMPTON	No
PLAINS WEST COAST TERMINALS LLC	2685 PIER S LN., LONG BEACH	No

### *Non-RECLAIM facilities*

As a result of the BARCT assessment conducted for RECLAIM facilities, some equipment at non-RECLAIM facilities will also be affected and will be required to meet BARCT NOx emissions. The BARCT assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities that may be subject to additional requirements is being developed.

### [AB 2588 Program](#)

The AB 2588 Program<sup>11</sup> is a statewide program that requires air districts to establish emissions inventory of air toxics from individual facilities.<sup>ii</sup> The AB 2588 program is implemented in South Coast AQMD through Rule 1402 - Control of Toxic Air Contaminants from Existing Sources<sup>12</sup> which requires certain facilities to conduct Health Risk Assessments to assess the health risk (long-term versus short-term) to the surrounding community. Facilities are required to submit Health Risk Assessments<sup>13</sup> based upon the toxicity and volume of toxic air contaminants released within proximity to potential receptors (e.g., hospitals, residences, work sites). Depending on the risk, facilities may be required to do public notices and hold a public meeting. If a facility is determined to exceed the significant risk level, as determined by each air district, they are required to reduce this risk by submitting a Risk Reduction Plan (RRP).<sup>14</sup> The RRP outlines what measures (e.g., high-efficiency particulate air (HEPA) filters) the facility will incorporate to reduce their risk. (Some facilities may be subject to the AB 2588 program, but do not exceed the action risk threshold and therefore are not required to submit a RRP.) Some facilities may also choose to voluntarily reduce

<sup>ii</sup> The South Coast AQMD's AB 2588 Program incorporates the requirements of the state AB 2588 program, as well as additional and/or more stringent requirements.

their risk by submitting a voluntary RRP (VRRP).<sup>iii</sup> If a facility has an approved VRRP, the risks will be reduced below the voluntary risk threshold. Table Appendix 3a-2<sup>iv</sup> shows facilities within the Wilmington, Carson, West Long Beach community that are currently in the AB 2588 program in the South Coast AQMD. This table includes the facility name, location address, and the most recent status under the AB 2588 program. Facilities in the AB 2588 program without a RRP or VRRP will have the prioritization level (High, Intermediate, or Low)<sup>v</sup> and what year the prioritization was conducted listed as the status. Prioritization is based on reporting every four years.

Table Appendix 3a-2: List of facilities in the AB 2588 program within the Wilmington, Carson, Long Beach community

Facility Name	Facility Address	Status within the AB 2588 Program
AIR PROD & CHEM INC	23300 S ALAMEDA ST, CARSON	Prioritization from 2017 - Intermediate
LMC ENTERPRISES, DBA FLO-KEM	19400-02 SUSANA RD, RANCHO DOMINGUEZ	Prioritization from 2016 – Low
LA CITY, TERMINAL ISLAND TREATMENT PLANT	445 FERRY ST, SAN PEDRO	Prioritization from 2015 - Intermediate
WESTERN TUBE & CONDUIT CORP	2001 E DOMINGUEZ ST, LONG BEACH	Prioritization from 2015 - Intermediate
PICK YOUR PART AUTO WRECKING	1903 N BLINN AVE, WILMINGTON	Prioritization from 2016 – Low
LA CITY, HARBOR DEPT	500 PIER A ST, BERTH 161, WILMINGTON	Prioritization from 2017 – Low
MAXIMA ENTERPRISES, INC.	23920-4 S VERMONT AVE, HARBOR CITY	Prioritization from 2015 – Low
PERVAN TOOLING CO., INC	1716 KONA DR, COMPTON	Prioritization from 2017 - Intermediate
BREA CANON OIL CO	630 LOMITA BLVD, WILMINGTON	Prioritization from 2015 - Intermediate
AIR PRODUCTS AND CHEMICALS, INC.	700 N HENRY FORD AVE, WILMINGTON	Prioritization from 2018 - Intermediate
RIBOST TERMINAL, LLC.	1405 PIER "C" ST, LONG BEACH	Prioritization from 2017 - Intermediate

<sup>iii</sup> Some facilities may have submitted applications for a VRRP; however, if the facility is found to be already under the voluntary risk threshold, no further reduction measures are required.

<sup>iv</sup> Facilities listed in the table are reducing risk or in the process of reducing risk.

<sup>v</sup> Facilities designated as high priority are required to submit Health Risk Assessments to assess the risk to their surrounding community. Facilities ranked as Intermediate priority are required to submit a complete toxics inventory once every four years. Facilities ranked as low priority are exempt from reporting.

Facility Name	Facility Address	Status within the AB 2588 Program
POLY ONE CORPORATION	2104 E 223RD ST, CARSON	Prioritization from 2017 – Low

#### Technology Clearinghouse

South Coast AQMD staff have been conducting Best Available Control Technology (BACT) analyses and working closely with CARB to provide data for the Technology Clearinghouse. Requirements for Toxics-Best Available Control Technology (T-BACT) are frequently established through the adoption and amendment of rules affecting air toxics (i.e., Regulation XIV). Staff will reference the Technology Clearinghouse and applicable air toxic rule requirements (inclusive of state Air Toxic Control Measures (ATCMs) and federal National Emission Standards for Hazardous Air Pollutants (NESHAPs), when available, to evaluate for potential tightening of rules through the rule development process. Permit considerations for both new and modified sources throughout the district are based on rule requirements.

# APPENDIX 4:

## ENFORCEMENT SUMMARY

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 4: Enforcement

### Authority and Legal Right to Issue Violations and Penalties

CARB and South Coast AQMD both have authority to conduct inspections of alleged air pollution sources, and the right to issue notices of violations that can lead to civil and criminal penalties. ~~CARB civil~~ Civil penalties can be up to \$250,000 per day; ~~South Coast AQMD civil penalties can be up to \$75,000 per day~~ for individuals and up to \$1,000,000 per day for corporations.<sup>i</sup> In cases with potential criminal violations, South Coast AQMD's ~~Office of Compliance and Enforcement (OCE)~~ may refer matters to federal, state, and local prosecuting agencies. Inspection warrants also may be obtained if necessary when access to facilities or potential emissions sites is denied.

### South Coast AQMD Hearing Board

The Hearing Board is a quasi-judicial panel authorized to provide relief from South Coast AQMD regulations under certain circumstances and to order businesses to take specific actions to come into compliance with regulations. As state law requires, Hearing Board members are appointed by, but act independently of, the South Coast AQMD Governing Board.

The Hearing Board is authorized to hear:

- Petitions by companies for variances.
- Petitions for abatement orders. An abatement order requires a company operating out of compliance to take specific actions or to shut down its operation. This is a severe remedy normally reserved for serious violations ~~orders~~.
- Appeals by companies ~~from the~~ regarding granting of permits, permit conditions, permit denials and suspensions, denials of emission reduction credits, and denials of pollution control plans.
- Appeals by third parties.

The Hearing Board is not authorized to:

- Modify rules.
- Exempt a business from complying with a rule.
- Grant a variance from a violation of the public nuisance law, such as one that creates an odor problem or threatens public health or property.
- Review a violation notice in any way.

<sup>i</sup> Fines and penalties are cited at the maximum amounts for willful and intentional emissions of air contaminants that results in great bodily harm or death. See Health and Safety Code § 42402.3(c);

CARB website: [www.arb.ca.gov/enf/policy2017/final\\_enforcement\\_policy\\_october2017.pdf](http://www.arb.ca.gov/enf/policy2017/final_enforcement_policy_october2017.pdf)

South Coast AQMD website: [www.aqmd.gov/nav/about/authority/enforcement](http://www.aqmd.gov/nav/about/authority/enforcement)

After hearing all sides of a case in which individuals or companies come into conflict with South Coast AQMD rules, the Hearing Board weighs the evidence and reaches a decision.

The following sections contain information regarding the compliance histories of facilities regulated by South Coast AQMD and CARB in this community. South Coast AQMD's section includes a list of all active facilities with active or expired permits, a summary of all complaints received, a list of all inspections conducted, and a list of all enforcement actions taken. CARB's section includes: lists of individual field inspections in 2016, 2017, and 2018 and an enforcement activities map.

## South Coast AQMD Compliance History in WCWLB, January 2016 to December 2018

List of All Active Facilities with Active or Expired Permits in June 2019

This table contains all of the facilities that are considered active and have valid or expired permits. Expired permits are included to ensure that any facilities that are still in operation but had not paid fees at the time of the query were still included.

Facility Name	Facility ID	Address	Technical Specialty (TS)	North American Industrial Classification System (NAICS)	
3777+ PARTNERS LP, HOWARD CDM	164098	3745 LONG BEACH BLVD. #150, LONG BEACH 90807	Ts-11 industrial: sector-based inspections	236115	New single-family housing construction (except for-sale builders)

Summary of All Complaints Received<sup>ii</sup> from January 2016 to December 2018

This table contains a summary of the number of complaints received by complaint type and sorted by their disposition between January 2016 and December 2018.

Complaint Disposition	Asbestos	Dust	Odors	Open Fire	Overspray	Residential Wood Burning	Service Stations	Smoke	Spots	Other	Total
Notice of Violation Issued	4	7	51		2			50		10	124
Notice To Comply Issued	30	13	19		7		1	3		5	78
Tag Issued to Service Station							1				1
Referred to Another Agency	2	1	11		3		3	4	1	4	29
No Enforcement Action Taken <sup>iii</sup>	68	193	1563	26	18	22	9	254	1	173	2327
Investigation in Progress; Disposition Pending	5	1	9				1	16		5	37

<sup>ii</sup> The complaint information, queried in May 2019, is based on the following Zip Codes: 90220, 90221, 90247, 90248, 90501, 90502, 90710, 90731, 90732, 90755, 90802, 90805, 90806, 90807, and 90813.

<sup>iii</sup> *No Enforcement Action Taken* means that the complaint investigation has concluded but did not result in any formal enforcement action. For example, an alleged air pollution source may have been operating in compliance at the time of the inspection or the event underlying the complaint was no longer occurring.

## CARB Supplemental Environmental Project Process

During the settlement process, violators have the opportunity to allocate up to 50% of their penalties to a supplemental environmental project (SEP). Community-proposed projects are funded by the violators to help improve public health, reduce pollution, increase environmental compliance and bring public awareness to air pollution issues. Additional SEPS are possible in the WCWLB community through the proposal process.

Proposals of projects that meet the following four requirements: reducing direct/indirect air emissions or exposure to air pollution, relates to the violation, does not benefit the violator, and goes above and beyond regulatory requirements can be submitted for consideration for future settlements through the SEP proposal form (<https://calepa.ca.gov/sep-proposal-form>). Six SEPs have been funded in South Coast AQMD's jurisdiction including paid environmental education internships, planting trees, writing articles to inform community about air pollution and resources, conducting research (e.g., air monitoring, truck traffic survey), and school air quality education programs and filtration systems.

## Further Information on Technology Used for Compliance Investigations

### Toxic Vapor Analyzer

*Toxic Vapor Analyzers (TVA):* Using a Flame Ionization Detector (FID) or Photoionization Detector (PID), this instrument is capable of detecting a wide variety of organic and inorganic compounds. The unit must be calibrated to identify specific compounds. Any day that the instrument is used for conducting compliance inspections, a trained inspector calibrates the equipment to a set calibration standard depending on the inspection type. For example, in an oil and gas process leak inspection to identify VOCs, a 3-Point Methane Calibration Curve is used.

This instrument displays concentrations of the gas it is calibrated to in parts per million (ppm), also known as the number of molecules of that gas per one million molecules of air. Inspectors can use TVAs to identify organic and inorganic vapors according to a standard set by the US Environmental Protection Agency (EPA) Method 21 – Determination of Volatile Organic Compound Leaks.<sup>vi</sup> This document from EPA sets the standard for the specifications and performance criteria of the instrument, as well as the process of identifying a leak.

### Infrared Cameras

*Infrared Cameras:* Using infrared cameras equipped with Optical Gas Imaging (OGI) technology, inspectors can detect hydrocarbon leaks at a variety of facilities, including those in the oil and gas industry. The device uses a non-contact technology which identifies the infrared energy (heat) of a specific gas and converts it into an electronic signal. This signal is processed into an image, giving inspectors the ability to view emissions that would otherwise be invisible to the naked eye.

Using Infrared OGI cameras enables inspectors to scan areas for emissions and quickly gain an overall representation for any large leaks there may be at a facility. The technology generally used by OCE is specifically calibrated to methane, enabling users to visibly identify VOC leaks. Inspectors can follow up with a TVA to quantify

<sup>vi</sup> <https://www.epa.gov/emc/method-21-volatile-organic-compound-leaks>

the leak. Inspectors who use this equipment have training through a multi-day course to understand the technology, uses, and limitations.

#### XRF

*X-Ray Fluorescence (XRF):* A handheld instrument which uses a non-destructive method to determine the chemistry of a sample. The device sends an x-ray to the sample that displaces the electrons, causing a release of energy. The energy released is measured by the special detector to analyze the chemistry of the sample. Inspectors can scan surfaces for the presence of toxic metals to identify sources of contamination and fugitive emissions.

#### H<sub>2</sub>S Analyzer

*H<sub>2</sub>S Analyzers (Jerome Meters):* A handheld instrument that can detect hydrogen sulfide in the air. This device takes in a small sample of air and provides a reading on the amount of H<sub>2</sub>S within a few seconds, down to levels in the parts per billion (ppb) range. This instrument serves as a safety tool for inspectors conducting an inspection in an area with potential H<sub>2</sub>S and can be used to identify a potential source of rotten egg type odors.

#### CARB Statewide Truck and Bus Regulation

CARB is achieving compliance with the Statewide Truck and Bus Regulation (STB), section 2025 of Title 13, California Code of Regulations (CCR) ~~(STB)~~ by 2023 via a streamlined auditing process. STB requires diesel trucks with a Gross Vehicle Weight Rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters or replace older engines with cleaner engine technology on a phased-in schedule based on the model year of the engine and GVWR. CARB staff process data from vehicle registration, compliance reporting, and inspection databases to identify potentially non-compliant fleets and prioritize them for enforcement action.

In April 2017, the Governor signed Senate Bill 1 (SB1) into law which included a provision that, beginning in 2020, a vehicle must demonstrate compliance with the STB regulation before it can be registered with the Department of Motor Vehicles (DMV). Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant heavy-duty diesel vehicles (HDDV) based on the model year of the HDDV, so that by the end of 2023, 100% compliance will be achieved for the truck and bus rule

#### Summary

Both South Coast AQMD and CARB are committed to working closely with the CSC to identify and investigate area quality issues in the community. For the mobile sources regulated by CARB, this will include actively enhancing enforcement activities through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the CSC on the status of inspections and to obtain additional areas of mobile source concern. CARB plans to have, at a minimum, annual meetings with the CSC in order to prioritize strategies and identify possible locations where non-compliant vehicles are present. CARB will report-back to the community with the number of inspections performed and the number of citations and/or Notices of Violations (NOVs) issued. Further information about CARB's and South Coast AQMD's commitments can be found in Chapter 5.

# APPENDIX 5B:

## REFINERIES

---

THIS PAGE IS INTENTIONALLY LEFT BLANK

## Appendix 5b: Refineries

### Rules and Regulations Applicable to Refineries and Related Facilities

Petroleum refineries, sulfur recovery plants, and hydrogen production plants are subject to rules and regulations, including, but not limited to, those adopted by the South Coast AQMD and regulations adopted by the U.S. EPA. The South Coast AQMD rules, as listed and U.S. EPA regulations listed below, are primarily focused address on refinery and related facility equipment and related operations. Administrative rules for permitting exemptions, New Source Review for new and modified sources for criteria pollutants or toxics, and source-specific rules regulating toxic air contaminants are not included. Refineries and their related facilities are additionally subject to South Coast AQMD regulations and rules such as general provisions or prohibitions. The South Coast AQMD rules and regulations are listed by the rule/regulation number, title of the rule/regulation, date of rule adoption or amendment, and a hyperlink to the rule/regulation language. A complete list of South Coast AQMD rules are available at: <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book>. The U.S. EPA regulations are available at: [https://www.ecfr.gov/cgi-bin/text-idx?gp=&SID=0bd285c07143d1e24bc9b1c58799fd33&mc=true&tpl=/ecfrbrowse/Title40/40tab\\_02.tpl](https://www.ecfr.gov/cgi-bin/text-idx?gp=&SID=0bd285c07143d1e24bc9b1c58799fd33&mc=true&tpl=/ecfrbrowse/Title40/40tab_02.tpl).

# Inventory of Boilers and Heaters at Petroleum Refineries

Boilers and heaters are commonly used in petroleum refineries to heat crude oil during the distillation process and for other processes. The table below provides a list of boilers and heater units at petroleum refineries in the Wilmington, Carson, West Long Beach Community. The table specifies the type of units (equipment category), unit size based on rated heating value (MMBTU/hr), source of fuel (refinery or natural gas), whether the emissions from each unit are monitored using a continuous emissions monitoring system (CEMS), the annual emissions from each unit (year 2016 NOx and PM emissions in pounds per year), the type of emission controls on each unit (ultra-low NOx burners, Low NOx burners, and/or Selective Catalytic Reduction), and whether the unit is subject to BARCT.

Facility	Equipment Specifications and Emissions							NOx Control		BARCT Assessment
Facility Name	Application Number	Equipment Category	Size (MMBTU/hr)	CEMS (Y/N)	Primary Fuel Type	Compliance Year 2016 Emissions (lbs/year)		Ultra-Low/Low NOx Burners	Selective Catalytic Reduction (SCR)	Subject to BARCT
						NOx	PM

# 2017 Criteria Pollutants and Toxic Air Contaminants

The criteria pollutant and toxic air contaminant emissions from each refinery in the Wilmington, Carson, West Long Beach Community are provided in the table below. The emissions are based on year 2017 Annual Emission Reporting (AER) data. This emissions data is used for updates the South Coast AQMD's emissions inventory. Additional information about the South Coast AQMD AER program is available at: <https://www.aqmd.gov/home/rules-compliance/compliance/annual-emission-reporting>.

## Public Meeting Comments (CSC Meeting #7 – June 13, 2019)

### Public Meeting Comment #1: Alicia Rivera – Communities for a Better Environment

- 1-1: The commenter requests information regarding the feasibility of flaring emission reductions.
- 1-2: The commenter would like a reference to emissions reduction goals in the plan that goes beyond flaring, such as an overall emissions reduction target. The commenter requested an estimate of the average amount of emissions in the community, how much of that baseline can be reduced, and by when. The commenter did not see specific emissions reduction plan or additional requirements for refinery boilers and heaters. The commenter would like to see a requirement for wet scrubbers on all catalytic crackers. The commenter requests South Coast AQMD for a phase out of fossil fuels and a cap on refinery expansion. The commenter would like to see improvements on VOC emissions.
- 1-3: The commenter would like to know if it is possible to set pollution prevention requirements in rules before finishing air quality monitoring, and identify new requirements for specific emission reductions.
- 1-4: The commenter would like the CERP to address sulfur, carbon sulfide, and other chemicals such as hydrogen sulfide. There is not a clear commitment for new regulations, and that the plan continues to require monitoring before taking actions. The South Coast AQMD should assume that oil drilling facilities are guilty until they prove they are otherwise and write a regulation.

#### Response to Public Meeting Comment #1-1

The South Coast AQMD staff provided 10 years of flaring emissions data for refineries and related facilities to the CSC members at CSC meeting #7 (held on June 13, 2019). This data is based on reporting in compliance with South Coast AQMD Rule 1118. Additionally, the CERP includes an action (see Action 3 of Chapter 5b) to initiate rule development for Rule 1118. Action 3 of Chapter 5b provides measures for evaluating methods and practices to reduce flaring (e.g., methods to reduce power failures and increased capacity to store gases during shutdowns). The goal of this action is to reduce refinery flaring events and/or emissions by 50%, if feasible. The South Coast AQMD staff estimates that this goal will result in 19 tons per year (tpy) of NO<sub>x</sub>, 11 tpy of SO<sub>x</sub> and 1 tpy of VOC emissions from flaring in the Wilmington, Carson, West Long Beach community.

#### Response to Public Meeting Comment #1-2

##### *Emissions Baseline and Emission Reductions*

Overall emission reduction targets are in Chapter 5a of the CERP. A summary of the emission reduction targets are in the table below. Baseline emissions refers to expected future emissions without any new action or regulation beyond those already adopted.

Emissions	NO <sub>x</sub>	SO <sub>x</sub>	VOCs	DPM
2017 Emissions (tpy)	10,614	1,437	5,641	120
Projected 2024 Emissions Baseline (tpy)	8,819	1,659	5,306	86
Emission Reductions from CERP, by 2024 (tpy)	606	--	20.6	9
Emission Reductions from CERP, by 2024 (%)	7	--	<1	10
Projected 2029 Emissions Baseline <sup>1</sup> (tpy)	9,250	1,715	5,256	93
Emission Reductions from CERP, by 2030 (tpy)	3,207 <sup>2</sup>	11	64	20
Emission Reductions from CERP, by 2030 <sup>3</sup> (%)	35% <sup>4</sup>	<1%	<1%	22%

The emission reduction targets in the table above are based on the actions in the Draft Final CERP. These actions will be implemented using six different strategies including incentives, outreach, collaboration, air monitoring, regulations, and enforcement that result in emission reductions. For example, the CERP includes 3 actions that require the South Coast AQMD to develop new rules and amend existing rules to achieve further emission reductions from petroleum refineries in this community by 2030. Additionally, the Draft Final CERP includes actions to reduce emissions from mobile sources (e.g., heavy-duty trucks, locomotives, cargo handling equipment, and ships). The mobile source actions will be implemented by strategies, such as, enhanced enforcement efforts from South Coast AQMD and regulations that are developed by CARB to reduce emissions from heavy-duty trucks, ships and other mobile sources (see the list of CARB measure in Table 5a-2).

<sup>1</sup>Per CARB guidance, the emissions baseline was estimated for 2017, and milestone years 2024 and 2029. However, the emission reductions in this table target a 2030 completion date, due to the complexity of the efforts. While the baseline emissions were not calculated for 2030, staff expect the emissions to be similar to the 2029 estimates (details presented in Appendix 3B).

<sup>2</sup>Based on maximum NO<sub>x</sub> emission reductions that may be reduced from Action 5 in Chapter 5b that is designed to achieve further reductions from refinery equipment through adoption of Rule 1109.1 – Refinery Equipment

<sup>3</sup>Based on maximum NO<sub>x</sub> emission reductions that may be reduced from Action 5 in Chapter 5b that is designed to achieve further reductions from refinery equipment through adoption of Rule 1109.1 – Refinery Equipment

<sup>4</sup>Percent calculated based on 2029 emissions baseline

Several actions in the CERP also emphasize emission reductions from fugitive emissions sources that are not quantifiable at this time. For example, an action to reduce leaks from oil wells requires enhanced air monitoring along with follow-up strategies (e.g., rule development and enforcement activities) to quantify and target reductions in fugitive emissions. Based on the information that is currently available, the resulting emission reductions from this action cannot be estimated at this time.

#### *Boilers, Heaters and Other Equipment at Refineries*

The CERP includes an action to Achieve further NO<sub>x</sub> emission reductions from boiler, heaters and other equipment at refineries through the adoption of Proposed Rule 1109.1 (See Action 5 of Chapter 5b). Under this Action the South Coast AQMD would pursue emission reductions from refinery equipment including existing boilers, heaters, gas turbines, fluid catalytic cracking units, sulfur recovery units, incinerators and a coke calciner. Adoption of Proposed Rule 1109.1 will require the installation of BARCT level controls on boilers, heaters and other refinery equipment. Additional information about Proposed Rule 1109.1 is available on the South Coast AQMD website at: <http://www.aqmd.gov/home/rules-compliance/rules/scagmd-rule-book/proposed-rules#1109.1>

#### *Requirements for Wet Scrubbers and Fluid Catalytic Cracking Units (FCCUs)*

Rule 1105.1 – Reduction of PM<sub>10</sub> and Ammonia Emissions from Fluid Catalytic Cracking Units (FCCUs) applies to all existing, new or modified fluid catalytic cracking units at petroleum refineries. The PM<sub>10</sub> emission limits required by Rule 1105.1 are the most stringent in the nation. For example, Regulation 6, Rule 5: Particulate Emissions from Refinery Fluidized Catalytic Cracking Units adopted by the Bay Area Air Quality Management District (BAAQMD) in December of 2018 does not specify emission limits for PM<sub>10</sub>. However, it does have similar emission limits for ammonia slip. The BAAQMD is currently conducting rulemaking activities for FCCUs.

All petroleum refineries in the Wilmington, Carson, West Long Beach community operate FCCUs. Refineries can install electrostatic precipitators (ESPs), wet electrostatic precipitators (WESPs) or wet gas scrubbers to meet the Rule 1105.1 emission limits. Also, refineries can use more than one of these technologies to comply with these limits, for example, Philips 66 uses both a wet gas scrubber and a WESP to comply with Rule 1105.1. The CERP commits South Coast AQMD staff to monitor the progress of the BAAQMD's rulemaking effort to assess whether additional PM emission reductions from FCCUs are feasible (see page 5b-4 of the CERP).

#### *Phase Out of Fossil Fuels and Caps on Refinery Expansions*

Staff believes that any policy that aims to phase-out the use of fossil fuels needs to be coordinated with a number of state agencies, including the Public Utilities Commission (PUC), the California Energy Commission (CEC), and CARB. State law (SB 100, 2018) already calls for a phase out of fossil fuels (zero-carbon goal) in the electricity generating sector by 2045, through

coordinated action of these state agencies. According to the Energy Information Administration, almost all petroleum used in California is used in the transportation sector. Under both the Clean Air Act and state law, South Coast AQMD does not have authority over the composition of motor vehicle fuels. So, the South Coast AQMD could not phase out fossil fuel use in motor vehicles. While the South Coast AQMD is not preempted from setting fuel requirements for off road engines, it would be prohibited from requiring zero-emission for these sources, which would constitute a preempted emission standard. The South Coast AQMD can set emission standards for refineries and their equipment as long as those standards are not arbitrary or capricious, but likely could not set standards for the purpose of limiting the production of fuels available for motor vehicles.

The South Coast AQMD has in place a number of regulations limiting emissions from refinery operations, including a requirement for best available control technology (BACT) for new or modified sources. If a refinery project meets the requirements of South Coast AQMD rules, South Coast AQMD is required to issue permits for the project. Our authority to adopt rules is limited to regulating air pollution emissions, rather than directly limiting refinery throughput.

#### *Improvements for VOC Emissions*

Action 2 of Chapter 5 is to conduct refinery monitoring to identify and address VOC leaks. This action includes goals that VOC emission reductions including:

- Establishing a 2020 emissions baseline for fugitive VOC's from all refineries in the Wilmington, Carson, West Long Beach community, and
- Working with the CSC to perform an assessment to determine the feasibility of reducing fugitive VOC emissions from refineries below 2020 baseline emission levels by 25% beginning in 2024, and 50% beginning in 2030

#### Reponses to Public Meeting Comment #1-3

Rule requirements may include emission limits or require control measures. Rules may also include maintenance requirements to ensure equipment is working properly. Monitoring described in the community air monitoring plan (CAMP) is a separate process from the rule development process. During the implementation period of the CERP, which will include rule development, monitoring efforts will continue. Any new requirements will be required to undergo the rule development process to allow for more focused meetings with all stakeholders to assess feasibility of proposed requirements or updated emission standards.

#### Reponses to Meeting Comment #1-4

##### *Pollutants:*

The Wilmington, Carson, West Long Beach Community Air Monitoring Plan (CAMP) outlines the air monitoring that will be conducted to address the community's prioritized air quality concerns and support effective implementation of the CERP. The CAMP addresses pollutants of interest emitted by the emissions sources prioritized by the CSC. The CAMP is available at South Coast

AQMD website at: [https://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/wcwlb\\_camp.pdf?sfvrsn=6](https://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/wcwlb_camp.pdf?sfvrsn=6)

### *Regulations and Air Monitoring*

The CERP commits to the development of numerous rules to address the air quality priorities identified by the CSC. For example, the CERP includes an action to Amend Rule 1118 (See Action 3 in Chapter 5b). The action includes considerations to further reduce flaring and an emission reduction goal of approximately 19 tpy of NO<sub>x</sub>, 11 tpy of SO<sub>x</sub>, and 1 tpy of VOC. The estimated timeline calls for initiating rule development activities by the first quarter of 2020. Air monitoring is not a prerequisite to most of the actions in the CERP, however, air monitoring can help track the progress of various actions.

### **Public Meeting Comment #2: Christopher Chavez – West Long Beach Active Resident**

- 2-1: The commenter requests information about boilers and wanted to know the timeline and process for BARCT and the rules related to refineries. The commenter requested an update on the BARCT Clearinghouse.
- 2-2: The commenter suggested that the indirect source rule should be tailored to the specific needs of the community.

### **Response to Public Meeting Comment #2-1**

Refinery equipment and related operations are subject to South Coast AQMD rules and U.S. EPA regulations. These are listed in Appendix 5b of the CERP. A new rule, Proposed Rule 1109.1 focuses on refinery equipment (e.g., boilers, heaters, fluid catalytic cracking units, etc.) and will include a Best Available Retrofit Control Technology (BARCT) assessment and requirements. Proposed Rule 1109.1 is scheduled to be considered by the Governing Board in late 2019 or early 2020. Information regarding the statewide BARCT Clearinghouse and information for each air district can be found online on the CARB website.

### **Response to Public Meeting Comment #2-2**

South Coast AQMD staff is currently crafting a Memorandum of Understanding (MOU) with the Ports. Staff is also developing Indirect Source Rules (ISR) for warehouses and railyards. Staff will consider the CSC's comments in the ISR rule development process, and staff encourages CSC members to participate in the ongoing working group meetings for ISR (warehouses, rails) and the MOU with the Ports.

### **Public Meeting Comment #3: Jesse Marquez – Coalition for a Safe Environment**

- 3-1: The commenter requested that South Coast AQMD provide a list of all technologies and their effectiveness in helping to reduce emissions at refineries. The commenter would like South Coast AQMD to identify every location or refinery where these technologies can be

applied. The commenter requests a plan to mandate these technologies. The commenter requests an emissions inventory for the community.

- 3-2: The commenter emphasized the need for community involvement in air monitoring. The commenter acknowledged that South Coast AQMD met with him and discussed his concerns and suggestions.

Response to Public Meeting Comment #3-1

All available technologies are being reviewed as part of the rule development process and BARCT assessment. Currently, Proposed Rule 1109.1 is undergoing the rule development process and NOx control technologies for equipment at refineries is being reviewed and will be made available to the public. The additional concerns and suggestions will also be addressed through the rule development process for Rule 1118 and Rule 1178 within the implementation period of the CERP (see Chapter 5b, Action 3 and Chapter 5b, Action 4). The source attribution analysis includes emissions inventory information in Appendix 3b.

Response to Public Meeting Comment #3-2

South Coast AQMD will collaborate with community organizations in implementing the CAMP, where appropriate.

**Public Meeting Comment #4: William Koons – Carson Active Resident**

- 4-1: The commenter requests that South Coast AQMD research current technologies available for vapor recovery. The commenter suggested that refineries should replace all gas pilot lights with non-gas pilot lighters.
- 4-2: The commenter brought up concerns that truck traffic in the community leads to truck idling. The commenter requested there be a complaint line that he could call about such incidents.
- 4-3: The commenter expressed that school air filtration systems should be mandatory in all schools.

Response to Public Meeting Comment #4-1

Current technologies for vapor recovery to avoid flaring will be addressed through the rule development process through amendments to Rule 1118 (see Chapter 5b, Action 3). The feasibility of replacing all gas pilot lights with non-gas pilot lighters can also be assessed in the rule development process. The rule development process allows for more focused meetings with all stakeholders to assess feasibility of proposed requirements or updated emission standards.

Response to Public Meeting Comment #4-2

Staff is aware that truck traffic can lead to truck idling. Improvements to congestion or truck traffic can be addressed through collaboration with cities or transportation agencies. The CERP

includes actions to address truck idling through focused inspections via collaboration with the CSC and CARB. Members of the public can make complaints at 1-800-CUT-SMOG.

Response to Public Meeting Comment #4-3

South Coast AQMD cannot mandate that schools have air filtration systems. However, staff will work with the local school districts to install air filtration systems at schools prioritized by the CSC.

Public Meeting Comment #5: Sylvia Betancourt – Long Beach Alliance for Children with Asthma

5-1: The commenter asked if the CERP addresses accidental flaring events. The commenter would like to see a cap on refinery expansions in the CERP.

5-2: The commenter would like to see goals or metrics in the CERP achieve a health standard. The commenter would like to see emissions reductions tied to health outcomes.

Response to Public Meeting Comment #5-1

Accidental or unplanned flaring events will be addressed through the rule development process (see Chapter 5b, Action 3). The CERP includes a commitment to amend Rule 1118 to address refinery flaring emissions.

The South Coast AQMD has in place a number of regulations limiting emissions from refinery operations, including a requirement for best available control technology (BACT) for new or modified sources. If a refinery project meets the requirements of South Coast AQMD rules, South Coast AQMD is required to issue permits for the project. Our authority to adopt rules is limited to regulating air pollution emissions, rather than directly limiting refinery throughput.

Response to Public Meeting Comment #5-2

Conducting a health study to establish a health baseline and track improvements will not provide a direct measurement of the success of the AB 617 program as there are many factors which contribute to health outcomes. Emission reductions in the CERP will provide long-term benefits for public health. Consistent with CARB's Blueprint, the CERP includes a series of specific metrics to directly measure implementation of the strategies for each of the actions. Key metrics include emission reduction goals for refinery emissions within the community, reduction of flaring, commitments for air measurements, and rule development to address fugitive VOC emissions.

The overall goal of AB 617 and the CERP is to improve public health from air quality related issues within the community. The CERP includes actions and strategies to meet this goal. Chapter 5g includes actions for direct public health improvement programs (e.g., asthma management programs).

#### Public Meeting Comment #6: Jill Johnston – University of Southern California

6-1: The CERP should include more metrics and details. The commenter wants to know what pollutants will be monitored, what actions can reduce these pollutants, and how actions will be prioritized. Mobile monitoring should include more details.

##### Response to Public Meeting Comment #6-1

The CERP outlines how the air quality priorities will be addressed. Step-by-step details are described in each of the actions. The goals section of each of the actions establishes metrics. Emission reduction targets have been incorporated in Chapter 5a (see Response to Public Meeting Comment # 1-2). More information can be found throughout Chapter 5 of the CERP on what actions will be implemented to address different priorities and pollutants. The community air monitoring plan includes more details on how mobile monitoring will be used and which pollutants will be monitored to address the air quality priorities.

#### Public Meeting Comment #7: Linda Bassett – Gulf Avenue Elementary School

7-1: The commenter would like to know what type of reductions will lead to emission reductions of at least 50%. The commenter would like more information on causes of death and illness.

##### Response to Public Meeting Comment #7-1

Information on emissions reduction targets can be found in Chapter 5a of the CERP (see Response to Public Meeting Comment # 1-2). Health data is available through other agencies, such as the County of Los Angeles Public Health, but note that cause of death information is not always accurate; hospitalization data may be more accurate. Mortality rates may be more accurate and can be found here: [https://admin.publichealth.lacounty.gov/ivpp/pdf\\_reports/reports\\_home.htm](https://admin.publichealth.lacounty.gov/ivpp/pdf_reports/reports_home.htm).

#### Public Meeting Comment #8: McKina Alexander – City of Carson

8-1: The commenter requested to have Wilmington Avenue added to the truck idling inspection list, specifically the section from the 91 freeway leading to the Ports. The commenter wanted to know who conducts inspections and how many are available. The commenter requested to know how monitoring will be subsidized.

##### Response to Public Meeting Comment #8-1

Wilmington Avenue was added to the list of locations prioritized by the CSC. South Coast AQMD and CARB enforcement are responsible for truck idling inspections. Action 1 of Chapter 5b addresses truck idling by conducting quarterly idling sweeps and focused inspections in high priority locations identified by the CSC. Enforcement staff will work to address idling at locations prioritized by the CSC. Monitoring is being funded through AB 617 funds.

Public Meeting Comment #9: Salvador Lara – Wilmington Active Resident

9-1: The commenter stated that past green spaces projects have failed due to lack of watering and water use restrictions. The commenter noted that the lack of maintenance resources makes it difficult for the communities to have green space in Wilmington.

Response to Public Meeting Comment #9-1

South Coast AQMD will encourage the use of native, drought tolerant plants as part of Chapter 5g, Action 4.

## Public Meeting Comments (CSC Meeting #8 – July 11, 2019)

### Public Meeting Comment #10: Jesse Marquez – Coalition for a Safe Environment

10-1: South Coast AQMD should help establish a public health baseline. The commenter recommends a public health survey, specifically a Community Assessment for Public Health Emergency Response (CASPER) study. South Coast AQMD should track public health and allocate \$1 million towards the public health baseline.

10-2: The commenter does not want a Memorandum of Understanding (MOU) for the Ports and requests an Indirect Source Rule (ISR).

#### Response to Public Meeting Comment #10-1

The issue of measuring AB617 health outcomes has been discussed at length during CARB's statewide AB617 consultation group meetings, of which the commenter is a member. The result of those discussions was that such studies will be difficult and expensive, and while they are desired, they are outside of the scope of the AB617 statute and funding. Additional funding and involvement of public health agencies will be sought. Also, see Response to Public Meeting Comment # 5-2.

#### Response to Public Meeting Comment #10-2

Pursuant to South Coast AQMD's Governing Board direction, staff is currently working with the Ports of Los Angeles and Long Beach (Ports) staff to develop an MOU based on the implementation of strategies in the San Pedro Bay Ports Clean Air Action Plan (CAAP) to accelerate the deployment of commercially available zero and near zero-emission vehicles and equipment in port-related operations and to achieve near-term emission reductions. In the event that the MOU approach with the Ports is not successful and emission reductions are not achieved, staff will recommend a regulatory approach, such as ISR, to the South Coast AQMD Governing Board.

### Public Meeting Comment #11: Brissa Sotelo – Long Beach Area Chamber of Commerce

11-1: The source attribution analysis has not been provided to the committee and the CERP does not adequately outline the current or proposed reductions at a comprehensive level.

#### Response to Public Meeting Comment #11-1

The source attribution analysis is in Chapter 3b of the CERP. Additionally, emission reduction targets are in Chapter 5a of the CERP (see Response to Public Meeting Comment # 1-2). The emission reduction targets included in Chapter 5a are based upon mobile source incentive data from replacement of heavy duty diesel trucks and equipment, statewide mobile source regulations, and proposed refinery regulations. Some actions in the CERP will result in emission reductions that are not currently quantifiable, such as VOC fugitive emissions. Fugitive emissions cannot be estimated until monitoring and enforcement actions occur to identify the location and

source of the emissions. Some rules and regulations require the rule development process to progress before emission reductions can be quantified.

**Public Meeting Comment #12: Christopher Chavez – West Long Beach Active Resident**

12-1: There is a need for tangible reductions. Community members would like to know how much cleaner their air will become. It is important to employ a scientific process to answer this question.

12-2: MOU must be as strong as possible. There was a concern about off-ramps being included in the CAAP.

**Response to Public Meeting Comment #12-1**

Chapter 5a outlines the emissions reduction targets from mobile source incentives from the replacement of heavy duty diesel trucks and cargo handling equipment, statewide mobile source regulations and proposed refinery regulations (where quantifiable).

Focused outreach may result in additional incentive application submittals from this community and any additional projects approved will result in more emission reductions than anticipated. Strategies such as monitoring and focused enforcement will result in emission reductions, but are not quantifiable at this time. Monitoring and follow-up inspections will identify where fugitive emissions are occurring and will result in emission reductions (e.g., trucks idling, leaks from emissions such as oil wells and oil tankers). Furthermore, large emission reductions will be achieved through rule development. However, the rule development process must occur to determine emission reductions for certain rules and regulations. The process includes a number of factors to determine emission reductions (e.g., applicable equipment, types of controls or emissions limits, cost-effectiveness, etc.). Rules will continue to apply and be enforced beyond the implementation period of this CERP.

**Response to Public Meeting Comment #12-2**

Pursuant to South Coast AQMD's Governing Board direction, staff is currently working with the Ports of Los Angeles and Long Beach (Ports) staff to develop an MOU based on the implementation of strategies in the San Pedro Bay Ports Clean Air Action Plan (CAAP) to accelerate the deployment of commercially available zero and near zero-emission vehicles and equipment in port-related operations and to achieve near-term emission reductions. Regardless of off-ramps, in the event that the MOU approach with the Ports is not successful and emission reductions are not achieved, staff will recommend a regulatory approach, such as ISR, to the South Coast AQMD Governing Board.

**Public Meeting Comment #13: Susan Stark – Marathon Petroleum Company**

13-1: It is important to link the source attribution to all of the CERP measures.

**Response to Public Meeting Comment #13-1**

Thank you for your comment. The source attribution analysis can be found in Chapter 3b. This analysis is used to establish baseline emissions to determine emission reductions linked to the actions in the CERP.

#### Public Meeting Comment #14: Alicia Rivera– Communities for a Better Environment

14-1: There should be an increase in criteria and metrics to meet health standards.

14-2: The anticipated projections for air pollution needs to be addressed.

14-3: The CERP needs to include an estimation of oil refinery emissions and inventory levels.

#### Response to Public Meeting Comment #14-1

See Response to Public Meeting Comment #5-2.

#### Response to Public Meeting Comment #14-2

Since this comment was made, Chapter 5a was updated to include an emission reductions target for NO<sub>x</sub>, SO<sub>x</sub>, VOC, and Diesel PM. The source attribution analysis was also added to Chapter 3b. The source attribution analysis includes the baseline reference (2017) and projected emissions in future milestone years of 2024 and 2029. The future milestone years include reductions from all rules and regulations that have been adopted since 2016. The projected emissions do not include any of the CERP actions.

#### Response to Public Meeting Comment #14-3

Appendix 5b of the CERP includes year 2017 emissions data for criteria pollutants (tons/year) and toxic air contaminants (pounds/year) for petroleum refineries within the Wilmington, Carson, West Long Beach community. Additionally, Chapter 5a of the CERP includes emission reduction goals for oil refineries based on CERP actions that address petroleum refineries.

#### Public Meeting Comment #15: Flavio Mercado– Wilmington Active Resident

15-1: Key points from the committee should be mentioned in the CERP.

15-2: Smokestacks at the refineries need to be addressed.

#### Response to Public Meeting Comment #15-1

Appendix 2 in the CERP includes links to all meeting summaries which summarize all the main points made by the CSC. Key points from the CSC were written down on large notepads during Committee Discussions during the CSC meetings and incorporated into the meeting summaries. Furthermore, the CERP was developed through direct input with the CSC received during monthly meetings and personal correspondence with CSC members via phone calls or email. The CERP also incorporates comments received through the written comments submitted. The key points raised by the CSC have been one of the main drivers guiding the development of the CERP, and

are incorporated into the actions where appropriate. All points raised by the CSC are being responded to in this Response to Comments appendix.

Response to Public Meeting Comment #15-2

All emissions including refinery smokestacks are limited by South Coast AQMD's Rule 401 – Visible Emissions, through opacity. Emissions from refineries will be monitored through South Coast AQMD's Rule 1180 – Refinery Fenceline and Community Air Monitoring. Rule 1180 requires real-time fenceline air monitoring systems and establishes a fee schedule to fund refinery-related community air monitoring systems. These systems will provide air quality information regarding levels of various criteria air pollutants, volatile organic compounds and other compounds at or near the property boundaries of petroleum refineries to the public and local response agencies. Starting in 2020, this sophisticated network of fenceline and community air monitoring systems will continuously (24 hours a day, 7 days a week) provide near-real time air quality information in this community. Furthermore, as of January 30, 2019, Rule 1118 – Control of Emissions from Refinery Flares requires refineries to keep a video monitor on each flare. The video monitors are required to monitor all flares for visible emissions using color video monitors with date and time stamp, capable of recording a digital image of the flare and the flame of flares that are not enclosed, at a rate of no less than one frame per minute. South Coast AQMD staff can provide these videos to the public upon request.

Public Meeting Comment #16: Maribel Alejandre – SBCC Thrive LA

16-1: The focus should be on tracking emission reductions and source attribution. The data should be made clearer than what has been presented thus far, as it is confusing to read.

Response to Public Meeting Comment #16-1

Chapter 5a outlines the emissions reduction targets from mobile source incentives, statewide mobile source measure regulations, and proposed refinery regulations (where quantifiable). Incentive-based emission reductions are based on historical performance of mobile source incentive projects and projections for specific rules. Focused outreach may result in additional incentive application submittals from this community and any additional projects approved will result in more emission reductions than anticipated. Strategies such as monitoring and focused enforcement will result in emission reductions, but are not quantifiable at this time. Monitoring and follow-up inspections will identify where fugitive emissions are occurring and will result in emission reductions (e.g., trucks idling, leaks from emissions such as oil wells and oil tankers). Furthermore, large emission reductions will be achieved through rule development. However, the rule development process must occur to determine more precise emission reductions for certain rules and regulations. The process includes a number of factors to determine emission reductions (e.g., applicable equipment, types of controls or emissions limits, cost-effectiveness, etc.). Rules will continue to apply and be enforced beyond the implementation period of this CERP. The source attribution analysis is available in Chapter 3b and Appendix 3b. Staff has worked to simplify the data and language to be more reader-friendly.

## Public Meeting Comments (CSC Meeting #9 – August 7, 2019)

### Public Meeting Comment #17: Susan Stark – Marathon Petroleum Company

17-1: South Coast AQMD should conduct a full source attribution analysis for Year 1, including determining pollutants that are driving the exposure risk, finding areas where concentrations are the highest, identifying equipment contributing to air pollution, determining what controls are currently available, and what additional efforts can be made. Benzene is only 2% of the health risk while Diesel PM is 86%. Source attribution is an essential assessment to complete to determine where emissions are coming from, from which facilities, and what the contributing factors are. It is important to prioritize scarce resources and focus on the true contributors. Significant rule development will be occurring. The commenter was surprised that the South Coast AQMD already has an idea of what the emission reductions will be, and would like to hear more about this.

#### Response to Public Meeting Comment #17-1

It is staff's goal to have a better understanding of the specific sources of emissions that stem from this community. Thus, staff has included a source attribution analysis based on emissions inventories in Chapter 3b and Appendix 3b. Staff is committed to updating source attribution data through the technical advisory group (TAG) as more tools and information become available. For example, when MATES V data becomes available staff will share this information. A more thorough analysis of the emission sources and controls will be conducted as a part of the rule development process for refinery flares and storage tanks. Proposed Rule 1109.1 is in the rule development process and includes reviewing equipment at refineries and a BARCT assessment. Staff is working on determining the estimated emission reductions from rule projects, such as Rule 1109.1. The CERP includes other actions to address diesel PM in the community such as replacing diesel equipment in railyards.

### Public Meeting Comment #18: Jill Johnston - University of Southern California

- 18-1: South Coast AQMD should develop a method to quantify emission reductions and include this in the CERP for the CSC to review the method. Determine how to track improvement over time.
- 18-2: With respect to health metrics, data should be collected to inform a health impact assessment. South Coast AQMD can help develop this or a different agency to understand the relationship between exposure reduction and health improvement.
- 18-3: During the initial CSC meetings, the CSC was shown a figure of a pie chart that identified diesel and benzene as top two toxics in this community. It is important to use black carbon or ultrafine as a marker for diesel rather than only using PM. Benzene should also be

monitored. Staff should identify a marker that will be used for fugitive emissions (e.g., methane) and how we can follow this marker over time.

Response to Public Meeting Comment #18-1

Staff added a VOC quantification method in Chapter 5b for refineries and staff will commit to further development of a methodology through the Technical Advisory Group (TAG). Air monitoring will help track progress. In addition, metrics such as number of citations or number of trucks replaced would be provided at the quarterly CSC updates, which will help track progress.

Response to Public Meeting Comment #18-2

See Response to Public Meeting Comment #5-2.

Response to Public Meeting Comment #18-3

Similar to previous MATES studies, staff will work to identify what portion of measured PM is DPM, and black carbon is a good marker that has been used before. Benzene will be directly monitored to help track progress. Diesel PM hotspots are looked at through multiple surrogates including black carbon, ultrafine, and NOx. Staff can measure methane emissions. Methane can also be used as a surrogate for other fugitive emissions such as natural gas. In any event, staff will use the appropriate marker or surrogate for the specific fugitive emissions identified.

**Public Meeting Comment #19: Jesse Marquez – Coalition for a Safe Environment**

19-1: The current CERP does not have goals nor measurable metrics of any type. The commenter used truck idling as an example, where, a goal would be to reduce truck idling, metrics would include identify a number of locations, identifying areas of concern, count the number of trucks idling at each location. Report back with number of citations given over a certain amount of time.

The commenter showed an example of what he would like the actions to entail with examples of goals, metrics, and tasks.

## Coalition For A Safe Environment

Received 8/7/19

### Examples of Metrics to Track Progress

<b>Goal # 1:</b>	<b>Reduce PM Emissions at oil refineries</b>
<b>Objective # 1:</b>	<b>Reduce Flaring Emissions</b>
<b>Metric # 1</b>	Identify the number of flare events at each refinery in 2000 - 2018
<b>Task</b>	<ul style="list-style-type: none"> <li>a. AQMD complete assessment by 1<sup>st</sup> quarter 2020</li> <li>b. AQMD post assessment report on website by 3<sup>rd</sup> quarter 2020</li> <li>c. AQMD host public meeting 4<sup>th</sup> quarter 2020</li> </ul>
<b>Metric # 2</b>	Identify the number of flare events caused by power failure
<b>Task</b>	<ul style="list-style-type: none"> <li>a. AQMD complete assessment by 2<sup>nd</sup> quarter 2020</li> <li>b. AQMD post assessment report on website by 3<sup>rd</sup> quarter 2020</li> <li>c. AQMD host public meeting by 4<sup>th</sup> quarter 2020</li> </ul>
<b>Metric # 3</b>	Identify methods to reduce power failures
<b>Task 1</b>	<p>Require refinery Back-Up Power Systems</p> <ul style="list-style-type: none"> <li>a. Assess Co-Generation Technologies</li> <li>b. Assess Hydrogen Fuel Technology</li> <li>c. Assess Solar Energy Technology</li> <li>d. Complete assessment by 4<sup>th</sup> quarter 2020</li> <li>e. Require installation by 4<sup>th</sup> quarter 2022</li> <li>f. Update refinery Title V Permit Requirements by 3<sup>rd</sup> quarter 2020</li> </ul>
<b>Task 2</b>	<p>Require refinery to purchase special LA DWP non-interruption industrial continuous power supply contract</p> <ul style="list-style-type: none"> <li>a. Research LA DWP non-interruption industrial power supply alternatives</li> <li>b. Complete research by 1<sup>st</sup> quarter 2020</li> <li>c. If none exist discuss feasibility of creating a new type of contract with LA DWP by 2<sup>nd</sup> quarter 2020</li> <li>d. If option exists require purchase by 2021</li> <li>e. Update refinery Title V Permit Requirements by 3<sup>rd</sup> quarter 2020</li> </ul>

The commenter would like to know why certain criteria pollutants and certain toxics increased even after new rules were implemented. The commenter requests that the source attribution is further broken down by facility. This will help CSC assess whether the rules have been effective in reducing emissions. The CSC would like to have annual reports to assess progress of the CERP.

#### Response to Public Meeting Comment #19-1

The goals are outlined in the actions to help track progress. Staff will conduct quarterly truck idling sweeps based on community input of prioritized locations. Staff will report back with metrics such as number of citations. . Staff has incorporated portions of the commenter's suggested template to address the request to include measurable metrics. Staff is also able to provide the CSC with annual emissions data to describe the measurable emission reductions to be obtained within this community. On the South Coast AQMD's website, Annual Emissions Report (AER) data is available for larger sources. AER data provides annual facility specific emissions data, and the emissions data for each refinery has been included in the CERP in response to this comment. More information can be found here: <http://www.aqmd.gov/home/rules-compliance/compliance/annual-emission-reporting>. Port emission data is available through the Clean Air Action Plan (CAAP) website: <http://www.cleanairactionplan.org/2017-clean-air-action-plan-update/>. As outlined in the statute or Blueprint, annual progress reports will be a part of the AB 617 process for the CERP.

#### Public Meeting Comment #20: Alicia Rivera – Communities for a Better Environment

20-1: Emissions reduction targets and metrics are not in the CERP. Commenter would like to know why they were not aware that refineries were the largest emitters of VOCs and NOx and if the emissions inventory has been updated to reflect the Fluxsense study. The commenter would like to see refinery emission reductions in pounds per year or tons per year. The commenter would like to see a projection of air pollution and planned emission reductions over the next 20 years. The commenter would like to see additional reductions on the sunseting of the RECLAIM program on refinery units.

A plan should first be developed, targets should be identified, the district should assess how to address it, and then the regulation should be adopted. The commenter expressed that the CSC should not have to wait for the rule development process to figure out targets and metrics and ways of achieving the targets and metrics. South Coast AQMD can develop details later.

#### Response to Public Meeting Comment #20-1

Chapter 5a of the CERP includes emission reductions targets. Fugitive emissions cannot yet be fully assessed until monitoring and enforcement efforts occur during the implementation of the CERP. Metrics are included as goals for many of the CERP actions and staff will provide updates to the CSC to track progress. Staff has committed to amend specific rules to address the CSC air quality priorities. Some rules will need to undergo the full rule development process to better determine emission reductions. The rule development process will help establish a better baseline of the source emissions, the available technology, and the methods to achieve emission reductions. Chapter 5b has been updated to include proposed goals in tons per year where possible, and percentage reduction where baseline is not yet determined. Large reductions will come from South Coast AQMD's rules that are in development. South Coast AQMD has begun

quantifying emission reductions from these rule development projects such as Rule 1109.1. Action 5, which includes the emission reductions from Rule 1109.1, has been added to Chapter 5b at the request of the CSC.

**Public Meeting Comment #21: Christopher Chavez – West Long Beach Active Resident, Coalition for Clean Air**

- 21-1: Toxics need to be part of the CERP discussion and targets in the CSC. The CSC should stay informed about rules related to AB 617 and when they come up. The CSC should remain informed about how these rules result in emission reductions in their community.
- 21-2: There should be a stronger health nexus in the CERP. Although the commenter approves of the inclusion of an asthma management program, this should not take away from having a strong nexus between health and the CERP.
- 21-3: The commenter would like to see the implementation of a very strong indirect source rule. It is important to clamp down on things that attract pollution, not just those that emit pollution.

**Response to Public Meeting Comment #21-1**

Addressing emissions from toxic air contaminants is a part of the AB 617 program and has been incorporated into the CERP. The source attribution analysis in Chapter 3b shows diesel particulate matter from mobile sources is the primary contributor to cancer risk in this community. As examples, actions in the CERP to address the emissions from the Ports or neighborhood truck traffic will address diesel PM. Actions to address VOC emissions from refineries and oil and gas extraction will also reduce associated gas-phase air toxics from those sources. South Coast AQMD is committed to informing the CSC of any rule development updates during the scheduled quarterly CSC meetings. Staff also encourages CSC members as well as any other interested members of the public to participate in the rule development processes applicable to this community.

**Response to Public Meeting Comment #21-2**

Staff is also committed to finding suitable agencies or organizations to collaborate with in developing or conveying the nexus between health and the CERP. South Coast AQMD is not the appropriate agency to develop that nexus, but staff recognizes that South Coast AQMD has tools or data that may be shared with the appropriate agencies to develop that requested nexus. Also, see Response to Public Meeting Comment #5-2.

**Response to Public Meeting Comment #21-3**

South Coast AQMD staff appreciates the interest in and support for the development of an Indirect Source Rule (ISR). Staff will provide updates to the CSC as written in the CERP actions.

#### Public Meeting Comment #22: Judeth Luong– Long Beach Department of Public Health

22-1: The commenter was pleased to see that Public Health Direct Programs such as asthma health management programs are being considered in the CERP. British Petroleum (BP) settlement funds had previously funded local regional programs such as asthma case management programs. Many local organizations and hospitals were funded by the BP settlement and had demonstrable success. The commenter encourages South Coast AQMD to bring back these programs, as many of the efforts and progress made are dwindling due to a lack of funding.

##### Response to Public Meeting Comment #22-1

The BP settlement funded many of these programs; however, there the funds have been largely spent. Staff will work to identify funding sources for and partners to collaborate with on asthma management programs.

#### Public Meeting Comment #23: William Koons – Carson Active Resident

23-1: The commenter gave staff locations of frequent truck idling and traffic along Lomita that he had previously mentioned during CSC meetings. He also gave locations of two other facilities where there is frequent idling and traffic. The commenter requested an improved complaint system where the complainant is given a tracking number and follow up.

##### Response to Public Meeting Comment #23-1

Staff incorporated the locations that were mentioned by the commenter at CSC Meeting #7 (July 11, 2019) in Chapter 5d, Action 1. City transportation departments may have data to track traffic. Traffic flow issues and congestion are not within the South Coast AQMD's expertise, but South Coast AQMD can partner with appropriate agencies and entities on air quality issues under South Coast AQMD's purview. Truck idling is allowed in certain situations, such as being stuck in traffic, queuing, or mechanical failure as noted in the Truck Idling Factsheet: <https://ww3.arb.ca.gov/msprog/truck-idling/factsheet.pdf>. A complaint submitted to 1-800-CUT-SMOG receives a complaint number which serves as a tracking number for follow up. Truck idling can also be reported to CARB through 1-800-END-SMOG.

#### Public Meeting Comment #24: Sylvia Arredondo – Wilmington Active Resident

24-1: It is important to keep businesses, industries, and sectors accountable. Commenter requested to have these added to the actions' implementing agencies section under the CERP. Commenter would like to see a year-to-year emissions reduction plan.

##### Response to Public Meeting Comment #24-1

Staff has added responsibilities to the appropriate industry stakeholders under the individual actions and the implementing agencies section (i.e., Chapter 5e). In response to the request for

a year to year emission reduction plan Chapter 5a provides 2017 emission levels and estimated future baseline emissions levels in years 2024 and 2030 with emission reduction targets. Additionally, Chapter 5h includes a commitment that the South Coast AQMD staff will provide an annual update to the CSC on the progress of meeting the emission reduction targets beginning in 2021.

**Public Meeting Comment #25: Salvador Lara– Wilmington Active Resident**

25-1: High levels of traffic on Lomita Blvd. happens very often due to an exit closure. As a result, the traffic goes through the neighborhood. Signs on their own do not work without enforcement of the requirements.

**Response to Public Meeting Comment #25-1**

Staff had added Lomita Blvd to the air quality concerns map. Staff is working with land use agencies, public works departments, and other responsible agencies to address policing and enforcement of ordinances related to traffic routing.

**Public Meeting Comment #26: Linda Bassett– Gulf Avenue Elementary School**

26-1: The commenter read out a comment on behalf of another CSC member who could not attend who opposes holding meetings on weekdays during normal work hours since that unfairly benefits those who work in industries that have a financial interest in South Coast AQMD policy decisions. It was also stated that for CSC members and community members who live and work in the community are unable to take time off and their voices are not heard. The commenter also said the CERP should be discussed and voted on by the AB 617 Committee. If the Committee does not get to vote on the CERP, then it lacks legitimacy.

**Response to Public Meeting Comment #26-1**

The schedule for CSC meetings was developed for the entire year, and posted online in January. Some meetings were scheduled for mornings based on comments received from other CSC members, who had childcare responsibilities in the evenings. At the end of the 2019 meeting schedule, there will have been ten CSC Meetings, with three of those taking place in the morning. The remaining morning meeting (October) will be held at the Carson Civic Center.

The South Coast AQMD Governing Board will be considering and voting on the CERP for adoption as part of a public meeting as required by state law. The CSC was established to build consensus around the proposed CERP. The meeting is open to the public and any comments regarding the CERP can be made during the public comment portion of the meeting. In addition, staff has been working closely with CSC members to gather input and address the air quality priorities. Staff has incorporated CSC input in the CERP. The CERP will not be voted on by the CSC, because the

objective of the CSC is to build a consensus to incorporate all perspectives and input from the CSC on behalf of the WCWLB community.

**Public Meeting Comment #27: Dulce Altamirano – Wilmington Active Resident**

27-1: How much will the pollution from the refineries be reduced (in pounds or tons per year) and by when?

**Response to Public Meeting Comment #27-1**

While emission reductions for certain actions such as fugitive VOCs cannot yet be quantified until additional monitoring work occurs, specific emission reduction targets have been added to the refinery actions in the CERP, either in terms of tons or in terms of percentage reduction. Significant reductions (3-4 tons per day) will be achieved from refineries through the rule development of Proposed Rule 1109.1. Additionally, Rule 1118 targets reductions in flaring events by 50%, or 19 tons per year of NO<sub>x</sub>, 11 tons per year of SO<sub>x</sub>, and 1 ton per year of VOCs.

## Public Meeting Comments (Stationary Source Committee – July 26, 2019)

### Public Meeting Comment #28: Jesse Marquez – Coalition for a Safe Environment

28-1: The air districts' obligations are outlined in Appendix C in the CARB Community Air Protection Blueprint. The commenter expressed concern that metrics are not outlined. A health metric is necessary and at a minimum CASPER should be incorporated.

#### Response to Public Meeting Comment #28-1

South Coast AQMD has been in discussions with CARB to ensure all elements of the Blueprint are met. Metrics have been outlined through the goals section of the Actions in the CERP, and new metrics and emission reductions goals have been added in subsequent drafts. See Response to CSC Meeting #8 Public Comment 1-1, regarding health studies and metrics.

### Public Meeting Comment #29: Kevin Maggay – Southern California Gas Company (SoCalGas)

29-1: Electric trucks have limitations. South Coast AQMD staff should focus on long-range trucks, and prioritize trucks based on available technology.

#### Response to Public Meeting Comment #29-1

Staff is aware that electric trucks may have limitations and are not suitable replacements for all applications. South Coast AQMD supports the cleanest technology that is technologically feasible and commercially available.

### Public Meeting Comment #30: Florence Gharibian – Del Amo Action Committee

30-1: There should be more “no truck idling” signage. Truck traffic is making the roads worse. Commenter would like to focus on technology to reduce particulate matter emissions, and community health surveys.

#### Response to Public Meeting Comment #30-1

Staff will continue to work with the CSC and collaborating agencies to identify locations for “no truck idling” signs. Staff will also work with the appropriate city agencies or entities to assess the feasibility sign placement and enforcement.

Emission reduction targets are included in Chapter 5a. The CERP addresses PM emissions. An example of an action that reduces PM is in Chapter 5b, Action 2 involving diesel truck replacements.

Staff may evaluate the feasibility of conducting a community health survey if a collaborating agency is identified and if it is requested by the CSC.

Public Meeting Comment #31: Christopher Chavez – West Long Beach Active Resident, Coalition for Clean Air

31-1: There is a need for emission reduction targets. State and Federal attainment goals should be met. An assessment of health outcomes would be helpful to the community. In addition to incentives, enforcement and rules should be included in the CERP, along with a strong Memorandum of Understanding (MOU) for Ports.

Response to Public Meeting Comment #31-1

Emission reduction targets have been included in Chapters 5a and 5b. Staff plans to achieve State and Federal attainment goals through the Air Quality Management Plan (AQMP) to address regional air pollution. The CERP is focused on actions within this community to address local air pollution. Incentives are just one strategy identified in the CERP. A combination of strategies such as monitoring, enforcement, regulations, and collaborations are also included as strategies to achieve emission reductions. Regarding health outcomes see Response to Public Meeting Comment #5-2

Staff is in communication with the Ports and is engaged in a public process to determine the terms of a MOU for the Ports. Staff encourages CSC members to participate in the working group meetings with the Ports.

## Comment Letters

### Comment Letter #1: Jesse Marquez – Coalition for a Safe Environment

Comment Letter #1 *Rec'd from Jesse Marquez*  
**Coalition For A Safe Environment** 6.13.19

#### AB 617 CERP Public Comments

6.13.2019

(1<sup>st</sup> Draft To Be Updated)

### Chapter 5 Ports

#### Community Air Quality Priority

1. Community Air Quality Priority is Zero Emissions from all ports, shipping, freight transportation and supporting industry vehicles and equipment sources using Zero Emission Technologies immediately.
2. Community Air Quality Priority is making all Non-Zero Emission Sources including Near-Zero Emission Vehicles and Equipment Zero Emissions Technology as soon as possible within 5 years. 1-1
3. Community Air Quality Priority is requiring all available BACT, BACRT and Emissions Capture & Treatment Technologies be phased-in as-soon-as possible beginning in 2020 and completed within 5 years as interim measures until 100% Zero Emissions is achieved.
4. Community Air Quality Priority is the immediate adoption of an Emissions CAP on all emission sources within 1 year.
5. Community Air Quality Priority is the establishment of a Public Health Baseline for Port Communities. 1-2

#### Community Request Priority for the South Coast AQMD

1. Community Request Priority for the South Coast AQMD is to create a comprehensive inventory list of all Port air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources supporting activities, itemized by vehicle and equipment type, to include: all supporting freight transportation routes, container storage yards, petroleum industry marine terminals, lift bridges & back-up generators, container fumigation facilities, container transloading facilities, etc. and all emissions by chemical type and annual emission quantities. Not an abbreviated short list. 1-3
2. Community Request Priority for the South Coast AQMD is to update the Ports inventories with all community identified air pollution source that are missing and for the SCAQMD to immediately establish the emissions quantities.
3. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies and identify all ports, shipping and freight transportation industry vehicles and equipment where these technologies can be applied now. 1-4

4. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB At-Berth Rule stating that:	
<ul style="list-style-type: none"> <li>No-Ship Category such as Break Bulk Ships be exempted.</li> <li>Include all ships at At-Berth and At-Ancor</li> <li>No grants or incentives be given to any technology company that does not show evidence of owning patents or have the rights to use patented technologies.</li> </ul>	1-5
5. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB Mobile Cargo Handling Equipment Regulation supporting all CHE be Zero Emissions within 5 years. Zero Emission Hydrogen Fuel Cell Electric Battery Technology exists now to replace all most all <del>electric</del> engines.	1-6
6. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and reduce to less than significant emissions from all Port and Freight Transportation Industry magnet sources and off-port tidelands indirect sources supporting industries within 1 year. State and federal law already allow it.	1-7
7. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB Commercial Harbor Craft Regulation supporting all CHC be Zero Emissions within 5 years. Zero Emission Hydrogen Fuel Cell Electric Battery Technology exists now to replace all most all electric engines.	1-8
8. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies.	1-9
9. Community Request Priority for the South Coast AQMD to pay all past debt grant funds to minority owned small business technology companies who have completed their green technology demonstration or pilot projects immediately whose technology is supported by the community.	1-10

#### Response to Comment Letter #1-1

South Coast AQMD strongly supports the development and deployment of zero-emission vehicles and equipment as a key strategy in achieving the region's air quality goals and protecting public health. South Coast AQMD has funded a variety of zero-emission (ZE) technologies over the years, including battery and fuel cell electric trucks and cargo handling equipment, leveraging grants from both federal and state agencies as well as cost shares from regional stakeholders such as Ports of Los Angeles and Long Beach. Although significant progress has been made in development of zero-emission technologies, most of these technologies are not yet ready for commercial market in terms of economic viability and technology maturity. For example, there are currently no feasible models of zero-emission heavy duty trucks commercially available,

although we expect that will change in the near term. South Coast AQMD will continue its on-going efforts to support the development of these zero-emission technologies to accelerate their commercialization and deployment as early as possible.

Pursuant to South Coast AQMD's Governing Board direction, South Coast AQMD staff is currently working with Ports of Los Angeles and Long Beach staff to develop a Memorandum of Understanding (MOU) based on the implementation of strategies in the San Pedro Bay Ports Clean Air Action Plan (CAAP) to accelerate the deployment of commercially available zero and near zero-emission vehicles and equipment in port-related operations and to achieve near-term emission reductions. In the event that the MOU approach with the Ports is not successful; staff will recommend a regulatory approach to South Coast AQMD Governing Board.

Response to Comment Letter #1-2

See Response to Public Comment Letter #5-2.

Response to Comment Letter #1-3

Annually, the Ports of Los Angeles and Long Beach prepare detailed emissions inventory reports on air emissions from port-related mobile sources including ocean-going vessels, harbor craft, cargo handling equipment, locomotives, and drayage trucks. The emission inventory reports are developed in coordination with a technical working group which consists of the two Ports, South Coast AQMD, CARB and U.S. EPA. In addition, most of stationary sources, including liquid and dry bulk terminals and container fumigation facilities, are regulated by South Coast AQMD and some of the larger facilities are also subject to annual emission reporting requirement to South Coast AQMD (i.e., included in the point source inventory). Other sources of air emissions at the Ports are also monitored and regulated by other agencies including CARB and U.S. EPA and subject to their reporting and recordkeeping requirements. As such, the majority of port sources are already included in the emissions inventory; however, staff will continue to work with all stakeholders including community members to make further improvements and refinements to the Ports emissions inventories. The emissions inventories for the Ports of LA and LB can be found on these websites:

<https://www.portoflosangeles.org/environment/air-quality/air-emissions-inventory>

<http://www.polb.com/environment/air/emissions.asp>

Response to Comment Letter #1-4

As required under the 2017 CAAP Update, the Ports have conducted technical feasibility assessments of zero and near zero-emission technologies for drayage trucks and cargo handling equipment. A final report for drayage trucks was released in April 2019 with overall assessment of various zero and near zero-emission truck technologies including battery electric trucks and NZE CNG trucks in terms of operational capability, commercial availability and infrastructure support. A draft report for cargo handling equipment was also released in April 2019 with the final report expected by this summer. In addition, CARB, in collaboration with South Coast AQMD,

has developed technology assessments for a variety of mobile sources, including trucks and buses, locomotives, commercial harbor crafts, cargo handling equipment and ocean-going vessels, and these reports can be found at <https://ww2.arb.ca.gov/resources/documents/technology-and-fuels-assessments>.

South Coast AQMD staff have been conducting Best Available Control Technology (BACT) analyses and working closely with CARB to provide data for the Technology Clearinghouse. Requirements for Toxics-Best Available Control Technology (T-BACT) are established through the adoption and amendment of rules affecting air toxics (i.e., Regulation XIV). The Technology Clearinghouse keeps track of technologies such as BART. Staff will reference the Technology Clearinghouse and applicable air toxic rule requirements (inclusive of state Air Toxic Control Measures (ATCMs) and federal National Emission Standards for Hazardous Air Pollutants (NESHAPs), when available, to evaluate for potential tightening of rules through the rule development process. Permit considerations for both new and modified sources throughout the district are based on rule requirements. South Coast AQMD is conducting Best Available Retrofit Control Technology (BARCT) assessments as part of the rule development efforts to transition RECLAIM facilities to command-and-control.

