

BOARD MEETING DATE: MAY 7, 2021

AGENDA NO. 27

PROPOSAL: Certify Final Environmental Assessment and Adopt Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305, Submit Rule 2305 for Inclusion Into the SIP, and Approve Supporting Budget Actions

SYNOPSIS: Proposed Rule 2305 will require warehouses greater than 100,000 square feet to directly reduce NOx and diesel PM, or to facilitate emission and exposure reductions of these pollutants. The Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program is a menu-based points system that will require warehouse operators to annually earn a specified number of points by completing actions from a menu. Menu items include acquiring or using: Near Zero Emissions (NZE) and/or Zero Emissions (ZE) on-road trucks, ZE cargo handling equipment, ZE charging/fueling infrastructure, solar panels, or particulate filters for nearby sensitive land uses. Alternatively, warehouse operators could prepare and implement a custom plan specific to their site, or they could pay a mitigation fee. Funds from the mitigation fee would be used through future solicitations and Board actions to incentivize the purchase of NZE or ZE trucks and ZE charging/fueling infrastructure in the communities near warehouses that paid the fee. Warehouse owners and operators would also have reporting and recordkeeping requirements. Proposed Rule 316 would establish fees for warehouse operators to fund South Coast AQMD compliance activities.

COMMITTEE: Mobile Source, February 19, March 19, and April 16, 2021, Reviewed

RECOMMENDED ACTIONS:

1. Adopt the attached Resolution:
 - a. Certifying the Final Environmental Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305;

- b. Adopting Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305; and
 - c. Submitting Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program for inclusion into the SIP;
2. Establish the Rule 2305 Mitigation Fee Alternate Compliance Special Revenue Fund (86); and
3. Authorize the Executive Officer to recognize upon receipt mitigation fees paid by warehouse operators into the Rule 2305 Mitigation Fee Alternate Compliance Special Revenue Fund (86).

Wayne Nastri
Executive Officer

SR:IM

Background

Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, and Proposed Rule 316 – Fees for Rule 2305, are new rules that seek to reduce regional and local emissions of nitrogen oxides (NO_x) and Diesel Particulate Matter (DPM) in order to assist in meeting state and federal ambient air quality standards for ozone and fine particulate matter and improve public health, especially in communities located near warehouses. Our region continues to have the worst ozone in the country, and about half of the NO_x contributing to ozone comes from the goods movement industry - with the largest source being heavy-duty diesel trucks. Warehouses are a key destination for trucks, which make up about 90 percent of the emissions associated with warehouses. NO_x emissions from the warehousing sector in 2019 (~45 tons/day) were almost the same as all stationary sources (~48 tons/day).

Our region faces many deadlines to achieve federal air quality standards in the coming years, with the 2023 and 2031 deadlines for ozone being the most prominent. If those standards are not met in time, in addition to the continuing public health impacts experienced by residents, the federal government could potentially impose significant sanctions. The 2016 Air Quality Management Plan (AQMP) includes a comprehensive approach to meeting all federal and state air quality standards, primarily through a strategy to reduce NO_x emissions. The 2016 AQMP, as approved by the California Air Resources Board (CARB) and the United States Environmental Protection Agency (U.S. EPA), requires the development of many different control measures, including

facility-based mobile source measures. PR 2305 and PR 316 would fulfill the requirement for implementing one of those facility-based measures (MOB-03).

Separately, four AB 617 Community Steering Committees identified air quality concerns related to truck traffic from warehousing as a priority. As a result, the Community Emission Reduction Plans adopted by the Board for the communities of Wilmington/West Long Beach/Carson, San Bernardino/Muscoy, East Los Angeles/Boyle Heights/West Commerce, and Southeast Los Angeles all include the development of a warehouse indirect source rule as an action.

Public Process

PR 2305 and PR 316 were developed through a thorough public process. Following the Board's approval of the 2016 AQMP, staff initiated a year-long process to identify potential voluntary measures to address emissions from warehouses that included five working group meetings. As no viable voluntary measures were identified during that process, the Board directed staff to initiate rulemaking in May 2018. Staff subsequently has conducted 12 working group meetings, two community meetings, seven updates to the Mobile Source Committee and three updates to the Board. Staff has also conducted dozens of warehouse site visits, presented updates of the proposed rule to numerous outside organizations such as Councils of Governments and trade associations, and had hundreds of meetings with individual businesses, governments and community members during development of the proposed rules.

Proposal

PR 2305 applies to both the operators and owners of warehouses greater than or equal to 100,000 square feet in size, although most requirements apply to warehouse operators. Warehouses will be phased in over a 3-year period based on their size, and stringency increases over a 3-year period. The overall structure of the rule is a menu-based points system, similar to programs like LEED for building design, or climate plans that have been used by local governments like San Bernardino County. Every year, warehouse operators covered by the rule will be required to earn a specified number of WAIRE Points using any combination of items from the WAIRE Menu, implementation of a Custom WAIRE Plan, or payment of a mitigation fee. The amount of points every warehouse operator must earn annually depends upon the number of truck trips to their warehouse during the 12-month compliance period.

The WAIRE Menu includes acquisition of, or visits from near zero emissions (NZE) and zero emissions (ZE) on-road trucks, acquiring or using ZE yard trucks, installing or using ZE charging/fueling infrastructure, installing or using solar panels, or installing particulate filters for nearby sensitive land uses. Alternatively, an operator may choose to apply to implement a site-specific Custom WAIRE Plan that incorporates actions that are not on the WAIRE Menu. Example plans could include acquiring and/or using NZE yard trucks using renewable fuels, developing onsite energy generation such as

hydrogen production and/or fuel cells, implementing energy management programs for cold storage warehouses, or developing off-site ZE charging/fueling stations.

PR 2305 includes a numerical stringency value that determines the number of WAIRE Points each warehouse operator must earn or obtain each year. The proposed stringency is 0.0025 WAIRE Points per Weighted Annual Truck Trips (WATTs) phased-in over three years. Warehouses will also be phased into the program over a three-year period based on warehouse size, beginning with the largest warehouses. This is not a trading program, however there is flexibility built into the proposed rule. Warehouse operators that over-comply during any compliance period may bank excess WAIRE Points for up to three years or may transfer WAIRE Points to another site within their operational control. WAIRE Points may also be transferred between a warehouse operator and owner, for example if a warehouse owner opts to earn WAIRE Points by installing onsite solar panels or charging infrastructure.

PR 2305 also requires warehouse owners to report basic information about their warehouse and their tenants. The first report would be due September 1, 2021, and any time there is a change to the warehouse building's square footage during a renovation, or when there is a new tenant. Warehouse operators would be required to submit a more detailed one-time report during the first compliance period at a warehouse, and annual reports after every compliance period detailing how many truck trips they had and how they satisfied their WAIRE Points Compliance Obligation (WPCO). These reports will be provided through a new online portal that would be developed if the rule is adopted. Information about program compliance will also be made available online to the public.

PR 2305 includes a sunset provision for when the lowest current federal and state standards for ozone have been achieved (currently 70 parts per billion). The deadline for achieving the federal standard is in 2038. One year prior to the anticipated achievement of that standard, the Executive Officer will provide recommendations to the Board on any potential continued need for the rule, including anti-backsliding or maintenance plan requirements.

Exemptions are provided for smaller warehouse operations. First, in multi-tenant warehouses, any operator who uses <50,000 square feet in a warehouse with $\geq 100,000$ square feet that may be used for warehousing activities is not required to earn WAIRE Points. Second, any warehouse operator with a WPCO of <10 will not be required to earn WAIRE Points. An additional exemption is included for rare cases of equipment malfunction due to manufacturer or installation defects.

PR 316 is the companion rule to PR 2305 and establishes the administrative fees that warehouse owners and operators must pay to support South Coast AQMD PR 2305 compliance activities and supporting administrative functions for the WAIRE Mitigation Program.

All mitigation fees paid by warehouse operators will go into the WAIRE Mitigation Program. This program will provide financial incentives for truck owners to purchase NZE or ZE trucks, and/or for the installation of ZE fueling and charging infrastructure. The WAIRE Mitigation Program will direct funds back to projects that will reduce emissions in the communities near the warehouses that decide to pay the fee. If sufficient projects are not identified in that community, they may be redirected to an adjacent community in the same county. All solicitations for projects and project awards will be brought to Board for approval in subsequent actions as funding becomes available. The WAIRE Mitigation Program will also include requirements that fund ZE charging infrastructure projects that utilize a skilled and trained workforce, and require trucking companies receiving funds disclose any labor law violations (consistent with other South Coast AQMD incentive programs).

This Board action also will establish the 2305 Mitigation Fee Alternate Compliance Special Revenue Fund (86) to hold the mitigation fees paid by warehouse operators, and will authorize the Executive Officer to receive those funds upon receipt. These funds will not be able to be spent without subsequent Board approval.

Key Issues

The key issues raised by the warehousing industry are that they believe South Coast AQMD does not have legal authority to adopt PR 2305, that PR 2305 is a tax, that the options included in PR 2305 are infeasible, that the costs are too high, that the rule will not result in any emission reductions or lower levels of ozone, and that the rule would not result in State Implementation Plan (SIP) credit. The natural gas industry has commented that the WAIRE Points system should be revised so that their technology receives a greater number of points and that natural gas infrastructure be allowed to earn points. Environmental and community groups have requested that the proposed rule have a higher stringency, and that the rule focus more on zero emission options.

Throughout the rulemaking process, staff worked with stakeholders to resolve issues, and the rule includes many significant revisions in response to concerns that have been raised. Staff believes that the concerns raised about legal authority and whether the proposed rule is a tax are unfounded, and have provided detailed responses to the Board and the public describing the clear authority that South Coast AQMD has to adopt PR 2305 and PR 316. CARB has also supported the position that South Coast AQMD has clear legal authority to adopt the proposed rule. Additional information about these key issues are included in Attachment B to this letter.

California Environmental Quality Act

PR 2305 and PR 316 are considered a “project” as defined by the California Environmental Quality Act (CEQA) and South Coast AQMD is the designated lead agency. Pursuant to South Coast AQMD’s Certified Regulatory Program (Public

Resources Code Section 21080.5 and CEQA Guidelines Section 15251(l); codified in South Coast AQMD Rule 110) and CEQA Guidelines Section 15081, the South Coast AQMD has prepared a Final Environmental Assessment (EA) for PR 2305 and PR 316, which is a substitute CEQA document, prepared in lieu of an Environmental Impact Report. The environmental analysis in the Final EA concluded that PR 2305 and PR 316 would have the potential to generate significant adverse environmental impacts for the topics of: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality and greenhouse gas emissions; 4) biological resources; 5) cultural resources; 6) energy; 7) geology and soils; 8) hazardous materials and solid and hazardous waste; 9) hydrology and water quality; 10) mineral resources; 11) noise; 12) transportation; and 13) utilities and service systems. The Final EA is included as an attachment to this Board package (see Attachment J).

Socioeconomic Analysis

Affected Warehouse Operators

PR 2305 is expected to require about 3,995 warehouse operators at 2,902 warehouses classified under a variety of industry codes to earn WAIRE Points. Approximately 89 percent of these warehouse operators are associated with industries belonging to the goods-movement sector, consisting of construction, manufacturing, wholesale trade, retail trade, and transportation and warehousing. An estimated 418 additional operators would only be subject to limited reporting requirements. Estimated revenue and employee data is available for 904 of the operators required to earn WAIRE Points under PR 2305. Using the range of small-business definitions from Rule 102 and the South Coast AQMD Small Business Assistance Office, small businesses are estimated to make up about 0 to 22 percent of potentially affected PR 2305 warehouse operators.

Community Profile Nearby Affected Facilities

Based on population-weighted averages, communities adjacent to PR 2305 warehouses face substantially higher burdens than those communities in the rest of the South Coast AQMD jurisdiction. This includes higher burdens from PM_{2.5} and diesel PM, and higher rates of asthma and heart attacks. Moreover, the population in communities adjacent to warehouses are more Hispanic and African American and have higher poverty rates than other communities within the South Coast AQMD jurisdiction.

Public Health Benefits

To estimate the potential impacts of PR 2305 and PR 316, emissions and cost estimates for 19 different scenarios were developed to show the range of potential compliance outcomes. This analysis acts as a bounding approach, with all operators choosing the same compliance approach for each scenario. In reality, warehouse operators are expected to choose a wide variety of options to comply with PR 2305 by using a combination of WAIRE Menu options. Based on this scenario analysis, PR 2305 is estimated to reduce NO_x by about 1.5 to 3.0 tons per day.

Monetized public health benefits for NO_x and primary PM emissions were modeled based on U.S. EPA's incidence per ton methodology and the detailed air quality and health impact modeling completed for the 2016 AQMP. PR 2305 is expected to result in 150 to 300 fewer deaths, 2,500 to 5,800 fewer asthma attacks, and 9,000 to 20,000 fewer work loss days from 2022-2031. Expected total discounted monetized public health benefits range from \$1.2 to \$2.7 billion over the compliance period of 2022-2031. On average, most scenarios modeled show about a 3:1 ratio of public health benefits compared to rule costs.

Cost Impacts

Average annual costs of complying with PR 2305, in 2018 U.S. dollars, are estimated to range from -\$12.6 million (-\$0.02/sq. ft./yr.) for the lowest cost scenario (ZE Class 6 visits from a third-party fleet) to \$979 million (\$1.21/sq. ft./yr.) for the highest cost scenario (Solar Panel Installations). Warehouse operators are expected to gravitate towards the lowest-cost options for their specific situations. The maximum cost warehouse operators would be expected to incur is about \$0.83/sq. ft./yr. from a mitigation fee-only scenario. If all warehouses pay the mitigation fee in this worst-case cost scenario, annual average costs would be about \$670 million. This level of funding in the WAIRE Mitigation Program would result in a substantial turnover of trucks, and much higher public health benefits, with emission reductions up to about 20 tons per day. However, because warehouse operators are expected to find ways to reduce their costs, it is expected that they would earn points from these incentivized trucks. A more realistic scenario showing the interaction between a mitigation fee-only scenario and the WAIRE Mitigation Program was modeled. If warehouse operators earn points from visits from trucks incentivized by the WAIRE Mitigation Program, costs could be as low as \$0.14/sq. ft./yr., similar to the costs warehouse operators would face if they took actions themselves to get NZE or ZE trucks to visit their facilities, with emission reductions of about 2.5 tons per day. While the worst case cost scenario would be equal to about 3 percent of an operator's total operating costs, for most compliance scenarios costs are anticipated to be about 0.5 percent of total operating costs.

Job Impacts

PR 2305 is projected to result in 240 jobs gained to 11,100 jobs forgone on average annually from 2022 to 2031 across all South Coast AQMD industries for the best case and worst case scenarios, compared to the baseline scenario of about 11.4 million jobs. Forgone jobs are a result of future jobs that would no longer be created due to investments shifting from typical warehouse operations to cleaner emission technologies. The best case scenario assumes all potentially affected warehouse operators comply with PR 2305 through third party visits from Class 6 zero-emission vehicles (which save money through lower total cost of ownership), while the worst case scenario assumes all potentially affected warehouse operators comply with PR 2305 by paying a mitigation fee and not receiving any benefit from the mitigation fee for future compliance with PR 2305. These projected job impacts represent about a

0.002 percent increase to a 0.10 percent decrease in total combined employment in Los Angeles, Orange, Riverside, and San Bernardino counties.

Competitiveness

The Board directed staff to oversee a third-party study on competitiveness of warehousing operations within the South Coast AQMD jurisdiction, and likelihood of warehouse operator relocation to nearby areas. The study, conducted by Industrial Economics, Inc. and peer reviewed by Kleinhenz Economics, found that no warehouses would relocate to nearby areas outside the South Coast AQMD jurisdiction due to costs imposed by PR 2305 at the currently proposed stringency. The low vacancy and continued increases in rents over the past decade support this conclusion.

Third-Party Peer Review

Following Board direction, a third-party peer review of the socioeconomic impact assessment and the warehouse relocation study was conducted by Kleinhenz Economics. Both peer reviews were supportive of the methodology and analysis performed. Suggested enhancements have been included in the final socioeconomic impact assessment (included in Attachment K.)

AQMP and Legal Mandates

Pursuant to Health & Safety Code Section 40460 (a), South Coast AQMD is required to adopt an AQMP demonstrating compliance with all federal regulations and standards. South Coast AQMD is also required to adopt rules and regulations that carry out the objectives of the AQMP. The 2016 AQMP committed South Coast AQMD to develop proposed Facility Based Mobile Source Measures (FBMSMs), one of which included MOB-03 – Emissions Reductions at Warehouse Distribution Centers, which became PR 2305 and PR 316. U.S. EPA approved the 2016 AQMP into the SIP, including control measure MOB-03. PR 2305 is needed to reduce emissions of NO_x and particulate matter to assist in meeting state and federal ambient air quality standards for ozone and fine particulate matter. The South Coast AQMD is required by the California Clean Air act, Health and Safety Code Section 40914, to adopt all feasible measures to attain air quality standards.

Implementation and Resource Impacts

Compliance activities for this program will include desktop and onsite audits, report and plan review, and administration of the WAIRE Mitigation Program. Additional staff will be required to administer the PR 2305 program and will be included in future budget actions. The cost of these staffing resources will be offset through fee revenues collected under PR 316. Additional resources that will also be needed to develop the online web portal will also be requested in future budget actions.

ATTACHMENT A SUMMARY OF PROPOSAL

Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program

Applicability

Applies to owners and operators of warehouses located in the South Coast AQMD jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building.

Requirements

- Facilities will be phased in over a 3-year period based on size, and stringency increases over a 3-year period.
- Operators must record annual truck trip data and calculate their WAIRE Points Compliance Obligation (WPCO)
- Operators must earn WAIRE Points by implementing items on the WAIRE Menu, implementing an approved Custom WAIRE Plan, or paying an optional mitigation fee
- Owners and operators must submit reports on the warehouse and warehouse operations

Transferring/Banking Points

- Excess WAIRE Points earned in any compliance period may be banked for up to three years in the future, or transferred to another site under the control of the operator, or transferred between a warehouse owner and operator

Exemptions

- Warehouse operators that lease less than 50,000 square feet of a $\geq 100,000$ square foot warehouse would not be required to earn WAIRE Points
- Low activity warehouses that have a WPCO of less than 10 will be exempt from the requirements of subparagraph (d)(1)
- Operators can apply for a one-time exemption for underperforming equipment due to manufacturer or installer defects

Compliance Schedule

- The first required report from warehouse owners would be due on September 1, 2021
- The first 12-month compliance period for warehouse operators in warehouses greater than or equal to 250,000 square feet, between 150,000-249,999 square feet, and between 100,000-149,999 square feet will begin January 1, 2022, January 1, 2023, and January 1, 2024, respectively. Once initiated, each warehouse phase's stringency will increase equally over a three-year period such that by the fifth year, all warehouses will be at the final stringency.