#### Response to Comment Letter #1-5

South Coast AQMD staff has been tracking CARB's proposed At-Berth regulation amendment through participating in public workshops as well as inter-agency meetings with CARB staff to share updates and comments. South Coast AQMD staff will continue to work closely with CARB on inclusion of various vessel types in the proposed regulation to the extent that the applicable control technologies are technically feasible, cost-effective and operationally safe. For vessel types that these controls may not be feasible, incentive programs will be developed to achieve surplus reductions.

CARB is currently assessing various zero-emission technologies for cargo handling operations with a tentative schedule to adopt the zero-emission cargo handling equipment regulation in 2022. South Coast AQMD staff will monitor and participate in the development of the regulation through public workshops, workgroup meetings, and other venues to support and accelerate the adoption and deployment of zero-emission cargo handling equipment at our Ports as early as practicable. A number of promising technology demonstration projects are currently underway to demonstrate zero and near-zero-emission technologies for cargo handling equipment, however, many of these technologies, including fuel cell electric technologies, are not feasible or commercially available for heavy-duty cargo handling operations.

#### Response to Comment Letter #1-6

South Coast AQMD has funded, and will continue to fund, development and demonstration of a wide range of zero- and near zero-emission technologies, including battery or fuel cell electric trucks and cargo handling equipment, leveraging grants from both federal and state agencies as

well as cost shares from regional stakeholders such as Ports of Los Angeles and Long Beach. In addition, South Coast AQMD has supported deployment of CARB approved control technologies, including zero- and near zero-emission technologies, through various incentive programs such as Carl Moyer and Prop 1B. While we agree that zero-emission technologies are the future and show great promise, currently zero-emission technology is not feasible or available for all applications, particularly those in heavy-duty.

#### Response to Comment Letter #1-7

Per South Coast AQMD's Governing Board directive, South Coast AQMD staff has been working on development of an MOU with the Ports to achieve quantifiable emission reductions and realize SIP credits through implementation of CAAP measures. We believe this approach provides a path to get emission reductions faster and in a more effective way than through regulation. Through the MOU, the Ports would make a binding commitment to reduce emissions. A Ports MOU Working Group has also been established to assist in the MOU development process. However, as noted earlier, if the MOU approach is not successful, South Coast AQMD staff will recommend a regulatory approach to South Coast AQMD Governing Board (i.e., indirect source rule).

#### Response to Comment Letter #1-8

CARB is currently conducting a survey to assess commercial availability and technical feasibility of various zero and near zero-emission technologies for commercial harbor craft, with a tentative schedule to amend the Commercial Harbor Craft regulation in 2020. South Coast AQMD staff will monitor and participate in the proposed amendment process through public workshops, workgroup meetings, and other venues to support and accelerate the adoption and deployment of cleanest harbor craft technologies, including battery electric and fuel cell powertrains.

#### Response to Comment Letter #1-9

South Coast AQMD has funded, and will continue to fund, development and demonstration of a wide range of zero and near zero-emission technologies, including battery or fuel cell electric trucks and cargo handling equipment, leveraging grants from both federal and state agencies as well as cost shares from regional stakeholders such as Ports of Los Angeles and Long Beach. In addition, South Coast AQMD has supported deployment of CARB approved control technologies, including zero- and near zero-emission technologies, through various incentive programs such as Carl Moyer and Prop 1B. While we agree that zero-emission technologies are the future and show great promise, currently zero-emission technology is not feasible or available for all applications, particularly those in heavy-duty.

#### Response to Comment Letter #1-10

Requests to pay-off debts for minority-owned small business technology companies are not within the scope of AB 617.

<p><b>Comments (Unlimited Size) *</b></p> <p>Existing grant programs do not work well enough for port trucks to achieve good participation rates. Grant programs are unnecessarily incredibly complex and restrictive. For example in a very recent grant program, less than 30% of 285 port trucks evaluated were suitable for grant submission. Once an application is submitted, the grant process takes over a year to issue a grant contract. This is simply too long. The only grant program that is streamlined is the CARB HVIP Voucher program, but unfortunately the \$45,000 grant amount is too small for port truckers to be able to afford a new clean truck. What is needed is a port-specific "superfund" grant program modeled after HVIP that is simple to apply, quick to award, and provides \$100,000 funding per truck.</p> <p>A major source of toxic diesel emissions is coming from trucks that have emission control systems that do not work properly. The visible evidence is everywhere in the port area and on the freeways. You can see the telltale plume of smoke as trucks shift gears, accelerate, or go up hills. This has become common and is becoming more and more prevalent with time. There needs to be a smoking truck patrol that is assigned to the port area and issues tickets to smoking trucks.</p> <p>The most important emissions reductions are the reductions that happen today, not at some unknown point in the future. Technologies that are available today need to replace the existing diesel truck fleet now. We cannot wait, we are all breathing polluted air. Ultralow-NOx trucks already exist and are being placed in operation. The trucks have air emissions that are as low as battery electric trucks that are charged by the power grid, and climate emissions that are even lower than electric trucks. There is no need to wait, the technology for cleaning the air is available now.</p>	<p>2-1</p> <p>2-2</p> <p>2-3</p>

### Response to Comment Letter #2-1

South Coast AQMD is continuously looking to identify new incentive funding programs to replace as many higher polluting trucks with cleaner technology that exceeds current requirements. Existing grant funds, such as Carl Moyer, have state approved implementation guidelines that require surplus emission reductions, funding fleets that are in compliance with existing regulations and not encouraging fleets and truck operators to receive public funds to pay for compliance. Implementation of Prop 1B funds does not have the same level of requirements, but still includes provisions to ensure that the emission reduction benefits are real and quantifiable, requiring additional reporting. South Coast AQMD staff expeditiously reviews applications and distributes incentive funds as quickly as possible. However, the number of applications received, and commensurate requested funding levels typically is significantly higher than available funds. As part of the process, applications are reviewed to ensure they meet incentive program funding guidelines and the most cost-effective projects are prioritized, including truck replacements.

Additionally, South Coast AQMD continues to apply for and implement grants funds that do not have the same degree of constraints, such as federal grants that provide flexibility to implement other approaches, including trade down approaches to provide lower emitting trucks to Independent Owner Operators (IOOs). Lastly, South Coast AQMD staff plans to use the approved CERP to implement approaches that accelerate emission reductions from all priority categories, including heavy duty trucks.

#### Response to Comment Letter #2-2

During the Community Steering Committee (CSC) meetings, and subsequently captured in the Draft Final CERP, CARB and South Coast AQMD plan to increase focused enforcement efforts to address idling and smoking trucks. CARB plans to implement additional compliance approaches to identify and notify the gross polluters and provide support to address issues, including repair of emission control systems. One strategy CARB is using to address gross polluters is working with the Department of Motor Vehicles to deny truck owners from renewing registrations for trucks that do not pass smog.

CARB intends to conduct enhanced roadside inspections in the areas surrounding the Ports of Los Angeles and Long Beach to identify and cite vehicles out of compliance with CARB regulations. Using CSC input to locate areas where the community has expressed concern with smoking and idling vehicles, CARB will conduct roadside inspections within areas where they can enforce (e.g., cannot pull vehicles over on freeways, but can on surface streets for inspections). In addition to gathering CSC's input, CARB and South Coast AQMD staff are regularly in the field conducting other enforcement efforts, and plan to document idling and smoking vehicles to further support the enhanced roadside inspection program.

There has been a recent reduction in allowable smoke opacity changing from 40 percent to five percent for heavy-duty trucks with diesel particulate filters. Smoke opacity is used to describe and measure the level of visible black smoke emissions. It is a method used to measure a PM-related emission parameter in the field. With this change in measurement, CARB enforcement staff will be able to ensure that vehicles are properly maintained. In addition to providing citations to non-compliant trucks, CARB enforcement staff will also distribute pamphlets to truck drivers on how to properly maintain emissions control equipment. CARB is also conducting research to determine the effectiveness of heavy-duty diesel vehicle onboard diagnostic systems to better support proper maintenance of heavy-duty diesel trucks in South Coast AQMD's AB 617 communities and will provide updates on the research's results when available.

#### Response to Comment Letter #2-3

South Coast AQMD was instrumental in providing funding for the development and certification of the near zero-emission (certified to be 90% cleaner than the existing NOx standard) engines, and continues to provide funds to replace higher polluting trucks with new cleaner trucks that meet the optional low NOx standards (OLNS), with approximately 500 near zero-emission natural gas 12L trucks funded to date, as well as hundreds of Class 5-7 trucks. South Coast AQMD is

working with the state and federal agencies to develop and certify additional lower and higher displacement internal combustion engines that meet the OLNS, using liquid or gaseous renewable fuels. Additionally, South Coast AQMD continues to fund the development of zero-emission Class 8 trucks that utilize battery electric and fuel cell power plants. South Coast AQMD staff is working closely with CARB on lowering the heavy-duty engine standard in California and has petitioned the U.S. EPA to establish near zero-emission NOx standard for the nation.

**Comments (Unlimited Size) \***

While recognizing that SCAQMD is not a public health agency, the SCAQMD AB617 Community Emission Reductions Plan (CERP) needs to explicitly state that the goal of its pollution mitigation measures is to improve community health outcomes for chronic illnesses exacerbated by pollution, such as asthma. To achieve this goal, the CERP should support policies that improve health outcomes from reduced air pollution by establishing programmatic partnerships and allocate CARB funds to projects with public health agencies and community health organizations to mitigate the adverse health impacts from pollution exposure.

4-1

The CERP should be linked to the Los Angeles County Department's Community Health Improvement Plan (CHIP), which is approved by the Los Angeles County Board of Supervisors. The CHIP has prioritized protecting public health near oil and gas facilities. <http://publichealth.lacounty.gov/plan/chip.htm>. SCAQMD can support the projects identified by the CHIP by:

- Provide real-time SCAQMD's air pollution monitoring data from the pollution sources identified by the CERP (Sections 5b, 5c, 5d, 5E, 5f) to LACDPH and community organizations. This enables projects identified in the CHIP to:
  - o alert residents of the presence of high levels of pollutants so that residents can adopt protective measures to reduce pollution exposure.
  - o use air pollution monitoring data to implement targeted population health interventions to improve the management of chronic illnesses exacerbated by pollution and reduce pollution exposure among sensitive populations.
- Use CARB/AB617 funds to support projects identified in the CHIP to reduce pollution exposure and mitigate the adverse health impacts exacerbated by pollution. This includes:
  - o support the use of technologies that improve the control of asthma for patients during episodes of high exposure to pollutants, in addition to air monitoring and filtration systems for schools, childcare centers and home (Section 5G).

Also, the SCAQMD should use asthma incidence and hospitalization rates in the AB617 communities to guide the air pollution enforcement mechanisms identified in the CERP (Sections 5b, 5c, 5d, 5E, 5f). This includes increased air pollution inspections during periods of high rates of asthma hospitalizations.

Action 4 in Chapter 5G (Increase Green Space in Areas Where People Spend Time) focus should be "creating air pollution buffer zones for sensitive populations." Initiatives should include partnerships with the respective agencies and community organizations to create greenbelts through tree planting, enforce truck idling free zones, reduce diesel freight traffic from the schools when children are present, and the development of land-use plans that limit pollution-emission activities.

**Response to Comment Letter #4-1**

Regarding health outcomes please see Response to Public Meeting Comment #5-2. The Los Angeles County Department of Public Health is currently developing the new Community Health Improvement Plan (CHIP) (2019-2025) and the details of the CHIP have not been finalized. Staff

can commit to reviewing the finalized CHIP and incorporate air quality related information to address or mitigate emissions from oil drilling and production sites.

Real-time monitoring data is available for ambient levels of air pollution at the end of each hour in the form of an hourly average. The South Coast AQMD has launched its AB 617 Community Air Monitoring website and its Data Display tool featuring air quality data reporting from selected fixed community air monitoring stations. The primary goal of this tool is to share preliminary continuous air measurements in near real time and finalized results of laboratory analyses and mobile platform survey monitoring. Additional information can be provided upon request. In addition, monitoring strategies are incorporated in Chapter 5d, Action 1 to reduce fugitive emissions from oil wells and associated activities at oil drilling and production facilities. Monitoring strategies include conducting mobile monitoring around oil drilling sites to identify potential leaks and sharing monitoring data partner agencies. This action also includes making monitoring data available and online in a user-friendly format. Additional details on monitoring in this community can be found in the Community Air Monitoring Plan (CAMP) which can be found here: [https://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/wcwlb\\_camp.pdf?sfvrsn=6](https://www.aqmd.gov/docs/default-source/ab-617-ab-134/camps/wcwlb_camp.pdf?sfvrsn=6).

A number of factors can contribute to asthma incidences and hospitalization rates (e.g., dust, smoking, seasonal variations, wildfires, etc.). Thus, the number of or increased air pollution inspections may not correlate with lowering rates of asthma hospitalizations. For example, the Air Quality Index on South Coast AQMD's website can indicate "Unhealthy" air days based on ozone and PM and those with asthma or respiratory diseases are encouraged to stay indoors; regardless of increased enforcement, other contributors (e.g., weather, wind) can attribute to an "Unhealthy" air day and possibly exacerbate asthma incidences. Staff will work to identify additional actions to improve public health, including public health interventions that have a nexus to air quality improvements.

#### Response to Comment Letter #4-2

South Coast AQMD will prioritize buffer zones for sensitive populations when new or existing sources or programs that can provide funding for tree planting are identified. South Coast AQMD is looking to partner with appropriate entities and organizations to encourage greenbelts through tree planting, enforcing truck idling free zones, reducing diesel freight traffic near schools when children are present, and the development of land-use plans that reduce near-source exposures. Although partners have not yet been identified, staff has incorporated other actions to address truck idling emissions in Chapter 5d – Neighborhood Truck Traffic, Action 1 and railyard emissions in Chapter 5f – Railyards, Action 1. To reduce exposure to diesel emissions at schools, school air filtration systems will be installed with priority given to schools near truck routes, railyards, and/or major freeways and is included in Chapter 5g, - Schools, Childcare Centers, and Homes, Action 2. Although the CERP does not include an action on the development of land-use plans to limit pollution-emission activities, the South Coast AQMD California Environmental Quality Act

(CEQA) Intergovernmental Review (IGR) staff regularly reviews documents prepared through land-use agencies and provides comments. Any comments that are submitted on a project where we are a commenting agency, can be viewed online: <http://www.aqmd.gov/home/rules-compliance/ceqa/commenting-agency>.

AB617 Comment Form

**Comments (Unlimited Size) \***

Union Pacific appreciates serving on the Steering Committee, and we offer the following comments on behalf of ourselves and BNSF Railway.

1. Page 5-1 of the draft CERP states that "Regional rail volumes are projected to more than double between 2012-2040 in response to growing international trade." Many variables are at play, and recent volumes suggest that the projection may be optimistic, at least in the near-term.
  2. Page 5-1 indicates that two railyards are located within the Wilmington, Carson, West Long Beach community, including BNSF Watson and Union Pacific Dolores/Intermodal Container Transfer Facility (ICTF). Locomotives, drayage trucks, cargo handling equipment (such as cranes, top picks and off-road yard trucks), and Transport Refrigeration Units are used at the Dolores/ICTF yard, while the Watson yard has no drayage trucks, cranes, top picks, or off-road yard trucks.
  3. We suggest the following edit in the Federal Actions section on page 5-2 to clarify U.S. EPA's role in regulating locomotive emissions.
    - a. "Railroads operations are regulated at the federal level primarily by the Federal Railroad Administration and the Surface Transportation Board, while locomotive emissions are regulated by the U.S. Environmental Protection Agency."
  4. On page 5-2, the draft states that "[The EPA] regulations do not require railroads to reduce their usage of older, higher-emitting locomotives." Please add "Locomotives must meet federal emissions standards when they are remanufactured, and may become cleaner at that time."
  5. On page 5-2, the draft states: "In 2017, CARB also petitioned EPA to develop a new regulation requiring engine manufacturers to meet a cleaner Tier 5 emission standard for new engines." Please add "The CARB petition is under review by the EPA."
  6. Page 5-3 states that the District "is evaluating potential strategies to reduce emissions from railyards, including developing a potential regulation affecting railyards called an Indirect Source Rule (ISR), and/or other potential partnering strategies that could reduce emissions." The railroads have participated in workshops related to Facility Based Mobile Source Measures and will continue to engage with District staff and the community. Any ISR proposals must be within the District's legal authority.
  7. Page 5-3 states that "[EPA's] regulations limit idling for both new and remanufactured locomotives..." EPA regulations do not limit idling, but instead require the installation of devices that reduce idling on newly manufactured and remanufactured locomotives.
  8. UP and BNSF have a multi-decade track record of improving air quality within the District and appreciate the District's successful efforts to partner with us to provide incentives to develop and test new cleaner technology used in railyards and locomotives.
  9. The railroads are updating emissions inventories for several southern California railyards which show significant reductions. We are reviewing these with District staff.
  10. Again, thank you for the opportunity to be a member of the Steering Committee. Please call or email with questions.
- Lupe Valdez  
Senior Director Public Affairs, Southern California & Arizona  
Union Pacific Railroad

6-1

6-2

6-3

**Suba comentarios adicionales y archivos de soporte (30 Mb máximo por archivo)**

Archivos de comentarios sobre el CERP

**Response to Comment Letter #6-1**

Staff revised the sentence in Chapter 5f to "Regional rail container volumes are projected to increase between 2012 - 2040 in response to growing international trade." A footnote was added to note that "The BNSF Watson yard does not have drayage trucks, cranes, top picks, or off-road yard trucks."

**Response to Comment Letter #6-2**

Staff clarified the sentences in Chapter 5f to state "Railroad operations are regulated at the federal level primarily by the Federal Railroad Administration and the Surface Transportation Board, while locomotive emissions are regulated by the U.S. EPA." and "Locomotives must meet federal emissions standards when they are remanufactured, and may become cleaner at that time."

The Draft CERP included the sentence “The CARB petition is under review by the EPA”. However, to elaborate and provide clarification, in the Draft Final CERP staff has replaced this sentence with: “In 2017, the California Air Resources Board (CARB) petitioned the U.S. EPA to update emission standards for new and remanufactured locomotives, establishing a cleaner Tier 5 standard for new engines. The petition asked that the new emission standards go into effect in 2023 for remanufactured locomotives, and 2025 for new locomotives. South Coast AQMD supported the petition by sending a letter of support. The U.S. EPA acknowledged the receipt of the petition, but has not provided any update or plans for further action.” In addition, a footnote was also added to provide additional information: “Even if the U.S. EPA were to update the emission standards in response to the petition, the new standards would only apply to new and remanufactured locomotive engines. Given the slow turnover of the railroads’ fleet, emission reductions would not be immediate.”

Staff also included this sentence in Chapter 5f to provide information on the railroads: “The railroads have participated in workshops related to Facility Based Mobile Source Measures and will continue to work with South Coast AQMD staff and the community.” Staff removed the sentence “These regulations also limit idling for both new and remanufactured locomotives and mandate the use of ultra-low sulfur diesel fuel” and replaced the sentence with “These regulations require the installation of devices that reduce idling on newly manufactured and remanufactured locomotives.”

#### Response to Comment Letter #6-3

Staff will continue to work with the railroads on emissions inventory data and to provide incentives for cleaner technology that goes above and beyond current requirements.

The Los Angeles County Department of Public Health (LAC DPH) Toxicology and Environmental Assessment (TEA) Branch participates on the Wilmington, Carson, and West Long Beach AB617 Community Steering Committee. LAC DPH review and recommendations on the Discussion Draft CERP are included as an attachment.

Comment Letter #7

	<b>Environmental Health Services</b> Toxicology and Environmental Assessment	<b>Submitted By</b> Matt Baca, BSHA, DR, TLO, Project Manager
<b>Executive Summary</b> The Los Angeles County Department of Public Health (LAC DPH) Toxicology and Environmental Assessment (TEA) Branch participates on the Wilmington, Carson, and West Long Beach AB617 Community Steering Committee (CSC). LAC DPH has reviewed the draft CERP documents provided by SCAQMD through the lens of environmental science, policy, community engagement, information sharing, and past engagement with the community. The review utilizes the California Air Resource Board (CARB) Blueprint for a base line comparison in relations with relevant actions provided by the SCAQMD produced Community Emission Reduction Plan (CERP). LACDPH review and recommendations are listed below in the following table for consideration.		
Actions the CERP should focus on according to the Blueprint	Relevant actions from the CERP draft	DPH recommendations to address gaps
<u>Community Steering Committee</u>	There are 34 primary members that comprise the CSC Roster as per Table 2-1. Table 2-2 shows the number of attendees at the CSC meetings.	Based on our attendance at CSC meetings, several CSC primary or alternate members are not present. On average around 15 members do not show based on unclaimed tent cards. DPH recommends improving CSC attendance by sending out meeting schedules in advance and during work time hours. Also, reporting the number of CSC attendees and meeting minutes from each meeting in Table 2-2 for transparency and accountability purpose is important.
<u>Technical Foundation</u> : "...that characterizes the community specific air pollution challenges and identifies key pollutants to be addressed in the CERP...technical assessment will provide a community profile of baseline pollution..."	Not included in CERP	Chapter 3B "Source Attribution" must include the technical assessment of the community. The baseline pollution metrics must be established here for all contributing stationary, mobile, and area-wide sources. As outlined in the Blueprint, this section should provide the "community-level emissions inventories and available methodologies for identifying and assessing contribution emissions sources" such as diesel particulate reductions.

7-1

7-2

<p><u>Measurable targets:</u> "...designed to focus on health-based air quality objectives for reducing emissions and exposure caused by local sources within and directly surrounding selected communities...Establishing specific, quantifiable, and measurable targets is critical to guide strategy development, track progress over time, and provide the baseline from which emissions reductions can be tracked and reported."</p>	<p>Not included in CERP</p>	<p>DPH recommends that each Chapter 5A-5G identify the Measurable Targets to address community emissions reductions from 1) refineries, 2) ports, 3) truck traffic, 4) oil drilling and production, 5) railroads, and at 6) schools, childcare centers and homes. Additionally, include health-based and data-driven air quality objectives including, but not limited to, the collection of community-level health data to be able to link emissions reductions to improved health outcomes. It is important that both the targets and baseline are established; therefore, it is possible to track progress of emissions reductions over time.</p>	7-3
<p><u>Near-term deadlines:</u> "define actions to meet the targets to be achieved within five years, along with an implementation schedule that includes immediate actions over the five-year timeframe."</p>	<p>Estimated timelines are provided for each action, but majority of these timelines are associated with providing updates to the CSC. In addition, some of these timelines are well beyond the five-year timeframe (see Action #2 in Neighborhood Truck Traffic regarding CARB's New Regulations phase in 2024-2030).</p>	<p>Develop clear overall timelines for the purpose of establishing near-term deadlines or "estimated timelines" to achieve the measurable targets. Providing updates to the CSC is given as per the Blueprint. DPH recommends that the estimated timelines are directly related to when AQMD plans to have met the specified goals. For example, Action #2 in Ports identifies a goal to "complete technology demonstration for retrofitting ships". What is the deadline for completing these demonstration projects?</p>	7-4
<p><u>Implementation Strategies:</u> "Each strategy will include a timeframe for action and implementation...will complement existing programs but will also require new approach to accentuate and focus direct reductions in emissions and air pollution exposure within the community to meet the emissions reduction targets" including:</p>	<p>- CERP draft lacks analysis addressing how existing rules have so far resulted in improvement for Wilmington; e.g. how effective are existing rules at addressing the odor complaints shown in fig 4.1? CERP lacks a concise summary of new rules and regulations and analysis of how new rules will address identified gaps and result in AQ improvement.</p>	<p>- Conduct an analysis of existing rules and determine how effective current rules are for addressing air emissions in Wilmington; summarize gaps in existing rules and what new rules are needed to improve OVERALL air quality; needs to be specific for this community and address cumulative burdens.</p>	7-5

2

LACDPH TEA AB617 CERP Review 6-19-19

<p>- Use of BART in issuing permits for new and modified sources</p>	<p>- No actions in draft CERP that address BART in permitting</p>	<p>- SCAQMD can use the Sacramento BART Implementation Plan as a model and create a similar, specific and detailed plan for sources in Wilmington; use SCAQMD permitting data/info to create target goal and timeline for implementation</p>	7-5 Cont.
<p>- Facility-specific risk reduction audits</p>	<p>- Not included</p>	<p>- Use the info in Figure 3-3 on Key Stationary Sources to complete a facility-specific risk reduction audit; use SCAQMD records on the 940 permitted facilities and approximately 800 facility inspections conducted from 2016 to 2018 to determine what has been effective, what needs to change</p>	
<p>- Incentives for cleaner technology</p>	<p>- Incentive actions in draft CERP are minimal, lack baseline and target goals, and rely on funding to be identified in the future</p>	<p>- Using data on source attribution and health profile for Wilmington, conduct an analysis on available clean technology and how to target incentives to bring the most benefit in the fastest timeline possible for residents and other sensitive receptors</p>	
<p>- Enforcement strategies: assess existing non-compliance issues, enhanced complaint reporting, specific compliance goals, dedicated enforcement teams, track enforcement activities</p>	<p>- CERP lacks an assessment of existing non-compliance issues in Wilmington and lacks specific compliance goals for any of the enforcement strategies mentioned; plan includes a goal to respond to odor complaints "on an expedited basis" but no specifics are given</p>	<p>- Using list generated from Source Attribution chapter, conduct an analysis of past SCAQMD enforcement activities at those sites to produce a list of priority enforcement strategies to meet the requirements listed in column one; include goals related to timeline for compliance and discuss SCAQMD's ability to require expedited timelines</p>	
<p>- Engagement in land use and transportation strategies (setbacks, buffers, VMT etc)</p>	<p>- There are no land use actions included in the CERP; the schools section has one mention of looking for funding for trees; the CERP does not acknowledge SCAQMD's ongoing role in CEQA and other land use rules and processes</p>	<p>- SCAQMD can provide information on the District's input to date for CEQA actions in the Wilmington area; should provide and understanding on how SCAQMD can leverage its existing role in the CEQA process to reduce air emissions and exposures; links to use of BART in issuing permits; include City and</p>	

3

LACDPH TEA AB617 CERP Review 6-19-19

## Appendix RTC-50

-Mitigation measures for existing sources (barriers, air filters for homes etc.)	- Mitigation actions in the CERP are minimal; includes goal of expanding air filter installation at schools with no clear dates or specific plan for priority locations, no data included to gauge effectiveness	County Planning experts in the CSC and technical advisory groups  - Once Source Attribution section is completed, identify priority sensitive receptors to focus mitigation actions for most possible benefits to community members	7-5 Cont.
--	--	---	--------------

#### Response to Comment Letter #7-1

Staff will consider these suggestions for improving CSC member attendance. The Wilmington, Carson, West Long Beach (WCWLB) CSC consists of 34 primary and 23 alternate members. Unclaimed tent cards may be representative of alternate members. Generally, the WCWLB CSC meetings are well attended. The CSC meeting flyer is sent out as early as two weeks in advance through email and posted on social media through Instagram, Facebook, and Twitter. The approximate number of attendees for each CSC meeting and sign-in sheets are included in Appendix 2 of the CERP. On average about 25 (out of 34) CSC members attended the meetings. Overall, the number of attendees for each CSC meeting in the WCWLB community ranges from 60 to 100 attendees. Meeting minutes (summaries) are available online and include which CSC member was in attendance and sat at the CSC table. In addition, for CSC members that are not in attendance the meetings are available on Facebook live and have shown to have been viewed approximately 100 times.

#### Response to Comment Letter #7-2

Since the comment was submitted, the source attribution analysis has been included in the CERP based on emissions inventories. Please see Chapter 3b, section 2, and Appendix 3b for the requested information. The source attribution analysis includes the baseline reference (2017) and projected emissions from future milestone years of 2024 and 2029. The future milestone years include all rules and regulations that have been adopted since 2016. The projected emissions do not include any of the CERP actions.

#### Response to Comment Letter #7-3

Emission reduction targets, where quantifiable, have been included in Chapter 5a. Implementation of the CERP is estimated to reduce 1,700 tpy of NOx and 20 tpy of DPM emissions from mobile sources. These emission reduction targets are based upon mobile source incentive data from the replacement of heavy-duty diesel trucks and equipment, certain CARB regulations, and some refinery regulations. The estimated emission reductions for mobile source incentive projects in this community are estimated to be between 40 and 50 tpy of NOx and 0.5 to 0.6 tpy of DPM emissions. Some actions in the CERP will result in emission reductions that are not currently quantifiable, such as VOC fugitive emissions. Fugitive emissions cannot be estimated until monitoring and enforcement actions occur to identify the location and source of the emissions. Some rules and regulations require the rule development process to occur before emission reductions can be quantified and targeted.

South Coast AQMD staff has included a goal and estimated timeline for each proposed course of action in Chapters 5b-5g. To track emission reductions, baseline emissions have been established using emissions inventory data as noted in Chapter 3b and Appendix 3b. The source attribution analysis includes the baseline reference (2017) and projected emissions from future milestone years of 2024 and 2029. The future milestone years include all rules and regulations that have been adopted since 2016. The projected emissions do not include any of the CERP actions. In addition, monitoring strategies have been incorporated in the CERP to address the air quality priorities and track progress. Also, see Response to Public Meeting Comment #5-2 regarding a health baseline.

Response to Comment Letter #7-4

South Coast AQMD staff have included a goal and estimated timeline for each proposed course of action in Chapters 5b-5g. Chapter 5h has also been included in the CERP to outline the implementation schedule. Demonstration projects are ongoing. Applications are submitted and reviewed by the South Coast AQMD. If approved and awarded, contracts are executed. Deadlines for demonstration projects vary and are outlined in the contracts administered by South Coast AQMD Technology Advancement Office (TAO) staff.

Response to Comment Letter #7-5

Thank you for your comment. Current rules are outlined in the “Ongoing Efforts” section of each section in Chapter 5. To ensure progress is tracked, each action contains goals and estimated timelines. The goals include metrics designed to measure the progress of the CERP. Also, Chapter 5a provides 2017 emission levels and estimated future baseline emissions levels in years 2024 and 2030 with emission reduction targets. Additionally, Chapter 5h includes a commitment that the South Coast AQMD staff will provide an annual update to the CSC on the progress of meeting the emission reduction targets beginning in 2021. Improvements for overall regional air quality is addressed through the Air Quality Management Plan (AQMP), which is a blueprint for how the South Coast AQMD will meet federal ambient standards. Rules that may be amended through the AB 617 process will also help regional air quality, because any rules that are amended or adopted will be applicable to all sources under the South Coast AQMD jurisdiction in the Basin. Rules are periodically updated when gaps are identified. Improvements in air quality will help decrease the cumulative burden in the Wilmington, Carson, West Long Beach community.

South Coast AQMD has created targets and an implementation schedule for Best Available Retrofit Control Technology (BARCT). South Coast AQMD is currently dismantling the Regional Clean Air Incentives Market (RECLAIM) program, because the ability to achieve NOx emission reductions using a market-based approach has diminished. These RECLAIM NOx facilities, typically larger facilities, will transition to a command-and-control regulatory structure to ensure these facilities meet BARCT. Analyses are ongoing that give priority to older, higher polluting equipment that would need to install retrofit controls. Appendix 3a identifies RECLAIM facilities in the Wilmington, Carson, West Long Beach community. However, equipment at non-RECLAIM

facilities that are within this community and do not meet new BARCT requirements will be required to do so. As part of the BARCT process, the following South Coast AQMD Rules will be evaluated or have been evaluated: 1109.1, 1110.2, 1117, 1118.1, 1134, 1135, 1146, 1146.1, 1146.2, 1147, 1147.1, and 1147.2 for BARCT. The BARCT assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities has not been finalized. For each rule, a BARCT assessment must be completed which takes into consideration other technologies or limits by other entities outside of the area; thus, if Sacramento Air Quality Management District has more stringent limits or requirements, these would also be incorporated into applicable South Coast AQMD rules for BARCT, unless infeasible.

Facility specific risk assessments are conducted through the AB 2588 Air Toxics “Hot Spots” Program. The AB 2588 program is a statewide program that requires air districts to establish emissions inventory of air toxics from individual facilities. It requires certain facilities to conduct Health Risk Assessments based upon the toxicity and volume of toxic air contaminants released within proximity to potential receptors (e.g., hospitals, residences, etc.). If a facility exceeds a specified risk level, as determined by each air district, they are required to reduce risk by submitting a Risk Reduction Plan. Some facilities may voluntarily reduce their risk even further. Facilities within the Wilmington, Carson, West Long community that are currently in the AB 2588 program at the South Coast AQMD have been identified in Appendix 3a. Those facilities that have been identified as a high priority would have either been notified to reduce their risk or have already reduced their risk such that they may no longer rank high on the prioritization list.

Staff continues to evaluate various funding sources for all air quality priorities, including clean technology, for improving air quality as soon as possible. Actions in the CERP include identifying funding for incentives to accelerate the adoption of clean technology or replacement as soon as possible, such as Chapter 5c – Ports, Actions 2 and 3.

Enforcement strategies will be prioritized based on CSC input and availability of resources. Past enforcement actions (e.g., Notices of Violations or Notices to Comply) from January 2016 – December 2018 for facilities within the Wilmington, Carson, West Long Beach community have been identified in Appendix 4. Goals and timelines have been incorporated into the CERP actions for each of the air quality priorities.

The South Coast AQMD has an obligation to implement the California Environmental Quality Act (CEQA) as a lead and commenting agency. In that role, the South Coast AQMD takes the lead on rule and some permit projects to ensure a proper analysis in accordance with CEQA requirements. These tasks include an evaluation of potential environmental impacts, and identification of potential feasible mitigation to reduce or eliminate impacts, alternatives to the project, if warranted, as well as cumulative impacts. As a responsible agency, the South Coast AQMD verifies CEQA compliance before issuing air quality permits, and as a commenting agency, South Coast AQMD’s Intergovernmental Review (IGR) staff reviews the air quality analysis of other lead agencies’ CEQA documents, and when necessary, submits comments and suggestions

(e.g., feasible mitigation measures to reduce air emissions and toxic exposures). All comments submitted by the South Coast AQMD are available online at <http://www.aqmd.gov/home/rules-compliance/ceqa/commenting-agency>. CEQA documents prepared for permit projects that the South Coast AQMD is the lead agency are also available online at <http://www.aqmd.gov/home/research/documents-reports/lead-agency-permit-projects>.

Staff will continue to seek input from all interested parties including city and county planning experts, other lead agencies, responsible agencies, technical experts, as well as the general public for lead agency rule and permit projects. The South Coast AQMD provides draft environmental assessments online, evaluates comments received for consideration, and responds to those comments accordingly. CEQA documents received from other lead agencies, reviewed by IGR staff, or being prepared with the oversight of the South Coast AQMD staff can be found in a monthly report generated for the Governing Board meeting. A link to the most recent Board meeting can be accessed from this webpage: <http://www.aqmd.gov/home/rules-compliance/ceqa/commenting-agency>. The location of these projects in our jurisdiction are clearly identified in the document and will include those projects located in the Wilmington, Carson, West Long Beach community. Staff will discuss with the CSC and if the CSC agrees, staff will provide monthly or quarterly updates on CEQA IGR projects within the Wilmington, Carson, West Long Beach community can be provided.

As an ongoing effort, South Coast AQMD is currently dismantling the Regional Clean Air Incentives Market (RECLAIM) program, because the ability to achieve NO<sub>x</sub> emission reductions using a market-based approach has diminished. These RECLAIM NO<sub>x</sub> facilities, typically larger facilities, will transition to a command-and-control regulatory structure to ensure these facilities meet Best Available Retrofit Control Technology (BARCT). As a part of this effort an analysis of the equipment at each RECLAIM facility is being conducted that gives priority to older, higher polluting equipment that need to install retrofit controls. Equipment at non-RECLAIM facilities that are within the community and do not meet new BARCT requirements, will be required to do so. As part of the BARCT process, the following South Coast AQMD Rules will be evaluated or have been evaluated: 1109.1, 1110.2, 1117, 1118.1, 1134, 1135, 1146, 1146.1, 1146.2, 1147, 1147.1, and 1147.2. The BARCT assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities has not been finalized. More information on the RECLAIM transition can be found here: <http://www.aqmd.gov/home/rules-compliance/reclaim-transition>. Permit applications for stationary sources are reviewed and evaluated to determine if the source equipment meets current rules and regulations. New or modified sources that will result in emission increases greater than 1.0 pound per day of any non-attainment air contaminant are subject to Best Available Control Technology (BACT). More information on BACT can be found here: <http://www.aqmd.gov/home/permits/bact>. Permits that are issued are available on the Facility Information Detail (FIND) system: <https://www.aqmd.gov/nav/FIND>.

The CERP prioritizes the CSC's air quality priorities, which includes reducing exposure to sensitive populations at hospitals, senior centers, and schools. Chapter 5g, Action 2, focuses on reducing exposure to harmful air pollutants at schools. Based upon source attribution data, which identifies diesel PM as the primary toxic air contaminant contributor in this community, and CSC input, schools toxic air contaminant contributor in this community, and CSC input schools that are near truck routes, railyards, and/or major freeways (contributors of diesel PM in this community) will be prioritized for air filtration systems. After the approval of the CERP and during the implementation period of the CERP, specific schools will be further prioritized with the input of the CSC.

Comment Letter #8: Christopher Chavez – West Long Beach Resident, Coalition for Clean Air

June 24, 2019

Dr. William Burke and Board Members  
South Coast Air Quality Management District (SCAQMD)  
21865 Copley Drive  
Diamond Bar, CA 91765

**Re: Comments on AB 617 Community Emission Reduction Plans (CERP) Discussion Drafts and the WWLBC CERP**

Dear Chair Burke and the SCAQMD Board Members,

The Coalition for Clean Air (CCA) is writing to provide comments regarding the CERP discussion drafts for the Year 1 AB 617 communities. These communities include Wilmington/West Long Beach/Carson (WWLBC), San Bernardino/Muscoy (SBM) and East Los Angeles/Boyle Heights/West Commerce (ELABHWC)<sup>1</sup>. Since its passage in 2017, CCA has been actively involved with the implementation of AB 617 (C. Garcia) at both the statewide and air district level. We firmly believe AB 617 has the potential to transform and empower California's most environmentally burdened disadvantaged communities.

These comments are divided into two sections. Section I provides broad comments and recommendations that are applicable to all CERPs. Meanwhile, Section II provides comments and recommendations specific to the WWLBC CERP, where most of our AB 617 work is focused. In submitting these comments, we recognize the importance of the communities themselves having the most influence over their respective CERP. Our intentions in providing these comments are by no means an attempt to "speak" for a community.

**Section I: Comments applicable to all CERPs**

- CERPs should specify emission reduction targets that are based on attaining state and national air quality standards and reducing health impacts from air pollution.

Each CERP details various strategies and actions for addressing the top air quality concerns as identified by the respective Community Steering Committees (CSCs). However, the CERPs in their current form do not specify emission reduction targets (e.g., reduce Diesel Particulate Matter (DPM) emissions by X amount by 2023.) Rather, the CERPs treat actions as the end goal in and of themselves (e.g., the WWLBWC CERP identifies "Conduct [X amount of] focused inspections and targeted sweeps within a [insert proposed timeframe]" as a goal.)

8-1

<sup>1</sup> The ELABHWC CERP Discussion draft is only partially available as of the submission of this letter.

The only reference to the overarching goals of AB 617 can be found at the beginning of each CERP. However, even here the goals of the CERPs are vague: “The CERP is a plan for achieving air pollution emission and exposure reductions within a community, and is tailored to address community-specific needs and air quality priorities.” For the CERPs to be successful in bringing clean air to these communities, specific emission reduction targets are needed.

While AB 617 did not include specific emission reduction targets, it does mandate them. §44391.2(c)(3) of the Health and Safety Code (HSC) states “the community emissions reduction programs shall be consistent with the state strategy and include emissions reduction targets, specific reduction measures, a schedule for the implementation of measures, and an enforcement plan.” Additionally, many members of all three CSCs have requested the CERPs to include specified targets.

8-1  
Cont.

Given this statutory requirement and community needs, we urge SCAQMD to include specific emission reduction targets based on attaining state and national air quality standards and improved community health outcomes. Using these standards has two major advantages: first, attaining state and national air quality standards will help the South Coast Air Basin comply with California law and avoid Federal Clean Air Act sanctions. Secondly, using health metrics will provide the communities with a visible, easily understandable way to gauge air quality improvements.

- **Incentives alone will not meet the objectives of AB 617. SCAQMD must also increase enforcement, create tighter rules and require polluters to proactively reduce emissions.**

The CERP discussion drafts correctly acknowledge that a mixture of strategies will be needed in order to reduce emissions. This mixture of strategies includes increased enforcement, tightening up rules and penalties, providing incentives, as well as reaching out to and empowering the community. However, the CERPs show a strong preference for incentives over other approaches. For example, in the SBM CERP, the emission reduction strategies outlined for the Omnitrans Bus Yard focuses on using incentive funds to replace Compressed Natural Gas (CNG) buses with electric models. Similarly, the WWLBC CERP focuses heavily on clean truck incentives. Lastly, the ELABHWC CERP’s only goal that will actively reduce emissions from railyards is using incentives to replace diesel equipment.

8-2

While incentive strategies should be included as part of the CERP, other strategies need prioritization. For example, creating strong Indirect Source Rules (ISRs), mandating on-site mitigation and requiring, rather than just incentivizing, zero-emissions port and railyard equipment are clear examples where tighter rules will yield emissions reductions. Additionally, rules must be enforced in order to be effective. As such, SCAQMD should include tougher penalties as authorized in AB 617 and greater enforcement efforts as part of its overall strategy.

- **SCAQMD must meet the deadline for Best Available Retrofit Control Technology (BARCT) implementation, and more clarity between BARCT's role in the CERPs is needed.**

In addition to implementing the Community Air Protection program and creating CERPs, AB 617 also directs nonattainment air districts to expedite BARCT implementation. HSC §40920.6(c)(1) required air districts in nonattainment for one or more major air pollutants to adopt an expedited schedule for BARCT implementation. Implementation of BARCT must be completed by the earliest feasible date but no later than December 31, 2023. SCAQMD has approved a schedule outlining 17 rule updates, the last of which is scheduled to be considered in 2022. We urge SCAQMD keep to this implementation schedule and begin requiring expedited compliance with the updated rules.

8-3

Additionally, CSC members have expressed the need for more clarity over the intersection between CERPs and BARCT implementation. The WWLBC CERP only briefly mentions BARCT as a strategy to reduce emissions from refinery flaring. Meanwhile, BARCT is not referenced in the SBM CERP or (as of June 24, 2019) ELABHWC CERP at all. As such, we ask SCAQMD to provide more clarity of how BARCT will impact CERP implementation, which local emission sources will be covered by BARCT, and how BARCT will provide air quality improvements to AB 617 communities.

- **SCAQMD's focus should include, but not be overly specific to concerns expressed during the CSC process.**

One of the key aspects of AB 617 and SCAQMD's implementation of the bill is giving community members the opportunity to identify specific emissions concerns. SCAQMD staff should be commended for drafting the CERPs in a way which reflect these community concerns. However, emissions sources like refineries and other industrial sources are very complicated and have many ways of emitting air pollution. For example, the WWLBC CERP specifies refinery boilers and heaters as being community concerns. However, this should not be interpreted to exclude cracking units and other refinery infrastructure and operations. Rather, SCAQMD should be focused on reducing emissions from the overall source – in this instance, the refinery – rather than its specific components identified by the CSC. While staff comments to the CSC suggest SCAQMD will take a broader approach, it should be made clear in the CERP.

8-4

- **To the greatest extent possible, all proposed emission reductions should meet State Implementation Plan (SIP) creditable criteria (quantifiable, surplus, enforceable and permanent). However, emission reductions that don't meet these criteria (e.g., working with local agencies to rectify bad land use decisions) should be considered.**

The emission reductions achieved by the CERPs should be real, meaningful, and verifiable. The closer they are to meeting the criteria for being SIP creditable, the more

8-5

confidence the community will have in the effectiveness of the Community Air Protection program. At the same time, we recognize that not all important reduction measures lend themselves to meeting these criteria. Other opportunities should not be ignored.

8-5  
Cont.

## Section II: Comments applicable to the WWLBC CERP

- **The WWLBC CERP must be more aggressive in reducing emissions from the ports and drayage operations.**

According to an SCAQMD staff presentation, just under 86% of all toxic air contaminants within the WWLBC community is DPM. As such, reducing DPM emissions is vital to the WWLBC CERP's success. While the WWLBC CERP references several CARB rules in development specifically to reduce air pollution from port sources such as drayage trucks, commercial harbor craft, ocean-going vessel fuel and at-berth rules, the CERP fails to commit SCAQMD to publicly supporting these rules. At minimum, SCAQMD should make written and verbal comments in support of these rules when they are being contemplated by CARB to help secure stronger regulations to reduce port air pollution in the South Coast Basin and throughout the state. Further, SCAQMD support for these rules should be made clear in the WWLBC CERP as well.

8-6

Additionally, many of the port-related actions outlined in the CERP should be strengthened:

- With respect to Action 1, "Reduce Leaks from Oil Tankers," this action's responsibilities should include specific deliverables and dates for completion for the responsible agencies identified.
- With respect to Action 2, "Reduce Emissions from Ships and Harbor Craft," the Ports of Los Angeles and Long Beach should be specifically listed among implementing agencies with responsibility to conduct outreach and education among shipping lines and harbor craft owners regarding new technologies and fuels available to reduce emissions in the operations of their vessels. Although such education and outreach are listed as a course of action, no agency is listed as responsible for such outreach. The Ports are best able to share such information directly with shipping lines and harbor craft owners and should be listed as such. Further, this action's responsibilities should include specific deliverables and dates for completion for the responsible agencies identified.
- With respect to Action 3, "Reduce Emissions from Port Equipment (Cargo-Handling Equipment) and Drayage Trucks," the first responsibility listed under SCAQMD should state, "Continue development of FBMSM (Facility Based Mobile Source Measure.) Conduct outreach to CSC for FBMSM work groups, workshops, and meeting participation. COMPLETE AND IMPLEMENT"

8-7

8-8

8-9

FBMSM BY SECOND QUARTER OF CALENDER YEAR 2020." As stated above, all responsibilities identified in the CERP should include specific deliverables and dates for completion of those responsibilities.

8-9  
Cont.

- **ISRs should be included as part of the WWLBC CERP's actions for addressing neighborhood truck traffic, as should working with local governments to move trucks away from sensitive receptors.**

The "Neighborhood Truck Traffic" strategy in the WWLBC CERP has no reference to ISRs being an action. Rather, the strategy refers to the broader FBMSM, which is mostly focused on port and drayage operations. This is problematic, as the WWLBC community includes warehouses, fuel depots, chassis yards and fueling stations that attract trucks and truck-related emissions. While this is partially addressed through the WWLBC CERP's strategy of enforcing CARB's anti-idling rules, ISRs should also be included as an action for neighborhood truck traffic. ISRs are referenced in WWLBC's & ELABHWC "Railyards" strategies and are also included in the SBM CERP's strategy for "Neighborhood Truck Traffic."

8-10

Additionally, the WWLBC CERP needs stronger language relating to reducing emissions exposure from trucks. Currently, the WWLBC CERP specifies three actions to reduce truck emissions around and exposure at sensitive land uses: enforcing CARB's anti-idling rules, public outreach and installing ventilation filtration systems. However, the SBM CERP includes a more robust action: working with local governments to move trucking routes away from sensitive receptors. Many schools and other sensitive receptors within the WWLBC community are on streets and roads heavily used by trucks. As such, we strongly urge SCAQMD to include moving truck traffic away from sensitive receptors as an action in the WWLBC CERP.

- **SCAQMD should work with local governments to create a 2,500-foot buffer zone between new residential or sensitive land uses and oil and gas operations**

Owing to the region's history as one of the most productive oil fields in the world, thousands of active and inactive oil and gas wells are spread across the WWLBC community. Many of the wells are underneath or near residential or sensitive land uses, and residents frequently complain about odors and emissions from these operations. While the WWLBC CERP specifies several strategies and action for reducing emissions from these operations, there is one action that's missing. SCAQMD should work with local governments to create a 2,500-foot buffer zone between residential or sensitive land uses and oil and gas operations. Though the WWLBC community is by far the most impacted by oil and gas operations, the buffer zone should also be applicable to all residential and sensitive land uses.

8-11

- **The Memoranda of Understanding (MOU) being negotiated with the Ports should be designed to meet air quality attainment goals rather than duplicating the Clean Air Action Plan (CAAP).**

The commitments made by the Ports of Los Angeles and Long Beach in their most recent CAAP are not enforceable by SCAQMD and may not be permanent. For example, some CAAP commitments are reliant on Port-sponsored feasibility studies and do not provide assurance that specific commitments will be met. Therefore, the CAAP commitments lack credibility and provide the community with little more than skepticism about the Ports' promises for a better, less polluted future.

8-12

- **More information on current efforts to reduce emissions from railyards is needed, and the MOU and ISR action for railroads must be clarified and strengthened.**

On page 5-3, under "State Actions (CARB)," the text does not provide any information regarding the railyards' compliance with the second agreement in 2005 between CARB, BNSF and Union Pacific. This information should be provided to the CSC and a summary of what the railroads have done to comply with the second rule should be included in the CERP.

8-13

With respect to Action 1, "Reduce Emissions from Railyards," under South Coast AQMD responsibilities, a specific date should be listed for the completion and implementation of the indirect source requirements for railyards, so as to provide the impacted communities with certainty regarding when the railyards and railroads can be expected to do their part in reducing pollution.

Further, there are NO responsibilities assigned to the railroads themselves. Once the indirect source requirements are implemented, the railroads should have the responsibility of complying with the indirect source requirements themselves.

- **Phase out Modified Hydrofluoric Acid (MHF) at refineries**

While not specific to AB 617, eliminating the use of MHF is critically important. Only two refineries in California use MHF and both jeopardize the WWLBC community (one refinery is within the community while the other is approximately one mile from the Normandie Avenue western border.) Industrial accidents (such as the 2015 Torrance Refinery explosion and the December 2018 MHF leak), cyberterrorism and large seismic activity can result in a catastrophic MHF release. Should an MHF release occur, a concentration as low as 35 parts per million can cause serious injury or death. The CERP should include a commitment to phasing out MHF, as well as anticipate potential emissions and economic impacts from the phase out and conversion process.

8-14

CCA appreciates the opportunity to submit these comments. We look forward to continuing our involvement with the AB 617 implementation process and will continue to provide feedback on the implementation of this important legislation.

8-14  
Cont.

Sincerely,

Christopher Chavez  
Deputy Policy Director  
Member (West Long Beach Resident), WWLBC AB 617 Community Steering Committee

#### Response to Comment Letter #8-1

Regarding emission reduction targets see Response to Public Meeting Comment # 1-2. Emission reductions from actions in the CERP that result in SIP approved rules will contribute to the South Coast Air Basins' attainment of the state and national air quality goals and improve community health outcomes.

#### Response to Comment Letter #8-2

Incentives are among the strategies used in the CERP because they can bring expedited emissions reductions above and beyond current requirements. However, the CERP does not rely on any one type of strategy, and instead uses a combination of strategies to reduce emissions, including regulation, enforcement, air monitoring, outreach and incentives. The totality of these actions will bring emission reductions to this community, as quantified in Chapter 5a. Penalties for issued Notices of Violation are determined on a case by case basis.

#### Response to Comment Letter #8-3

As an ongoing effort, South Coast AQMD is currently dismantling the Regional Clean Air Incentives Market (RECLAIM) program, because the ability to achieve NOx emission reductions using a market-based approach has diminished. These RECLAIM NOx facilities, typically larger facilities, will transition to a command-and-control regulatory structure to ensure these facilities meet BARCT. As a part of this effort an analysis of the equipment at each RECLAIM facility is being conducted that gives priority to older, higher polluting equipment that need to install retrofit controls. Equipment at non-RECLAIM facilities that are within the community and do not meet new BARCT requirements, will also be required to do so. As part of the BARCT process, the following South Coast AQMD Rules will be evaluated or have been evaluated: 1109.1, 1110.2, 1117, 1118.1, 1134, 1135, 1146, 1146.1, 1146.2, 1147, 1147.1, and 1147.2. The BARCT

assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities has not been finalized.

Response to Comment Letter #8-4

The CERP focuses on air quality concerns prioritized by the CSC. However, the plan also includes actions that are based on the Source Attribution Report in Chapter 3b and provides emission reduction targets for a broader range of emission sources than specified by the CSC. For example, as opposed to only addressing emissions from refinery boilers and heaters prioritized by the CSC the CERP addresses emissions from other equipment used at petroleum refineries, such as, gas turbines, fluid catalytic cracking units, sulfur recovery units, gas turbines, incinerators and a coke calciner (see Action 5 in Chapter 5b).

Response to Comment Letter #8-5

The emission reduction targets quantified in the CERP are in part based on actions that will result in emission reductions that meet the SIP creditable criteria (i.e., quantifiable, surplus, enforceable, and permanent). See response to Comment 8-1 for additional details.

Response to Comment Letter #8-6

The CERP includes measures in Action 2 of Chapter 5c – Ports for South Coast AQMD staff to support CARB’s rule development for the proposed At-Berth Regulation and future updates to rules for other port-related mobile sources (e.g., commercial harbor crafts, drayage trucks, and cargo handling equipment). South Coast AQMD staff will monitor and participate in the development of these regulations to support and accelerate the deployment of zero and near-zero emission technologies at the Ports as early as practicable.

Response to Comment Letter #8-7

Chapter 5c – Ports, Action 1 in the CERP includes an estimated timeline and specifies the agencies responsible for implementing the Action. For example, the Action specifies that South Coast AQMD staff is responsible for using optical gas imaging technology, air measurements, and other available information to identify oil tankers with fugitive emissions leaks. Also, based on the estimated timeline for this Action the South Coast AQMD staff is responsible for providing the CSC with quarterly updates on these activities beginning in mid-2020.

Response to Comment Letter #8-8

In the CERP the Ports are listed as implementing agencies for Action 2 of Chapter 5 – Ports. Based on this Action the Ports and South Coast AQMD are responsible for working together to hold one outreach event per year to provide equipment owners and operators information about incentives (e.g., opportunities for cleaner ships and harbor craft).

Response to Comment Letter #8-9

Staff incorporated CCA’s request to add that South Coast AQMD would continue to develop Facility Based Mobile Source Measures (FBMSM) for the Ports (through an MOU) and to conduct outreach to CSC members for FBMSM working groups, workshops, and meetings. CCA requested

that South Coast AQMD complete and implement a FBMSM by second quarter 2020. South Coast AQMD's goal is to develop an MOU with the Ports in early 2020.

Response to Comment Letter #8-10

Action 2 of Chapter 5d: Neighborhood Truck Traffic in the CERP includes a measure that commits South Coast AQMD staff to continue to develop Facility Based Mobile Source Measures for warehouses. Additionally, the same action includes a measure to work with the city of the county to evaluate potential designated truck routes and identify resources to enforce these routes.

Response to Comment Letter #8-11

South Coast AQMD requires mandatory disclosure of oil field chemical use for well drilling, well completion and well rework activities. Rule 1148.2 requires well operators and chemical suppliers to submit and report chemical usage data related to routine oil and gas activities. This information is available on South Coast AQMD's website at: <http://www.aqmd.gov/home/rules-compliance/compliance/1148-2>. Also, Rule 1148.2 requires well operators to notify South Coast AQMD of certain well activities that occur within 1,500 feet of a sensitive receptor such as a residence, school, hospital, or other health care facility. Additionally, the Draft Final CERP includes a measure to review the Los Angeles County Department of Health's Community Improvement Plan (CHIP) and provide the Los Angeles County Department of Health with technical support (e.g., air quality data) to mitigate air quality impacts from oil drilling and production sites.

The South Coast AQMD is aware that the City of Los Angeles is looking at the feasibility of establishing setbacks for sensitive receptors within a specified distances of an existing or a new oil and gas well. The City of Los Angeles' report recognized that other engineering and operational controls can provide additional public health protection. The CERP includes an action that is based on engineering and operational controls that focuses on oil drilling and production that can complement efforts at the City of Los Angeles or other local jurisdictions. These control strategies are designed to improve early leak detection, reduce fugitive emissions from leaking wells, use of advanced air measurement technologies to screen wells, and follow-up investigation and enforcement activities to ensure leaks are fixed. This action includes rule development for Rule 1148 series and Rule 1173 to reduce emissions and improve reporting. The South Coast AQMD staff will monitor the City of Los Angeles' efforts on this issue.

Response to Comment Letter #8-12

South Coast AQMD is currently working with the Ports to quantify the emission benefits associated with implementation of SIP creditable CAAP measures. The MOU is intended to establish metrics and mechanisms to monitor the implementation of these measures and to track progress toward achieving actual emission reductions.

Response to Comment Letter #8-13

According to CARB both BNSF and Union Pacific (UP) railroads met the 2005 Agreement provisions that included the following:

- Rail yard inventories and modeling (enabling the HRAs and community processes),
- Idle reduction devices,
- Lower sulfur fuel, and
- Facility inspections.

BNSF and UP's compliance with the 2005 agreement with CARB has been added in Chapter 5e, within the "State Actions (CARB)" section under "Ongoing Efforts". The compliance status of both of these railroads have been included within the Wilmington, Carson, West Long Beach CERP.

One of the strategies South Coast AQMD is evaluating to reduce emissions from railyards is through Indirect Source Rules (ISR). The development of ISRs was initially intended to address regional air pollution, specifically nitrogen oxides (NOx) emission reductions, and to attain the National Ambient Air Quality Standards as required by the Clean Air Act. However, the CSC has made it clear that an ISR must also focus on reducing localized impacts, and staff will consider that focus in the rulemaking process. South Coast AQMD staff's goal is to present the railroad ISR proposal to the Governing Board in the fourth quarter of 2020.

Staff acknowledges that rail operators play a key role in reducing emissions within the Wilmington, Carson, West Long Beach community. South Coast AQMD staff will continue to work with CARB and both BNSF and UP to reduce emissions.

#### Response to Comment Letter #8-14

South Coast AQMD is currently considering the issue of the storage and use of MHF at the two local refineries. Recently, the Governing Board directed staff to work with both the community and industry to reach resolution and present to the Refinery Committee for review, with the Committee making recommendations to the full Board. Staff held 19 meetings with the community, unions, and refineries discussing both an MOU and a rule approach. As directed by the Board, staff presented the status of these meetings to the Refinery Committee on Saturday June 22, 2019. This is an ongoing effort that is being developed under Board directive in a process that is open to the public and all interested parties. Potential emissions and economic impacts from any action to be taken will be evaluated as appropriate through environmental and socioeconomic analyses. For more information on this effort, please visit South Coast AQMD's website at <https://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/proposed-rules/proposed-rule-1410>.

Comment Letter #9: Tim DeMoss – Port of Los Angeles

Comment Letter #9

Diamond Bar, CA 91765

**SUBJECT: COMMENTS ON AB 617 WILMINGTON, WEST LONG BEACH, CARSON DRAFT COMMUNITY EMISSIONS REDUCTION PLAN**

The City of Los Angeles Harbor Department (Port of Los Angeles or Port) appreciates this opportunity to provide comments to South Coast Air Quality Management District (SCAQMD) on the AB 617 Wilmington, West Long Beach, Carson Draft Community Emissions Reduction Plan (CERP).

The Port of Los Angeles has the following comments on Chapter 5C – Ports, on the Wilmington, West Long Beach, Carson CERP.

**A) Corrections in section titled “San Pedro Bay Ports Clean Air Action Plan (CAAP)”**

1. The first paragraph of this section contains the following sentence:

*“The Port of Los Angeles also provides funding for ships participating in a technology demonstration program.”*

9-1

Funding for ship projects can be provided by the ports of Los Angeles and Long Beach (Ports). The Ports have a joint Technology Advancement Program (TAP) that provides funding for technology demonstration programs. More information on the Ports' joint TAP can be found at the link below.

<http://www.cleanairactionplan.org/technology-advancement-program/>

2. The second paragraph of this section contains the following sentence:

*“Under this program, beginning in 2020, all heavy duty trucks will be charged a rate to enter the Ports' terminals....”*

9-2

Please include the following information from the CAAP Update at the link below:

<http://www.cleanairactionplan.org/documents/final-2017-clean-air-action-plan-update.pdf/>

The CAAP 2017 Update states on pages 39-40 that initiation of the truck rate will be contingent on several critical elements:

9-2  
Cont.

1) Promulgation of a near-zero-emission standard by California Air Resources Board (CARB); and 2) Economic study to establish the Clean Truck Fund rate that will evaluate the capacity of the industry to absorb this expense, the effect on the Ports' economic competitiveness and the potential for cargo diversion; and 3) Completion of the Truck Feasibility Assessment, including evaluation of availability of trucks meeting the CARB certification level; and 4) Establishment of a truck rate collection mechanism.

3. In footnote 10, please include the Port of Long Beach's Green Ship Program, see link below.

9-3

<http://www.polb.com/environment/air/greenflag.asp>

**B) Clarification in Action 1, Section "Implementing Agency, Organization..."**

Port of Los Angeles' tenants, not the Port, must grant access to their terminals. The Port is willing to facilitate contact with our tenants for SCAQMD and CARB staff to arrange inspections of the terminals; however, the Port cannot guarantee access.

9-4

**C) Clarification in Action 3**

1. In the "Course of Action" section, the fourth bullet states:

*"Continue developing Facility-Based Mobile Source Measures (FBMSM) for Ports"*

The Port requests addition of "through a Memorandum of Understanding (MOU) with the Ports" after FBMSM. We appreciate the ongoing work between the Ports and SCAQMD on the MOU based on the 2017 San Pedro Bay Ports CAAP Update.

9-5

2. In the "Estimated Timeline" section, the Port requests inclusion of CARB promulgation of a near-zero emissions manufacturing standard in the "... based on feasibility assessment study for trucks and truck rate study..." in the second bullet.

9-6

AB 617 Team

Page 3

3. In the *"Implementing Agency, Organization..."* section, the Port again requests to include "through a MOU" after FBMSM under SCAQMD's Responsibility.

9-7

**D) General Corrections**

1. Consistency on capitalization of Ports. There are areas where Ports are capitalized and other parts where Ports are in lower case.
2. Spelling errors in Action 3 for *"handling"* and *"targeted."*

9-8

The Port of Los Angeles would like to thank SCAQMD for continuing to work with us in achieving significant public health benefits.

Sincerely,

CHRISTOPHER CANNON  
Director of Environmental Management

APP No.: 110128-840

Response to Comment Letter #9-1

In Chapter 5c – Ports, under the section titled "San Pedro Bay Ports Clean Air Action Plan (CAAP) – Port of Long Beach and Port of Los Angeles" the sentence "The Port of Los Angeles also provides funding for ships participating in a technology demonstration program" was rewritten to "The Ports also provide funding for ships participating in a technology demonstration program through the joint Technology Advancement Program (TAP)." Staff included a reference at the end of the rewritten sentence that provides the link provided by the commenter.

Response to Comment Letter #9-2

In Chapter 5c – Ports, under the section titled "San Pedro Bay Ports Clean Air Action Plan (CAAP) – Port of Long Beach and Port of Los Angeles" the sentence in the second paragraph was changed from "Under this program, beginning in 2020, all heavy duty trucks will be charged a rate to enter the Ports terminals..." to "By 2035 only trucks that are certified to meet zero-emissions will be exempt from the rate. Initiation of the truck rate is contingent on certain elements (e.g., an economic study to establish the rate)." Staff included a reference at the end of the new sentence that provides the link provided by the commenter.

Response to Comment Letter #9-3

In Chapter 5c – Ports, an additional reference (12) was added to include information about the Port of Long Beach’s Green Flag Incentive Program.

Response to Comment Letter #9-4

Chapter 5c – Ports, Action 1, under the “Implementing Agency, Organization, Business or Other Entity” section, has been updated to “Tenants of the Ports (Los Angeles and Long Beach)” and “Work with South Coast AQMD, CARB, and the Ports’ tenants to facilitate contact between the regulatory agencies and tenants to arrange inspections of the terminals”.

Response to Comment Letter #9-5

Chapter 5c – Ports, Action 3, the fourth bullet point under the “Course of Action” section was clarified as “Continue developing FBMSM for Ports through an MOU”. In the event that the MOU approach is not successful and emission reductions are not achieved, staff will recommend the Governing Board consider a regulatory approach (i.e., ISR) for reducing emissions from the Ports.

Response to Comment Letter #9-6

In Chapter 5c – Ports, Action 3, the second bullet point under the “Estimated Timeline” section was revised to “Beginning 2020, implement Ports’ Clean Truck Program as described in the CAAP (based on feasibility assessment study for trucks and truck rate study and the promulgation of near zero-emission manufacturing standards by CARB)”.

Response to Comment Letter #9-7

Chapter 5c – Ports, Action 3, under “Implementing Agency, Organization, Business or Other Entity” section has been revised to, “Continue development of FBMSM through a MOU and conduct outreach to CSC for FBMSM working groups, workshops, and meetings”, under South Coast AQMD’s responsibility.

Response to Comment Letter #9-8

The term “Ports” was used when applicable to the Port of Long Beach and the Port of Los Angeles. The capitalization of Ports and spelling errors for “handling” and “targeted” have been addressed throughout the CERP.

TO: South Coast Air Quality Management District - AB 617 Team  
21865 Copley Dr, Diamond Bar, CA 91765

SUBJECT: AQMD AB617 Community Emission Reduction Plan (CERP) Comments

Dear AB 617 Team,

I am writing in response to the request for comments on the AB 617 Community Emission Reduction Plan (CERP). Below is a series of comments related to the oil drilling and production sections:

*Chapter 5: Actions to Reduce Community Air Pollution, Oil Drilling and Production*

*Action 2: Improved Public Information and Notifications on Activities at Oil Drilling and Production Sites*

*Course of Action: Work with stakeholders to identify and implement key areas for improvement for the Rule 1148.2 information and notifications. Work with local public health departments on health-related messaging on risks and how to reduce exposures.*

**OPNGAS Comment #1:**

Pursuant to Rule 1148.2, onshore oil and gas well operators and their chemical suppliers are required to submit data on chemical usage for events including well drilling, well completion, well rework, and well stimulation within the SCAQMD. Operators must submit notification of well drilling, completion, or rework between 10 and 2 days prior to starting.

However major data gaps regarding chemical identities, properties, and data reliability need to be addressed. In a recent study by my office where SCAQMD chemical and event data from June 4, 2013 to August 31, 2018 were downloaded on August 31, 2018, a total of 327 chemicals reported in the SCAQMD dataset could not be definitively identified by Chemical Abstracts Service Registration Number (CASRN) and were labeled trade secret chemicals.

Chemical information that is submitted by operators includes errors, such as incorrect CASRNs, obvious misspellings, and inconsistent data entries.

10-1

Table 1. Examples of chemicals with invalid CASRNs that could be identified.

Standardized Name	Correct CASRN	Original Reported Name	Original Invalid CASRNs
Alcohols, C12-15 ethoxylated	68131-39-5	Ethoxylated alcohol C12-15	683131-39-5
Bentonite	1302-78-9	Bentonite	1305-78-9
Isotridecanol, ethoxylated	9043-30-5	Isotridecanol, ethoxylated	9403-30-5
Pine oil	8002-09-3	Terpene hydrocarbon	80020-90-3 8002-09-0

10-1  
Cont.

The lack of strict quality control over operator submitted data hinders analysis and usability of the dataset.

SCAQMD should verify and validate all submitted chemical and mass usage information. Mass, density, concentration, and volume data should be required for all chemical disclosures, including trade secret chemicals, to ensure mass usage data is adequate and verifiable. Data reported to SCAQMD should be compared to and verified against other datasets, including those which are only reported to regulators and not publicly available.

SCAQMD should adopt approaches to chemical use reporting similar to SB 4 but also require operators to disclose all trade secret chemicals for all events associated with oil and gas operations in general and not only for hydraulic fracturing and well stimulation. SCAQMD should continue to work with chemical suppliers to come up with solutions to protecting trade secrets while at the same time encouraging disclosure, such as is exercised under AB 1328.

#### OPNGAS Comment #2:

The disjointed nature of the SCAQMD dataset hinders analysis and usability of the dataset. The SCAQMD dataset is maintained as separate event and chemical reporting datasets, which themselves are further divided into the periods before and after September 4th, 2015. Chemical reporting data (e.g. chemical names, masses, etc.) and event notification data (e.g. event type, start date, latitude, longitude) are in separate datasets. SCAQMD should maintain their data as one integrated dataset that combines both event and chemical reporting data from all time periods.

10-2

#### Chapter 5: Actions to Reduce Community Air Pollution, Oil Drilling and Production

##### Action 3: Evaluate Feasibility to Amend Rule 1148 Series to Reduce Emissions and Require Additional Reporting

Course of Action: Consider amendments to Rule 1148 series and Rule 1173 to reduce emissions and improve emissions reporting from oil drilling and production sites. Examples of additional requirements that could be considered are:

- Leak detection technologies and programs
- Lower-emission or zero-emission equipment for on-site operations
- Annual reporting of emissions
- Improved reporting of chemicals used on-site
- Additional requirements to conduct root-cause analysis and implement odor minimization plans when odors are traced back to a facility

**OPNGAS Comment #3:**

- "Lower-emission or zero-emission equipment for onsite operations" should be specified as Tier 4, Tier 3 or LEV III engines.

10-3

**OPNGAS Comment #4:**

- "Annual reporting of emissions" should be monitoring based rather than operator reported to verify volume as well as understand emission patterns over time.

10-4

**OPNGAS Comment #5:**

- "Improved reporting of chemicals used on-site" The lack of strict quality control over operator submitted data and the disjointed nature of the SCAQMD dataset hinders analysis and usability of the dataset. Chemicals from the California Environmental Reporting System (CERS) should also be included in the disclosures.

10-5

**OPNGAS Comment #6:**

Other additional requirements to add are:

- Real Time Fence line air monitoring (including for alkanes, VOCs, H<sub>2</sub>S, SO<sub>x</sub>, Criteria pollutants and Hazardous Air Pollutants) for background conditions, changes and leak detection targeting
- Requirements for vapor recovery systems
- NO<sub>x</sub> Reduction programs including requirements for tuned equipment, idling limits, electric temporary power, permitted micro turbines and diesel particulate filters.
- Meteorological Stations to aid in community notifications

10-6

**OPNGAS Comment #7:**

There is a large focus on well drilling, but many emissions are also generated during well rework and maintenance activities (heavy diesel equipment is brought in, drill rigs, etc.). Include further measures to capture emissions from 24 hours / 7 days a week operations and maintenance work done on drill sites.

10-7

We appreciate that SCAQMD is seeking input from the public and local organizations on this important monitoring plan and are glad to have the opportunity to comment. If you have any questions, please feel free to reach me at (213) 978-1697 or via email at Uduak.Ntuk@lacity.org.

Sincerely,

Uduak-Joe Ntuk

**PETROLEUM ADMINISTRATOR**

c: UJN:eb

Response to Comment Letter #10-1

South Coast AQMD staff revised Action 3 of Chapter 5e: Oil Drilling and Production in the Draft Final CERP to include a measure for considering amendments to the 1148 series rules (e.g., Rule 1148.2 – Notification and Reporting Requirements for Oil and Gas Wells and Chemical Suppliers). Considerations would include improving reporting of chemicals used on-site, such as event and chemical reporting information as described in the Draft Final CERP.

Response to Comment Letter #10-2

South Coast AQMD staff will review the dataset and evaluate the feasibility of combining both event and chemical reporting data from all time periods in a more user-friendly format.

Response to Comment Letter #10-3

South Coast AQMD staff will conduct a review of on-site equipment during the rule development process and consider the classification of equipment. Certain on-site equipment may be regulated by CARB (e.g. portable engines). South Coast AQMD staff will work with CARB staff to identify on-site equipment, equipment classifications, and potential measures to reduce emissions from on-site operations.

Response to Comment Letter #10-4

Air monitoring efforts are outlined in the Community Air Monitoring Plan (CAMP) to address oil drilling and production sites. These air monitoring efforts may help supplement annual emissions reports by providing additional information about emission levels measured over time.

Response to Comment Letter #10-5

South Coast AQMD staff will review and consider these suggestions during rule development activities for Action 3 of Chapter 5e: Oil Drilling and Production.

Response to Comment Letter #10-6

The South Coast AQMD staff incorporated these suggestions into Action 3 of Chapter 5e: Oil Drilling and Production under the considerations to amend the Rule 1148 series.

Response to Comment Letter #10-7

Staff will monitor or inspect these sites during well rework and maintenance activities as resources are available. If elevated levels are observed through the monitoring efforts detailed in the CAMP, monitoring staff may remain at a location of concern for a longer period of time or compliance staff may follow up with an investigation to identify and address the emissions being generated during well rework and maintenance activities. Also, Action 3 of Chapter 5e: Oil Drilling and Production specifies considerations for lowering emissions from on-site equipment, improving emission controls during well rework and maintenance activities, and lower emission or zero-emission equipment for on-site operations.

The City of Los Angeles July 29, 2019 report “Council File No 17-0447 – Feasibility of Amending Current City Land Use Codes in Connection With Health Impacts at Oil and Gas Wells and Drill Sites” suggested that one possible way to improve health oversight is to have “Los Angeles County deputize the Los Angeles City Fire Department with health officer authority for oversight and inspections of oil and gas facilities within the City. This action would be proactive for future incidents and move away from a more reactive model of oversight while empowering our local emergency services agency, LAFD, to have more oversight related to oil and gas operation.”

RE: AB 617 Draft Community Emissions Reduction Plans and  
Community Air Monitoring Plans

Dear Drs. Fine and Ghosh,

On behalf of the members of the California Council for Environmental and Economic Balance (CCEEB), we appreciate the opportunity to submit comments on the South Coast Air Quality Management District (SCAQMD or "District") draft community emissions reduction plans (CERPs) and draft community air monitoring plans (CAMPs). The SCAQMD has been a leader in developing AB 617 programs and policies, and its work in the communities of Wilmington-Long Beach-Carson, Boyle Heights-East Los Angeles-West Commerce, and San Bernardino-Muscoy serves as a model statewide for achieving targeted and effective emissions and exposure reductions in overly burdened communities. CCEEB members operate in each of these three "first-year" communities, and many are active in the District's Community Steering Committee (CSC) process, as well as related activities and proceedings at the District related to AB 617 implementation.

Individual CCEEB members have been engaging with the District and other community members at the community-level, offering perspective and expertise as part of the plan development process. CCEEB has been engaging on a broader level, through its participation in the SCAQMD AB 617 Technical Advisory Group and the Air Resources Board (ARB) AB 617 Consultation Group. Our comments reflect this broader perspective, but are based on consultation with and feedback from our membership. Our intent is to help support successful program development, both in the three "first-year" communities as well as looking forward to the continued and expanded implementation of AB 617 in future communities.

Our main point is as follows:

- **Emission reduction actions should be based on technical review of those sources that contribute most to community-level exposures.** However, detailed community inventories and data on source apportionment have not yet been released, and only a high-level discussion of community impacts has occurred at community meetings. CCEEB believes the draft plans should be re-evaluated by the District and community stakeholders as more detailed and localized emissions data becomes publicly available.

AB 617 specifies that the statewide strategy to reduce criteria pollutant and toxic air contaminant emissions must include assessment of sources or source categories contributing to high cumulative exposure burdens, including the relative contribution of each source. AB 617 further specifies that air district community emissions reduction plans (CERPs) must be consistent with the statewide strategy. Yet draft actions have been developed *ahead of* the requisite technical analysis, putting the proverbial cart before the horse. For example, the Source Attribution section of the Community Profiles for Wilmington-Long Beach-Carson and San Bernardino-Muscoy will not be ready until after comments have been received on the draft CERPs. Moreover, localized air monitoring data, meant to measure and validate sources of concern to local communities, will not be available until a much later date and are not available to help establish baseline conditions or set reduction targets.

11-1

CCEEB acknowledges that much of the timing problem lies outside staff control given the accelerated implementation schedule set by the Legislature, as well as work that must be done by ARB to develop the on-road and off-road mobile inventories. However, the lack of technical background creates process concerns that will need to be addressed as new information becomes available. For example, in the Wilmington-Long Beach-Carson CERP, two of three refinery actions focus on flaring, yet no analysis has been done to show the degree to which flaring contributes to overall pollutant concentrations or that it even poses significant health risks. As such, it is difficult to evaluate whether these actions should be priorities as compared to other sources or actions, both refinery and non-refinery.

While high-level data has been presented to the CSCs, it has not been granular enough to indicate clear areas of focus. As such, identified concerns have been based on anecdotal experience and perceptions, without scientific validation. Moreover, a narrow focus in the plans on limited District authority omits a much needed discussion of how the SCAQMD, communities, and ARB can and should be partnering on strategies that tackle mobile source impacts, including diesel particulate matter. For example, while staff recognizes risks from on-road and off-road mobile sources under ARB authority, it has not yet specified the relative risk from different source types.

CCEEB recommends that the draft CERPs be revisited once technical data is available, and urges staff to provide scientific evidence validating community concerns and justifying recommended actions. CCEEB also recommends that the District and

community stakeholders engage ARB so that it is demonstrably responsible for community sources under its authority, as specified in the Health and Safety Code Section 44391.2(c)(6).

11-1  
Cont.

In addition to our main point about the technical analysis needed to support the CERPs, we offer these additional recommendations on other areas of the CERPs and CAMPs.

- SCAQMD air monitoring programs are robust and seem to be well aligned with the data collection needs of AB 617 communities.** CCEEB appreciates the tremendous amount of advance work that has been done to secure appropriate instrumentation and expertise, both in-house and through outside contractors. Moving forward, it will be important that the District work with all stakeholders to ensure that data collection, data interpretation, and communication of results will be clear, transparent, and understandable to public users. Context is key. CCEEB believes that the three Community Steering Committees and the AB 617 TAG can assist with this work and provide valuable insight to District staff. Additionally, the District will need to establish how different types of monitoring data can be used for different purposes, e.g., mobile monitoring such as FluxSense can be valuable as a screening tool, but most often more precise measurements are needed as a basis for regulatory actions.
- Effective program metrics are important, yet will be a challenge to develop, track and quantify.** CCEEB believes program success should be measured based on sound data directly related to emissions and exposure reductions, to the extent feasible, while recognizing that some actions will take time to achieve desired results. Thus, it is important for the District to establish realistic timeframes, working with community members to set expectations.
- Incentives and grants will play a major role in reducing emissions and exposures in AB 617 communities.** The CERPs should include a discussion of what funds have been allocated to date, how investments will achieve quantifiable results and community benefits, and what more needs to be done, particularly how groups can help support sustained funding efforts.

11-2

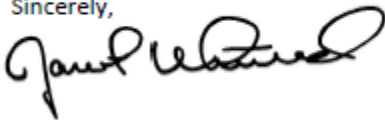

11-3

11-4

In closing, CCEEB wants to recognize the full spectrum of AB 617 activity at the District, much of which lies outside the community plans. This includes but is not limited to work to accelerate implementation of best available retrofit control technology (BARCT), the parallel process to sunset the Regional Clean Air Incentives Market, advocacy at the Legislature and with the Governor's Office to secure nearly \$700 million in incentive funding statewide for AB 617 communities, and substantial technical assistance to ARB and other agencies on issues such as emissions reporting, air monitoring, deployment of low-cost sensors, and development of scientifically sound community inventories based on monitoring and modeling data. While our comments here are specific to the first-year community draft plans, we want to express our appreciation for the totality of

SCAQMD work implementing AB 617 and for its leadership statewide in advancing effective solutions that reduce community exposures and air pollution burden. Across all these efforts, CCEEB commits to continuing our support of the District in its implementation of the landmark AB 617 legislation.

Sincerely,

Janet Whittick  
CCEEB Policy Director

cc: Ms. Karen Magliano, Director of the Office of Community Air Protection, ARB  
Ms. Frances Keeler, CCEEB Vice President and South Coast Air Project Manager  
Mr. Bill Quinn, CCEEB President  
Members of the CCEEB South Coast Air Project

#### Response to Comment Letter #11-1

Chapter 3b – Source Attribution Analysis for the WCWL B CERP was released July 12, 2109 based on the best available inventory data, which is all that is available at this time. The analysis supports the need for the actions in the Draft Final CERP that address sources prioritized (e.g., refineries and ports) by the CSC. For example, based on emissions data provided in the source attribution analysis (see Figure 3 of Chapter 3b) petroleum refineries account for 17% of VOC and 21% of NO<sub>x</sub>, and 65% of SO<sub>x</sub> emissions in the WCWL B community. Overall petroleum refineries are estimated to emit 1,182 tpy of VOCs and 229 tpy of PM<sub>2.5</sub>. These data support the CSC's priority for the actions in the Draft Final CERP to reduce emissions from petroleum refineries.

#### Response to Comment Letter #11-2

The South Coast AQMD staff will continue efforts to work with all stakeholders to ensure that data collection, data interpretation, and communication of results are clear, transparent, and understandable to public users. The South Coast AQMD has launched its AB 617 Community Air Monitoring website and its Data Display tool featuring air quality data reporting from selected fixed community air monitoring stations. The primary goal of this tool is to share preliminary continuous monitoring data in near real time and finalized results of laboratory analyses and mobile platform survey monitoring.

South Coast AQMD staff presented initial results from air monitoring conducted for the AB 617 CAMPs at the CSC meeting held on August 7, 2019. Several actions in the CERP include a commitment from staff to continue to provide similar updates. For example, Action 1 of Chapter

5g, includes a commitment from South Coast AQMD staff to provide CSC members quarterly or biannual updates on efforts for air monitoring beginning the third quarter of 2020.

Response to Comment Letter #11-3

The Draft Final CERP includes emission reduction goals and a course of action (i.e., step by step measures) with an estimated timeline. For example, the Draft Final CERP includes a goal to reduce overall NOx emissions from refineries by 50% by 2030. This overall emission reduction goal is supported by five different actions to reduce emissions from petroleum refineries. The actions include step by step measures to address emission sources at refineries, timelines and an estimate of emission reductions that contribute to the overall emission reduction goals for the Draft Final CERP. The South Coast AQMD staff will update the CSC on emission reduction progress.

Response to Comment Letter #11-4

Approximately \$101 million were allocated to projects in the South Coast Air basin that were funded by AB 134, of which 89% were located in disadvantaged and low-income communities. Of the total allocation \$319,622 was awarded to emission reduction projects located in the East Los Angeles, Boyle Heights, West Commerce community. Also, \$21,925,447 was awarded to emission reduction projects located in the San Bernardino, Muscoy community and \$9,036,563 to the Wilmington, Carson, West Long Beach community. Clean off-road equipment and near-zero emission trucks are two examples of the kinds of projects that the allocation funded.

The emission reduction targets in Chapter 5a for mobile source incentives are based on mobile source projects that have historically been incentivized in the Year 1 communities. Based on this information the estimated emission reductions for mobile source incentive projects in the Year 1 communities are between 40 and 50 tpy of NOx and 0.5 to 0.6 tpy of DPM emissions. The CERPs include actions to work with other entities to identify new funding opportunities.

Comment Letter #12: Alicia Rivera, et al. – Communities for a Better Environment (CBE)

SCAQMD

The AB617 Team

Submitted Electronically:

<https://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>

**Re: Wilmington/Carson/W. Long Beach Draft CERP does not meet AB617 promised goals**

Dear AB617 Team,

Thanks for your hard work toward a new process in Wilmington / Carson / W. Long Beach (WCWLB) to listen to our community members, and develop a Community Emission Reduction Plan (CERP), to address long-standing unfair and extreme air pollution burdens here. AB617 (Assembly Bill 617, C. Garcia, 2017) was adopted by California with the promise that it would address cumulative impacts of “co-pollutants”, including smog-precursors and toxics emitted at the same time as greenhouse gases (GHG). This was designed to make up for GHG pollution trading through Cap & Trade, which allows concentration of harmful fossil fueled sources and expansion of these sources in our community, through a pay-to-pollute system. WCWLB bears the burden of the highest concentration of fossil fueled and other air pollution sources on the West Coast, with 5 oil refineries, the Ports of LA and Long Beach, extensive urban oil fields, extreme diesel traffic, and many other sources in a community that is over 90% people of color. Consequently, this area received approval to develop a customized Community Emission Reduction Plan for cumulative impacts (out of less than ten communities statewide in the first round, though many other communities need one).

This new AB617 process through the WCWLB Steering Committee started out somewhat chaotic, but improved in facilitation, and the District made many efforts to include us effectively. However, we are very disappointed in the substance of the draft CERP developed by the District (6/7/2019).<sup>1</sup> It does not quantify goals for emission reductions over time to eliminate or measurably reduce cumulative air pollution burdens here, nor to meet health standards. It is not an actual plan to meet AB 617 goals – it is a list of a few potential measures for each source category. It includes very few actual regulations toward this end, instead consisting mainly of air monitoring and enforcement of existing requirements. And the few proposed regulations were generally measures previously promised by the District, or separate from AB 617, so they do not seem to fulfill a new mandate. They are however a beginning and a step forward, and do include some measures we requested.

12-1

We apologize for submitting our formal written comments in response to the CERP a few days late, but we also ask the District to ensure that they are fully considered, as we have made most if not all of these same comments previously, to the District and the California Air Resources Board (CARB). We have received correspondence from the District stating that our comments may not be guaranteed to be addressed until September in the CERP process. This would be inadvisable and unfair in achieving AB617 goals. The District itself did not meet its own deadline for publishing the Draft CERP (which was promised to the public in May,

12-2

<sup>1</sup> <https://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>

but published as an incomplete version starting June 7<sup>th</sup> and continuing in pieces for days after). There are many factors which made it very difficult for our community to complete comments by the District's strict deadline. Two days before your June 24<sup>th</sup> comment deadline, the District held a major public hearing on a different regulatory issue, far from our community in Diamond Bar, necessitating long travel and preparation for community testimony (on Rule 1410, on use of deadly modified hydrogen fluoride). The District has also held multiple public meetings or events key to our communities but separate from AB617 almost every week for months, in which our communities took part intensively, despite the burdens to our members, families, and staff, and with little or no consultation about scheduling. We know the District personnel also worked long hours on all these subjects, but we expect full consideration and addressing our comments at the July 11<sup>th</sup> WCWLB Steering Committee, and at the July Stationary Source Committee of the Board. These are not new issues that the District did not previously hear from us.

12-2  
Cont.

I. General Recommendations Summary:

- A workable plan must include quantified emissions reductions (for example in pounds per day), with the purpose of addressing the cumulative burdens in our local communities – the current plan does not. We and others have previously made this comment orally during multiple AQMD WCWLB meetings, also as part of our written slideshow presentation by our representative Alicia Rivera during the AQMD May Steering Committee ["AQMD needs to contribute cuts in tons/day with deadlines."],<sup>2</sup> and among other comments, in our letter to the State, regarding the design of the overall AB617 program Blueprint through the California Environmental Justice Alliance (CEJA). ["All CERPs should result in substantial and quantifiable annual reductions that are above and beyond what is already required by existing law and regulations and ensure no net increase in criteria air pollutant and toxic air contaminant emissions."] As a member of CEJA, CBE (Communities for a Better Environment) and other member organizations developed and submitted these comments July 23, 2018. Please see these CEJA comments in full, which we incorporate by reference on this topic and on many other topics described below. We assume AQMD would take into account extensive comments made to CARB regarding the overall state Blueprint development AB617 last year. If not already done, we reference our CEJA comments here.<sup>3</sup>
- A workable plan needs metrics to meet health standards – We noted the LA County Health Department also stated this in their recently submitted comments on the draft CERP.<sup>4</sup> We agree with the County's comments regarding both the need to meet health standards and quantify emission reductions. ["DPH recommends that each Chapter 5A-5G identify the Measurable Targets to address community emissions reductions from 1) refineries, 2) ports, 3) truck traffic, 4) oil drilling and production, 5) railyards, and at 6) schools, childcare centers and homes. Additionally, include health-based and data-driven air quality objectives including, but not limited to, the collection of community-level health data to be able to link emissions reductions to improved health outcomes. It is important that both the targets and baselines are established; therefore, it is possible to track progress of

<sup>3</sup> CEJA Comments on Draft Community Air Protection Blueprint, p. 5 available at: <http://www.cbecal.org/wp-content/uploads/2018/07/CEJA-Comments-on-CARB-DRAFT-617-Blueprint.pdf>

<sup>4</sup> Matt Baca, BSHA, DR, TLO, Project Manager, and Alyssa Beltran, MPH, June 20, 2019, available at: [http://onbase-pub.aqmd.gov/publicaccess/DatasourceTemplateParameter.aspx?MyQuervID=257&OBKey\\_1409\\_1=WIL](http://onbase-pub.aqmd.gov/publicaccess/DatasourceTemplateParameter.aspx?MyQuervID=257&OBKey_1409_1=WIL)

*emissions reductions over time.”]* Our CEJA comment above also stated this last year to CARB, with many specific detailed recommendations on achieving health standards.

- **AQMD needs to address anticipated increases in air pollution projected ~2025 to 2029 and potentially continuing, by planning comprehensive switching to clean, renewable, zero emission energy sources.** AQMD identified in presentations to the its AB617 Technical Advisory Committee, that despite the District’s emission reduction plans, certain pollutant levels increase after ~2025, because of increased production or population. For example, the slide entitled “Projecting Future Point Source Emissions: Example of NOx Emission”, shows progress in emissions reductions through about 2025 due to existing regulation, then increasing air pollution due to economic growth factors.<sup>5</sup> Because of the extreme fossil fuel burdens here, the plan must not only include individual source reduction regulations, but must include reasoned longer term plans that explicitly phase out fossil fueled sources step by step by 2050. Otherwise, our local communities and the region cannot meet AB617’s goal to address air pollution inequities, nor California’s goals to cut GHGs 80% by 2050 (in AB32 and other requirements). 12-5
- **While AQMD is right in elevating the community priorities, this cannot be used to shield the District from its responsibility to use its own expertise to reach AB617 goals.** Obviously the District has many more resources than community members. While community members’ knowledge and expertise must be recognized and seriously respected, AQMD must also propose a coherent plan that comprehensively and quantitatively addresses the cumulative impacts. Community members of the steering committee and public have made substantial contributions, but should not be expected to do the whole job. The District has placed undue focus solely on a few listed community priorities, rather than supplementing with a full plan. 12-6
- **Please review our referenced CEJA comments regarding many other general recommendations statewide, that apply equally to WCWLB.**

## II. Oil Refineries and Oil Drilling

### A. Report Card

Regarding specific measures in the CERP on Oil Refineries (Chapter 5b), and Oil Drilling and Production (Chapter 5e)<sup>6</sup>, we first summarize our finding in the following Table and Report Card. Unfortunately, due to many problems including those deficiencies identified above, we gave the District a D (Unsatisfactory) for these emissions sources, because of a lack of quantified emissions reductions and overall emissions and goals, lack of plans for switching, and for leaving out specifics we had previously proposed or supported. We note however that important measures were identified that represent improvements from existing conditions.

The concepts and many specifics of this table were orally presented to AQMD at the June Steering Committee of WCWLB by CBE and other community members.

<sup>5</sup> SCAQMD, Emissions Inventory in the Base and Future Milestone Years – Point and On-Road Mobile sources, Assembly Bill (AB) 617 Community Air Initiatives, Technical Advisory Group Meeting, May 29, 2019, Slide 11, available at: <https://www.aqmd.gov/docs/default-source/ab-617-ab-134/technical-advisory-group/presentation-may29-2019.pdf?sfvrsn=9>

<sup>6</sup> Available at: <https://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>

## Community Summary Report Card on SCAQMD WCWLB CERP Preliminary Draft of 6/7/2019 – Oil Refineries and Oil Drilling

(Grading – A: Excellent, B: Good, C: Satisfactory, D: Unsatisfactory, E: Failed)

Sector / Grade / Achieved New Emissions Reductions?	Improvements from Status Quo / Notes / Other
<p><b>REFINERIES -- D+ -- Unsatisfactory</b></p> <p>Only 1 regulation with a specific reduction goal – Flare Regulation Goal to reduce flaring 50% (although no mass emission reduction identified)</p> <p>Does not include Refinery Boiler &amp; Heater requirements beyond RECLAIM commitments (only refers to existing RECLAIM replacement program Rule 1109.1).</p> <p>Does not require Cat. Crackers to add Wet Scrubbers we identified, which BAAQMD is considering.</p> <p>Does not require new Refinery Storage Tank emission reductions, though District previously identified this in its slides at WCWLB meeting as potential measure</p> <p>Does not include <i>any</i> new refinery control measure beyond those identified by the community.</p> <p>Allows continued Oil Refinery expansion permits in already over-burdened region – does not fulfill AB617 promise for plan over time to quantitatively address local burdens.</p> <p>No measures to identify or address changes in Crude Oil characteristics that impact air emissions (e.g. API or sulfur %)</p> <p>Contains no long-term ideas for fossil fuel replacement necessary to achieve goals</p>	<p><b>IMPROVEMENT FROM STATUS QUO:</b> Does include important measures promised in past by AQMD or already required, but not previously scheduled:</p> <ul style="list-style-type: none"> <li>• Flaring notice improvements</li> <li>• Tightened flaring requirements (promised 2 years ago by AQMD but now formally committed)</li> <li>• Improved VOC leak detection (increased monitoring &amp; enforcement of existing regulations but no new emissions reductions requirements). This begins to address higher VOCs found by the joint AQMD Fluxsense study with Swedish scientists published 2017, highlighted by community members but unaddressed in AQMD inventory and permitting.</li> </ul> <p><b>NOTE re need for MHF Regulation:</b></p> <p>Although another community recommendation (Banning MHF at 2 SoCal refineries) relates to accidental release threat rather than ongoing criteria and toxic emissions, refinery MHF use causes a major threat of death or permanent harm in a major release. Oil Refinery safety cannot be separated from ongoing emissions, so the CERP should include a goal to phaseout MHF within 4 years, as urged by the community. (This is an inherent part of Valero Refinery's fossil fuel production, and so related to both the GHG and local emissions.) Please incorporate by reference previous written comments by CBE with other organizations in the Rule 1410 context, which urge the District to develop a direct regulation for phaseout within four years, without a Performance Standard allowing continued MHF use.</p>
<p><b>DRILLING – D – UNSATISFACTORY</b></p> <p>Does not address biggest need – STOP EXPANDING DRILLING NEAR NEIGHBORS, SUPPORT COMMUNITY GOAL OF 2500 FT BUFFER ZONE</p> <p>Does not commit clearly to any new emission reduction regulation – proposes <i>considering</i> tightening of Rule 1148.1 requirements</p> <p>Continues to require reporting and monitoring to prove persistent problems before taking action. This approach has failed repeatedly– it assumes Oil Drilling is innocent until proven guilty, despite being a known emissions risk that is inappropriate near neighbors. Reporting &amp; monitoring are important, but cannot replace pollution prevention.</p> <p>Does not address emissions reductions nor monitoring of sulfur compounds (H<sub>2</sub>S, SO<sub>x</sub>, CS<sub>2</sub>, COS, etc.)</p>	<p><b>IMPROVEMENT FROM STATUS QUO:</b> Does include measures intended to reduce odors, leaks, give public notice:</p> <ol style="list-style-type: none"> <li>1) Leak Reduction efforts: <ul style="list-style-type: none"> <li>• ID high priority wells, increase monitoring, leak detection, enforcement of existing requirements</li> <li>• Make data more user-friendly and accessible to community</li> <li>• Take follow-up action if persistent emissions detected (this will fail if not consistent enough since well impacts can wax and wane over time)</li> <li>• Expedite response to odor complaints</li> </ul> </li> <li>2) Improved Public information: Factsheets, infographics, outreach, public education.</li> <li>3) <i>Evaluates whether to tighten Rule 1148.1 to require emissions cuts.</i></li> </ol>

12-7

12-8

## B. Oil Refinery Flaring – Details of Emission Reduction Improvements Needed

CBE has previously submitted detailed comments on Oil Refinery flaring, for example during the Rule 1118 update in July 2017. At that time the District had committed to come back in 2018 with additional improvements to the regulation, including committing to provide optical sensing for flares, after the District had found that previous flare emission estimates were major underestimations of emissions. CBE has been closely involved with the original development of AQMD flare regulations, which greatly reduced flaring. However, substantial flaring still occurs, and it can dump large volumes of VOCs, SOx, particulate matter, and other pollutants in a short time. While this is not a continuous major emission source, it can have a big impact in concentrated time periods.

We incorporate our attached comments on the Final Proposed flaring Regulation 1118, which we submitted July 6, 2017<sup>7</sup> and request that the District include these recommendations and those below in the CERP, to supplement the rule update proposed for the CERP.

CBE also discussed many details of improvements for flaring during Alicia Rivera's May 9<sup>th</sup> presentation to the WCWLB Steering Committee, which came from our written and oral comments during the 2017 flare rule proceedings, summarized (and supplemented) as follows:

- **Flaring needs more emissions cuts (not just Notification), and the District should investigate eliminating most flaring, as it previously stated it would begin.** We do note and appreciate that in the Draft CERP, AQMD has added a goal to reduce flaring 50% if feasible. We propose eliminating or minimizing flaring to the greatest extent feasible. We understand flares are needed for *true* emergencies, but much more can be done to prevent emergencies, *and* to prevent planned flaring. This will also improve refinery safety (because one way to eliminate flaring is to reduce repeated malfunctions, including a common one – shutdowns due to power outage). It should also evaluate storing some level of gases within refineries through slower degassing of vessels during partial shutdowns, in order to further reduce planned flaring.
- **All refineries should have Flare Minimization Plans.** This should also prevent flaring in power outages.
- **Tighten Sulfur Oxide requirements and set a VOC standard, plus penalties for VOCs.**
- **We need Optical Remote Sensing for flares** as promised in the past. Monitoring in flare stacks is important but not enough. (Currently flare gas volume and concentration of pollutants are measured within the stack, then an estimated destruction efficiency / emissions factor is used to estimate emissions after combustion in the flare. This has proven inaccurate, causing underestimation of flaring in the past as the District is aware, since it was necessary to modify emission factors during the last round of flare rule updates.
- **"Clean Service" flares are not really clean** and should not have special exemptions. Emissions Factors for burning propane, butane, and methane in flares greatly underestimate VOCs.
- **Methane should no longer be exempt** - studies show it can substantially add to ground-level ozone, not only greenhouse gases, as we have previously commented to the District.
- **Flare Data should be online!** BAAQMD puts daily flare data online, but SCAQMD only provides quarterly totals. We shouldn't have to do Public Records Requests every time we want to look at flare data. We appreciate that AQMD has told us that it plans to improve online data.

12-9

<sup>7</sup> CBE, Alicia Rivera, Julia May, Jaimini Parekh, *Re: Support Flare Rule 1118 with 2 Easy Amendments: 1) Fix Bad Emission Factor, 2) Add Plans to set VOC Performance Standard*, attached

### C. Other Major Refinery and Oil Drilling sources we previously identified

#### 1. Need Comprehensive Refinery Boiler and Heater Emission Reductions:

AQMD has committed to replacing the RECLAIM program with direct emission reduction measures, including through development of Rule 1109.1 this year for oil refineries. We had commented on the need to go beyond RECLAIM replacement, to address more comprehensively the emissions from Refinery Boilers and Heaters. We previously commented on this need at multiple points orally during the WCWLB meetings, also in the slide presentation of Alicia Rivera [*"Giant old Refinery Boilers and Heaters use massive quantities of fuel and need to be replaced with BACT, to achieve more cuts than just replacing RECLAIM."*] Note that BACT (Best Available Control Technology) can include fuel switching options, including innovative systems such as solar-preheating, which we urge the District to consider

CBE also submitted our own comments to CARB during the development of the AB617 Blueprint (in addition to the CEJA comments).<sup>8</sup> **We incorporate these by reference (available in the link below).** We urge AQMD to consider the details of that comment as it applies to Refinery Boilers & Heaters (and other sources). This identified a CARB data evaluation of Boilers & Heaters Statewide, which evaluated many ways to minimize emissions, including through replacement. Here is an excerpt of the comments regarding reduction measures for numbers of these sources statewide (a large portion of which are located in the South Coast):

12-10

Emission reduction measures included (for 282 Refinery Boilers, 293 Oil and Gas Boilers, and 524 Refinery Process Heaters):

1. Replacing low and medium efficiency Boilers (Categories 1 and 2)
2. Optimizing boilers by reducing excess air
3. Retrofitting feedwater economizers
4. Retrofitting with air preheaters
5. Blowdown Reduction with controls and with feedwater cleanup
6. Blowdown heat recovery
7. Optimizing steam quality
8. Optimizing condensate recovery
9. Minimizing vented steam
10. Boiler insulation maintenance
11. Steam trap maintenance
12. Steam leak maintenance
13. Replacing low and medium efficiency heaters
14. Optimizing heaters
15. Recovering flue gas heat
16. Replacing refractory brick
17. Heater insulation maintenance

We know the District is also very aware of emission reduction measures for these sources.

<sup>8</sup> CBE Comments on Draft Community Air Protection Blueprint pursuant to AB 617; Need Strong State Mandated Refinery, Transportation, and Small Cumulative Source Cuts, 7/23/2018, pp. 7-11, available at: <https://www.arb.ca.gov/lists/com-attach/29-ab617ecap18-UTMGaQBvU2FQOgZ7.pdf>

Many old Boilers and Heaters have avoided strong regulation over long decades, and been given breaks in permitting during expansions which allowed increased use, without new emissions controls or application of BACT.

The District should plan within the CERP and the region to fully optimize emissions reductions for Refinery Boilers and Heaters, go beyond RECLAIM requirements, and eliminate antiquated sources. Frequently, oil refineries that could have saved money and energy (according to CARB's data), have foregone replacement of boilers until they plan expansions. Then regulators have allowed them to do so voluntarily, so that they could use the shutdowns to offset other refinery expansions. These old units should have instead been cleaned up earlier through regulatory requirements, rather than using them to enable further fossil fueled expansion. We need to see this kind of practice stop, and plan to meet BACT standards for these units.

12-11

## 2. Need consideration to add requirement for Wet Scrubbers for oil refinery FCCUs

The BAAQMD (Bay Area Air Quality Management District) is considering adopting a regulation that would drastically cut oil refinery particulate matter and other emissions from FCCUs (Fluid Catalytic Crackers). CARB also directed AQMD to bring such a rule for consideration as part of AB617. Our WCWLBB steering committee representative Alicia Rivera's slides also brought up this issue [*"Also require refinery Catalytic Cracking units to cut PM2.5 and SOx at least equal to Wet Scrubbers being considered in the BAAQMD, with no emission increases."*, Slide 10]

12-12

In addition, our previously described 2018 AB617 Blueprint comment letter to CARB, (available in the CARB docket link<sup>9</sup>), described this issue in detail. We incorporate those statewide comments, and refer AQMD's WCWLBB CERP team to them (see pp. 11-14). We ask that you mandate that air districts require wet scrubbing or equivalent PM2.5 and SOx emission cuts from catalytic cracking units (CCUs) at oil refineries, and include this in the draft CERP.

## 3. Evaluation and Moratorium on Extreme Crude Oils related to air pollution and safety

So far the District has declined to provide a serious evaluation of the impacts of crude oils on air pollution, including impacts of extremely heavy or high sulfur crudes including Canadian Tar Sands, or extremely volatile, high benzene crude oils such as North Dakota Bakken Crude Oil. There has been a continuing threat that these previously geographically isolated crudes will develop new transport (major pipelines, crude by rail to port permits, etc.) that would allow access to high volumes of such extreme crude oils to LA refineries. The District should provide web data for easy access of crude oils used by oil refineries in the region, to the public. This data can be accessed currently only for non-domestic crudes, through the US EIA (Energy Information Administration), but it requires a fair amount of digging and processing this data. The District could make such data more accessible, and could also gather data on domestic crude oil use at the refineries. The District could certainly provide this in aggregate, if not in detail, and evaluate how different crudes impact air pollution at oil refineries, related to energy use, sulfur emissions, criteria pollutants, GHGs, heavy metals, etc. CBE has submitted extensive comments on this issue in the past.

12-13

## 4. Additional Measures

<sup>9</sup> <https://www.arb.ca.gov/lists/com-attach/29-ab617ocap18-VTMGaQBvU2FQOeZZ.pdf>

Please address the following in the CERP:

- Add a moratorium on refinery and drilling expansions (as well as longer term plans to phase them out).
- The AQMD Fluxsense Study published in 2017 by Swedish Scientists, found Oil Refinery benzene emissions are greatly underestimated and on average should be 34 times higher. The scientists said VOCs & benzene are mostly from Storage Tanks, but AQMD has not changed the emission inventory.
- We urge that the District emissions inventory and permitting calculations be updated to reflect the true VOC & benzene impacts.
- We urge the District to re-open refinery Storage Tank regulations to achieve additional VOC and benzene reductions, taking into account the underestimated emissions.

5. Regarding Oil Drilling, see the report card earlier, and support the Community's Recommendation for a 2500 ft. buffer zone between drilling and residents.

In addition to the need for a buffer zone, the District should strengthen its recommendation regarding considering tightening Rule 1148.1, and make a clear commitment to tightening this rule.

Regarding the buffer zone, the District has previously stated it does not believe it has the authority to require it. Regardless, the District can recommend and support that a buffer zone (which we are seeking from the City and County of LA), would reduce community exposure to air pollutants from oil drilling and production. We urge the District to recommend that this be carried out by the City and County, and for the State of California. Since oil drilling operations have been able to do lateral drilling for some time, there is flexibility in the location of the wells, and it is not necessary to operate near residents. Furthermore, the District should support a phaseout by 2050 of oil drilling in the District, as part of California's 80% GHG cuts goals. This would also help the District meet criteria pollutant standards in the region.

### III. More comments will be possible when the District develops a quantitative plan

It is difficult for us to comprehensively comment without having a more comprehensive plan. We look to the District to develop a customized plan for WCWLB that seeks to solve the inequities of air pollution here over time. We know this will not instantly happen, but we also know that more can be done. We again emphasize the concepts of zero emission technologies and a Just Transition to clean renewable energy. This comment has focused mostly on stationary sources, but we strongly support measures to achieve zero emission, non-fossil-fueled transportation. This will not only eliminate transportation emissions, but also eventually eliminate the need for oil refineries and oil drilling. This is the only way to solve the problem in the long term.

Thank you for your consideration.

Response to Comment Letter #12-1

The comment provides an overall summary of the comments listed below. Please see the detailed responses below for a point-by-point response.

Response to Comment Letter #12-2

Staff is addressing CBE's submitted comments within this appendix. Portions of CBE's comment letter were addressed in the Draft CERP released in July 2019 and in subsequent drafts.

Response to Comment Letter #12-3

Please see Response to Public Meeting Comment # 1-2.

Response to Comment Letter #12-4

Please see Response to Comment Letter #1-2 and 7-3.

Response to Comment Letter #12-5

The CERP includes actions to address the replacement of mobile source equipment (e.g., heavy-duty diesel trucks) with zero-emission technologies once they become available, and near-zero emission technologies until that time. These actions reduce the reliance on fossil fuels for the planning horizon years 2025 and beyond. Additionally, certain actions in the CERP simultaneously reduce emissions from petroleum refineries, for example, Action 5 of Chapter 5b has a goal of 50% NOx emission reductions by 2030. See Response to Public Meeting Comment # 1-2 regarding long term plans for phasing out fossil fueled sources.

Response to Comment Letter #12-6

See Response to Comment Letter #8-4.

Response to Comment Letter #12-7

CBE provided a report card that rated the actions in the Discussion Draft CERP that address petroleum refineries and oil drilling and production. South Coast AQMD staff worked closely with CBE to address actions that CBE rated as unsatisfactory in the report card. The results of this work have been integrated into subsequent CERP drafts where appropriate and are explained below.

- The South Coast AQMD staff quantified potential emission reductions for flaring and revised the CERP to include estimates for a reduction of flaring events and/or emissions by 50% by 2030, if feasible. The estimated emission reductions are 19 tpy of NOx, 11 tpy of SOx, and 1 tpy of VOCs by 2030.
- Rule 1109.1 is described in Action 5 of Chapter 5b in the CERP. This Action includes an evaluation of the technical feasibility and cost effectiveness of Best Available Retrofit Control Technology (BARCT) to reduce emissions from refinery equipment including existing boilers and heaters, and also other types of refinery equipment. Additionally, the Action commits South Coast AQMD staff to exploring opportunities to replace older equipment with newer, more efficient, and less emitting equipment with other pollutant co-benefits.

- See Response to Public Meeting Comment # 1-2 regarding requirements for PM controls on fluid catalytic cracking units (FCCUs)
- Action 4 in Chapter 5b includes an additional measure to initiate rule development to amend Rule 1178 – Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities. This Action includes establishing baseline emissions based on air monitoring and initiating amendments to Rule 1178 in 2021. Also, the Action contributes to the overall 50% VOC emission reduction goal for refineries by 2030.
- Regarding refinery expansions and fossil fuel replacement see Response to Public Meeting Comment # 1-2.
- Regarding crude oil characteristics see Response to Comment Letter ##12-13.
- South Coast AQMD is currently considering the issue of the storage and use of MHF at the two local refineries in a separate public process. Recently, the Governing Board directed staff to work with both the community and industry to reach resolution and present to the Refinery Committee for review, with the Committee making recommendations to the full Board. Staff held 19 meetings with the community, unions, and refineries discussing both an MOU and a rule approach. As directed by the Board, staff presented the status of these meetings to the Refinery Committee on Saturday June 22, 2019.

#### Response to Comment Letter #12-8

Air monitoring and enforcement data provide the South Coast AQMD staff with additional information to further reduce emissions from oil and gas production sites. Additionally, Action 1 of Chapter 5e commits South Coast AQMD staff to share air monitoring information with other agencies (e.g., land use agencies). This information can help other agencies make informed land use decisions (e.g., appropriate buffers) to mitigate air quality impacts from oil drilling and production sites. Also see response to comment 8-11. Regarding emission reductions for sulfur compounds see Response to Public Meeting Comment #1-2.

#### Response to Comment Letter #12-9

##### *Flaring Needs More Emission Cuts*

In Action 3 of Chapter 5b, South Coast AQMD staff has committed to initiate rule development to amend Rule 1118 with a goal of reducing flaring emissions by 50%. The Action identifies examples of additional provisions to be considered during rule development that further reduce flaring. These examples include:

- Lower performance targets and/or increased mitigation fees,
- Increased capacity of vapor recovery systems to store gases during shutdowns,

- Header modification for gas diversion with process controls,
- Back-up power systems for key process units,
- Remote optical sensing for flare emissions characterization,
- Lower-emission flaring technologies, and
- Flare minimization plans for all refineries.

#### *Flare Minimization Plans*

Rule 1118 requires refineries to submit flare minimization scoping plans. South Coast AQMD staff will review these plans, new technologies, and other information to assess the technical feasibility of future rule requirements. Consideration of flare plans for all refineries have been added to Action 3 of Chapter 5b.

#### *Tighten Sulfur Oxide Requirements*

The Goal of Action 3 in Chapter 5b is to contribute to the overall emission reduction goal for refineries by 11 tpy of SO<sub>x</sub> by 2030.

#### *Optical Remote Sensing*

During the 2017 amendment to Rule 1118, staff mentioned that a pilot study of optical remote sensing<sup>5</sup> could lead to new techniques that can better evaluate flaring emissions, and can potentially improve flare combustion efficiency by providing real-time feedback on combustion dynamics to facility operators. The results of a RFI (Request for Information) is under review and optical remote sensing is explicitly provided as an example of additional provisions to be considered during rule development to further reduce flaring.

#### *Clean Service Flares*

Facilities that are subject to Rule 1118 are required to submit daily and quarterly emissions reports for criteria pollutants from each flare and each flare event. This does not include methane. EPA has not yet classified methane as a regulated VOC for ozone control purposes. Methane is considered to be a greenhouse gas that is regulated by CARB. As part of the California Methane Research Program, CARB and the California Energy Commission (CEC) are working together to facilitate research efforts to achieve methane reduction goals laid out by both the Governor and the legislature. To find out more information regarding those findings, please visit CARB's website: <https://ww2.arb.ca.gov/our-work/programs/methane-research>.

#### *Online Flare Data*

---

<sup>5</sup> Please see the 2017 Rule 1118 Final Staff Report, Response to Comment 5-3:  
<http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-jul7-038.pdf?sfvrsn=5>.

Action 1 of Chapter 5b is to improve refinery flaring notifications. Further, this Action includes posting flare emissions data in a more user-friendly format on South Coast AQMD's website and/or the mobile application.

Response to Comment Letter #12-10

The process of transitioning the refineries in RECLAIM to a command-and-control regulatory structure involves a comprehensive review of NOx emissions from all refinery equipment. Proposed Rule 1109.1 will not only address boilers and heater, which are major sources of emissions in refineries, but other equipment as well. The South Coast AQMD staff is developing Best Available Retrofit Control Technology (BARCT) limits for boilers, heaters, gas turbines, incinerators, engines, fluid catalytic cracking units, a coke calciner, and sulfur recovery units. Staff is not limited by the emission reduction commitments in the RECLAIM NOx shave, the BARCT assessment will reduce emissions whenever technically feasible and cost effective. Further, the South Coast AQMD staff does not consider the BARCT assessment to preclude replacement technologies where they meet the definition of BARCT; staff considers BARCT to be an emission limitation and not limited to a particular technology, whether add-on or replacement.

Response to Comment Letter #12-11

As stated in response to comment 12-10, South Coast AQMD staff is not limited by the emission reductions committed to under the 2015 RECLAIM NOx shave or the Control Measure CMB-05 – *Further NOx Reductions from RECLAIM Assessment* in the 2016 Air Quality Management Plan. Staff is conducting a completely new BARCT assessment, separate from what was completed in 2015, which will seek the maximum emission reductions possible, provided they are technically feasible and cost-effective. As directed by Assembly Bill 617, the rule will give highest priority to those permitted units that have not modified emissions-related permit conditions for the greatest period of time. Staff always seeks to develop rules that are technology neutral; therefore, the rule will not dictate whether a facility must replace or retrofit older equipment, but will identify an emissions limit that must be met. However, staff will evaluate factors that might hinder equipment replacement to identify pathways toward the installation of more efficient equipment meeting current Best Available Control Technology. Staff welcomes community participation in the rule development process.

Response to Comment Letter #12-12

See Response to Public Meeting Comment #1-2 regarding requirements for PM controls on fluid catalytic cracking units (FCCUs).

Response to Comment Letter #12-13

The refineries consider specific information regarding the types of crude oils processed by their facilities to be confidential trade secret information. Although the South Coast AQMD does not collect that information, there are other entities, such as the California Energy Commission (CEC) that do. The CEC collects various types of information, such as total crude oil from the California refineries, and publishes the total crude oil capacity for each refinery on its website:

[https://ww2.energy.ca.gov/almanac/petroleum\\_data/refineries.html](https://ww2.energy.ca.gov/almanac/petroleum_data/refineries.html). The South Coast AQMD has not found it necessary to collect this type of data for its regulatory purposes.

Through the Petroleum Industry Information Reporting Act, the CEC collects data about the amount and type of fuel used by refineries in California in the Monthly Refinery Fuel Use Report. The data is available at: [https://ww2.energy.ca.gov/almanac/petroleum\\_data/refineries.html](https://ww2.energy.ca.gov/almanac/petroleum_data/refineries.html). The U.S. Department of Energy - Energy Information Administration (EIA) also requires petroleum refineries located throughout the United States to submit a Month Refinery Report through the Federal Energy Administration Act of 1974. The EIA conducts a monthly energy review which is a publication of recent energy statistics: <https://www.eia.gov/totalenergy/data/monthly/>. The data categories within this publication include petroleum and crude oil and natural gas resource development.

#### Response to Comment Letter #12-14

The South Coast AQMD has in place a number of regulations limiting emissions from refinery operations, including a requirement for best available control technology for new or modified sources. If a refinery project meets the requirements of South Coast AQMD rules, we are required to issue permits for the project. Our authority to adopt rules is limited to regulating air pollution emissions, rather than directly limiting refinery throughput. Staff is currently working on a new BARCT rule for refineries, Rule 1109.1, and will continue to seek input from interested members of the public during this process.

#### Response to Comment Letter #12-15

See Response to Public Meeting Comment #1-2 regarding VOC emission reductions. Additionally, Action 4 of Chapter 5b is to initiate rule development to amend Rule 1178 – Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities (see Action 4 of Chapter 5b – Refineries). This Action also includes specific considerations for amendments to Rule 1148, for example, the use of enhanced leak detection tools (e.g., forward-looking infrared (FLIR) cameras and optical remote sensing) to further identify more quickly and mitigate leak emissions from storage tanks and other sources at refineries.

#### Response to Comment Letter #12-16

See Response to Comment Letter #8-11.

#### Response to Comment Letter #12-17

The comment is a summary of the detailed comments in the Comment Letter. South Coast AQMD has responded to the comments in the above responses, in revision to the Draft Final CERP, and in Response to Comment Letter #17.

We the Coalition For A Safe Environment are concerned that the AQMD writes a nice picture of everything when in fact we have very serious concerns and aspirations of hope for our communities that need to be clearly written in the CERP. We do not see our comments or request's as controversial. We want the reader and public to know AB 617 requirements, our communities concerns, perspectives, requests and expectations.

The Community Plan, CERP and CAMP are our plans.

Please see attachments of our 10 detailed public comments.

## Comment Letter #13

### Executive Summary

This Community Emissions Reduction Plan (CERP) outlines the actions and commitments by the Community Steering Committee (CSC), **Community Organizations with Air Quality Monitoring and Mitigation Experience** and the South Coast AQMD to reduce air pollution in the Wilmington, Carson, West Long Beach community. An essential piece of the AB 617 program is the partnership and collaboration with the community to ensure that the CERP addresses the community's air quality priorities. At the center of these efforts is the CSC that was established, in part, to participate in the development and implementation of these plans. The CSC is a diverse group of people who live, work, own businesses, and/or attend school within the community. Local land use agencies and public health agencies that serve the community are also part of the CSC. Through the CERP development process, the CSC members provided guidance, insight, and community wisdom, all of which were important ingredients for the CERP. The CERP is a critical part of implementing Assembly Bill 617 (AB 617), which is a California law that addresses the disproportionate impacts of air pollution in environmental justice communities. The AB 617 program aims to invest new resources and conduct focused actions in these communities to improve air quality as a step toward environmental equity.

13-2

The Wilmington, Carson, West Long Beach community identified the following air quality priority areas for addressing through this plan:

- Refineries
- Ports
- Neighborhood Truck Traffic
- Oil Drilling and Production
- Railyards
- Schools and Homes

At the core of this plan are the actions to address each of these air quality priorities. Specifically, the actions aim to reduce air pollution emissions in this local community and reduce the community's exposure to air pollution. This is accomplished through targeted actions using many complementary strategies, including developing and enforcing regulations, providing incentives to accelerate the adoption of cleaner technologies, and conducting outreach to provide useful information to support the public in making informed choices. Additionally, air monitoring strategies will be used to help provide critical information to help guide investigations or provide public information. Collaborative efforts with other agencies, organizations, businesses, and other stakeholders will amplify the impact of these actions. While many of the actions will only be conducted during the time frame of this plan, there are also many actions (such as regulation, ongoing enforcement activities, and certain incentive programs) that will be ongoing activities conducted by the South Coast AQMD.

The vision of this plan is to bring real air quality improvements in the Wilmington, Carson, West Long Beach community, through focused efforts and community partnerships. The CSC will

ES-1

Discussion Draft, version 060719

continue to be engaged throughout the process of implementing the CERP and tracking its progress, and will work closely with South Coast AQMD staff to ensure a continuing dialog.

#### The Reader's Guide to the CERP

The opening chapters provide background information about the AB 617 program and timeline (Chapter 1), the CSC process and community engagement (Chapter 2), and information about the air pollution sources in the community (Chapter 3).

Next, information about past and ongoing enforcement activities conducted by both the South Coast AQMD and the California Air Resources Board (CARB) enforcement staff are described in Chapter 4.

The core of the plan are the actions described in Chapter 5 – Actions to Reduce Community Air Pollution. This chapter is organized by air quality priority area, and the ideas addressing each one are presented in the CERP action templates. Within each CERP action, the entities involved in implementing that action are listed alongside their specific roles. The timeframe and goals of the actions are also described. The CERP actions are numbered in the order in which they are presented in this document. Chapter 5 also includes a summary of the analysis of whether California Environmental Quality Act (CEQA) requirements are needed based on the proposed actions within this plan.

Finally, a summary of the air monitoring approach is included as Chapter 6, but these efforts are described in much greater detail in the Community Air Monitoring Plan (CAMP)<sup>1</sup>, which serves as the sister document to the CERP. The actions described in Chapter 5 include specific air monitoring activities, as they relate to other specific actions in the CERP. The CAMP describes the overall air monitoring approach to address the community air quality priorities. Findings from air monitoring will help to evaluate next steps, and South Coast AQMD staff will work with the CSC to review findings and make necessary adjustments.

The Appendix to the CERP will include additional reference material related to the CERP content.

## Comment Letter #13

### Chapter 4: Enforcement Plan

#### Chapter 4: Enforcement Plan

##### Introduction

This chapter describes the enforcement history and overall approach to enforcement by the South Coast AQMD and the California Air Resources Board (CARB). In addition, the Community Emissions Reduction Plan (CERP) includes focused enforcement actions, which are described within Chapter 5. It is important that enforcement actions are part of the overall AB 617 program actions, which enables the program to be more effective in addressing this community's air quality priorities.

##### Chapter 4 Highlights

- From 2016 to 2018, CARB has conducted over 2,200 inspections and South Coast AQMD conducted approximately 800 inspections and responded to approximately 2,600 complaints in the Wilmington, Carson, West Long Beach community.
- Both CARB and South Coast AQMD have designed their programs to most effectively address sources within their respective jurisdictions.
- An enforcement approach that utilizes specialized program structures, outreach efforts in the community, use of technology, and interagency partnerships can lead to higher compliance rates and further emission reductions.

13-2  
Cont.

##### Overview of Enforcement Program Purpose and Jurisdiction

The primary goal of enforcement activities is for regulated parties to achieve compliance with air quality rules and regulations, and to protect public health. Part of this process involves consistently identifying and resolving violations, thereby ensuring a level playing field for all regulated entities and preventing unfair advantages for violators.

Both CARB and South Coast AQMD regulate and enforce air pollution regulations. Both agencies have the right to conduct inspections of air pollution sources, and the right to issue violations that can lead to penalties.<sup>1</sup>

An air pollution source can be a specific piece of equipment, a business, a government agency, or any other entity that creates air pollution. CARB is primarily responsible for enforcement of trucks, buses, and other mobile sources, while South Coast AQMD is primarily responsible for enforcement on facilities (i.e. stationary sources).<sup>2</sup> Table 4-1 provides an overview of the agencies' regulatory authorities.

<sup>1</sup> More information about penalties is provided in Appendix.

<sup>2</sup> In some cases, CARB may have agreements that give local air districts delegated authority to enforce a particular CARB

Table 4-1. Overview of regulatory authority for South Coast AQMD and CARB

Air Pollution Source Category	Examples	Main Regulatory Agency
Mobile sources	Trucks, buses, ships, boats, cargo handling equipment	CARB
Stationary sources	Refineries, power plants, oil and gas facilities, manufacturing plants; indirect sources	South Coast AQMD
Area-wide sources	Paint used on buildings, dust	South Coast AQMD
Sources of greenhouse gases	Methane and volatile organic compound emissions from facilities	CARB and South Coast AQMD

### Enforcement History

Over the years, both CARB and South Coast AQMD enforcement staff have had a significant presence in the community of Wilmington, Carson, and West Long Beach (WCWLB). This section provides the 3-year enforcement history for each agency in this community.

### South Coast AQMD Enforcement History in this Community

South Coast AQMD's enforcement presence includes many different compliance-related activities, such as investigating complaints, responding to breakdowns, and performing facility inspections.

Responding to complaints is a crucial part of South Coast AQMD's enforcement program. By taking complaints directly from members of the public, inspectors can focus their efforts to identify and address air pollution problems that matter to the community. South Coast AQMD's enforcement team gives priority to complaints and attempts to respond to every air quality complaint received. The process of responding to a complaint can be unique for each instance, depending on factors such as whether the air quality concern is ongoing, the type of source, the time of day, and the number of complaints for that air quality concern. For example, South Coast AQMD responds to off hour complaints based on the number of complaints that are received for a particular air quality concern. Figure 4-1 shows the number and types of complaints received by South Coast AQMD in this community, for the time period 2016-2018. The large number of complaints in the WCWLB community is due to the large number of air pollution sources – these include oil and gas production sites, diesel truck traffic, and refineries.<sup>3</sup>

<sup>3</sup> Complaints referenced are from WCWLB and the surrounding community.

Figure 4-1. Number of complaints (by type) in the Wilmington, Carson, West Long Beach community.

Additionally, South Coast AQMD's enforcement staff perform inspection activities at facilities and other air pollution sources. Those activities can include onsite inspections for permitted and non-permitted equipment, leaks, and compliance with rules, as well as surveillance activities in the community, such as to trace the source of an odor. As of May 2019, South Coast AQMD has approximately 940 permitted facilities in this community and conducted approximately 800 facility inspections from 2016 to 2018. A list of these facilities is available in Appendix X.

Enforcement actions typically involve issuing one of two types of notices:

- *Notice to Comply (NC)* – requiring a facility to quickly correct a minor violation or to provide specified records
- *Notice of Violation (NOV)* – formally identifying a violation of particular rules or regulations, which may result in civil penalties or, in some cases, referral for criminal prosecution.

13-2  
Cont.

Between 2016 and 2018, South Coast AQMD has issued 214 NOV's in the Wilmington, Carson, West Long Beach community. Figure 4-2 shows the number of NCs and NOV's in this community during the time period 2016-2018.

Figure 4-2. Number of Notices to Comply (NCs) and Notices of Violation (NOVs) issued in the Wilmington, Carson, West Long Beach community

#### CARB Enforcement History in this Community

CARB's enforcement process is two-pronged, including conducting field inspections and fleet-wide audits. For field inspections, the focus has been on enforcing heavy-duty diesel vehicle (HDDV) regulations, such as the statewide truck and bus rule, off-road rule, and the heavy-duty vehicle inspection program (HDVIP); at the refineries and fueling stations enforcing fuel formulation regulations; and in the ports enforcing regulations related to shore power, ocean-going vessels, commercial harbor craft and cargo handling equipment. As Figures 4-3 and 4-4 show, of the vehicles inspected, fuels tested, and marine enforcement conducted at the Ports of Los Angeles and Long Beach, compliance with CARB's regulations has been high. CARB's enforcement has been focused on fuels and port regulations in this area with over 700 fuel inspections and almost 1,450 marine-related inspections in the community in the past three years.

For fleet-wide audits, generally fewer heavy-duty vehicle enforcement inspections have occurred in the area during this time-frame, however beginning in 2018 CARB added the Streamlined Truck Enforcement Program (STEP) to enhance its ability to enforce the Statewide Truck and Bus regulation.

Between January 2018 and May 2019, 286 fleets were audited in WCWLB. A total of 859 vehicles were part of this audit with California Department of Motor Vehicles (DMV) registration holds placed on 389 of those vehicles. As of May 2019, 63 of those vehicles audited have been brought into compliance. For some of CARB's regulations, enforcement staff have not yet conducted many enforcement activities on the issues that concern the community, however, CARB's enforcement efforts are being enhanced in this community to address community concerns.

13-2  
Cont.

Figure 4-3. CARB Heavy-duty Diesel Vehicle and Fuels Enforcement History 2016 – 2018 in the Wilmington, Carson, and West Long Beach Community.

Figure 4-4. CARB Marine Enforcement History 2016 – 2018 in the Wilmington, Carson, West Long Beach community.

In summary, from 2016 to 2018, both CARB and South Coast AQMD have conducted a range of compliance activities in the community. This includes more than 2200 inspections from CARB enforcement staff related to port vessels and equipment, heavy-duty vehicles, and fuels. Of those inspections, the vast majority were in compliance, with less than 50 not in compliance and 19 cases pending. South Coast AQMD enforcement staff conducted approximately 800 facility inspections, responded to approximately 2,600 complaints, and conducted numerous other investigatory activities in WCWLB. South Coast AQMD issued 214 Notices of Violation. A compliance rate may not be an effective predictor of overall compliance within the area, since a portion of compliance actions are against the same facilities.

Due to the large number of potential air pollution sources in this community, an enforcement approach by both agencies that fully utilizes their specialized program structures, outreach efforts in the community, use of technology, and interagency partnerships can lead to further reductions in non-compliance and emission reductions. Both South Coast AQMD and CARB will continue to work closely with the CSC to identify and investigate air quality issues within the community.

13-2  
Cont.

## Enforcement Approach

### Program Structures

Both CARB and South Coast AQMD have designed their programs to most effectively address sources under their respective jurisdictions.

#### South Coast AQMD's Office of Compliance and Enforcement

The structure of this group is based on teams that focus on source type, and inspectors are also assigned by geographic region. The organizational structure based on source type enables inspectors to become technical specialists on the air pollution regulations that apply to the types of industries or facilities assigned to that team. In addition, assigning inspectors by geographic area improves the agency's ability to respond to complaints or compliance issues in that area.

For example, gas stations have underground gasoline storage tanks, which are inspected by the Retail Service Station Team. This team has the specialized knowledge and procedures to be able to cover the thousands of gas stations across the district. Refineries also have underground gasoline storage tanks, but these are inspected by the Refinery Team, which has a full time employee assigned to inspect each refinery. The inspectors in the Refinery team specialize in enforcing regulations that apply to all refinery equipment, including the Alkylation or Crude Units, underground gasoline storage tanks, and many other pieces of equipment. However, certain facilities may be inspected by inspectors from multiple teams. This ensures that the approach is focused enough to address a variety of sources, yet flexible enough to handle complex facilities.

For most teams, the inspectors conduct regular inspections at their assigned facilities or within their assigned geographic regions. The frequency of regular inspections depends on the type of facility. For example, a chrome plating facility is inspected more frequently than an auto body shop. It is important to consider that there are approximately 110 chrome plating facilities in the South Coast Air Basin, compared to over 1,500 auto body facilities in the region. When considering limited resources, priority for inspections is typically given to higher risk pollution sources – that is, those facilities that emit the more toxic air pollutants and/or are close to schools, hospitals, and residential areas.

The following teams operate in the WCWLB community:

13-2  
Cont.

Chapter 4: Enforcement Plan

13-2  
Cont.

Figure 4-5. South Coast AQMD Enforcement Program teams

\*RECLAIM, for REgional Clean Air Incentives Market, is a program that requires participating facilities to manage their total nitrogen oxides (NOx) and/or sulfur oxides (SOx) emissions (which reduce over time) by adding pollution controls, changing their equipment or processes, or buying credits from other RECLAIM facilities that have lower emissions than their cap. The program is currently being transitioned to a command-and-control regulatory program

#### CARB Enforcement's Program Structure

Through targeted enforcement or public complaints, CARB identifies a potential violation. CARB then contacts the responsible party to explain the enforcement process and to obtain additional information. Enforcement staff evaluates the information collected and works with CARB's Legal Office to determine violations of statutory and/or regulatory requirements. When violations are substantiated, CARB can take enforcement action, at which point the responsible party is provided an opportunity to discuss the violation.

This outcome includes taking appropriate enforcement action within the scope of CARB's enforcement authority, which may include issuing cease and desist orders, Notices of Violation, mitigation, or pollution prevention actions. Cases can be resolved via civil and criminal litigation. In lieu of litigation, cases typically are settled through CARB's mutual settlement program. Penalties are sought that provide adequate deterrence to future non-compliance or public nuisance.

For example, in 2017, settlement agreements were made with Union Pacific Railroad Company (UP) and BNSF Railway regarding drayage truck regulations. Under CARB's Drayage Truck Regulation, California ports and Class I rail terminals must report noncompliant heavy-duty diesel trucks entering their facilities. For years, BNSF and UP failed to accurately report to CARB information on noncompliant trucks entering their facilities, which hampered CARB's ability to enforce the regulatory requirements. The settlements resulted in UP turning away noncompliant trucks from their facilities and BNSF accurately reporting truck data to CARB for enforcement, resulting in reduced diesel emissions from heavy-duty diesel trucks around both UP and BNSF facilities.<sup>8</sup>

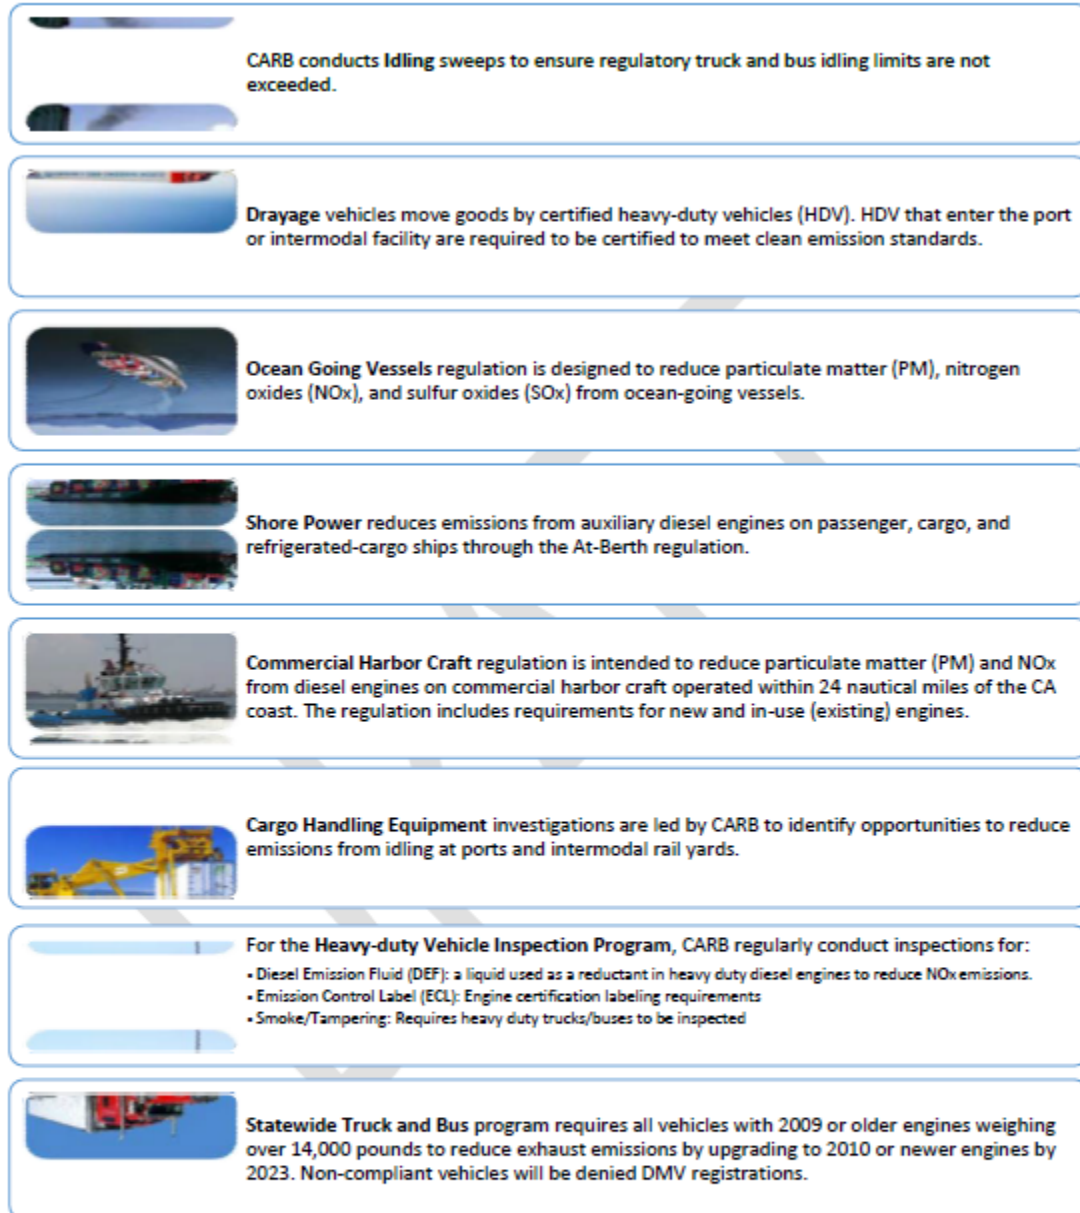

During the settlement process, violators have the opportunity to allocate up to 50% of their penalties to a supplemental environmental project (SEP)<sup>4</sup>. Community-proposed projects are funded by the violators to help improve public health, reduce pollution, increase environmental compliance and bring public awareness to air pollution issues. Additional SEPS are possible in the WCWLB community through the proposal process.<sup>9</sup> CARB has over 50 enforcement programs that focus on specific source types. A few of the programs that are relevant to enforcement activity in WCWLB community are:

13-2  
Cont.

<sup>4</sup> Other examples of enforcement settlement cases can be found in CARB's Annual Enforcement Reports (<https://www.arb.ca.gov/enf/reports/reports.htm>).

Chapter 4: Enforcement Plan

CARB Enforcement's Program Structure

13-2  
Cont.

Figure 4-6. CARB Enforcement Program teams relevant to the WCWLB community

### How the Public Helps Reduce Air Pollution

Members of the public play an important role in communicating air quality concerns to both South Coast AQMD and CARB. The complaint process helps both agencies identify issues that are directly affecting the WCWL community. The most effective way to contact the agency is through the complaint hotlines. In addition to South Coast AQMD's mobile application, both agencies can be contacted by phone and online:

<p><b>CARB - Mobile Sources</b>  <b>Automobiles, Trucks, Off-road Equipment,  or other Vehicles</b>  Phone: 1-800-END-SMOG  Online: <a href="http://calepa.ca.gov/enforcement/complaints">calepa.ca.gov/enforcement/complaints</a></p>	<p><b>South Coast AQMD - Stationary Sources</b>  <b>Odors, Smoke, Dust, or other Air  Contaminants</b>  Phone: 1-800-CUT-SMOG  Online:  <a href="https://www.aqmd.gov/home/air-quality/complaints">https://www.aqmd.gov/home/air-quality/complaints</a></p>
--	---

Both CARB and South Coast AQMD value input from those who live and work every day in the community, and communicating air quality issues directly to the agencies with the information above is the best way to address an air pollution concern. Letting us know of an issue when it is occurring rather than after the fact really helps our ability to find the source of the problem.

13-2  
Cont.

An effective complaint should contain information with specific details. This information helps inspectors conduct a thorough investigation and take appropriate enforcement action. The following information is valuable to a thorough complaint investigation:

- Type of air quality concern (odor, smoke, dust, etc.)
  - o Odors: description of odor
  - o Smoke: color of smoke; does the smoke disappear or hang in the air?
  - o Dust: type of dust
- Location of air pollution concern
- Name or address of potential source
- Time of day that the air quality issue began, and is the concern still occurring?
- Has the concern occurred before, and do other people in your community experience it as well?
- Contact information for the person reporting the complaint<sup>5</sup>

<sup>5</sup> Although anonymous complaints are accepted, staff have found that having contact information helps with getting additional information to help with the investigation

## Technology

Both South Coast AQMD and CARB enforcement staff have embraced the use of technology as a means for more efficient and effective inspections. South Coast AQMD inspectors have access to advanced instruments to help identify air pollution issues in real-time. The following portable instruments are available to inspectors:

*Toxic Vapor Analyzers (TVA):* Inspectors can use TVAs to provide information about the level of certain gases in a specific area. This includes methane and volatile organic compounds (VOCs), which are emitted by petroleum sources and other types of sources.

*Infrared Cameras:* Inspectors can use specialized infrared cameras to view emissions of gases (including methane and VOCs) that would otherwise be invisible to the naked eye. This equipment enables inspectors to scan areas for emissions and quickly check for any large leaks at a facility.

*X-Ray Fluorescence (XRF):* Inspectors can use this handheld instrument to identify the types of chemicals that are on a surface or in a dust pile. This tool helps identify potential pollutants that are particles. For example, an XRF can be used to scan surfaces at a facility to identify which specific toxic metals may be deposited in that location, and which locations that have the highest levels of those toxic metals.

*H<sub>2</sub>S Analyzers (Jerome Meters):* Inspectors can use this handheld instrument to measure hydrogen sulfide gas levels in the air. This information can be used to identify a potential source of rotten egg type odors.

Figure 4-7. Portable instruments used by South Coast AQMD inspectors in the field

In addition, inspectors are trained on how to collect field samples, including air samples, liquid samples, or bulk material samples. These samples can then be provided to the South Coast AQMD laboratory or contract laboratories for analysis. The results of these analyses can be used as evidence to support investigations and/or Notices of Violation issued to air pollution sources.

South Coast AQMD regulates over 25,000 facilities, receives approximately 10,000 public complaints per year, and operates a vast air quality monitoring network; and CARB regulates mobile sources throughout the state. Analyzing the data that results from these efforts can provide insight into the trends and sources of air pollution as well as new enforcement opportunities. Both agencies use information technology to enhance the ability to conduct investigations and enforce regulations. As an example, for CARB's truck fleet enforcement program, the traditional approach was to inspect several thousand trucks annually through fleet-based inspections. Starting in January 2018, CARB began the Streamlined Truck Enforcement Process (STEP), and is now able to conduct 20,000 to 25,000 inspections per year through the use of a data-driven approach, noncompliance letters, and a scheduled settlement process. South Coast AQMD's investigation of crude oil tankers is another example of using information technology in enforcement activities. Inspectors used mapping software, weather data, and ship databases to help identify an oil tanker as a potential source of emissions. The oil tanker was later issued a Notice of Violation when it berthed at a port near this community. These multi-faceted approaches can be applied to address other air pollution concerns in WCWLB. Providing transparent access to the information that both agencies possess will lead to a stronger partnership with the community.