Proposed Rule 316 – Fees for Rule 2305

Applicability

Applies to owners and operators of warehouses subject to Rule 2305

Requirements

- Pay fees for each required report, notification, Custom WAIRE Plan application, and mitigation fee payment submitted pursuant Rule 2305

Exemptions

- Owners of warehouses that have less than 100,000 square feet of floor space dedicated to warehousing activities
- Warehouse operators that operate less than 50,000 square feet for warehousing activities

ATTACHMENT B

KEY ISSUES AND RESPONSES

Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program

PR 2305 Legal Authority

Staff believes that the concerns raised about our legal authority and whether the proposed rule is a tax are unfounded, and detailed responses have been provided to the Board and the public and are included in this Board Package describing the clear authority that South Coast AQMD has to adopt PR 2305 and PR 316. CARB has also supported staff's position that South Coast AQMD has clear legal authority to adopt the proposed rule.

PR 2305 Feasibility

The concerns about feasibility center first on whether warehouse operators control the trucks that visit their facilities. While many warehouse operators operate their own truck fleet and/or directly arrange for trucks to deliver goods to or from their warehouse, some do not. For those warehouse operators who do not have a direct relationship with any trucks visiting their facility, they do contract directly with goods owners to warehouse their goods, and the goods owners are the entities who arrange for trucking services. If a warehouse operator wanted to take actions to earn WAIRE Points from truck visits (which is not required), they could explore emerging three-way business models between themselves, the goods owners, and trucking companies to ensure that at least some NZE or ZE trucks would visit their warehouse. Warehouse operators are also allowed to earn WAIRE Points for NZE or ZE truck visits just by tracking any that happen to visit their facility, even without their active involvement. This mechanism can be increasingly important as more incentive funding becomes available (either with the WAIRE Mitigation Program, or other programs like Carl Moyer or the ports' anticipated updates to their Clean Truck Program) puts more NZE or ZE trucks into the overall fleet operating in South Coast AQMD. Importantly, other non-trucking options are also available in the WAIRE Menu, through Custom WAIRE Plans, and through the mitigation fee.

The second concern about feasibility focuses on the supposed unavailability of technology to earn WAIRE Points. Staff believes this concern mischaracterizes the rule by focusing only on the commercial availability of Class 8 ZE trucks today. While Class 8 ZE trucks are not widely commercially available today, they are anticipated to become more available beginning later this year, with more manufacturers beginning to offer them in 2022 and beyond. The phase-in periods in PR 2305 are designed in part to accommodate the anticipated increasing penetration of zero emission technologies into the market through time. For example, in the first compliance year in 2022, only about one third of warehouses will be required to earn WAIRE Points in 2022, and only at one-third of the final stringency. Even if Class 8 ZE trucks are not available in the first compliance year, there are at least 30 other options available for warehouse operators to earn WAIRE Points. For example, NZE trucks have been available commercially for several years (as evidenced by the more than 1,200 trucks that have been funded by the Board).

PR 2305 Costs

Due to concerns raised early in the rulemaking process about costs, they were incorporated directly into the WAIRE Point system itself along with NO_x and DPM emission reductions.

The costs of PR 2305 and PR 316 and the potential economic impacts have been thoroughly analyzed in the socioeconomic impact assessment and an accompanying Board-commissioned third-party report on warehouse relocation in response to the rules. These analyses also received third-party peer review. These analyses concluded that the public health benefits of the rule are expected to outweigh the potential costs by a ratio of about 3:1, for most compliance scenarios that were analyzed. Further, the cost-effectiveness of PR 2305 was found to be similar to the cost-effectiveness of several mobile source regulations adopted by CARB in recent years.

Duplicative approach with CARB rules, therefore PR 2305 would not reduce emissions

Stakeholders commented early in the process about the potential overlap of PR 2305 with CARB regulations. PR 2305 is designed to both achieve surplus emission reductions beyond CARB rules on its own, as well as facilitate the implementation of CARB rules by encouraging early adoption of rule requirements. To estimate the amount of surplus emission reductions, the analysis contained in the staff report quantitatively accounts for all applicable recently adopted CARB regulations. This analysis shows that for most compliance scenarios, the expected range of emission reductions beyond CARB rules is expected to be about 1.5 to 2.5 tons per day of NOx, with emission reductions beginning as early as 2022 and reaching this level of anticipated reduction in the 2023-2024 period. These emission reductions would occur as a component of the larger 2016 AQMP strategy, which was specifically designed to reduce ozone levels.

PR 2305 would not receive SIP credit

The concern about SIP credit does not consider the full range of options normally available to fold emission reductions into the SIP inventory. These options are discussed in Appendix D of the staff report. As an example, the indirect source rule adopted by San Joaquin Valley Air District was approved into the SIP by U.S. EPA, but the approval did not include any 'SIP credit' for emission reductions. However, the emission reductions achieved by their rules are included as part of normal updates to the mobile source emissions inventory in regular updates by CARB. This is likely the primary process by which SIP creditable emissions reductions would be accounted for with PR 2305 as well. Other prospective SIP creditable emission reductions methods may be possible too with the WAIRE Mitigation Program once funds are received and the program has been established.

Insufficient time to comply with deadlines soon after Board vote

The most recent draft of PR 2305 includes additional time for compliance. The first report would be due September 1, 2021 (adding about two months compared to the previous proposal), and the first compliance period would begin January 1, 2022 (adding six months to the previous proposal).

NZE yard trucks and infrastructure should be included, and the WAIRE Points system should be revised so that NZE options get more points

The WAIRE Implementation Guidelines have been revised to allow NZE yard trucks fueled with renewable fuels to earn WAIRE Points, using a customized WAIRE plan, and a streamlined calculation has been provided, using methods consistent with the WAIRE Menu Technical Report. NZE fueling infrastructure has not been included in part to support state goals for advancing ZE technology, and because previous statements from the natural gas industry have indicated that their business model does not require government support for

fueling infrastructure, only for the trucks themselves. The current WAIRE Points system is designed to give points based on the emission reductions from an action, as well as from the cost. NZE trucks are treated equally with other technologies in the WAIRE Menu. Including the cost in the calculation is important because it serves as a proxy for an operator's level of effort to comply with the rule and it is a common metric to all WAIRE Menu items. In addition, as shown in the analysis in the staff report, when comparing NZE options with comparable ZE options (e.g., third party Class 8 truck visits), even with less points per visit, the NZE option results in lower costs and higher emissions reductions.

No sunset date even if air quality standards are met

The most recent draft of PR 2305 includes a sunset provision when the latter of the state or federal ozone standard of 70 parts per billion is attained. The Executive Officer will provide recommendations to the Board one year prior to this anticipated date with recommendations about whether to keep all or parts of the rule, including consideration of anti-backsliding or maintenance plan requirements.

Small warehouses should not be included in PR 2305

The smallest warehouse included in the rule is 100,000 square feet, and the smallest operator includes 50,000 square feet in a building with at least 100,000 square feet of warehousing activity. The most recent draft of PR 2305 includes a very low activity provision where operators with a WPCO <10 would not be required to earn WAIRE Points. This is equal to an average of about two Class 8 truck visits/day, about 1/3rd the amount of activity of a typical 50,000 square foot operator.

The rule should be more stringent

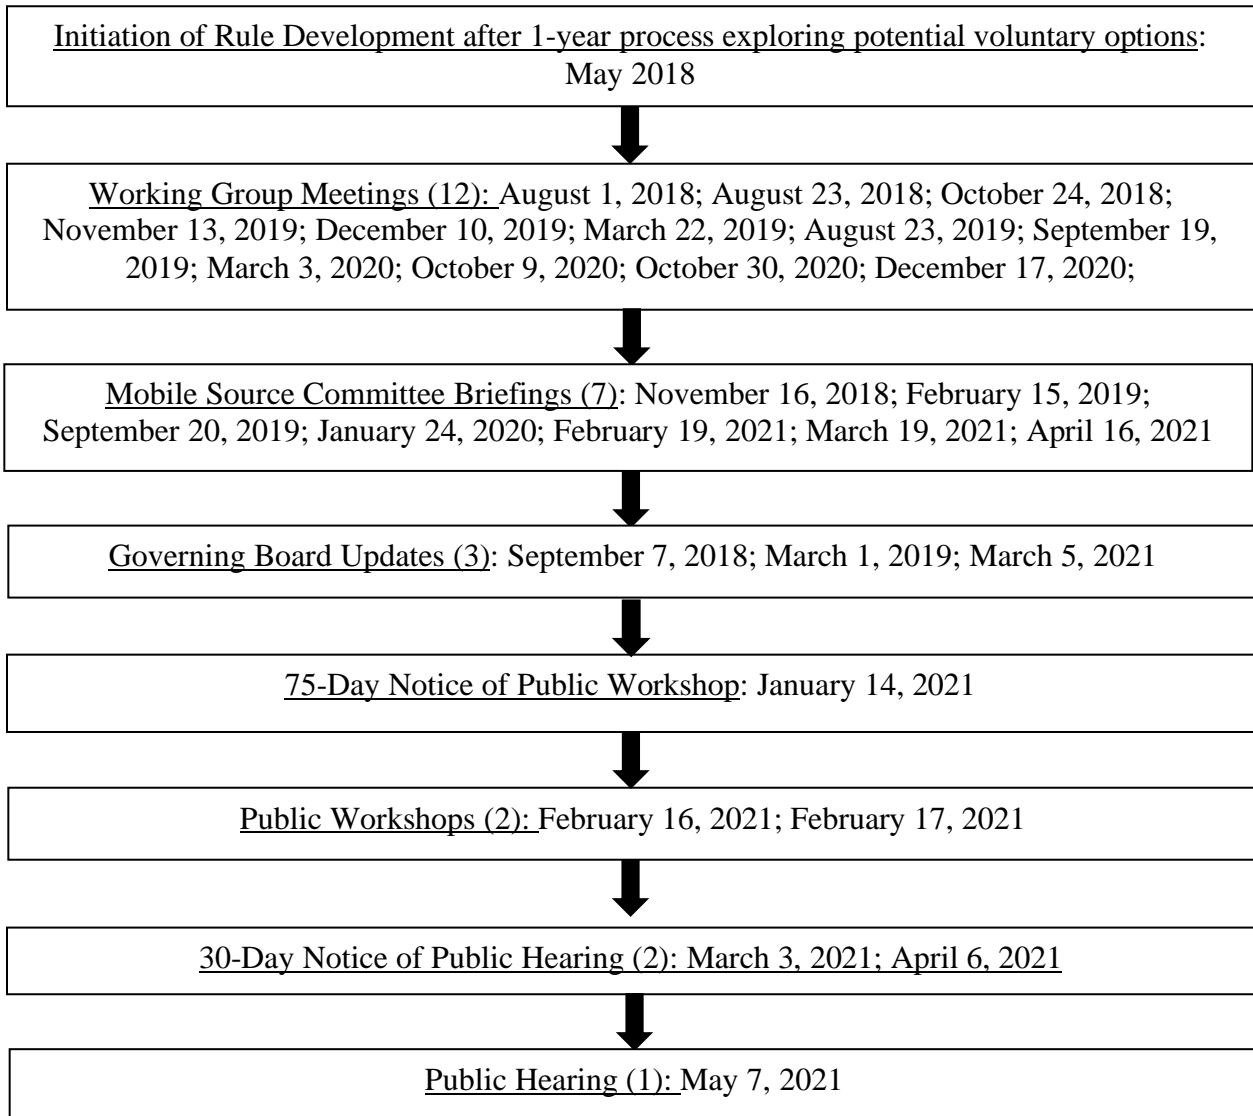

A range of potential stringencies has been considered during development of the proposed rule. A higher stringency would result in higher emission reductions and greater public health benefits, but would also impose higher costs on industry. At the highest stringency evaluated (0.005 Points per WATT), the costs for some compliance approaches may cause some warehouses relocate to nearby areas outside of South Coast AQMD. A study of the proposed stringency (0.0025 Points per WATT) found that no warehouses would be expected to leave beyond baseline conditions that exist without the rule. Because this is a new program, staff will provide annual reports on implementation of PR 2305 (if approved) to the Mobile Source Committee to evaluate how industry is responding to the rule, and will make recommendations at that time on any changes to rule stringency, if warranted.

The rule should focus more on zero emissions technologies

PR 2305 includes a mix of ZE and NZE technologies. NZE technologies have been included as these trucks are expected to be more widely available early in the life of the rule, and can provide early emission reductions more cost-effectively, a critical concern given upcoming attainment deadlines. NZE technologies have at least 90% lower NO_x than diesel trucks, and no toxic DPM. Some fleets already have begun using this technology (some in part with the assistance of South Coast AQMD incentive funds), and allowing its use in the rule would avoid stranding those assets. However, the Board Resolution includes a technology review in five years, including for ZE and NZE technologies, and staff will make recommendations to update the WAIRE Menu at that time, if warranted.

ATTACHMENT E

RESOLUTION NO. 21-_____

A Resolution of the Governing Board of the South Coast Air Quality Management District (South Coast AQMD) certifying the Final Environmental Assessment (EA) for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Proposed Rule 316 – Fees for Rule 2305.

A Resolution of the South Coast AQMD Governing Board adopting Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program, and Rule 316 – Fees for Rule 2305.

A Resolution of the South Coast AQMD Governing Board submitting Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions Program to EPA for inclusion in the State Implementation Plan.

WHEREAS, the South Coast AQMD Governing Board finds and determines that Proposed Rule 2305 and Proposed Rule 316 are considered a “project” as defined by the California Environmental Quality Act (CEQA); and

WHEREAS, the South Coast AQMD has had its regulatory program certified pursuant to Public Resource Code Section 21080.5 and CEQA Guidelines Section 15251(1), and has conducted a CEQA review and analysis of the proposed project pursuant to such program (South Coast AQMD Rule 110): and

WHEREAS, the South Coast AQMD Governing Board has determined that the requirements for an Environmental Impact Report have been triggered pursuant to its Certified Regulatory Program and CEQA Guidelines Section 15081, and that an Environmental Assessment (EA), a substitute document allowed pursuant to CEQA Guidelines Section 15252 and South Coast AQMD’s Certified Regulatory Program, is appropriate; and

WHEREAS, the South Coast AQMD Governing Board hereby finds that Rule 316 is statutorily exempt from CEQA pursuant to Public Resources Code Section 21080(b)(8) and CEQA Guidelines Section 15273 because it finds that the fees are for the purpose of meeting operating expenses including the administration and enforcement of Rule 2305 and the WAIRE mitigation fee program; and

WHEREAS, the South Coast AQMD prepared a Draft EA pursuant to its Certified Regulatory Program and CEQA Guidelines Sections 15081 and 15252 setting forth the potential environmental consequences of Proposed Rule 2305 and Proposed Rule 316 and determined that the proposed project would have the potential to generate significant adverse environmental impacts for the topics of: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality and greenhouse gas emissions; 4) biological resources; 5) cultural resources; 6) energy; 7) geology and soils; 8) hazardous

materials and solid and hazardous waste; 9) hydrology and water quality; 10) mineral resources; 11) noise; 12) transportation; and 13) utilities and service systems; and

WHEREAS, the Draft EA was circulated for a 45-day public review and comment period from January 26, 2021 to March 12, 2021, and seven comment letters were received; and

WHEREAS, the Draft EA has been revised to include the comment letters received on the Draft EA and the responses, so that it is now a Final EA; and

WHEREAS, it is necessary that the South Coast AQMD Governing Board review the Final EA prior to its certification, to determine that it provides adequate information on the potential adverse environmental impacts that may occur as a result of adopting the proposed project, including responses to the comment letters received relative to the Draft EA; and

WHEREAS, pursuant to CEQA Guidelines Section 15252(a)(2)(A), since significant adverse environmental impacts were identified, the Final EA includes an alternatives analysis and analysis of mitigation measures; and

WHEREAS, no feasible mitigation measures were identified that would reduce or eliminate the significant adverse impacts, and thus no Mitigation, Monitoring, and Reporting Plan has been prepared; and

WHEREAS, Findings pursuant to Public Resources Code Section 21081.6 and CEQA Guidelines Section 15091, and a Statement of Overriding Considerations pursuant to CEQA Guidelines Section 15093, regarding the potentially significant adverse environmental impacts that cannot be mitigated to less than significant levels, have been prepared and are included in Appendix 1 to this Resolution, which is attached and incorporated herein by reference; and

WHEREAS, the South Coast AQMD Governing Board that is voting to adopt Proposed Rule 2305 and Proposed Rule 316 has reviewed and considered the information contained in the Final EA, including the responses to the comment letters, the Findings, the Statement of Overriding Considerations, and all other supporting documentation, prior to its certification, and has determined that the Final EA, including the responses to comment letters received, has been completed in compliance with CEQA; and

WHEREAS, Proposed Rule 2305 and Proposed Rule 316 and supporting documentation including but not limited to, the Final EA, the Final Staff Report, and the Socioeconomic Impact Assessment, were presented to the South Coast AQMD Governing Board and the South Coast AQMD Governing Board has reviewed and considered this information, as well as has taken and considered staff testimony and public comment prior to approving the project; and

WHEREAS, the South Coast AQMD Governing Board finds and determines that all the changes made in the Final EA after the public notice of availability of the Draft EA, were not substantial revisions and do not constitute significant new information within the meaning of CEQA Guidelines Sections 15073.5 and 15088.5, because: 1) no new, unavoidable significant environmental impacts would

result from the project or from a new mitigation measure proposed to be implemented; 2) there is no substantial increase in the severity of an environmental impact; 3) no other feasible project alternative or mitigation measure was identified that would clearly lessen the environmental impacts of the project and was considerably different from others previously analyzed, 4) the Draft EA did not deprive the public from meaningful review and comment, and 5) all changes merely clarify, amplify, or make insignificant modifications to the Draft EA, such that recirculation is therefore not required; and

WHEREAS, the Final EA reflects the independent judgement and analysis of the South Coast AQMD Governing Board; and