13-2  
Cont.

### The Interagency Approach

CARB and South Coast AQMD are committed to working with other agencies on joint initiatives that will directly result in cleaner air. The combined resources, expertise, and legal authorities of different agencies can create a well-rounded approach to the regulatory process that leverages their respective strengths to address issues that cumulatively impact public health. For example, the Los Angeles County Oil and Gas Strike Team is a group of multiple agencies that conducted crude oil production (oil well) inspections throughout Los Angeles County. Representatives from multiple agencies conducted inspections together, covering not only compliance with air, but also water, public health, and code enforcement. Both South Coast AQMD and CARB have demonstrated experience working in close collaboration with other regulatory agencies, cities and counties, public health agencies, and local police and fire departments to conduct investigations and provide public information about local air pollution sources.

13-2  
Cont.

Figure 4-8. Examples of agencies that routinely collaborate with South Coast AQMD and CARB

CARB partners with local agencies to create memoranda of understanding (MOUs), such as an agreement with South Coast AQMD to enforce CARB's greenhouse gas standards at certain facilities. In addition, CARB has already established partnerships with California DMV working on implementing registration holds for non-compliant trucks and buses, California Highway Patrol (CHP) to conduct roadside inspections, and other state and regional agencies to ensure we are supporting each other's enforcement efforts.

The compliance process seeks to ensure that all rules and regulations are followed through a fair and robust enforcement program, resulting in reduced air pollution emissions. Adaptability is crucial, whether in the program's overall, or in day-to-day, operations, to ensure that community concerns are addressed quickly and that enforcement action is taken when violations are identified. Both CARB and South Coast AQMD enforcement teams will continue to search for innovative strategies, lead in community transparency, and take swift action for non-compliance.

## Community Requests Regarding Enforcement

Communities have asked for complete transparency regarding enforcement activities and have identified the following concerns and requests:

- |  |      |
|--|------|
| <ul style="list-style-type: none"> <li>• CSC members and the public have discovered that not all air pollution sources are regularly inspected and in some cases agencies are not even aware of these sources. CSC members and the public have asked SCAQMD and CARB to inspect all community identified Air Polluting Industry Sources and that they be scheduled for regular inspections: this would include as a minimum: container storage yards, chassis storage yards, truck storage yards, truck repair and maintenance yards, railyards, container fumigation facilities operating oil well sites, gas stations, abandoned oil well sites, landfills and brownfields.</li> </ul> | 13-3 |
| <ul style="list-style-type: none"> <li>• CSC members and the public have asked SCAQMD and CARB to publish repeat offender and trends information so as to determine if enforcement actions being taken have been effective in stopping and reducing Notice to Comply (NC) – requiring a facility to quickly correct a minor violation or to provide specified records, Notice of Violation (NOV) – formally identifying a violation of particular rules or regulations, which may result in civil penalties or, in some cases, referral for criminal prosecution and Fines</li> </ul>  | 13-4 |
| <ul style="list-style-type: none"> <li>• CSC members and the public have asked SCAQMD and CARB to issue Cease and Desist Orders to all air polluting companies who exceed three NOV's, three NOC's, three Fines and Suspend all Permits. The Public has seen governmental regulatory agency favoritism toward the Oil Refining Industries in allowing them to be significant repeat offenders.</li> </ul>  | 13-5 |
| <ul style="list-style-type: none"> <li>• CSC members and the public have asked SCAQMD and CARB as part of their enforcement action to mandate that parts, equipment and systems be replaced that have exceeded their manufacturer's warranty in order to prevent mechanical breakdowns leading to violations. It is industries practice to wait until something fails to replace it.</li> </ul>  | 13-6 |
| <ul style="list-style-type: none"> <li>• CSC members and the public have asked SCAQMD and CARB to include community organization air quality monitoring to support enforcement and identification of new and emerging air pollution sources.</li> </ul>  | 13-7 |

Final

**Chapter 5a      Actions to Reduce Community Air Pollution**

**Community Air Quality Priority**

1. Community Air Quality Priority and Goal is Zero Emissions from all industry stationary and mobile sources using Zero Emission Technologies immediately.
2. Community Air Quality Priority is making all Non-Zero Emission Sources including Near-Zero Emission Vehicles and Equipment Zero Emissions Technology as soon as possible within 5 years.
3. Community Air Quality Priority is requiring all available BACT, BACRT and Emissions Capture & Treatment Technologies be phased-in as-soon-as possible beginning in 2020 and completed within 5 years as interim measures until 100% Zero Emissions is achieved. Our EJ Communities desired goal is 100% ZE by 2025.
4. Community Air Quality Priority is the immediate adoption of an Emissions CAP on all industry emission sources within 1 year.
5. Community Air Quality Priority is the establishment of a Public Health Baseline for EJ Communities based on a Health Impact Assessment and Public Health Survey of each community. The Public Health Baseline is needed to determine if the measures being taken have been effective in reducing air pollution and improving public health in the future.
6. Community Air Quality Priority is the reduction of public exposure from emissions from all Industry sources direct and indirect. We want a Comprehensive Inventory List by Industry Sources. To include by general major classifications and specific life threatening categories:
  - Criteria Pollutants (CP)
  - Toxic Pollutants (TP)
  - Hazardous Air Pollutants (HAPs)
  - Volatile Organic Compounds (VOCs)
  - Greenhouse Gases (GHG)
  - Particulate Matter (PM)
  - Heavy Metals (HM)
  - Polycyclic Aromatic Hydrocarbons (PAHs)
  - Unregulated Pollutants

13-8

13-9

13-10

- |   |       |
|---|-------|
| 7. The Coalition For A Safe Environment Volunteers to participate in community organization based air quality monitoring, identification of air pollution sources, the recommendation of mitigation measures and the identification of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies and Carbon Capture via Community Greenscaping to reduce public exposure. | 13-11 |
|---|-------|

**Community Request Priority for the South Coast AQMD**

- |   |       |
|---|-------|
| 1. Community Request Priority for the South Coast AQMD in cooperation with CARB to prevent all public exposure to all major classifications and specific life threatening categories of air pollution emissions.  | 13-12 |
| 2. Community Request Priority for the South Coast AQMD is to create a Comprehensive Inventory List of all air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources by chemical type and annual emission quantities. Not an abbreviated short list. From this list the Public and the CSC will prioritize which classifications and categories should be part of Phase I. | 13-13 |
| 3. Community Request Priority for the South Coast AQMD is to update the Emissions Inventories with all community identified air pollution source that are missing and for the SCAQMD to immediately establish the emissions quantities, baselines and post 5, 10, 15, 20 year trends on SCAQMD website.   | 13-14 |
| 4. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies, identify all Industries and categories where these technologies can be applied now.   |       |
| 5. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and/or reduce to less than significant emissions from all Industries within 1 year. We do not support an MOU under any conditions. State and Federal law already allow Indirect Source Rules.  | 13-15 |
| 6. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies.   | 13-16 |
| 7. Community Request Priority for the South Coast AQMD to submit Port CAAP and Industry Project EIRs public comments requests supporting mandatory use of Zero Emissions Technologies, BACT, BACRT and Emissions Capture & Treatment Technologies.  | 13-17 |
| 8. Community Request Priority for the South Coast AQMD to mandate and recommend to the Port CAAP and Industry EIRs Air Purification Filtration Systems to Mitigate Air Pollution Public Health Impacts to children and the public. Our priority recommendations are:  |       |
| <ul style="list-style-type: none"> <li>• Public Schools</li> <li>• Childcare Centers</li> <li>• Public Libraries</li> </ul>   |       |

<ul style="list-style-type: none"> <li>• Indoor Recreational Centers</li> <li>• Senior Citizen Housing</li> <li>• Senior Citizen Centers</li> <li>• Hospitals</li> <li>• Residential Homes</li> </ul>	13-17 Cont.
<b>Community Recommendations for the South Coast AQMD</b>	
1. Conduct Industry bi-annual information outreach events on incentives and programs.	13-18
2. Allow Emerging Industry Technology Companies Volunteer Demonstration Projects even if there is not governmental agency grant. Open to the public.	13-19
3. SCAQMD website include information, photos, illustrations, videos and animation of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies. Information and links can be from companies, non-profit organizations, institutes, universities, colleges and the public.	13-20
4. SCAQMD to include Aerial Drones to monitor all air pollution sources, routes and destinations. There are now Aerial Drones that can fly-hoover 8-24 hrs.	13-21
<b>Community Requested Information to be Included</b>	
<b>Community Air Protection Blueprint</b>	
1. APPENDIX C.	
CRITERIA FOR COMMUNITY EMISSIONS REDUCTION PROGRAMS	
The requirements for community emissions reduction programs include:	
<ul style="list-style-type: none"> <li>• Establishing a community steering committee to guide development of the program elements, including members who live, work, or own businesses in the community (e.g. community residents, small businesses, facility managers/workers, school personnel), with the majority representation from community residents.</li> <li>• Developing a strong technical foundation for understanding the sources of air pollution impacting the community.</li> <li>• Characterizing current public health data in the community related to air pollution.</li> <li>• Setting specific, quantifiable emissions reduction targets to be achieved within five years, along with annual milestones and commitments for specific compliance and technology/control technique deployment goals.</li> <li>• Identifying applicable regulatory, enforcement, incentive, and permitting strategies to implement new actions and the most stringent approaches for reducing emissions, with a focus on zero emission technologies where feasible.</li> </ul>	13-22

- Identifying needed land use and transportation strategies to implement and defining specific actions for engaging with local government agencies to actively promote these strategies.
- Developing an enforcement plan to ensure effective implementation and engagement with community members on addressing compliance issues.
- Defining specific, quantifiable metrics to track progress.

13-22

#### Chapter 5c      Ports

##### Community Air Quality Priority

- |  |       |
|--|-------|
| 1. Community Air Quality Priority is Zero Emissions from all ports, shipping, freight transportation and supporting industry vehicles and equipment sources using Zero Emission Technologies immediately.  | 13-23 |
| 2. Community Air Quality Priority is making all Non-Zero Emission Sources including Near-Zero Emission Vehicles and Equipment Zero Emissions Technology as soon as possible within 5 years.  |       |
| 3. Community Air Quality Priority is requiring all available BACT, BACRT and Emissions Capture & Treatment Technologies be phased-in as-soon-as possible beginning in 2020 and completed within 5 years as interim measures until 100% Zero Emissions is achieved. Our EJ Communities desired goal is 100% ZE by 2025. |       |
| 4. Community Air Quality Priority is the immediate adoption of an Emissions CAP on all emission sources within 1 year.   |       |
| 5. Community Air Quality Priority is the establishment of a Public Health Baseline for Port Communities. The Public Health Baseline is needed to determine if the measures being taken have been effective in reducing air pollution and improving public health in the future.  | 13-24 |
| 6. Community Air Quality Priority is the inclusion of all Port Petroleum Industry air pollution sources, such as ship loading and unloading terminals, storage tank facilities, port-to-landside pipelines, operating oil wells and abandoned oil wells.   | 13-25 |

##### Community Request Priority for the South Coast AQMD

- |   |       |
|---|-------|
| 1. Community Request Priority for the South Coast AQMD is to create a comprehensive inventory list of all Port air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources supporting activities, itemized by vehicle and equipment type, to include: all supporting freight transportation routes, container/Chassis/TRU Units storage yards, petroleum industry marine terminals, lift bridges & back-up generators, container fumigation facilities, container transloading facilities, etc. and all emissions by chemical type and annual emission quantities. Not an abbreviated short list. | 13-26 |
| 2. Community Request Priority for the South Coast AQMD is to update the Ports inventories with all community identified air pollution source that are missing and for the SCAQMD to   |       |

immediately establish the emissions quantities, baselines and post 5, 10, 15, 20 year trends on SCAQMD website.	13-26 Cont.
3. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies and identify all ports, shipping and freight transportation industry vehicles and equipment where these technologies can be applied now.	13-27
4. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB At-Berth Rule stating that: <ul style="list-style-type: none"> <li>No-Ship Category such as Break Bulk Ships be exempted.</li> <li>Include all ships at At-Berth and At-Anchor</li> <li>No grants or incentives be given to any technology company that does not show evidence of owning patents or have the rights to use patented technologies.</li> </ul>	13-28
5. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB Mobile Cargo Handling Equipment Regulation supporting all CHE be Zero Emissions within 5 years. Zero Emission Hydrogen Fuel Cell Electric Battery Technology exists now to replace all most all electric engines.	13-29
6. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and reduce to less than significant emissions from all Port and Freight Transportation Industry magnet sources and off-port tidelands indirect sources supporting industries within 1 year. We do not support an MOU under any conditions. State and Federal law already allow Indirect Source Rules.	13-30
7. Community Request Priority for the South Coast AQMD to submit public comments to CARB on the new CARB Commercial Harbor Craft Regulation supporting all CHC be Zero Emissions within 5 years. Zero Emission Hydrogen Fuel Cell Electric Battery Technology exists now to replace all most all electric engines.	13-31
8. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies.	13-32
9. Community Request Priority for the South Coast AQMD to pay all past debt grant funds to minority owned small business technology companies who have completed their green technology demonstration or pilot projects immediately whose technology is supported by the community.	13-33
10. Community Request Priority for the South Coast AQMD to submit CAAP and Port Terminal EIR public comments requests supporting Ports mandatory expanded use of the Alameda Corridor of 10% per year for the next 5 years.	13-34
11. Community Request Priority for the South Coast AQMD to submit CAAP and Port Terminal EIR public comments requests supporting Ports mandatory expanded Terminal Lease Agreement Terms & Conditions to include supplier and subcontractor Zero Emission vehicles and equipment.	

### Community Recommendations for the South Coast AQMD

- |  |       |
|--|-------|
| 1. Conduct Port industry bi-annual information outreach events on incentives and programs.   | 13-35 |
| 2. Allow Port Industry Technology Companies Volunteer Demonstration Projects even if there is not governmental agency grant. Open to the public.   | 13-36 |
| 3. SCAQMD website include information, photos, illustrations, videos and animation of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies. Information and links can be from companies, non-profit organizations, institutes, universities, colleges and the public. | 13-37 |
| 4. SCAQMD to include Aerial Drones to monitor terminal and ships emissions. There are now Aerial Drones that can fly-hoover 8-24 hrs.  | 13-38 |

**Chapter 5d      Neighborhood Truck Traffic**

**Community Air Quality Priority**

- |  |       |
|--|-------|
| 1. Community Air Quality Priority is Zero Emissions from all freight transportation Trucks and supporting industry vehicles and equipment sources using Zero Emission Technologies immediately.  | 13-39 |
| 2. Community Air Quality Priority is making all Non-Zero Emission Sources including Near-Zero Emission Vehicles and Equipment Zero Emissions Technology as soon as possible within 5 years.  |       |
| 3. Community Air Quality Priority is requiring all available BACT, BACRT and Emissions Capture & Treatment Technologies be phased-in as-soon-as possible beginning in 2020 and completed within 5 years as interim measures until 100% Zero Emissions is achieved. Our EJ Communities desired goal is 100% ZE by 2025.   |       |
| 4. Community Air Quality Priority is the immediate adoption of an Emissions CAP on all Truck emission sources within 1 year.   |       |
| 5. Community Air Quality Priority is the establishment of a Public Health Baseline for Port EJ Communities.  | 13-40 |
| 6. Community Air Quality Priority is the inclusion of all Port Truck Industry air pollution sources, such as truck routes, emerging truck routes, truck storage yards, truck repair & maintenance garages and yards, truck diesel fueling stations and off-port property truck destinations such as container storage yards, chassis storage yards, container fumigation facilities, transloading facilities, warehouses and distribution centers. | 13-41 |

**Community Request Priority for the South Coast AQMD**

- |  |       |
|--|-------|
| 1. Community Request Priority for the South Coast AQMD in cooperation with CARB and Port Police to prevent any illegal community and residential truck traffic and idling.   | 13-42 |
| 2. Community Request Priority for the South Coast AQMD is to create a comprehensive inventory list of all Port Truck Routes and Destination air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources supporting activities, itemized by vehicle and equipment type, to include: all supporting freight transportation routes, container/Chassis/TRU Units storage yards, petroleum industry marine terminals, lift bridges & back-up generators, container fumigation facilities, container transloading facilities, etc. and all emissions by chemical type and annual emission quantities. Not an abbreviated short list. | 13-43 |

3. Community Request Priority for the South Coast AQMD is to update the Ports Truck emission inventories with all community identified air pollution source that are missing and for the SCAQMD to immediately establish the emissions quantities, baselines and post 5, 10, 15, 20 year trends on SCAQMD website.	13-43 Cont.
4. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies and identify all Trucks, freight transportation industry supporting vehicles and equipment where these technologies can be applied now.	13-44
5. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and reduce to less than significant emissions from all Port and Freight Transportation Industry Truck magnet sources and off-port tidelands indirect sources supporting industries within 1 year. We do not support an MOU under any conditions. State and Federal law already allow Indirect Source Rules.	13-45
6. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies.	13-46
7. Community Request Priority for the South Coast AQMD to submit CAAP and Port Terminal EIR public comments requests supporting Ports mandatory expanded use of the Alameda Corridor of 10% per year for the next 5 years to lower community truck traffic.	13-47
<b>Community Recommendations for the South Coast AQMD</b>	
1. Conduct Port Truck Industry bi-annual information outreach events on incentives and programs.	13-48
2. Allow Port Truck Industry Technology Companies Volunteer Demonstration Projects even if there is not governmental agency grant. Open to the public.	13-49
3. SCAQMD website include information, photos, illustrations, videos and animation of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies. Information and links can be from companies, non-profit organizations, institutes, universities, colleges and the public.	13-50
4. SCAQMD to include Aerial Drones to monitor truck routes and destinations. There are now Aerial Drones that can fly-hoover 8-24 hrs.	13-51

Final Update

**Chapter 5e Oil Drilling & Production**

**Community Air Quality Priority**

1. Community Air Quality Priority is Zero Emissions from all Port Tidelands Petroleum Industry and Off-Port Tidelands Petroleum Industry vehicles, equipment, product processing systems, boilers, heaters, wet scrubber, catalytic crackers, storage tanks, oil well emission sources using Zero Emission Technologies immediately. 13-52
2. Community Air Quality Priority is making all Non-Zero Emission Sources including Near-Zero Emission Vehicles and Equipment Zero Emissions Technology as soon as possible within 5 years.
3. Community Air Quality Priority is requiring all available BACT, BACRT and Emissions Capture & Treatment Technologies be phased-in as-soon-as possible beginning in 2020 and completed within 5 years as interim measures until 100% Zero Emissions is achieved. Our EJ Communities desired goal is 100% ZE by 2025.
4. Community Air Quality Priority is the immediate adoption of an Emissions CAP on all Petroleum Industry emission sources within 1 year.
5. Community Air Quality Priority is the establishment of a Public Health Baseline for EJ Communities that are fenceline and near within 5 miles of all Petroleum Industry air pollution sources. The Public Health Baseline is needed to determine if the measures being taken have been effective in reducing air pollution and improving public health in the future. 13-53
6. Community Air Quality Priority is the inclusion of all Petroleum Industry air pollution sources inventories, such as ship loading and unloading terminals, product system processing & manufacturing, product storage tank facilities, product storage barns, port-to-landside pipelines, truck product transport, train product transport, conveyor system product transport, operating oil wells, abandoned oil wells and gas-fueling stations. 13-54

**Community Request Priority for the South Coast AQMD**

1. Community Request Priority for the South Coast AQMD is to create a comprehensive inventory list of all Petroleum Industry air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources supporting activities, itemized by vehicle and equipment type, back-up generators, and all emissions by chemical type and annual emission quantities. Not an abbreviated short list. 13-55

2. Community Request Priority for the South Coast AQMD is to update the Petroleum Industry inventories with all community identified air pollution sources that are missing and for the SCAQMD to immediately establish the emissions quantities, baselines and post 5, 10, 15, 20 year trends on SCAQMD website.	13-55 Cont.
3. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies and identify all Petroleum Industry sources where these technologies can be applied now.	13-56
4. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and reduce to less than significant emissions from all Petroleum Industry sources and supporting industries within 1 year. We do not support an MOU under any conditions. State and Federal law already allow Indirect Source Rules.	13-57
5. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration Projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies.	13-58
6. Community Request Priority for the South Coast AQMD to allow community non-profit organizations experienced with air quality monitoring experience to participate in Fenceline Air Quality Monitoring of Petroleum Industry emission sources where feasible. Such as oil well sites fenceline Air Quality Spot Inspections which identify fugitive emissions in which the SCAQMD can follow-up with more precise equipment.	13-59
7. Community Request Priority for the South Coast AQMD to request from CARB that Wilmington, Carson, West Long Beach communities be added to the Study of Neighborhood Air near Petroleum Sources (SNAPS) program.	13-60
8. Community Request Priority for the South Coast AQMD to request from CARB, DOGGR and DTSC the remediation of all abandoned/orphaned oil wells sites with priority given to oil well sites located near public schools, libraries, parks, recreational facilities and in residential areas.	13-61
9. Community Request Priority for the South Coast AQMD to initiate legislative action to change the odor nuisance law to state inhalation exposure to a toxic chemical.	13-62
10. Community Request Priority for the South Coast AQMD to support EJ Community request to the Los Angeles County Dept. of Public Health and/or CARB AB 617 Community Grants to conduct a CASPER Public Health Survey in Wilmington in 2020 than Carson and Long Beach in 2021-2022 in order to establish EJ Communities Public Health Baseline.	13-63
11. Community Request Priority for the South Coast AQMD to require in the Title V Permits that all oil refineries and specialty refiners have emergency back-up power systems to prevent power outages and flaring. We further request thus use of Renewable Energy Sources and Hydrogen Fuel Cell Electric Battery Storage Systems.	13-64
12. Community Request Priority for the South Coast AQMD to require additional low-cost safety equipment such as gas detectors and pressure gages in the Title V Permits that all	

oil refineries, specialty refiners, oil, gas and fuel distribution centers and pipelines to prevent explosions and leaks.

13. Community Request Priority for the South Coast AQMD to require On-Site Air Quality Monitoring, Public Notification and a Public Meeting when oil companies conduct oil drilling or depth expansion activities at oil well sites located near public schools, libraries, parks, recreational facilities and in residential areas.

13-64  
Cont.

#### Community Recommendations for the South Coast AQMD

1. Conduct Petroleum Industry bi-annual information outreach events on incentives and programs.
2. Allow Petroleum Industry Technology Companies Volunteer Demonstration Projects even if there is not a governmental agency grant. Open to the public.
3. SCAQMD website include information, photos, illustrations, videos and animation of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies. Information and links can be from companies, non-profit organizations, institutes, universities, colleges and the public.
4. SCAQMD to include Aerial Drones to monitor all Petroleum Industry locations emissions. There are now Aerial Drones that can fly-hoover 8-24 hrs.

#### Community Request Priority for the South Coast AQMD

1. Community Request Priority for the South Coast AQMD in cooperation with CARB to prevent all public exposure to all major classifications and specific life threatening categories of air pollution emissions. 13-87
2. Community Request Priority for the South Coast AQMD is to create a Comprehensive Inventory List of all air pollution direct sources on-port tidelands properties and off-port tidelands indirect sources by chemical type and annual emission quantities. Not an abbreviated short list. From this list the Public and the CSC will prioritize which classifications and categories should be part of Phase I. 13-88
3. Community Request Priority for the South Coast AQMD is to update the Emissions Inventories with all community identified air pollution source that are missing and for the SCAQMD to immediately establish the emissions quantities, baselines and post 5, 10, 15, 20 year trends on SCAQMD website.
4. Community Request Priority for the South Coast AQMD to provide a list of all available Zero Emissions Technology, BACT, BACRT, Emissions Capture & Treatment Technologies, identify all Industries and categories where these technologies can be applied now. 13-89
5. Community Request Priority for the South Coast AQMD to adopt an Indirect Source Rule to eliminate and/or reduce to less than significant emissions from all Industries within 1 year. We do not support an MOU under any conditions. State and Federal law already allow Indirect Source Rules. 13-90
6. Community Request Priority for the South Coast AQMD to sponsor technology Demonstration projects, pilot projects, infrastructure projects and incentives with ZERO Emission Projects being the # 1 priority. We want no investment of public funds in outdated technologies. 13-91
7. Community Request Priority for the South Coast AQMD to submit Port CAAP and Industry Project EIRs public comments requests supporting mandatory use of Zero Emissions Technologies, BACT, BACRT and Emissions Capture & Treatment Technologies.
8. Community Request Priority for the South Coast AQMD to mandate and recommend to the Port CAAP and Industry EIRs Air Purification Filtration Systems to Mitigate Air Pollution Public Health Impacts to children and the public. Our priority recommendations are: 13-92
  - Public Schools
  - Childcare Centers
  - Public Libraries
  - Indoor Recreational Centers
  - Senior Citizen Housing

- |  |                |
|--|----------------|
| <ul style="list-style-type: none"> <li>• Senior Citizen Centers</li> <li>• Hospitals</li> <li>• Residential Homes</li> </ul> | 13-92<br>Cont. |
|--|----------------|

**Community Recommendations for the South Coast AQMD**

- |  |       |
|--|-------|
| 1. Conduct Industry bi-annual information outreach events on incentives and programs.  | 13-93 |
| 2. Allow Emerging Industry Technology Companies Volunteer Demonstration Projects even if there is not governmental agency grant. Open to the public.   | 13-94 |
| 3. SCAQMD website include information, photos, illustrations, videos and animation of Zero Emission Technologies, BACT, BACRT, Emissions Capture & Treatment Technologies. Information and links can be from companies, non-profit organizations, institutes, universities, colleges and the public. | 13-95 |
| 4. SCAQMD to include Aerial Drones to monitor all air pollution sources, routes and destinations. There are now Aerial Drones that can fly-hoover 8-24 hrs.  | 13-96 |

**Community Partner Outreach & Initiatives**

- |  |       |
|--|-------|
| <ul style="list-style-type: none"> <li>• The Coalition For A Safe Environment (CFASE) Volunteers to participate in public information and community outreach.</li> <li>• CFASE Volunteers to recruit other community organizations to participate in public information and community outreach.</li> <li>• CFASE Volunteers to notify local news media and social media to participate in public information and community outreach.</li> <li>• CFASE will research Governmental, Foundation and Private Industry Project Grant Funding Opportunities to support our community based air quality monitoring, public health research, emerging technology research, public information and community outreach.</li> </ul> | 13-97 |
|--|-------|

## Comment Letter #13 Coalition For A Safe Environment

### AB 617 CERP Public Comments

Final

#### Chapter 6      Air Monitoring Summary

##### Community Organization Air Quality Monitoring

The participating communities of Wilmington, Carson and West Long Beach have requested that community non-profit Environmental Justice Organizations who have air quality monitoring experience participate in local community air monitoring as part of the CAMP-Community Air Monitoring Plan.

13-98

The Coalition For A Safe Environment (CFASE) has over 12 years of experience and has participated in air quality studies by the California Air Resources Board, UCLA, USC and Liberty Hill Foundation. CFASE owns a variety professional air quality instruments and has an air quality monitoring station and weather station on its office roof. Funds for CFASE's air quality monitoring equipment have been funded by CARB, Cal EPA, DTSC and USEPA.

CFASE has identified that it could partner with the SCAQMD in doing VOC Fugitive Emissions Fenceline Spot Checking of Operating Oil Well Sites and Abandoned Oil Well Sites. CFASE owns a professional \$10,000 TSI Q-Trak Instrument which measures VOCs in the ambient air in real-time. CFASE could also use the same instrument for Fenceline Spot Checking for Methane Gas at Landfills and Brownfields.

13-99

CFASE has requested that the South Coast AQMD support the expansion of the CFASE LACEEN Wilmington Air Quality Network Expansion.

CFASE is a member of the AIRE Collaborative of 5 EJ Community Organizations that have a network of over 40 PM Air Quality Monitors in California.

13-100

LBACA in Long Beach, Communities for a Better Environment in Wilmington and Community Dreams in Carson have participated in community air quality monitoring in the past.

##### Community Requested Information to be Included

##### Community Air Protection Blueprint

##### 1. APPENDIX E – STATEWIDE AIR MONITORING PLAN COMMUNITY AIR PROTECTION PROGRAM

Figure E-1 Community Air Monitoring Plan Elements

WHAT IS THE REASON FOR CONDUCTING COMMUNITY AIR MONITORING?

13-101

1. Form community partnerships.
2. State the community-specific purpose for air monitoring.
3. Identify scope of actions.
4. Define air monitoring objectives.
5. Establish roles and responsibilities.

#### HOW WILL MONITORING BE CONDUCTED?

6. Define data quality objectives.
7. Select monitoring methods and equipment.
8. Determine monitoring areas.
9. Develop quality control procedures.
10. Describe data management.
11. Provide work plan for conducting field measurements.

#### HOW WILL DATA BE USED TO TAKE ACTION?

12. Specify process for evaluating effectiveness.
13. Analyze and interpret data.
14. Communicate results to support action.

## 2. APPENDIX E – STATEWIDE AIR MONITORING PLAN

### ANALYZE AND INTERPRET DATA

Some analysis examples include, but are not limited to:

- Comparing trends in community air monitoring data to trends in data from nearby regulatory air monitors.
- Performing analysis to determine which source(s) may be primarily responsible for elevated concentrations in order to develop appropriate control strategies.
- Tracking progress over time to determine if strategies put in place by community emissions reduction programs yield ambient air quality improvements.

## 3. CHECKLIST FOR COMMUNITY AIR MONITORING EVALUATION

Table E-2 Checklist for Community Air Monitoring Evaluation

13-101  
Cont.

Response to Comment Letter #13-1

Thank you for your comments. South Coast Air Quality Management District takes all community member concerns seriously and will address each comment received.

Response to Comment Letter #13-2

Thank you for your suggested edits. The suggestion to change the first sentence in the CERP Executive Summary, “This Community Emissions Reduction Plan (CERP) outlines the actions and commitments by the Community Steering Committee (CSC) and the South Coast AQMD to reduce air pollution in the Wilmington, Carson, West Long Beach community” to include “Community Organizations with Air Quality Monitoring and Mitigation Experience” was not included. The CSC is composed of various stakeholders within the community including community based organizations. Therefore, the sentence already encompasses these groups, including those with air quality monitoring and mitigation experience.

Response to Comment Letter #13-3

South Coast AQMD’s enforcement program provides for regular inspections, to the extent allowed by available resources, of permitted facilities and air pollution sources that fall within the jurisdiction of the agency. In addition to complaints, inspections are prioritized at facilities with toxic emissions (e.g., hexavalent chromium) or with the highest potential to emit, such as RECLAIM and Title V facilities. These facilities are inspected at least annually. Other types of facilities (such as oil wells and gas stations) are generally inspected less frequently. Further, South Coast AQMD staff investigates reports of facilities operating without permits and performs inspections at new businesses. Additionally, we are committed to conducting inspections and/or investigating all of the concerns that have been prioritized by the Community Steering Committee. As part of the AB 617 process, community input is welcomed to help identify potential new pollution sources that should be considered for inclusion within our regulatory program.

Response to Comment Letter #13-4

As part of the CERP, South Coast AQMD is publishing information relating to Notice of Violations (NOVs) and Notice to Comply (NCs). Specifically, Appendix 4 provides a list of inspections that includes whether enforcement action was taken and a separate list of each enforcement action. Both lists are organized by facility/company and allows the identification of repeated violations. The South Coast AQMD Office of Compliance and Enforcement intends to update this information and also present trend data in its scheduled updates to the CSC. For example, Beginning in 2020 the South Coast AQMD Office of Compliance and Enforcement will provide CSC members periodic updates on inspection or complaint investigations on fugitive emissions and odors from oil drilling and production sites.

Response to Comment Letter #13-5

South Coast AQMD does not have the legal authority to create or implement this type of general policy. All enforcement actions are considered on a case-by-case basis, and must be consistent with our statutory authority and regulations.

Response to Comment Letter #13-6

South Coast AQMD does not have the legal authority to create or implement this type of general policy. All enforcement actions are considered on a case-by-case basis, and must be consistent with our statutory authority and regulations

Response to Comment Letter #13-7

South Coast AQMD staff has discussed the possibility of using VOC sensors operated by community members to conduct spot-checks of active and abandoned oil wells as qualitative measurements. Community members would alert the South Coast AQMD of points of interest and staff would follow up with more advanced monitoring equipment. Enforcement action must be based on evidence that meets the legal requirements for admissibility in court. Furthermore, the commenter recently received a small grant to work with different research institutions to develop low-cost VOC sensors. South Coast AQMD had provided a letter of support toward this effort. South Coast AQMD will continue to collaborate with community organizations on the implementation of the CERP and CAMP. Additionally, CARB provides Community Air Grants as part of the Community Air Protection Program, and community air monitoring projects are one category of projects that may be funded through these grants.

Response to Comment Letter #13-8

Please see Response to Comment Letter #1-1.

Response to Comment Letter #13-9

Please see Response to Comment Letter #1-2.

Response to Comment Letter #13-10

The community air quality priorities found in chapter 5 were identified and discussed by the CSC across various monthly meetings. Staff recognizes the community's priority is to achieve emission reductions from the priority sources, and the actions proposed in the CERP are consistent with this priority. Please see Chapter 3b and Appendix 3b for a detailed report on source attribution, which includes information about specific pollutants and pollutant categories (e.g. VOCs). With respect to the request for inventory information, please see Response to Comment Letter #1-3"

Response to Comment Letter #13-11

South Coast AQMD staff thanks the Coalition for a Safe Environment for their willingness to volunteer in air monitoring and other efforts. South Coast AQMD staff will continue to collaborate with community organizations on the implementation of the CERP and CAMP.

Response to Comment Letter #13-12

South Coast AQMD staff has developed actions within the CERP to improve air quality as outlined in the CARB Blueprint. This includes actions that reduce public exposure based on the air quality priorities identified by the CSC. Chapters 5b through 5g of the CERP identify actions that reduce emissions and/or reduce public exposure.

Response to Comment Letter #13-13

Please see Response to Comment Letter #1-3.

Response to Comment Letter #13-14

South Coast AQMD staff have been conducting Best Available Control Technology (BACT) analyses and working closely with CARB to provide data for the Technology Clearinghouse. Requirements for Toxics-Best Available Control Technology (T-BACT) are frequently established through the adoption and amendment of rules affecting air toxics (i.e., Regulation XIV). The Technology Clearinghouse keeps track of technologies such as BART. Staff will reference the Technology Clearinghouse and applicable air toxic rule requirements (inclusive of state Air Toxic Control Measures (ATCMs) and federal National Emission Standards for Hazardous Air Pollutants (NESHAPs), when available, to evaluate for potential tightening of rules through the rule development process. Permit considerations for both new and modified sources throughout the district are based on rule requirements. South Coast AQMD is conducting Best Available Retrofit Control Technology (BARCT) assessments as part of the rule development efforts to transition RECLAIM facilities to command-and-control.

Response to Comment Letter #13-15

Please see Response to Comment Letter #1-8.

Response to Comment Letter #13-16

Please see Response to Comment Letter #1-9.

Response to Comment Letter #13-17

The South Coast AQMD will take direct actions to mitigate air pollution public health impacts to children and the public. The CERP includes exposure reduction actions, such as Chapter 5g, Action 2, to address the children and the public. Through this action, South Coast AQMD will continue the installation of school air filtration systems<sup>6</sup> with priority given to schools near truck routes, railyards, and/or major freeways. Staff will also explore opportunities for additional schools and funding to provide filter replacements for schools already equipped with high efficiency filtration systems.

---

<sup>6</sup> Some schools or community centers have had air filtration systems previously installed; however, filter replacements may be needed. Replacement filters will continue to be provided to schools that have had air filtration systems installed. Given that these projects are dependent on available funding, the CSC will need to prioritize schools for air filtration systems

As stated in Response to Comment Letter #13-14, South Coast AQMD is conducting BARCT assessments as part of the rule development efforts to transition RECLAIM facilities to command-and-control. Please also see Response to Public Meeting Comment # 2-1 and Response to Comment Letter #8-3 regarding BARCT.

Response to Comment Letter #13-18

The South Coast AQMD conducts regular outreach events throughout the year for South Coast AQMD's incentive funding programs. These outreach activities continue to generate high interest in the programs, resulting in funding requests that far exceed the amount of available funding for these programs. In addition to regular outreach scheduled for each of the four counties for available incentive funds, starting in 2017, South Coast AQMD expanded these outreach efforts by notifying fleets (drayage and non-drayage), sea and inland ports, rail yards, warehouses, and other facilities located within the AB 617 communities of the funding opportunities. This expanded outreach resulted in about \$60.1 million in funding requests from the three AB 617 communities (as well as additional funding requests for projects in other disadvantaged and low-income communities) under the current Carl Moyer/Community Air Protection Programs application process. Since the various incentive programs are open to receive applications at different times in the year, the outreach efforts conducted by South Coast AQMD are coordinated with the timing of each program to maximize interest and participation. However, for some incentive programs, such as Replace Your Ride, South Coast AQMD provides outreach throughout the year. If included in approved Community Emissions Reduction Plans, South Coast AQMD can plan to conduct semiannual outreach.

Response to Comment Letter #13-19

Most of the mobile source demonstration projects are funded from the South Coast AQMD Clean Fuels Fund that has approximately \$13 Million per year in funding. Thus, Clean Fuel Funds are programmatically leveraged with other state and federal government agencies, as well as private funding opportunities, in order to support a wide variety of technologies both emerging and pre-commercial. Without this leveraging of funds, South Coast AQMD would be limited on the number and scope of technology demonstration projects that can be supported. Furthermore, demonstration projects also need to show a commercialization pathway to maximize the air quality benefits to the region. However, generally, public funding sources typically require the demonstration and deployment in disadvantaged communities, and many are deployed with the three AB 617 communities, especially the Wilmington, Carson, West Long Beach community. For those instances where demonstration projects are not funded by a governmental agency grant, the emerging industry technology company demonstration projects will be evaluated on a case by case basis. Generally speaking, the nature of the project will have to be evaluated to ensure that the project follows the parameters established by any pertinent demonstration project guidelines.

Response to Comment Letter #13-20

The Clean Fuel Annual Reports, summarizing the South Coast AQMD efforts on research, development, demonstration and deployment projects for mobile sources, are available on the South Coast AQMD website and can be accessed by the public. These annual reports include information on current and completed projects that focus on zero- and near zero-emission technologies, emission capture and treatment. Information on the projects, data, photos and illustrations are included in the reports, as well as links to government and non-government agencies and organizations, including academia that lead funded efforts. South Coast AQMD can also include links to our technology partners' sites, such as Volvo Trucks Electromobility site (<https://www.volvotrucks.com/en-en/about-us/electromobility.html>), which include videos and animations on electric truck technology. South Coast AQMD does not develop content on various technologies the best course would be to direct people to partner websites that do have content that informs and educates the public. Additionally, South Coast AQMD does not develop content on various technologies. However, South Coast AQMD can direct people to partner websites that do have content that informs and educates the public. Additionally, South Coast AQMD website includes links to the BACT program (<http://www.aqmd.gov/home/permits/bact>) and CARB website maintains a BACT Clearinghouse (<https://ww3.arb.ca.gov/bact/bactnew/rptpara.htm>) and RACT/BARCT Clearinghouse (<https://ww3.arb.ca.gov/ractbarc/ractbarc.htm>).

Response to Comment Letter #13-21

While Unmanned Aerial Vehicles (UAVs) are not suited to monitor "all air pollution sources, routes and destinations", they can provide valuable information on air pollution sources that are difficult to reach with more conventional monitoring techniques. South Coast AQMD staff is exploring the possibility to use UAV technology for various applications related to AB 617 monitoring.

Response to Comment Letter #13-22

Thank you for your request. The CERP was developed to follow the guidelines outlined in the CARB Blueprint. The CERP includes each of the elements in the bulleted points highlighted by the commenter:

- The community steering committee was established by the South Coast AQMD. Information about the CSC members and their affiliations can be found in the CERP Chapter 2, Table 2-1.
- The source attribution for the air pollution impacting the WCWL community can be found in Chapter 3b.
- Data on public health factors included in CalEnviroScreen 3.0 (asthma, low birth weight, and cardiovascular disease) is provided in Chapter 3a.
- The emissions reduction targets in the CERP are outlined in Chapter 5a. The implementation schedule for the actions that lead to the emissions reduction targets can be found in Chapter 5h. Each action is specific to reducing emissions from the six air

quality priorities identified by the CSC and can be found in Chapters 5b through 5g. The specific actions within the aforementioned chapters includes strategies such as compliance, incentives, public outreach, etc.

- The actions found in Chapters 5b through 5g include regulatory, enforcement, incentive, and other strategies to reduce emissions in the WCWL community.
- Many of the actions found in Chapters 5b through 5g will be conducted in collaboration with local government agencies. For example, Chapter 5d, Action 2 includes collaborations with local cities on transportation strategies (e.g. restricted truck routes).
- Chapter 4 of the CERP outlines the enforcement plan for the WCWL CERP.
- Chapter 5a through 5h lay out the actions for the CERP to reduce emissions, including goals and metrics that will be used to track the progress of this plan. The Implementation Schedule in Chapter 5h outlines the timeline for implementation, and staff will provide updates to the CSC on the progress made on the CERP actions.

Response to Comment Letter #13-23

Response to Comment Letter #13-24

Please see Response to Comment Letter #1-2.

Response to Comment Letter #13-25

The community air quality priorities found in chapter 5 were identified and discussed by the CSC across various monthly meetings. The air quality priorities for this community do include refinery emissions (including storage tanks), ports (including emissions from oil tankers), and oil drilling and production (e.g. emissions from operating and abandoned oil wells). The actions to address these community priorities can be found in Chapters 5b, 5c, and 5e.

Response to Comment Letter #13-34

The 2017 CAAP updates establishes a goal of expanding on-dock rail to accommodate 35% of all cargo leaving the port complex by rail, which represents a significant increase from the existing levels (i.e., about 24%). Staff will continue working with the ports through the MOU process to encourage expanded use of on-dock rail. Based on the 2017 CAAP Update, terminal operators are required to consider purchasing zero-emission equipment first, if feasible, beginning in 2020. The feasibility of zero-emission equipment will be determined through “public and collaborative process” based on the Ports’ Feasibility Assessment, which is expected to be released in Q3 2019 with subsequent assessments to follow at least every three years. The Ports will also work with terminal operators to accelerate the transition to zero-emission terminal equipment through lease renewals, EIR mitigation measures and other opportunities and venues, with a goal to transition to 100% zero-emission terminal equipment by 2030.

Response to Comment Letter #13-41

The community identified neighborhood truck traffic as one of the air quality priorities to be addressed in the CERP. Actions in Chapter 5d include working with the cities on truck routes, and reducing emissions from idling and operating trucks in the community. These actions will help decrease emissions from trucks in the community, including those that frequent storage yards, fueling stations, container storage yards, and other locations in the community.

Response to Comment Letter #13-42

Chapter 5d includes South Coast AQMD's commitment to conducting idling sweeps in the community. CARB has also committed to conducting and coordinating idling truck inspections with the California Highway patrol. This commitment also includes responding to noncompliant truck idling in the community and residential areas. For any instance of illegal truck traffic, South Coast AQMD will refer the complaint to the responsible agency. For example, if the truck traffic is subject to laws enforced by the Port Police, South Coast AQMD will refer the case to the Port Police as the responsible agency.

Response to Comment Letter #13-43

Please see Response to Comment Letter #1-3.

Response to Comment Letter #13-44

A list of zero-emissions technology can be provided. However, not all available zero-emission truck technologies are suitable alternatives for field applications. South Coast AQMD encourages zero-emissions when technologically feasible and commercially available. Also, see Response to Comment Letter #1-1.

Response to Comment Letter #13-45

Response to Comment Letter #13-58

Please see Response to Comment Letter #1-6.

Response to Comment Letter #13-59

South Coast AQMD staff will continue to collaborate with community organizations on the implementation of the CERP and CAMP. Chapter 5e, Action 1 specifically identifies community-based organizations as a key implementing entity to conduct community air monitoring that is complementary to the South Coast AQMD community air measurement efforts.

Response to Comment Letter #13-60

CARB staff developed a systematic selection process to identify and prioritize communities for air monitoring in the Study of Neighborhood Air near Petroleum Sources (SNAPS). The selection process is composed of three stages: identification, evaluation, and prioritization. Additional considerations may be incorporated into the process over time and the mechanisms of these existing stages might be revised as more information becomes available.

In the identification stage, staff developed a list of candidate communities for potential study. This list was based on (1) a mapping analysis to determine areas with significant co-location of oil and gas production and populations, and (2) suggestions for additional specific communities made by the public and local air districts. The resulting candidate community list contains 56 communities from across the State, most of which were identified by the mapping analysis.

In the evaluation stage, staff gathered additional data for each community on the candidate community list. This data is intended to differentiate communities that may have a higher likelihood of being impacted by oil and gas production emissions. A threshold analysis of eight indicators (within four thematic categories) enables staff to advance communities that meet the thresholds for the highest number of indicators to the prioritization stage. This is intended to continue with additional communities being elevated for prioritization over time. The eight indicators are detailed below.

In the prioritization stage, communities are prioritized according to a more detailed analysis of the eight indicators and additional considerations primarily related to logistics of placing air monitoring equipment within a community. This effort is currently ongoing. Staff divided the State into two regions for this analysis: Central Valley/Northern and Central/South Coasts. Communities are only compared to others in the same region because of the differences between the regions in terms of population characteristics, well placement relative to communities, and existing air measurement data. When possible, staff plan to rotate air monitoring between the two regions, using the time while air monitoring is occurring in one region to prepare to monitor in the other region.

Both Wilmington and Signal Hill are on the list of 56 candidate communities, all determined from the identification stage. After the evaluation stage was completed in 2018, CARB placed Wilmington and Signal Hill on the “First Round Short List” based on the number of indicators they received compared to other candidate communities (see table posted on SNAPS website). This short list was then narrowed down further in the prioritization stage to four initial communities for SNAPS air monitoring: Lost Hills, McKittrick/Derby Acres, Baldwin Hills, and South Los Angeles. These four communities will be the first to receive SNAPS monitoring. After monitoring is completed in these four communities, additional communities will be selected for the second round of air monitoring under the SNAPS program. Wilmington and Signal Hill will be considered for this second round of monitoring.

#### Response to Comment Letter #13-61

As part of Chapter 5e, Action 1, South Coast AQMD staff will request that data from DOGGR that identifies the well status, including whether a well was abandoned or remediated. Staff will work with the CSC to identify which wells within the community are the highest priority, including considering whether the proximity of the wells to sensitive receptors.

#### Response to Comment Letter #13-62

The South Coast AQMD is given broad authority by the California legislature to regulate air pollution from "all sources, other than emissions from motor vehicles" (H&SC Section 40000). The term "air pollutant" includes odors (H&SC Section 39013). Currently, the South Coast AQMD has authority under Rule 402 to take enforcement action to address odors causing air quality related public complaints that rise to the level of a public nuisance. The California Health & Safety Code identifies that CARB, in consultation with the California Office of Environmental Health Hazard Assessment (OEHHA), is tasked with assessing the scientific data to establish whether a pollutant is considered a toxic air contaminant. In addition, the U.S. EPA has the authority to list substances as federal hazardous air pollutants. Air pollutants that meet either of these definitions can then be regulated as air toxics. If an odorous air pollutant is identified as an air toxic under either these definitions, then South Coast AQMD can regulate that pollutant as an air toxic. In addition, South Coast AQMD staff has taken enforcement action for violation of Rule 402 or Health and Safety Code Section 41700 (public nuisance) based upon high levels of emissions of identified toxic air contaminants, such as an action against a chrome anodizing facility for emissions of hexavalent chromium. Therefore staff does not believe state law needs to be amended to allow public nuisance cases to include toxic emissions.

Response to Comment Letter #13-63

South Coast AQMD staff will work with the LA County Department of Public Health to assess what tools may be appropriate to gather public health data. See also Response to Comment Letter #1-2.

Response to Comment Letter #13-64

Chapter 5b, Action 3 describes some additional requirements that could be considered in PAR 1118 to address refinery flaring, including back-up power systems to prevent power outages and subsequent flaring. A technical assessment will be conducted as part of the rule development process. Additional requirements (e.g. notifications, pressure gauges, monitoring) for refinery equipment or oil drilling activities will be evaluated in the rule development process pertaining to that equipment.

Response to Comment Letter #13-71

Chapter 3b and Appendix 3b includes a detailed report on source attribution, including emissions from trains, ships, and other sources. In addition, South Coast AQMD staff has recently received updated emissions inventories for railyards. Staff will work with the railroad companies to review the data and will provide updates to the community in the coming months.

Response to Comment Letter #13-72

Please see Response to Comment Letter #1-3. In addition, South Coast AQMD staff has recently received updated emissions inventories for railyards. Staff will work with the railroad companies to review the data and will provide updates to the community in the coming months.

Response to Comment Letter #13-73

Please see Response to Comment Letter #1-4.

Response to Comment Letter #13-74

South Coast AQMD staff have already been working on developing an Indirect Source Rule for railyards, which is expected to be considered for adoption in 2020. For more information, please see Response to Comment Letter #8-13.

Response to Comment Letter #13-75

Response to Comment Letter #13-92

South Coast AQMD has previously supported efforts to install air filtration systems at public schools and community centers; these efforts in this community are described in Chapter 5g. Chapter 5g, Actions 2 and 3 describe efforts to reduce exposures through the installation of air filtration systems at schools and homes, which were identified by the CSC as the priorities for these exposure reduction actions.

See also Response to Comment Letter #1-1 regarding the development of an MOU to implement the Ports CAAP.

Response to Comment Letter #13-93

Please see Response to Comment Letter #13-18.

Response to Comment Letter #13-94

Please see Response to Comment Letter #13-19.

Response to Comment Letter #13-95

Response to Comment Letter #13-96

Please see Response to Comment Letter #13-21.

Response to Comment Letter #13-97

The South Coast AQMD staff appreciates CFASE's efforts, as public engagement is critical to the success of this program.

Response to Comment Letter #13-98

South Coast AQMD staff will continue to collaborate with community organizations on the implementation of the CERP and CAMP. Chapter 5e, Action 1 specifically identifies community-based organizations as a key implementing entity to conduct community air monitoring that is complementary to the South Coast AQMD community air measurement efforts.

Response to Comment Letter #13-99

South Coast AQMD staff has discussed the possibility of using VOC sensors operated by community members to conduct spot-checks of active and abandoned oil wells as qualitative measurements. Staff will continue to discuss the details with the CSC in order to draft a plan for implementing these efforts. Furthermore, South Coast AQMD staff recently wrote a letter of support that led to CSC member Jesse Marquez to receive a grant to work with different research institutions to develop a low-cost VOC sensor.

Response to Comment Letter #13-100

South Coast AQMD staff has previously discussed this request with CSC member Jesse Marquez. As previously discussed with him, South Coast AQMD staff will be providing a few PM and VOC sensors to help build the CFASE sensor network.

Response to Comment Letter #13-101

The CAMP was developed following the guidelines outlined in the CARB Blueprint.

Comment Letter #14: Bridget McCann – Western States Petroleum Association (WSPA)

Comment Letter #14

**Bridget McCann**  
Manager, Technical and Regulatory Affairs

July 2, 2019

Dr. Philip Fine  
Deputy Executive Officer, Planning and Rules  
South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

sent via email: [pfine@aqmd.gov](mailto:pfine@aqmd.gov)

**Re: AB617 Community Emission Reduction Plan (CERP)**  
**Discussion Draft for Wilmington, Carson & West Long Beach (WCWLB)**

Dear Dr. Fine,

Western States Petroleum Association (WSPA) appreciates the opportunity to participate in South Coast Air Quality Management District's (SCAQMD or District) AB617 Community Steering Committee meetings for the Wilmington, Carson, West Long Beach (WCWLB) community. WSPA is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in five western states including California. WSPA has been an active participant in air quality planning issues for over 30 years. WSPA-member companies operate petroleum refineries and other facilities in the South Coast Air Basin. Some of these facilities are located within the WCWLB community boundary.

The District recently published "discussion draft" versions of select CERP chapters for the WCWLB community area. These sections included (potential) actions to reduce air pollution emissions or exposures for a number of stationary source and/or mobile source categories.<sup>1</sup> District Staff presented an overview of these CERP chapters to the WCWLB Community Steering Committee on 13 June 2019.<sup>2</sup> WSPA offers the following comments specifically on discussion draft Chapter 5b - Refineries.<sup>3</sup>

- 1. CERP Section 5b needs to detail the comprehensive coverage of existing and proposed District rules already focused on refinery sector sources.**

The discussion draft version of CERP Section 5b, Refineries, specifically identifies flaring events and refinery process equipment as priorities identified in the WCWLB steering committee meetings. The discussion draft also notes that "ongoing rule development and air monitoring

<sup>1</sup> SCAQMD, Discussion Draft, Community Emissions Reduction Plan (CERP) for the Wilmington, Carson & West Long Beach Community, June 2019, posted at <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>.

<sup>2</sup> CSC meeting presentation from 13 June 2019 is available at <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm>.

<sup>3</sup> CERP Discussion Draft, Section 5b – Refineries, June 2019.

July 2, 2019  
Page 2

efforts by the District will help address some of these air quality priorities” in the WCWLB community,<sup>4</sup> and cites the following Best Available Retrofit Control Technology (BARCT) rules:

- Rule 1118, Control of Emissions from Refinery Flares
- Rule 1180, Refinery Fenceline and Community Air Monitoring
- Rule 1109.1, Refinery Equipment

14-1

These facilities are subject to a large number of other air quality rules/regulations which are enforced by the District, the California Air Resources Board (CARB), and the U.S. Environmental Protection Agency (USEPA). Chapter 5b should be revised to detail the comprehensive level of these existing rules and regulations to better inform the steering committee and other community stakeholders.

With respect to the prospective use of mobile monitoring (i.e., proposed Action 2),<sup>5</sup> we generally agree that mobile monitoring may be useful for enhanced leak detection and repair (LDAR) activities. We note that some mobile monitoring platforms are based on air monitoring technologies which have not been reviewed and/or approved by USEPA for regulatory purposes. So, while such mobile monitoring platforms may be used for enhanced LDAR purposes, the information may not be suitable for enforcement purposes. The discussion of Action 2 in Chapter 5b should be accordingly revised.

14-2

**2. Any future changes to District BARCT rules (e.g., Rule 1118) must be based upon the consideration of specified criteria pursuant the California Health & Safety Code.**

The California Health & Safety Code authorizes the District to establish Best Available Retrofit Control Technology (BARCT) requirements based upon the consideration of specified criteria. This includes a demonstration that any new or amended BARCT requirements are both technically feasible and cost effective.

14-3

The discussion draft version of CERP Section 5b, Refineries, suggests that the District may require methods to reduce refinery flaring emissions through amendments to Rule 1118.<sup>6</sup> We note that the current version of District Rule 1118, which was just amended in 2017, harmonized current Rule 1118 with USEPA’s flare standards in the national Refinery Sector Rule and included significant new prohibitions on certain types of flaring.<sup>7</sup> The current version of Rule 1118 also required the facilities to prepare an engineering “scoping document” that evaluates the feasibility of minimizing (or avoiding) planned and unplanned flaring events. The outcome of those engineering demonstrations will inform what additional control measures, if any, may be technically feasible under the rule.

The discussion draft suggests a reduction target for refinery flare emissions under Action 3. At this time, that suggestion appears to lack any basis. Since any future amendments to Rule 1118 will need to conform with applicable BARCT criteria, including a demonstration of technical feasibility, the discussion draft should be revised to describe the current Rule 1118 scoping

<sup>4</sup> CERP Discussion Draft, Section 5b – Refineries, June 2019. See page 5-3.

<sup>5</sup> CERP Discussion Draft, Section 5b – Refineries, June 2019. See page 5-4.

<sup>6</sup> CERP Discussion Draft, Section 5b – Refineries, June 2019. See page 5-6.

<sup>7</sup> SCAQMD, Draft Staff Report for Proposed Amended Rule 1118 – Control of Emissions from Refinery Flares, July 2017.

July 2, 2019  
Page 3

document process, and explain to the steering committee how that engineering process will inform any future amendments to Rule 1118.

14-3  
Cont.

**3. The Discussion Draft does not provide a technical foundation to support emission control measures beyond those found in existing or proposed rules and regulations (e.g., BARCT).**

The AB617 statute and associated Community Air Pollution Protection Blueprint specify a number of requirements for Community Emissions Reduction Programs (CERPs).<sup>8</sup> Among the required analytical tasks is a source attribution analysis which estimates the relative contribution of emissions sources (or categories of sources) to elevated air pollution exposures in the community. Such an analysis has not been presented in the discussion draft or the materials presented to the WCWLB steering committee. On the contrary, information presented to the steering committee by the District suggests that refineries actually represent a relatively low contribution to exposure levels in the WCWLB community.<sup>9</sup>

14-4

The discussion draft also fails to fully assess existing and available measures for reducing emissions from contributing sources or source categories including, but not limited to, Best Available Control Technology (BACT), BARCT, or Best Available Control Technology for Toxic Air Contaminants (T-BARCT), or how those measures in existing or proposed rules would reduce air pollution exposures in the future. Such a demonstration is required for the CERP.<sup>10</sup>

In the absence of these required analytical tasks, the discussion draft CERP lacks a technical foundation for suggesting control measures beyond those found in existing or proposed rules and regulations. The discussion draft should be accordingly revised.

WSPA appreciates the opportunity to provide these comments. We look forward to continued discussion of this important planning process. If you have any questions, please contact me at (310) 808-2146 or via e-mail at [bridget@wspa.org](mailto:bridget@wspa.org).

Sincerely,

Cc: Wayne Natri

<sup>10</sup> CARB, Community Air Protection Blueprint, Appendix C, Criteria for Community Emission Reduction Programs.

Response to Comment Letter #14-1

South Coast AQMD staff provided a list of rules and regulations that apply to refineries in Appendix 5b of the Draft Final CERP. The list includes rules, such as, Rule 1123 – Refinery Turnarounds and Rule 1178 – Further Reductions of VOC Emissions from Storage Tanks and Petroleum Facilities.

Response to Comment Letter #14-2

The air measurements in Action 2 of Chapter 5b – Refineries, will be used to identify, quantify and mitigate potential leaks from refineries. Mobile air measurements are not an enforcement tool. However, if the monitoring data shows elevated emissions related to refinery operations it may be necessary to conduct follow-up inspections at refineries to identify the source of emissions. Data from mobile air measurements could be used to focus South Coast AQMD inspections on the potential source of elevated emissions and help refinery operators expeditiously resolve fugitive emissions leaks, equipment breakdowns, etc.

Response to Comment Letter #14-3

Based on recent emissions data from petroleum refineries in the WCWL community emissions from flaring during the first quarter of 2016 to the fourth quarter of 2018 resulted in an average of 39 tpy of NOx, 3 tpy of PM10, 4 tpy of VOCs and 22 tpy of SOx. Also, recent data shows that over half of flaring emissions are from planned events.<sup>7</sup> To further address emissions from flaring the South Coast AQMD staff will review flare minimization plans, new technologies and other information to assess the technical feasibility of future rule requirements.

The 2017 amendment to Rule 1118 included a requirement for the affected facilities to submit a Scoping Document to evaluate the feasibility of minimizing or avoiding planned and unplanned flaring events. The scoping documents include potential physical controls and/or operating practices, technical feasibility, cost estimates, and timing to reduce planned flare events. The documents also include essential operation needs flare events and the feasibility of installing and maintaining at least three physical or automated process controls to avoid or minimize emergency flare events. The “Course of Action” for Action 3 of Chapter 2b in the Draft Final CERP includes a measure to consider the scoping documents required by Rule 1118 for future rule development to Amend Rule 1118.

Response to Comment Letter #14-4

Chapter 3b – Source Attribution Analysis for the WCWL CERP was released July 12, 2109. Based on data provided in the analysis (see Figure 3 of Chapter 3b) petroleum refineries account for 17% of VOC, 21% of NOx, and 65% of SOx total community emissions in WCWL. Furthermore, refineries are a significant source of heavy metal emissions as well. The hexavalent chromium, nickel, arsenic, beryllium and lead emissions from the refineries contribute 15%, 37%, 40%, 92% and 7% of the community total emissions, respectively.

---

<sup>7</sup> <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-jul7-038.pdf?sfvrsn=5>

The CERP includes revisions that assess existing and available measures for reducing emissions from contributing sources. For example, Chapter 5b – Refineries, includes Action 5: Achieve Further NO<sub>x</sub> Emissions from Refinery Equipment through Adoption of Rule 1109.1 – Refinery Equipment. This action provides a specific measure to evaluate the technical feasibility and cost effectiveness of Best Available Retrofit Control Technology (BARCT) to reduce emissions from refinery equipment including existing boilers, heaters, gas turbines, fluid catalytic cracking units, sulfur recovery units, incinerators, and a coke calciner. Also, Appendix 5b – Refineries, includes revisions to identify existing rules or measures that reduce emissions from refineries.

<b>Comments (Unlimited Size) *</b>	
-Exposure Reduction for Schools, Childcare Centers and Homes. I would suggest that Parks be added to that list. Of particular concern is the park at Opp and Banning in Wilmington.	15-1
-Neighborhood Truck Traffic: Work with LADOT to explore physical interventions, such as chicanes or traffic circles, at key locations (supported by residents & homeowners in the area) to prevent trucks from entering residential neighborhoods.	15-2
-Oil Drilling and Production: Work with the oil industry to identify and encourage abandonment of lower-producing wells and wells located within residential neighborhoods. The sites can then be converted into community gardens (example: I Heart Wilmington Community Garden) or other appropriate uses.	15-3
-Relocation assistance for existing industrial uses located within residential neighborhoods to more appropriate sites. (i.e., 1116 N Watson Ave, 1022 N Eubank Ave, & 1020 N McFarland to name a few)	15-4

#### Response to Comment Letter #15-1

Chapter 5g includes reducing exposures at schools, childcare centers, homes, and other locations where people spend a lot of time, which would also encompass community centers at parks. The John Mendez Baseball Park at Opp and Banning in Wilmington has been incorporated into the air quality concerns map in Chapter 3a. The interactive air quality concerns map online will be updated with this location and is available at: <https://scaqmd-online.maps.arcgis.com/apps/MapJournal/index.html?appid=f4089b44d00a4ada806cfa62309ab98e>

#### Response to Comment Letter #15-2

South Coast AQMD will identify the appropriate agency and work towards collaboration to determine the feasibility of this suggestion. This suggestion has been added in Chapter 5d, Action 2.

#### Response to Comment Letter #15-3

In Chapter 5e, Action 3, staff will evaluate the feasibility on Rule 1148 series and Rule 1173 amendments to reduce emissions. The rule development process is a public process and South Coast AQMD encourages all stakeholders to participate, including those from the oil industry and CSC members. The development of requirements in rules must occur within the rule development process (i.e., working groups) with all stakeholders involved. Initial concepts based on CSC input, such as this suggestion, have been incorporated and will be considered in implementing Action 3.

#### Response to Comment Letter #15-4

The statutory restrictions and/or state-adopted guidelines that govern South Coast AQMD's funding programs do not allow for the use of funds to help stationary sources relocate to more appropriate locations. In most cases, the funds are to be used for emission reductions, which would not necessarily occur as a result of a relocation, and many of the programs primarily focus on mobile sources.

Comment Letter #16: Alicia Rivera, et al – Communities for a Better Environment (submitted for Stationary Source Committee)

## Comment Letter #16

7/25/2019

SCAQMD Governing Board  
Stationary Source Committee

Re: My brief comments on AB617 Community Emission Reduction Plan to be discussed 7/26/2019  
– We need a serious step by step plan in tons per day or year, to reduce refinery and other emissions in Wilmington / Carson / W. Long Beach

Dear Stationary Source Committee Members,

I am CBE's representative on the Wilmington / Carson / W. Long Beach AB617 Community Steering Committee. I have been very active representing our community on this committee, as CBE's Wilmington Community Organizer. I have also been invited by AQMD to provide a formal presentation at the steering committee, and to present during a tour of the area for legislators and board members. Many of our other Wilmington members, staff, and coalition organizations have actively taken part, and have made many substantial recommendations in development of the Community Emission Reduction Plan (CERP<sup>1</sup>). I am also attaching the fuller comments we submitted to staff on the first draft of the plan, many of which still apply. Since we made those comments, we appreciate that staff have improved the CERP. But there are still key gaps in the plan. We understand this has been a major new effort by the District, requiring much staff time, but we need to ensure a plan that will make serious progress is developed.

Here is a brief summary of comments on the updated July version of the plan:

- **Staff added an important commitment to update the Refinery Storage Tank regulation, as we requested.** These are sources of benzene, VOCs, and more. The District's own comprehensive monitoring study (the Fluxsense study) done jointly with Swedish Scientists showed refinery benzene emissions are on average 43 times higher than the District inventory, and found these emissions were likely from refinery storage tanks, it is important that staff added this regulation to the CERP. We appreciate it. 16-1
- **Unfortunately, our main concern remains. The plan does not have any specific commitment to emissions reductions for refineries (or for other sources) – not 1 ton of required refinery reductions.** Instead it has a few goals to generally reduce emissions from a couple of refinery sources, based on later decisions which the District hopes will lead to emission reductions. We agree that these actions will likely lead to some reductions, but there are few measures in the plan, and no overall emission reduction goal for refineries. 16-2
- **For transportation, the District added to the updated plan some *estimations* of emissions reductions from *incentive* measures (including existing measures). These however are not *required* reductions.**<sup>2</sup> 16-3

<sup>1</sup> Available at: <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>

<sup>2</sup> For example, see the plan says in Chapter 5a – Actions to Reduce Air Pollution Emissions or Exposures, p. 5a-2

- **What we need in Wilmington / Carson / W. Long Beach is for the District to develop a clear plan over time to reduce emissions step by step, at the refineries, oil drilling, the ports, transportation, and all sources which cumulatively make up our unfair burden of emissions in Wilmington. For instance, the plan should have a goal to reduce emissions by significant specified percentages every year.** 16-4
- **Without having step by step goals, we cannot address the cumulative problem. It is not enough to say you will add a couple oil refinery regulations or measures.**
- **Most of the measures in the plan are enforcement, notification, or monitoring measures, not actual emissions reduction requirements.** 16-5
- **In addition, we must also elevate zero emission technologies, and begin to seriously develop a vision and plan to phase out harmful fossil fuels over time. That is really the only way to address the heavy burdens in Wilmington / Carson / W. Long Beach. Given all the record heat waves and many other climate dangers, we must realize we are in a climate emergency. If we don't start to develop a plan in the area of LA that has the highest concentration of fossil fuel infrastructure (5 oil refineries, one of the largest oil wells in any urban area in the country, and the massive ports and goods movement corridors), we will not make progress on either local disproportionate health burdens, nor on the greater climate crisis.** 16-6

Thank you for evaluating these issues. I understand that the Stationary Source is just an informational discussion tomorrow, but since AB617 was adopted with the promise that finally we would get a customized local plan to address our unfair burden of pollution, we wanted to let you know that we rely on the development of a strong emission reduction plan.

Alicia Rivera  
Wilmington Community Organizer, CBE  
(Communities for a Better Environment)

#### Response to Comment Letter #16-1

Thank you for your comment.

#### Response to Comment Letter #16-2

See Response to Public Meeting Comment #1-2

#### Response to Comment Letter #16-3

The estimated emission reductions for mobile source incentive measures are based on historical data from projects that were funded in the Wilmington, Carson, West Long Beach community. However, incentive programs facilitated by South Coast AQMD are often oversubscribed (i.e., the number of applications received, and commensurate requested funding levels are typically significantly higher than available funds). Therefore, it is likely that the CERP will achieve the

emission reduction goals resulting from mobile source incentive measures. See Response to Public Meeting Comment # 1-2 regarding emission reduction targets.

Response to Comment Letter #16-4

The CERP uses a combination of strategies to reduce emissions, including regulations, air monitoring, enforcement, outreach and incentives. These strategies are to be implemented with over 60 step-by-step measures in the CERP to achieve emission reduction targets. Additionally, the plan includes emission reduction goals for petroleum refineries based on future regulatory actions specified in the CERP. For additional information on emission reduction targets and goals please refer to Response to Public Meeting Comment # 1-2 above and Chapter 5 of the CERP.

Response to Comment Letter #16-5

See Response to Comment Letter #16-4 regarding how the plan will achieve emission reductions. Specific emission reduction requirements for sources will be determined through a combination of future regulatory, enforcement and other strategies (e.g., MOUs) specified in the CERP.

Response to Comment Letter #16-6

South Coast AQMD has committed to participate in CARB rule development efforts and supports achieving zero-emission technology in any application where it is technologically feasible and commercially available. For example, the plan specifies measures to accelerate adoption of cleaner port equipment and drayage trucks, prioritizing zero emission technologies when technologically feasible and commercially available (see Action 2 of Chapter 5d).

It is respectfully submitted that AB617 funds be timely allocated to conduct a much needed project to detect and counter violations committed by Ocean Going Vessels (OGV's) who do not observe the California Sulfur Rule while going in and out of the Ports of Los Angeles and Long Beach.

This suggested project is titled "Aerial monitoring of OGV's emissions to evaluate compliance w/fuel composition requirements in California waters".

UAV's (drones) w/payloads consisting of specialized sensor packages will be flown in the plume of ships going in and out of San Pedro Bay.

The objectives of this project include - and are not limited to:

- (1) Determine the level and extent of OGV violations of the California Sulfur Rule;
- (2) Determine the costs of such enhanced enforcement of the California Sulfur Rule; and
- (3) Adapt sensor and UAV technologies developed in Europe to California specific conditions.

Enhanced enforcement via aerial monitoring (UAV's equipped w/various gas sensors + other sensors) is now broadly practiced in the European Union (EU).

Where it's used - it has positively impacted air quality.

Further - where it is being practiced - it has paid for itself (e.g. Norway) through fines.

Several aerial monitoring systems are now used in or near EU ports or environmentally sensitive areas (e.g. Norwegian fjords).

Others are in the early implementation stages in China, Canada and Singapore.

Why is it needed?

Because there is good reason to believe that about 10% of OGV's calling in California Ports violate the CA Sulfur Rule (and the EPA SECA rule.)

This not only pollutes the disadvantaged communities of Wilmington, Carson and West Long Beach - but because it's undetected - little has been done so far being done to correct it.

Worse, the folks who make air quality models for the California Air Resources Board (CARB) and the SCAQMD have assumed that the OGV's are in full compliance w/the California Sulfur Rule and this sneaky pollution is currently unaccounted in various SIP's (including the District's).

A recent Maritime Executive article (April 14, 2019) - see <https://www.maritime-executive.com/article/in-singapore-high-sulfur-fuel-could-lead-to-prison> - reads:

"Goldman Sachs forecasts that roughly 20 percent of the world's fleet will simply not comply with the new requirement in the first year of implementation; OPEC's estimate is slightly higher at about 25 percent."

Given these educated predictions and the large price incentive to use heavy fuel oil, enhanced enforcement (e.g. aerial monitoring) it is strongly suggested to be explored as a viable means to secure full or near-full adoption of existing & impending rules.

There is indisputably strong incentive for OGV's to cheat.

For instance, the forward spread between GasOil (which is 0.5% S) and HSFO - is now ~\$240 per ton.

And the incentive to cheat is even greater when OGV's must burn the even more expensive Very Low Sulfur Fuel Oil (which is what is required by the California Sulfur Rule) - which is 0.1% S.

Must also take into consideration that the punishment for cheating is quite low vs. the benefits to be reaped from violating the law. Please consider that:

- (a) the current per incident penalty (if and when caught) is typically \$10K or less per day - and,
- (b) if the OGV cheats, a container ship can save between a half a million and one million on a round trip between China and LA.

Based on the high probability of undetected cheating - it is submitted that a significant amount air pollution caused by OGV's - which violate the California Sulfur Rule in waters within SCAQMD's territory - goes undetected and unaccounted for.

Based on data collected over the last eleven (11) months - from similar EU and Asian programs - as well as based on additional facts - it is impossible to support the SIP modelers' overoptimistic assumption that all OGV's comply w/the CA Sulfur Rule (as well as w/the SECA rule.)

Thus, the preponderance of circumstantial evidence leads to the conclusion that the Annual Emissions Inventory for the Ports is underreported as far as the OGV component is concerned.

17-1

And - given the above - there is good reason to support a project to determine the degree to which OGV's currently flaunt the California Sulfur Rule.

The California Sulfur Rule is a CARB rule - yet the pollution caused by OGV's violating this rule (& the SECA Rule) directly affects the District's residents - and particular those who live and work in or near the disadvantaged communities in or near California's commercial ports.

CARB has not had the resources (staff & equipment) nor the methodologies to effectively enforce this rule - nor has the US Coast Guard had the resources (or the mission priority) to significantly monitor compliance w/the SECA regulation it signed an MOU w/EPA in 2011 to enforce.

Further, one of the challenge at hand lies in the false belief by some that random checks at pier of OGV's fuel (right before the engine) is an effective means to dissuade violators of the sulfur rule/s. This myth was disproved in all the EU countries where aerial monitoring is being practiced.

Given the above - it is reasonable and conservative to posit that ~10% of the OGV's calling in the ports of LA and LB violate max. sulfur-in-fuel (air quality) regulations.

The above data was uncovered by a student team at UCLA's Institute of the Environment and Sustainability (IoES) as part of their 2018-19 Senior Practicum.

In this context - it's pertinent to note that in the past SCAQMD and CARB have signed MOU's to facilitate greater enforcement - and that such collaboration can be extended to monitoring for fuller OGV's compliance.

Some ships cheat intentionally and some have unintentional malfunctions that cause them to pollute .  
Re: unintentional malfunctions: the fact is that occasional unintended pollution happens. At the same time greater financial penalties are indicated to upgrade more and to implement smarter maintenance practices. Even excellent shipping companies occasionally experience malfunctions. For instance, last week, Maersk SEMBAGANG was fined \$22,000 for polluting in the port of Algeciras (Spain) as a fuel injection system broke.

Scrubbers have been shown to occasionally fail - and such failures are not immediately noticed and/or repairable.  
UAV plume inspections facilitate better monitoring of such unintended failures and provide motivation to OGV operators to pollute less.

The use of drones to target most likely violators of the California Sulfur rule also does away w/a potential hurdle to judicious enforcement.  
The fact is that ports of LA and Port of LB cannot guarantee access to CARB and/or SCAQMD inspectors to the terminals to conduct fuel sampling.  
Only the terminal operators can grant such access. As such - CARB enforcement activities are now limited by access to a terminal where an OGV docks (all inspections are now done randomly and at pier.)  
UAV based monitoring and targeting reduces the terminal operator's potentially restricting role in the inspection process - particularly since the terminal operator may be conflicted when all is said and done.

The experience to date w/aerial targeting w/UAV's equipped w/sensors has brought about a more cost-effective deployment of its inspectors (reportedly four times greater).

It is collaterally suggested that enhanced UAV aerial monitoring of OGV's dovetails nicely w/other SCAQMD AB 617 objectives

Via the AB 617 implementation process - it was noticed that SCAQMD also wishes to detect and reduce leaks from oil tankers.

See Under "Action 1: Reduce Leaks from Oil Tankers:

- Use optical gas imaging technology, air monitoring, and other available emissions information to identify potential fugitive emission leaks from oil tankers and conduct targeted enforcement of Rule 1142 - Marine Tank Vessel Operations
  - Evaluate opportunity to amend South Coast AQMD Rule 1142 to require marine vessels to calibrate and maintain pressure relief devices and require recordkeeping, with the goal of minimizing fugitive emission leaks"
- The same aerial monitoring systems used to detect compliance w/The California Sulfur Rule - w/minor sensor payload modifications - can be used to detect and quantify leaks from Oil Tankers.

17-1  
Cont.

Response to Comment Letter #17-1

CARB believes there is merit in pursuing aerial monitoring of noncompliant vessels as a potential compliance screening tool. Aerial monitoring in the European Union (EU) is used only as a screening tool to detect potentially non-compliant vessels and not as a direct method for enforcing fuel regulation. Sampling fuels on the vessels is the only way to determine whether a ship is compliant. This is true for both EU and California. Additionally, current remote sensing technology does not distinguish between Ultra Low Sulfur Fuel Oil (ULSFO), which is a heavy marine fuel oil, and low sulfur distillate fuels, such as marine gas oil (MGO)/marine diesel oil (MDO). EU and the rest of the world only require fuels that meet a certain sulfur level, whereas, CARB's Ocean-Going Vessels (OGV) Fuel Sulfur Regulation requires the use of distillate fuel. Until the remote sensing technology can distinguish between ultra-low sulfur fuel oil (ULSFO) and distillate fuels which both meet the 0.1% sulfur limits, the remote sensing technology has only limited value as an enforcement screening tool. Further, aerial monitoring technology would be more appealing if it included measurements of other pollutants such as PM, black carbon (BC), or NOx. Moreover, while SO<sub>2</sub> is an important pollutant to measure, other pollutant information would add more value.

At this point, we have no information that confirms whether 20-25% of the world's shipping vessels are currently in compliance with the new International Maritime Organization (IMO) fuel standard (0.5% sulfur) that will go into effect next year. We can confirm, however, that these rates do not apply to Regulated California Waters (RCW). CARB's compliance rates are much higher. CARB has published, most recently, in the Enforcement Division's 2018 annual report that the compliance rate for the OGV Fuel Sulfur Regulation is about 97-99%. This number is based on over 500 vessel inspections including fuels analysis. Although CARB agrees that the current penalty structure in the Health and Safety Code should be changed to allow for higher penalties, CARB still believes it has an effective enforcement program that acts as a deterrent. The compliance numbers show vessels are complying with CARB's regulation. There are many factors other than penalties, such as poor corporate image or negative publicity that can compel ship operators to comply with state law. CARB has been invited to four different countries to discuss CARB's enforcement program and provide training on the OGV inspection/enforcement process.

CARB uses aerial monitoring remote sensing for enforcement as follows:

- Screening tool to identify vessels that have fuel sulfur over 0.1% (which does not detect noncompliant ULSFO meeting the 0.1% sulfur standard)
- To assist the federal government (i.e., United States Coast Guard (USCG)) to screen vessels for Emission Control Area (ECA) compliance from 24 nautical miles to 200 nautical miles. Note: The federal government requires probable cause to board a ship and collect a fuel sample.

- To help CARB estimate compliance rates at the 24 nautical mile transition zone, especially on outbound vessels (which does not detect noncompliant ULSFO meeting the 0.1% sulfur standard)

Comment Letter #18: Christopher Chavez – Coalition for Clean Air

Comment Letter #18

August 6, 2019

Dr. William Burke and Board Members  
South Coast Air Quality Management District (SCAQMD)  
21865 Copley Drive  
Diamond Bar, CA 91765

**Re: Comments on AB 617 Community Emission Reduction Plans (CERP) for the  
Wilmington/West Long Beach/Carson (WWLBC) Community**

Dear Chair Burke and the SCAQMD Board Members,

The Coalition for Clean Air (CCA) is writing to provide comments regarding the draft CERP for the WWLBC community. Since its passage in 2017, CCA has been actively involved with the implementation of AB 617 (C. Garcia) at both the statewide and air district level. CCA staff has participated in most of the AB 617 meetings hosted by the California Air Resources Board (CARB) and SCAQMD. We acknowledge and appreciate some of our previous comments being addressed and incorporated into the WWLBC CERP, and are providing these comments to ensure a stronger, more effective emissions reduction plan.

- **The WWLBC CERP still lacks a direct health nexus and any projections or targets for reductions of toxic air contaminants.**

The Community Steering Committee (CSC) has been very clear in its request to see specific emission reduction targets that include a nexus with community health outcomes. Yet, the draft CERP continues to lack specific emissions reduction targets, let alone targets based on health outcomes. Rather, the draft CERP anticipates a 40-50 tons per year (tpy) reduction of oxides of nitrogen (NOx – a criteria pollutant rather than a toxic air contaminant) and a .5-.6 tpy reduction in particulate matter (PM). Even then, these anticipated reductions are estimates rather than targets, and provide little insight into reductions of toxic air contaminants.

Again, we point to the text of AB 617 and its mandate for emission reduction targets. Section 44391.2(c)(3) of the Health and Safety Code (HSC) states, “[T]he community emissions reduction programs shall be consistent with the state strategy and include emissions reduction targets, specific reduction measures, a schedule for the implementation of measures, and an enforcement plan.” For the CERP to not include specific emission reduction targets is inconsistent with both the spirit and letter of the law. As such, we urge SCAQMD to include specific toxic air contaminant emission reductions and a nexus to community health in the finalized CERP.

[www.ccair.org](http://www.ccair.org)

- To the greatest extent possible, proposed emission reductions should meet State Implementation Plan (SIP) creditable criteria (quantifiable, surplus, enforceable and permanent). However, reductions that don't meet these criteria (e.g., working with local agencies to rectify bad land use decisions) should not be excluded.

18-2

The emission reductions achieved by the CERP should be real, measurable, and verifiable. The closer they are to meeting the criteria for being SIP creditable, the more confidence the community will have in the effectiveness of the Community Air Protection program. "Paper" compliance threatens to undermine the effectiveness of the WWLBC CERP and reduce the benefit to the local communities. At the same time, we recognize that not every important reduction measure lends themselves to meeting these criteria. Other opportunities which are not as easily measured but still have a positive community-level impact should not be ignored.

- Phase out Modified Hydrofluoric Acid (MHF) at refineries

Eliminating the use of MHF is critically important to the CSC and the larger South Bay region. Only two refineries in California use MHF<sup>1</sup> and both jeopardize the WWLBC community: the Valero Wilmington Refinery (which is within the community) and the Torrance Refinery (which is approximately one mile from the community's western border). Industrial accidents such as the Torrance Refinery's 2015 explosion and December 2018 MHF leak, cyberterrorism and large seismic activity can result in a catastrophic release. Should a serious MHF release occur, hundreds of thousands of people could be at risk for serious injury or death.<sup>2</sup> The CERP should include a commitment to phasing out MHF, as well as anticipate potential emissions and economic impacts from the phase out and conversion process.

18-3

- The draft CERP needs to better define polluters' roles and responsibilities in implementation. Additionally, the draft CERP still has a heavy bias towards incentives over rulemaking and enforcement.

For AB 617 and the WWLBC CERP to be successful, all stakeholders need to be responsible for its implementation. Yet, the draft CERP assigns few implementation responsibilities to the polluters themselves. Specifically, refineries, warehouses and other truck magnets, oil and gas well owners, and railyards have no responsibilities assigned to

18-4

<sup>1</sup> *A proposal to ban a potentially lethal chemical might change – or close – 2 oil refineries in Southern California*, Daily Breeze (January 16, 2018), <https://www.dailybreeze.com/2018/01/16/a-proposal-to-ban-a-potentially-lethal-chemical-might-change-or-close-2-oil-refineries-in-southern-california-2/>.

<sup>2</sup> *Status Update on PR 1410 – Hydrogen Fluoride Storage and Use at Petroleum Refineries*, Presentation, South Coast Air Quality Management District (February 1, 2019), <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2019/2019-feb1-025.pdf?sfvrsn=6Link>, 14

them through the CERP. While the draft CERP does assign some responsibilities to the Ports, these responsibilities are vague and lack firm deadlines.

Additionally, the CERP continues to show a strong preference for incentives over tighter rules and greater enforcement. While incentives should be included as part of the final CERP, other strategies need prioritization. For example, creating strong Indirect Source Rules (ISRs), mandating on-site mitigation and requiring, rather than just incentivizing, zero-emissions port and railyard equipment are clear examples where tighter rules will yield measurable emissions reductions. Additionally, rules must be enforced to be effective. As such, SCAQMD should include tougher penalties as authorized in Section 9 of AB 617 and greater enforcement efforts as part of its overall strategy.

18-4  
Cont.

Lastly, the lack of a specific implementing agency or firm deadlines undercuts the effectiveness of incentive programs. Regarding Action 2 of Neighborhood Truck Traffic, "Reduce Emissions from Heavy-Duty Trucks," SCAQMD has again failed to establish measurable goals for reducing emissions from trucks. The first goal states the following, "Organize [insert number] of incentive outreach events per year and provide biannual updates to the CSC." SCAQMD should at least provide an anticipated number of outreach events it intends to conduct about incentive funding for trucks, instead of leaving this information blank for CSC members to fill in. At minimum (and considering the health impacts of trucks emissions and the necessity of meeting Clean Air Act goals for the South Coast Basin), SCAQMD should be providing at least monthly outreach events to trucking companies and truck drivers on incentive funding. Anything less would be irresponsible.

- **SCAQMD must meet the deadline for Best Available Retrofit Control Technology (BARCT) implementation, and BARCT's role in the CERP still needs clarification and expansion.**

In addition to implementing the Community Air Protection program and creating CERPs, AB 617 also directs air districts in nonattainment to expedite BARCT implementation. HSC §40920.6(c)(1) requires air districts in nonattainment for one or more major air pollutants to adopt an expedited schedule for BARCT implementation. Implementation of BARCT must be completed by the earliest feasible date but no later than December 31, 2023. SCAQMD has approved a schedule outlining 17 rule updates, the last of which is scheduled to be considered in 2022. We continue to urge SCAQMD to keep to this implementation schedule and begin requiring expedited compliance with the updated rules.

18-5

Additionally, the WWLBC draft CERP only briefly mentions BARCT in the context of refineries. However, AB 617's BARCT requirements were not intended to be focused on a specific industry or industrial operation; rather, it includes all sources covered by the state's Cap-and-Trade program and prioritizes the ones with the oldest emissions controls. As such, we again ask SCAQMD to provide more clarity of how BARCT will impact CERP implementation, which local emission sources will be covered by BARCT, and how BARCT will provide air quality improvements to AB 617 communities.

18-5  
Cont.

- **The draft CERP must be more aggressive in reducing emissions from the Ports, goods movement and drayage operations.**

The draft still provides too much flexibility to the Ports and lacks specific deliverables. Though the CERP does commit SCAQMD to supporting the development of several CARB rule changes, it does not commit the agency to publicly supporting these rules. At minimum, SCAQMD should make written and verbal comments in support of these rules when they are being contemplated by CARB to help secure stronger regulations to reduce port air pollution in the South Coast Basin and throughout the state.

Additionally, many of the port-related actions outlined in the draft CERP should be strengthened:

- With respect to Action 1, "Reduce Leaks from Oil Tankers," this action's responsibilities should include specific deliverables and dates for completion for the responsible agencies identified. Additionally, the CERP should include an effort to speed up oil tanker compliance with CARB's forth coming "at-berth" rule.
- Regarding Ports' Action 2: Reduce Emissions from Ships and Harbor Craft, as indicated in our prior comments, there is reference to a goal of an outreach event to "provide information about incentives." However, in the Implementing Agency section of that Action, no entity is assigned the responsibility of actually conducting the outreach to the appropriate parties regarding funding incentives. Please indicate who will take responsibility for this important aspect of outreach to relevant parties around the Ports.
- Regarding Action 1 of Neighborhood Truck Traffic, "Reduce Truck Idling," SCAQMD has completely failed to articulate a measurable goal for reducing truck idling in impacted communities surrounding the Ports. The "goal" states the following: "Conduct [X amount of] focused inspections and targeted sweeps within a [insert proposed timeframe]." This is completely vague and ambiguous, and also unacceptable as a SCAQMD statement at this late stage of the

18-6

Community Air Protection Actions development. We respectfully request that SCAQMD establish a meaningful and measurable goal for this Action and circulate it for CSC review and comment before making the CERP final.

18-6  
Cont.

- **The Memoranda of Understanding (MOU) being negotiated with the Ports should not merely duplicate the Clean Air Action Plan (CAAP) and instead close off any loopholes or offramps for missed commitments.**

18-7

The commitments made by the Ports of Los Angeles and Long Beach in their most recent CAAP are not enforceable by SCAQMD and may not be permanent. For example, some CAAP commitments are reliant on Port-sponsored feasibility studies and do not provide assurance that specific commitments will be met. Therefore, the CAAP commitments lack credibility and provide the community with little more than a basis for skepticism about the Ports' promises for a better, less polluted future. As such, we request the MOU with the Ports close off any loopholes or offramps that allow the Ports to escape their commitments to the community.

- **An Indirect Source Rule (ISR) targeting truck operations must be included as part of the WWLBC CERP's actions for addressing neighborhood truck traffic.** The "Neighborhood Truck Traffic" strategy in the draft CERP completely ignores the role of warehouses and other truck magnets in polluting the WWLBC community. Rather, the draft CERP refers only to education about incentives and the broader Facility-Based Mobile Source Measure (FBMSM), which is mostly focused on port and drayage operations. This is problematic, as the WWLBC community includes warehouses, fuel depots, chassis yards and fueling stations that attract trucks and truck-related emissions. While this is partially addressed through the WWLBC CERP's strategy of enforcing CARB's anti-idling rules, ISRs should also be included as an action for neighborhood truck traffic. ISRs are referenced in WWLBC's & ELABHWC "Railyards" strategies and are also included in the SBM CERP's strategy for "Neighborhood Truck Traffic."

18-8

Despite the glaring omission of ISR, we applaud SCAQMD for including our previous recommendation to re-route trucks away from sensitive receptors in the draft CERP. This action will help reduce sensitive receptors' exposure to localized toxic air contaminants from truck traffic.

- **SCAQMD should work with local governments to create a 2,500-foot buffer zone between new residential or sensitive land uses and oil and gas wells. Additionally, well owners need to be assigned responsibilities.**

The draft CERP still contains no language supporting the development of a buffer zone between oil and gas wells and new residential or sensitive land uses. SCAQMD should work with local governments to create a 2,500-foot buffer zone between residential or sensitive land uses and oil and gas operations. Additionally, the draft CERP fails to delegate any responsibility to well owners, such as ensuring proper maintenance.

18-9

- **More information on current efforts to reduce emissions from railyards is needed, and railroads still need responsibilities and deadlines assigned to them.**

The draft CERP still does not provide any information regarding the railyards' compliance with the second agreement in 2005 between CARB, BNSF and Union Pacific. This information should be provided to the CSC and a summary of what the railroads have done to comply with the second rule should be included in the CERP.

Further, there are still NO responsibilities assigned to the railroads themselves. Once the indirect source requirements are implemented, the railroads should have the responsibility of complying with the indirect source requirements themselves. Regarding Action 1 of Railyards, "Reduce Emissions from Railyards," and as stated in our prior comments, it makes no sense that the railroads themselves are not listed as one of the "Implementing Agency, Organization, Business or Other Entity" that will work to reduce emissions from railyards. Surely it cannot be beyond the power of SCAQMD to mention that BNSF and Union Pacific will have to be involved in any action or policy taken to reduce emissions at their associated railyards. The railroads are certainly aware that the CERP is being developed and that this goal is being included. Referencing the railroads themselves in the CERP as an implementing business entity is essential for this goal to be finalized.

18-10

Lastly, there is uncertainty as to if there will be an MOU or ISR for railyards. Throughout this process, SCAQMD staff has stated an MOU with the railyards was the preferred course of action. However, the draft CERP only references the ISR. While we strongly support a legally enforceable ISR than an MOU, SCAQMD's strategy in this regard is unclear. To this end, the CSC needs clarity as to if SCAQMD is going to pursue an MOU with the railyards or an ISR.

We appreciate the opportunity to submit and your consideration of our comments. CCA acknowledges and commends the thousands of staff-hours put into the implementation of AB 617, and understands this is a living, evolving process and document. However, the draft WWLBC CERP still needs much work and strengthening if it is going to live up to the promise of bringing cleaner, healthier air to California's most polluted, vulnerable communities.

18-10

Sincerely,

Christopher Chavez  
Deputy Policy Director  
Member (West Long Beach Resident), WWLBC AB 617 Community Steering Committee

#### Response to Comment Letter #18-1

See Response to Public Meeting Comment # 1-2 for updated emission reduction targets in the CERP for criteria air pollutants. Additionally, there are six actions that will reduce diesel particulate emissions from ships, harbor craft, port equipment, trucks, railyards and oil drilling and production sites. Also, there are five actions that target VOC emissions from refineries, oil wells, and oil tankers that will concurrently reduce other toxic air contaminant emissions such as benzene, toluene, ethylbenzene, and xylene. Please see Response to Public Meeting Comment 5-2 regarding health metrics.

Although it is not currently feasible to use health metrics and outcomes as tools for measuring the success of the CERP, health data has been a critical part of this process. South Coast AQMD used health data in the prioritization of communities for the implementation of community plans. Health data also influenced various policy decisions, including CARB's decision to focus on toxic air contaminants and PM2.5. The CERP will have positive impacts on public health, for example, by reducing DPM emissions, which is the primary contributor to air toxics cancer risk in the community. In addition, to bring further public health benefits to the community, the CERP includes actions to partner with local health organizations for direct public health interventions, such as asthma management programs. Similarly, the CERP includes actions to conduct school-based outreach to provide air quality information, such as the Clean Air Ranger Education (CARE) program. The CERP also includes collaborative efforts with local organizations to provide public information on how to receive air quality advisories and reduce exposure to air pollution. This type of outreach would be provided to schools, childcare centers, and made available at community events.

Finally, when CARB received comments asking it to include tracking of health indicators as part of AB 617, it did not agree that such tracking was appropriate. Instead, it too responded with information on the other ways that health data would be incorporated into the program. CARB declared: “Reducing emissions and improving air quality in overburdened communities will lessen the cumulative impacts that air pollution has on public health.” (See CARB Summary of Comments – Community Air Protection Program, <https://ww2.arb.ca.gov/summary-comments-community-air-protection-program>.)

Response to Comment Letter #18-4

Where possible, South Coast AQMD Staff identified the responsibility of facilities that are sources of emissions under the “Implementing agency, organization, business or other entity” section for each action. For example, Action 2 of Chapter 5b is to Conduct Refinery Air Measurements to identify and address VOC leaks and refineries and related facilities are assigned a specific responsibility. They include working with the South Coast AQMD staff to develop protocols (e.g., safety protocols) to conduct air monitoring (e.g., mobile air measurements) inside refineries and related plants, if fenceline or community air monitoring systems show ongoing elevated emission levels.

Regarding the comments on incentives and penalties, please see Response to Comment Letter #8-2. Regarding comments on outreach, please see Response to Comment 13-18.

Response to Comment Letter #18-5

Comments (Unlimited Size) *	
Please excuse typos- typing on a small keyboard/ cell phone-. Thanks for your understanding im advance. The draft CERP continues to miss the mark on aming specific emission reduction actions to improve health outcomes in the WWCLB communities.	
5b. Refineries: - Business agencies, the refineries, need to be held to greater accountability so they should also be included in the implementing agency section across all actions. -Flaring needs to be addressed through the lens of cumulative impacts- multiple flare events in a week/ month from diferent refineries.. multiple small events add up.	19-1
5c.Ports: -Actions need direct emission reductions instead of relying on incentives. Incentives are also not defined in the draft document basically this draft would have us approve incentives without know what they are exactly.	19-2
5e. Oil drilling & Production: - Action to set a standard for human health and safety buffer at 2,500 ft. It's the job of SCAQMD to clean the air protect public heath. It is the job of SCAQMD to be biased towards protecting the health and safety of children, elders and other sensitive receptors by identifying innovative strategies.	19-3
5f. railyards: Rail agencies need to be held accountable and should be included in the section on implementing agenciae and in other sections of the Action.	19-4
5g. Schools, childcare, homes: Let's be clear. This action set is not a direct emmission reduction from polluters which is the spirit of Ab617. I understamd there are CSC members that believe this is within the scope of AB617, I maybe wrong, but SCQAMD staff should better advise on this action. I would hate for resources that can be better directed to reduce emmission at the source from Ab617 than used to reduce health impacts from emissions.	
However of these actions: Increasing green space doesn't go far enough, planting trees is not the only way to achieve green space. Include native garden pocket parks w native shade trees to also reduce the urban heat island effect. Programs and projects to transform sidewalks. - Any outreach events should be listed as 3 participation events: at least SCAQMD participates in 1 event in each of the communities. - Rebate programs for energy star products- air purifiers, they are not currently listed in rebate programs.. so including zipcodes in the WWCLB communities to the approved list.	19-5

### Response to Comment Letter #19-1

Emission reduction targets have been identified and incorporated, where quantifiable, into Chapter 5a. The refineries and related plants have been included under the “Implementing Agency, Organization, Business or Other Entity” sections, where applicable, across the actions in Chapter 5b of the CERP. The refineries and related facilities’ responsibilities include participating in the rule development process. Chapter 5b, Action 3 has been included in the CERP to address refinery flaring emissions, specifically to further reduce flaring events. The manner in which flaring events will be addressed will be determined during the rule development process. Any

rules and regulations adopted by the South Coast AQMD and CARB will be applicable to those subject to the rules and regulations.

Response to Comment Letter #19-2

As noted above in Response to Comment Letter #19-1, emission reductions resulting from actions in the CERP, where quantifiable, have been incorporated into Chapter 5a. The CERP uses a combination of strategies to reduce emissions, including regulations, air monitoring, enforcement, outreach and incentives. Incentives are provided for owners or operators that go above and beyond current requirements. South Coast AQMD administers incentive programs to replace older more polluting equipment with cleaner technology. South Coast AQMD staff expeditiously reviews applications and distributes incentive funds as quickly as possible. The actual number of and type of applications which will be received are not yet known; however, emissions reduction targets can be calculated for mobile source incentives, based on historical mobile source incentive data. As part of the process, applications are reviewed to ensure they meet incentive program funding guidelines and the most cost-effective projects are prioritized. Incentive projects funded will be provided in the annual progress reports, and also provided to the CSC as part of the periodic updates.

Response to Comment Letter #19-3

The CSC has prioritized addressing fugitive emissions from leaking wells, and the CERP includes actions to conduct air measurements to identify potential leaking wells. Additional air measurements can be made to quantify the distance of any impacts from leaking wells. South Coast AQMD commits to working with local city, county, and state agencies to determine if a buffer zone is feasible and to refer any future concerns regarding this matter to the respective authorities. Staff also recognizes that air quality is one of many considerations that can inform a buffer zone decision. Accordingly, The City of Los Angeles Office of Petroleum and Natural Gas Administration & Safety recently submitted a report with a recommendation to the Los Angeles City Council to outline the feasibility of a physical surface setback distance of 600 feet from sensitive receptors on existing oil and gas wells, associated production facilities, and drill sites. The report also recommends outlining the feasibility of a 1,500 foot setback from sensitive receptors on future oil and gas development. South Coast AQMD staff will continue to monitor the city's progress on this issue.

Response to Comment Letter #19-4

The railyards have been included under the "Implementing Agency, Organization, Business or Other Entity" section in the action in CERP Chapter 5f. The responsibilities listed for the railyards include participating in the rule development process for Indirect Source Rule (ISR) for railyards and working with South Coast AQMD to replace diesel-fueled equipment with cleaner technologies. Any rules and regulations adopted by the South Coast AQMD and CARB will be applicable to those subject to the rules and regulations.

Response to Comment Letter #19-5

South Coast AQMD staff has developed actions within the CERP to improve air quality as outlined in the CARB Blueprint, which emphasizes emission reductions, but also reducing exposure due to proximity to air pollution sources. A majority of the CERP, Chapters 5b to 5f, include actions to reduce emissions from the CSC's air quality priorities. Chapter 5g includes actions to reduce public exposure to the various sources of pollution because the CSC prioritized reducing exposure where children, senior, and sensitive populations spend time (e.g., hospitals, schools, etc.). The combination of reducing emissions and exposure from air pollution sources can help reduce the negative impacts of air pollution on the community. The language in Action 4 of Chapter 5g will be changed to include broader forms of green space expansion beyond tree planting. Sidewalk programs and projects are under the purview of the cities. Action 1 of Chapter 5g includes two public outreach events at schools or childcare centers on information relating to air quality and reducing exposure, in addition to collaborating with community-based organizations to engage in outreach meetings. These outreach events will be focused within the Wilmington, Carson, West Long Beach community. The Energy Star is a U.S. EPA program focused on improving energy efficiency. Rebates for this program are typically administered by the local utilities such as SoCalGas, Southern California Edison, and Los Angeles Department of Water and Power (LADWP). South Coast AQMD is uncertain as to whether air purifiers are available for rebates under the Energy Star Rebates program for zip codes within the Wilmington, Carson, West Long Beach community zip codes. Additional information on the Energy Star Rebates Program is available at: <https://www.energystar.gov/rebate-finder>. However, in Action 3, of Chapter 5g, residential air filtrations systems have been included as a part of the CERP.

South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

**RE: Assembly Bill 617 (AB 617) Community Emission Reduction Plans (CERPs)**

Dear Dr. Fine,

Thank you for the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD) AB 617 efforts. Southern California Gas Company (SoCalGas) has participated in numerous Community Steering Committees (CSCs) and would like to commend SCAQMD staff on moving this monumental effort forward. SoCalGas looks forward to working with and assisting SCAQMD in the future. To that end, SoCalGas would like to submit the following comments on AB 617 and the Community Emission Reduction Plans (CERPs).

**I. INCENTIVES**

Incentives are integral to achieving emission reductions from Class 7 and 8 Heavy-Duty trucks. However, there are not enough incentives available to turn over the number of trucks needed to meet state, regional, and community emission reduction goals. Therefore, incentives need to be used wisely and cost-effectively to achieve the greatest amount of emission reductions today.

**Scrappage programs should be used to maximize emission reductions**

The most effective approach to reducing emission reductions with incentives is to require scrappage. While it is important to get clean trucks into service, it is equally important to remove older, dirtier trucks operating in disadvantaged communities. Without removing a dirtier truck through scrappage, there is no way to ensure that truck will no longer operate in communities as the fleet expands. Scrapping trucks ensures that emission reductions will be maximized. Voucher programs with no scrappage requirements, such as the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP), are also integral in moving the existing statewide fleet to alternative fuels, however, emission reductions in targeted areas should utilize scrappage programs to maximize emission reductions. SoCalGas recommends that incentive funding be prioritized for scrappage programs like Carl Moyer and Prop 1B.

20-1

**Funding technology advancement is contrary to the purpose of AB 617 – Current year incentives should be used for available technologies**

The purpose of AB 617 is to reduce emissions in disadvantaged communities within the five-year Community Emission Reduction Plan (CERP) time frame. While some have called for the use of incentives for demonstrations and pilots, this approach does not achieve the immediate emission reductions required by the AB 617 statute.<sup>1</sup> There are many other technology advancement programs locally and statewide that fund demonstrations and pilots for advancing technologies, such as the Low Carbon Transportation Pilots and Demonstrations, Zero and Near-Zero Emission Freight Facilities (ZANZEFF) and others. Those seeking funding for those types of projects should be directed to those programs. SoCalGas recommends that CERP incentives should focus solely on available technologies that can achieve tangible emission reductions.

20-2

**Incentives should prioritize technologies that can maximize emission reductions today**

Due to the current state of development, advanced technologies, such as battery electric class 7 and 8 trucks, have significant operating limitations, including but not limited to:

- **Range:** The California Air Resources Board (ARB) has stated that a technology is commercially available if it can be included in the HVIP eligibility list, as there is a robust process for a vehicle to be eligible for an HVIP voucher. Currently, there is only one Class 8 heavy-duty truck applicable for goods movement on the list. This truck has a maximum advertised range of 124 miles per charge. This is considerably less mileage than what the existing diesel fleet can achieve. This limited range also prohibits a one-to-one replacement of an older truck, limits how much a truck can be used, and thus limits its emission reduction potential.
- **Charging time:** Battery electric trucks can take several hours to charge. This is a significant operational difference between today's existing fleet, which requires only several minutes to refuel. Down time for charging will limit the hours a truck can be used in a day, which also limits its emission reduction potential.
- **Infrastructure availability:** The availability of infrastructure in the region is a major concern for battery electric technologies. While some may argue that charging stations can be slowly built out, there is a broader concern of finding land to accommodate charging and parking for these trucks. Due to charging, these trucks will be relegated to "return to base" operations and charging lots will need to be built nearby. In this case, it would be in or near an AB 617 community. AB 617 communities have stated various concerns with congestion and parking for trucks and placing charging lots in or near the communities would exacerbate the situation.

20-3

While these limitations may be overcome in the future, it is unrealistic to think that they will be resolved within the five-year CERP window. These limitations, and others, currently prevent battery electric technologies from doing all the things that the existing diesel fleet can do, therefore limiting the reductions that can be achieved. Natural gas trucks that meet ARB's

<sup>1</sup> See [https://leginfo.ca.gov/faces/billTextClient.xhtml?bill\\_id=201720180AB617](https://leginfo.ca.gov/faces/billTextClient.xhtml?bill_id=201720180AB617)

Optional Low nitrogen oxides standard<sup>2</sup> (Low-NOx trucks) can achieve significant emission reductions and can operate just like its diesel counter parts. Low-NOx trucks have similar range, power, and fuel time. They have been thoroughly tested, are available today, and can truly be a one-to-one replacement for diesel trucks.

20-3  
Cont.

#### Emission Reduction Effectiveness

Low-NOx trucks are the most effective solution in reducing emissions from heavy duty trucking. If SCAQMD used \$100 million of \$107 million in AB 617 incentives for low-NOx trucks, the emissions impact between the number of battery electric trucks versus Low-NOx trucks would be staggering.

*What could \$100 million of incentives get?*

Technology	Incentive Amount	Number of Trucks
Battery Electric	*\$332,500 <sup>3</sup>	300
Low NOx	\$100,000 <sup>4</sup>	1,000

*\*not including the \$50,000 per charger needed, an additional \$15 million total*

As shown above, \$100 million of incentives would result in 300 battery electric trucks or 1,000 Low NOx Trucks. In scrappage programs, this would also result in removing 1,000 diesel trucks from disadvantaged communities when funding Low NOx Trucks, compared to just 300 when funding battery electric trucks.

20-4

Both zero-tailpipe technologies and alternative fuel technologies would eliminate diesel particulate matter. For NOx, if all units were deployed at the same time, 300 battery electric trucks would reduce NOx emissions by 738 tons over the five-year CERP life, while 1,000 Low NOx trucks deployed at the same time would reduce NOx emissions by 2,406 tons over the same period. The significant discrepancy in emission reductions is due to the large difference in the number of Low-NOx trucks that can be turned over with \$100 million and the limited range<sup>5</sup> of battery electric trucks which results in substantially more emission reductions for Low-NOx trucks. In addition to achieving more emission reductions, it is important to point out that investing incentives into Low-NOx Trucks also removes 700 more older trucks from public roads, which would otherwise continue to emit.

As shown below, the emission difference is substantial even though the same amount of incentives would be used in each scenario. To utilize incentives most effectively, SCAQMD

<sup>2</sup> 0.02 grams of NOx per brake horsepower hour

<sup>3</sup> Based on a \$350,000 truck and a 95% funding from the Carl Moyer Program

<sup>4</sup> Based on Prop 1B scrappage and comparable to current Carl Moyer Program

<sup>5</sup> Battery Electric annual mileage of 37,448 based on BYD T8 advertised range of 124 miles per day for 302 days per year), Low NOx truck annual mileage of 44,558 based on EMFAC 2014 T7POLA category.

must get as many clean trucks on the road as possible, remove as many dirty trucks as possible, and prioritize technologies that can be used in all applications.

NOx Emissions from 1,000 Trucks on the Road Today	
2,548 tons	
NOx Emission Reductions from Using \$100 million to replace with:	
Battery Electric (300 trucks)	738 tons
Low NOx (1,000 trucks)	2,406 tons
Remaining NOx emissions from Replacing Diesel Trucks	
Battery Electric (300 trucks)	1,721 (300 battery and 700 diesel trucks remain)
Low NOx (1,000 trucks)	53 (1,000 Low NOx and zero diesel trucks remain)

20-4

Page 5

## II. ENERGY EFFICIENCY TECHNOLOGY ADVANCEMENTS FOR AB 617 COMMUNITIES

Below are near-term technologies SoCalGas is working on that could improve energy efficiency in AB 617 communities and reduce the amount of fuel combusted for space and water heating.

### Gas-Fired Absorption Residential Heat Pump

SoCalGas has been working with Stone Mountain Technologies Inc. and the Gas technology Institute (GTI), to demonstrate a high-efficiency Gas-fired Absorption residential Heat Pump (GAHP) water heater with an Energy Factor >1.3, 11,000 Btu/hr output, and 60-80-gallon storage capacity. The GAHP is already certified by the SCAQMD and meets the 10 ng NOx/Joule regulation limit in Rule 1121. This would be a drop-in replacement for standard water heaters in existing homes.

20-5

### Residential Fuel Cell Units

SoCalGas has partnered with AQMD to demonstrate a Residential Fuel cell to be used in conjunction with solar arrays and battery storage. The solar and fuel cell will both have the ability to power the home directly while simultaneously charging the battery. The unit also has the ability to recover heat for water and/or space heating needs, which increases overall efficiency. This technology is widely used in Europe and can be an ideal solution for reducing emissions from combustion of natural gas for space and water heating in homes.

## III. Conclusion

SoCalGas appreciates your consideration of our comments. We look forward to working with staff and other stakeholders in future meetings. If you have any questions, please do not hesitate to contact me.

Sincerely,

Priscilla R. Hamilton  
Environmental Affairs Manager  
Southern California Gas Company

Dan McGivney  
Kevin Maggay  
Edith Moreno

Response to Comment Letter #20-1

The CERPs for all three Year 1 communities include actions to address emissions for neighborhood trucks. The CERP prioritizes zero-emission technologies, where commercially available and technologically feasible; and where zero-emissions technology are not available, equipment will be replaced with cleaner technology (i.e., near zero) through incentives to achieve much needed emission reductions sooner. While the South Coast AQMD is currently testing and evaluating a broad range of zero-emission capable heavy-duty trucks, including battery electric and fuel cell, the only commercially available technology is the near zero-emission (0.02 g/bhp-hr NOx) 9L and 12L engines for Class 7 and 8 trucks. Therefore, as is the case with all South Coast AQMD implemented incentive programs (e.g., Carl Moyer, Prop 1B), an emphasis on cost-effectiveness will continue to be placed to maximize emission reductions, providing local and regional air quality benefits. Scrapping requirements are an integral part of many current incentive programs to ensure that the emission reductions are real and permanent.

Response to Comment Letter #20-2

Incentives focus on currently available technologies, such as the near zero-emission (0.02 g/bhp-hr NOx) 9L and 12L engines for Class 7 and 8 trucks. The CSCs have prioritized zero-emission technology, where commercially available and technologically feasible, but which are not commercially available at this time for heavy-duty trucks. The development, demonstration, and commercialization of cleaner technologies helps to expedite cleaner technologies prioritized by the CSC. Current year AB 617 community incentives will be used for available technologies. South Coast AQMD is funding and/or cost-sharing various zero-emission capable, heavy-duty truck projects to ascertain performance and needs to varying duty cycles, including range, charging time, and infrastructure availability. As demonstration projects with truck original equipment manufacturers (OEMs) are completed, including Daimler Trucks of North America and Volvo Trucks, OEMs plan to incorporate any necessary design changes and implement these into more robust commercial projects, expected to be available at in small commercial scales in 2021. South Coast AQMD will consider providing incentives to these zero-emission trucks upon commercialization and meeting incentive guidelines.

Response to Comment Letter #20-3

The CERPs include actions to implement the technologies commercially available today and maximize the use of available incentive funds to ensure the greatest emission reductions. South Coast AQMD staff is working closely with CARB on lowering the heavy-duty engine standard in California and has petitioned the U.S. EPA to establish near zero-emission NOx truck standards for the nation.

Response to Comment Letter #20-4

South Coast AQMD is uncertain as to the cost estimates included in the comment, or the basis for incentive amounts, but as indicated in Responses to Comment 20-1 and 20-3, the CERPs include actions to implement the technologies commercially available today and maximize the use of the available incentive funds to ensure the greatest emission reductions, using cost-

effectiveness as one of the key criteria. For mobile source projects, the incentive funds are to be implemented consistent with Carl Moyer or Prop 1B guidelines.

Response to Comment Letter #20-5

Thank you for your comment on gas-fired absorption residential heat pumps and residential fuel cell units. AB 617 focuses on reducing emissions from the sources of pollution prioritized by the community. These air quality priorities include refineries, ports, neighborhood truck traffic, oil drilling and production, railyards, and exposure reduction at schools, childcare centers, and homes. South Coast AQMD appreciates SoCal Gas's effort to provide information on technology that improves energy efficiency.

Comment Letter #21: Alicia Rivera, et al – Communities for a Better Environment

Comment Letter #21

8/7/2019

CBE Updated Report Card AQMD AB617 Process, Draft CERP for Wilmington/Carson/W. Long Beach:

Also see Recommendations section below.

**Our general finding is that the District made progress and provided more data, but has still not committed to a single ton of emissions reductions in the Oil Refining or Oil Drilling sector, and has no overall plan with any metrics to reduce emissions over time to meet measured targets (in tons per day or tons per year).**

Instead, the District has committed to doing more a couple of rules on refinery flare and storage tanks, and add more enforcement of existing requirements for VOC leaks, but with no emission reduction target. These are important, but not nearly enough. Separately, AQMD is developing a refinery boiler and heater regulation to replace the existing RECLAIM program that is being sunsetted. But there is no commitment to go beyond the tons per day associated with the RECLAIM program, through AB617. This category includes large numbers of major polluters, and these have potential for larger emissions reductions. The District has agreed to later evaluate the possibility of tightening oil drilling operations (1148.1 and 1173 leaks), but again, with no specific reduction targets.

21-1

- ▶ This flaw is inconsistent with AB617's requirements. For example, AB617 states: "The community emissions reduction programs shall be consistent with the state strategy and include emissions reduction targets, specific reduction measures, a schedule for the implementation of measures, and an enforcement plan." (SEC. 8. Section 44391.2 4c3)
- ▶ The District appears not to acknowledge that AB617 requires emission reduction targets.

**POSITIVE:** Thumbs Up for the Air District's providing the set of emissions data separating out the emissions in Wilmington / Carson / W. Long Beach (WCWLB). (Chapter 3b) This data finally provides a view of local emissions that has been generally missing, and is an important step forward, even if some of the data might need to be updated.

This data highlights how important oil refinery emissions are:

- Your new data on the baseline emissions in Wilmington shows that, contrary to most communication, Oil Refinery emissions dominate many of the pollutants, and frequently are even bigger than the transportation sources, which are already huge.<sup>1</sup>
- For VOCs – in WCWLB, the petroleum refining industry is the largest VOC emitter (see p. 6). We don't even know if that includes the Fluxsense study results, which showed refineries had 6 times higher VOCs than reported to the emissions inventory.
- For NOX – Refineries and refinery-related sulfur recovery & hydrogen plants were listed as the second-largest contributors to NOx, after ocean going vessels. On-road transportation emissions, although large, are *smaller* than refinery NOx. These sources are all very large.
- For PM2.5 – Industrial and petrochemical processes were the largest sector. PM2.5 is deadly – it causes increased death rates for vulnerable populations, such as people in the hospital. The District has identified diesel particulate matter from trucks as the main driver of *cancer* rates (because diesel

21-2

<sup>1</sup> SCAQMD, Wilmington, West Long Beach, Carson - Community Emissions Reduction Plan, Chapter 3b-Community Profile – Source Attribution, <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>

particulate is a potent carcinogen). However, separately, PM<sub>2.5</sub> levels are *also* associated with other *acute* health impacts, including increasing death rates for vulnerable populations. With the oil refineries and other industrial sources showing as the largest emissions source of PM<sub>2.5</sub> in this sector, we again see the importance of achieving oil refinery emissions reductions.

- Also note that oil refinery emissions are projected to stay the same through 2029 in your data (excerpted at the end of this document from Appendix 3b), except for a small reduction of 3 tons per year of VOCs from existing requirements. (Note that AQMD explained on 8/6/2019 in our phone conversation regarding the inventory, that this does not include further regulation on refineries since 2016. However AQMD also agreed that there no large emission reduction regulations for refineries have been adopted since 2016, so the projection for 2029 remains relevant. These are the emissions we can expect, unless the District adopts substantial new measures.)

21-2  
Cont.

#### OTHER POSITIVES:

- We appreciate that the District responded to the community by expanding the boundaries after the District had initially excluded the Phillips Wilmington refinery.
- We appreciate that the District's facilitation improved. Meetings at first were very chaotic, but late mostly improved substantially.
- We appreciate that the District added a commitment to re-visit the Refinery Storage Tank regulation in the most recent draft.

21-3

NEGATIVES: Unfortunately, there are also some big negatives. There is no plan with emissions reduction targets to substantially reduce emissions from the baseline provided from all sectors. We focus here on Oil Refineries:

- There is no year to year emission reduction plan, no plan to *substantially* reduce Oil Refinery emissions, and not even a commitment to reduce emissions by any amount.
- The District has argued that it does not yet have the data to commit to specific reductions, and that will happen in rulemaking.
- But AB617 promised communities and requires achieving actual emissions reductions. This situation is similar to Clean Air Act proceedings. Under the CAA, first a plan is developed, emissions reduction targets are identified, the measures the District expects will meet these targets are listed, and later these regulations are adopted, even though the District does not have all the details of the regulation ahead of time.
- Even if the District needs to later develop more details, it can still have a goal to reduce Oil Refinery emissions by, for example, a certain percentage per year.
- We need metrics – specific numbers for emissions reduction plans. The rate of emissions reduction can be discussed, but right now, there is no commitment.
- In addition to numeric emission reduction goals, we need enough regulations in the plan to meet that goal.
- Ultimately, there will be no way to completely address the impacts of the largest concentration of fossil fuels on the West Coast, without the District acknowledging that we will also need to phase out fossil fuels over time (in addition to conventional regulation to reduce emissions).

21-4

21-5

**Recommendations:**

- As required by AB617, the District needs to develop specific emissions reduction targets to address the unfair burdens of heavy oil refinery, oil drilling, transportation, ports, and other emissions in WCWLB
- Identify sufficient regulatory measures to meet those requirements.
- Commit to specific emissions reductions goals overall for oil refineries, and specific targets for the regulations identified in the CERP, including flares, storage tanks, VOC leak detection, oil drilling operations, and more.
- Let us know if the refinery VOC emissions do not reflect the findings of the Fluxsense study. If they do not, please update the VOC (and benzene) emissions inventory to reflect that oil refineries have 6 times the emissions, as shown by the Fluxsense study.
- Please provide the emissions separately for each oil refinery for 2017, 2024, and 2029.
- Add to the list of Oil Refinery regulations to be developed, a requirement for wet scrubbers on oil refinery FCC Units (fluid cat crackers). This would reduce PM2.5 from oil refineries, which are major emissions sources, as your inventory highlighted.
- Commit to increased reductions from refinery Boilers and Heaters under AB617, going beyond replacing tons per day associated with RECLAIM.
- The District should explicitly support the development of a 2500 ft buffer zone for oil drilling operations under consideration at the City of LA.
- Provide additional data on air toxics, including BTEX (Benzene, Toluene, Ethylbenzene, Xylene), and other air toxics.
- Support a phaseout within 4 years of MHF through Rule 1410.
- See our previous comments with more detail on the above.

21-6

See attached excerpts from AQMD Chapter 3b, projecting that refinery emissions do not go down by 2029.

South Coast AQMD acknowledges the impact of fossil fuels and supports zero-emission technology when it is technologically feasible and commercially available. Staff believes a phase-out of fossil fuels needs to be coordinated with a number of state agencies, including the Public Utilities Commission, the California Energy Commission, and CARB. State law (SB 100, 2018)

already calls for a phase out of fossil fuels (zero-carbon goal) in the electricity generating sector by 2045 through the coordinated action of these state agencies. Please see Response to Comment 1-2 regarding the request to phase out fossil fuels.

Response to Comment Letter #21-6

CBE's concerns have been addressed in the previous two letters received from this organization. Regarding air toxics, staff will provide updates on air monitoring efforts, including updates on air toxics (e.g., benzene, toluene, etc.) measurements.

Comment Letter #22: Bridget McCann – Western States Petroleum Association (WSPA)

**Re: AB617 Draft Community Emission Reduction Plan (CERP) for  
Wilmington, Carson & West Long Beach (WCWLB)**

Dear Dr. Fine,

Western States Petroleum Association (WSPA) appreciates the opportunity to participate in South Coast Air Quality Management District's (SCAQMD or District) AB617 Community Steering Committee meetings for the Wilmington, Carson, West Long Beach (WCWLB) community. WSPA is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in five western states including California. WSPA has been an active participant in air quality planning issues for over 30 years. WSPA-member companies operate petroleum refineries and other facilities in the South Coast Air Basin. Some of these facilities are located within the WCWLB community boundary.

The District recently released "draft" versions of select CERP chapters for the WCWLB community area. These sections included proposed actions to reduce air pollution emissions or exposures for a number of stationary source and/or mobile source categories.<sup>1</sup> District Staff workshopped some of these draft CERP chapters at the WCWLB Community Steering Committee on July 11, 2019.<sup>2</sup> Other changes to the draft have been posted online after July 11. WSPA offers the following comments specifically on draft Chapter 5b - Refineries.<sup>3</sup>

1. CERP Section 5b needs to detail the comprehensive degree of existing and proposed District rules already focused on refinery sector sources.

As with the prior "discussion draft" version of CERP Section 5b, Refineries, the current draft version identifies flaring events and refinery process equipment as priorities identified in the WCWLB Steering Committee meetings. The draft section also notes that "ongoing rule development and air monitoring efforts by the District will help address some of these air quality

<sup>1</sup> SCAQMD, Draft, Community Emissions Reduction Plan (CERP) for the Wilmington, Carson & West Long Beach Community, July 2019, posted at <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm/cerp>.

<sup>2</sup> CSC meeting presentations are available at <http://www.aqmd.gov/nav/about/initiatives/community-efforts/environmental-justice/ab617-134/wilm>.

<sup>3</sup> CERP Draft, Section 5b – Refineries, June 2019.

August 6, 2019  
Page 2

priorities” in the WCWLB community,<sup>4</sup> and cites the following Best Available Retrofit Control Technology (BARCT) rules:

- Rule 1118, Control of Emissions from Refinery Flares
- Rule 1180, Refinery Fenceline and Community Air Monitoring
- Proposed Rule 1109.1, Refinery Equipment

22-1

As noted in our prior comment letter, these facilities are already among the most heavily regulated industrial operations in the country (if not the world) and are already subject to a large number of other air quality rules and regulations which are enforced by the District, the California Air Resources Board (CARB), and the U.S. Environmental Protection Agency (USEPA). Chapter 5b should be revised to detail the comprehensive level of existing regulation to better inform the Steering Committee and other community stakeholders.

**2. The Draft CERP, inclusive of information presented to the Technical Advisory Group (TAG), does not support emission control measures beyond those found in existing or proposed rules and regulations.**

The AB617 statute and associated Community Air Pollution Protection Blueprint specify a number of requirements for Community Emissions Reduction Programs (CERPs).<sup>5</sup> Among the required elements is a source attribution analysis which estimates the relative contribution of emissions sources (or categories of sources) to elevated air pollution exposures in the community. The District recently presented a draft source attribution analysis to its AB617 TAG.<sup>6</sup> Notably, most of the information presented in the draft technical document is regional data—not focused on the WCWLB community. The report discusses the various source attribution methodologies identified by CARB in the Blueprint guidance and notes the following:

*“Amongst the five technical approaches, South Coast AQMD used (1) inventory ratios and (2) air quality modeling for the South Coast Air Basin developed for the Multiple Air Toxics Exposure Studies (MATES IV), (South Coast AQMD, 2015) described in Section 2.2, with a heavier focus on developing detailed emissions inventories for the three first-year communities....”<sup>7</sup>*

22-2

The District subsequently presented community-specific emissions inventory information to the TAG<sup>8</sup> which has now been appended to the draft CERP.<sup>9</sup> This inventory information clearly suggests that refineries represent a very small contribution (i.e., 2%) to exposure levels in the WCWLB community, which when complete source attribution is completed by SCAQMD staff (hopefully next year), actual exposure may be found to be less. Given this information, the draft CERP lacks technical foundation for suggesting refinery focused control measures beyond those found in existing or proposed rules.

<sup>4</sup> CERP Draft, Section 5b – Refineries, June 2019. See page 5-3.

<sup>5</sup> CARB, Community Air Protection Blueprint, Appendix C, Criteria for Community Emission Reduction Programs.

<sup>9</sup> CERP Draft, Appendix 3b, July 2019.

August 6, 2019  
Page 3

The draft also fails to fully assess all existing and available measures for reducing emissions from contributing sources or source categories including, but not limited to, Best Available Control Technology (BACT), BARCT, or Best Available Control Technology for Toxic Air Contaminants (T-BARCT), or how those measures in existing or proposed rules would reduce potential future air pollution exposures in the AB617 community area. Such a demonstration is required for the CERP.<sup>10</sup> We would request that the District explain to the Steering Committee what potential additional emission reductions might be expected for the rules identified in Section 5b, and how that would compare to the overall estimated future health risks from air quality in the community. Given the relatively small contribution to exposure levels in the WCWLB community,<sup>11</sup> the benefit of any reductions from these proposed actions is also likely to be relatively small.

22-3

**3. Any future changes to District BARCT rules (e.g., Rule 1118, Rule 1178) must be based upon the consideration of specified criteria pursuant the California Health & Safety Code.**

The California Health & Safety Code authorizes the District to establish Best Available Retrofit Control Technology (BARCT) requirements based upon the consideration of specified criteria. This includes a demonstration that any new or amended BARCT requirements are both technically feasible and cost effective.

The draft version of CERP Section 5b, Refineries, suggests that the District may require methods to reduce refinery flaring emissions through amendments to Rule 1118.<sup>12</sup> The current version of District Rule 1118, which was just amended in 2017, harmonized current Rule 1118 with USEPA's flare standards in the national Refinery Sector Rule and included significant new prohibitions on certain types of flaring.<sup>13</sup> The current version of Rule 1118 also required the facilities to prepare an engineering "scoping document" that evaluates the feasibility of minimizing (or avoiding) planned and unplanned flaring events. The outcome of those engineering demonstrations will inform what additional control measures, if any, may be technically feasible under the rule.

22-4

The draft suggests a reduction target for refinery flare emissions under Action 3; a suggestion which lacks any technical basis. Any future amendments to Rule 1118 will need to conform with applicable BARCT criteria, including a demonstration of technical feasibility. Thus, proposed Action 3 should be revised to describe the current Rule 1118 scoping document process and explain to the Steering Committee how that engineering process will inform any future amendments to Rule 1118. Additionally, the arbitrary reduction target should be removed from proposed Action 3 as it is without any technical basis.

**4. Proposed Action 4 should be revised to note that it would be contingent on future findings from proposed Action 2, and any future changes to Rule 1178 would also need to be based on specified BARCT criteria. Certain mobile monitoring techniques may not be cost effective when compared to other optical technologies.**

22-5

With respect to the prospective use of mobile monitoring (i.e., proposed Action 2),<sup>14</sup> we generally agree that mobile monitoring might be useful for enhanced leak detection and repair (LDAR)

August 6, 2019  
Page 4

activities. The same can also be said for certain handheld optical monitoring techniques (e.g., forward looking infra-red). We again note that some mobile monitoring platforms are based on monitoring technologies/methodologies which have not been reviewed and/or approved by USEPA for regulatory purposes. So, while such mobile monitoring platforms might be used for enhanced LDAR purposes the information is not suitable for enforcement and may not be useful as a basis for rulemaking.

WSPA has previously highlighted various technical issues with the solar occultation flux (SOF) methodology. Those issues raise significant questions about the ability of that technique to provide meaningful or accurate emissions estimates. A summary of those concerns was presented in the attached letter (see Attachment 1). To our knowledge, these technical concerns have not been resolved, so emissions representations using the methodology may not be meaningful.

22-5  
cont.

As for technologies that might be considered for enhanced LDAR purposes, cost effectiveness will be an important consideration. There are a number of optical remote sensing technologies which in theory could be used for leak detection purposes. The District would need to demonstrate that one or some of these actually enhance LDAR program performance compared to current techniques. BARCT rules must also consider cost effectiveness, so it will be important that any future amendments to Rule 1178 (proposed Action 4) consider comparative cost effectiveness of any technologies thought to provide quantifiable benefits. At this point, it is not clear if any of the additional options would actually enhance LDAR program performance to a quantifiable degree, let alone in a cost effective manner.

WSPA appreciates the opportunity to provide these comments. We look forward to continued discussion of this important planning process. If you have any questions, please contact me at (310) 808-2146 or via e-mail at [bridget@wspa.org](mailto:bridget@wspa.org).

Re: Additional Comments on Draft Optical Remote Sensing Report from FluxSense

Dear Dr. Miyasato:

Western States Petroleum Association (WSPA) is a non-profit trade association representing companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California, Arizona, Nevada, Oregon, and Washington. WSPA-member companies operate petroleum refineries and other facilities in the South Coast Air Basin that will potentially be affected by the information presented in the draft Reports from FluxSense, Inc.

WSPA and its members appreciate the October 6<sup>th</sup> workshop organized by your team with FluxSense. The additional information provided by the FluxSense representatives concerning their technical methodology was very helpful as we continue working to understand the technology's capabilities and limitations.

As you know, FluxSense uses two mobile remote gas sensing techniques, Solar Occultation Flux (SOF) and Mobile SkyDOAS (Differential Optical Absorption Spectroscopy) to estimate facility-wide mass emission fluxes of volatile organic compounds (VOCs), sulfur dioxide (SO<sub>2</sub>) and nitrogen dioxide (NO<sub>2</sub>). These mobile remote gas sensing techniques are complemented by two mobile extractive optical methods, MeFTIR (Mobile extractive Fourier Transform Infrared Spectroscopy) and MWDOAS (Mobile White cell DOAS) to characterize ground-level concentrations of alkanes, methane and aromatic VOCs and to calculate "inferred fluxes."<sup>1</sup>

After reviewing FluxSense's workshop presentation<sup>2</sup> and the responses provided to WSPA's comments on the FluxSense Draft Report,<sup>3</sup> we still have several important concerns over the "inferred fluxes"

<sup>1</sup> FluxSense ("FluxSense Draft Report"), *Emission Measurements of VOCs, NO<sub>2</sub> and SO<sub>2</sub> from the refineries in the South Coast Air Basin using Solar Occultation Flux and other Optical Remote Sensing Methods*, Final Draft Report, 31 October 2016, page 2 et seq.

<sup>2</sup> Johan Mellqvist and Marianne Ericsson, FluxSense Inc ("FluxSense Presentation"), *Data Collection and Interpretation Workshop: Solar Occultation Flux and Other Optical Remote Sensing Techniques to Fully Characterize and Quantify Fugitive Emissions from Refineries in the South Coast Air Basin*, 6 October 2016.

which have not been addressed. And we continue to have significant technical and policy concerns over how those inferred fluxes are being presented as annual emissions, along with the authors' suggestions that their estimates are somehow more accurate than annual emissions estimates prepared in accordance with approved methodologies from the USEPA and the South Coast Air Quality Management District (AQMD).

1. We appreciate that the report qualifies data for certain chemical species as "inferred fluxes." Since inferred fluxes are not directly measured values, the information may be of limited technical usefulness.

The FluxSense Draft Report now reports certain information as "inferred fluxes," including the data presented for benzene, BTEX (i.e., Benzene, Toluene, Ethylbenzene and Xylenes), and methane (CH<sub>4</sub>). That qualification is important for all pollutants where the technology is incapable of direct measurement. Significant care must be taken before drawing conclusions based on such inferred flux data since these are not direct measurements and are subject to important technical limitations.

2. The VOC estimates presented by FluxSense are also "inferred fluxes."

The "inferred" qualification must also be applied to VOCs since this criteria pollutant cannot be directly measured using the SOF technology. Significant care must be taken before drawing conclusions based on such inferred flux data since these are not direct measurements and are subject to important technical limitations.

3. The FluxSense methodology does not measure NO<sub>x</sub> flux, so any comparisons in the FluxSense Draft Report to the facilities' reported actual NO<sub>x</sub> emissions data are semi-quantitative at best.

In the South Coast AQMD, refinery NO<sub>x</sub> emissions are among the most closely monitored air pollutant emissions. Major NO<sub>x</sub> sources at these facilities are regulated under Regulation XX – Regional Clean Air Incentives Market (RECLAIM). Specifically for NO<sub>x</sub>, Rule 2012 provides the requirements for monitoring NO<sub>x</sub> and sets very stringent guidelines to ensure the accuracy of the reported data. Rule 2012 requires NO<sub>x</sub> measurements be taken using Continuous Emissions Monitoring Systems (CEMS) or an equivalently accurate method.<sup>4</sup> Further the rule requires that the system calibrations be checked daily and be within 5% accuracy based upon the span range value.<sup>5</sup> In addition to the daily checks, Rule 2012 requires semiannual Relative Accuracy Test Audits (RATA) where a third party testing company compares the measurements made by their own independent system to those recorded by the facility CEMS. In order to pass the RATA, the relative accuracy of the pollutant concentration monitor and the mass emission rate measurement system must be less than or equal to 20%.<sup>6</sup> In short, these NO<sub>x</sub> CEMS, which directly measure NO<sub>x</sub> by converting any NO<sub>2</sub> to NO and analyzing the resultant stream, are understood to result in reported NO<sub>x</sub> emissions with a very high level of accuracy.

<sup>5</sup> SCAQMD, *Rule 2012 Protocol – Attachment C – Quality Assurance and Quality Control Procedures*, 4 December 2015, Page 6.

<sup>6</sup> *Ibid.*, page 9.

In the Final Draft Report, FluxSense makes certain representations concerning the facilities' annual NO<sub>x</sub> emissions even though the SkyDOAS methodology is only able to directly measure NO<sub>2</sub>. More specifically, the Final Draft Report compares SkyDOAS-derived NO<sub>2</sub>-only estimates to the facilities' annual NO<sub>x</sub> emissions which are primarily derived from RECLAIM CEMS. This comparison, which is presented as a "Discrepancy Factor (Measured/Reported)," is then used to suggest the SkyDOAS methodology can estimate annual NO<sub>x</sub> emissions with some precision (i.e., the Discrepancy Factors are presented to suggest a close correlation between reported NO<sub>x</sub> emissions and SkyDOAS-derived NO<sub>2</sub> data). But for reasons outlined below, this comparison is flawed and the results are at best semi-quantitative.

#### 4. The NO<sub>2</sub> fluxes presented in the FluxSense Draft Report are very likely overstated.

It is generally accepted that natural gas combustion sources exhibit NO<sub>2</sub>/NO<sub>x</sub> ratios between 10% and 20% at the stack.<sup>7</sup> FluxSense quotes a single study to suggest that 80% of NO<sub>x</sub> is converted to NO<sub>2</sub> by the time it reaches fence line<sup>8</sup> and that assumption is then used to support the comparison of FluxSense NO<sub>2</sub> data with facilities' reported NO<sub>x</sub> emissions. But that assumption is flawed.

Ambient NO-to-NO<sub>2</sub> conversion has been shown to be a function of ambient ozone concentrations, not just residence time. During FluxSense's 2015 surveys in the Carson/Wilmington area, ambient ozone concentrations during the survey hours ranged between 25 and 43 parts per billion (ppb), with an average concentration of approximately 36 ppb.<sup>9</sup> According to the literature, the maximum NO<sub>2</sub>/NO<sub>x</sub> ratio at these ozone levels would be expected in the 50-65% range.<sup>10</sup> At those lower ratios, the measurements using the SkyDOAS methodology would be overstating facility NO<sub>x</sub> flux by 54-100%. This is significantly higher than the error suggested in the report, and the NO<sub>2</sub> fluxes presented in the report do nothing to validate the method's accuracy for other pollutants.

#### 5. VOC fluxes presented in FluxSense's draft report are very likely overestimated due to assumptions which overstate wind speeds affecting VOC containing plumes.

SOF and Mobile SkyDOAS were used to measure the total mass of molecules along the roads traveled, but those data have to be multiplied by a wind speed to compute a mass flux. For the 2015 survey, FluxSense relied on wind data from a stationary remote sensing wind-LIDAR providing vertical wind profiles. The reported wind-LIDAR data starts at 50 meters above ground surface (AGS). As presented at the workshop, FluxSense contends that wind speeds measured by the wind-LIDAR show little differentiation with elevation. On that basis, (inferred) VOC fluxes were calculated using wind speeds at heights ranging from 239 to 835 meters depending on the facility.<sup>11</sup>

<sup>7</sup> USEPA, NO<sub>2</sub> In-Stack Ratio Database, available at [https://www3.epa.gov/scram001/no2\\_isr\\_database.htm](https://www3.epa.gov/scram001/no2_isr_database.htm).

<sup>10</sup> [NO<sub>2</sub>]:[NO<sub>x</sub>] from Janssen Method (Figure 1) at Environment Agency, *Review of Methods for NO to NO<sub>2</sub> Conversion in Plumes at Short Ranges*, Science Report: SC030171/SR2, November 2007.

<sup>11</sup> FluxSense Presentation, see slides 79-81.

FluxSense also presented technical information on vertical plume mixing to support their wind speed choices. While this material may be fitting for thermally-buoyant combustion source plumes, we believe that basis is inappropriate for characterizing plumes from fugitive VOC sources. Fugitive VOC sources (e.g., tanks, valves, etc.) are different than plumes from combustion sources. Combustion sources are typically exhausted from elevated stacks at elevated temperatures (e.g., > 250 F). On the other hand, fugitive sources typically emanate from near-ground heights without the thermal or mechanical properties to drive vertical mixing. In fact, this lower plume height phenomenon was actually observed by National Physical Laboratory (NPL) in their study for AQMD.<sup>12</sup> The DIAL technology used by NPL actually affords the ability to directly map the height and concentration of VOC plumes. And for the refinery tank farm surveyed by NPL, the fugitive VOC plumes were observed to be at heights lower than 50 meters AGS.<sup>13</sup>

Figure 4.14a1 Observed VOC concentration for Scan 106 representing TV09/LOS1.

Source: NPL Report. Annotation by ERM for WSPA.

This is important, because wind speeds below 50 meters are considerably less than those which were measured above 50 meters using wind-LIDAR. For example, on one of the study days the wind-LIDAR wind speed aloft was over 13 mph, while the ground-level (i.e., 10 meters AGS) wind speed was averaging about 7 mph.<sup>14</sup> Since the inferred fluxes are directly proportional to assumed wind speed, such elevated wind speed assumptions could be overstating VOC fluxes by nearly 100%.

**6. The inferred VOC fluxes presented in FluxSense's Draft Report rely on ground-level BTEX measurements which may result in overstated VOC emissions.**

<sup>12</sup> National Physical Laboratory (NPL Report), Differential Absorption LIDAR (DIAL) Quantification of Benzene and VOC Fugitive Emissions from a Refinery Tank Farm in Los Angeles, USA, September – October 2015.

<sup>13</sup> NPL Report, see Figure 4.1.a1, Figure 4.9.a1, and Figure 4.14a1.

<sup>14</sup> ERM analysis, comparison of wind-LIDAR wind speeds presented in FluxSense Presentation (Slide 79) to wind data from POLB Inner Harbor monitoring station on 16 September 2015.

According to the data presented by FluxSense, while the SOF method has reasonable cross-sensitivity to alkanes (70-87%) the technology's cross-sensitivity to non-alkane organics is poor. This includes alkenes (only 5-15%) and aromatics such as BTEX (only 5-16%). In the case of benzene, the reported cross-sensitivity was actually 0%.<sup>15</sup> To compensate for this shortcoming, MeFTIR and MWDOAS are used to measure ground-level concentrations of alkanes and aromatic VOCs. Those ground-level alkanes/aromatics ratios are then used to "infer" BTEX fluxes at the higher elevations.

$$\begin{aligned} \text{Emissions } X &= [\text{concentration of } X / \text{concentration of alkanes}]_{\text{FTIR}} * (\text{emission of alkanes})_{\text{SOF}} \\ \text{Where } X &= \text{BTEX, CH}_4 \text{ or N}_2\text{O}^{16} \end{aligned}$$

In short, the method assumes that pollutant ratios will be constant so ground-level pollutant ratios are representative of pollutant ratios aloft (i.e., all the way to sun). But as explained above, plumes from fugitive VOC sources (e.g., tanks, valves, etc.) are likely found at lower heights. Any plumes at higher heights that may contain alkanes may not be compositionally similar to fugitive VOC plumes found at lower heights. Combustion source plumes (likely to be found at higher heights) do contain alkanes, but the benzene/alkane ratio from these sources would normally be significantly less.

For example:

External Combustion, Natural Gas:	Benzene/Alkanes ratio = 0.00019 <sup>17</sup>
Fugitive VOC, Liquid Service:	Benzene/Alkanes ratio = 0.001 <sup>18</sup>

Per these references, the benzene/alkanes ratio for a fugitive VOC plume would be 400% higher than the expected benzene/alkanes ratio of a combustion source's plume. Just the same, the "inferred flux" calculation would estimate benzene (and VOC) concentration of the thermally buoyant plume area as being the same as the near ground-level benzene/alkanes ratio.