WHEREAS, the South Coast AQMD Governing Board finds and determines, taking into consideration the factors in Section (d)(4)(D) of the Governing Board Procedures (codified as Section 30.5(4)(D)(i) of the Administrative Code), that the modifications to Proposed Rule 2305 and Proposed Rule 316 since the notice of public hearing was published are clarifications that meet the same air quality objective and are not so substantial as to significantly affect the meaning of the proposed rule within the meaning of Health and Safety Code Section 40726 because: (a) the changes do not impact emission reductions, (b) changes do not affect the number or type of sources regulated by the rules, (c) the changes are consistent with the information contained in the notice of public hearing, and (d) the effects of Proposed Rule 2305 and Proposed Rule 316 do not exceed the effects of the range of alternatives analyzed in the CEQA document; and

WHEREAS, the South Coast AQMD Governing Board has determined that there is a problem that PR 2305 will help alleviate which is that the South Coast AQMD is not in attainment of federal and state standards for ozone, and particulate matter, a need exists to adopt Proposed Rule 2305 to reduce oxides of nitrogen and particulate matter emissions to assist in meeting state and federal air quality standards for ozone and fine particulate matter, and to facilitate emission and exposure reductions from these pollutants related to warehouse operations; and

WHEREAS, the South Coast AQMD Government Board adopted the 2016 Air Quality Management Plan to establish a path toward the goal of attainment of state and federal ambient air quality standards, which included a Facility-Based Mobile Source Measure directed at warehouses; and

WHEREAS, the South Coast AQMD Governing Board directed South Coast AQMD Staff to conduct an independent study of the impacts of a warehouse indirect source rule; and

WHEREAS, the South Coast AQMD Governing Board directed South Coast AQMD Staff to develop a warehouse indirect source rule; and

WHEREAS, the South Coast AQMD Governing Board has determined that adoption of Proposed Rule 2305 would also be consistent with Community Emission Reduction Plans adopted for the AB 617 communities in San Bernardino/Muscoy, Wilmington/Carson/West Long Beach, East Los Angeles/Boyle Heights/West Commerce, and Southeast Los Angeles; and

WHEREAS, Proposed Rule 2305 would establish a menu-based points system that would apply to owners and operators of warehouses at least 100,000 square feet in size;

WHEREAS, Proposed Rule 2305 would require warehouse operators to annually earn a prescribed number of points based on the truck trips that visit the warehouse; and

WHEREAS, Proposed Rule 2305 would allow points to be earned by acquiring or using any of the following: near-zero emission (NZE) or zero emission (ZE) trucks, NZE and ZE yard trucks, ZE charging and fueling infrastructure, solar panels, and/or installing filters in ventilations systems for nearby sensitive land uses; and

WHEREAS, Proposed Rule 2305 would allow points to be earned by developing and implementing a site-specific custom plan or paying a mitigation fee; and

WHEREAS, Proposed Rule 316 has been developed to establish fees for warehouse operators to fund the South Coast AQMD compliance activities associated with Proposed Rule 2305 pursuant to Health and Safety Code Section 40522.5 that authorizes South Coast AQMD to collect fees to recover costs associated with regulatory programs for areawide or indirect sources; and

WHEREAS, the South Coast AQMD Governing Board has determined that the Socioeconomic Impact Assessment of Proposed Rule 2305 and Proposed Rule 316 is consistent with the March 17, 1989 Governing Board Socioeconomic Resolution for rule adoption; and

WHEREAS, the South Coast AQMD Governing Board has determined that the Socioeconomic Impact Assessment for Proposed Rule 2305 and Proposed Rule 316 is consistent with the provisions of Health and Safety Code Sections 40440.8 and 40728.5; and

WHEREAS, the South Coast AQMD Governing Board has determined Proposed Rule 2305 and Proposed Rule 316 will result in increased costs to the affected industries, with a total annualized cost as specified in the Socioeconomic Impact Assessment; and

WHEREAS, the South Coast AQMD Governing Board has actively considered the Socioeconomic Impact Assessment and has made a good faith effort to minimize such impacts; and

WHEREAS, the South Coast AQMD staff conducted a CEQA Scoping Meeting on December 2, 2020 and a Public Workshop on February 16, 2021 for Proposed Rule 2305 and Proposed Rule 316; and

WHEREAS, Proposed Rule 2305 will be submitted to the California Air Resources Board and the United States Environmental Protection Agency for inclusion into the State Implementation Plan; and

WHEREAS, Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the Final Staff Report; and

WHEREAS, Proposed Rule 2305 and Proposed Rule 316 implement sections of the Federal Clean Air Act including 42 U.S.C. §§ 7410, 7416, 7502, 7511a, and 7513a. The South Coast AQMD Governing Board has determined that a need exists to adopt Proposed Rule 2305 to reduce regional and local oxides of nitrogen and diesel particulate matter emissions to assist in meeting state and federal air quality standards for ozone and fine particulate matter, and to facilitate emission and exposure reductions from these pollutants related to warehouse operations; and

WHEREAS, the South Coast AQMD Governing Board obtains its authority to adopt, amend or repeal rules and regulations from Sections 39002, 39650 et. seq., 40000, 40440, 40441, 40506, 40510, 40522, 40522.5, 40701, 40702, 40716, 40717, 40725 through 40728, 40910, 40920.5, 41508, 41511 and 41700 of the Health and Safety Code; and

WHEREAS, the South Coast AQMD Governing Board has determined that Proposed Rule 2305 and Proposed Rule 316 are written or displayed so that the meaning can be easily understood by the persons directly affected by it; and

WHEREAS, the South Coast AQMD Governing Board has determined that Proposed Rule 2305 and Proposed Rule 316 are in harmony with and not in conflict with or contradictory to, existing statutes, court decisions or state or federal regulations; and

WHEREAS, the South Coast AQMD Governing Board has determined that Proposed Rule 2305 and Proposed Rule 316 do not impose the same requirements as any existing state or federal regulations, and the proposed rule is necessary and proper to execute the powers and duties granted to, and imposed upon, South Coast AQMD; and

WHEREAS, the South Coast AQMD Governing Board, in adopting Proposed Rule 2305 and Proposed Rule 316, references the following statutes which the South Coast AQMD hereby implements, interprets, or makes specific: Health and Safety Code Sections, 40440, 40716, 40717, 41700 and 42 U.S.C. §§ 7410 and 7416; and

WHEREAS, Health and Safety Code Section 40727.2 requires the South Coast AQMD to prepare a written analysis of existing federal air pollution control requirements applicable to the same source type being regulated whenever it adopts, or amends a rule, and the South Coast AQMD's comparative analysis of Proposed Rule 2305 and Proposed Rule 316 are included in the Final Staff Report; and

WHEREAS, a public hearing has been properly noticed in accordance with the provisions of Health and Safety Code Section 40725 and 40440.5; and

WHEREAS, the South Coast AQMD Governing Board has held a public hearing in accordance with all applicable provisions of state and federal law; and

WHEREAS, the South Coast AQMD specifies that the Planning and Rules Division Deputy Executive Officer overseeing the development of Proposed Rule 2305 and Proposed Rule 316 as the custodian of the documents or other materials which constitute the record of proceedings upon which the adoption of the proposed rules is based, which are located at the South Coast Air Quality Management District, 21865 Copley Drive, Diamond Bar, California; and

NOW, THEREFORE, BE IT RESOLVED, that the South Coast AQMD Governing Board has considered the Final EA for Proposed Rule 2305 and Proposed Rule 316 together with all comments received during the public review period, and, on the basis of the whole record before it, the South Coast AQMD Governing Board: 1) finds that the Final EA, including the responses to the comment letters, was completed in compliance with CEQA and the South Coast AQMD's Certified Regulatory Program, 2) finds that the Final EA and all supporting documents were presented to the South Coast AQMD Governing Board, whose members exercised their independent judgment and reviewed, considered and approved the information therein prior to acting on Proposed Rule 2305 and Proposed Rule 316, and 3) certifies the Final EA; and

BE IT FURTHER RESOLVED, that the Governing Board does hereby adopt Findings pursuant to CEQA Guidelines Section 15091 and a Statement of Overriding Considerations pursuant to CEQA Guidelines 15093, as required by CEQA, and which are included as Appendix 1 to this Resolution and incorporated herein by reference; and

BE IT FURTHER RESOLVED, that the South Coast AQMD Governing Board does hereby adopt, pursuant to the authority granted by law, Proposed Rule 2305 and Proposed Rule 316 as set forth in the attached, and incorporated herein by reference; and

BE IT FURTHER RESOLVED, that the South Coast AQMD Governing Board does hereby direct the Executive Officer to develop the Warehouse Actions and Investments to Reduce Emissions (WAIRE Mitigation Program) with funds generated from mitigation fee payments from Proposed Rule 2305 and Proposed Rule 316; and

BE IT FURTHER RESOLVED, that any solicitations for projects and project awards using funds from the WAIRE Mitigation Program must be first approved by the South Coast AQMD Governing Board. Proposed solicitations and project awards shall be presented to the Technology Committee and Governing Board no less frequently than an annual basis; and

BE IT FURTHER RESOLVED, that the Governing Board hereby directs the Executive Officer to track mitigation fees paid by warehouse operators according to the Source Receptor Area and County in which they are located; and

BE IT FURTHER RESOLVED, that projects funded by the WAIRE Mitigation Program shall achieve and/or facilitate emission reductions in the same Source Receptor Areas (SRAs) and counties in which the mitigation fees were paid. If sufficient projects are not identified in each individual SRA relative to the available funding, then funds may be directed either to an adjacent SRA in the same county, or held for a subsequent funding; and

BE IT FURTHER RESOLVED, that funding from the WAIRE Mitigation Program may be combined with other incentive funding programs as allowed by the funding program to be combined; and

BE IT FURTHER RESOLVED, that any recipients of WAIRE Mitigation Program incentives that involve construction work use a skilled and trained workforce as defined in Public Contract Code section 2601 to perform such work; and

BE IT FURTHER RESOLVED, that any recipients of WAIRE Mitigation Program incentives that involve the installation of electric vehicle infrastructure shall: 1) be installed by a contractor with the appropriate license classification, as determined by the Contractors' State License Board, and at least one electrician on each crew, at any given time, holds an Electric Vehicle Infrastructure Training Program certification, and 2) meet a requirement that at least 25 percent of the total electricians working on an electric vehicle infrastructure project installing a charging port supplying 25 kW or more, at any given time, hold Electric Vehicle Infrastructure Training Program certification, consistent with the Public Utilities Code section 740.20; and

BE IT FURTHER RESOLVED, that any recipients of WAIRE Mitigation Program incentives or funding for the installation of ZE charging or fueling infrastructure for on-road vehicles that are not yard trucks must make the stations available for public use; and

BE IT FURTHER RESOLVED, that, consistent with existing South Coast AQMD funding programs, any recipients of WAIRE Mitigation Program incentives shall disclose any labor violations in the three years prior to receiving funding and during the life of the funded project; and

BE IT FURTHER RESOLVED, that the South Coast AQMD Governing Board does hereby direct the Executive Officer to evaluate the state of technology and the WAIRE Menu every five years from the date of adoption of Proposed Rule 2305 and to report the results and make any recommendations for potential updates to the WAIRE Menu to the Mobile Source Committee; and

BE IT FURTHER RESOLVED, that the South Coast AQMD Governing Board does hereby direct the Executive Officer to ensure that, prior to WAIRE Mitigation Program solicitations and awards, public outreach is conducted that includes community groups, local governments, and small business; and

BE IT FURTHER RESOLVED, that the Executive Officer is hereby directed to develop an online portal for the purpose of submitting required reports and documents as required by Proposed Rule 2305 and Proposed Rule 316, as well as to

provide the public information about how warehouse operators and owners are complying with Proposed Rule 2305 and Proposed Rule 316, and how WAIRE Mitigation Program funds are spent; and

BE IT FURTHER RESOLVED, that the Executive Officer is hereby directed to conduct outreach to applicable warehouse operators to provide training and guidance on how to comply with PR 2305 with emphasis on warehouse operators that are small businesses; and

BE IT FURTHER RESOLVED, that the Executive Officer is hereby directed to provide annual updates on the status and progress of Proposed Rule 2305 and Proposed Rule 316 to the-South Coast AQMD Mobile Source Committee; and

BE IT FURTHER RESOLVED, that the Executive Officer is hereby directed to forward a copy of this Resolution and Proposed Rule 2305 to the California Air Resources Board for approval and subsequent submittal to the U.S. Environmental Protection Agency for inclusion into the State Implementation Plan.

I. INTRODUCTION

The South Coast Air Quality Management District (South Coast AQMD) has developed Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, to facilitate local and regional emission reductions associated with existing and new warehouses with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building and the mobile sources attracted to these warehouses. PR 2305 will be submitted into the State Implementation Plan (SIP). South Coast AQMD also developed PR 316 – Fees for Rule 2305, a fee program designed to recover administrative costs associated with PR 2305. These proposed rules were determined to be a “project” as defined by the California Environmental Quality Act (CEQA) and the Public Resources Code Section 21000 et. seq. Specifically, CEQA requires: 1) the potential adverse environmental impacts of proposed projects to be evaluated; and 2) feasible methods to reduce or avoid any identified significant adverse environmental impacts of these projects to also be evaluated. Since PR 2305 and PR 316 are South Coast AQMD-proposed rules, the South Coast AQMD has the greatest responsibility for carrying out or approving the project as a whole, which may have a significant effect upon the environment, and is the most appropriate public agency to act as lead agency. [Public Resources Code Section 21067 and CEQA Guidelines Section 15051(b)].¹

Thus, the analysis of PR 2305 and PR 316 indicated that the type of CEQA document appropriate for the proposed project is an Environmental Assessment (EA) with significant impacts. The EA is a substitute CEQA document, which the South Coast AQMD, as lead agency for the proposed project, prepared in lieu of an Environmental Impact Report (EIR) with significant impacts (CEQA Guidelines Section 15252), pursuant to the South Coast AQMD’s Certified Regulatory Program (Public Resources Code Section 21080.5, CEQA Guidelines Section 15251(l); South Coast AQMD Rule 110 – Rule Adoption Procedures to Assure Protection and Enhancement of the Environment). Therefore, as lead agency, the South Coast AQMD has prepared a Final EA with significant environmental impacts pursuant to CEQA Guidelines Sections 15089 and 15132.

When considering for approval a proposed project that has one or more significant adverse environmental effects, a public agency must make one or more written findings for each significant adverse effect, accompanied by a brief rationale for each finding (Public Resources Code Section 21081 and CEQA Guidelines Sections 15065 and 15091). The analysis in the Final EA concluded that the proposed project has the potential to generate significant adverse environmental impacts on aesthetics, agriculture and forestry resources, air quality and greenhouse gas emissions, biological resources, cultural and tribal cultural resources, energy, geology and soils, hazard materials and solid and hazardous waste, hydrology and water quality, mineral resources (during operations), noise, transportation, and utilities and service systems (during operations). For a

¹ CEQA Guidelines refers to California Code of Regulations, Title 14, Section 15000 and following.

proposed project with significant adverse environmental impacts, CEQA also requires the lead agency to balance the economic, legal, social, technological, or other benefits of a proposed project against its significant unavoidable environmental impacts when determining whether to approve the proposed project. Under CEQA Guidelines Section 15093(a), “If the specific economic, legal, social, technological, or other benefits of a project outweigh the unavoidable significant adverse environmental effects, the adverse environmental effects may be considered ‘acceptable.’” Thus, after adopting findings, the lead agency must also adopt a “Statement of Overriding Considerations” to approve a proposed project with significant adverse environmental effects.

South Coast AQMD’s certified regulatory program does not impose any greater requirements for making written findings for significant environmental effects than is required for an EIR under CEQA.

When a lead agency adopts measures to mitigate or avoid significant adverse environmental effects, a mitigation and monitoring report may be required pursuant to CEQA Guidelines Section 15097 and Public Resources Code Section 21081.6. The Final EA does not identify any CEQA mitigation measures within the authority of South Coast AQMD to adopt or implement and South Coast AQMD has no authority to impose mitigation measures on local governments, or other agencies. Therefore, no Mitigation, Monitoring, and Reporting Program is included in this document.

A. Project Summary

The proposed project is comprised of PR 2305, including a mitigation fee program component, PR 316, to recover administrative costs, and the submittal of PR 2305 into the SIP. PR 2305 has been developed to reduce emissions and facilitate local and regional emission reductions associated with existing and new warehouses with an indoor warehouse floor space equal to or greater than 100,000 square feet within a single building and the mobile sources attracted to these warehouses. Under PR 2305, operators of applicable existing and new warehouses would be subject to an annual Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points Compliance Obligation (WPCO) intended to reduce regional and local NO_x and PM emissions associated with warehouses and from mobile sources attracted to warehouses. PR 2305 implements Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, which is one of four Facility-Based Mobile Source Measures identified in the 2016 Air Quality Management Plan (AQMP) for the warehouse and distribution sector.

To meet the WPCO, WAIRE Points can be earned by warehouse operators and/or owners by selecting from a menu of implementation measures: 1) acquiring and/or using near-zero emissions (NZE) and zero-emission (ZE) trucks; 2) acquiring and/or using ZE yard trucks; 3) installing and/or using ZE charging/fueling infrastructure (e.g., electric charger, hydrogen fuel station) for cars, trucks, and/or transport refrigeration units; 4) installing and/or using onsite energy systems

(e.g., solar panels); and 5) implementing community benefits (e.g., operation of Minimum Efficiency Reporting Value (MERV) filters or filtration systems rated MERV-16 or greater). In addition, warehouse operators may apply to earn WAIRE Points through a Custom WAIRE Plan specific to their operations that satisfy prescribed performance metrics. WAIRE Points may be earned only for “surplus” actions that go beyond existing state and federal regulations. The WAIRE Points obligation for a warehouse operator and/or owner is calculated by multiplying the number of weighted annual truck trips (WATT) by a stringency factor and an annual variable. The stringency factor is a dimensionless multiplier that determines how many points an operator needs to earn, and the annual variable is a dimensionless multiplier which controls how the stringency will phase in through time.

In lieu of earning WAIRE Points through WAIRE Menu Options or a Custom WAIRE Plan, or to supplement earned WAIRE Points to satisfy the WPCO, within each compliance year, a warehouse operator may choose to pay an optional mitigation fee to South Coast AQMD that would be used in a mitigation program implemented by South Coast AQMD to achieve or facilitate the emissions reductions. Similar to the measures used to earn WAIRE Points, the mitigation program would implement measures such as subsidizing the purchase of NZE and ZE trucks and/or the installation of charging and fueling infrastructure for ZE trucks. The mitigation program would prioritize use of the mitigation fees in areas near the warehouses using this compliance option.