#### 7. The reliance on ground-level BTEX ratios likely significantly overstates BTEX and benzene fluxes for plumes at higher heights.

For similar reasons, the reliance on ground-level BTEX/alkanes and benzene/alkanes ratios likely is causing significant overstatement for the inferred BTEX and benzene fluxes. These inferred fluxes are not direct measurements and are subject to critical technical limitations. The method's overly simplistic assumptions concerning plume wind speeds are likely causing significant overstatement for fugitive VOC-containing plumes at lower heights. And the method relies on ground-level benzene/alkanes and BTEX/alkanes ratios to characterize benzene and BTEX levels in higher-height plumes. For combustion source plumes, such an assumption would cause significantly overstated results.

<sup>17</sup> USEPA, *AP-42 Section 1.4 External Combustion, Natural Gas*, Table 1.4-2 and 1.4-3. Ratio of benzene and alkanes emission factors.

<sup>18</sup> CARB, *Identification of Volatile Organic Compound Species Profiles*, ARB Speciation Manual, Second Edition, August 1991. Ratio of benzene to alkanes emission factors from Oil & Gas liquid service.

Given the significance of the method's inherent errors, we would caution against drawing any conclusions from the BTEX or benzene inferred fluxes presented in the Report and any representations of annual quantities should be removed.

**8. The controlled release study did nothing to address these technical shortcomings related to inferred flux values for VOC, benzene, BTEX or NO<sub>x</sub>.**

In September 2015, the District oversaw a controlled release experiment for the purpose of validating field measurements from different optical remote sensing techniques. While a report has yet to be released for this experiment, AQMD Staff have made several public presentations overviews the experiment.<sup>19</sup> As we understand the scope, the study involved the controlled release of non-odorized propane at various emission rates with each release rate lasting about one hour. Propane is an alkane compound.

Without commenting on any other aspect of the study design, this controlled release study design did nothing to address the technical issues related to inferred fluxes presented by FluxSense for VOC, benzene, BTEX or NO<sub>x</sub>. The SOF is able to directly measure alkane concentrations (like propane), so one would certainly expect performance with this compound to be reasonable especially since the location and timing of the release also known (only the release rate was unknown). But VOC (the non-alkane fraction), benzene, BTEX and NO<sub>x</sub> are not directly measured by the SOF-based methodology. So the controlled release study did not validate field measurements for these compounds.

**9. In summary, the inferred flux estimates presented in the FluxSense Revised Draft Report are not useful for characterizing emissions for VOC, benzene, BTEX or NO<sub>x</sub>.**

We have highlighted several fundamental technical problems which compromise the inferred flux values presented in the Revised Draft Report. These inferred flux data, which are not direct pollutant measurements, appear significantly overstated and offer highly questionable accuracy. In the above example, the NO<sub>x</sub> inferred fluxes presented in the Report are likely overstating actual facility NO<sub>x</sub> flux by 54-100%. So while the report presented NO<sub>x</sub> inferred fluxes in an attempt to demonstrate the method's accuracy for other pollutants, it doesn't quantify NO<sub>x</sub> with reasonable accuracy. And the method's inherent error relative for non-alkane organics is more problematic. The Report notes the technology's cross-sensitivity to non-alkane organics is poor, so direct measurement of concentration or mass flux is not possible for these pollutants. And the simplistic assumptions introduced for this shortcoming are themselves flawed. As a result, the VOC, benzene and BTEX inferred fluxes presented in the Report are overstated; by perhaps an order of magnitude.

**10. Attempts to characterize annual emissions values from short-term observations are fundamentally flawed; such values are semi-quantitative at best.**

WSPA agrees that the various optical remote sensing (ORS) methods (e.g., SOF, DIAL, etc.) being tested by AQMD may have utility for remote sensing of emissions, but there are significant unresolved problems concerning attempts to extrapolate short-term observations from limited study periods to estimate annual emissions. These extrapolations still have not been demonstrated as accurate or

<sup>19</sup> SCAQMD, Presentation: Controlled Release Experiment to Validate Field Measurements from Different Optical Remote Sensing Techniques, 19 October 2016.

meaningful. For techniques which can directly measure pollutant concentrations, a long term study would be necessary to demonstrate the use of such ORS data for estimating annual emissions with some reasonable accuracy. While WSPA understands that FluxSense may be retained by SCAQMD to conduct seasonal monitoring under an USEPA grant, we strongly recommend that any study making a representation of annual emissions should be a full 12 months in length.

We strongly recommend that the FluxSense Draft Report be revised to exclude all representations concerning estimated annual emissions and/or statements comparing such extrapolations to emissions reported by the facilities using regulatory approved reporting methods. We further recommend similar revisions to any statements regarding estimated annual emissions in the draft NPL and Atmosfir reports.

If you have any questions, please contact me at (310) 808-2144 or by email at [patty@wspa.org](mailto:patty@wspa.org).

Sincerely,

cc: Dr. Laki Tisopulos, SCAQMD  
Andrea Polidori, SCAQMD

Response to Comment 22-1:

Please see Response to Comment Letter #14-1.

Response to Comment 22-2:

AB 617 focuses on reducing toxic air contaminants and criteria pollutants in communities affected by a high cumulative exposure burden (Sec. Cal. Health and Safety Code, § 44391.2 (b)). Emissions from petroleum refineries contribute a significant portion of the total emissions in the Wilmington, Carson, West Long Beach community. The VOC, NOx and SOx emissions from the refineries account for 17%, 21% and 65%, respectively, of the community total emissions. The emission reduction goals in the CERP are to reduce these levels by 50%. The overall estimated reduction in emissions from petroleum refineries are 1,095 to 1,460 tpy of NOx, 11 tpy of SOx and 1 tpy of VOCs. These emission reduction goals are subject to future assessments and regulatory analyses as stated in the CERP.

The Actions in the CERP reduce emissions from sources prioritized by the Wilmington, Carson, West Long Beach CSC. Aside from petroleum refineries the CERP also includes actions to reduce emissions from ports, railyards, trucks, and oil drilling and production. These non-refinery Actions contribute to 100% of the DPM emission reductions and over 50% of the NOx emission reduction estimates for the CERP.

Response to Comment 22-3:

As part of the BARCT process, the following South Coast AQMD Rules will be evaluated or have been evaluated: 1109.1, 1110.2, 1117, 1118.1, 1134, 1135, 1146, 1146.1, 1146.2, 1147, 1147.1, and 1147.2. The BARCT assessment is still currently being conducted for a number of rules and the list of affected non-RECLAIM facilities has not been finalized. For each rule, a BARCT assessment must be completed which takes into consideration other technologies or limits by other entities.

The estimated emission reductions from the *Actions* that require rulemaking in the CERP are summarized in the table below. The VOC emission reductions that result from these Actions may reduce localized health risk impacts from refinery emissions since certain VOC's (e.g., benzene) contribute to these impacts.

Title of Action	Timeline <sup>8</sup>	Implementing Entity	Emission Reductions Targets (tpy) <sup>9</sup>		
			NOx	SOx	VOC
Initiate Rule Development to Amend Rule 1118 – Control of Emissions from Refinery Flare	beginning 2020	South Coast AQMD	19	11	1
Initiate Rule Development to Amend Rule 1178 -Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities	beginning 2021	South Coast AQMD	N/A	N/A	TBD
Achieve Further Reductions from Refinery Equipment through Adoption of Rule 1109.1 – Refinery Equipment	beginning 2019	South Coast AQMD	1,095 to 1,460	N/A	N/A
Evaluate the Feasibility to Amend Rule 1148 and Rule 1173 to Reduce Emissions and Require Additional Monitoring	beginning 2020	South Coast AQMD	N/A	N/A	TBD

#### Response to Comment 22-4:

Rule 1118 required facilities to submit a Scoping Document 12 months after the rule was adopted. The Scoping Document evaluates the feasibility of minimizing or avoiding planned and unplanned flaring events. Rule 1118 requires that the scoping document include:

- An analysis of two alternatives to reduce Planned Flaring Events for each of three annual performance targets (0.10, 0.05, and 0.01 or lower tons of SOx per million barrels of crude processing capacity, and 0.1 tons of VOC per year from clean service flares),
- An analysis of the potential controls, technical feasibility, approximate cost, and timing constraints to implementing each of these alternatives as soon as feasible,
- An analysis of how a facility can reduce emissions from Unplanned Flare Events caused by four scenarios: 1) a sudden influx of vent gas into the flare gas header, 2) a sudden loss of the process unit with the highest fuel gas consumption rate of recovered flare gas, 3) a sudden loss of all externally generated electrical power, 4) a sudden loss of internally generated electrical power, and

<sup>8</sup>Please refer to Chapters 5b and 5e for details on the timeline for each action

<sup>9</sup>Emission reduction targets that are TBD will be determined upon implementation of the action and based on available information, such as, air monitoring data gathered from the Wilmington, Carson, West Long Beach Community Air Monitoring Plan

- A description of the components of the flare system.

Per the Course of Action provided for Action 3 in Chapter 5b, the information from the Scoping Documents provided by facilities along with other information will be considered during rule development to amend Rule 1118

Response to Comment 22-5:

Staff have previously responded to these concerns from WSPA and look forward to continuing our efforts and discussion on the topic.

Comment Letter #23: Alicia Rivera, et al – Communities for a Better Environment  
**Comment Letter #23**

From CBE 8/13/2019

**Summary needed for SCAQMD WCWLB AB617 Refinery Emission Reductions**

Community members including CBE have previously proposed these and other measures, and have asked AQMD for a comprehensive plan with substantial tons per day or tons per year reductions for Oil Refineries. Community members have asked AQMD to provide emissions reductions requirements that go beyond enforcing existing regulations, and beyond monitoring. We have also asked AQMD to identify additional oil refinery emission reduction measures, so this should not be considered comprehensive. **All of these need a target deadline, in addition to target emission reductions.** Below includes written & oral comments previously proposed to District.

	What's in the Plan / What's Missing?	Can District Provide?	
Refineries -- total emissions reductions	<ul style="list-style-type: none"> <li>District listed refineries as the largest VOC source, the 2<sup>nd</sup> largest NOx source, and with other industrial sources, the largest PM2.5 source. We need a plan with commitments for substantial reductions.</li> <li><u>Add overall Refinery Emission Reduction Target, such as percent per year over 10 years</u> (for each criteria pollutant, plus toxics including benzene and for other priority toxics)</li> </ul>		23-1
Refinery inventory	<ul style="list-style-type: none"> <li>Need emissions baseline for each separate oil refinery (including separate inventories for each of Phillips 66 Wilmington &amp; Carson, and each of Marathon Wilmington &amp; Carson). Staff responded to Jesse Marquez that he could look these up, but he requested these be provided in the plan for all community members to have; CBE agrees.</li> <li>Need Refinery VOC emissions clarification – Do VOCs in baseline inventory for Oil Refineries include the Fluxsense results, which showed VOCs on average 6 times higher for Oil Refineries?</li> <li>Need Refinery benzene emissions clarification – Do benzene emissions page 10 of Source Attribution Chapter 3b include Fluxsense results, showing benzene on average 43 times higher than inventory, and other charts showing benzene? (What is the total for benzene on that page? Unclear from chart – appears to be 768 lbs/year – weighted by Air Toxics Risk for comparison to DPM (Diesel Particulate matter).</li> </ul>		23-2
Flares	<ul style="list-style-type: none"> <li>Plan includes new flaring notification improvements</li> <li>Goal to reduce flaring 50% (good, maybe can do better)</li> <li>District has offered to turn this into an emission reduction target (we are looking forward to this)</li> </ul>		23-3

From CBE 8/13/2019			
	<ul style="list-style-type: none"> <li>(CBE previously submitted more detailed comments.)</li> </ul>		23-3 Cont.
Refinery Boilers & Heaters	<ul style="list-style-type: none"> <li>Provide community with inventory of Refinery Boilers &amp; Heaters at each refinery, date built, date modified, pollution controls, CEMs, emissions, whether these are being evaluated for BARCT / BACT update</li> <li>Assessment of emissions reductions potential if all boilers &amp; heaters met BACT</li> <li>Currently is outside of AB617 plan – only referred to as RECLAIM replacement</li> <li>We have asked to go beyond RECLAIM replacement, since each refinery has dozens of these units which operate almost continuously, and many are old</li> <li>Need Commitment to regulation for additional tons per day of reductions beyond RECLAIM as part of AB617 plan, with Emission Reduction Target range</li> </ul>		23-4
FCC unit Wet Scrubbers	<ul style="list-style-type: none"> <li>FCCUs are major PM sources + other major pollutants.</li> <li>AQMD allowed Tesoro to voluntarily shut down old FCC &amp; use credits for most pollutants (except CO) to expand other parts of the refinery.</li> <li>AQMD inventory found Oil Refineries &amp; other industries largest source of PM2.5 in WCWLB, so FCCU updates are an obvious area for a regulation.</li> <li>CARB also direct BAAQMD to start a regulation this year.</li> <li>Need Commitment to regulation, and Emission Reduction Target range.</li> </ul>		23-5

From CBE 8/13/2019

Refinery Storage Tanks	<ul style="list-style-type: none"> <li>• Provide community with inventory of Refinery Storage Tanks for each refinery, volume, size, throughput, materials stored, type, those with domes, vapor controls, vapor pressure limits, heating, location, etc.</li> <li>• AQMD added to the plan that it will later consider updating the Storage Tank regulation</li> <li>• This is not a clear commitment – we ask for a clear commitment to tighten this regulation, especially since the Fluxsense study authors found Storage Tanks likely source for greatly increased VOCs &amp; benzene found</li> <li>• Need Emission Reduction Target range. May combine this measure with VOC leak detection target.</li> <li>• Also need clarification – Marathon claimed already offloading from ships faster, but we were told they have no Title V permit yet for new storage tanks.</li> </ul>	23-6
VOC Leak Detection	<ul style="list-style-type: none"> <li>• We request a report on the sources responsible for the added emissions found by the Fluxsense study of 6 times the VOCs &amp; 43 times the benzene on average for refineries. Identify failures of EPA Tanks Model to accurately identify emissions.</li> <li>• Fix emission inventory to reflect the increased emissions</li> <li>• Eliminate added emissions found by the Fluxsense study</li> <li>• Need Emission Reduction Target range. May combine this measure with VOC leak detection target.</li> </ul>	23-7
Crude Oil Characterization	<ul style="list-style-type: none"> <li>• Collect inventory of Crude Oils for refinery in District, including monthly volume, geographic origin, transport method (ship, pipeline, rail, truck), API gravity, sulfur percent, TAN, metals content, and other characteristics, including for both Domestic and Foreign crude oils.</li> <li>• District currently argues this information is confidential (we disagree), but at minimum, District can collect the data itself.</li> <li>• Begin by providing the public with monthly and annual total volumes and characteristics in aggregate.</li> </ul>	23-8
BARCT / BACT	<ul style="list-style-type: none"> <li>• Update from AQMD on progress on meeting BARCT by 2023, and which sources it considers highest priority under Cap &amp; Trade</li> </ul>	23-9
MHF	<ul style="list-style-type: none"> <li>• Phaseout MHF within 4 years</li> </ul>	23-10

From CBE 8/13/2019

	<ul style="list-style-type: none"> <li>Clarification - when will District publish a draftR regulation, as directed by the Board?</li> <li>Has District evaluated the community proposed MHF regulation which was based on the 1991 rule?</li> </ul>		23-10 Cont.
Stop Refinery Expansions	<ul style="list-style-type: none"> <li>Stop Oil Refineries expansions in WCWLB</li> </ul>		23-11
Long Term fossil fuel phaseout plan	<ul style="list-style-type: none"> <li>Acknowledge in the plan that it will be necessary in the long term to phase out fossil fuels, in order to eliminate local criteria and toxic emissions from oil refineries, drilling operations, and transportation source emissions in Wilmington / Carson / W. Long Beach</li> </ul>		23-12

+ Remove Methane exemption

#### Response to Comment 23-1

Chapter 5a now contains information about the CERP refinery emission reduction goals for the Wilmington, Carson, West Long Beach community by 2030, which are as follows:

Pollutant(s)	Minimum Emission Reduction Goal by 2030 (or earlier if feasible)*	Actions and Notes
NOx	50%	Reductions primarily from Rule 1109.1 amendments, but flaring reductions from 1118 will also contribute
VOCs (and associated air toxics such as benzene)	50%	Applies to fugitive emissions, flaring, and unidentified leaks. Baseline emissions to be assessed by advanced air monitoring techniques The progress identified as the ratio of these baseline measurements to future ones will use the same methods. Emission reductions will be achieved through amendments to Rules 1178, 1118, and/or 1173, including more rapid leak detection and response

Pollutant(s)	Minimum Emission Reduction Goal by 2030 (or earlier if feasible)*	Actions and Notes
		enabled by advanced air measurements
SOx	50%	Applies to flaring emissions (Rule 1118). SOx RECLAIM program re-assessment may also contribute to additional reductions

\*The NOx emission reduction goals are consistent with the estimated emission reductions from refinery facilities in the Wilmington, Carson, West Long Beach community based on the 2016 AQMP measure CMB-05. NOx, SOx and VOC emission reduction goals are subject to future assessments and regulatory analyses.

#### Response to Comment 23-2

Appendix 5b now contains emissions data for each refinery located in the Wilmington, Carson, West Long Beach community.

The current VOC and benzene inventories do not include the results from the Fluxsense study as these results are not sufficient to determine new inventories. However, in Response to Public Meeting Comment # 1-2, *Action 2* of Chapter 5b is to conduct refinery monitoring to identify and address VOC leaks. This action includes:

- Establishing a 2020 emissions baseline for fugitive VOCs from all refineries in the Wilmington, Carson, West Long Beach community, and
- Working with the CSC to perform an assessment to determine the feasibility of reducing fugitive VOC emissions from refineries below the 2020 baseline emission levels by 25% beginning in 2024, and 50% beginning in 2030

#### Response to Comment 23-3

Staff has included an emission reduction target for Action 3 of Chapter 5b. Staff has calculated that the proposed 50% emission reduction goal in NOx, SOx, and VOCs would equate to approximately 19 tpy, 11 tpy, and 1 tpy of emission reductions. These emission reduction goals are subject to future assessments and regulatory analyses. The South Coast AQMD will work with stakeholders to perform an assessment to determine the feasibility of reducing fugitive VOC emissions. The goal is a 50% reduction; however, actual reductions may be higher or lower depending on baseline emissions, pollution control technologies, early leak detection techniques using various technologies, and any other new or innovative approaches identified through the assessment process.

#### Response to Comment 23-4

The inventory of boilers and heaters is provided in Appendix 5b, for the refineries in the Wilmington, Carson, West Long Beach community. The appendix table includes information about the equipment size, CEMS, primary fuel type, NOx and PM emissions, NOx controls, and whether they are subject to BARCT. Action 5 of Chapter 5b adds rule development for Proposed Rule (PR) 1109.1 to the CERP. The NOx reductions from Chapter 5b, Action 5 includes the goal to achieve an overall 50% NOx emission reduction target (approximately 3 to 4 tons per day (tpd) or 1,095 to 1,460 tpy).

See Response to Comment 12-10 and 12-11.

Response to Comment 23-5

Please see Response to Public Meeting Comment # 1-2.

Response to Comment 23-6

Chapter 5b, Action 4 includes a commitment to evaluate the results of the air measurements conducted within Action 2 that includes evaluating the feasibility of improving leak detection and repair programs using Smart LDAR. Within this rule development process, staff will provide the CSC with an inventory of refinery storage tanks for each applicable refinery within the community and conduct mobile air monitoring and follow-up investigations to gather necessary data to determine any potential amendments to Rule 1178. Although the Fluxsense emissions information is not a currently acceptable method to use for enforcement actions, air monitoring data can support enforcement staff's efforts to identify sources of emissions for these types of equipment. Many of the emissions from refinery storage tanks would be fugitive emissions, for which we are unable to establish a baseline at this time. This measure seeks to reduce VOC emission reductions 25% by 2024 and 50% by 2030.

Response to Comment 23-7

Chapter 5b, Action 2 describes actions by the Fluxsense mobile unit to conduct measurements of refineries to identify potential sources. There is current no established methodology to adjust the emissions inventory. Staff, however, agrees that reducing fugitive VOC emissions from refineries is important. Therefore, Action 2 in Chapter 5b describes the actions that will be taken to establish a fugitive VOC baseline in 2020 using air monitoring and measurement data, and working to achieve a 50% reduction in VOC emissions from this baseline.

Response to Comment 23-8

Please see response to comment 12-13.

Response to Comment 23-9

Staff can provide an update on South Coast AQMD's progress on meeting BARCT. Staff will work with the CSC to determine how often the CSC would like to request BARCT updates from the South Coast AQMD. In addition, the South Coast AQMD does provide a quarterly report to its Stationary Source Committee on the status of NOx BARCT rules for the RECLAIM transition.

Response to Comment 23-10

Please see Response to Comment 8-14 and 18-3.

Response to Comment 23-11

Please see Response to Comment 12-14.

Response to Comment 23-12

Staff did not explicitly acknowledge that a phase out of fossil fuels would eliminate local criteria and toxic emissions, since some air pollutants, such as hexavalent chromium, are the result of production processes which could potentially continue even without the burning of fossil fuels. Staff's position is that a phase-out of fossil fuels needs to be coordinated with a number of state agencies, including the PUC, the CEC, and the ARB. Under both the Clean Air Act and state law, South Coast AQMD does not have jurisdiction over the composition of motor vehicle fuels and can take no action to phase out fossil fuel use in motor vehicles. Please see Response to Comment 12-5 regarding the request to phase out fossil fuels.

The South Coast AQMD does promote alternative cleaner technologies and is working on a number of advanced technology projects to move mobile sources towards zero and near zero emissions. These programs will help to reduce criteria pollutants and diesel particulate matter, which is a carcinogen.

### Comment Letter #24

#### CITY OF CARSON COMMENTS

#### COMMUNITY EMISSIONS REDUCTION PLAN (CERP)

<b>Executive Summary:</b>			
The City of Carson participates on the Wilmington, Carson, and West Long Beach (WCWLB) AB617 Community Steering Committee (CSC). The City of Carson has reviewed the draft CERP documents provided by SCAQMD and have submitted the following recommendations for consideration.			
1	Land use and transportation strategies	Implement land use strategies e.g. use setbacks, buffers (tree canopy), VMT to decrease air emissions and exposures to sensitive receptors	24-1
2	Consider adding these truck traffic locations to the priority areas that impact adjacent residential neighborhoods	Sepulveda Blvd./Alameda St.; Carson St. from Wilmington to Alameda St.; Del Amo Blvd. from Wilmington Ave to Alameda, Wilmington Ave from Del Amo to Lomita.	24-2
3	Tree planting	Partner with organizations and agencies to increase tree canopy in opportunity areas	24-3
4	Sound Wall	Partner with organizations and agencies to add and/or replace sound walls along truck traffic impacted corridors	24-4
	Infiltration Systems – School Districts	CERP provides vague strategy regarding collaborating with organizations/agencies and identifying a clear timetable to install filter within the community schools. Include metrics showing baseline and improvements.	24-5
5	Public Outreach: Reporting of technical analyses	Maintain an on-line presence that is written in layman's terms. We encourage information sharing that can be understood by the non-technical person.	24-6
6	CARB – Code Enforcement Effort	Collaborate with SCAQMD and City agencies to identify and regularly monitor truck traffic impacted areas. Compliance with idling and clean vehicle standards.	24-7
7	Targets – Clearly identify, provide measures and means	Clearly provide measurable targets and means. By 2025, X amount of emissions shall be reduced by doing...	24-8
8	Cleaner Technology	The CERP draft incentive actions need to become more robust and identify funding source(s). Research to find available clean technology and develop a plan to identify incentives that will be the fastest and result in the best benefits for sensitive receptors.	24-9

### Response to Comment Letter #24-1

Thank you for your suggestions. South Coast AQMD will identify local agencies with land use jurisdiction and support efforts to use setback, buffers, etc. to decrease sensitive receptors' exposure to harmful air pollutants.

### Response to Comment Letter #24-2

The locations listed by the commenter include Sepulveda Blvd./Alameda St.; Carson Street from Wilmington to Alameda Street; Del Amo Blvd. from Wilmington Ave to Alameda; and Wilmington Ave from Del Amo to Lomita, are incorporated in Chapter 5d, Action 1, specifically under "high traffic corridors on Wilmington Avenue" and "Alameda Corridor". The interactive air quality concerns map online will be updated with these locations and is available at: <https://scagmd->

[online.maps.arcgis.com/apps/MapJournal/index.html?appid=f4089b44d00a4ada806cfa62309ab98e](https://online.maps.arcgis.com/apps/MapJournal/index.html?appid=f4089b44d00a4ada806cfa62309ab98e). Chapter 5d, Action 1 that addresses idling trucks based on CSC input the following locations: high traffic corridors on Wilmington Avenue, Lomita Boulevard, Santa Fe Avenue, Figueroa Street, Pacific Coast Highway, Anaheim Street, Harry Bridges Boulevard, the Alameda corridor, and Lakme Avenue.

#### Response to Comment Letter #24-3

Chapter 5g, Action 4 commits the South Coast AQMD to identify new or existing sources that can provide funding for tree planting and other forms of green space expansions. Staff welcomes suggestions of specific organizations or agencies that can help with tree planting and other green space increase efforts.

#### Response to Comment Letter #24-4

Sound walls are typically the purview of Caltrans or the Los Angeles County Metropolitan Transportation Authority. South Coast AQMD recognizes the potential exposure reduction benefit of sound walls along truck corridors, and can work with agencies to provide data on locations within the community that have high truck pollution impacts. This action has been added to Chapter 5d, Action 2.

#### Response to Comment Letter #24-5

Chapter 5g, Action 2 addresses exposure reduction at schools through the installation of school filtration systems. Current schools with air filtration systems are listed in the section titled “Ongoing Efforts”. Table 5g-1 lists the schools in Wilmington, Carson, West Long Beach that have had air filtration systems installed through programs administered by the South Coast AQMD. Table 5g-2 lists the schools that have had air filtration systems installed through funding from the Port of Long Beach. Staff will provide updates to the CSC biannually on the number of school filtration systems that have been installed. Moreover, monitoring efforts conducted near or around the schools prioritized by the CSC will be another form of tracking progress.

#### Response to Comment Letter #24-6

Staff will continue efforts to ensure that data collection, data interpretation, and communication of results are clear, transparent, and understandable to public users. Staff will aim to continue to share data and information with the CSC in layman's terms. As an example, staff recently launched the AB 617 Community Air Monitoring website, which includes a Data Display tool to display community air monitoring data in an interactive and visual format.

#### Response to Comment Letter #24-7

Chapter 5d, Action 1 addresses truck idling emissions. South Coast AQMD commits to conducting focused enforcement for idling trucks in high traffic areas with the highest priority for areas near schools and residential areas. Chapter 5d, Action 2 commits the Cities in the Wilmington, Carson, West Long Beach communities to collaborate with South Coast AQMD to evaluate potential

designated truck routes and identify resources to enforce these routes. Furthermore, CARB commits to conducting enhanced roadside enforcement of existing Drayage Truck and Truck and Bus regulations. CARB will also be considering amendments to rules for heavy-duty trucks.

Response to Comment Letter #24-8

Chapter 5a has been updated to explicitly state the emissions reduction targets that the CERP will achieve by the year 2030. These include reductions of NOx, VOCs, SOx, and PM in tons per year.

Response to Comment Letter #24-9

This information will be provided in the annual progress reports, and also provided to the CSC as part of periodic updates. The South Coast AQMD is committed to identifying incentive programs that will result in much needed emission reductions sooner. South Coast AQMD staff expeditiously reviews applications and distributes incentive funds as quickly as possible.

## Comment Letter #25: Harvey Eder – Public Solar Power Coalition

### Response to Comment Letter #25-1

Comment Letter #25 consists of the 66 documents listed below. The majority of these documents are from the 2016 Air Quality Management Plan (AQMP), and associated comments and responses to those comments. Staff has already responded to those comments and do not have any additional information to supplement those responses.

Additional documents that have been submitted are of the nature of news articles about “superbugs” and solar energy, reports from other government agencies on alternative energy sources, and other documents related to alternative energy. The documents did not include any comments regarding the CERP.

Staff appreciates the commenter’s concerns regarding drug-resistant bacteria and the desire to expand the use of alternative energy sources. Based on the input from the CSC and community, these topics were not within the top air quality priorities for the community as a whole, and therefore are not addressed in the CERP.

The files attached to Comment Letter #25 are listed below:

**ATTACHMENT C**  
**RESOLUTION NO. 19-\_\_\_\_\_**

**A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) determining that the Community Emissions Reduction Plan for the Wilmington, Carson, West Long Beach community (WCWLB CERP) is exempt from the requirements of the California Environmental Quality Act (CEQA).**

**A Resolution of the South Coast AQMD Governing Board Adopting the Community Emissions Reduction Plan for the Wilmington, Carson, West Long Beach community.**

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the WCWLB CERP is considered a “project” pursuant to CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and

**WHEREAS**, the South Coast AQMD has had its regulatory program certified pursuant to Public Resources Code Section 21080.5 and CEQA Guidelines Section 15251(l), and has conducted a CEQA review and analysis of the proposed project pursuant to such program (South Coast AQMD Rule 110); and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines after conducting a review of the proposed project in accordance with CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA, and CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA, that the proposed project is determined to be exempt from CEQA; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that it can be seen with certainty that there is no possibility that the proposed project may have any significant effects on the environment, and is therefore, exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project is also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment, because the proposed project is designed to further protect or enhance the environment; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project contains action items which qualify as feasibility or planning studies which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project may result in some minor physical modifications to existing structures or buildings, such as installing air filters or monitoring equipment, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project involves the collection or exchange of information or data obtained from inspections and air monitoring, which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project also involves inspections that require performance or compliance checks which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections; and

**WHEREAS**, the South Coast AQMD Governing Board finds and determines that the proposed project relies on enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies; and

**WHEREAS**, the South Coast AQMD Governing Board has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions; and

**WHEREAS**, the South Coast AQMD staff has prepared a Notice of Exemption for the proposed project that is completed in compliance with CEQA Guidelines Section 15062 – Notice of Exemption; and

**WHEREAS**, the WCWLB CERP, and other supporting documentation, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, as well as has taken and considered staff testimony and public comment prior to approving the project; and

**WHEREAS**, Assembly Bill (AB) 617 directs the California Air Resources Board (CARB) to select locations around the state for preparation of community emissions reduction programs; and

**WHEREAS**, in 2018, the South Coast AQMD Governing Board recommended communities to CARB for the AB 617 program; and

**WHEREAS**, in 2018, CARB selected the community of Wilmington, Carson, West Long Beach as one of the communities for which a Community Emissions Reduction Plan shall be prepared; and

**WHEREAS**, the AB 617 statute specifies that the air district must adopt the Community Emissions Reduction Plan within one year of the state board's selection of the community; and

**WHEREAS**, the WCWLB CERP is a planning document designed to assist future regulatory programs and rule development efforts, and to reduce emissions of and exposure to air toxics and other pollutants; and

**WHEREAS**, the WCWLB CERP is required by AB 617 and it builds upon existing criteria pollutant and air toxic programs, with greater emphasis on cumulative and localized impacts, and

**WHEREAS**, although the results of MATES IV show regional reductions in health risk from exposure to toxic air contaminants, some communities such as Wilmington, Carson, West Long Beach are disproportionately impacted by air toxics, and other environmental pollution, as well as social and economic burdens; and

**WHEREAS**, the Wilmington, Carson, West Long Beach Community Steering Committee has worked with staff to develop the Community Emissions Reduction Plan to reflect the community's air quality priorities and strategies to address these priorities; and

**WHEREAS**, the Community Emissions Reduction Plan aims to reduce air toxics and other pollutants in the Wilmington, Carson, West Long Beach community.

**NOW, THEREFORE BE IT RESOLVED**, that the South Coast AQMD Governing Board does hereby determine, pursuant to the authority granted by law, that the WCWLB CERP is exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, the WCWLB CERP contains action items which are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies. The proposed project contains action items that are also categorically exempt from CEQA pursuant to, CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures, CEQA Guidelines Section 15306 – Information Collection, CEQA Guidelines Section 15308 – Actions by

Regulatory Agencies for Protection of the Environment, CEQA Guidelines Section 15309 – Inspections, and CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies. No exceptions to the application of the categorical exemptions set forth in CEQA Guidelines Section 15300.2 – Exceptions, apply to the proposed project. This information was presented to the South Coast AQMD Governing Board, whose members reviewed, considered and approved the information therein prior to acting on the proposed project; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing finds that the WCWLB CERP meets the requirements of AB 617 and will advance the mission of cleaning the air at a community scale in the Wilmington, Carson, West Long Beach community and will provide emission reduction co-benefits toward achieving state and national air quality standards; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board does hereby approve the WCWLB CERP; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board directs staff to periodically report to the Stationary Source Committee on the implementation of the WCWLB CERP, including updates on the actions within the plan and the emissions reductions achieved; and

**BE IT FURTHER RESOLVED**, that the South Coast AQMD Governing Board authorizes staff to make any necessary, non-substantive edits which do not have any material impact on the environment to the WCWLB CERP prior to submission to CARB for approval; and

**BE IT RESOLVED**, that the South Coast AQMD Governing Board adopts the WCWLB CERP, dated September 2019.

Denise Garzaro, Clerk of the Boards

## NOTICE OF EXEMPTION FROM THE CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

---

**To:** County Clerks  
Counties of Los Angeles, Orange,  
Riverside, and San Bernardino

**From:** South Coast Air Quality Management District  
21865 Copley Drive  
Diamond Bar, CA 91765

---

**Project Title:** Community Emissions Reduction Plan for the Wilmington, Carson, and West Long Beach Community per Assembly Bill 617

---

**Project Location:** The project is located at the following community within the South Coast Air Quality Management District (South Coast AQMD) jurisdiction: the neighborhood of Wilmington within the City of Los Angeles, the City of Carson, and the neighborhood of West Long Beach within the City of Long Beach referred to herein as Wilmington, Carson, and West Long Beach (WCWLB) in Los Angeles County.

---

**Description of Nature, Purpose, and Beneficiaries of Project:** In accordance with Assembly Bill (AB) 617, which was signed into state law in 2017, and the California Air Resources Board's (CARB) Community Air Protection Program which implements AB 617, the South Coast AQMD is required to take specific actions to reduce air pollution and toxic air contaminants from commercial and industrial sources to address the disproportionate impacts of air pollution in environmental justice communities. Implementation of the specific actions is expected to occur over several years, and AB 617 specifies that the highest priority areas shall be disadvantaged communities with a high cumulative exposure burden for criteria pollutants and toxic air contaminants. After conducting extensive public outreach and data analysis, South Coast AQMD staff identified WCWLB as one of three communities qualifying as a high priority area for where the first efforts to implement community monitoring and emission reduction plans pursuant to AB 617 will occur. The purpose of this project is to implement a Community Emissions Reduction Plan (CERP) for the WCWLB community per AB 617. The beneficiary of the project is the identified community and the nearby areas, but the entire region within South Coast AQMD's jurisdiction will also benefit. The CERP contains the following action items which have been tailored for the WCWLB community's identified air quality concerns as they relate to:

Refineries (including flaring and the public notification process, refinery equipment, and storage tanks/refinery leaks): 1) implement a notification system for flaring events and providing real-time flaring information; 2) collaborate with Los Angeles County and City of Long Beach Departments of Public Health and schools to develop notification language and outreach materials for the public relative to refinery flaring; 3) continue the ongoing rule development and implementation of Best Available Retrofit Control Technology (BARCT) pursuant to South Coast AQMD Rule 1109.1 – Refinery Equipment; 4) continue the ongoing rule development and implementation of South Coast AQMD Rule 1178 – Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities; and 5) conduct mobile monitoring in and around refineries and follow-up with enforcement where needed.

Ports: 1) monitor oil tankers at-berth using forward-looking infrared (FLIR) camera and following up with enforcement where needed; 2) support rule development of CARB's proposed At-Berth Regulation; 3) collaborate on the enforcement of CARB's Drayage Truck Regulation; 4) continue the ongoing development of Facility-Based Mobile Source Measures (e.g., Indirect Source Rule) for ports; and 5) incentive the acceleration of cleaner ships and harbor craft.

Trucks: 1) implement targeted enforcement sweeps for idling trucks with priority given to sweeps near schools; and 2) incentivize the accelerated deployment of cleaner trucks.

Oil Drilling and Production Wells (including leaks and odors): 1) conduct monitoring efforts around oil drilling activities, including fenceline monitoring and other potential approaches such as optical remote sensing; 2) use monitoring data to prioritize inspections for leaks in active and abandoned oil wells; 3) amend notification requirements for the oil and gas industry through South Coast AQMD rule development, if needed (e.g., Rule 1148.1 – Oil and Gas Production Wells, and Rule 1148.2 – Notification and Reporting Requirements for Oil and Gas Wells and Chemical Suppliers); and 4) collaborate with the Los Angeles County Department of Public Health and schools on notifications and outreach materials about chemicals, toxicity, health effects and recommendations related to oil drilling activities.

---

**Rail:** 1) continue the ongoing development of Facility-Based Mobile Source Measures (e.g., Indirect Source Rule) for rail; and 2) support CARB's petition to the United States Environmental Protection Agency for new national locomotive emission standards.

**Schools:** 1) install school air filtration systems; 2) collaborate with the Los Angeles County Department of Public Health, the City of Long Beach Department of Public Health and other agencies on air quality advisories and/or asthma related programs; and 3) bring Environmental Justice Community Partnership, Clean Air Ranger Education, and Kids Making Sense programs to schools.

---

**Public Agency Approving Project:**

South Coast Air Quality Management District

**Agency Carrying Out Project:**

South Coast Air Quality Management District

---

**Exempt Status:**

CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption

CEQA Guidelines Section 15262 – Feasibility and Planning Studies

CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures

CEQA Guidelines Section 15306 – Information Collection

CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment

CEQA Guidelines Section 15309 – Inspections

CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies

---

**Reasons why project is exempt:** In accordance with the California Environmental Quality Act (CEQA), South Coast AQMD staff has reviewed the proposed project pursuant to: 1) CEQA Guidelines Section 15002(k) – General Concepts, the three-step process for deciding which document to prepare for a project subject to CEQA; and 2) CEQA Guidelines Section 15061 – Review for Exemption, procedures for determining if a project is exempt from CEQA. Because the physical changes that may occur as a result of implementing portions of the proposed project would only require minimal construction activities and cause negligible physical impacts, South Coast AQMD staff has determined that it can be seen with certainty that there is no possibility that any physical actions that may be associated with the proposed project may have a significant adverse effect on the environment. Therefore, the project is considered to be exempt from CEQA pursuant to CEQA Guidelines Section 15061(b)(3) – Common Sense Exemption. Further, because the overall purpose of this project is to improve the environment of the WCWL community and nearby areas, and all of the action items within the WCWL CERP support this goal, the action items are also categorically exempt from CEQA pursuant to CEQA Guidelines Section 15308 – Actions by Regulatory Agencies for Protection of the Environment.

The WCWL CERP contains elements that qualify as feasibility and planning studies, because the collection of information is needed in order to make an informed decision about whether to take further action (e.g., future rule development). However, the portions of the WCWL CERP that qualify as feasibility and planning studies do not prescribe or commit to specific details about the future actions that may occur, nor have the future actions been approved or adopted in advance, because they require an open public process. Specifically, after the portions that qualify as feasibility or planning studies are completed, and if they result in a decision to go forward with future rule development, the regulated community, stakeholders, interested parties, and the public will be invited to participate in the rule development process in a public forum. For these reasons, the following action items for the WCWL CERP are statutorily exempt from CEQA pursuant to CEQA Guidelines Section 15262 – Feasibility and Planning Studies:

- Continuing the ongoing rule development and implementation of BARCT per South Coast AQMD Rule 1109.1 – Refinery Equipment;
  - Continuing the ongoing rule development and implementation of South Coast AQMD Rule 1178 – Further Reductions of VOC Emissions from Storage Tanks at Petroleum Facilities;
  - Continuing the ongoing development of Facility-Based Mobile Source Measures (e.g., Indirect Source Rule) for ports;
  - Continuing ongoing development of Facility-Based Mobile Source Measures (e.g., Indirect Source Rule) for rail; and
  - Amending notification requirements through rule development if needed (e.g., Rules 1148.1 and 1148.2).
-

The following action items within the WCWL CERP involve minor physical modifications to existing structures or buildings which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15303 – New Construction or Conversion of Small Structures:

- Installing school air filtration systems;
- Conducting monitoring around oil drilling activities (including fenceline monitoring and other approaches).

The following action items within the WCWL CERP involve information collection activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15306 – Information Collection:

- Conducting mobile monitoring in and around refineries;
- Conducting monitoring around oil drilling activities (including fenceline monitoring and other approaches);
- Using monitoring data to prioritize inspections for leaks in active and abandoned oil wells;
- Collaborating with the Los Angeles County Department of Public Health and schools to obtain and distribute information on notifications and outreach materials about chemicals, toxicity, health effects and recommendations related to oil drilling activities; and
- Collaborating with the Los Angeles County Department of Public Health, the City of Long Beach Department of Public Health and other agencies to obtain and distribute information on air quality advisories and/or asthma related programs.

The following action items within the WCWL CERP involve inspection activities that check for performance or compliance are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15309 – Inspections:

- Based on the results of mobile monitoring in and around refineries, follow-up with inspections where needed;
- Monitoring oil tankers at-berth using FLIR camera and follow-up with enforcement where needed;
- Implementing targeted enforcement sweeps for idling with priority given to sweeps near schools; and
- Conducting monitoring efforts around oil drilling activities (including fenceline monitoring and other approaches).

The following action items within the WCWL CERP involve enforcement activities which are categorically exempt from CEQA pursuant to CEQA Guidelines Section 15321 – Enforcement Actions by Regulatory Agencies:

- Based on the results of mobile monitoring and inspections at refineries, follow-up with enforcement where needed;
- Monitoring oil tankers at-berth using FLIR camera and follow-up with enforcement where needed; and
- Implementing targeted enforcement sweeps for truck idling with priority given to sweeps near schools all potentially involve enforcement of South Coast AQMD regulations or regulations by other regulatory agencies such as CARB.

Further, South Coast AQMD staff has determined that there is no substantial evidence indicating that any of the exceptions to the categorical exemptions apply to the proposed project pursuant to CEQA Guidelines Section 15300.2 – Exceptions. Therefore, the proposed project is exempt from CEQA.

#### **Date of Project Approval:**

# AB 617 Community Emissions Reduction Plan for Wilmington, Carson, West Long Beach

---

GOVERNING BOARD MEETING

SEPTEMBER 6, 2019

# AB 617 Year 1 Communities

September 2018, CARB designated:

- San Bernardino, Muscoy
- East Los Angeles, Boyle Heights, West Commerce
- Wilmington, Carson, West Long Beach

Extensive Community Outreach:

- 3 Community Steering Committees (CSCs)
- 27 CSC meetings
- 60 + individual meetings
- 2 community bus tours
- 3 Technical Advisory Group meetings
- 6 community workshops

# Community Steering Committee

- ❖ Community cohosts
- ❖ Committee member presentations
- ❖ Community testimonials

# Community-Driven Efforts to Develop the CERPs

## CERP Development

AQ  
Priorities

Strategies  
& Metrics

Actions &  
Steps

## CERP Action

- 49 actions (approx. 160 steps) across the 3 CERPs
- 28 are emission reduction actions
- Each action includes:
  - Suite of strategies
  - Steps
  - Timeline/milestones
  - Metrics to track progress
  - Collaborating entities

- Plans are flexible to adapt to new information

# New Efforts and Approaches in the CERPs

## Rules and Regulations

- 7 new South Coast AQMD rule efforts
- 8 regulations to be considered by CARB
- Increased engagement and ISR efforts (e.g. Working Group meetings in communities)

## Collaboration

- Community-led monitoring
- Agency collaborations on permit cross-checks, trucking regulations, public communication

## Enforcement

- Focus on areas identified by the communities
- Improved communication for complaint response

## Public Information and Outreach

- Small business outreach to increase compliance
- School-based programs

## Incentives

- Focused efforts to generate incentive proposals in these communities
- Use technology to identify older trucks for incentive programs (e.g. ALPR)

## Air Monitoring

- Advanced monitoring technologies to provide new, purposeful data
- Data will inform compliance efforts and provide public information

# Air Quality Priorities

## Wilmington, Carson, West Long Beach Community

**Ports**

**Neighborhood Truck  
Traffic**

**Railyards**

**Refineries**

**Oil Drilling and  
Production**

**Schools, Childcare  
Centers, Homes**

# Actions to Reduce Mobile Source Emissions

## Wilmington, Carson, West Long Beach Community

**Ports**

- Oil tanker VOC leak surveillance
- Incentives for cleaner ships and harbor craft
- Rule development/MOU: Ports MOU, Rule 1142, CARB At-Berth, CARB Commercial Harbor Craft

**Neighborhood Truck Traffic**

- Truck idling sweeps & inspections
- Incentives & outreach for cleaner heavy-duty trucks
- Work with cities on truck routes and enforcement
- Rule development: CARB Advanced Clean Truck, Heavy-Duty Low NOx, Heavy-Duty Vehicle Inspection & Maintenance

**Railyards**

- Work with CARB to develop new requirements to reduce railyard emissions
- Incentives for cleaner equipment
- Rule development: Railyard ISR

# Mobile Source Emission Reduction Targets

## Wilmington, Carson, West Long Beach Community

Mobile Source Measure	Timeline	Regulatory Entity	Emission Reductions Targets (tpy) by 2029		
			NOx	VOC	DPM
Shore Power for Ocean-going Vessels At-Berth	2019	CARB	1,268	62	19
Heavy-Duty Vehicle Inspection and Maintenance	2020	CARB	153	N/A	1.3
Advanced Clean Trucks Regulation	2019	CARB	10.1	N/A	0.3
Heavy-Duty Low NOx Rule	2020	CARB	246	N/A	N/A
Mobile Source Incentives resulting from the CERP Actions	2020	South Coast AQMD	40-50	N/A	0.5-0.6

Timeline based on first CARB Board hearing dates for each measure or beginning of implementation for mobile source incentives

tpy = Tons per year

# Mobile Source Emission Reduction Targets

## Wilmington, Carson, West Long Beach Community

BASELINE MOBILE SOURCE DPM EMISSIONS

WITH CERP (SOUTH COAST AQMD AND CARB ACTIONS)

CERP Reductions in 2024 and 2029:

# Actions to Reduce Stationary Source Emissions

## Wilmington, Carson, West Long Beach Community

**Refineries**

- Mobile measurements to screen all refineries
- VOC leak detection & repair
- Refinery flaring notifications
- Rule development: Rules 1118, 1178, and 1109.1

Refineries

**Oil Drilling and Production**

- Mobile measurements to screen all wells, collaborate with organizations
- Leak detection and repair
- Oil well notifications

AGENDA NO. 26

**PROPOSAL:** Receive and File 2018 Annual Report on AB 2588 Program and Approve Updates to Facility Prioritization Procedure

**SYNOPSIS:** The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) requires local air pollution control districts to prepare an annual report. The report provides the public with information regarding South Coast AQMD programs to reduce emissions of toxic air contaminants. This annual update describes the various activities in 2018 to satisfy the requirements of AB 2588 and Rule 1402, such as quadrennial emissions reporting and prioritization, the preparation and review of Air Toxics Inventory Reports, Health Risk Assessments, Voluntary Risk Reduction Plans, Risk Reduction Plans, and additional South Coast AQMD activities related to air toxics. Staff is also proposing revisions to the Facility Prioritization Procedure to correct minor transcription errors. These actions are to receive and file the 2018 Annual Report on the AB 2588 Air Toxics "Hot Spots" Program and approve revisions to the Facility Prioritization Procedure.

**COMMITTEE:** No Committee Review

**RECOMMENDED ACTIONS:**

1. Receive and File 2018 Annual Report on the AB 2588 Program.
2. Approve Updates to Facility Prioritization Procedure.

Wayne Natri  
Executive Officer

## **Introduction**

The California Air Toxics “Hot Spots” Information and Assessment Act (AB 2588) enacted in 1987, is a statewide program implemented by local air districts to address health risks from air emissions associated with existing permitted facilities. One of the main goals of AB 2588 is to provide the public with information regarding potential health effects from toxic air contaminants emitted from existing facilities, and to develop plans to reduce associated risks. The South Coast AQMD implements AB 2588 requirements through Rule 1402 – Control of Toxic Air Contaminants from Existing Sources, which includes additional requirements beyond the state law, including a program to encourage facilities to voluntarily reduce risk, and to compel high risk facilities to reduce toxic emissions much more quickly than previously required.

The AB 2588 Program as implemented under Rule 1402 is only one part of South Coast AQMD’s comprehensive program in regulating air toxics. Other elements include South Coast AQMD’s permitting program and Rule 1401 – New Source Review of Toxic Air Contaminants requirements, rules adopted to address air toxic emissions from certain equipment and processes, enforcement efforts to ensure facilities comply with all applicable air quality requirements, and the Multiple Air Toxics Emissions Study, a study measuring the amount of regional toxic air contaminants and their risks throughout the air basin. Additionally, within the past five years, South Coast AQMD has performed ambient air monitoring in many neighborhoods and found high levels of air toxics. This monitoring has helped to identify high risk facilities, which have then been required to implement risk reduction measures under Rule 1402. Additional reductions have occurred through voluntary measures, enforcement actions, Orders for Abatement, and rule development.

As required under the California Health and Safety Code Section 44363, staff has prepared the “2018 Annual Report on the AB 2588 Program.” This annual report summarizes South Coast AQMD’s air toxics program activities in 2018, including AB 2588 activities and other air toxic related programs as explained below. The annual report will be available on South Coast AQMD’s website and distributed to county boards of supervisors, city councils, and local health officers.

## **Background**

The AB 2588 Program, combined with implementation of Rule 1402, includes requirements for toxic emissions inventories, categorizing and prioritizing facilities, and reviewing and approving detailed Air Toxic Inventory Reports (ATIRs), Health Risk Assessments (HRAs), public notifications, Voluntary Risk Reduction Plans (VRRPs) and Risk Reduction Plans (RRPs).

There are two broad classes of facilities within the AB 2588 Program: larger facilities (core facilities) are subject to individual reporting requirements while facilities that are generally small businesses are in the industrywide source categories and have fewer requirements under the AB 2588 Program than core facilities. Industry-wide source

category facilities are generally small businesses with relatively similar emission profiles (such as gas stations and auto-body shops). Some industry-wide categories have requirements in source-specific rules to address toxic air contaminants.

Larger facilities (core facilities) are required to report their air toxic emissions to South Coast AQMD, such as hexavalent chromium, nickel, benzene, formaldehyde, and diesel particulate matter (DPM), every four years through the web-based Annual Emissions Reporting (AER) Program. This quadrennial emissions reporting is staggered so that not all facilities report their toxics emissions at the same time. Of the 469 facilities in South Coast AQMD's core AB 2588 Program, 259 facilities were required to submit their reports in 2018 for reporting year 2017. Additionally, on October 7, 2016, Rule 1402 was amended to add requirements for Potentially High Risk Level facilities. Potentially High Risk Level facilities are facilities that South Coast AQMD staff believes may pose significant health risk to the local community. Potentially High Risk facilities must implement Early Action Reduction Plans to immediately reduce risk and to submit ATIRs, HRAs and RRP's under expedited timelines. So far, three facilities in Paramount (Anaplex Corp, Aerocraft Inc. and Lubeco Inc.) have been designated as Potentially High Risk Level facilities under Rule 1402.

The AB 2588 Program requires air districts to categorize each facility using the reported emissions as either high, intermediate, or low priority to determine if a facility needs to conduct a Health Risk Assessment (HRA). Once a facility is designated as high priority, they may be required to submit a Health Risk Assessment to assess the risk to their surrounding community. From the beginning of the AB 2588 Program in 1987 through the end of 2018, staff has reviewed and approved 344 HRAs from 337 facilities. Of these, 59 facilities were required to perform public notification activities and 27 facilities were required to implement risk reduction measures.

### **2018 Accomplishments**

The attached report summarizes staff activities in 2018 for the AB 2588 Program, implementation of Rule 1402, air toxic monitoring performed in conjunction with the AB 2588 Program and Rule 1402, analysis of toxic program impacts from the addition of new or revised health risk values for air toxics, and future activities.

### **Summary of Activities for Specific AB 2588 Program Facilities**

In 2018, staff initiated audit activities of quadrennial reports for 140 facilities with priority scores greater than 10 and reviewed a variety of work products submitted by 37 different facilities as a requirement of the AB 2588 Program. Key activities conducted include review of 24 Air Toxics Inventory Reports, 17 Health Risk Assessments, five Risk Reduction Plans, one Early Action Reduction Plan, seven Voluntary Risk Reduction Plans, and two revised priority scores. Many of these key activities were for facilities that tend to have more sources and are more complex, such as refineries and other larger industrial facilities. Overall, a total of 196 documents were reviewed in 2018 for the 20 facilities that were subject to AB 2588 review. Table 1 lists the facilities

that submitted these documents. The attached Annual Report provides detailed information regarding the AB 2588 Program activities at each facility.

**Table 1 – AB 2588 Program Facilities in 2018**

### **Air Monitoring and Source Testing Activities to Support the AB 2588 Program**

Based on monitoring for hexavalent chromium in Paramount, three facilities were designated as Potentially High Risk Level Facilities in 2016 and 2017. Highly elevated levels were found initially and additional efforts were conducted to identify and address sources of hexavalent chromium that were impacting nearby communities. As a result, several facilities made a range of improvements, some voluntary and some through rule changes and enforcement actions. South Coast AQMD's ongoing air monitoring results indicate substantial progress in reducing ambient levels of hexavalent chromium as a result of these actions. As a result, South Coast AQMD is updating its air monitoring efforts in Paramount to focus on conducting studies to evaluate other potential sources of hexavalent chromium and also monitoring other areas that may have higher potential for air toxics exposure.

In July 2018, staff began special air monitoring in the city of Compton to measure levels of hexavalent chromium near several metal-processing facilities in the community, with an emphasis on hexavalent chromium plating and anodizing plants due to their close proximity to each other and to sensitive receptors. Staff is investigating sources and will continue the effort to reduce emissions from these sources to a level that does not pose an immediate threat to public health.

### **Assembly Bill 617 (AB 617)**

AB 617 was passed by the California legislature in 2017 and focuses on improving air quality and public health in environmental justice communities. This law first allows local residents to provide recommendations for the selection of the environmental justice communities. South Coast AQMD will use updated data to assess the communities most affected, to identify key sources of pollution and develop targeted emissions reduction plans to reduce community exposures to air pollution. A small number of communities have been selected for the first year and other communities will be added over time.

For each selected community, South Coast AQMD will work with local stakeholders to evaluate their greatest air pollution concerns. Depending on the needs of each community, South Coast AQMD may conduct targeted community air monitoring and develop a tailored community air plan. South Coast AQMD will work with CARB, other agencies, and all stakeholders to implement these community air plans to reduce local air pollution emissions and benefit public health. In September 2018, CARB approved three communities in our region for the first year of this program:

- Wilmington, Carson, West Long Beach
- East Los Angeles, Boyle Heights, West Commerce
- San Bernardino, Muscoy

South Coast AQMD has convened a Community Steering Committee in each of the three communities with the purpose of identifying specific community air quality concerns, discussing resolutions, and developing recommendations for improving the local air

quality. These committees work closely with South Coast AQMD and CARB to discuss emissions reductions targets and strategies to inform a tailored community air plan that addresses the community's highest priority concerns. South Coast AQMD will deploy systems to monitor air quality in selected communities where this information is most needed. The analysis of the data collected will inform future community emissions reduction plans and will be used to track progress. This information will also be shared with the public and CARB.

### **HRA Modeling Projects**

In 2018, staff supported permitting and enforcement activities by reviewing air dispersion modeling to determine compliance with Rules 1420.2 – Emission Standards for Lead from Metal Melting Finishing, and 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants.

Rule 1420.2 establishes standards for lead emissions from metal melting facilities. Air dispersion modeling is used to identify the appropriate location for placement of ambient air monitors. In 2018, staff reviewed compliance plans with air dispersion modeling for four facilities under this rule: two involve siting of ambient air monitors, and two for relief from future monitoring requirements.

Rule 1466 establishes limits for particulate matter emissions from soils with toxic air contaminants. In 2018, staff reviewed requests from two facilities requesting an alternate limit for particulate matter emissions under this rule. Staff reviewed these requests to ensure the alternate limit remains health protective to the public.

### **Rules Adopted or Amended in 2018**

On November 2, 2018, Rule 1469 - Hexavalent Chromium Emissions from Chromium Electroplating and Chromic Acid Anodizing Operations was amended to further reduce emissions of hexavalent chromium from tanks that were not previously regulated.

### **Program Impacts from New or Revised Health Risk Values for Air Toxics**

OEHHA adopted risk values for two toxic air contaminants in 2018. A chronic risk value was adopted for ethylene glycol mono-n-butyl ether (EGBE); at the same time, the acute risk value was revised to a lower value. Cancer risk values were also adopted for tert-butyl acetate (TBAC). In reviewing 2017 reporting data, 13 facilities reported emissions of EGBE. Facilities are currently not required to report TBAC. However, facilities required to submit inventory reports under Rule 1402 will be required to report TBAC emissions beginning in 2019.

### **Future Activities**

In addition to the routine AB 2588 Program implementation activities, staff plans to:

- Audit quadrennial emissions inventories for approximately 70 facilities;
- Track development of potential REL revisions by OEHHA;
- Notify seven asphalt aggregate plants to prepare ATIRs or VRRPs if warranted;

- Continue to provide support to rulemaking staff;
- Work with CARB and through the CAPCOA Toxics and Risk Managers Committee (TARMAC) to update CARB Emission Inventory Guidelines, including review of draft list of chemicals;
- Continue to work with CARB and through the TARMAC to develop HRA guidelines for the industry-wide categories of gasoline dispensing facilities, autobody shops, and diesel internal combustion engines, and to provide training to district staff and the regulated community; and
- Train new staff on the expanded emissions reporting under amended Rule 301 and upcoming AB 617.

### **Updates to the Facility Prioritization Procedure**

In June 2016, the Board adopted revisions to the Facility Prioritization Procedure in conjunction with amendments to Rule 1402 that incorporated the 2015 OEHHA Risk Assessment Guidelines update.

In September 2018, the Board adopted revisions to update the Facility Prioritization Procedure to incorporate the most current meteorological dataset (Version 9) and adjusting the calculation of the non-cancer acute score to account for short-term exposure at the facility fenceline. Staff has updated the Facility Prioritization Procedure to correct minor transcription errors from the September 2018 version.

## Executive Summary

The California Air Toxics “Hot Spots” Information and Assessment Act (AB 2588) was enacted in 1987. It is a key statewide program implemented by local air districts to address health risks from air emissions associated with existing permitted facilities. One of the main goals of AB 2588 is to provide the public with information regarding potential health effects from toxic air contaminants emitted from existing permitted facilities, and to develop plans to reduce associated risks. The South Coast Air Quality Management District (South Coast AQMD) implements AB 2588 requirements through Rule 1402, which includes additional requirements beyond the state law, including a program to encourage facilities to voluntarily reduce risk, and to compel high risk facilities to reduce toxic emissions much more quickly than previously required.

The AB 2588 Program as implemented under Rule 1402 is only one part of South Coast AQMD’s comprehensive program in regulating air toxics. Other elements include South Coast AQMD’s permitting program and Rule 1401 requirements, enforcement efforts to ensure facilities comply with all applicable air quality requirements, and the Multiple Air Toxics Emissions Study, a study measuring the amount of regional toxic air contaminants and their risks throughout the air basin. Additionally, within the past five years, South Coast AQMD has performed ambient air monitoring in many neighborhoods and found high levels of air toxic contaminants. This monitoring has helped to identify high risk facilities, thereby requiring them to implement risk reduction measures under Rule 1402. Monitoring will also be an important component for implementation of the AB 617 program that targets air pollution reductions in environmental justice communities.

Under state law, the South Coast AQMD is required to prepare an Annual Report of activities. This report fulfills that requirement and describes the South Coast AQMD’s ongoing efforts to regulate and reduce air toxic emissions.

The following summaries highlight key AB 2588 activities in 2018:

<b>AB 2588 and Rule 1402 Implementation Activities</b>	Prioritized 259 facilities based on their quadrennial toxic emission inventory updates
	Initiated 140 audits based on prioritization scores
	Reviewed 24 ATIRs, 17 HRAs, 5 RRP, 1 Early Action Reduction Plan, and 7 VRRPs, and 2 revised priority scores from 37 facilities
<b>Streamlining and Program Improvement Activities</b>	Updated AB 2588 Facility Prioritization Procedures
	Updated AB 2588 Supplemental Guidelines
	Updated AB 2588 Voluntary Risk Reduction Plan Guidelines
	Provided support to rulemaking and AB 617 staff
	Provided support in implementation of Rules 1420.2 and 1466

## California's Air Toxics "Hot Spots" Program

### Background

In 1987, the California legislature adopted the Air Toxics "Hot Spots" Information and Assessment Act. The "Hot Spots Act" was proposed under Assembly Bill 2588 and therefore is commonly referred to as AB 2588. Since exposure to toxic air contaminants may produce various adverse health impacts, AB 2588 incorporated certain goals such as to collect emissions data of toxic air contaminants from stationary sources, identify facilities having localized impacts, determine health risks, and notify affected individuals. The California Air Resources Board (CARB) has developed the AB 2588 Program requirements of the "Hot Spots" Act; however, local air districts are required to implement and enforce the requirements. This chapter describes the state requirements of the AB 2588 Program.

### Emissions Reporting

Facilities are subject to AB 2588 reporting requirements if they emit any toxic air contaminants listed by CARB in the *Emission Inventory Criteria and Guidelines for the Air Toxics "Hot Spots" Program* (CARB Emission Inventory Guidelines).<sup>1</sup> Under the AB 2588 Program, larger facilities (core facilities) are subject to individual reporting requirements while facilities that are generally small businesses are in the industrywide source (IWS) categories, which are described later in this chapter. CARB Emission Inventory Guidelines provides both criteria and direction for facilities to compile and submit air toxic emission data. The requirements within the CARB Emission Inventory Guidelines have been incorporated by reference into title 17 of the California Code of Regulations and thus are enforceable.

### Prioritization

Core facilities in the AB 2588 Program submit an air toxics inventory once every four years. The AB 2588 Program requires air districts to categorize each facility using the reported emissions as either high, intermediate, or low priority to determine if a facility needs to conduct a Health Risk Assessment (HRA) and to determine appropriate program fees. Guidance to prioritize facilities was provided at the state level in the *Facility Prioritization Guidelines*, August 2016, Air Toxics and Risk Managers Committee of the California Air Pollution Control Officers Association (CAPCOA Prioritization Guidelines).<sup>2</sup>

The CAPCOA Prioritization Guidelines presents two procedures for prioritizing facilities. The emission and potency procedure relies on three parameters to prioritize facilities: emissions, potency or toxicity, and the proximity of potential receptors; the dispersion adjustment procedure relies on four parameters: emissions, potency or toxicity, dispersion, and receptor proximity. While

---

<sup>1</sup> *Emission Inventory Criteria and Guidelines for the Air Toxics "Hot Spots" Program*, September 26, 2017, California Air Resources Board

<https://www.arb.ca.gov/ab2588/final/reg.pdf>

<sup>2</sup> <http://www.capcoa.org/wp-content/uploads/2016/08/CAPCOA%20Prioritization%20Guidelines%20-%20August%202016%20FINAL.pdf>

there are two procedures, both are similar in nature and involve calculating scores for separate health effects in order to derive a final score.

Using the procedures, a facility first receives separate scores for carcinogenic (cancer) effects and non-cancer chronic and acute effects. The facility is then given a Total Facility Score (TS) which is the higher of these scores. The Total Facility Scores are separated into three categories: high priority are those with TS greater than 10, intermediate priority for less than or equal to 10 but greater than one, and low priority for TS less than or equal to one. Once a facility is designated as high priority, they may be required to submit a Health Risk Assessment to assess the risk to their surrounding community. Facilities ranked with intermediate priority are considered to be District Tracking facilities and must continue to submit toxics emissions reports on a quadrennial basis. Facilities ranked with low priority may be eligible to be exempted from the AB 2588 Program altogether.

Priority Score	Category	Action
$TS > 10$	High Priority	Submit HRA
$1 < TS \leq 10$	Intermediate Priority	No HRA required; continue toxics emissions reports
$TS \leq 1$	Low Priority	May be eligible to be exempt from AB 2588 Program

### Health Risk Assessments

AB 2588 requires that the Office of Environmental Health Hazard Assessment (OEHHA) develop risk assessment guidelines for the program. The most recent version of these guidelines is the February 2015 version of *The Guidance Manual for Preparation of Health Risk Assessments*<sup>3</sup> (OEHHA HRA Guidelines). The 2015 OEHHA HRA Guidelines incorporated age sensitivity factors which resulted in increased cancer risk estimates by approximately three times. The OEHHA HRA Guidelines contains a description of the algorithms, recommended exposure variates, cancer and non-cancer health values, and the air modeling protocols needed to perform a HRA in accordance with the state AB 2588 Program. The entire risk assessment process can be characterized in four steps described below:

#### *Hazard Identification*

Hazard Identification involves identifying all toxic air contaminants emitted from a facility and whether these pollutants are potential human carcinogens or non-carcinogens containing other types of adverse health effects. A facility must identify all substances that are listed in the CARB Emissions Inventory Guidelines.

---

<sup>3</sup> <https://oehha.ca.gov/media/downloads/crn/2015guidancemanual.pdf>

### ***Exposure Assessment***

The purpose of the exposure assessment is to estimate extent of public exposure of emitted toxic air contaminants, and estimating exposures for which potential health effects will be evaluated. Evaluating exposure involves emission quantification, air dispersion modeling, and identifying exposure routes and exposure durations.

### ***Dose Response***

Dose-response assessment is the process of characterizing the relationship between exposure to a toxic air contaminant and the incidence of an adverse health effect in exposed populations. For dose-response, OEHHA has compiled cancer potency factors and non-cancer reference exposure levels (RELs) for certain toxic air contaminants. By using these factors along with the estimated exposure information for the toxic air contaminants identified during the hazard identification process, potential cancer and non-cancer risks can be evaluated during risk characterization.

### ***Risk Characterization***

Risk characterization is the final step of the risk assessment process. Modeled concentrations and exposure information determined through the exposure assessment process are used with cancer potency factors and non-cancer RELs to assess total cancer risk and noncarcinogenic health effects. An HRA shows the combined cancer risk and non-cancer risk for all toxic air contaminants emitted from a specific facility.

### **Public Notification**

Public notification is a core element of the AB 2588 Program requirements. California Health and Safety Code (H&S Code), Section 44362(b) requires the operator of the facility to provide notice to all exposed persons regarding the results of the HRA if the local air district finds there is significant health risk from the facility. The public notification procedures are specified by the local air districts.

### **Risk Reduction Plans**

In 1992, the California legislature added a risk reduction component, the Facility Air Toxic Contaminant Risk Audit and Reduction Plan (SB 1731), which required each air district to specify the significant risk level, above which risk reduction would be required. The requirements of SB 1731 are found in California H&S Code, Sections 44390 through 44394. The requirements are for facilities to audit and identify the source of toxic emissions and risk, then develop and carry out a plan to reduce the emissions and risk. This state law also presents an implementation timeline for risk reduction plans; however, local air districts may create more stringent timelines in their respective programs.

### **Industrywide Sources**

Under the AB 2588 Program individual air districts may designate separate IWS categories. Facilities falling into this category are generally small businesses where individual compliance would impose economic hardship. The advantage to industrywide categories is that compliance may be handled collectively for each category rather than each individual facility. For each IWS

category, a district may prepare an industrywide emission inventory and HRA. The California Air Pollution Control Officers Association (CAPCOA), in cooperation with OEHHA and CARB develop IWS risk assessment guidelines.<sup>4</sup> These guidelines provide a cost-effective and uniform method for calculating facility emissions and estimating toxic risks for these facilities under each air district's jurisdiction.

The requirements for designating individual IWS categories are:

- facilities must emit less than 10 tons per year of criteria pollutants;
- facilities share a common Standard Industrial Classification (SIC) code;
- the majority of the class are small businesses;
- individual compliance would impose severe economic hardships; and
- emissions are easily and generically characterized.

---

<sup>4</sup> Three IWS risk assessment guidelines have been published: autobody shops, dry cleaners, and retail gasoline stations <https://ww3.arb.ca.gov/ab2588/riskassess.htm>

## South Coast AQMD's Air Toxics AB 2588 "Hot Spots" Program

### Background

The South Coast AQMD's AB 2588 Program incorporates the requirements of the state AB 2588 program, as well as additional and/or more stringent requirements. Despite being one of the smoggiest urban areas in the U.S., South Coast AQMD has achieved significant reductions in air toxics in the Basin. For example, monitoring studies have shown that cancer risks have decreased by more than 50 percent in the past decade alone.<sup>5</sup> While these reductions were primarily attributable to reductions in diesel particulate matter, there have also been a significant reduction in risks from stationary source facilities. The AB 2588 Program as implemented by South Coast AQMD has played a significant role in achieving those reductions, by improving public awareness thereby leading many businesses to voluntarily reduce their toxic emissions, and through mandatory risk reductions triggered by facilities exceeding health risk thresholds. Figure 1 below demonstrates the reductions in risk that have been achieved despite the substantial number of facilities located within our district.

**Figure 1 — Trends in Inhalation Cancer Risks<sup>6</sup> in the Basin (1990-2017)**

South Coast AQMD Rule 1402 - Control of Toxic Air Contaminants from Existing Sources implements various aspects of AB 2588 and SB 1731 including public notification and risk reduction requirements for facilities. Rule 1402 adopts health risk thresholds and implementation

<sup>5</sup> Reductions measured between the Multiple Air Toxics Exposure Studies (MATES) versions III and IV: [https://www.aqmd.gov/docs/default-source/default-document-library/mates-v-admin-comm-presentation-060917final\\_jg.pdf](https://www.aqmd.gov/docs/default-source/default-document-library/mates-v-admin-comm-presentation-060917final_jg.pdf)

<sup>6</sup> Calculated with 2015 OEHHA Risk Assessment Guidelines, excluding cancer risks from DPM.

schedules that are above what are specified in AB 2588 and SB 1731. Rule 1402 was most recently amended in October 2016. This most recent amendment included a new provision beyond what is required under state law. This provision created a Voluntary Risk Reduction Program that allows facilities to implement early risk reduction measures that go beyond the normal risk reduction thresholds in exchange for an alternative public notification process. At the same time, a Potential High Risk Level facility category was also created. Facilities designated under the Potential High Risk Level category must comply with expedited schedules for submitting an Air Toxics Inventory Report (ATIR) and HRA reports and for reducing risk. Both the Voluntary Risk Reduction Program and the new Potential High Risk Level category result in facilities evaluating and reducing their associated air toxics risks faster than would occur under the state AB 2588 program alone.