Implementation of the proposed project is expected to result in long-term and permanent emission reductions of nitrogen oxides (NO_x) and particulate matter (PM) in South Coast AQMD’s jurisdiction, including diesel PM and reduced associated public health impacts from warehouse activities which will vary depending upon the implementation measures employed, reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617, and reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse. There may be additional industrial properties and warehouse operators and owners that will only be required to provide reports but will not be required to earn WAIRE Points.

PR 316 has been developed to establish fees to be paid by warehouses subject to PR 2305 to recover South Coast AQMD administrative costs associated with submittal and review of various notifications and reports, Custom WAIRE Plan evaluation, and implementing a program using mitigation fees from warehouse operators that chose to pay a mitigation fee, as well as compliance activities such as conducting desktop audits, onsite inspections, and reviewing records.

The main objectives of the proposed project are to:

- 1) Reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities.

- 2) Facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM2.5.
- 3) Implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617.
- 4) Reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse.

B. WAIRE Points Scenarios

Because of the programmatic nature of the proposed project, it is not possible to predict how each of the warehouse operators will comply with the WAIRE Program. As a result, it is not possible to forecast a particular, region-wide compliance approach for the initial 2,902 warehouses that would likely need to earn WAIRE Points in any given year. Instead, the Final EA analyzes the potential environmental impacts that would result if all warehouse operators subject to the proposed project chose one of the “scenarios” described in Table 1 as their compliance path from 2022 through 2031 to meet their WPCO. Each modeled WAIRE Points scenario assumes the entire universe of warehouses meet their WPCO only through that action in each scenario. The WAIRE Points scenarios modeled serve as a bounding analysis approach. No single scenario in this bounding analysis is expected to occur. Rather, they present possible extreme compliance outcomes, and thus provide a conservative estimate of potential impacts. In reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur. This approach allows for the analysis of environmental impacts associated with each of the individual compliance options as well as the range of environmental impacts and benefits from the proposed project that could be anticipated. See Section 4.0.1.2 of the Final EA for further discussion on WAIRE Points scenario modeling.

Table 1
WAIRE Points Scenarios

SCENARIO #	DESCRIPTION
Scenario 1	NZE Class 8 truck acquisitions and subsequent visits from those trucks
Scenario 2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase) ^a
Scenario 3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks ^{b, c}
Scenario 4	NZE Class 8 truck visits from non-owned fleets ^c
Scenario 5	ZE Class 8 truck visits from non-owned fleet ^{c,d}
Scenario 6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers ^e
Scenario 7	Pay Mitigation Fee
Scenario 7a	Pay Mitigation Fee and account for NZE trucks visiting the facility incentivized from the WAIRE Mitigation Program
Scenario 8	NZE Class 6 truck acquisitions and subsequent visits from those trucks
Scenario 9	NZE Class 6 truck visits from non-owned fleets ^c
Scenario 10	ZE Class 6 truck visits from non-owned fleets ^c
Scenario 11	Rooftop solar panel installations and usage ^f
Scenario 12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station ^g
Scenario 13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks
Scenario 14	ZE Class 2b-3 truck visits from non-owned fleets
Scenario 15	Filter System Installations
Scenario 16	Filter Purchases
Scenario 17	TRU plug installations and usage in cold storage facilities ^h
Scenario 18	ZE Hostler Acquisitions and Usage

Notes: MERV: Maximum Efficiency Reporting Value

a One additional truck is acquired earlier than required, thus increasing WAIRE Points earned from truck visits in subsequent years.

b Mitigation fees paid to earn WAIRE Points in first year of compliance.

c No WAIRE Points earned for truck acquisitions.

d ZE Class 8 trucks are assumed to not be commercially available until late 2022. Mitigation fees paid to earn WAIRE Points until then.

e Chargers provide ~30,000 kWh/year per Class 6 truck, and ~90,000 kWh/yr per Class 8 truck. Class 8 trucks only acquired if 25 Class 6 trucks had been previously purchased for one warehouse.

f Solar panel coverage limited to 50 percent of building square footage. Mitigation fees used to make up any shortfall in WAIRE Points.

g System installation in first year is followed by a truck acquisition. In subsequent years trucks are only acquired if needed to earn WAIRE Points.

h Scenario is only applied to cold storage warehouses. Plugs limited to 1:10,000 sq. ft. of building space.

Furthermore, the Industrial Economics, Incorporated (IEc) Study titled “Assessment of Warehouse Relocations Associated with the South Coast AQMD Warehouse ISR” analyzed potential warehouse relocations to neighboring real estate markets outside of the South Coast AQMD's

jurisdiction in response to the WAIRE Program. The IEc study found that up to 10 warehouses potentially would relocate to neighboring regions today, even without the proposed project in place. Under the most conservative scenario analyzed in the IEc Study, i.e., where compliance with PR 2305 costs warehouse operators \$2.00 per square foot (which translates to a stringency factor of greater than 0.0050 WAIRE Points per WATT), the IEc study concluded that the proposed rule could result in approximately six additional warehouses being built outside of the South Coast AQMD's jurisdiction. For the currently proposed rule stringency of 0.0025 WAIRE Points per WATT, the IEc study supports the conclusion that the proposed project would not result in any warehouse relocations. Nonetheless, the Final EA assumed the potential for up to three warehouse relocations as the worst-case warehouse relocation scenario for the purpose of providing a conservative analysis of the proposed project's potential impacts on operational air quality, greenhouse gas (GHG) emissions, energy, and transportation. See Section 4.0.1.3.1 of the Final EA for further discussion on potential warehouse relocations.

Additionally, the IEc Study concluded that moving to a nearby region increases the travel time by only a few hours. In contrast, moving to a different port on the east coast would be more than 10+ days²; therefore, it is not reasonably foreseeable that cargo owners will ship their goods to other ports to avoid the cost of the proposed project. However, the Final EA conservatively considered that the proposed project could contribute to some cargo growth diversion at the Ports of Los Angeles and Long Beach. Since the amount of potential cargo growth diversion associated with the proposed project is speculative and it is not possible to identify where cargo would be diverted to or predict how cargo shippers would respond to the proposed project, cargo growth diversion impacts are discussed qualitatively throughout the EA, where applicable. See Section 4.0.1.3.2 of the Final EA for further discussion on potential cargo growth diversion.

The Final EA also assumed that implementation of the proposed project does not generate an increase in the national or even international demand for trucks used in the goods movement sectors because the proposed project will not increase the amount of cargo being transported. In analyzing the potential impacts of the purchase of new NZE and ZE trucks pursuant to the proposed project, the Final EA assumed that these new trucks will be replacing older trucks. The Final EA further assumes that some of the older trucks that are replaced by NZE and ZE trucks will be retired (i.e., scrapped) and some will be sold to other operators (either within the South Coast AQMD's jurisdiction or outside of it) to replace even older, higher emissions trucks in that operator's truck fleet. These assumptions are used in the analysis of the proposed project's environmental impacts and support the conclusion that the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without its implementation.

Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 (pp 55-56). <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/warehs-distr-wkng-grp>

II. CEQA PROVISIONS REGARDING FINDINGS

CEQA generally requires agencies to make certain written findings before approving a project with significant environmental impacts. South Coast AQMD is exempt from some of CEQA's requirements pursuant to its Certified Regulatory Program, but complies with its provisions where required or otherwise appropriate.

CEQA Guidelines Section 15091 provides:

- (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:
 - 1. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.
 - 2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
 - 3. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.
- (b) The findings required by subsection (a) shall be supported by substantial evidence in the record.
- (c) The finding in subdivision (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives. The finding in subsection (a)(3) shall describe the specific reasons for rejecting identified mitigation measures and project alternatives.
- (d) When making the findings required in subdivision (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures

must be fully enforceable through permit conditions, agreements, or other measures.

- (e) The public agency shall specify the location and custodian of the documents or other material which constitute the record of the proceedings upon which its decision is based.
- (f) A statement made pursuant to Section 15093 does not substitute for the findings required by this section.

The “changes or alterations” referred to in CEQA Guidelines Section 15091(a)(1) may include a wide variety of measures or actions as set forth in CEQA Guidelines Section 15370, including:

- (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
- (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- (e) Compensating for the impact by replacing or providing substitute resources or environments.

III. CALIFORNIA ENVIRONMENTAL QUALITY ACT

In conformance with the CEQA Statute and Guidelines, the South Coast AQMD’s Certified Regulatory Program (Public Resources Code Section 21080.5, CEQA Guidelines Section 15251(l), and South Coast AQMD Rule 110), South Coast AQMD conducted an extensive environmental review of the proposed project. Under its Certified Regulatory Program, the South Coast AQMD typically prepares an EA, a substitute CEQA document prepared in lieu of an EIR, for proposed projects with significant impacts (CEQA Guidelines Section 15252), to evaluate the environmental impacts for rule projects proposed for adoption or amendment.

The following describes South Coast AQMD’s environmental review process for the proposed project:

- South Coast AQMD determined that an EA would be required for the proposed project and issued a Notice of Preparation (NOP) of a Draft EA and Initial Study (IS) (collectively referred

to as “NOP/IS”) on November 12, 2020. The 32-day public review and comment period began Friday, November 13, 2020 and ended Tuesday, December 15, 2020.

- South Coast AQMD conducted a CEQA scoping meeting via video conference and by telephone on December 2, 2020 at 1:30 p.m.
- Based upon the environmental analysis in the NOP/IS, South Coast AQMD staff determined that a Draft EA should be prepared for the proposed project. The scope of the Draft EA was determined based on the NOP/IS, comments received in response to the NOP/IS, and comments received at the CEQA scoping meeting conducted by South Coast AQMD. Sections 1.2 and 4.0.1.1 of the Draft EA describe the issues identified for analysis in the Draft EA.
- South Coast AQMD prepared a Draft EA, which was made available for a 45-day public review and comment period beginning January 26, 2021 and ending Friday, March 12, 2021.
- South Coast AQMD held a public workshop on February 16, 2021 and a community meeting on February 17, 2021 regarding the proposed project during the public review and comment period for the Draft EA.
- South Coast AQMD prepared a Final EA, Findings, and a Statement of Overriding Considerations. The Final EA also contains comments received relative to the Draft EA, written responses to those comments, revisions including clarifications to the Draft EA, and appended documents.
- The Final EA, Appendix 1, and PR 2305 and PR 316 will be considered at the Governing Board Meeting (and Public Hearing) scheduled for May 7, 2021 (subject to change).

A. Responses to Comments Relative to the Draft EA

The South Coast AQMD received comment letters relative to the Draft EA, evaluated the environmental issues raised, and prepared written responses. The Final EA contains seven comment letters received relative to the Draft EA and responses to the comments, as a separate section. The responses to the comments focus on the disposition of environmental issues as raised.

None of the comments indicate that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated. Instead, the information presented in the responses to comments “merely clarifies or amplifies or makes insignificant modifications” in the Draft EA. These comments do not require recirculation of the Draft EA. See CEQA Guidelines Sections 15073.5 and 15088.5(b). The Draft EA has been revised to include the aforementioned modifications as part of the Final EA.

B. Revisions to the Proposed Project

After the Draft EA was circulated for public review, and in response to comments received and stakeholder input, PR 2305 was modified in the following ways:

- (a) A sunset provision was added, ending the proposed rule’s requirements once state and federal air quality standards have been reached.
- (b) “Low use” warehouse operators were exempted from compliance with the rule.
- (c) NZE yard trucks that use renewable fuels were added as an allowable option under Custom WAIRE Plans.
- (d) The compliance period was shifted by 6 months, starting January 1, 2022.

There were no changes made to PR 316. None of the revisions: 1) constitute significant new information; 2) constitute a substantial increase in the severity of an environmental impact; or, 3) provide new information of substantial importance relative to the Draft EA.

Including a sunset provision would reduce the potential environmental impacts of the proposed rule by eliminating all compliance obligations after the standards are achieved. “Low use” operators are those with a WPCO score of less than 10, meaning they receive approximately two Class 8 truck visits/day. There are not expected to be many “low use” warehouses. Exempting them from the rule would reduce the adverse environmental impacts of the proposed project because the exempt facilities would not be required to implement any compliance options, such as constructing new charging stations. The “low use” exemption could reduce the benefits of the proposed rule, but any reduction in benefit would be negligible, because there are not expected to be many “low use” warehouses and their compliance obligations would have been small to begin with. Similarly, including a sunset provision could reduce the benefits of the proposed rule, but the sunset provision is triggered only when state and federal air quality standards have been met and the need for the project benefits has therefore been reduced or eliminated. Including NZE yard trucks under the Custom WAIRE Plans could decrease air quality and GHG benefits when compared with allowing only ZE yard trucks as a compliance option but would still result in an air quality and GHG benefit with respect to baseline conditions. Additionally, allowing NZE yard trucks would also lessen the impacts of battery disposal associated with ZE yard trucks. Lastly, shifting the compliance period would result in the same impacts occurring at a later date.

The Final EA reflects revisions, clarifications, and corrections to the Draft EA as a result of changes to the proposed rule language subsequent to the public review and comment period. South Coast AQMD staff has reviewed the modifications to PR 2305 and PR 316 and has updated the CEQA analysis in the Final EA accordingly.

C. Tiering and Incorporation by Reference

South Coast AQMD's Final Program Environmental Impact Report for the 2016 Air Quality Management Plan

The EA for the proposed project tiers off of the Final Program Environmental Impact Report (EIR) for the 2016 Air Quality Management Plan (AQMP) (State Clearinghouse No. 2016071006)³ (referred to as “the 2016 AQMP Final Program EIR”), pursuant to Public Resources Code Section 21094 and CEQA Guidelines Section 15152(g). The 2016 AQMP Final Program EIR analyzed a number of air pollution control measures to be implemented by South Coast AQMD, including Control Measure MOB-03 – Emission Reductions at Warehouse Distribution Centers, which required the assessment and identification of potential actions to reduce emissions associated with mobile sources operating in and out of warehouse distribution centers. The proposed project is consistent with the 2016 AQMP, as it implements Control Measure MOB-03. The 2016 AQMP includes a Mitigation Monitoring and Reporting Plan. There are no additional mitigation measures beyond those set forth in that Plan that South Coast AQMD could implement to reduce the significant impacts of the proposed project.

CEQA encourages tiering whenever feasible (Public Resources Code Section 21093). Pursuant to CEQA, as long as a program EIR has adequately addressed a potentially significant impact, the later EIR need not provide further analysis. See CEQA Guidelines Section 15152(f); CEQA Section 21093 (“tiering is appropriate when it helps a public agency exclude duplicative analysis of environmental effects examined in previous environmental impact reports”). An impact has been adequately addressed if it has been examined at a sufficient level of detail in the prior environmental impact report to enable the lead agency and public to consider whether those effects can be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the later project. See CEQA Guidelines Section 15152(f). The 2016 AQMP Final Program EIR adequately addressed potentially significant impacts from implementation of the 2016 AQMP, including from Control Measure MOB-03, and this analysis is incorporated by reference in the EA for the proposed project (CEQA Guidelines Section 15150).

The 2016 AQMP Final Program EIR reviewed approximately 17 environmental topic areas and analyzed whether the implementation of the 2016 AQMP, including Control Measure MOB-03, would create potentially significant adverse impacts. The analysis in 2016 AQMP Final Program EIR concluded that significant and unavoidable adverse environmental impacts are expected to occur after implementing mitigation measures for the following environmental topic areas: 1) aesthetics from increased glare, construction site staging and equipment laydown areas, and from the construction and operation of catenary lines and use of bonnet technology for ships; 2) construction air quality and GHG emissions; 3) energy (due to increased electricity demand); 4)

³ South Coast Air Quality Management District. 2017, March. Final Program EIR for the 2016 AQMP. <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf>

hazards and hazardous materials due to: (a) increased flammability of solvents; (b) storage, accidental release and transportation of ammonia; (c) storage and transportation of liquefied natural gas (LNG); and (d) proximity to schools; 5) hydrology (water demand); 6) construction noise and vibration; 7) construction waste and operational waste from vehicle and equipment scrapping; and 8) transportation and traffic during construction and during operation on roadways with catenary lines and at the harbors.

It is important to note, however, that, because the 2016 AQMP included other measures in addition to Control measure MOB-03, not all of the conclusions of significance are applicable to the proposed project. Table 2 summarizes the significant and unavoidable adverse environmental impacts identified in the 2016 AQMP Final Program EIR and identifies which topic area applies to the proposed project in the Final EA.

Table 2
Applicability of the Significant and Unavoidable Adverse Environmental Impacts Identified in the 2016 AQMP Final Program EIR to Proposed Project for Direct Impacts

CONCLUSION OF SIGNIFICANT ENVIRONMENTAL IMPACTS IN THE 2016 AQMP FINAL PROGRAM EIR	APPLICABLE TO THE PROPOSED PROJECT?	EXPLANATION
Aesthetics from increased glare, construction site staging and laydown areas, and from the construction and operation of catenary lines and use of bonnet technology for ships	Yes	This environmental topic is applicable to the proposed project because solar panels and WPCO measures that require construction are applicable to the implementation of some of the WAIRE Points Menu actions and/or due to incentivizing increased acquisition and use of ZE trucks and yard trucks. Therefore, this conclusion is applicable to the proposed project.
Construction air quality and GHGs	Yes	The proposed project has the potential to generate direct impacts associated with construction emissions from constructing infrastructure to support NZE and ZE trucks and ZE trucks from the WAIRE Menu. Therefore, this conclusion is applicable to the proposed project.
Energy due to increased electricity demand	Yes	The proposed project would increase the penetration of ZE trucks and yard trucks resulting in an increase in electricity consumption, as well as an increased energy demand from the operation of MERV-16 or greater filters and filtration systems. Therefore, this conclusion is applicable to the proposed project.
Hazards and hazardous materials due to the increased flammability of solvents	No	Implementation of the WAIRE Points Menu actions would not require the use of solvents for their operation. Therefore, this conclusion is not applicable to the proposed project.
Hazards and hazardous materials due to the storage, accidental release and transportation of ammonia	No	Implementation of the WAIRE Points Menu actions would not require the storage and transportation of ammonia. Therefore, this conclusion is not applicable to the proposed project.

Table 2 (concluded)
Applicability of the Significant and Unavoidable Adverse Environmental Impacts Identified in the 2016 AQMP Final Program EIR to Proposed Project for Direct Impacts

Hazards and hazardous materials due to the storage and transportation of liquefied natural gas (LNG)	Yes	Since the proposed project could result in the increased use of NZE trucks, the use, storage, and transport of LNG could also increase. Therefore, this conclusion is applicable to the proposed project.
Hazards and hazardous materials due to the use of reformulated coatings, solvents, adhesives, and sealants in the proximity to schools	No	The management of hazardous materials used during the construction and operational phase of new infrastructure pursuant to the implementation of the proposed project would be regulated by federal, state, and local laws and would not be in such quantities or stored in such a manner as to pose a significant safety hazard. Therefore, impacts to nearby schools through the use and transport of hazardous materials are not expected to be significant, and this discussion is not applicable to the proposed project.
Hydrology (water demand)	No	Implementation of the WAIRE Points menu options would not utilize water for their operation. Therefore, this conclusion is not applicable to the proposed project.
Construction noise and vibration	Yes	Implementation of the proposed project could generate potential noise and vibration impacts associated with the installation of air pollution control equipment, (e.g., MERV-16 or greater filters and filtration systems), replacement of existing equipment, installation of roadway infrastructure (wayside power and catenary lines or other similar technologies), installation of, battery charging or fueling infrastructure, and the installation of solar panels. Therefore, this conclusion is applicable to the proposed project.
Construction waste and operational waste from vehicle and equipment scrapping	Yes	The proposed project could result in an increased volume of vehicles, equipment, and disposal of batteries and hydrogen fuel cells that need to be retired in a short timeframe. Furthermore, since the extent and timing of construction needed to implement the proposed project at the individual warehouses is not known or possible to predict how individual warehouse subject to the WAIRE Program will comply, the potential to exceed landfill capacities is also possible. Therefore, this conclusion is applicable to the proposed project.
Transportation and traffic during construction and during operation on roadways with catenary lines and at the harbors	No	Catenary lines and the associated transportation and traffic impacts on roadways and at the harbors are not applicable to the proposed project. Therefore, this conclusion is not applicable to the proposed project.

California Air Resources Board’s Final Environmental Assessment for the Advanced Clean Trucks Regulation

Because the WAIRE Program would incentivize the purchase and use of zero emission vehicles, some comments received on the Initial Study noted that the proposed project could lead to the construction of new manufacturing and battery recycling facilities, and improvements to the electrical grid. While it is too speculative to analyze the particular impacts of such future hypothetical development projects, the California Air Resources Board (CARB) provided a general, qualitative analysis of these potential development projects and the environmental impacts in its Final EA for the Advanced Clean Trucks (ACT) Regulation. The ACT Regulation is part of the mobile source emission reduction activities at the state level to accelerate a large-scale transition to zero emission vehicles by establishing a new requirement that manufacturers selling new medium- and heavy-duty trucks in California be required to sell zero-emission trucks at an increasing percentage by 2035.

In the Final EA for the ACT Regulation, CARB concluded that actions taken in response to the ACT Regulation could result in potential indirect physical changes to the environment from potential future development projects related to manufacturing, recycling, mining, and grid improvements. The Final EA for the proposed project acknowledged the potentially significant impacts of such development projects by incorporating by reference CARB’s Final EA for the ACT Regulation (State Clearing House No. 2018052041).

Because these impacts are indirect impacts of the proposed project, and because it would be speculative to analyze the specific impacts caused by hypothetical future construction projects whose scale and location is unknown at this time, both the CARB EA and the Final EA for this Project evaluated these impacts at a more general level of detail than the proposed project’s direct impacts. While lead agencies must use their best efforts to find out and disclose all that they reasonably can about a proposed project’s potentially significant environmental impacts, they are not required to predict the future or foresee the unforeseeable (CEQA Guidelines Section 15144).

IV. FINDINGS ON IMPACTS DETERMINED TO BE LESS THAN SIGNIFICANT

A. Impact Areas Concluded to be Less Than Significant in the Notice of Preparation/Initial Study

South Coast AQMD prepared a NOP/IS to identify the potential significant effects of the proposed project and most environmental topic areas were concluded to have no project impacts or less than significant project impacts. After comments were received on the NOP/IS, all the environmental topic areas were re-evaluated for their potential impacts in the EA. However, the following conclusions from the NOP/IS were not modified by the EA:

1. Aesthetics

The proposed project would not have a substantial direct effect on scenic vistas and scenic resources. Additionally, the proposed project would not directly alter the visual character of a project site or conflict with local regulations governing scenic quality. The proposed project would also not create a new source of substantial light or glare.

Finding. The proposed project would have less than significant direct impacts relating to aesthetics. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

2. Agriculture and Forestry Resources

The proposed project would not directly convert Farmland to non-farm use or conflict with agricultural zoning. The proposed project would not directly conflict with lands zoned as forest land or Timberland Production or result in the loss of forest land to non-forest use. The proposed project would not directly result in the loss of Farmland or forest land to non-agricultural or non-forest use.

Finding. The proposed project would have less than significant direct impacts relating to agriculture and forestry resources. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

3. Air Quality and Greenhouse Gas Emissions

The proposed project would not conflict with or obstruct the implementation of the South Coast AQMD's AQMP, and in fact implements the AQMP. The proposed project also would not diminish an existing air quality rule or future compliance requirement. The proposed project would not result in odors that adversely affect a substantial number of people.

Finding. The proposed project would have less than significant direct, indirect, and cumulative impacts relating to these air quality impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

4. Biological Resources

The proposed project would not directly impact habitat for candidate, sensitive, or special status species. The proposed project would not directly impact riparian or other sensitive habitat, including wetlands. Additionally, the proposed project would not directly impact wildlife movement. The proposed project would also not conflict with local biological resources policies or conflict with habitat conservation plans or natural community conservation plans.

Finding. The proposed project would have less than significant direct impacts to biological resources. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

5. Cultural and Tribal Cultural Resources

The proposed project would not directly impact historical resources, archeological resources, human remains, or tribal cultural resources.

Finding. The proposed project would have less than significant direct impacts to cultural and tribal cultural resources. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

6. Energy

The proposed project would not conflict with or obstruct adopted energy conservation plans, or a state or local plan for renewable energy and energy efficiency. The proposed project would comply with existing energy standards. Additionally, the proposed project would not result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. Impacts from construction vehicles and equipment were also found to be less than significant.

Finding. The proposed project would have less than significant direct impacts for these energy impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

7. Geology and Soils

The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving earthquake hazards. Additionally, the proposed project would not result in substantial soil erosion or the loss of topsoil. The proposed project would also not be affected by other geological hazards (e.g., landslides, lateral spreading, liquefaction, or subsidence) or expansive soil. The proposed project would not have impacts from septic tanks or alternative waste disposal systems. Additionally, the proposed project would not result in direct impacts to paleontological resources.

Finding. The proposed project would have less than significant direct impacts to geology and soils. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

8. Hazards and Hazardous Materials

The proposed project would not result in impacts that pose a significant safety hazard to existing and proposed schools. Implementation of the proposed project would not result in impacts associated with development of a site that is listed pursuant to Government Code Section 65962.5. The proposed project would also not result in a safety hazard for projects that are within airport safety zones including safety, noise, overflight and airspace protection. The proposed project would also not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Development pursuant to the proposed project would also not significantly increase fire hazards in areas with flammable materials.

Finding. The proposed project would have less than significant direct, indirect, and cumulative impacts relating to these hazards and hazardous materials topics. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

9. Hydrology and Water Quality

The proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water. The proposed project would also not substantially decrease groundwater supplies or interfere substantially with groundwater recharge. The proposed project would not alter the existing drainage of an affected warehouse site in a manner that would increase erosion; alter the rate or amount of surface runoff; contribute to the runoff water that would exceed the capacity of the existing drainage system or provide substantial additional sources of polluted runoff; or impede or redirect flood flow. The proposed project would not result in flood hazards from tsunamis, seiche zones, or dam inundation. The proposed project would also not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. The proposed project would not construct or relocate new or expanded wastewater treatment or storm drain facilities or result in impacts to the wastewater treatment system. The proposed project would not result in impacts to water supply.

Finding. The proposed project would have less than significant direct impacts relating to hydrology and water quality. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

10. Land Use and Planning

The proposed project would not divide an established community or conflict with any land use plan, policy, or regulation that was adopted for the purpose of avoiding or mitigating an environmental impact.

Finding. The proposed project would have less than significant direct, indirect, and cumulative impacts relating to land use and planning. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

11. Mineral Resources

The proposed project would not result in loss of availability of a known mineral resource that is of value to the region, residents of the state, or locally important mineral resources.

Finding. The proposed project would have less than significant direct impacts relating to mineral resources. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

12. Noise

The proposed project would not generate substantial temporary or permanent increase in ambient noise above the levels established in local general plans/ordinances. The proposed project would also not generate excessive groundborne noise or vibration. The proposed project would not expose people to excessive noise from proximity to aircraft or airport noise.

Finding. The proposed project would have less than significant direct impacts relating to noise. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

13. Population and Housing

The proposed project would not induce substantial unplanned population growth or displace substantial numbers of people or housing that would necessitate replacement housing elsewhere.

Finding. The proposed project would have less than significant direct impacts relating to population and housing. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

14. Public Services

The proposed project would not result in substantial adverse physical impacts to fire protection facilities, police protection facilities, school facilities, parks, or other public facilities.

Finding. The proposed project would have less than significant direct impacts relating to public services. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

15. Recreation

The proposed project would not increase the use of existing park or other recreational facilities or include the construction of new recreational facilities that might have an adverse physical impact on the environment.

Finding. The proposed project would have less than significant direct impacts relating to recreation. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

16. Solid and Hazardous Waste

The proposed project would not conflict with regulations related to solid and hazardous waste.

Finding. The proposed project would have less than significant impacts relating to this solid and hazardous waste topic. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

17. Transportation

The proposed project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses or result in inadequate emergency access.

Finding. The proposed project would have less than significant direct, indirect, and cumulative impacts relating to these transportation impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

18. Wildfire

The proposed project would not impair an adopted emergency response plan or emergency evacuation plan and would not exacerbate wildfire risks. Additionally, the proposed project would not be associated with wildfire prevention infrastructure that may result in temporary or ongoing impacts to the environment. People or structures would not be exposed to post-fire impacts or a significant risk of loss, injury, or death involving wildfires due to the proposed project.

Finding. The proposed project would have less than significant direct, indirect, and cumulative impacts relating to wildfire impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

B. Impact Areas Concluded to be Less Than Significant in the Final EA

This section identifies direct and indirect impacts of the proposed project determined to be less than significant within the following topic areas. This determination was based on the application of standards and/or requirements of existing regulations as detailed in Chapter 3 of the Final EA and the analysis in Chapter 4 of the Final EA. As mentioned above, the Final EA for the proposed project tiers off of and incorporates by reference the analysis from the 2016 AQMP Final Program EIR by reference. Additionally, the analysis of indirect impacts related to manufacturing, recycling, mining, and grid improvements was incorporated by reference from CARB's Final EA for the ACT Regulation.

Direct and indirect impacts of the proposed project within these topic areas that the Final EA determined to be significant are addressed in Section IV.

1. Air Quality and Greenhouse Gas Emissions

Given that all WAIRE Point scenarios, except scenarios 15 (high efficiency filtration systems) and 16 (filter purchases), would result in substantial NO_x reductions and given that the proposed project would include tracking and monitoring to ensure that the NO_x emissions reductions benefits from the WPCO Points are realized over time, the Final EA concluded that the emissions benefits from the proposed project far outweigh any potential increase from warehouse relocations.⁴ Therefore, long-term operation of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutants or expose sensitive receptors to substantial criteria pollutant concentrations. Additionally, the proposed project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. The proposed project would also have a less than significant indirect greenhouse gas emission impact associated with the construction of new or modified manufacturing or recycling facilities or infrastructure projects.

Finding. The proposed project would have less than significant direct and indirect impacts related to the thresholds for air quality and GHG emissions. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

2. Energy

Short-term energy impacts during construction of improvements at warehouses and construction-related indirect impacts associated with new or modified manufacturing or recycling facilities or

⁴ It is unlikely that all warehouse operators would select installation of high efficiency filtration systems and filter purchases as the primary means of fulfilling their WPCO since installation of filtration systems in private properties is the second most expensive compliance option and is harder to implement since this option has the higher long-term costs for private properties owners, which would make it less likely to occur.

infrastructure projects would result in less than significant impacts to utility infrastructure and energy supply.

Finding. The proposed project would have less than significant direct and indirect impacts relating to these energy impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

3. Hazardous Materials and Solid and Hazardous Waste

Hazardous waste impacts associated with routine transport, use, or disposal of batteries are less than significant during operation.

Finding. The proposed project would have less than significant direct impacts relating to these hazardous materials and solid and hazardous waste impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

4. Transportation

Direct transportation impacts from construction activities vehicle miles traveled (VMT) and employee commute VMT from warehouse relocations that were assumed for the purpose of the environmental analysis for the proposed project would be less than significant.

Finding. The proposed project would have less than significant direct impacts relating to these transportation impacts. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

5. Other Impact Areas (Indirect Impacts)

Indirect impacts to Mineral Resources, Population and Housing, Land Use and Planning, Public Services, and Recreation due to the construction of new manufacturing and recycling facilities and improvements to the electrical grid are found to be less than significant. There would be no construction-related indirect impacts to Utilities and Service Systems. Indirect impacts to Population and Housing, Land Use and Planning, Public Services, and Recreation due to the operational phase are less than significant.

Finding. The proposed project would have less than significant indirect impacts for these environmental topics. Accordingly, no changes or alterations to the proposed project were required to avoid or substantially lessen any significant environmental impacts under those thresholds.

V. FINDINGS REGARDING POTENTIALLY SIGNIFICANT ENVIRONMENTAL IMPACTS

The following potentially significant environmental impacts were analyzed in the EA, and the effects of the proposed project were considered. Public Resources Code Section 21081(a) and CEQA Guidelines Section 15091(a) provide that a public agency shall not approve or carry out a project with significant environmental effects unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. Three potential findings can be made for potentially significant impacts:

Finding 1: Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the Final EA (Public Resources Code Section 21081(a)(1) and CEQA Guidelines Section 15091(a)(1)).

Finding 2: Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency (Public Resources Code Section 21081(a)(2) and CEQA Guidelines Section 15091(a)(2)).

Finding 3: Specific economic, legal, social, technological, or other considerations make infeasible the mitigation measures or project alternatives identified in the Final EA. (Public Resources Code Section 21081(a)(3) and CEQA Guidelines Section 15091(a)(3)).

Based on the analysis in the EA, there are no feasible mitigation measures that South Coast AQMD could adopt to reduce the proposed project's potentially significant environmental impacts. Therefore, South Coast AQMD's findings are limited to Findings 2 and 3.

A. Findings on Potentially Significant Adverse Environmental Impacts that Cannot be Reduced Below a Significant Level

The following summarizes the environmental impact topic areas identified in the Final EA which were concluded to have significant and unavoidable impacts, provides a description of the mitigation measures (if applicable), explains why the environmental impacts cannot be reduced to be less than significant, and presents the South Coast AQMD's findings.

The Final EA identified potentially significant and unavoidable adverse environmental impacts for the proposed project within the following 13 topic areas: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality and greenhouse gas emissions; 4) biological resources; 5) cultural and tribal cultural resources; 6) energy; 7) geology and soils; 8) hazard materials and solid and hazardous waste; 9) hydrology and water quality; 10) mineral resources (during operations); 11) noise; 12) transportation; 13) and utilities and service systems (during operations).

1. Air Quality and Greenhouse Gas Emissions

Environmental Impact: Construction-related air quality impacts and impacts during overlap of construction and operational activities from the installation of ZE truck chargers and hydrogen fueling station infrastructure would result in a cumulatively considerable net increase in criteria air pollutants for which the project region is non-attainment.

The Final EA conducted construction modeling for Scenario 6 (ZE truck charger installation) and Scenario 12 (hydrogen fueling station infrastructure), the scenarios with the highest potential construction air quality impacts. Tables 4.1-3 and 4.1-4 in the Final EA represent the potential second highest and highest construction emissions scenarios, respectively, if all warehouse operators selected these options as the single, sole compliance option to meet their WPCO in a compliance year. Because the Final EA cannot predict how each of the operators will comply with the proposed project, it is not possible to forecast a particular, region-wide compliance approach for the initial 2,902 warehouses that would likely need to earn WAIRE Points in any given compliance year. Thus, the analysis in the Final EA took a conservative scenario approach to estimating the maximum potential impacts associated with the proposed project. The peak daily emissions in Table 4.1-4 in the Final EA represent the highest potential emissions that could occur with implementation of the proposed project. Construction activities associated with the proposed project have the potential to exceed South Coast AQMD significance thresholds for NO_x and CO during the construction phase in the peak year.

The overlap of emissions for these two compliance options Scenarios are provided in Table 4.1-7 of the Final EA for the “worst-case” year and at compliance year 10 (year 2031) of proposed project implementation. The Final EA found that the peak daily emissions during the construction and operational overlap period would exceed the South Coast AQMD's regional air quality CEQA significance thresholds for NO_x for operation in the worst-case year for Scenario 6 (i.e., year 2021) and for NO_x for operation in the worst-case year for Scenario 12 (i.e., year 2024). By year 2031 the initial upfront emissions from installation would be offset by the potential emissions benefits from Scenario 6 and Scenario 12. However, because emissions modeling considers the worst-case scenario in the year where there are higher construction emissions than emissions benefits, the proposed project would temporarily result in significant adverse air quality impacts for NO_x during the “worst-case” construction and operation overlap period under the most conservative scenario.

Mitigation Measures:

The mitigation measures from the 2016 AQMP Final Program EIR, as identified in the Final EA, can be used during construction to reduce these construction-related air quality impacts, where applicable and feasible. Throughout these Findings, these mitigation measures are referred to as “AQ Construction Mitigation Measures.” Additionally, South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 AQMP is an additional resource to assist lead or

responsible agencies with identifying other potential mitigation measures. While these measures could reduce the direct air quality impacts associated with potential construction projects, South Coast AQMD does not have land use authority over those projects, and there are no other feasible mitigation measures which would reduce or eliminate this impact.

Findings:

Finding 2. South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving construction projects implementing the proposed rule, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section V of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: Indirect construction-related air quality emissions associated with the construction of new manufacturing and recycling facilities, as well as infrastructure for NZE and ZE vehicles could result in a cumulatively considerable net increase in criteria pollutant for which the project region is non-attainment.