### Program Implementation Elements

Under South Coast AQMD's AB 2588 Program, core facilities are categorized into four groups, or phases. Phases are assigned to discrete reporting years with each phase reporting once every four years. Currently, there are over 400 core facilities that are subject to the main components of the South Coast AQMD's AB 2588 Program as categorized in Table 1. These are:

- **Emissions Reporting** – Since the FY 2000-01 reporting cycle, toxics emissions reporting for the AB 2588 Program was incorporated into South Coast AQMD's Annual Emissions Reporting (AER) Program. Core facilities must report emissions for 23 toxic air contaminants through the AER Program. Since there are four phases, each core facility is required to submit reporting 177 toxic air contaminants during the quadrennial reporting year. This more detailed inventory serves as a foundation for an ATIR, if required.
- **Prioritization** – South Coast AQMD uses a refined method for prioritizing facilities based on CAPCOA Guidelines. The current South Coast AQMD Procedure incorporates the revised risk calculation methodologies from the 2015 OEHHA HRA Guidelines. The South Coast AQMD Prioritization Procedure is described in more detail in the *Streamlining Activities* chapter.

In 2018, 259 facilities were required to report their quadrennial toxic emission inventory updates. Based on emissions inventory submittals, South Coast AQMD staff calculated priority scores for these facilities.

- **Health Risk Assessment** – High priority facilities (those with priority scores greater than ten), including those that qualify for the Voluntary Risk Reduction Program, are required to prepare an ATIR, a complete and detailed inventory of approximately 450 toxic air contaminants, along with detailed information about the processes and release points using the Emissions Inventory Module from the latest CARB Hotspots Analysis and Reporting Program (HARP). For facilities participating in the traditional pathway, if the ATIR indicates that the facility is still considered a high priority, the facility must prepare an HRA that conforms to the OEHHA HRA Guidelines. Specific instructions for the South Coast AQMD are also available in the *AB 2588 and Rule 1402 Supplemental Guidelines, (Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots"*

*Information and Assessment Act*).<sup>7</sup> This document is commonly referred to as the AB 2588 Supplemental Guidelines.

- **Public Notification** – If the health risk reported in the HRA exceeds the Notification Risk Levels of Rule 1402, then the facility is required to provide public notice to the affected community. The Notification Risk Levels of Rule 1402 are triggered when cancer risk from the facility exceeds 10 in-a-million, or when the acute or chronic hazard indices are greater than 1. The requirements for public notification are described in the *South Coast AQMD Public Notification Procedures for Facilities Under the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) and Rule 1402*, October 2016 (South Coast AQMD Public Notification Procedure).<sup>8</sup> These requirements emphasize transparency in communicating risk to the affected community in the following ways:
  - The notice must clearly identify the area above the notification thresholds
  - The notice must be distributed to all addresses (individual residences and workplaces), and to parents of children attending school in the area of impact.
  - The approved HRA must also be provided to all schools in the area of impact.
  - South Coast AQMD conducts a public meeting to describe the HRA results to the affected community and to answer questions from community members.
- **Risk Reduction** – Rule 1402 adopts stringent health risk thresholds and aggressive implementation schedules that are beyond the traditional AB 2588 and SB 1731 state requirements (see Table 2 below). Under state requirements, facilities exceeding a significant risk threshold must reduce risk within five years. Under Rule 1402, Potential High Risk Level facilities must submit an Early Action Reduction Plan to immediately reduce risk, followed by a detailed Risk Reduction Plan designed to comprehensively reduce risk. The Risk Reduction Plan under Rule 1402 must be implemented as quickly as feasible, but no later than two years after approval. Facilities exceeding the Action Risk Level under Rule 1402 must also implement risk reduction plans no later than two and a half years after risk reduction plan approval.<sup>9</sup> Rule 1402 also includes an optional Voluntary Risk Reduction Program provision that is designed to achieve risk reductions that are not otherwise required under state program requirements. In order to qualify for the Voluntary Risk Reduction Program, a facility must have a previously approved HRA and must not be designated as a Potentially High Risk Level facility.

---

<sup>8</sup> [http://www.aqmd.gov/docs/default-source/planning/risk-assessment/pn\\_procedures.pdf](http://www.aqmd.gov/docs/default-source/planning/risk-assessment/pn_procedures.pdf)

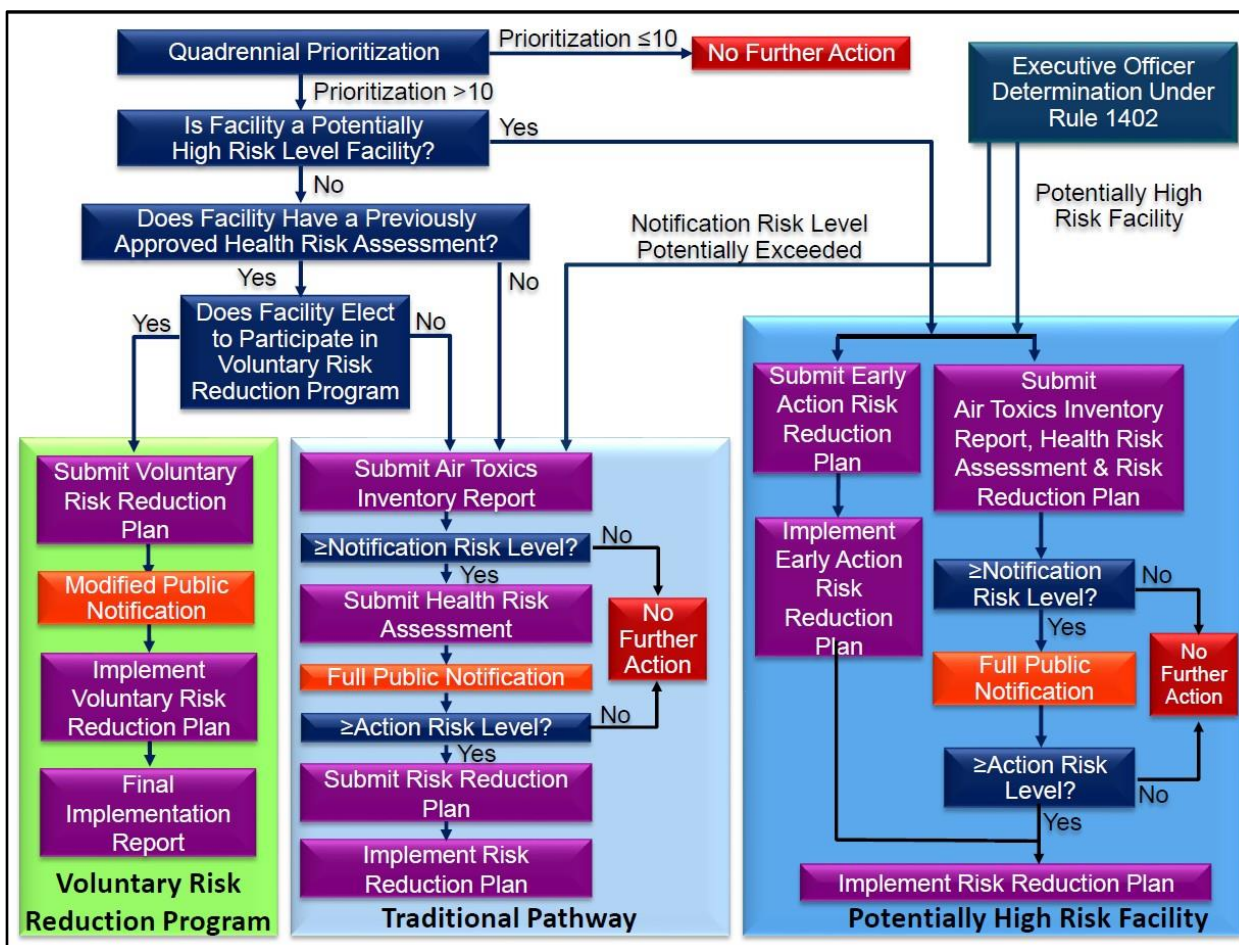

<sup>9</sup> Rule 1402 allows extensions but only for those facilities that meet certain requirements. Extensions are not allowed if for any facilities exceeding the Significant Risk Level. Even with extensions, the implementation timelines are shorter than state requirements.

- **Fees** – State and local costs of implementing the Act are recovered through annual fees. As described previously, AB 2588 requires each district to recover state and district program costs. These fees are specified in South Coast AQMD Rules 307.1.

**Figure 2 — Overview of the AB 2588 “Hot Spots” Program**

### Progress in Implementing the AB 2588 Program

From the beginning of the AB 2588 Program in 1987 through the end of 2018, staff has reviewed and approved 344 HRAs from 337 facilities. There are more approved HRAs than facilities as some facilities have prepared more than one HRA. Of these 337 facilities, 27 were required to implement risk reduction measures, 59 were required to perform public notification activities, while the remaining facilities were below the public notification threshold. As a result of the AB 2588 Program, about 95 percent of facilities that have been in the Program historically have HRAs demonstrating cancer risks below ten in-a-million and a hazard index (HI) of less than 1.0 for both non-cancer acute and non-cancer chronic, or their emissions have been low enough to not require an HRA. The summary of risks from approved HRAs illustrated in Figure 3 is based on the information in Appendix C, which lists the core facilities and the health risks from their approved HRAs. Table C-1 in Appendix C lists the facilities in order of their cancer risks and Table C-2 in Appendix C lists the same facilities ordered by facility ID. Table D-1 in Appendix D lists facilities which have prepared a Risk Reduction Plan (RRP) for the AB 2588 Program and

their corresponding health risks [H&S Code 44363(a) (2) and (3)] and Table D-2 in Appendix D lists facilities which have successfully participated in the voluntary risk reduction program. Appendix E contains a list of acronyms and abbreviations used in this report.

**Figure 3 — Distribution of Risks for AB 2588 Facilities with an Approved HRA**

**Table 2 — Rule 1402 Risk Reduction Categories**

<b>Rule 1402 Levels</b>	<b>Thresholds</b>	<b>Requirements</b>	<b>RRP Implementation Timeline</b>
Notification Risk Level	Cancer risk of 10 in-a-million or greater Acute or chronic HI of 1.0 or greater Exceeding lead National Ambient Air Quality Standard (NAAQS)	Public notification	No risk reduction required
Voluntary Risk Level	Cancer risk of 10 in-a-million or greater Acute or chronic HI of 1.0 or greater Exceeding lead National Ambient Air Quality Standard (NAAQS)	Public notification (modified) and implement VRRP	No later than 2.5 years after approval of plan (an additional 2.5 years extension may be requested)
Action Risk Level	Cancer risk greater than 25 in-a-million Cancer burden of 0.5 or more Acute or chronic HI of 3.0 or more Exceeding lead NAAQS	Public notification and implement RRP	No later than 2.5 years after approval of plan (an additional 2.5 years extension may be requested)
Significant Risk Level	Cancer risk of 100 in-a-million or greater Cancer burden of 0.5 or more Acute or chronic HI of 5.0 or more	Public notification and implement RRP	No later than 2 years after approval of plan for facilities designated as Potentially High Risk Facilities

***Summary of South Coast AQMD Staff Activities for AB 2588 Facilities in 2018***

In 2018, staff addressed facilities in various stages of the AB 2588 process and initiated audit activities on 140 facilities with priority scores greater than 10. Key activities conducted include review of 24 ATIRs, 17 HRAs, five RRP, one Early Action Reduction Plan, seven Voluntary Risk Reduction Plans (VRRPs), and two revised priority scores. Many of these key activities were for facilities that tend to have more sources and are more complex such as refineries and other industrial facilities. Overall, a total of 196 documents were reviewed in 2018 from 37 facilities, with some facilities having multiple documents submitted for South Coast AQMD staff review. Table 3 presents a summary of key activities for facilities participating in the traditional AB 2588 Program and Table 4 presents a summary of key activities for facilities participating in the Rule 1402 Voluntary Risk Reduction Program.

**Table 3 — Actions Taken in 2018 for Facilities in the Traditional AB 2588 Program**

Ultramar Inc	800026		X		

Notes:

For VRRPs: R=Report Received; C=Comment letter sent to facility; A=Report Approved.

A description of these activities for each facility in Tables 3 and 4 is listed in Appendix A

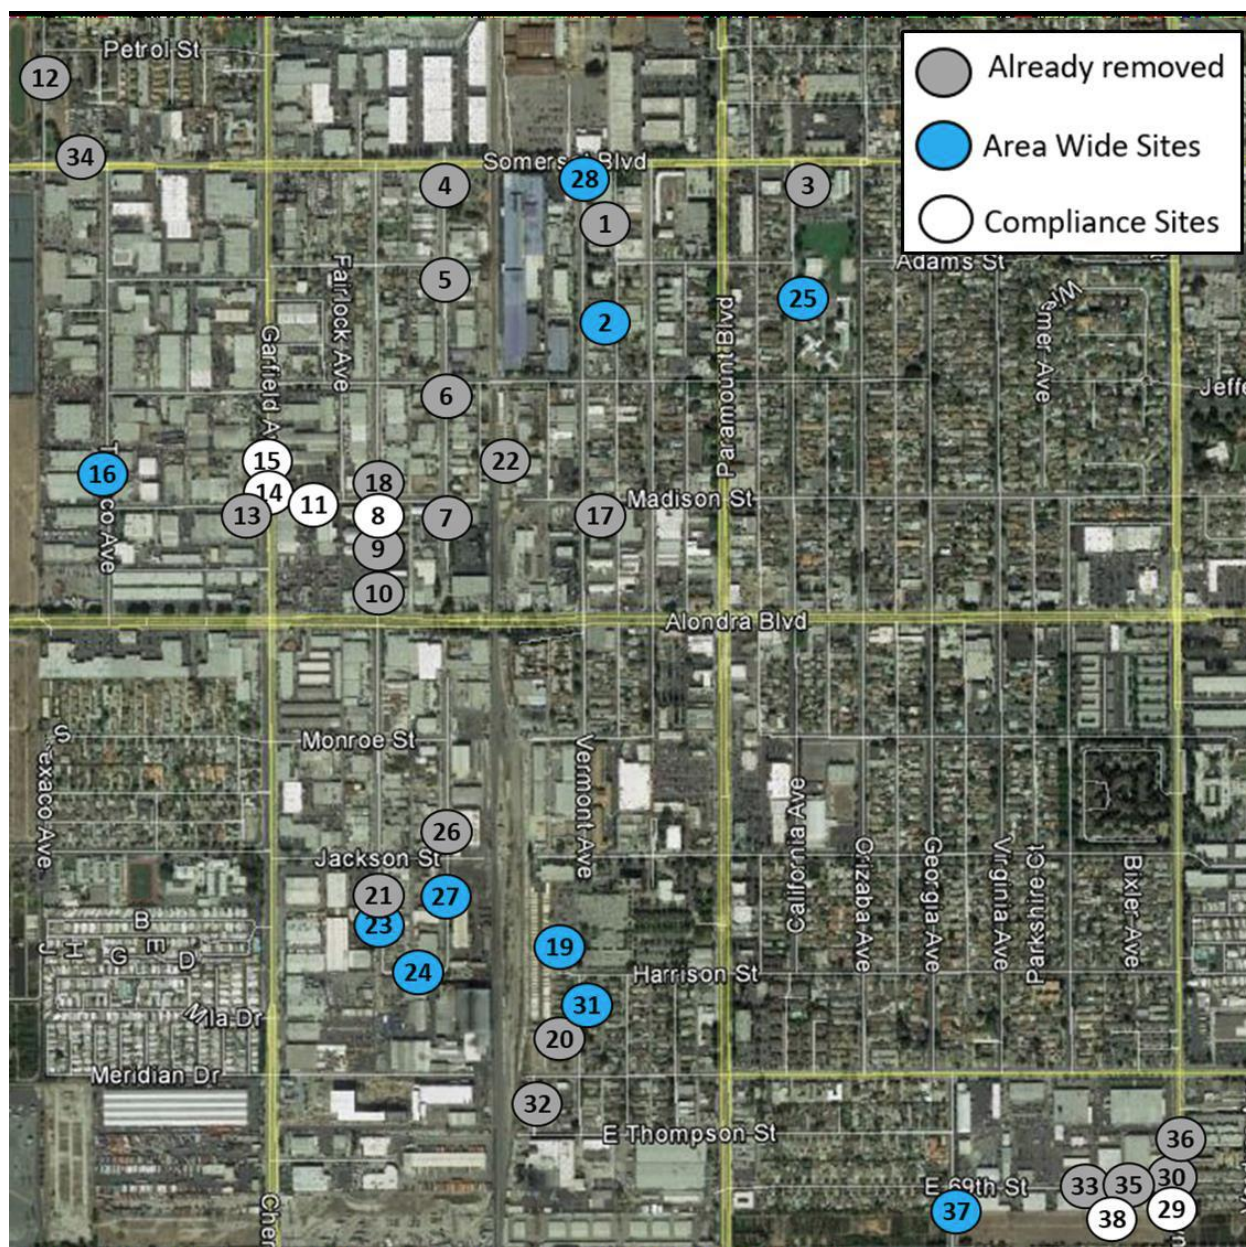

### ***Paramount - Air Monitoring Activities***

In addition to the AB 2588 Program, South Coast AQMD also conducts other activities to address air toxics, including special monitoring projects. In 2013, South Coast AQMD staff began conducting an investigation into local sources of emissions, including initiating a local air sampling study after receiving a series of metallic odor complaints from local community members in the City of Paramount (Paramount) and surrounding areas. The purpose of these activities was to determine the source of emissions and potential air pollution control strategies. This investigation focused on two toxic metals of concern: nickel and hexavalent chromium. In July 2016, a larger number of samplers were deployed to allow South Coast AQMD to better measure spatial and temporal variations of hexavalent chromium in the area and identify its potential sources. In October 2016, South Coast AQMD initiated an extensive air monitoring campaign to assess levels of hexavalent chromium in the industrialized sections of Paramount. Highly elevated levels were found initially and additional efforts were conducted to identify and address sources of hexavalent chromium that were impacting nearby communities. Once potential sources were identified, the sampling strategy was adjusted to focus on specific facilities and on characterizing hexavalent chromium levels in the adjacent communities. As a result, several facilities made a range of improvements, some voluntary and some through rule changes and enforcement actions. These changes have substantially reduced ambient hexavalent chromium levels in Paramount and surrounding areas. As a result, South Coast AQMD is updating its air monitoring efforts in Paramount to focus on conducting studies to evaluate other potential sources of hexavalent chromium and also monitoring other areas of the Basin that may have higher potential for air toxics exposure.

Throughout this period, air monitoring in Paramount has occurred at a total of 38 locations as shown in Figure 6, and 12 schools. School sampling has been supported by CARB. Currently, South Coast AQMD collects air samples for hexavalent chromium analysis at 16 locations in the City of Paramount. Among these active monitoring locations, six are adjacent to facilities that are operated under an Order of Abatement during 2018 with South Coast AQMD's independent Hearing Board ("Compliance" sites; see Figure 6). The remaining monitoring sites are close to other potential sources or near residential areas and sensitive receptors of Paramount. Because hexavalent chromium levels in Paramount have been declining steadily and are now within the typical levels, the size of this monitoring network can be reduced to focus on other areas that have higher potential for air toxics exposure.

**Figure 4 — Location of the monitoring sites in the City of Paramount**

## Streamlining Activities

### Background

South Coast AQMD has undertaken several efforts to help affected facilities comply with rule requirements and to interact with the public regarding general air quality-related issues. This chapter describes these efforts along with the services created to advance these efforts.

### South Coast AQMD Guidelines and Procedures for AB 2588

#### *Consolidated Emissions Reporting*

As described earlier, core AB 2588 facilities are required to provide an update of their toxics emissions inventory to South Coast AQMD on a quadrennial basis. Beginning with the fiscal year 2000-01 reporting cycle, toxics emission reporting was incorporated into South Coast AQMD's Annual Emissions Reporting (AER) Program. This was the first step towards streamlining emissions reporting between criteria pollutants and toxics. In 2008, South Coast AQMD created a web-based reporting system for facilities. The reporting tool automatically identifies if a facility is in the AB 2588 Program and also informs a facility if a particular year is subject to a quadrennial update. These upgrades and consolidation efforts have made for a much more efficient system that benefits both facilities and South Coast AQMD staff.

#### *Prioritization Procedures*

South Coast AQMD has taken various steps over the years in streamlining prioritization procedures for the AB 2588 Program while maintaining consistency with the CAPCOA guidelines. In 2016, South Coast AQMD adopted the use of local meteorological stations and evaluated risks at actual closest receptor locations in addition to evaluating receptors in the worst case wind direction. Most recently in July 2018, the procedures were updated to incorporate the most recent meteorological data set and to simplify the calculation of a facility's non-cancer acute priority score. By using the South Coast AQMD Prioritization Procedure, fewer facilities are incorrectly categorized as high priority.<sup>10</sup> This streamlining is highly effective since less facilities are immediately notified each year.

The AB 2588 group also conducts a detailed audit of those facilities that are initially categorized as high priority to ensure proper designation. Certain steps may include confirming the correct use of emission factors, control efficiencies, source test methods, and relative proportions of toxic air contaminants. Additionally, staff confirms the correct distances to residential and worker receptors as well as any modifications to any equipment for the given quadrennial year and contacts the facility as needed for additional clarification. This additional information obtained through priority score auditing will often negate the need to require an ATIR and HRA. This process and use of this refined priority scoring methodology serves to reduce the number of facilities that are required to be notified and overall reduces unnecessary workload for the facilities and for staff.

---

<sup>10</sup> <http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab-2588-facility-prioritization-procedure-201809.pdf>

### ***Hotspots Analysis and Reporting Program (HARP)***

The Hotspots Analysis and Reporting Program, commonly known as HARP, is a software suite developed by CARB that assists with the technical requirements of the AB 2588 Program. HARP consists of three independent modules: the Emissions Inventory Module, Air Dispersion Modeling and Risk Tool, and Risk Assessment Standalone Tool. South Coast AQMD requires the use of HARP for Rule 1402 related work such as ATIRs, VRRPs, and HRAs. The use of HARP by facility operators, and other individuals promotes consistency and a more efficient and cost-effective way to develop inventories and conduct HRAs.

### ***General Supplemental Guidelines***

The OEHHA HRA Guidance defers to local air districts for specific or additional requirements. The AB 2588 Supplemental Guidelines lists the specific instructions for preparing AB 2588-related documents in South Coast AQMD. By clearly indicating what is required from facilities and by periodically updating the document as needed, South Coast AQMD ensures that facilities have a clear and up to date understanding of all requirements. This will also minimize the amount of general inquiries and preliminary discussions, provided for a more efficient process.

### ***Voluntary Risk Reduction Program***

Another element streamlining the South Coast AB 2588 Program is the provision for the Voluntary Risk Reduction Program. We amended Rule 1402 to provide this option in response to industry interest in a mechanism to voluntarily reduce health risks from their facilities in return for modified public notification requirements. A facility may participate in the Voluntary Risk Reduction Program only if it has a previously approved HRA that is below the Action Risk Level and is not a Potentially High Risk Level facility. This program provides a more expeditious risk reduction program than the traditional pathway under state requirements, and also reduces notification requirements and other process for participating facilities. Under the traditional program, facilities are required to reduce cancer risk below 25 in-a-million. To successfully participate in the Voluntary Risk Reduction Program, risks from the participating facility must be reduced below 10 in-a-million, which is up to 60% reduction in cancer risk. To further expand the use of the Voluntary Risk Reduction Program and assist facilities, the AB 2588 staff developed guidelines that describe the requirements of a VRRP in September 2018.<sup>11</sup>

### ***Air Dispersion Modeling***

#### ***Modeling Guidance***

The United States Environmental Protection Agency's (U.S EPA) air quality dispersion model AERMOD is required for use to estimate concentrations of toxic air contaminants for risk assessments conducted pursuant to Rules 1401 and 1402. The AERMOD model is a steady-state Gaussian plume model capable of estimating pollutant concentrations from a wide variety of

---

<sup>11</sup> South Coast AQMD Guidelines for Participating in the Rule 1402 Voluntary Risk Reduction Program, September 2018

<http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab-2588-vrrp-guidelines-201809.pdf>

sources that are typically present at a facility. It is a stand-alone application, but has also been incorporated into the CARB-developed HARP program as well as other programs from third party developers. South Coast AQMD has developed guidance regarding the use of AERMOD to assist modelers such as the use of regulatory defaults, averaging times, receptor grids and elevation data.<sup>12</sup> The AB 2588 Program staff has provided specific guidance regarding the required parameters in the HARP program. This guidance not only increases the quality of submissions but also decreases the amount of time spent by staff to answer basic questions.

### ***Meteorological Data***

South Coast AQMD has prepared meteorological data from 24 stations throughout the South Coast Air Basin for download. The South Coast AQMD website includes a map showing the locations of each of these meteorological stations along with the corresponding most recent five years of meteorological data for each station. The meteorological station that best represents the facility's meteorological conditions (such as prevailing winds), terrain, and surrounding land use should be used in all modeling analyses. In many cases, this would be the nearest located station. South Coast AQMD staff are available to provide assistance to modelers to ensure the most representative station is used.

## **Other Streamlining Activities**

### ***Rule 1401 Guidance***

Rule 1401 requires any new, modified, or relocated permit units which emit toxic air contaminants to comply with certain allowable limits. South Coast AQMD has developed the Rule 1401 Risk Assessment Procedures<sup>13</sup> to assist applicants as well as staff to evaluate Rule 1401 and 1401.1 compliance. The guidance document provides four tiers to determine health risk for Rule 1401 risk assessment, ranging from a quick look up table that uses very conservative health-protective values, to instructions to conduct detailed risk assessments involving air quality dispersion modeling analysis. By allowing permit applicants to utilize this tiered option to demonstrate compliance with risk limits, this often times leads to an expedited analysis since detailed risk assessments often are not necessary for most permit applications. The document also provides detailed sample calculations and instructions for each tier, allowing facilities to have a more thorough understanding of the risk assessment process associated with Rule 1401.

### ***Web tools***

South Coast AQMD has also developed web tools such as the Facility Information Detail (F.I.N.D) tool that allows a user to search for public information about South Coast AQMD-regulated facilities. Some of the facility information that can be found using F.I.N.D include: general facility details, equipment lists, compliance history, emissions inventory (including toxic pollutants), and

---

<sup>12</sup> South Coast AQMD modeling guidance is available at:

<http://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance>

<sup>13</sup> Risk Assessment Procedures for Rules 1401, 1401.1 and 212, Version 8.1, September 1, 2017, South Coast AQMD

<http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf>

<http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/attachmentn-v8-1.pdf>

hearing board information. There are several existing web-based applications on South Coast AQMD's website that provide similar information, however, F.I.N.D makes the data available in a much more consolidated and user friendly way. Updates to the database are made at least once per week and the tool also includes a very useful interactive map with aerial imagery from the U.S Geological Service.<sup>14</sup>

### ***Small Business Assistance***

South Coast AQMD has a team of engineers and inspectors that are specifically designated to help small businesses (100 or fewer employees or an annual gross revenue up to \$5 million) understand and comply with air quality rules and regulations. Whether it is assistance in understanding regulations that may apply to a facility, identifying equipment that may need a permit, assistance with permit applications, or even scheduling a no fault on-site inspection, the small business assistance unit act as advocates for these small businesses. Offering these services to smaller businesses serves to streamlines efforts to regulate air quality while also creating a positive open working relationship with small local businesses.

### ***Public Assistance***

The South Coast AQMD's AB 2588 Program provides public assistance services that includes both a hotline at (909) 396-3610 and email address ([ab2588@aqmd.gov](mailto:ab2588@aqmd.gov)) to answer any program-related questions. Our website also includes a section specifically dedicated to the AB 2588 Program that provides up to date activities, including approved HRAs, RRP's, and public notices, and information on air toxics monitoring in local communities, such as in Paramount.

South Coast AQMD also provides several other services, such as a telephone number to answer fee-related questions, an online complaint system and telephone number where members of the public can notify staff of air quality problems, such as odor and visible emissions.<sup>15</sup> These services help to maintain good working relationships with facilities and to protect air quality and public health.

### ***Continued Air Toxics Monitoring in Communities***

As a result of lessons learned during South Coast AQMD's investigation into air monitoring for sources of toxic metal emissions in Paramount and other areas, staff continues to investigate, identify and remediate any additional sources across our four-county region that may emit high levels of toxic air contaminants. South Coast AQMD will systematically identify and prioritize high-risk facilities, then use the latest air monitoring technology to confirm specific sources causing high emissions associated with metal-processing facilities. If identified, South Coast AQMD will seek Orders for Abatement from the independent South Coast AQMD Hearing Board to require these facilities to reduce their emissions to a level that does not pose an immediate threat to public health quickly.

---

<sup>14</sup> <http://www.aqmd.gov/nav/FIND/facility-information-detail>

<sup>15</sup> <http://www3.aqmd.gov/webappl/complaintsystemonline/NewComplaint.aspx>;

Telephone hotline: 1-800-CUT SMOG® (1-800-288-7664)

The goal is to eliminate or minimize the release of hexavalent chromium into the environment associated with metal-processing facilities. This program is expected to be a seven-year, labor-intensive effort with the air monitoring portion costing approximately \$6 million to \$7 million annually. It will focus on a variety of metal processing facilities across South Coast AQMD's four-county jurisdiction with the potential to emit toxic metal contaminants including hexavalent chromium, lead, arsenic, cadmium and nickel.

As with the process in Paramount, South Coast AQMD staff will engage and communicate regularly about its work with residents, community groups, local governments and their elected officials, partner regulatory agencies, affected facilities and industry groups. South Coast AQMD will seek to leverage the regulatory authorities of other agencies to assist in swiftly curtailing emissions from high-emitting facilities.

### ***Assembly Bill 617 (AB 617)***

AB 617 was passed by the California legislature in 2017 and focuses on improving air quality and public health in environmental justice communities. This law first allows local residents to provide recommendations for the selection of the environmental justice communities. South Coast AQMD will use updated data to assess the communities most affected, to identify key sources of pollution and develop targeted emissions reduction plans to reduce community exposures to air pollution. A small number of communities have been selected for the first year and other communities will be added over time.

For each selected community, South Coast AQMD will work with local stakeholders to evaluate their greatest air pollution concerns. Depending on the needs of each community, South Coast AQMD may conduct targeted community air monitoring and develop a tailored community air plan. South Coast AQMD will work with CARB, other agencies, and all stakeholders to implement these community air plans to reduce local air pollution emissions and benefit public health. In September 2018, CARB approved three communities in our region for the first year of this program:

- Wilmington, Carson, West Long Beach
- East Los Angeles, Boyle Heights, West Commerce
- San Bernardino, Muscoy

South Coast AQMD has convened a Community Steering Committee in each of the three communities with the purpose of identifying specific community air quality concerns, discussing resolutions, and developing recommendations for improving the local air quality. These committees work closely with South Coast AQMD and CARB to discuss emissions reductions targets and strategies to inform a tailored community air plan that addresses the community's highest priority concerns. South Coast AQMD will deploy systems to monitor air quality in selected communities where this information is most needed. The analysis of the data collected will inform future community emissions reduction plans and will be used to track progress. This information will also be shared with the public and CARB.

## State Level Air Toxics Related Activities

### *OEHHA Updates*

#### *Toxic Program Impacts with New or Revised Toxic Air Contaminants*

As described previously, OEHHA is required to develop guidelines for conducting HRAs under the AB 2588 Program. In implementing this requirement, OEHHA develops new or revises risk factors for many toxic air pollutants. South Coast AQMD staff monitor the progress for these changes closely. For any finalized changes in risk factors, staff performs a preliminary estimate of potential Rule 1402 program impacts. Notice is provided to the Governing Board and affected industries annually through this and other AB 2588 annual reports.

#### *Toxic Air Contaminants With New or Revised Health Values*

OEHHA adopted risk values for two toxic air contaminants in 2018. In May, OEHHA adopted both new and revised RELs for ethylene glycol mono-n-butyl ether (EGBE).<sup>16</sup> RELs are airborne concentrations of a chemical that are not anticipated to result in adverse non-cancer health effects for specified exposure durations in the general population, including sensitive subpopulations. EGBE is a solvent that is used as a component in cleaning products, cosmetics, lacquers, latex paint, firefighting foam, and hydraulic fluid. Because of its properties as a solvent, it has gained widespread use in industrial and consumer applications.

In August, OEHHA adopted new cancer slope factors and a unit risk factor for tert-butyl acetate (TBAC).<sup>17</sup> Cancer Potency Factors represent the 95th percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. TBAC is a solvent that is used in the production of lacquers, enamels, inks, adhesives, thinners, and industrial cleaners.

The revised and adopted values are summarized in Table 5. The previous values are shown in parentheses below the current values; N/A within parentheses indicate no previous value existed.

**Table 5 — New or Revised Health Values in 2018 from OEHHA**

CAS #	Name	Inhalation Slope Factor (mg/kg-day) <sup>-1</sup>	Oral Slope Factor (mg/kg-day) <sup>-1</sup>	Chronic REL µg/m <sup>3</sup>	8-Hour Chronic REL µg/m <sup>3</sup>	Acute REL µg/m <sup>3</sup>
111-76-2	EGBE	N/A	N/A	82 (N/A)	164 (N/A)	4700 (14000)
540-88-5	TBAC	4.7 x 10 <sup>-3</sup> (N/A)	5.0 x 10 <sup>-3</sup> (N/A)	N/A	N/A	N/A

<sup>16</sup> <https://oehha.ca.gov/media/downloads/crnrfinalegberel050418.pdf>

<sup>17</sup> <https://oehha.ca.gov/media/downloads/crnrfbaciur081618.pdf>

*Assessment of Impacts to Existing Facilities*

Since TBAC is a newly added pollutant with no prior reporting requirements, staff was unable to conduct a preliminary estimate of Rule 1402 impacts. However, facilities required to submit an ATIR under Rule 1402 will be required to report TBAC emissions beginning in 2019. TBAC is potentially emitted during coating operations such as autobody shop operations. Autobody repair facilities are included as an industrywide category. Additionally, staff will review any facilities that are required to submit a HRA to ensure TBAC emissions are included in inventories when necessary.

EGBE is a previously listed pollutant and is subject to reporting by AB 2588 facilities every four years. Data for the 2017 reporting year was used because it is the most current data available. For the 2017 reporting period only, 13 facilities reported annual emissions of EGBE. A breakdown of the types of facilities and the number of those types of facilities that reported EGBE emissions are presented in Table 6.

**Table 6 — 2017 Summary of EGBE Emitting Facilities**

<b>Facility Description</b>	<b>Number of Facilities</b>
Printing/Publishing	2
Building/Construction/Mineral Products	1
Harbors	1
Aerospace	2
Other Industrial/Manufacturing	3
Metal and Alloys Products	1
Military Base	1
Chemical Plants	1
Other Institutional/Commercial	1
<b>Total:</b>	<b>13</b>

Two of the 13 facilities have previously approved HRAs. The HRAs for both of these facilities were approved in 2002. At that time, EGBE was not reported for either HRA. EGBE is required to be reported on a quadrennial cycle and therefore is examined when screening and prioritization occurs in accordance with program requirements.

## Future Activities

### AB 2588 Activities

In 2019, staff will prioritize approximately 70 facilities, and notify those with high priority scores to prepare ATIRs or VRRPs, if eligible, and HRAs and RRP, if necessary. There are a substantial number of ATIRs and VRRPs that are expected to be reviewed in 2019. Public notification, and public meetings as necessary, will also occur for multiple facilities including City of Glendale Water & Power (ID 800327), Lubeco, Inc. (ID 41229), Phillips 66 Company, Los Angeles Refinery – Wilmington Plant (ID 171107), Southern California Gas Company, Playa del Rey Storage Facility (ID 8582), and Kirkhill Inc (ID 187823).

In addition to the AB 2588 Program implementation activities, staff will be working on:

- Notification of seven asphalt aggregate plants to prepare and submit ATIRs or VRRPs if eligible
- Continue to provide support to rulemaking staff
- work with CARB and through the CAPCOA Toxics and Risk Managers Committee (TARMAC) to update CARB Emission Inventory Guidelines, including review of draft list of chemicals
- Continue to work with CARB and through the CAPCOA-TARMAC to develop HRA guidelines for the industry-wide categories of gasoline dispensing facilities, diesel internal combustion engines, providing training to South Coast AQMD personnel and the regulated community
- Train new staff on the expanded emissions reporting under amended Rule 301 and AB 617
- Track development of potential REL revisions by OEHHA

## Appendix A — Description of Facilities/Projects

### *A.1. Aerocraft Heat Treating Co. Inc. (ID 23752) – Paramount*

Aerocraft Heat Treating Company (Aerocraft) operates a facility in the City of Paramount that processes forgings, castings, bar, plate and rough-machined parts. The facility uses various heat treating furnaces, quench tanks, and metal grinding equipment, as well as plasma cutting operations. Based on ambient monitoring conducted near Aerocraft which showed elevated levels of hexavalent chromium, Aerocraft was officially designated as a Potentially High Risk Level Facility on December 14, 2016. As part of this designation, Aerocraft was required to submit an Early Action Reduction Plan by March 14, 2017, an ATIR by May 16, 2017, a HRA and a RRP by June 13, 2017. Additional details regarding the ambient monitoring in Paramount and near Aerocraft and events that led up to the designation of Aerocraft as a Potentially High Risk Facility are discussed in the 2016 AB 2588 Annual Report and on South Coast AQMD's website.<sup>18</sup>

The Early Action Reduction Plan was received on March 13, 2017 and after South Coast AQMD's staff review, a comment letter was sent on April 26, 2017 requesting revisions and resubmittal. Subsequently, on May 4, 2017, a revised Early Action Reduction Plan was received.

On May 16, 2017, Aerocraft submitted an ATIR, and the HRA and RRP were submitted on June 13, 2017, in accordance with the required deadlines. Conditional approval of the revised Early Action Reduction Plan was granted on May 31, 2017. On February 9, 2018, South Coast AQMD staff provided Aerocraft with comments and recommendations on the submitted ATIR, HRA, and RRP, and requested revision and resubmittal of those respective documents. After technical conference calls with Aerocraft representatives, South Coast AQMD staff received the Revised ATIR on March 29, 2018. The Revised ATIR was approved on May 9, 2018.

The Revised HRA and Revised RRP were received on May 17, 2018. The Revised HRA was approved by South Coast AQMD staff and OEHHA on October 9, 2018. The revised HRA representing the 2016 inventory year indicated that Aerocraft posed a maximum cancer risk of 1,900 in-a-million for a residential receptor located at the corner of Madison Street and Illinois Avenue, based on a 30-yr exposure, and 350 in-a-million for the worker receptor located immediately south of Aerocraft, based on a 25-yr exposure. The cancer risk was mainly due to hexavalent chromium emissions from furnaces and rack welding operations. A cancer burden of 11 was estimated, based on a 70-yr exposure.

The maximum non-cancer chronic hazard indices of 0.10 and 0.15 were projected for residential and non-residential receptors, respectively. The maximum non-cancer 8-hour chronic hazard index is less than 0.01 and the maximum non-cancer acute hazard index was 2.9 at Aerocraft's property boundary.

Since the HRA results were above the Significant Risk Level in Rule 1402, Aerocraft was required to notify the public about the health risk in addition to conducting annual public notification

---

<sup>18</sup> Information regarding Aerocraft and compliance-related activities in Paramount can be found at the following link:  
<https://www.aqmd.gov/home/news-events/community-investigations/air-monitoring-activities/facilities---order-for-abatement/aerocraft>

meetings until the Rule 1402 Action Risk Level was achieved pursuant to Rule 1402(p). Notices of the public notification meeting were sent out to over 35,000 people in the area of impact. South Coast AQMD staff held a public notification meeting at the Progress Park Community Center on December 1, 2018 to explain the impact of Aerocraft's emissions on public health and to discuss next steps. South Coast AQMD staff were reviewing the Revised RRP at the end of 2018.

#### *A.2. Anaplex Corp (ID 16951) - Paramount*

Anaplex Corporation (Anaplex) operates a metal processing and finishing company in the City of Paramount. The facility processes parts for commercial and defense aerospace applications. The processes include anodizing and plating process lines which use hexavalent chromium, nickel, and cadmium. Additional details regarding the ambient monitoring in Paramount and near Anaplex and events that led up to the designation of Anaplex as a Potentially High Risk Facility are discussed in the 2016 AB 2588 Annual Report and on South Coast AQMD's website.<sup>19</sup>

Based on ambient monitoring in December 14, 2016, South Coast AQMD staff designated Anaplex as a Potentially High Risk Level Facility specifically based on high levels of hexavalent chromium found at monitors adjacent to Anaplex. As part of this designation, Anaplex was required to submit an Early Action Reduction Plan by March 14, 2017, an ATIR by May 16, 2017, a HRA and a RRP by June 13, 2017. Following litigation in Superior Court, the Hearing Board granted a Stipulated Order for Abatement on January 18, 2017.

Anaplex submitted an Early Action Reduction Plan on March 13, 2017. South Coast AQMD staff provided comments on April 26, 2017 and requested revisions and resubmittal of the Early Action Reduction Plan. Anaplex submitted a revised Early Action Reduction Plan on May 11, 2017 which was conditionally approved on May 31, 2017.

On May 15, 2017, Anaplex submitted an ATIR and a HRA and RRP on June 13, 2017. South Coast AQMD staff provided written comments regarding all three documents on December 8, 2017, and requested revisions and resubmittal of each document. On December 8, 2017, South Coast AQMD staff provided Anaplex with comments and recommendations on the submitted ATIR, HRA and RRP, and requested revision and resubmittal of those respective documents. After numerous technical conference calls and meetings with Anaplex representatives, South Coast AQMD staff received the Revised ATIR on May 1, 2018 and the Revised HRA and RRP on May 17, 2018. After review, South Coast AQMD staff requested another revision and resubmittal of the HRA and RRP. Anaplex submitted the Revised HRA and Revised RRP on September 26, 2018. The revised ATIR was approved on October 9, 2018.

The Revised HRA submitted by Anaplex contained alternate HRA scenarios in the main HRA report, which was not consistent with South Coast AQMD's AB 2588 Supplemental Guidelines. In the interest of time and pursuant to Rule 1402 (e)(2)(D), South Coast AQMD staff modified the Revised HRA resubmitted on September 26, 2018 to follow Appendix B of South Coast AQMD's AB 2588 and Rule 1402 Guidelines<sup>20</sup>. The HRA relied upon results of one of the scenarios contained in Anaplex's resubmitted Revised HRA, and presented the information consistent with

<sup>19</sup> <http://www.aqmd.gov/home/news-events/community-investigations/air-monitoring-activities/facilities---order-for-abatement/anaplex-corp>

<sup>20</sup> <http://www.aqmd.gov/docs/default-source/planning/risk-assessment/ab-2588-supplemental-guidelines-201809.pdf>

South Coast AQMD's AB 2588 Supplemental Guidelines. Anaplex's modified HRA was conditionally approved on October 9, 2018. The HRA was submitted to OEHHA for their review. Therefore, the HRA is conditionally approved, pending any further comments or edits by OEHHA. The HRA results representing the 2016 inventory year indicated that Anaplex posed a maximum cancer risk of 931 in-a-million for a residential receptor located at the corner of Madison Street and Illinois Avenue, based on a 30-yr exposure, and 2,836 in-a-million for a worker receptor located immediately south of Anaplex, based on a 25-yr exposure. The cancer risk was mainly due to hexavalent chromium emissions from spray booth operations. A cancer burden of 9.73 was estimated, based on a 70-yr exposure.

The maximum non-cancer chronic hazard indices of 0.06 and 2.02 were projected for residential and non-residential receptors, respectively. The maximum non-cancer 8-hour chronic hazard index is 0.11 and the maximum non-cancer acute hazard index was 23.84 at Anaplex's property boundary.

Since the HRA results were above the Significant Risk Level in Rule 1402, Anaplex was required to notify the public about the health risk in addition to conducting annual public notification meetings until the Rule 1402 Action Risk Level was achieved pursuant to Rule 1402(p). Notices of the public notification meeting were sent out to over 35,000 people in the area of impact. South Coast AQMD staff held a public notification meeting at the Progress Park Community Center on December 1, 2018 to explain the impact of Anaplex's emissions on public health and to discuss next steps. South Coast AQMD staff were reviewing the Revised RRP at the end of 2018.

#### ***A.3. Arconic Global Fasteners & Rings, Inc. (ID 134931) – Fullerton***

Arconic Global Fasteners & Rings, Inc. (Arconic) manufactures precision fastening systems and components for the aerospace industry. They operate plating lines, ovens and abrasive blasting equipment.

This facility has an HRA that was approved in November 1997 with elevated cancer risks requiring risk reduction. The RRP was submitted in February 2001 and approved March 2001. The RRP involved eliminating use of perchloroethylene as a cleaning solvent, and installing scrubbers to control emissions of various metals from plating operations. This RRP was fully implemented and approved in October 2003. However, the resulting acute hazard index was greater than 1.0 due to use of sodium hydroxide as part of the plating operations.

The facility voluntarily submitted an HRA to demonstrate that the acute hazard index is no longer greater than 1.0. This document is currently under review.

#### ***A.4. The Boeing Company (ID 16660) – Huntington Beach***

The Boeing Company (Boeing Huntington Beach) is part of the Boeing Defense, Space, & Security division of The Boeing Company and located in Huntington Beach. Boeing Huntington Beach manufactures aerospace parts, applies coatings and finishes, and conducts polishing and grinding activities.

On January 31, 2018, South Coast AQMD staff sent a letter requesting Boeing Huntington Beach to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10

based on its 2015 annual emissions. The main air toxic contributing to the priority score is methylene phenyl diisocyanate (MDI). On February 27, 2018, Boeing Huntington Beach sent South Coast AQMD staff modifications to their reported MDI emissions and requested the priority score to be updated. After review of the modifications, South Coast AQMD staff sent a letter on May 18, 2018, revising Boeing Huntington Beach's priority score to be less than 10.

Boeing Huntington Beach is still required to prepare annual emission reports and quadrennial emissions inventories. The next quadrennial emissions inventory year will be 2019.

#### ***A.5. Boral Roofing LLC (ID 1073) – Corona***

Boral Roofing, LLC (Boral Roofing) is a clay and concrete tile manufacturing plant located in the City of Corona. Boral Roofing has two production lines for manufacturing clay roof tiles. Clay is delivered by trucks and then premixed by a skip loader. The clay is then grounded into a fine powder in a mill, screened, and transported to storage silos. Clay is transferred by belt conveyor to their manufacturing process where it is mixed with water and additives in pug mills. The wet clay mixture is extruded to tile form, then dried and fired in various natural gas kilns.

On March 20, 2017, South Coast AQMD staff sent a letter requesting Boral Roofing to prepare an ATIR due to the facility having a priority score greater than 10 based on its 2015 annual emissions with hexavalent chromium and arsenic as the main air toxics contributing to the high priority score.

The ATIR was submitted on August 25, 2017. Following comments from South Coast AQMD staff regarding technical discrepancies, Boral Roofing submitted the revised ATIR on November 16, 2017 which included corrections to calculations for hexavalent chromium that resulted in lower emissions. On March 27, 2018, South Coast AQMD staff sent a letter to Boral Roofing requiring the submittal of an HRA. Boral Roofing submitted the HRA on June 26, 2018. After review by staff, the HRA was approved on September 13, 2018. The results of the HRA showed that the Notification Risk Level was exceeded by the non-cancer chronic hazard index for the maximum exposed worker receptor. The chronic health risks are mainly due to arsenic, hydrogen fluorides, and hydrogen chlorides from the kilns. The area of notification was to the north of the facility. Since the area affected only a single property owned by City of Corona, a public notification meeting was not held. However, a public notification letter detailing the health risks was sent to the City of Corona on October 19, 2018.

#### ***A.6. Chevron Products Co. (El Segundo Refinery) (ID 800030) – El Segundo***

Chevron Products Co. (Chevron ES) is a 1,000 acre petroleum oil refinery in the City of El Segundo with a 290,000 barrels of crude oil per day processing capacity. Chevron ES has approximately 20% of the gasoline market share in Southern California and is one of the largest refineries on the West Coast. The main products of the refinery are transportation fuels, such as gasoline, jet fuel, and diesel fuel.

On October 14, 2016, South Coast AQMD staff sent a letter requesting Chevron ES to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with furans, polycyclic aromatic hydrocarbons, arsenic, cadmium, and related compounds as the main air toxics contributing to the high priority score. Chevron elected to participate in the Voluntary Risk Reduction Program and submitted a VRRP on March 27, 2017.

Reductions of diesel particulate matter (DPM) from unpermitted internal combustion engines are an element of the VRRP. In 2018, staff have worked with the permitting teams to evaluate options for incorporating these requirements so that they are enforceable. Technical review is complete and VRRP approval is expected in early 2019.

***A.7. Eisenhower Medical Center (ID 3671) – Rancho Mirage***

Eisenhower Medical Center is a hospital based in Rancho Mirage, California serving the Coachella Valley region.

On June 12, 2018, South Coast AQMD staff sent a letter requesting Eisenhower Medical Center to prepare an ATIR due to the facility having a priority score greater than 10 based on its 2014 annual emissions, with formaldehyde from the cogeneration units as the main air toxics contributing to the high priority score.

On November 9, 2018, Eisenhower Medical Center submitted an ATIR. South Coast AQMD staff reviewed the submittal and worked with the facility to make some necessary revisions such as building and stack coordinates in addition to emission estimation methods. Based on results from preliminary analysis of the ATIR and discussion with the facility, Eisenhower Medical Center submitted a request to source test both cogeneration units for formaldehyde, 1-3 butadiene, and acetaldehyde. At the end of 2018, staff was awaiting the submittal of a source test protocol.

***A.8. Elite Comfort Solutions (ID 182610) – Commerce***

Elite Comfort Solutions (Elite Comfort) operates a facility in city of Commerce and manufactures polyurethane foam for bedding, furniture, packaging, automotive, and medical industries.

On January 31, 2018, staff sent a letter requiring Elite Comfort to either prepare an ATIR or VRRP due to the facility having a priority score greater than 10 based on 2015 annual emissions, with toluene diisocyanates as the main air toxic contributor to the high priority score.

Elite Comfort elected to participate in the Voluntary Risk Reduction Program and submitted the VRRP on June 22, 2018. Following review, staff required Elite Comfort to provide missing information and to make several revisions. Elite provided information and a revised submittal on November 7, 2018. In reviewing this submittal, however, South Coast AQMD staff found that additional risk reduction measures were necessary in order to meet the Voluntary Risk Reduction Threshold. In response, the facility submitted revisions to the VRRP on December 3, 2018, and another one on December 17, 2018. South Coast AQMD staff is currently reviewing the revised VRRP.

***A.9. Equilon Enter. LLC, Shell Oil Prod. US (ID 800372) – Carson***

Equilon Enterprises LLC (Equilon) operates a petrochemical product distribution terminal in the City of Carson which is comprised of loading racks, storage tanks, and product pipeline. The products are transported by pipeline, trucks, or rail.

On October 10, 2017, South Coast AQMD staff sent a letter requesting Equilon to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015

annual emissions with benzene, ethyl benzene, and naphthalene emissions as the main air toxics contributing to the high priority score. Equilon elected to prepare an ATIR and submitted it on March 9, 2018. After review and subsequent revisions, South Coast AQMD sent a letter to Equilon on May 30, 2018 approving the ATIR and requiring the preparation of an HRA.

On August, 28, 2018, Equilon submitted an HRA. The HRA is currently under review.

***A.10. Fontana Paper Mills Inc. (ID 11716) - Fontana***

Fontana Paper Mills Inc. (Fontana Paper Mills) is a manufacturing plant for asphalt roofing material, including shingles and saturated and coated roofing paper underlayments. The facility recycles paper products and manufactures roll stock for shingle backing or underlayments. The emissions from the asphalt mixer, heater and rollcoater are controlled by thermal oxidizer. Other emissions from the saturator process are controlled by a scrubber, followed by a high efficiency air filter. Emissions of polycyclic aromatic hydrocarbons are the main toxic pollutant of concern and can occur when asphalt is heated.

South Coast AQMD staff noted discrepancies in reported emissions from three asphalt roofing companies and determined that additional investigation was warranted. As a result, on October 14, 2016, South Coast AQMD staff requested an emissions inventory update from Fontana Paper Mills in order to get a better understanding of actual emissions and corresponding health risks. Because Fontana Paper Mills did not have a previously approved HRA, an ATIR was requested based on its 2014 annual emissions. The ATIR was submitted on March 14, 2017, and the facility proposed source testing of toxic air contaminants at the high efficiency air filter vents. However, since Fontana Paper Mills was undergoing modifications in order to be able to manufacture products using polymer asphalt, source testing was postponed until construction for the modified manufacturing line has been completed. Construction was not completed in 2018 and therefore emissions from the high efficiency air filter vents were approximated using a different methodology. Based on this methodology, an updated emissions inventory was received on June 15, 2018 and a preliminary HRA analysis was completed by South Coast AQMD staff. On June 28, 2018, an ATIR approval letter was sent to Fontana Paper Mills informing them that the preliminary HRA analysis demonstrated that an HRA would not be required.

***A.11. Garrett Aviation Services LLC dba Standard Aero (ID 155828) – Los Angeles***

Garrett Aviation Services operated a facility in Los Angeles near the Los Angeles International Airport that performed maintenance, repair, and overhaul of business jets. The facility operated jet engine test cells, spray booths and a brush plating tank.

On April 20, 2018, South Coast AQMD staff sent a letter requiring Garrett to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2016 annual emissions with arsenic emissions from the jet engine test cell as the main air toxic contributing to the high priority score.

On April 25, 2018, South Coast AQMD staff were notified by the facility contact that the facility had cancelled all permits and permanently shut down on March 16, 2018 and therefore no further action was required.

### ***A.12. Gerdau/TAMCO (ID 18931) – Rancho Cucamonga<sup>21</sup>***

Gerdau/TAMCO (Gerdau) is located in the City of Rancho Cucamonga and was acquired by TAMCO steel mini mill in October 2010. The facility produces steel reinforcing bars that are commonly used in construction. Ferrous steel scrap is recycled and delivered to the facility by trucks and rail, and then melted in an electric arc furnace to produce steel billets. The billets are reheated in a reheat furnace to form concrete reinforcing bar (rebar). The primary pollutants for this facility are hexavalent chromium, nickel, manganese, mercury, and arsenic.

Gerdau was directed to submit an ATIR and HRA based on significantly high levels of cadmium reported in its 2011 annual emissions reporting. The HRA was approved on October 8, 2015 based on the 2015 OEHA Risk Assessment Guidelines. Several health risks in the approved HRA exceeded levels specified in Rule 1402 and Gerdau was therefore required to notify the public regarding the results of its HRA, and also submit a RRP. Notices of the public notification meeting were sent out to 1,523 people in the area where the health risks were above the levels established in Rule 1402. South Coast AQMD staff held a public notification meeting on November 30, 2015 to explain the impact of Gerdau's emissions on public health and to discuss next steps.

Gerdau submitted its first RRP on April 5, 2016. After review of the RRP and several meetings with facility representatives, South Coast AQMD staff provided comments on the RRP and on July 1, 2016, Gerdau submitted a revised RRP. However, the revised RRP did not account for hexavalent chromium emissions from ladle heaters, billet reheat furnace, and spray chamber stack. South Coast AQMD staff added these emissions which resulted in a projected potential maximum residential cancer risk of 8.7 in-a-million. The cancer burden and acute and chronic HI remain below 1, so after making these revisions, South Coast AQMD staff conditionally approved Gerdau's RRP on July 5, 2016. The RRP consisted of ten risk reduction measures to be completed by January 5, 2019.

On July 5, 2017, Gerdau submitted a progress report to update South Coast AQMD on the status of its risk reduction measures. . On January 25, 2018, Gerdau submitted an amendment to the RRP to specify plans to pave vehicle travel paths, which South Coast AQMD staff approved. On July 13, 2018, Gerdau submitted their second progress report indicating that they implemented seven of the ten risk reduction measures, while three of the measures are still in process. A public notice of risk reduction activities by Gerdau was mailed out to the notification area on September 18, 2018. South Coast AQMD staff continues to monitor the progress of the RRP and anticipates all risk reduction measures to be implemented within specified timeframes.

### ***A.13. Glendale City, Glendale Water & Power (ID 800327) – Glendale***

Glendale Water & Power (GWP) is a municipal power plant owned and operated by the City of Glendale. GWP consists of three utility boilers and eight stationary combustion turbines with a combined 238 MW generation capacity. These units combust natural gas which is supplemented by methane gas from a Class III landfill.

---

<sup>21</sup> <http://www.aqmd.gov/home/rules-compliance/compliance/toxic-hot-spots-ab-2588/gerdau>

On March 1, 2017, South Coast AQMD staff sent a letter requesting GWP to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with dioxins and furans, hexavalent chromium, and arsenic as the main air toxics contributing to the high priority score.

GWP elected to prepare an ATIR and submitted it on July 28, 2017. On March 22, 2018, the ATIR was approved and the facility notified to prepare an HRA. On July 18, 2018, the HRA was submitted. HRA was approved in early part of 2019.

#### *A.14. GS II, Inc. (ID 183567) – Wilmington*

GS II, Inc. (GS II), located in the City of Wilmington, manufactures asphalt roof shingles. The manufacturing process at the facility includes asphalt storage tanks, asphalt heaters, roll coaters and saturators and are primary emission sources. Up until November of 2016, GS II operated under facility ID 57094.

As described previously, due to discrepancies in reported emissions from three asphalt roofing companies, on October 28, 2016, South Coast AQMD staff sent a letter requesting GS II to prepare either an ATIR or a VRRP in order to get a better understanding of actual emissions and corresponding health risk. On November 14, 2016, GS II staff informed South Coast AQMD staff of their intention to participate in the Voluntary Risk Reduction Program. However, GS II informed South Coast AQMD staff on November 1, 2017 that the company wanted to opt out of the Voluntary Risk Reduction Program. As a result, on November 1, 2017 South Coast AQMD staff terminated GS II's participation in the Voluntary Risk Reduction Program and notified GS II that an ATIR and HRA was due within 90 days of the notification letter.

On January 30, 2018, GS II submitted an ATIR and a HRA to South Coast AQMD for review. The HRA was approved on February 21, 2018. Since the HRA showed a non-cancer acute hazard index of 1.82 due to hydrogen sulfide emissions from the laminant storage tank, public notification was required. On March 28, 2018, a public notification letter was sent to Phillips 66 Wilmington Refinery, which was the sole party impacted.

#### *A.15. Hixson Metal Finishing (ID 11818) - Newport Beach <sup>22</sup>*

Hixson Metal Finishing (Hixson) located in the City of Newport Beach, is a metal finishing facility that conducts anodizing, testing, plating, coating, and painting operations on various parts for use in the aerospace and defense industries. Some of the potential onsite sources of emissions include the chrome anodizing line, nickel and cadmium plating, curing and drying ovens, paint spray booths, abrasive blasting equipment, wastewater treatment system and miscellaneous natural gas combustion sources. The major source of concern with Hixson's operation is fugitive dust containing hexavalent chromium. On April 3, 2014, South Coast AQMD staff required Hixson to prepare and submit a HRA and a RRP, in conjunction with a Stipulated Order for Abatement approved by South Coast AQMD's Hearing Board that limited Hixson's activities, and required shutdown of certain operations using hexavalent chromium if monitored ambient levels exceeded specified hexavalent chromium levels.

---

<sup>22</sup> <http://www.aqmd.gov/home/regulations/compliance/toxic-hot-spots-ab-2588/hixson-metal-finishing>

Hixson submitted their HRA to South Coast AQMD on November 13, 2014. Upon detailed review and use of the 2015 OEHHA Risk Assessment Guidelines, South Coast AQMD staff finalized the submitted HRA on May 8, 2015. The approved HRA found a maximum residential cancer risk of 1,502 in-a-million mainly from hexavalent chromium emissions. The estimated cancer risk was based on emissions occurring before the facility instituted various control measures and today's level of risk is substantially lower. Since the HRA results were above the Significant Risk Level in Rule 1402, Hixson was required to notify the public about the health risk in addition to conducting annual public notification meetings until the Rule 1402 Action Risk Level was achieved pursuant to Rule 1402(p). Notice of the public notification meeting was sent out to over 7,300 people in the area of impact. South Coast AQMD staff held a public notification meeting at the Hoag Conference Center on June 18, 2015.

Hixson submitted its first RRP on March 2, 2015. On May 8, 2015, South Coast AQMD staff rejected Hixson's first RRP and required resubmittal. Hixson subsequently submitted a second RRP on June 5, 2015. On June 26, 2015, South Coast AQMD staff rejected Hixson's second RRP due to its failure to demonstrate that the proposed controls reduce risks below Rule 1402 thresholds. Hixson resubmitted a revised RRP on July 1, 2015, and South Coast AQMD staff conditionally approved it on July 24, 2015. The associated permits to construct implementing the RRP were approved on December 11, 2015 and a second public notification meeting was held on February 11, 2016 at the Hoag Conference Center to inform interested parties regarding the key activities surrounding the RRP. In the 2016 Annual Report for the AB 2588 Program, staff incorrectly stated that the RRP was fully implemented as of December 31, 2016. The Order for Abatement expired on December 31, 2016, as Hixson had constructed all the measures contained in the RRP. However, one of the risk reduction measures requires all emissions from Building 2 to be captured and routed through a dry scrubber followed by ULPA filters. The existing chromic acid anodizing tank (Tank 70) is located in Building 2 and currently has a control system that includes an ULPA filtration system. As part of the modifications to Building 2, existing Tank 70 is being replaced with a new chromic acid anodizing tank (also designated Tank 70) vented to the new Building 2 control system, which also includes ULPA filtration. However, there was an issue with the temperature controls for the new Tank 70, which has delayed its operation. Since the existing Tank 70 is already being controlled by an ULPA filtration system, there are no additional emissions expected from the continued operation of existing Tank 70 compared to new Tank 70, as proposed in the RRP. Ambient monitoring for hexavalent chromium continues in the vicinity of Hixson. As of the end of 2018, the new Tank 70 is constructed but source testing on the unit is still being evaluated in order to determine compliance with the RRP.

#### *A.16. Holliday Rock Co., Inc. (ID 41580) – Rialto*

Holliday Rock Co., Inc. (Holliday Rock) is a hot mix asphalt plant located in Rialto. There are multiple locations of Holliday Rock in the South Coast air basin. It is one of the largest independent producers of aggregate, ready mix concrete, and hot mix asphalt in the United States.

On December 20, 2018, South Coast AQMD staff sent a letter requiring Holliday Rock to prepare an ATIR due to the facility having a priority score greater than 10 based on its 2017 emissions. The main toxic air contaminants contributing to the priority score are manganese and manganese

compounds, mercury and mercury compounds, and nickel and nickel compounds. The main sources of emissions are from cement silos and loadout hoppers.

Holliday Rock's ATIR is due on May 19, 2019.

***A.17. Kirkhill Inc (ID 187823) – Brea***

Kirkhill Inc (Kirkhill) is a rubber manufacturing facility located in Brea. Kirkhill produces multiple types of rubbers for industries including aerospace and medical manufacturing. The rubber manufacturing process includes raw material mixing, milling, pressing, and various types of curing.

On January 31, 2018, South Coast AQMD staff sent a letter requesting Kirkhill to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 emissions. The main air toxic contributing to the priority score is hexavalent chromium from mixers, mills, presses, ovens, autoclave, and roto-curing devices.

Kirkhill elected to prepare an ATIR and submitted it on July 3, 2018. On October 19, 2018, South Coast AQMD staff sent a letter to the facility approving the ATIR and requiring the preparation of an HRA based on the approved ATIR. The HRA is due on January 17, 2019.

***A.18. LA City, Sanitation Bureau (Hyperion Treatment Plant) (ID 800214) – Playa del Rey***

The City of Los Angeles owns and operates the Hyperion Water Reclamation Plant (Hyperion) in the Playa del Rey community. Hyperion is a publically owned wastewater treatment plant with over 275 million gallon capacity with primary and full secondary treatment processes. As part of the treatment process, more than 885,000 pounds of solid and organic materials are removed daily and treated through anaerobic digestion.

On October 28, 2016, South Coast AQMD staff sent a letter requesting Hyperion to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with perchloroethylene and arsenic as the main air toxics contributing to the high priority score.

On November 23, 2016, Hyperion elected to participate in the Voluntary Risk Reduction Program and submitted a VRRP on January 24, 2017. Throughout 2018, South Coast AQMD and Hyperion staff have been working to resolve various issues regarding electronic format of the emissions inventory, the use of unapproved source tests, the distribution of emissions, and receptor grid spacing. This information was under review at the end of 2018.

***A.19. Lubeco Inc (ID 41229) – Long Beach***

Lubeco, Inc. (Lubeco) is a metal finishing company operating in Long Beach near the southern border of the City of Paramount. Lubeco's primary operations involve painting, surface preparation, anodizing, sealing and coating of metals for the aerospace industry. Ancillary operations include abrasive blasting, wastewater treatment, and operation of a natural gas-fired boiler and ovens.

Lubeco utilizes baking and drying ovens, spray booths, tanks for chromic acid anodizing, aqueous solutions, and acid surface preparations. These processes can potentially generate hexavalent chromium emissions.

Beginning in October 2016, through expanded monitoring efforts in the City of Paramount, South Coast AQMD staff found high concentrations of hexavalent chromium in the vicinity of Lubeco. As a result, Lubeco was selected as a host facility for testing of hexavalent chromium emissions from a heated sodium dichromate seal tank due to elevated ambient monitoring readings in the nearby south Paramount area. On April 27, 2017, South Coast AQMD staff conducted source tests for hexavalent chromium emissions from the sodium dichromate seal tank with the main objective of determining an emission factor to calculate emissions from such tanks used in plating operations. The results of the source tests showed the heated sodium dichromate tank to be a source of hexavalent chromium. The second objective of this testing was to identify potential sources of hexavalent chromium emissions as measured by South Coast AQMD ambient air monitors in the nearby south Paramount area. South Coast AQMD subsequently filed a petition for Order for Abatement with the Hearing Board. Following the hearings on August 17 and August 23, 2017, the Hearing Board granted South Coast AQMD permission to install ambient monitors and a meteorological station on the facility property and permission to conduct additional source tests.

Because of the ambient measurements, South Coast AQMD staff notified Lubeco on September 8, 2017 that the facility may be designated as a Potentially High Risk Level Facility. Lubeco representatives and South Coast AQMD staff met on September 22, 2017 to discuss the monitoring results that had led to the notification. On September 28, 2017, Lubeco was officially designated as a Potentially High Risk Level Facility. As part of this designation, Lubeco was required to expeditiously reduce risks and to submit an Early Action Reduction Plan by December 27, 2017, an ATIR by February 27, 2018, a HRA and a RRP by March 27, 2018. The Early Risk Reduction Plan was submitted on December 8, 2017. On January 12, 2018, South Coast AQMD sent Lubeco an approval letter for the Early Risk Reduction Plan. On February 9, 2018, Lubeco submitted an ATIR followed by an HRA and RRP on March 27, 2018. Staff is currently reviewing all submitted documents.

#### *A.20. MM West Covina LLC (ID 113873) – WestCovina*

MM West Covina is a cogeneration facility located on the BKK Landfill in the City of West Covina. Landfill gas from the inactive BKK Landfill, which received Class I and Class III waste, is combusted in the facility's steam generator. The steam powers a 7,100 kW capacity steam turbine to produce electricity.

On January 11, 2017, South Coast AQMD staff sent a letter requesting MM West Covina to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on 2014 annual emissions with dioxins and hexavalent chromium being the main air toxic contributors to the high priority score.

On February 15, 2017, MM West Covina elected to prepare an ATIR. The ATIR was submitted on June 13, 2017. South Coast AQMD staff provided comments on August 17, 2017 requiring revisions to the ATIR which was provided on August 29, 2017. South Coast AQMD staff approved the ATIR on March 27, 2018, and notified the facility to prepare and submit a HRA by June 26,

2018. MM West Covina submitted an HRA on July 2, 2018. After review, on August 1, 2018, South Coast AQMD staff informed the facility that HRA did not include all of the emissions, specifically dioxins and furans, from the approved ATIR and therefore rejected the HRA. MM West Covina opted to conduct a source test to address the accuracy of the inventory of dioxin and furans in the ATIR. At the end of 2018, the source test result has been submitted and is under review.

***A.21. Orange County Sanitation District, Fountain Valley (Plant No. 1) (ID 17301) – Fountain Valley***

The Orange County Sanitation District (OCSD) is a public agency that provides wastewater collection, treatment, and reclamation services in central and northwest Orange County. Plant No. 1, located in Fountain Valley, is one of the two wastewater treatment plants operated by OCSD. Plant No. 1 treats wastewater from residential, commercial and industrial sources using advanced primary and secondary treatment.

On April 28, 2017, South Coast AQMD staff sent a letter requesting OCSD Plant No. 1, to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on 2015 annual emissions with formaldehyde being the main air toxic contributor to the high priority score. Formaldehyde emissions were from three cogeneration engines combusting primarily digester and supplemental natural gas. Digester gas is produced at the facility through anaerobic digestion, which is part of the solids processing facilities.

OCSD elected to participate in the Voluntary Risk Reduction Program, and submitted the VRRP on September 25, 2017. The plan focused on installation of oxidation catalysts on the exhaust of the three engines, which serves to reduce formaldehyde emissions and emissions of nitrogen oxides. The oxidation catalyst system was previously planned and fully permitted on February 28, 2017. On April 11, 2018, South Coast AQMD staff approved the VRRP.

***A.22. Orange County Sanitation District, Huntington Beach (Plant No. 2) (ID 29110) – Huntington Beach***

The Orange County Sanitation District (OCSD) is a public agency that provides wastewater collection, treatment, and reclamation services in central and northwest Orange County. Plant No. 2, located in Huntington Beach, is one of the two wastewater treatment plants operated by OCSD. Plant No. 2 treats wastewater from residential, commercial and industrial sources using advanced primary and secondary treatment.

On April 28, 2017, South Coast AQMD staff sent a letter requesting OCSD Plant No. 2 to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on 2015 annual emissions with formaldehyde being the main air toxic contributor to the high priority score. Formaldehyde emissions were from three cogeneration engines combusting primarily digester and supplemental natural gas. Digester gas is produced at the facility through anaerobic digestion, which is part of the solids processing facilities.

OCSD elected to participate in the Voluntary Risk Reduction Program, and submitted the VRRP on September 25, 2017. The plan focused on the installation of oxidation catalysts on the exhaust of the three engines, which serves to reduce formaldehyde emissions and emissions of nitrogen

oxides. The oxidation catalyst system was previously planned and fully permitted on February 28, 2017. On April 12, 2018, South Coast AQMD staff approved the VRRP.