Because the proposed project incentivizes the purchase and use of NZE and ZE vehicles, it could indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as infrastructure improvements to support NZE and ZE vehicles. Construction and operational activities would result in an increase in emissions; however, such facilities would be required to seek local land use approvals prior to their implementation. Part of the land use entitlement process requires that each of these projects undergo environmental review consistent with CEQA and other applicable local requirements, and that the land use authority impose feasible mitigation. Nonetheless, because South Coast AQMD does not have land use approval authority, it could not guarantee that any mitigation measures will be imposed, and there are no other feasible

mitigation measures which would reduce or eliminate this impact. Therefore, these indirect construction-related effects are significant.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be adopted by agencies approving construction projects implementing the proposed rule, where applicable and feasible. While these measures could reduce impacts, South Coast AQMD does not have land use authority over those projects, and there are no other feasible mitigation measures which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving construction projects implementing the proposed rule, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: The proposed project could generate GHG emissions from operations, either directly or indirectly, that may have a significant adverse impact on the environment from the additional energy use caused by installation of MERV 16 or greater filters and filtration systems (Scenario 15) and from cargo growth diversion that were assumed for the purpose of the environmental analysis.

Implementation of the proposed project could increase energy demand and associated GHG emissions under Scenario 15, which assumes that all warehouse operators would install and operate high-efficiency filter systems or replace filters in residences, schools, daycares, hospitals, or community centers proximate to the warehouse location as the single, sole compliance option

to meet their WPCO. The Final EA identified that by the year 2031 this scenario would exceed South Coast AQMD's GHG CEQA significance threshold. Additionally, although it is not reasonably foreseeable that cargo shippers would divert to other ports to avoid the increased cost of compliance with the proposed project, because of the uncertainty of the market response, the Final EA assumes some shipping diversion. Because the cumulative area of impact for GHG emissions is global emissions, the Final EA considers emissions outside of the South Coast AQMD's jurisdiction from cargo growth diversion and impacts are significant and unavoidable.

Mitigation Measures:

There are no feasible mitigation measures that would reduce or eliminate the increase in GHG emissions from the additional energy use caused by operation of MERV 16 or greater filters and filtration systems (Scenario 15) and from potential cargo growth diversion.

Finding:

Finding 3. South Coast AQMD's Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

2. Energy

Environmental Impact: The proposed project could expedite the need for expanded electricity, natural gas, and hydrogen fuel infrastructure resulting in project-level and cumulative energy impacts.

Impacts associated with the need for new or substantially altered utility systems, new and expanded infrastructure, and effects on peak and base period electricity demands are significant and unavoidable impacts of the proposed project. Southern California Edison (SCE) plans for and accommodates the need for electrical, natural gas, and transportation fuel grid infrastructure expansions and improvements through the biennial Integrated Energy Policy Report (IEPR) and is forecasting an increase in energy demand from ZE vehicles. While the IEPR is considering the cumulative effect of N-79-20, which would ultimately shift California's transportation economy to carbon neutral energy sources, the proposed project would expedite this timeline for ZE heavy duty trucks. Since the proposed project expedites the need for electricity, natural gas fueling, and

hydrogen fueling infrastructure to accommodate the electricity demand created by the proposed project this is considered a significant impact.

Additionally, the larger transition to NZE and ZE vehicles would warrant expansion of the energy infrastructure. Public utility companies would continue to improve infrastructure and implement strategies to diversify the grid to accommodate additional electricity demand from use of NZE and ZE vehicles. Most, if not all, new or modified facilities, no matter their size and location would be required to seek local or State land use approvals prior to their development. In addition, part of the land use entitlement process for facilities proposed in California requires that each of these projects undergo environmental review consistent with the requirements of CEQA and the CEQA Guidelines. At this time, the specific location and type of construction needed is not known and would be dependent upon a variety of market factors that are not within the control of South Coast AQMD. Thus, the specific impacts to energy service providers cannot be identified with any certainty, and individual compliance responses could potentially result in significant environmental impacts for which it is unknown whether mitigation would be available to reduce the impacts. However, as stated above, while there are ongoing planning efforts and programs in place to expand hydrogen and natural gas fueling infrastructure in addition to electricity infrastructure, the proposed project would contribute to expediting the need for expansion of the various infrastructure for these energy sources. Therefore, the proposed project's cumulative contribution to impacts on energy infrastructure is cumulatively considerable.

Mitigation Measures:

The authority to determine project-level impacts and require project-level mitigation lies with land use and/or permitting agencies for individual projects. While impacts could likely be reduced to a less-than-significant level by land use and/or permitting agencies, South Coast AQMD does not have the authority to implement mitigation related to new or modified energy infrastructure and such mitigation could include a wide variety of possible measures that are too speculative for identification or analysis at this time. These measures include the AQ Construction Mitigation Measures, measures from the South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 AQMP, and the measures described in CARB's Final EA for the ACT Regulation. There are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD's Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving or implementing energy infrastructure improvement projects, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation were applicable and feasible,

adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

3. Hazardous Materials and Solid and Hazardous Waste

Environmental Impact: The proposed project could result in a substantial increase in batteries and hydrogen fuel cells that could exceed the capacity of the existing recycling infrastructure.

The increased spent battery and fuel cell waste stream could trigger the need for additional recyclers. As described previously, it is not possible to identify the incremental increase in the number of EV batteries caused by the proposed project. Batteries used by EVs would either be reused in a secondary market (e.g., battery storage) or recycled when batteries reach their end of life.⁵ As identified above, Umicore, Glencore, Inmetco, Li-Cycle, and Retriev Technologies (previously known as Toxco) have the technology to recycle NiMH, NiCad, and Li-ion batteries in the nation.⁶ The limited number of existing Li-ion battery recyclers and the fact that these existing recyclers have plans to expand battery recycling, highlights that the recycling industry is only now beginning to expand operations to accommodate EV batteries reaching their end-of-life. The cumulative burden of EV waste is substantial given the growth trajectory of the EV market.⁷ Unlike the solid waste sector, which is required to plan for or adequate safe disposal capacity for

⁷ Harper, Gavin; Sommerville, Roberto; Kendrick, Emma; Driscoll, Laura; Slater, Peter; Stolkin, Rustam; Walton, Allan; Christensen, Paul; Heidrich, Oliver; Lambert, Simon; Abbott, Andrew; Ryder, Karl; Gaines, Linda; & Anderson, Paul (Harper *et. al.*). 2019, November 6. “Recycling Lithium-ion Batteries from Electric Vehicles.” *Nature* 575, 75–86 (2019). <https://www.nature.com/articles/s41586-019-1682-5>

a minimum of 15 years or plan for new and/or expanded facilities pursuant to Assembly Bill 939, no such requirement currently exists for the recycling industry.

To meet the increased demand of refurbishing or reusing batteries and fuel cells, new facilities or modifications to existing facilities would need to be constructed to accommodate recycling activities. In the long term, implementation of the proposed project along with State standards such as the Sustainable Communities and Climate Protection Act (SB 375) and CARB's Advanced Clean Cars program and Truck and Bus Regulation would result in a shift away from petroleum-based fuels toward hydrogen or electric. California is moving in the direction of electrifying its transportation and energy systems and it is anticipated that this would result in a corresponding increase in the market demand for recycling facilities. As more EVs and solar panel systems are introduced to the transportation and energy sector increased economic incentives are anticipated to drive modifications to existing infrastructure.

However, there are no federal, state, or local regulations that require the recycling industry to forecast the capacity of infrastructure needed to meet the demand. While CalEPA formed the Lithium-Ion Car Battery Recycling Advisory Group in 2019 to advise the Legislature on policies pertaining to the recovery and recycling of lithium-ion vehicle batteries, recommendations are still forthcoming. The group is required to submit policy recommendations on or before April 1, 2022. The policy recommendations are intended to address the end-of-life issues with a goal of ensuring that “as close to 100 percent as possible of lithium-ion vehicle batteries in the state are reused or recycled.”⁸ Therefore, while it is expected that efforts are underway to ensure adequate infrastructure for the reuse, recycling, or disposal of lithium-ion batteries, implementation of the proposed project could result in the generation of spent batteries and fuel cells that exceed the current capacity of local recycling infrastructure and impacts are potentially significant.

Mitigation Measures:

The requirement to mandate that the solid waste sector, and the recycling industry, in particular, identify and plan for the potential increase in batteries in the waste stream is outside of the jurisdiction of South Coast AQMD. Similarly, impacts associated with construction of new facilities could likely be reduced to a less-than-significant level by land use and/or permitting agency conditions of approval, including AQ Construction Mitigation Measures, measures from the South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 AQMP, and the measures described in CARB's Final EA for the ACT Regulation. South Coast AQMD does not have the authority to implement or require such conditions. Other potential mitigation is too speculative for identification or analysis at this time. Thus, there are no feasible mitigation

⁸ CalEPA, 2021, Lithium-ion Car Battery Recycling Advisory Group, AB 2832 Advisory Group: Draft Work Plan, <https://calepa.ca.gov/climate/lithium-ion-car-battery-recycling-advisory-group/draft-workplan-for-discussion-on-12-14-20-by-the-lithium-ion-car-battery-recycling-advisory-group/>, accessed January 17, 2021.

measures that South Coast AQMD could adopt that could reduce or eliminate the impacts from the increase in battery recycling to the capacity of the existing recycling infrastructure.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by relevant permitting and regulatory agencies, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation were applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: The proposed project could result in the accidental release of LNG fuel during routine transportation, use, or disposal.

LNG is non-toxic, flammable, disperses more readily in air than conventional fuels, and has more rigorous standards for transportation. It is expected that the increased use of NZE vehicles due to the implementation of the proposed project could increase facilities that receive LNG from local suppliers located in the South Coast Air Basin (Basin). Deliveries of LNG would be made by tanker truck via public roads. LNG trucks are double-walled aluminum and are designed to withstand accidents during the transport of LNG. However, accidental releases may still occur. Four accidental release scenarios were identified in the 2016 AQMP Final Program EIR as having major consequences and the adverse impacts from the four scenarios were determined (refer to section 4.3.4.7.1 of the 2016 AQMP Final Program EIR pp. 4.3-37). During transportation of LNG, it was estimated that the adverse impacts from these release scenarios would extend 0.3 mile. Because sensitive receptors may be within this distance, the accidental release of LNG during transport could cause significant adverse hazards and the increased storage and transport of LNG may substantially alter existing transportation hazards associated with mobile source fuels. Consequently, increased usage of LNG due to implementation of the proposed project could generate significant adverse hazard impacts during routine storage, disposal, use, and transport.

Mitigation Measures:

The mitigation measures from 2016 AQMP Final Program EIR, as identified in the Final EA, can be used as a reference for other agencies, where applicable and feasible, to reduce impacts related to routine storage, disposal, use, and transport LNG. However, these mitigation measures are outside of the South Coast AQMD's jurisdiction, and there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD's Governing Board finds that the mitigation measures identified above can and should be adopted by the relevant permitting or regulatory agencies, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation were applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD's Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: The project-related waste from construction and scrapped vehicles and equipment could exceed the capacity of local landfills.

Implementation of the proposed project could result in the early retirement of equipment such as on-road trucks and vehicles, off-road vehicles, gasoline-fueled engines, and diesel-fueled engines. Impacts could occur since the older equipment or vehicle parts would be taken out of service in the South Coast AQMD jurisdiction and scrapped and disposed of in landfills. However, approximately 80 percent of a vehicle can be recycled and reused in another capacity. Therefore, the amount of solid waste landfilled because of the proposed project would be relatively small, since most of the parts being replaced have commercial value as scrap metal. The generation of additional waste associated with implementation of the proposed project could impact the abilities of cities and counties to further reduce wastes. However, as discussed above the increase in solid waste expected to be diverted to a landfill is small and many of the waste streams are recyclable.

The U.S. EPA has a policy to ensure that emission reductions programs seeking credit in the SIP are quantifiable, surplus (*not already required*), permanent, and enforceable. Thus, it is expected that when older vehicles are scrapped, they are put out of service permanently and there are mechanisms in place to ensure that this requirement is enforced. Even with the ability to recycle metals from vehicles, there are no guarantees that vehicles will continue to be scrapped in the future, especially if the market is saturated with a high number of vehicles being sought for turnover. So, in an abundance of caution, the potential solid and hazardous waste impacts from the retirement of equipment is concluded to be significant.

Mitigation Measures:

There are no feasible mitigation measures that could reduce or eliminate the impacts from construction and scrapped vehicle and equipment impacts to landfill capacity. Additionally, no mitigation measures were included in the 2016 AQMP Final Program EIR for the impacts of construction waste and scrapped vehicles and equipment to the capacity of local landfills and there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 3. South Coast AQMD's Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: The proposed project could indirectly result in the construction of new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles, which would create significant short-term construction and long-term operational impacts regarding hazards and hazardous materials through the routine transport, use, or disposal of hazardous materials during the construction and operational phase.

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulation, and this Final EA incorporates that analysis by reference here. In summary, CARB's analysis found

that short-term construction and long-term operational effects associated with the need for new manufacturing and recycling facilities, as well as infrastructure improvements to support the transition to NZE and ZE vehicles, would create significant impacts regarding hazards and hazardous materials through the routine transport, use, or disposal of hazardous materials.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used by agencies approving new facilities, where applicable and feasible. While these measures could reduce impacts, South Coast AQMD does not have land use authority over those projects, and there are no other feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

4. Transportation

Environmental Impact: In the reasonable “worst-case” analysis for up to three warehouse relocations, which the Final EA assumed would occur for the purpose of the environmental analysis, the proposed project would result in a net increase in truck VMT during operations.

The proposed project is assumed to have the potential to affect regional VMT associated with potential warehouse relocations out of the South Coast AQMD's jurisdiction, potential cargo diversion to other ports, or as a result of a potential decrease in efficiency of goods movement in

the South Coast AQMD's jurisdiction. The WAIRE Program would require warehouse operators to satisfy an annual WPCO, which is based on the reported number of annual truck trips serving the warehouse. To meet the WPCO, WAIRE Points must be earned by completing actions and investments, which include options for acquiring and/or using NZE and ZE trucks. Warehouse operators with multiple warehouses in the South Coast AQMD's jurisdiction may satisfy the WPCO through acquiring NZE and ZE trucks and rerouting those trucks so that the usage points are accumulated by multiple warehouses. Similarly, warehouse operators may contract with trucking companies that already own NZE and ZE trucks to route those trucks to warehouses in the South Coast AQMD. As a result, there is a potential for trucks to be diverted by operators of warehouse to meet their WPCO, thus decreasing the efficiency of goods movement in the South Coast AQMD region, assuming truck routes are currently optimized for efficiency, which may not be true. The increase in truck VMT associated with the proposed project is considered significant and unavoidable.

Mitigation Measures:

There are no feasible mitigation measures that South Coast AQMD could adopt that could reduce or avoid the impacts from an increase in truck VMT and potential cargo growth diversion.

Findings:

Finding 3. South Coast AQMD's Governing Board finds that there are no feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Environmental Impact: Potential indirect transportation impacts resulting from the construction of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

Because the proposed project encourages and incentivizes the purchase and use of NZE and ZE vehicles, it could also indirectly result in the construction and operation of new manufacturing and recycling facilities, as well as infrastructure improvements to support the transition to NZE and ZE vehicles. These potential impacts were analyzed in CARB's Final EA for the ACT Regulations, and this Final EA incorporates that analysis by reference here.

In summary, CARB's analysis found that short-term construction activities would result in short-term construction traffic (primarily motorized) in the form of worker commute- and material delivery-related trips. Depending on the amount of trip generation and the location of new facilities, implementation could result in potentially significant transportation impacts. Additionally, new manufacturing and recycling facilities may affect local roadways during the operational phase potentially increasing VMT levels on nearby roadways. Local roadways may also experience additional egress/ingress points or increased traffic that would result in hazardous conditions on local roadways. Inadequate access may impede emergency vehicle access to new facilities. Therefore, the proposed project's long-term operational-related indirect transportation impacts associated with the construction of new manufacturing facilities, recycling facilities, and infrastructure improvement were also found to be potentially significant.

Mitigation Measure:

The Final EA identified the mitigation measures described in CARB's Final EA for the ACT Regulation that can be used by agencies approving these new facilities, where applicable and feasible. While these measures could reduce impacts, South Coast AQMD does not have land use authority over those projects, and there are no other feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Finding:

Finding 2: South Coast AQMD's Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD's Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

5. Other Impact Areas (Indirect Impacts)

The impact analysis for other impacts in the topic areas for Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (during operations), Noise, and Utilities and Service Systems (during operations), is incorporated by reference from the CARB ACT Regulation Final Environmental Analysis. Pursuant to that analysis, the following impacts associated with the proposed project are considered significant and unavoidable.

Aesthetics

Environmental Impact: Aesthetics impacts, which are indirect impacts of the proposed project, during construction and operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

There is uncertainty as to the exact locations of new and modified manufacturing/recycling facilities and infrastructure. Operation and construction of these facilities, though likely to occur in areas with appropriate zoning where other similar facilities may already exist, could introduce or increase the presence of non-natural appearing elements in areas with national, State, or county designated scenic vistas and/or scenic resources visible from State scenic highways. In addition, operation and construction may introduce substantial sources of nighttime lighting for safety and security purposes.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB's Final EA for the ACT Regulation that can be used by agencies approving these new facilities, where applicable and feasible. While impacts could be reduced to a less than significant level by mitigation measures prescribed by local, state, federal, or other land use or permitting agencies, South Coast AQMD does not have the authority to require implementation of mitigation measures related to new or modified facilities that would be approved by local jurisdictions. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD's Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation were applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Agriculture and Forestry Resources

Environmental Impact: Impacts to agricultural land, forest land, and timberland, which are indirect impacts of the proposed project, during construction and operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

There is uncertainty as to the exact locations of new and modified manufacturing and recycling facilities, improvements to the electrical grid, and lithium mining; therefore, their location in relation to agricultural land, including farmland, land zoned for agricultural use, and land under Williamson Act (Government Code Section 51200 et seq.) contract is unknown. Similarly, it is uncertain where new and modified facilities would be in relation to forest land and timberland. Construction and modification of these facilities, though likely to occur in areas with appropriate zoning that would not have agricultural or forestry uses, could result in conversion of agricultural land or forest land if they are sited in areas of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, Williamson Act conservation contracts, forest land or timberland.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible.

Potential agricultural and forest resource impacts could be reduced to a less-than-significant level by mitigation measures prescribed by local, state, federal, or other land use or permitting agencies with approval authority over the development projects. However, South Coast AQMD does not have the authority to require implementation of mitigation related to new or modified facilities that would be approved by local jurisdictions. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Biological Resources

Environmental Impact: Biological Resources impacts, which are indirect impacts of the proposed project, during construction and operations from new manufacturing facilities, recycling facilities, and infrastructure improvements to support the transition to NZE and ZE vehicles.

Construction of new recycling and manufacturing facilities and improvements to the electrical grid could require disturbance of undeveloped area which could adversely affect biological resources. Additionally, operation of a new facility could deter wildlife from the surrounding habitat or could impede wildlife movement through the area, operational activities could also cause a reduction in sensitive habitat, interference with a wildlife corridor, loss of special-status species, or conflict with a habitat conservation plan or natural community conservation plan.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. Impacts to biological resources could be reduced to a less-than-significant level by mitigation that can and should be implemented by local agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Section 21081((a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Cultural Resources

Environmental Impact: Impacts to cultural resources, which could be indirectly caused by construction and operations of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

The cultural resources could potentially be affected by ground disturbance activities associated with new manufacturing and recycling facilities and improvements to the electrical grid. Impacted resources could include, prehistoric and historical archaeological sites, paleontological resources, historic buildings, structures, or archaeological sites associated with agriculture and mining, and heritage landscapes. Properties important to Native American communities and other ethnic groups, including tangible properties possessing intangible traditional cultural values, also may exist. Historic buildings and structures may also be adversely affected by demolition-related activities. Most operational activities would not have the potential to affect archaeological, paleontological, or historical resources. Operation of new facilities may, however, change the visual setting of the surrounding area, which could adversely affect historic resources and districts with a visual component.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible.

Potential construction-related and operational-related cultural resources impacts could be reduced to a less-than-significant level by mitigation that can and should be implemented by agencies but is beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Geology and Soils

Environmental Impact: Impacts to geology and soils, which could be indirectly caused by construction and operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

Although it is reasonably foreseeable that construction activities could occur as a result of new or modified manufacturing and recycling facilities and improvements to the electrical grid, there is uncertainty as to the exact location of new facilities/infrastructure and, as a result, there is uncertainty as to geologic conditions at project sites. Implementation of the proposed project would not be expected to result in effects to seismicity. The level of susceptibility to geologic effects, such as erosion and landslides, varies by location and geologic conditions.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. The impacts to geology and soil resources could be reduced to a less-than-significant level by mitigation that can and should be implemented by federal, State, and local agencies, but is beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Hydrology and Water Quality

Environmental Impact: Impacts to hydrology and water quality, which could be indirectly caused by construction and operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

New and modified manufacturing and recycling facilities and improvements to the electrical grid could be in locations with a range of hydrologic conditions. Construction of buildings may exacerbate hydrologic hazards. Precise impacts cannot be determined because specific construction details, siting locations, and associated hydrology and water quality conditions are not known at this time. Furthermore, lithium mining and extraction could result in over drafting of groundwater and has substantial effects on water quality.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. Impacts could be reduced to a less-than-significant level by mitigation that can and should be implemented by other agencies where applicable, but the identified measures are beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Mineral Resources

Environmental Impact: Impacts to mineral resources, which could be indirectly caused during operation to support the transition to ZE vehicles.

Long-term operational compliance responses associated with the proposed project include increased mining and processing of rare materials, especially lithium and platinum. Depending on the magnitude of required materials, implementation of the proposed project could conceivably affect the availability of these mineral resources, which is an indirect impact of the proposed project if access to resources becomes impeded.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. While these measures could reduce impacts to a less-than-significant level, South Coast AQMD does not have land use authority over those projects. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation were applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Noise

Environmental Impact: Noise impacts, which are indirect impacts of the proposed project, during construction and operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

Construction and modification of manufacturing and recycling facilities and improvements to the electrical grid would result in construction-related noise and vibration in excess of applicable standards or that result in a substantial increase in ambient levels at nearby sensitive receptors. Operational-related activities associated with lithium mining could produce substantial stationary sources of noise. New sources of noise associated with the implementation of the proposed project could include operation of manufacturing plants and recycling facilities. Depending on the proximity to existing noise-sensitive receptors, stationary source noise levels could exceed applicable noise standards and result in a substantial increase in ambient noise levels.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. This impact could be reduced to a less-than-significant level by mitigation that can and should be implemented by other agencies where applicable, but these measures are beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

Utilities and Service Systems

Environmental Impact: Impacts to utilities and service systems, which could be indirectly caused by operation of new manufacturing facilities, recycling facilities, and infrastructure improvement to support the transition to NZE and ZE vehicles.

New manufacturing plants and recycling facilities could generate substantial increases in the demand for water supply, wastewater treatment, storm water drainage, energy, and solid waste services in their local areas. Additionally, depending on the location, new facilities may require new utility service lines and connections. At this time, the specific location, type, and number of new manufacturing and recycling facilities developed is not known and the ultimate magnitude and location of demand for utilities such as water and wastewater cannot be known. Thus, the specific impacts cannot be identified with any certainty, and individual plants could potentially

result in significant environmental impacts related to procurement and delivery of utilities and public services.

Mitigation Measures:

The Final EA identified the mitigation measures described in CARB’s Final EA for the ACT Regulation that can be used as a reference for other agencies, where applicable and feasible. Potential long-term operational-related utilities and service systems impacts could be reduced to a less-than-significant level by mitigation that can and should be implemented by other agencies where applicable, but these measures are beyond the authority of South Coast AQMD and not within its purview. Therefore, there are no feasible mitigation measures that South Coast AQMD could adopt which would reduce or eliminate this impact.

Findings:

Finding 2: South Coast AQMD’s Governing Board finds that the mitigation measures identified above can and should be adopted by lead and responsible agencies approving new facilities, where applicable and feasible. However, all of these measures are within the responsibility and jurisdiction of local governments or other agencies. While these entities can and should adopt appropriate mitigation where applicable and feasible, adoption or implementation of the measures identified above is outside the responsibility and jurisdiction of South Coast AQMD.

Finding 3. South Coast AQMD’s Governing Board finds that there are no other feasible mitigation measures that have been identified, taking into consideration specific economic, legal, social, technological or other factors, that would avoid or substantially lessen this impact, and further, that specific economic, legal, social, technological, or other considerations make infeasible the alternatives identified in the EA, as discussed in Section IV of these Findings (Public Resources Code Sections 21081(a)(3); CEQA Guidelines Sections 15091(a)(3)). As described in the Statement of Overriding Considerations, South Coast AQMD has determined that this impact is acceptable because specific overriding economic, legal, social, technological, or other benefits, including regionwide or statewide environmental benefits, of the proposed project outweigh its significant effects on the environment.

VI. FINDINGS FOR ALTERNATIVES TO THE PROPOSED PROJECT

A. Alternatives Considered and Rejected During the Scoping/Project Planning Process

One public comment recommended that the EA evaluate and consider alternatives such as stricter engine emission standards to be adopted by CARB and implementation of stricter truck emission standards at the ports of Los Angeles and Long Beach. The alternatives that the comment recommended are outside the scope of the South Coast AQMD’s legal authority and ability to enforce as an air district; therefore, these alternatives are legally infeasible and have not been

included in Chapter 5, *Alternatives*, of the Final EA. South Coast AQMD does not have the authority to require CARB to adopt stricter engine emission standards nor is that in the scope of the analysis of the EA. Additionally, South Coast AQMD and the Commercial Marine Ports Working Group is currently evaluating a proposed rule to address indirect sources at the Ports. This is a separate strategy evaluated in the 2016 AQMP and not under the auspice of the proposed project. Furthermore, this alternative would not achieve the project's objectives, which include reducing public health impacts from warehouse activities.

B. Alternatives Selected for Further Analysis in the EA

The following alternatives were determined to represent a reasonable range of feasible alternatives with the potential to feasibly attain most of the basic objectives of the proposed project but avoid or substantially lessen some of the potentially significant effects of the proposed project. Additionally, when comparing the overall effects of alternatives to a project that is designed to benefit the environment such as the proposed project, it is important to consider both adverse and beneficial effects.

1. Alternative A: No Project

The No Project alternative (Alternative A) consists of what would occur if the proposed project was not approved. Alternative A allows decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project.

Alternative A assumed that the WAIRE Program would not be implemented. Therefore, existing and new warehouses located in the South Coast AQMD's jurisdiction to which the proposed project would apply would not be required to meet their WPCO under this alternative. The WPCO compliance strategies in the form of WAIRE Menu actions, a Custom WAIRE Plan, and/or the payment of the optional mitigation fee would not be implemented.

Finding:

This alternative is not capable of meeting any of the project objectives. Because it maintains the status quo, it has no direct adverse significant environmental impacts and would not result in any of the significant and unavoidable impacts associated with the proposed project. However, Alternative A will not provide the substantial emissions reductions or public health protection benefits associated with the proposed project.

Overall, Alternative A is less environmentally beneficial than the proposed project. Unlike the proposed project, it would not provide any emission reduction benefits and would be inconsistent with the 2016 AQMP. Alternative A fails to achieve any of the proposed project objectives, which are: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions

associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse. Because Alternative A is not environmentally superior to the proposed project and does not achieve the project objectives, South Coast AQMD's Governing Board finds it infeasible. Pub. Resources Code 21081(a)(3); *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1000-1001 (upholding finding of infeasibility where agency determined alternative failed to achieve project objective).

2. Alternative B: Decreased Emission Reductions

The Decreased Emission Reductions alternative (Alternative B) consists of a version of the proposed project that would result in fewer emission reductions of NO_x and PM_{2.5} in the following three ways:

- The applicability of the WAIRE Program is narrowed to reduce the number of affected warehouses. Specifically, the warehouse size requirement is increased from “greater than or equal to 100,000 square feet” to “greater than or equal to 200,000 square feet”, such that the number of affected warehouses would decrease.
- The beginning of the initial compliance and reporting dates are delayed by one year, such that the regulated warehouses would have a longer time period to plan for and phase in any actions that they would need to undertake to meet their WPCO.
- The rule stringency is relaxed⁹, such that the rule stringency factor for this alternative is below 0.0025 WAIRE Points per WATT and could be as low as 0.0001 WAIRE Points per WATT. The WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee would not change.

For the purpose of comparing alternatives to the proposed project Alternative B is considered to encompass all three elements (i.e., an increase in the size requirement, a delay in the initial compliance date, and a decrease in the rule stringency factor) to provide “book-ends” of the range of potential environmental impacts and a framework for understanding the greatest potential impacts when compared to the proposed project.

Finding:

Alternative B is expected to result in fewer regional and local NO_x and PM, including DPM, emission reductions than the proposed project. It would; therefore, take a longer period to achieve,

⁹ Relaxing the stringency factor results in warehouses needing to acquire fewer WAIRE Points to meet the requirements of the proposed project. The stringency factor for the proposed project is 0.0025.

or never achieve, the emission reductions that are needed to meet attainment of federal and state air quality standards for ozone and PM_{2.5} than the proposed project. Alternative B would also provide less public health protection regionally and against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, than the proposed project.

Furthermore, reducing the number of affected warehouses and relaxing the rule stringency would result in:

- Less adverse direct impacts to air quality during construction because fewer EV chargers and hydrogen fueling stations would be installed. Overlapping of construction and operational activities would also decrease.
- Less adverse direct impacts to GHG emission since fewer MERV 16 or greater filters and filtration systems would need to be installed and used, resulting in lower electricity demands. Additionally, Alternative B would lead to less cargo growth diversion being diverted to other ports because the rule stringency factor would be lower than the proposed project.
- Lower demand for electricity since fewer warehouses would acquire ZE trucks and yard trucks and install charging stations to earn WAIRE Points resulting in less adverse direct impacts to energy.
- Less construction activities and lower acquisition of ZE and NZE trucks. This could lead to the generation of less construction waste and scrapped vehicles resulting in a less adverse direct impact on existing landfills exceeding their capacity. Additionally, the lower demand for ZE vehicles and solar panels would reduce the number of batteries that need to be recycled resulting in less adverse direct impact on the existing recycling infrastructure from exceeding their capacity. The amount, frequency, and duration of routine transport, use, or disposal of LNG fuel would also be less than the proposed project and adverse direct impacts would decrease. Therefore, Alternative B would result in less adverse direct impacts to hazardous materials and solid and hazardous wastes.
- Less truck VMT from warehouse relocations when compared to the proposed project since the lower rule stringency factor would likely lead to fewer than the three warehouse relocations that were assumed for analyzing the proposed project's transportation impacts. Therefore, Alternative B would result in less adverse direct impacts to transportation.

If the compliance date is delayed, Alternative B is expected to result in similar direct impacts compared to the proposed project because a delayed compliance date merely gives warehouses more time to meet the WPCO without changes to the impacts from the proposed project.

Additionally, the reduction in the number or intensity of development of new facilities and grid improvement would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Air Quality and Greenhouse Gas Emission, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Energy, Geology and Soils, Hydrology and Water Quality, Hazardous Materials and Solid and Hazardous Wastes, Mineral Resources, Noise, Transportation, and Utilities than the proposed project. If the compliance date is delayed, indirect adverse environmental impacts would be similar to the proposed project because having more time to comply with the proposed project is not expected to change how warehouses will need to meet the WPCO or change the compliance actions or activities and the level of significance for indirect adverse environmental impacts that could result.

When considering the overall effects of this alternative to the proposed project, even though Alternative B could have less adverse direct and indirect environmental impacts than the proposed project, it would also have less NO_x and PM, including DPM, emissions reductions and less reduction of air pollution that disproportionately affects environmental justice communities than the proposed project. Therefore, this alternative's ongoing, long-term, and permanent air quality and public health benefits would be less when compared to the proposed project, and the alternative would satisfy project objectives to a lesser extent than the proposed project. See Section 2.4 of the Final EA (listing project objectives as: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionally affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse). The failure to achieve project objectives to the same extent as the project renders this alternative "infeasible" under Public Resources Code section 21081(a)(3). *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1000-1001 (upholding finding of infeasibility where agency determined alternative failed to achieve project objective).

3. Alternative C - Increased Emission Reductions

The Increased Emission Reductions alternative (Alternative C) consists of a version of the proposed project that would result in greater emission reductions of NO_x and PM_{2.5} in the following two ways:

- The applicability of the WAIRE Program is broadened to increase the number of affected warehouses. Specifically, the warehouse size requirement of "greater than or equal to 100,000

square feet” is removed and all warehouses, regardless of their size, will be subject to the WAIRE Program.¹⁰

- The rule stringency is increased, such that the rule stringency factor for the proposed project is above 0.0025 WAIRE Points per WATT and could be as high as 0.0050 WAIRE Points per WATT. The three-year initial compliance period and WPCO compliance strategies such as the WAIRE Menu (all of the actions), a Custom WAIRE Plan, and/or the payment of optional mitigation fee would not change.

For the purpose of comparing alternatives to the proposed project, Alternative C is considered to encompass both elements (i.e., a decrease in the size requirement and an increase in the rule stringency factor) to provide “book-ends” of the range of potential environmental impacts and a framework for understanding the greatest potential impacts when compared to the proposed project.

Finding:

Alternative C is expected to result in greater regional and local NO_x and PM, including DPM, emission reductions than the proposed project, which would help accelerate attainment of federal and state air quality standards for ozone and PM_{2.5}. This alternative would also provide greater public health protection against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities, than the proposed project. Thus, this alternative would go further in achieving the project objectives than the proposed project. See Final EA Section 2.4 (listing project objectives as: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and 4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse).

However, increasing the number of affected warehouses and increasing the rule stringency would result in:

- Greater adverse direct impacts to air quality during construction because more EV chargers and hydrogen fueling stations would be installed. The overlap of construction and operational activities would also increase.

¹⁰ The Final Socioeconomic Impact Analysis did not quantify the additional benefits associated with Alternative C from expansion of the rule to encompass warehouses under 100,000 square feet. As currently modeled, Alternative C only affects warehouses greater than or equal to 100,000 square feet and includes a stringency of 0.0050 with a 7-year phase-in period.

- Greater adverse direct impacts to GHG emission since more MERV 16 or greater filters and filtration systems would need to be installed and used, resulting in higher electricity demands. Additionally, because this alternatives' rule stringency factor would be higher than the proposed project, and because it is not reasonably foreseeable to predict how cargo shippers would respond to the increased rule stringency factor, this analysis assumes that implementation would likely lead to more cargo growth being potentially diverted to other ports and generate greater GHG emissions than the proposed project.
- Greater demand for electricity since more warehouses would acquire ZE trucks and yard trucks and install charging stations to earn WAIRE Points resulting in more adverse direct impacts to energy.
- More construction activities and a higher acquisition of ZE and NZE trucks. This could lead to generation of more construction waste and scrapped vehicles resulting in a more adverse direct impact on existing landfills exceeding their capacity. Additionally, Alternative C would result in a higher adverse direct impact on the existing recycling infrastructure from exceeding their capacity. Furthermore, the use of LNG fuel would be more than the proposed project. Therefore, Alternative C would result in more adverse direct impacts to hazardous materials and solid and hazardous wastes.
- Although it is uncertain if smaller warehouses, i.e., warehouses of less than 100,000 square feet in size, would relocate under this alternative, it is expected that the impacts to transportation from truck VMT caused by warehouse relocations could be greater when compared to the proposed project.
- Expanding the proposed project to cover up to 52,000 additional warehouses could incur a substantial administrative burden including compliance activities, such as conducting desktop audits, onsite inspections, and reviewing records.

Additionally, the increase in the number or intensity of development of new facilities and grid improvement would likely lead to more adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Air Quality and Greenhouse Gas Emission, Biological Resources, Cultural Resources, Energy, Geology and Soils, Hydrology and Water Quality, Hazardous Materials and Solid and Hazardous Waste, Mineral Resources, Noise, Transportation, and Utilities and Service Systems than the proposed project. However, Alternative C's direct and indirect environmental impacts would be similar and continue to be less than significant when compared to the proposed project for Land Use and Planning, Mineral Resources (during construction), Population and Housing, Public Services, Recreation, and Wildfire.