#### ***A.23. Phillips 66 Co/LA Refinery Wilmington Plant (ID 171107) – Wilmington***

The Phillips 66 Company operates two linked facilities, five miles apart, in Carson and Wilmington. The Phillips 66 Wilmington Refinery (Wilmington Refinery) was built in 1919 and is situated on approximately 424 acres. As described previously, this facility receives and processes intermediate product from the Carson facility and produces petroleum fuels as well as fuel-grade petroleum coke. Air toxic emissions are generated from fluid catalytic cracking, steam generation, electricity generation, and sulfuric acid production processes.

On March 1, 2017, South Coast AQMD staff sent a letter requesting Wilmington Refinery to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with hexavalent chromium and polycyclic aromatic hydrocarbons being the main air toxic contributors to the high priority score.

Wilmington Refinery elected to prepare an ATIR, and submitted the ATIR on August 1, 2017. Following review, South Coast AQMD staff found several deficiencies. Revisions were submitted by Wilmington Refinery staff on November 10, and December 20, 2017. Staff subsequently requested calculations and supporting data. The latest revision was submitted on December 19, 2018 and is currently under review.

#### ***A.24. Phillips 66 Company/Los Angeles Refinery (ID 171109) - Carson***

The Phillips 66 Company operates two facilities, five miles apart, in Carson and Wilmington. The Phillips 66 Carson Refinery (Carson Refinery) was built in 1923 and is situated on approximately 235 acres. The refinery processes mainly heavy, high-sulfur crude oil, which is received by pipeline and at a terminal in the Port of Long Beach. The Carson Refinery produces intermediate product, which is then sent to the Phillips 66 Wilmington Refinery for further processing to produce petroleum fuels and fuel-grade petroleum coke. These facilities have fluid catalytic cracking, alkylation, hydrocracking, coking and naphtha reforming units.

On March 1, 2017, South Coast AQMD staff sent a letter requesting Carson Refinery to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on 2015 annual emissions with arsenic and sulfuric acid being the main contributors to the high priority score. These emissions were mainly from crude distillation, hydro-treating, and steam generation processes at the facility.

Carson Refinery elected to participate in the Voluntary Risk Reduction Program, and submitted the VRRP on August 1, 2017. Following review, South Coast AQMD staff noted several deficiencies. Revisions and clarifications were provided by Carson Refinery staff on multiple instances in 2017 and 2018. South Coast AQMD staff is currently reviewing the latest submittal from September 11, 2018. Reductions of DPM from unpermitted internal combustion engines are an element of the VRRP. In 2018, staff have worked with the permitting teams to evaluate options for incorporating these requirements so that they are enforceable.

### A.25. *Quemetco Inc (ID 8547) – City of Industry* <sup>23</sup>

Quemetco operates a battery recycling and lead recovery facility in the City of Industry. At this facility, used batteries are received, fragmented, and the lead-containing materials are recovered and purified. The primary pollutants for this facility are arsenic, lead, benzene, and 1,3-butadiene.

Multiple AB 2588 HRAs have been approved for Quemetco in the past, most recently in 2010. In October and November 2013, South Coast AQMD staff conducted source tests at Quemetco. The results of the 2013 source tests showed elevated arsenic, benzene, and 1,3-butadiene emissions compared to previous 2009, 2010, and 2012 source tests. As a result, on December 10, 2013, South Coast AQMD staff requested that Quemetco prepare and submit an HRA pursuant to Rule 1402. Quemetco submitted an HRA on May 9, 2014. South Coast AQMD staff sent a comment letter on September 23, 2014 requiring Quemetco to revise their HRA in several areas including an assessment of potential lead impacts relative to the NAAQS, and to address minor comments from the OEHHA. Quemetco provided an updated HRA in January 2015. South Coast AQMD staff requested that Quemetco prepare a new HRA to include two scenarios: 1) a baseline scenario utilizing the November 2013 South Coast AQMD source test input into the dispersion model, and 2) dispersion modeling that reconciled any potential differences between onsite fenceline monitoring data that became available in 2014 and source tests also available from 2014. Quemetco provided an updated HRA in May 2015. On September 16, 2015, South Coast AQMD sent Quemetco a tentative approval of the staff-modified revised HRA. Quemetco commented that the monitoring data collected onsite required revision before incorporating into the HRA. South Coast AQMD staff evaluated Quemetco's monitoring data in late 2015 and early 2016. Onsite fenceline monitoring data was corrected for pre-existing arsenic on blank filters and the dispersion modeling source parameters were also adjusted.

Additionally, in 2014, South Coast AQMD staff initiated a technology demonstration pilot study for in-stack continuous emissions monitoring system (CEMS) and fenceline/perimeter ambient air monitoring for multi-metals. Contracts with Cooper Environmental Services, the only manufacturer of these types of continuous monitors, were initiated to implement the study. The pilot study was conducted at Quemetco and Gerdau in 2015. Preliminary findings from 2015 for ambient multi-metal monitor showed favorable results for lead and less quantitative results for other metals, but most results were useful for trend detection. Quemetco purchased the in-stack CEMS.

South Coast AQMD staff approved the HRA on May 17, 2016 with some revisions. The approved HRA showed that the residential cancer health risk was 16 in-a-million, the worker chronic HI was 1.28, and the cancer burden was 2.0. These values exceeded the Action Risk Level of Rule 1402 and public notification and a RRP were required. Notice of the public meeting was sent to approximately 8,000 residents and businesses within the public notification area. A public notification meeting was held on June 23, 2016 at La Puente High School.

Quemetco submitted an RRP on November 16, 2016. As part of the RRP, Quemetco proposed using in-stack multi-metals CEMS to ensure that Rule 1402 risk thresholds are not exceeded. Quemetco's RRP was conditionally approved on June 22, 2017. The conditions for approval were

---

<sup>23</sup> <http://www.aqmd.gov/home/regulations/compliance/toxic-hot-spots-ab-2588/quemetco>

all related to operation of the CEMS. On June 19, 2018, Quemetco submitted the final implementation report for the RRP. South Coast AQMD approved this report on July 27, 2018.

In addition, Quemetco has requested a permit modification to allow a 25% increase in their daily throughput. South Coast AQMD staff is processing this permit request, and is also preparing an Environmental Impact Report (EIR) as required by the California Environmental Quality Act (CEQA). The EIR will evaluate the potential environmental impacts of this proposed permit modification and will include an analysis of the health risks associated with the throughput increase. There will be multiple opportunities for the public to provide input on the EIR. The Final EIR will include responses to all comments received and must be certified before the permit modification request can be considered for approval.

#### ***A.26. So Cal Edison Co (ID 4477) – Pebbly Beach***

So Cal Edison Co (SCE Pebbly Beach) is the primary producer of electric power for Santa Catalina Island and is located approximately one mile southeast of the city of Avalon. Electricity is generated using six diesel-fired engines. There is also a diesel-fired backup generator and 23 microturbines. Diesel fuel and liquefied petroleum gas (LPG) are periodically shipped in and stored at the facility. LPG is vaporized to produce a petroleum gas and air mixture to form a natural gas surrogate, where it is sent to either local residents or combusted in the microturbines.

On June 13, 2018, South Coast AQMD staff sent a letter requiring SCE Pebbly Beach to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 emissions. The main air toxic contributing to the priority score is DPM from the six diesel-fired internal combustion engines.

SCE Pebbly Beach elected to prepare an ATIR and submitted it on November 13, 2018. The ATIR is currently under review.

#### ***A.27. So Cal Gas Co./Playa del Rey Storage Facility (ID 8582) – Playa del Rey***

Southern California Gas Company (SoCal Gas) is a public utilities company that owns and operates a natural gas storage facility in the Playa del Rey community in the City of Los Angeles. Natural gas is compressed and stored in underground reservoirs. Transmission pipelines distribute natural gas to and from the facility. Primary equipment at the facility include three natural gas internal combustion engines driving air compressors to facilitate storage of natural gas.

On May 31, 2017, South Coast AQMD staff sent a letter requesting SoCal Gas to prepare an ATIR due to the facility having a priority score greater than 10 based on its 2015 annual emissions with formaldehyde, 1,3-butadiene and benzene being the main air toxic contributors to the high priority score. On October 31, 2017, the ATIR was submitted.

On March 22, 2018, the ATIR was approved and SoCal Gas was required to submit an HRA based on the approved ATIR. The HRA was submitted on June 7, 2018 and is currently under review.

***A.28. So Cal Holding, LLC (ID 169754) – Huntington Beach***

SoCal Holding, LLC (SoCal Holding) is a subsidiary of California Resources Corporation, an oil and natural gas exploration and production company. SoCal Holding leases and operates oil production wells, mainly in Huntington Beach with some wells located offshore on a platform approximately 1.5 miles from shore. Recovered field gas is either sold to AES Huntington Beach, combusted in microturbines or flared. The liquid product is stored in tanks linked to truck loading or pipeline.

On October 11, 2017, South Coast AQMD sent a letter requesting SoCal Holding to prepare an ATIR due to the facility having a priority score greater than 10 based on 2015 annual emissions with polycyclic aromatic hydrocarbons and benzene being the main air toxic contributors to the high priority score. The source for polycyclic aromatic hydrocarbons emissions was a flare located on a leased property northwest of the intersection of Goldenwest Street and Pacific Coast Highway. Benzene emissions were reported as fugitive leaks throughout the facility. The ATIR was received on March 13, 2018. Following review, staff found errors and requested corrections to the ATIR. The corrected ATIR was submitted on July 13, 2018. On July 25, 2018, the corrected ATIR was approved and South Coast AQMD staff directed So Cal Holding to prepare and submit an HRA. The HRA was submitted on October 23, 2018 and is currently under review.

***A.29. Southern California Edison (ID 160437) – Redlands***

Southern California Edison owns and operates a power plant, named the Mountainview Generating Station (Mountainview), in the city of Redlands. The power plant consists of four natural gas-fired turbines, each equipped with duct burners, to generate and provide electricity for the Inland Empire area.

On April 20, 2018, South Coast AQMD staff sent a letter requiring Mountainview to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2014 annual emissions, with polycyclic aromatic hydrocarbons being the main air toxic contributor to the high priority score. Polycyclic aromatic hydrocarbons emissions were due to natural gas combustion in the turbines.

Mountainview elected to prepare an ATIR, which was submitted on September 18, 2018. After review, South Coast AQMD staff requested revision and resubmission. The final ATIR incorporating the corrections was submitted on October 23, 2018. The ATIR was reviewed and approved on December 5, 2018.

***A.30. Tesoro Refining & Marketing Co., LLC, Calciner (ID 174591) – Wilmington***

Tesoro Calciner produces calcined petroleum coke, or raw or “green” petroleum coke heated to high temperatures so that volatile hydrocarbon compounds and excess moisture are heated out of the coke. Equipment in Tesoro Calciner’s operations include a rotary kiln, baghouses, conveyor belts, receiver and separator vessels, an afterburner, surge bins, boiler, bucket elevators, loading and unloading stations, shakers, and storage silos.

On April 28, 2017, South Coast AQMD staff sent a letter requesting Tesoro Calciner to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2016 annual emissions with sulfuric acid, arsenic, manganese, and nickel as the main air toxic contributors to the high priority score. On May 25, 2017, Tesoro Calciner elected to participate in the Voluntary Risk Reduction Program, and subsequently submitted the VRRP on September 21, 2017.

After review of the VRRP, South Coast AQMD staff found several deficiencies and on January 31, 2018, a letter requesting revision and resubmittal of the VRRP was sent to the facility. Tesoro Calciner submitted a revised VRRP on February 26, 2018 and again on September 7, 2018. The latest information involved welding emissions. Staff is ensuring that these calculations are consistent for the various submittals received. This most recent information was under review at the end of 2018.

***A.31. Tesoro Refining & Marketing Co., LLC, Los Angeles Refinery (ID 800436, 174655, 174694, 174703) – Carson and Wilmington***

The Tesoro Los Angeles Refinery (Tesoro Refinery) is located along the city border between the cities of Carson and Wilmington in south Los Angeles County. The Tesoro Refinery was originally two adjacent but not contiguous refineries but has been undergoing consolidation through the Los Angeles Refinery Integration and Compliance Project.<sup>24</sup> The Tesoro Refinery will be comprised of approximately 930 acres with a processing capacity of approximately 380,000 barrels per day. In 2017, the Tesoro Corporation underwent a name change to Andeavor.

On December 22, 2016, South Coast AQMD staff sent a letter requesting Tesoro Refinery to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with polycyclic aromatic hydrocarbons, hexavalent chromium, arsenic, naphthalene, benzene, and cadmium as the main air toxic contributors to the high priority score.

Tesoro Refinery elected to participate in the Voluntary Risk Reduction Program, and submitted their VRRP on May 23, 2017. After initial review, South Coast AQMD staff required Tesoro Refinery to make several revisions. Both South Coast AQMD staff and Tesoro Refinery representatives have met several times regarding the revisions and risk reduction measures proposed. South Coast AQMD staff is currently waiting for the necessary revisions to be submitted before continuing the review of the VRRP. At the completion of 2018, South Coast AQMD staff have identified heaters located at Carson for possible source testing. The intention of source testing is to derive a representative emission profile for heaters located at Carson.

***A.32. Tesoro Refining & Marketing Co., LLC (Sulfur Recovery Plant) (ID 151798) – Carson***

Tesoro Sulfur Recovery Plant (Tesoro SRP) is located in Carson east of the Tesoro Los Angeles Refinery. The facility supports petroleum refinery operations by utilizing the Claus process to recover sulfur in the form of hydrogen sulfide from the byproduct gases of refining crude oil. The facility operates boilers, incinerators, condensers, absorbers, storage tanks, sumps, and sulfur pits.

---

<sup>24</sup> [http://www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2017/tesorolaric/tesoro\\_feir.pdf](http://www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2017/tesorolaric/tesoro_feir.pdf)

On December 22, 2016, South Coast AQMD staff sent a letter requesting Tesoro SRP to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions with arsenic, polycyclic aromatic hydrocarbons, hexavalent chromium, and formaldehyde as the main air toxic contributors to the high priority score.

Tesoro SRP elected to participate in the Voluntary Risk Reduction Program, and submitted the VRRP on May 23, 2017. After review, on February 15, 2018, South Coast AQMD staff sent a letter requesting revisions and resubmittal of the VRRP. Ongoing communication with Tesoro SRP has occurred to develop the most representative emission estimation methodology. On November 9, 2018, a finalized emissions inventory was submitted by Tesoro SRP for South Coast AQMD staff review. Staff are currently reviewing all documents associated with the VRRP.

#### ***A.33. Torrance Refining Company LLC (ID 181667) – Torrance***

Torrance Refining Company LLC (Torrance Refining) is a subsidiary of PBF Energy, an independent petroleum refiner and supplier of unbranded transportation fuels, heating oils, petrochemical feedstocks, lubricants, and other petroleum products. The Torrance Refinery sits on 750 acres in the City of Torrance and has a 155,000 barrels per day of crude oil processing capacity. The refinery produces various petroleum productions along with coke, and sulfur.

On January 11, 2017, South Coast AQMD staff sent a letter requesting Torrance Refining to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2015 annual emissions polycyclic aromatic hydrocarbons,, arsenic, benzene, and cadmium being the main air toxic contributors to the high priority score.

Torrance Refining elected to participate in the Voluntary Risk Reduction Program and was to submit the VRRP on August 24, 2017 for the 2015 inventory year. However, due to the fact that an explosion had occurred at the facility's fluid catalytic cracking unit during 2015, the facility had limited operations during that year, and South Coast AQMD staff decided that 2016 would be more representative of facility's routine operations and, as a result, required Torrance Refining to use 2016 as the inventory year for their VRRP.

The facility submitted the VRRP on August 24, 2017. After review, South Coast AQMD staff sent a comment letter requesting revisions and resubmittal of the VRRP on October 19, 2017. The revised VRRP was received on November 2, 2017. Supplemental information to this submittal was received through May 8, 2018. On July 12, 2018, Torrance Refining requested alteration of risk reduction measures and to submit a revised VRRP. Following discussion with staff, a further revised VRRP was received on December 5, 2018. This VRRP and associated information are currently under review.

#### ***A.34. Triumph Processing, Inc. (ID 800267) – Lynwood***

Triumph Processing, Inc. (Triumph) owns and operates a metal treating and finishing facility in the City of Lynwood. Triumph treats aluminum and titanium parts for the aerospace industry by using anodizing, plating and painting operations.

On May 31, 2017, South Coast AQMD staff sent a letter requesting Triumph to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2014 annual

emissions with MDI being the main air toxic contributor to the high priority score. MDI emissions were due to coating operation in the spray booths.

Triumph elected to prepare an ATIR, which was submitted on October 30, 2017. As part of the ATIR submittal, Triumph staff audited the reported emissions and discovered that they had misreported the quantities of isocyanates and diisocyanates. South Coast AQMD staff evaluated this emissions revision during the review of the ATIR and evaluated research documents which show isocyanates and diisocyanates are fully transformed into epoxies and not emitted into the ambient air. As a result, staff calculated a new priority score below 10. Subsequently, on May 24, 2018, South Coast AQMD staff sent a letter informing Triumph Processing of the revised priority score and that no further action was required in response to the original notice.

#### ***A.35. TST, Inc. (ID 434326) – Fontana***

TST Inc. (TST) conducts secondary aluminum refining of scrap metal. The facility consists of two separate operations, the first produces aluminum ingots from scrap metal, while the second produces billets. Aluminum chips and borings are received in scrap barrels and bins and dumped into a receiving hopper. The chips and borings are crushed and, if necessary, passed through a dryer to remove any oils or coatings. The aluminum is then sent to furnaces where the dross is used to create the billets and ingots.

On April 20, 2018, South Coast AQMD staff sent a letter requesting TST to prepare either an ATIR or a VRRP due to the facility having a priority score greater than 10 based on its 2014 annual emissions with nickel and arsenic as the main air toxics contributing to the high priority score. On May 22, 2018, TST chose to prepare an ATIR and also submitted the initial information for the ATIR. In accordance with Rule 1402(d)(2)(A), TST was required to submit an ATIR within 150 days of the initial notification date. TST failed to meet the required deadline and was issued a Notice to Comply on October 10, 2018. In response, TST submitted an ATIR on October 24, 2018. South Coast AQMD staff reviewed the ATIR and found errors and required resubmittal. A revised ATIR was submitted on November 30, 2018 but contained additional errors. Staff is currently working with TST to ensure a correct inventory is prepared prior to the next submittal.

#### ***A.36. Ultramar Inc (ID 800026) – Wilmington***

Ultramar Refining Company (Ultramar) is a subsidiary of Valero Energy Corporation and operates a 135,000 barrel per day crude oil processing capacity petroleum refinery facility in Wilmington.

On March 29, 2017, South Coast AQMD staff sent a letter requesting Ultramar to either prepare an ATIR or a VRRP due to the facility having a priority score greater than 10 based on 2015 annual emissions with polycyclic aromatic hydrocarbons emissions as the main air toxic contributor to the high priority score.

Ultramar elected to participate in the Voluntary Risk Reduction Program and submitted the VRRP on August 25, 2017. After review by South Coast AQMD staff, items were found to be missing, which included throughput data, emission factors, calculation basis, and certain devices and device descriptions. Ultramar subsequently provided the missing information on September 15 and October 26, 2017. Ultramar provided information on emission factor reference sources on February 26, 2018. However, review indicated that the VRRP still had an incomplete emissions

inventory, among other issues. From March 22, 2018 thru the end of the year, staff provided comments to the facility regarding unaccounted emissions and continued deficiencies in the submitted files. Upon review of revised files received on December 13, 2018, South Coast AQMD staff determined that the facility once again failed to provide all the requested information and another resubmission was required. Staff is currently working on a final request for the facility to send complete information.

*A.37. Univ Cal, Riverside (ID 49387) – Riverside*

The University of California, Riverside (UCR) is a public research university located in the City of Riverside. UCR submitted an HRA based on their 2013 inventory year emissions. The HRA was submitted voluntarily in order for UCR to be exempt from the requirements of South Coast AQMD Rule 1472. Specifically, Rule 1472 (j) provides an exemption for facilities that comply with all applicable requirements of Rule 1402. The emissions inventories prepared pursuant to Rule 1402 must include the emissions from all diesel engines. South Coast AQMD staff reviewed the HRA and approved it with two modifications: using AERMOD for dispersion modeling, and evaluating risk using the risk assessment methodologies from the 2015 OEHHA Guidelines.

The HRA was approved on November 16, 2018 with resulting risk below the Notification Risk Level.

## Appendix B — Summary of Toxic Air Contaminants in the South Coast Air Basin

In addition to South Coast AQMD's periodic Multiple Air Toxics Exposure Studies (MATES), CARB has maintained a long-term continuous toxics monitoring network since the late 1980's.<sup>25</sup> In this chapter, trends in cancer risks are illustrated for sites in the South Coast Air Basin. Health risk levels for the most recent three-year period (i.e., 2015 to 2017) are also shown for the air toxics which are monitored. CARB's monitoring network does not include DPM, which contributes significantly to cancer risks in the Basin. Since this is ambient air quality data, both mobile and stationary emission sources are captured in the health risk levels provided here. Looking at this historical data set illustrates the benefits of past regulatory control efforts.

Four of the approximately 16 current active sites in CARB's statewide toxics monitoring network are in or near the Basin as shown in Figure B-1. CARB's long-term sites are located in Azusa, Los Angeles, and Riverside-Rubidoux. Simi Valley is included in this analysis since it is just outside the western edge of the Basin and represents conditions at the western end of San Fernando Valley. The measurements consist of 24-hour integrated samples collected once every 12 days. Table B-1 lists the toxic air contaminants that are monitored with the carcinogenic compounds identified with an asterisk.

**Figure B-1 — CARB toxic monitoring sites in the South Coast Air Basin**

<sup>25</sup> Information about and data from CARB's toxic monitoring data are available at:  
<http://www.arb.ca.gov/adam/toxics/toxics.html>

**Table B-1 — Toxic Air Contaminants Monitored**

<b>Toxic VOC</b>		<b>Toxic PM</b>
<b>Acetaldehyde*</b>	<b>Methyl Bromide</b>	<b>Hexavalent Chromium*</b>
<b>Acrolein</b>	<b>Methyl Chloroform</b>	<b>Lead*</b>
<b>Benzene*</b>	<b>Methyl Ethyl Ketone</b>	<b>Manganese</b>
<b>1,3-Butadiene*</b>	<b>Methylene Chloride*</b>	<b>Nickel*</b>
<b>Carbon Tetrachloride*</b>	<b>Perchloroethylene*</b>	<b>Selenium</b>
<b>Chloroform*</b>	<b>Styrene</b>	
<b>Ethyl Benzene*</b>	<b>Toluene</b>	
<b>Formaldehyde*</b>	<b>Trichloroethylene*</b>	

\* Carcinogen

The 2015 OEHHA Risk Assessment Guidelines incorporates age sensitivity and exposure factors which increase cancer health risk estimates to residential and sensitive receptors by approximately three times, and more than three times in some cases depending on whether the toxic air contaminant has multiple pathways of exposure in addition to the inhalation pathway. Under the 2015 OEHHA Risk Assessment Guidelines, even though the toxic pollutant concentrations may not have increased, the estimated cancer risk to a residential receptor will increase.

Figure B-2 presents health risk trends using the 2015 OEHHA Risk Assessment Guidelines.<sup>26</sup> The inhalation cancer risk shown is estimated based on a 30-year exposure. Inhalation cancer health risks have decreased significantly at all stations since 1990. Cancer risks have decreased by 71, 82, and 78 percent at Riverside, Los Angeles, and Simi Valley, respectively.<sup>27</sup> Azusa station shows a decrease in cancer risk by 44 percent since 2000.

Note that the Riverside station showed an increase in cancer risk for 2016. This was solely due to higher measured concentrations of methylene chloride for 2016, which were more than 30 times higher than the previous year. The readings for 2017, however, dropped to a level that is more consistent with 2015 and earlier data. Figure B-3 shows the monitored methylene chloride concentrations at the Riverside station from 2000 to 2018, averaged by quarter.

<sup>26</sup> Excluding cancer risks from DPM.

<sup>27</sup> Some concentrations were not available for certain years. In order to avoid under-representing the total cancer risk from all toxic compounds, values are interpolated between years where possible. If data for a certain toxic compound is unavailable for the latest year, the available data point from the most recent prior year is used in its place.

**Figure B-2 — Trends in Inhalation Cancer Risks in the Basin (1990-2017)**

**Figure B-3 — Methylene Chloride Monitored Concentrations at Riverside Station, Averaged by Quarter (2000 to 2018)**

Azusa station started in 1995 as one of the Photochemical Assessment Monitoring Stations (PAMS) network aimed at determining speciated hydrocarbon ozone precursor compounds in ambient air. On October 17, 2006, U.S. EPA issued final amendments to PAMS monitoring requirements in 40 CFR Code 58. On July 1, 2009, to address these amendments, and with site-specific observations from the PAMS network assessment project, Azusa station was reclassified from Type 3 (maximum ozone concentration site) to Type 2 (maximum ozone precursor emissions impact site or above 8-hour ozone). The proposed change addressed the National PAMS Network Assessment that Azusa has high Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NOX) concentrations, with lower ozone concentrations. The site now more closely resembles a Type 2 ozone precursor site.

The reduction in cancer risk at the Azusa station is primarily from reductions in ambient concentrations of benzene and 1,3-butadiene. Benzene accounts for 41 percent of the cancer risk reduction and 1,3-butadiene accounts for 46 percent of the cancer risk reduction.

The cancer risk reductions shown in Figure B-2 occurred despite significant increases in population and vehicle activity. As shown in Table B-2, the population increased by 40 percent since 1990 and daily vehicle miles traveled), vehicle population, and daily fuel consumption increased by 44, 55, and 32 percent, respectively.

**Table B-2 — Change in Population and Vehicle Activity in the Basin Since 1990**

<b>Activity Variable</b>	<b>1990</b>	<b>2018</b>	<b>Percentage Increase</b>
<b>Population</b>	<b>13,083,594</b>	<b>18,278,662</b>	<b>39.7%</b>
<b>Daily Vehicle Miles Traveled (1,000 mile per day)</b>	<b>282,561</b>	<b>406,476</b>	<b>43.9%</b>
<b>Vehicle Population</b>	<b>7,547,354</b>	<b>11,707,190</b>	<b>55.1%</b>
<b>Daily Fuel Consumption (1,000 gal per day)</b>	<b>18,338</b>	<b>24,265</b>	<b>32.3%</b>

Source: [http://www.arb.ca.gov/app/emsinv/trends/ems\\_trends.php](http://www.arb.ca.gov/app/emsinv/trends/ems_trends.php).

The relative importance of each of the toxics at the four monitoring stations is illustrated in Figure B-4 below. These ranges do not represent all potential exposures, and some areas near facilities with toxic air contaminant emissions may have higher cancer risks. The range of cancer risks for the four sites analyzed here are shown for the most recently available three-year period (2015 to 2017). As mentioned previously, the range of inhalation cancer risk includes the high measurements for methylene chloride from 2016 at the Riverside station that are inconsistent with all other readings taken at this station. To better demonstrate the effect, methylene chloride is shown in the charts twice: inclusive of all readings, and exclusive of the high Riverside readings.

\* Excludes peak readings from Riverside station in 2016

**Figure B-4 — Inhalation Cancer Risks in the Basin (2015 to 2017) (excluding DPM)**

Benzene, 1,3-butadiene, formaldehyde, carbon tetrachloride, hexavalent chromium, methylene chloride, acetaldehyde, and ethyl benzene are the largest contributors to the inhalation cancer risks, contributing individually from approximately 0.9 to 396 in-a-million. The ambient carbon tetrachloride concentrations observed in the Basin are not from a local source of emissions but represent background conditions. Note that there is little variability in cancer risks attributable to carbon tetrachloride as indicated by its short bar in Figure B-4. In fact, there is little variability statewide in carbon tetrachloride concentrations, with concentrations varying by less than ten percent. Perchloroethylene, chloroform, and nickel each contribute between approximately 0.6 and 9.5 in-a-million and trichloroethylene and lead contribute on average about two in-a-million to the inhalation cancer risks.

As demonstrated in the series of MATES conducted by South Coast AQMD staff, DPM is by far the largest contributor to inhalation cancer risks observed in the Basin. The MATES IV study attributed about 68 percent of the inhalation cancer risks to DPM based on emissions from 2012,<sup>28</sup> compared to 84 percent in MATES III based on emissions in 2005.<sup>29</sup> The total cancer risks shown in Figures B-2 and B-4 therefore represent only about 32 percent of the population weighted inhalation cancer risks found in the MATES IV study.

<sup>28</sup> See page ES-2 of the MATES IV Executive Summary which is available at: <http://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/mates-iv-final-draft-report-4-1-15>

<sup>29</sup> See page ES-3 of the MATES III Executive Summary which is available at: <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iii/mates-iii-final-report>

The range of non-cancer chronic risks for the four sites analyzed here are shown in Figure B - 5 for the most recently available three-year period (2015 to 2017). Similar to the cancer risk analysis, an additional Methylene Chloride data entry (denoted with an asterisk) was added to remove the high readings recorded at the Riverside monitor. For each toxic air contaminant, the ratio of the observed concentration to the pollutant's chronic REL is shown. Ratios less than one indicate that the observed concentrations are less than OEHHA's defined RELs, and are not anticipated to result in adverse non-cancer health effects in the general population, including sensitive subpopulations. Ratios greater than one indicate the potential for adverse health effects. This concentration to REL ratio is also referred to as the Hazard Index (HI).

\* Excludes peak readings from Riverside station in 2016

**Figure B-5 — Non-cancer Chronic Risks in the Basin (2015 to 2017)**

Note that acrolein, a respiratory irritant, is the only toxic air contaminant in which ambient concentrations are above its REL throughout the state and thus may partially reflect general background conditions. However, it should be noted that acrolein is well known to be difficult to measure with current techniques, and therefore, there is considerable uncertainty and data quality

issues associated with these measurements.<sup>30</sup> At best, acrolein monitoring data should be considered as a rough indicator, not accurate enough to be compared to health benchmarks. Acrolein emissions can better be estimated using computer modeling methods.

**Figure B-6 — Non-cancer 8-Hour Chronic Risks in the Basin (2015 to 2017)**

The 2015 OEHHA Risk Assessment Guidelines includes methodology for estimating an 8-hour chronic HI using 8-hour REL developed for this purpose. The 8-hour RELs were developed only for repeated, chronic daily 8-hour exposures (e.g. a typical worker or resident exposed to a facility that operates equal to or more than 8 hours per day and 5 days per week). The 8-hour chronic HI is based upon the daily average 8-hour exposure only for those chemicals with 8-hour chronic RELs. The range of non-cancer 8-hour chronic health risks for the four sites analyzed here are shown above in Figure B-6 for the most recently available three-year period (2015 to 2017). Methylene chloride does not have an 8-hour REL as defined by OEHHA and does not affect the 8-hour chronic hazard index.

As stated above, acrolein is the only toxic air contaminant in which ambient concentrations are above its REL. It should be noted that the ambient concentrations of acrolein are above its REL throughout the state and thus may partially reflect general background conditions.

## Appendix C — Health Risks from Facilities with an Approved HRA

The tables in Appendix C list the facilities and the health risks identified in their HRAs or RRP as reviewed and approved by South Coast AQMD staff. Risks presented in these tables were calculated based on guidance that was available from OEHHA at the time of HRA approval. For example, the health risks presented in this appendix for facilities with HRA approval date prior to 2015 do not include the health risk calculation methodologies (2015 OEHHA Risk Assessment Guidelines) that account for the differences in children's breathing rates and place greater emphasis on their susceptibility to cancer risk in comparison to adults. The health risks in all HRAs finalized by South Coast AQMD staff in 2015 were recalculated to reflect the 2015 OEHHA Risk Assessment Guidelines. Additionally, facilities that have elected to participate in the Voluntary Risk Reduction Program and have an approved VRRP are listed in Table D-2.

Table C-1 lists the facilities in order of their cancer risks and Table C-2 lists the facilities ordered by facility ID. The listed health risks are from an approved HRA, unless an approved RRP has been fully implemented. In those instances, the listed health risks reflect the health risks after the implementation of the RRP. Appendix D lists the status of the facility's RRP and is presented by facility ID. Attention should also be given to the footnotes for this appendix which denote facilities with updated HRAs pending approval and facilities with health risks including emergency diesel internal combustion engines. It also provides the last known status of each facility as follows:

“A” – Active (note that facilities with this status may not be in operation currently)

“O” – Out of business or inactive

“Out of business or inactive” facilities have been retained for historical purposes since staff occasionally receives public inquiries regarding these facilities. Facilities may undergo change of ownership could have different name and facility ID numbers. The following thresholds are identified in South Coast AQMD Rule 1402 — Control of Toxic Air Contaminants from Existing Sources:

Thresholds	Cancer Risk in MM	Acute, Chronic HI	Cancer Burden
<b>Significant Risk Level</b>	$\geq 100$	$\geq 5.0$	N/A
<b>Action Risk Level</b>	$\geq 25$	$\geq 3.0$	$\geq 0.5$
<b>Notification Risk Level</b>	$\geq 10$	$\geq 1.0$	N/A
<b>Voluntary Risk Threshold</b>	$\geq 10$	$\geq 1.0$	N/A
<b>Exemption Level</b>	$< 1$	$< 0.1$	N/A

**Table C-1**  
**Health Risks from Facilities with an Approved HRA**

(Listed in descending order by cancer risk)

Facility ID	Facility Status (a)	Facility Name	City	Cancer Risk (per million)	Cancer Burden (e)	Non-Cancer Acute Hazard Index	Non-Cancer Chronic Hazard Index	HRA Approval Year (d)

**Notes:**

- (a) “A” – Active (note that facilities with this status may not be in operation currently); O = Out of Business or Inactive
- (b) The specific risk driver listed in this HRA is no longer in use & the resulting risk has been eliminated or minimized.
- (c) South Coast AQMD staff has requested these facilities to update their HRAs.
- (d) All HRAs with HRA Approval Year dated 2015 and later have used the 2015 OEHHA Risk Assessment Guidelines for preparation of their HRA.
- (e) ND = Not Determined

**Notes:**

- a) A = Active (note that facilities with “Active” status within South Coast AQMD’s database may not currently be in operation); I = Inactive; OB = Out of Business
- b) The specific risk driver listed in this HRA is no longer in use & the resulting risk has been eliminated or minimized.
- c) South Coast AQMD staff has requested these facilities to update their HRAs.
- d) All HRAs with HRA Approval Year dated 2015 and later have used the 2015 OEHHA Risk Assessment Guidelines for preparation of their HRA.
- e) ND = Not Determined

## Notes:

- (a) Facility has shut down, resulting risks are zero.
- (b) The specific risk driver listed in this HRA is no longer in use & the resulting risk has been eliminated.
- (c) Facility undergoing closure and is no longer operating.
- (d) Represents previously approved HRA and RRP values. New HRA and RRP review is in progress.

### Facilities with an Approved Rule 1402(h) Voluntary Risk Reduction Plan

South Coast AQMD's Rule 1402 — Control of Toxic Air Contaminants from Existing Sources includes a Voluntary Risk Reduction Program. Facilities that participate in the Voluntary Risk Reduction Program reduce their health risks sooner and below the thresholds required under Rule 1402. Facilities that participate in this program have already had a HRA approved by South Coast AQMD that shows the facility's risks were below risk reduction thresholds at the time of HRA approval. An HRA is a study that estimates how a facility's emissions affect people's health risks in the surrounding community.

On March 6, 2015, OEHHA approved revisions to its guidelines (2015 OEHHA Guidelines) that are used by all air districts throughout the state to prepare HRAs. The 2015 OEHHA Guidelines incorporates age sensitivity factors which will increase cancer risk estimates to residential and sensitive receptors by approximately three times, and more than three times in some cases depending on whether the TAC has multiple pathways of exposure in addition to inhalation. Under the 2015 OEHHA Guidelines, even though the toxic emissions from a facility have not increased, the estimated cancer risk to a residential receptor will increase. Cancer risks for offsite worker receptors are similar between the existing and revised methodology because the methodology for adulthood exposures remains relatively unchanged. The Voluntary Risk Reduction Program provides an opportunity for participating facilities to address the increase in their estimated cancer risk due to the 2015 OEHHA Guidelines.

Table D-2 below lists the facilities with an approved Voluntary Risk Reduction Plan.

**Table D-2 — Facilities with Approved Voluntary Risk Reduction Plans**

Facility ID	Facility Status (a)	Facility Name	Address	City	VRRP Approval Year (e)

## Preface

This version of the Prioritization Procedure updates the previous ~~November-September 2016~~ version, which was updated to incorporate the California Office of Environmental Health Hazard Assessment *Air Toxics Hot Spots Program Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments* (2015 OEHHA Guidelines). This is intended to be a "living" document, which staff will update periodically as needed.

The revisions to this document from the previous September 2018 ~~for this current September-May 2019~~ version include:

- Correcting equations for calculation of cancer score;
- Correcting description of emissions for calculation of non-cancer acute score;

The major revisions to this document ~~forom the September 2018~~ from the previous November 2016 version include:

~~Revising the proximity adjustment factors to account for the latest meteorological data (Version 9);~~  
~~Simplifying the determination of a facility score for acute hazard index;~~  
~~Revising the residential and worker combined exposure factor for calculation of total cancer score to be consistent with the *Risk Assessment Procedures for Rules 1401, 1401.1 and 212*;~~  
~~Referencing the table in the *Supplemental Instructions Reporting Procedures for AB 2588 Facilities for Reporting their Quadrennial Air Toxics Emissions Inventory* for de minimis reporting limits for toxics rather than including it in this document;~~  
~~Referencing the table in the *Permit Application Package "N"* for multipathway adjustment factors rather than including it in this document; and~~  
~~Clarifying the descriptions of existing calculation methods~~

## I. INTRODUCTION

The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (commonly known as AB 2588) established a statewide program for the inventory of air toxics emissions from individual facilities as well as requirements for risk assessment and public notification of potential health risks. AB 2588 requires the South Coast Air Quality Management District (~~SCAQMD~~South Coast AQMD) to designate high, intermediate, and low priority categories and include each facility within the appropriate category based on its individual priority score. In establishing priorities, ~~SCAQMD~~South Coast AQMD is to consider the potency, toxicity, quantity and volume of hazardous materials released from the facility; the proximity of the facility to potential receptors, including, but not limited to, hospitals, schools, daycare centers, worksites and residences; and any other factors that ~~SCAQMD~~South Coast AQMD finds and determines may indicate that the facility may pose a significant risk to receptors.

## II. FACILITY PRIORITIZATION PROCEDURE

This document describes the facility prioritization procedure utilized by ~~SCAQMD~~South Coast AQMD (~~SCAQMD~~South Coast AQMD Procedure), which is consistent with the California Air Pollution Control Officers Association's (CAPCOA) August 2016 Facility Prioritization Guidelines (CAPCOA Guidelines)<sup>1</sup> developed by the Toxics and Risk Managers Committee (TARMAC).

The CAPCOA Guidelines primarily rely on four parameters to prioritize facilities: emissions, toxicity, the proximity to potential receptors, and stack height. While the ~~SCAQMD~~South Coast AQMD Procedure is consistent with the CAPCOA Guidelines, several refinements have been made over the history of ~~SCAQMD~~South Coast AQMD's AB 2588 Program. In September 1990, ~~SCAQMD~~South Coast AQMD refined the original CAPCOA Guidelines to include adjustment factors for receptor proximity, exposure period, and averaging times in addition to the treatment of multipathway pollutants. In August 2004, ~~SCAQMD~~South Coast AQMD revised its Procedure to accommodate the use of cancer potency factors (instead of unit risk factors) to allow for daily breathing rate and body weight variations as well as revised multipathway factors for resident and workers. In March 2011, the ~~SCAQMD~~South Coast AQMD Procedure was revised to include updated toxicity criteria. In June 2015, the ~~SCAQMD~~South Coast AQMD Procedure was updated to incorporate the revised risk calculation methodologies in the 2015 Office of Environmental Health Hazard Assessment (OEHHA) Guidance Manual for Preparation of Health Risk Assessments.

In November 2016, the ~~SCAQMD~~South Coast AQMD Procedure was revised to further streamline and refine the prioritization methodology for better characterization of the priority score for each facility before an Air Toxics Inventory Report (ATIR) or a Voluntary Risk Reduction Plan (VRRP) is requested. The 2016 ~~SCAQMD~~South Coast AQMD Procedure used the local meteorology from all available ~~SCAQMD~~South Coast AQMD meteorological stations (Version 8 meteorological data) for every facility and evaluated risks at the actual closest receptor locations as well as receptors located in the worst case wind direction (e.g., downwind). This ~~current~~ (~~July~~September

---

<sup>1</sup> <http://www.capcoa.org/wp-content/uploads/2016/08/CAPCOA%20Prioritization%20Guidelines%20-%20August%202016%20FINAL.pdf>

20182019) SCAQMD South Coast AQMD Procedure incorporates the Version 9 meteorological data and simplifies calculation of a facility's non-cancer acute score.

A facility receives scores for four health endpoints: cancer, non-cancer chronic, non-cancer chronic 8-hr, and non-cancer acute. The cancer, non-cancer chronic, non-cancer chronic 8-hr health endpoints are evaluated for four receptors for each facility: the absolute closest sensitive receptor and worker receptor, and the closest sensitive receptor and worker receptor in the worst case wind direction. The non-cancer acute health endpoint is evaluated at a single receptor only in the worst case wind direction. Unlike the sensitive and worker receptor, this single receptor can be at the facility fenceline due to a potential for one-hour exposure duration. Every facility therefore receives 13 different scores: three health endpoints (cancer, non-cancer chronic and non-cancer chronic 8 hour) at four receptors, and one non-cancer acute health endpoint at a single receptor. The highest score is used to determine the Priority Score (PS).

Three categories are used in the ranking: high priority, intermediate priority and low priority. Based on the priority score, facilities designated as high priority are required to submit either an ATIR or VRRP under the AB 2588 Program. Facilities ranked with intermediate priority are considered to be District Tracking facilities, which are then required to submit complete an air toxics inventory once every four years. Facilities ranked with low priority are potentially exempt from reporting. Due to the very conservative nature of the screening SCAQMD South Coast AQMD Procedure used for prioritization, and consistent with CAPCOA's Guidelines, a priority score of 10 may be considered similar to a calculated cancer risk of 100 per million or a HI of 10. The same emissions profile evaluated in a more detailed Health Risk Assessment (HRA) using actual stack parameters and more detailed dispersion modeling will likely result in much lower calculated risks. The following table summarizes thresholds used to prioritize facilities:

**Table 1: Prioritization Categories**

Priority Score	Category
$PS > 10$	High Priority
$1 < PS \leq 10$	Intermediate Priority
$PS \leq 1$	Low Priority

Facilities subject to the AB 2588 Program are required to submit a detailed list of their air toxic emissions every four years (referred to as a quadrennial update). Based on their level of air toxic and criteria pollutant emissions, each year a different group of facilities will report a detailed list of its air toxic emissions. Upon initial prioritization of facilities, SCAQMD South Coast AQMD staff conducts auditing to confirm the distances reported to sensitive receptors and workers, and that the reported emissions are consistent with expected levels considering trends and facility changes such as new or modified permitted equipment or pollution controls, and comparing the priority score results with the last (HRA) or Risk Reduction Plan (Voluntary or Traditional), if applicable. This additional information obtained through priority score auditing will often negate the need to ask for additional reports such as an ATIR. If, however, the priority score remains high, the facility is asked to prepare an ATIR or a VRRP under the AB 2588 Program.

## A. Calculation of Cancer Score

The scores for residential and worker cancer effects are calculated as follows:

$$S_{r,cancer} = \sum \left( \frac{E_c}{CP_c} \right) E_c \times CP_c \times MP_{c,r} \times RP_r \times 677.40 \times 10^{-1}$$

$$S_{w,cancer} = \sum \left( \frac{E_c}{CP_c} \right) E_c \times CP_c \times MP_{c,w} \times RP_w \times 55.86 \times 10^{-1}$$

Where;

$S_{r,cancer}$	=	Total cancer score (summed for all carcinogens separately, by the residential
$S_{w,cancer}$	=	receptor and worker receptor)
c	=	Specific carcinogen
r	=	Residential receptor
w	=	Worker receptor
$E_c$	=	Annual emissions of carcinogen, c $\left( \frac{ton}{year} \right)$
$CP_c$	=	Cancer potency of carcinogen, c $(mg/kg-day)^{-1}$
$MP_{c,r}$	=	Multipathway adjustment factor of carcinogen, c; there are separate
$MP_{c,w}$	=	multipathway factors for residential receptor and worker receptor for the
		applicable exposure duration (see Table 3.1 of <i>Permit Application Package</i>
		"N")
$RP_r$	=	Receptor proximity adjustment factor for residential receptor and worker
$RP_w$	=	receptor, $\chi/Q \left( \frac{\mu g}{m^3} / \frac{ton}{year} \right)$
WAF	=	Worker Adjustment Factor (dimensionless)
677.40	=	Residential Combined Exposure Factor that accounts for age-specific
		breathing rate, age specific factor, exposure duration, exposure frequency, and
		averaging time from <del>SCAQMD</del> <u>South Coast AQMD's Risk Assessment</u>
		<i>Procedures for Rules 1401, 1401.1 and 212</i>
55.86	=	Worker Combined Exposure Factor that accounts for age-specific breathing
		rate, age specific factor, exposure duration, exposure frequency, and averaging
		time from <del>SCAQMD</del> <u>South Coast AQMD's Risk Assessment Procedures for</u>
		<i>Rules 1401, 1401.1 and 212</i>
$10^{-1}$	=	Scalar to adjust priority score to 1-10 scale

### Annual Emissions:

Annual emissions of carcinogens are taken from the Toxic Air Contaminants (TAC)/Ozone Depleting Compounds (ODC) Emissions and Fees Summary of the Annual Emission Reporting (AER) Program. Each substance has a degree of accuracy associated with them that is a de-minimis emission level for reporting. As a result, facility-wide air toxic emissions greater than one-half of their corresponding degree of accuracy are inventoried and reported. Conversely, total facility air toxic emissions less than one-half of their corresponding degree of accuracy levels are not considered in the prioritization. The carcinogens and associated degree of accuracy levels are listed

in the *Supplemental Instructions Reporting Procedures for AB 2588 Facilities for Reporting their Quadrennial Air Toxics Emissions Inventory*.<sup>2</sup>

### **Cancer Potency:**

The Cancer Potency (CP) factor is a measure of the cancer potency of a carcinogen. The CP is the estimated probability that a person will contract cancer as a result of a daily inhalation of 1 milligram of the carcinogen per kilogram of body weight continuously over a period of 70 years. The cancer potencies used in this Procedure are published by the Office of Environmental Health Hazard Assessment (OEHHHA).<sup>3</sup>

### **Multipathway Adjustment Factor:**

The multipathway (MP<sub>c</sub>) adjustment factor is used for carcinogens that may contribute to risk from exposure pathways other than inhalation. These carcinogens deposit on the ground in particulate form and contribute to risk through ingestion of soil or backyard garden vegetables or through other routes. This factor is used to account for additional risks from exposure through non-inhalation pathways. The MP<sub>c</sub> adjustment factors for specific carcinogens have been developed by SCAQMD South Coast AQMD staff by using the Health Risk Assessment Standalone Tool (RAST) developed by the California Air Resources Board (CARB).<sup>4</sup> The MP<sub>c</sub> factors also satisfy the requirements of the SCAQMD South Coast AQMD's *Risk Assessment Procedures for Rules 1401, 1401.1 and 212*.<sup>5</sup> The substances and associated MP<sub>c</sub> adjustment factors for worker and residents for longest exposure duration listed in Table 3.1 of *Permit Application Package "N"*<sup>6</sup> or the most current version of the document. For carcinogens that only affect the inhalation pathway, the MP<sub>c</sub> adjustment factor is set to one.

### **Receptor Proximity Adjustment Factor:**

There are four Receptor Proximity (RP) adjustment factors calculated for each facility for cancer score. They are calculated based on the distances from the facility to the nearest sensitive (e.g., residential) and worker receptors regardless of wind direction, and the nearest sensitive and worker receptors in the worst case wind direction. The receptors in the worst case wind direction are also evaluated in case the nearest receptors do not experience the highest risk. Receptor locations are off-site, where persons may be exposed to air toxic emissions from the facility. The receptor distance is defined as the closest distance between any major source or group of major sources of air toxic emissions at the facility and the property boundary of any one of the receptor locations. Consistent with the CAPCOA Guidelines, the minimum distance evaluated is 50 meters. The RP adjustment factors for every meteorological station<sup>7</sup> using the Version 9 meteorological data at receptor locations of 50, 75, 100, 200, 300, 500, and 1000 meters are included in Tables 3 and 4 at the end of this guidance. These RP adjustment factors are ( $\chi/Q$ ) values derived from U.S. EPA's AERMOD air dispersion model utilizing a unitary emission rate of one ton per year exiting out of a 0.1 meter diameter stack that is 0.27 meters above a 4.0 meter tall building, with a velocity of 5

<sup>7</sup> Meteorological station information is available here:

[www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod](http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod)

meters per second. Linear interpolation is used to determine the appropriate ( $\chi/Q$ ) for receptor locations located between the distances specified in Tables 3 and 4.

### **Worker Adjustment Factor:**

The modeled annual average air concentration should be adjusted to the air concentration that the worker is actually exposed to if the source does not operate continuously. The Worker Adjustment Factor (WAF) is calculated with the following equation:

$$WAF = \frac{H_r}{H_{source}} \times \frac{D_r}{D_{source}}$$

Where,

- $H_r$  = Number of hours per day the annual average residential air concentration is based on (always 24 hours)
- $H_{source}$  = Number of hours the source operates per day
- $D_r$  = Number of days per week the annual average residential air concentration is based on (always 7 days)
- $D_{source}$  = Number of days the source operates per week

## **B. Calculation of Non-Cancer Score**

For a toxic substance, non-cancer health effects can occur via acute, non-cancer 8-hour exposure, and/or annual chronic exposure. All of these non-cancer effects are used in the calculation of a facility's priority score. For each substance associated with acute, non-cancer 8-hour and chronic toxicity, ~~SCAQMD~~South Coast AQMD staff calculates separate scores using the formulas shown below.

### **Non-Cancer Chronic Score:**

For a facility which emits pollutants with known non-cancer chronic health effects, the scores for non-cancer chronic effects for residential receptor and worker receptor are calculated as follows:

$$S_{r,chronic} = \sum \left( \frac{E_t}{REL_{t,chronic}} \right) \times MP_{t,r} \times RP_r$$

$$S_{w,chronic} = \sum \left( \frac{E_t}{REL_{t,chronic}} \right) \times MP_{t,w} \times RP_w$$

Where;

- $S_{r, chronic}$  = Total chronic score (summed for all substances with non-cancer chronic effects separately, by the residential receptor and worker receptor)
- $S_{w, chronic}$  =
- $t$  = Toxic substance
- $r$  = Residential Receptor
- $w$  = Worker Receptor
- $E_t$  = Annual emissions of substance,  $t$  (ton/year)

$REL_{t, \text{chronic}}$	=	Chronic reference exposure level of toxic substance, t ( $\mu\text{g}/\text{m}^3$ )
$MP_{t,r}$	=	Multipathway adjustment factor of carcinogen, c; there are separate multipathway factors for residential receptor and worker receptor as shown in Table 3.2 of <i>Permit Application Package "N"</i>
$MP_{t,w}$	=	Multipathway adjustment factor of carcinogen, c; there are separate multipathway factors for residential receptor and worker receptor as shown in Table 3.2 of <i>Permit Application Package "N"</i>
$RP_r$	=	Receptor proximity adjustment factor for residential receptor and for worker
$RP_w$	=	Receptor proximity adjustment factor for residential receptor and for worker receptor, $\chi/Q \left( \frac{\mu\text{g}}{\text{m}^3} / \frac{\text{ton}}{\text{year}} \right)$
WAF	=	Worker Adjustment Factor (dimensionless)

### **Non-Cancer 8-Hour Score:**

For a facility which emits pollutants with known non-cancer 8-hour health effects, the scores for non-cancer 8-hour effects for residential receptor and worker receptor are calculated as follows:

$$S_{r,8\text{-hr}} = \sum \left( \frac{E_t}{REL_t} \right) \times (WAF) \times RP_r$$

$$S_{w,8\text{-hr}} = \sum \left( \frac{E_t}{REL_t} \right) \times (WAF) \times RP_w$$

Where;

$S_{w, 8\text{-hr}}$	=	Total 8-hour score (summed for all substances with non-cancer 8-hour effects separately, by the residential receptor and worker receptor)
$S_{r, 8\text{-hr}}$	=	Total 8-hour score (summed for all substances with non-cancer 8-hour effects separately, by the residential receptor and worker receptor)
t	=	Toxic substance
r	=	Residential Receptor
w	=	Worker Receptor
$E_t$	=	Annual emissions of substance, t (ton/year)
$REL_{t, 8\text{-hr}}$	=	8-hour reference exposure level of toxic substance, t ( $\mu\text{g}/\text{m}^3$ )
$RP_r$	=	Receptor proximity adjustment factor for residential receptor and worker
$RP_w$	=	Receptor proximity adjustment factor for residential receptor and worker receptor, $\chi/Q \left( \frac{\mu\text{g}}{\text{m}^3} / \frac{\text{ton}}{\text{year}} \right)$
WAF	=	Worker Adjustment Factor (dimensionless)

### **Non-Cancer Acute Score:**

For a facility which emits pollutants with known non-cancer acute health effects, the score for non-cancer acute effects is calculated as follows:

$$S_{acute} = \sum \left( \frac{E_t}{REL_t} \right) \times RP$$

Where;

$S_{acute}$	=	Total acute score (summed for all substances with non-cancer acute effects separately, by the residential receptor and worker receptor)
t	=	Toxic substance
$E_t$	=	Annual Maximum hourly emissions of substance, t ( <del>tons/year</del> lb/hour)
$REL_t$	=	Acute reference exposure level of toxic substance, t ( $\mu\text{g}/\text{m}^3$ )

$$RP = \text{Receptor proximity adjustment factor for hourly concentration, } \chi/Q \left( \frac{\mu g}{m^3} \bigg/ \frac{lb}{hr} \right)$$

### **Annual and Maximum Hourly Emissions:**

Two different emissions rates are required for calculating the score for non-cancer health effects. The methodology for calculating the non-cancer score for chronic exposure requires annual emissions (tons/year) for each emitted pollutant whereas calculation of the non-cancer score for acute exposure requires maximum hourly emissions (lbs/hr) for each emitted pollutant. Maximum hourly emissions are obtained by dividing the annual emissions (lbs/yr) of the pollutant by the facility's actual operating hours and then multiplied by a maximum hourly emission adjustment factor of 1.25. Annual emissions are taken from the Toxic Air Contaminants (TAC)/Ozone Depleting Compounds (ODC) Emissions and Fees Summary of the AER Program. As specified previously, emissions of specified substances which are below one-half of their corresponding degree of accuracy levels are neglected in the computation.

### **Reference Exposure Levels:**

The Reference Exposure Level (REL) is used as an indicator of all potential adverse non-cancer health effects, and refers to a concentration level ( $\mu g/m^3$ ) or dose (mg/kg-day) below which no adverse health effects are anticipated. The RELs used in this Procedure are published by OEHHHA and CARB.<sup>8</sup>

### **MultiPathway Adjustment Factor:**

The MultiPathway ( $MP_t$ ) adjustment factor is used for substances that may contribute to non-cancer chronic risks from exposure pathways other than inhalation. The  $MP_t$  adjustment factors to evaluate the non-cancer chronic health endpoint for selected toxic pollutants can be found in Table 3.2 of *Permit Application Package "N"*<sup>9</sup> or the most recent version of the document. There are separate MP factors for workers and residents. For non-cancer chronic health effects, substances that only affect the inhalation pathway, the  $MP_t$  adjustment factor is set to one (1.0). Note that for calculation of non-cancer scores, the  $MP_t$  is relevant for the chronic risk endpoint.

### **Receptor Proximity Adjustment Factor:**

The Receptor Proximity (RP) adjustment factor is the same adjustment factor used in the calculation of the facility cancer score discussed previously. The RP adjustment factor for non-cancer acute score is based on a single distance from the facility to the nearest receptor regardless of wind direction. This receptor can be at the facility fenceline to account for the short one-hour exposure duration. To simplify calculation of the non-cancer acute score, the worst case wind direction is used for the single receptor distance.

<sup>9</sup> [www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/attachmentn-v8-1.pdf](http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/attachmentn-v8-1.pdf)

**Worker Adjustment Factor:**

The modeled annual average air concentration should be adjusted to the air concentration that the worker is actually exposed to if the source does not operate continuously. This is the same adjustment factor used in the calculation of the facility cancer score discussed previously.

**C. Facility Ranking**

From the computed scores for cancer and all non-cancer effects, the priority score is the higher of the 13 scores, and serves as the basis for ranking a facility as described in Table 1.

**Table 2: Annual Receptor Proximity Adjustment Factors**  $\left(\frac{\mu\text{g}}{\text{m}^3} \cdot \frac{\text{ton}}{\text{yr}}\right)$

# AB 2588 Toxic Hot Spots 2018 Annual Report

**Governing Board Meeting  
September 6, 2019**

# Introduction

- H&S Code §44363 requires a public hearing to present results of Annual Report
- AB 2588 Program Annual Report summarizes
  - Activities implemented under AB 2588 “Hot Spots Act” consistent with state law
  - South Coast AQMD activities to reduce toxic air contaminants
  - Future activities relating to AB 2588

# Goals and Objectives of AB 2588

Air Toxics “Hot Spots” Information and Assessment Act (1987)

Collect  
emissions data  
for air toxics

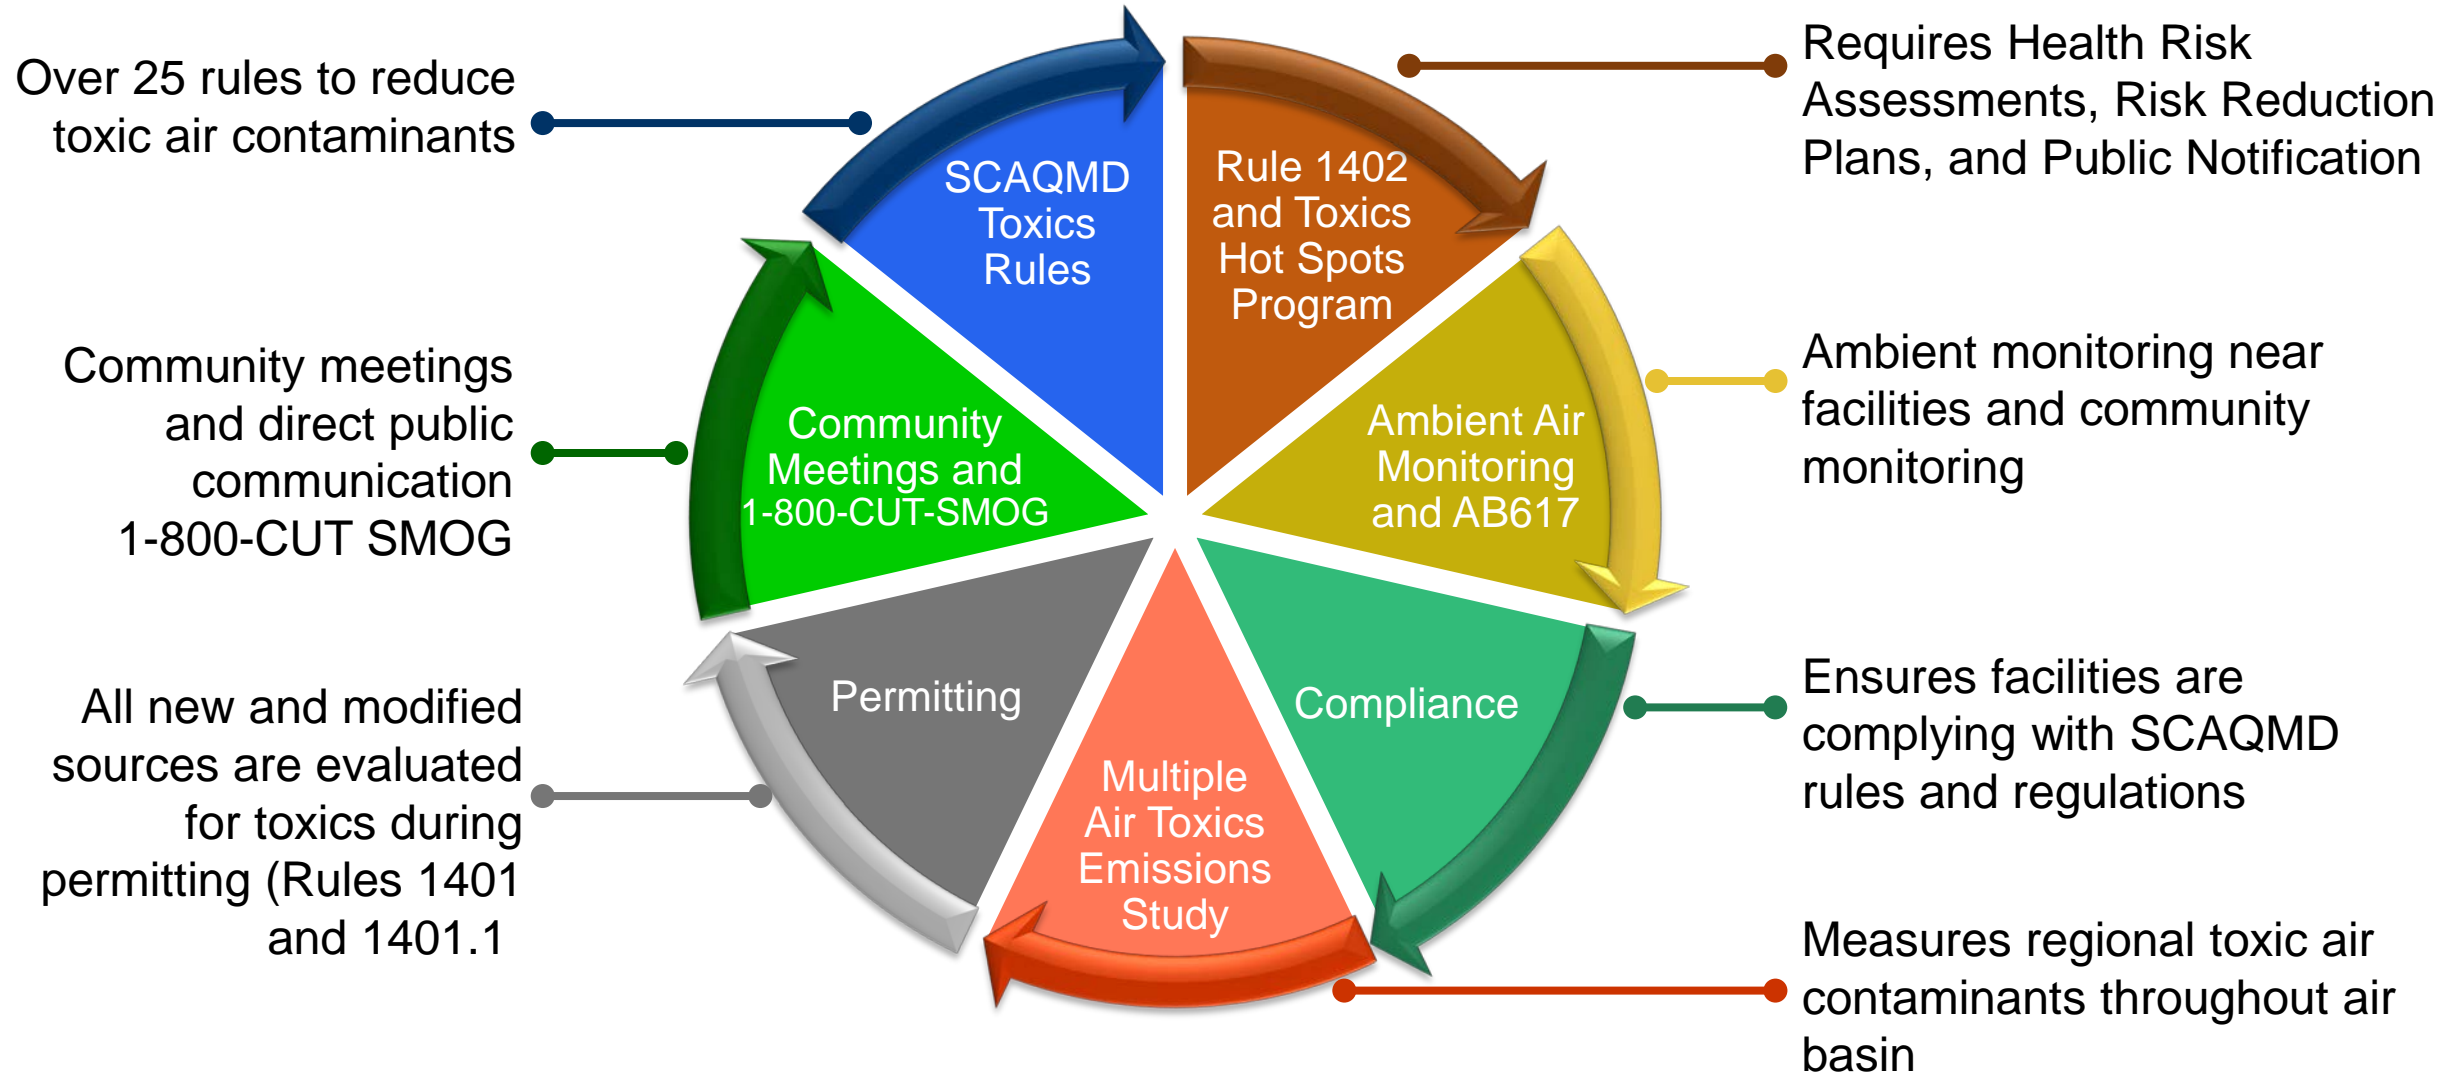

Identify facilities  
with localized  
impacts

Determine  
potential health  
risks

Provide public  
notification

Reduce  
significant risks

# AB 2588 is one Component of the Air Toxics Program

# Pathways for Facilities in Rule 1402

## Traditional Approach

Facilities with cancer risks <100 per million

- Air Toxic Inventory Report
- Health Risk Assessment
- Public Notification (if cancer risks > 10 per million)
- Risk Reduction Plan (if cancer risks > 25 per million)

## Voluntary Risk Reduction Program

Facilities with cancer risks <100 per million and approved Health Risk Assessment

- Air Toxic Inventory Report
- Voluntary Risk Reduction Plan committing to reduce cancer risks below 10 per million
- Modified Public Notification

## Potentially High Risk Level

Facilities with cancer risks >100 per million

- Early Action Reduction Plan
- Air Toxic Inventory Report
- Health Risk Assessment
- Public Notification (if cancer risks > 10 per million)
- Risk Reduction Plan (if cancer risks > 25 per million)

# Facility Data Reviews in 2018

**196**

Reviews

2

## Revised Priority Score

- 2 Revised Priority Score < 10 (No further action)

168

## Traditional AB 2588

- 140 Quadrennial Emission Reports
- 17 Air Toxics Inventory Reports
- 10 Health Risk Assessments
- 1 Risk Reduction Plan

7

## Voluntary Risk Reduction Program

- 7 Voluntary Risk Reduction Plans

19

## Potentially High Risk Level Facilities

- 1 Early Action Reduction Plan
- 7 Air Toxics Inventory Reports
- 7 Health Risk Assessments
- 4 Risk Reduction Plans

# Summary of Rule 1402 Actions for Facilities in 2018

## Revised Priority Score < 10

- The Boeing Company
- Garrett Aviation Services, LLC dba Standard Aero
- Triumph Processing, Inc.

## Voluntary Risk Reduction Program

- Chevron Products Co.
- Elite Comfort Solutions
- LA City, Sanitation Bureau (HTP)
- OCSD, Fountain Valley
- OCSD, Huntington Beach
- Phillips 66 Co. (Carson Refinery)
- Tesoro Ref & Mktg Co., LLC, Calciner
- Tesoro Ref & Mktg Co., LLC, Refinery
- Tesoro Ref & Mktg Co., LLC, SRP
- Torrance Refining Company, LLC
- Ultramar Valero Refinery

## Potentially High Risk Level

- Aerocraft Heat Treating Co., Inc.
- Anaplex Corp.
- Lubeco Inc.

## Traditional AB 2588 Program

- Arconic Global Fasteners & Rings
- Boral Roofing, LLC
- Eisenhower Medical Center
- Equilon Enterprises, LLC, Shell
- Fontana Paper Mills Inc.
- Gerdau/TAMCO
- Glendale City Water & Power
- GS II, Inc.
- Hixson Metal Finishing
- Holliday Rock Co., Inc.
- Kirkhill Inc.
- MM West Covina, LLC
- Quemetco
- Phillips 66 Co. (Wilmington Refinery)
- So Cal Edison Co. Pebbly Beach
- So Cal Gas, Playa del Rey Storage Facility
- So Cal Holding, LLC
- Southern California Edison
- TST, Inc.
- University of California, Riverside

# Other Key Toxics-Related Activities in 2018

## Rulemaking

### Amended Rule 1469

Amendments further reduce hexavalent chromium emissions by establishing new requirements for certain hexavalent chromium-containing tanks that were not previously regulated.

## Special Monitoring

Continued air monitoring in Paramount

Continued air monitoring in Compton

Conducted a five week mobile monitoring campaign in the Greater Los Angeles area

## Other

Reviewed air dispersion modeling for lead emissions from four facilities under Rule 1420.2

Reviewed requests for alternative PM10 limits for two facilities under Rule 1466

# Projected 2019 Toxics-Related Activities

- Audit quadrennial emissions inventories for approximately 70 facilities
- Develop Proposed Rules 1407.1, 1480
- Develop proposed amendments to Rules 1403 and 1407
- Develop measures to address modified hydrofluoric acid
- Track development of potential additions or revisions to health risk values by OEHHA
- Work with CARB and CAPCOA to update AB 2588 guidelines, including a proposed list of additional chemicals to be added

# Facility Prioritization Procedures

- South Coast AQMD has specific procedures for prioritizing AB 2588 facilities
  - Consistent with CAPCOA Guidelines
  - Uses emissions, toxicity, proximity to receptors, and meteorology specific to South Coast AQMD
- Previous September 2018 revision incorporated the latest meteorological dataset
- Latest version corrects transcriptional errors
  - Calculation of cancer score
  - Acute score (emissions basis is pounds per hour, not per year)

# Recommendation

- Receive and File the 2018 Annual Report on the AB 2588 Program
- Approve Updates to Facility Prioritization Procedure