When considering the overall effects of Alternative C to the proposed project, even though adverse effects on the environment could be greater than the proposed project in some areas, some of the adverse effects are indirect (e.g., associated with the development of new manufacturing, battery

recycling, and grid improvement facilities) and would result in short-term, temporary construction activities. Moreover, this alternative's beneficial effects on the environment would be long-term and permanent. Alternative C would also have greater protection against exposure to emissions from mobile sources in the communities in the vicinity of warehouse, as such AB 617 communities, than the proposed project. Therefore, this alternative is considered the environmentally superior alternative. CEQA Guidelines, section 15126.6(e)(2)

Nonetheless, this alternative would impose a significant additional administrative burden on the South Coast AQMD that would not be imposed by the proposed project. This is because Alternative C would apply to up to 52,000 warehouse facilities, whereas the proposed project would apply to approximately 3,320 warehouse facilities. This increased administrative burden is a specific economic or "other" consideration that makes this alternative "infeasible" pursuant to Public Resources Code section 21081(a)(3).

4. Alternative D: All Natural Gas Options Only

The All Natural Gas Options Only alternative (Alternative D) is based on the currently proposed applicability and rule stringency factor for the proposed project. However, Alternative D limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under this alternative are related to the use of all natural gas trucks such as the acquisition and/or use of natural gas trucks renewable natural gas (RNG) and/or LNG and equipment, and installation and/or use of natural gas infrastructure. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation fee would still be available to use by warehouse operators to comply with the proposed project but limits the custom WAIRE Plan options to natural gas options.

Finding:

Since Alternative D does not include the acquisition and/or use of ZE trucks and yard trucks as allowable actions, it could result in fewer regional and local NO_x and PM emission reductions than the proposed project. Additionally, Alternative D would not provide protection against exposure to emissions from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities because it does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu.

Furthermore, this alternative would result in:

- Less adverse direct impacts to air quality during construction since EV chargers and hydrogen fueling stations would not be included as actions available on the WAIRE Menu. The overlap of construction and operational activities would also decrease.

- Less adverse direct impacts on GHG emissions during operations than the proposed project because Alternative D would not result in increased use of MERV 16 or greater filters and filtration systems. The demands for renewable energy for RNG trucks could increase, but the use of RNG trucks, instead of diesel fueled trucks, could potentially generate more GHG emissions reductions.
- Alternative D would not use ZE trucks and yard trucks or ZE fueling infrastructure, therefore the need for additional electricity demands and energy infrastructure would not exist and adverse direct impacts to energy would be less than the proposed project.
- Alternative D would not generate batteries and hydrogen fuel cells, and the need to recycle them at the existing recycling infrastructure would not exist. Additionally, since natural gas fueling stations are already commercially available, the need for building new natural gas fueling stations and infrastructure would not be as great as for EV chargers and hydrogen fueling stations when compared to the proposed project, and the impact on local landfill would decrease. However, this alternative would accelerate and increase the use of NZE trucks such as LNG trucks. This could lead to a substantial increase in the amount, frequency, and duration of routine transport, use, or disposal of LNG fuel than the proposed project and a potentially greater adverse direct impact on hazardous materials and solid and hazardous waste.
- Because natural gas trucks and infrastructure are more commercially available and currently being deployed in the market, it is expected that it could be less costly to comply with the WPCO under Alternative D than the proposed project. Therefore, Alternative D is expected to have less adverse direct transportation impacts from truck VMT than the proposed project because it would likely lead to fewer than three warehouse relocations.

Additionally, since warehouses subject to the WAIRE Program under Alternative D would not need to use ZE technology or install EV chargers and hydrogen fueling stations, the development of new facilities, including manufacturing, recycling, and grid infrastructure facilities would not be needed. This would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Air Quality and Greenhouse Gas Emission, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Hazardous Materials and Solid and Hazardous Wastes, Mineral Resources, Noise, Transportation, and Utilities and Service Systems than the proposed project.

When considering the overall effects of Alternative D to the proposed project, it should be noted that even though this alternative could have less adverse direct and indirect environmental impacts than the proposed project, it could also have less NO_x and PM, including DPM, emissions reductions than the proposed project. NZE trucks result in approximately 90 percent of reductions in NO_x emissions and some PM emissions reductions while electric trucks result in 100 percent of NO_x and PM emissions reductions. Additionally, Alternative D would not provide protection

against exposure to emissions from mobile sources in the communities in the vicinity of warehouses that the proposed project provides. Alternative D does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plans. Therefore, this alternative's ongoing, long-term, and permanent air quality benefits as well as protection against exposure to emissions from mobile sources could be less when compared to the proposed project. As a result, this alternative is not environmentally superior to the proposed project.

Moreover, the alternative would satisfy project objectives to a lesser extent than the proposed project because it would likely result in fewer emission reductions. See Section 2.4 of the Final EA (listing project objectives as: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and (4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse). The failure to achieve project objectives to the same extent as the project renders this alternative "infeasible" under Public Resources Code section 21081(a)(3). *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1000-1001 (upholding finding of infeasibility where agency determined alternative failed to achieve project objective).

5. Alternative E: All Electric Options Only

The All Electrical Options Only alternative (Alternative E) is also based on the currently proposed applicability and rule stringency factor for the proposed project at 0.0025 WAIRE Points per WATT. However, Alternative E limits the number of actions on the WAIRE Menu that warehouse operators could select and implement to earn WAIRE Points. Specifically, the only actions allowed to earn WAIRE Points under this alternative are related to the use of all electric equipment such as the acquisition and/or use of all electric trucks and installation and/or use of ZE fueling or charging infrastructure. Other WPCO compliance strategies such as a Custom WAIRE Plan and/or the payment of optional mitigation would still be available to use by warehouse operators to comply with the proposed project.

Finding:

Alternative E is expected to result in greater regional and local NO_x and PM_{2.5} emission reductions than the proposed project, which would help accelerate attainment of federal and state air quality standards for ozone and PM_{2.5}. However, due to the current market availability of electric trucks and yard trucks within the initial compliance period, compliance with Alternative E to use only the ZE technology would be challenging for some warehouse operators at the beginning. Additionally, Alternative E would not provide protection against exposure to emissions

from mobile sources in the communities in the vicinity of warehouses, such as AB 617 communities through the use of air filtration systems on the WAIRE Menu or Custom WAIRE Plan.

Furthermore, Alternative E would result in:

- Similar air quality impacts directly resulted from construction and overlapping construction and operations to those for the proposed project.
- Although electricity uses for electric trucks and yard trucks and associated GHG emissions could increase under Alternative E, this increase could be partially offset by the reductions of electricity uses and GHG emissions associated with the use of MERV 16 or greater filters and filtration systems because filters and filtration systems would no longer be on the WAIRE Menu or Custom WAIRE Plans. Therefore, this alternative could have less adverse direct impacts on GHG emissions during operations than the proposed project.
- The magnitude of additional electricity demand and energy infrastructure would be similar to the proposed project since some of the modeled WAIRE Points scenarios already accounted for the possibility of all ZE serving the warehouses subject to the WAIRE Program. Therefore, Alternative E would have similar but likely somewhat greater than some scenarios direct impacts on energy during operations.
- The amount of spent EV batteries and hydrogen fuel cells generated by Alternative E would be similar to the proposed project since some of the modeled WAIRE Points scenarios already accounted for the possibility of all ZE serving the warehouses subject to the WAIRE Program. Therefore, the direct impacts on hazardous materials and solid and hazardous waste with regards to exceeding the capacity of the existing recycling infrastructure to meet the recycling of batteries and hydrogen fuel cells of Alternative E is similar to the proposed project. Additionally, this alternative's direct impact on hazardous materials and solid and hazardous waste from construction waste that could be characterized as potentially hazardous would not be as great as the proposed project because of the similar amount of ZE serving the warehouses, and because construction debris from installing MERV 16 or greater filters and filtration systems would not exist. Since the use of NZE trucks such as LNG trucks would not be included on the WAIRE Menu or Custom WAIRE Plans, the direct impact on hazardous materials and solid and hazardous waste from routine transport, use, or disposal of LNG fuel would not exist.
- When the only available compliance option is the ZE technology, and a market-wide commercial deployment of ZE technology, particularly in trucks, is not currently available at the time of this EA, Alternative E is likely to cause more warehouses that are not able to use the ZE technology to relocate outside the South Coast AQMD's jurisdiction, thereby resulting

in greater adverse transportation impacts on truck VMT from warehouse relocation than the proposed project.

Additionally, the indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation could be greater for Alternative E than the proposed project. Since the only available compliance option is the ZE technology, this could lead to an increased use and demand of the ZE technology (e.g., electric trucks and yard trucks) and necessary supporting infrastructure that could indirectly lead to construction of more manufacturing and battery recycling facilities, and more improvements to the electrical grid. The increase in the development of new facilities and grid improvement would likely lead to greater adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry Resources, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources, Noise, and Utilities and Service Systems than the proposed project. As a result, this alternative is not environmentally superior to the proposed project.

Alternative E could have greater NO_x and PM, including DPM, emissions reductions than the proposed project; however, using only the ZE technology would be challenging for some warehouse operators at the beginning. This technological challenge makes this alternative “infeasible” pursuant to Public Resources Code section 21081(a)(3). When considering the overall effects of this alternative to the proposed project, this alternative is intended to further accelerate the use of ZE technology than the proposed project to make it more available and less costly. This alternative’s ongoing, long-term, and permanent air quality benefits could be greater overtime than the proposed project. However, because Alternative E does not include MERV 16 or greater filters and filtration systems on the WAIRE Menu or Custom WAIRE Plans, it would not provide protection against exposure to emissions from mobile sources in the community in the vicinity of warehouse, such as AB 617 communities that the proposed project provides. Alternative E is also likely to cause more warehouses that are not able to use the ZE technology to relocate outside the South Coast AQMD’s jurisdiction, thereby resulting in fewer emission reductions. As a result, this alternative would satisfy some project objectives to a lesser extent than the proposed project. See Section 2.4 of the Final EA (listing project objectives as: 1) reduce NO_x and PM emissions, including DPM emissions, and reduce associated public health impacts from warehouse activities; 2) facilitate local and regional reduction of emissions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting federal and state air quality standards for ozone and PM_{2.5}; 3) implement actions to reduce air pollution that disproportionately affects environmental justice communities in accordance with AB 617; and (4) reduce exposure from emissions associated with warehouse activities for communities located in the vicinity of a warehouse. The failure to achieve project objectives to the same extent as the project renders this alternative “infeasible” under Public Resources Code section 21081(a)(3). *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1000-1001 (upholding finding of infeasibility where agency determined alternative failed to achieve project objective).

VII. FINDINGS CONCLUSION

Based on the preceding, South Coast AQMD's Governing Board finds that there are no feasible mitigation measures it could adopt which would reduce or avoid the proposed project's potentially significant environmental impacts. While the Final EA identifies certain mitigation that can or should be adopted or implemented by local governments or other agencies when acting as lead or responsible agencies, and where feasible and appropriate, these measures are within the responsibility and jurisdiction of these other agencies. In addition, South Coast AQMD's Governing Board finds that specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the Final EA.

VIII. STATEMENT OF OVERRIDING CONSIDERATIONS

CEQA requires decision makers to balance the benefits of a proposed project against its unavoidable environmental risks when determining whether to approve a project. If the benefits of the project outweigh the unavoidable adverse environmental effects, those effects may be considered "acceptable" (CEQA Guidelines Section 15093(a)). CEQA requires the decision-making agency to support, in writing, the specific reasons for considering a project acceptable despite its significant impacts. Such reasons must be based on substantial evidence in the Final EA or elsewhere in the administrative record (CEQA Guidelines Section 15093 (b)). The agency's statement is referred to as a Statement of Overriding Considerations.

The following provides a summary of the proposed project's significant and unavoidable adverse environmental impacts and the South Coast AQMD's statement of overriding considerations.

A. Impacts of the Proposed Project

If significant adverse environmental impacts of a proposed project remain after incorporating mitigation measures, or no measures or alternatives to mitigate the significant adverse impacts are identified or feasible, the lead agency must make a determination that the benefits of the project outweigh any significant adverse environmental effects if it is to approve the project (CEQA Guidelines Section 15093(a)). If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse effects may be considered "acceptable" (CEQA Guidelines Section 15093(a)). Accordingly, a Statement of Overriding Considerations has been prepared. This Statement of Overriding Considerations is included as part of the record of the project approval for the proposed project. Pursuant to CEQA Guidelines Section 15093(c), the Statement of Overriding Considerations will also be noted in the Notice of Decision for the proposed project.

As set forth above, in the EA, and the Second Draft Staff Report for the proposed project, the proposed project has potentially significant direct and indirect adverse impacts in the following

areas: aesthetic, agriculture and forestry resources, air quality and greenhouse gas emission, biological resources, cultural resources, energy, geology and soils, hazardous materials and solid and hazardous waste, hydrology and water quality, mineral resources (with regards to long-term, operation-related impacts), noise, transportation, and utilities and service systems (during operations).

However, the analysis of potential adverse environmental impacts incorporates a conservative approach, as follows:

- **Conservative Findings for Warehouse Relocations.** Based on the currently proposed rule stringency of 0.0025 WAIRE Points per WATT, the proposed project would not result in warehouse relocations out of South Coast AQMD's jurisdiction. Under the most conservative scenario analyzed in the IEc Study at \$2.00 per square foot (which translates to a stringency factor greater than 0.0050 WAIRE Points per WATT), the proposed project would result in a maximum of six warehouse relocations. The Final EA conservatively considers the potential for up to three warehouse relocations from the proposed project, even though no such relocations are expected based on the IEc Study, to provide a conservative analysis of the operational air quality and GHG emissions, energy, and transportation impacts. An analysis of greater relocations is provided in the Alternatives section of the EA, which includes an alternative rule that uses a stringency of 0.0050 WAIRE Points per WATT.
- **Conservative Findings for Cargo Growth Diversion.** It is speculative to identify where cargo would be diverted given the number of options of ports outside the South Coast AQMD's jurisdiction for international shipping companies. The Ports of Los Angeles and Long Beach have recently studied the potential impacts of imposing a clean truck fund rate on trucks transporting goods to and from the Ports pursuant to the Ports' Clean Truck Program. In particular, the analysis studied whether the cost of complying with that proposed update would cause cargo owners to ship their goods to other ports. The analysis concluded that it would be more cost effective for the vast majority of goods (98.6 percent) to continue using the ports of Los Angeles and Long Beach than to relocate to other ports. Furthermore, the IEc Study found that at a stringency factor of 0.0050 WAIRE Points per WATT (which is higher than the stringency factor of the proposed project) only up to six warehouses might relocate to a nearby region. Because moving to a nearby region increases the travel time by only a few hours, rather than 10+ days from moving to a different port on the east coast, it is not reasonably foreseeable that cargo owners will ship their goods to other ports to avoid the cost of the proposed project if those costs are less than or equal to the costs associated with a 0.0050 WAIRE Points per WATT stringency factor. Nevertheless, the Final EA assumed that there may be some cargo owners who decide to ship their cargo to a different port to avoid the cost of compliance. This is a conservative assumption, as it is a highly unlikely market response.

- **Conservative Analysis of Environmental Impacts Associated with the WAIRE Points Scenarios.** Because the proposed project is a rule that will govern future activities, and because the rule allows regulated parties to comply in a variety of ways, it is impossible to predict or forecast precisely what the environmental impacts of the rule would be. The WAIRE Menu has 32 compliance options, which can be combined, and an approved Custom WAIRE Plan could include compliance options that are not on the WAIRE Menu. The warehouse operator's strategies to satisfy their WPCO may vary from year to year. Since it is speculative to determine individual market actions operators will choose to comply with the proposed project, the Final EA considered the WAIRE Points scenarios to identify the environmental impacts of the WAIRE Points isolated for each individual compliance option. The WAIRE Points scenarios modeled serve as a bounding analysis approach, whereby all 2,902 warehouses were assumed to only comply with a single scenario approach from 2022 through 2031. The scenarios in the Final EA result in a conservative estimate of impacts because it is highly unlikely that all operators would choose to fulfill their WPCO through a single compliance option, every compliance year, for 10 years. No single scenario in this bounding analysis is expected to occur. Rather, they present possible extreme compliance outcomes, and thus provide a conservative, "book-end" estimate of potential impacts. The Final EA selected scenarios based on the greatest potential to result in air quality and GHG emissions, energy consumption, generation of EV batteries and fuel cells, and increase in truck VMT in order to show the range of potential environmental consequences associated with the proposed project therefore providing a very conservative estimate of the potential greatest possible impact associated with the proposed project. In reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur.
- **Conservative Findings from Truck Vehicle Miles Traveled.** Neither the Office of Planning and Research's (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA (Technical Advisory) nor CEQA Guidelines Section 15064.3(a) directly address how to analyze transportation impacts associated with changes to goods movement, which is largely carried out by heavy-duty trucks. CEQA Guidelines Section 15064.3(a) specifies that VMT to be analyzed is defined as the amount and distance of automobile travel attributable to a project. The term 'automobile' refers to on-road passenger vehicles, specifically cars and light trucks. Senate Bill (SB) 743 is not intended to require the inclusion of heavy-duty truck trips, utility vehicles, or other types of vehicles in the VMT analysis. Nonetheless, to provide a conservative estimate of the potential impacts of the proposed project, the transportation analysis in the Final EA considered potential impacts from truck VMT associated with up to three warehouse relocations that were assumed for the purpose of the analysis. Goods movement generally refers to the movement of raw, semi-finished, and finished materials and products used by businesses and residents across the transportation system. Products can make their way to a business, retail store, or directly to consumers versus traditional purchases by consumers at physical retail outlets. Under this definition, goods movement in Southern California closely

resembles the transportation patterns of retail uses described in the OPR's Technical Advisory. In the Technical Advisory, the recommended significance threshold for retail projects is a net increase in total VMT. Since OPR has not identified guidance for heavy-duty trucks, the Final EA conservatively considered changes in truck VMT associated with the proposed project to be significant if implementation of the proposed project would result in a net increase in total truck VMT associated with up to three warehouse relocations that were assumed for the purpose of the analysis.

- **Conservative Findings from Indirect Impacts.** For indirect impacts, the proposed project's Final EA incorporates the analysis from the CARB's Final EA for the ACT Regulation by reference. The proposed project would likely result in fewer new facilities than CARB's ACT Regulation, given the more limited geographic scope of the proposed project (only within South Coast AQMD's jurisdiction), its more limited application (just to subject warehouses), and the alternative methods of compliance available to warehouses (e.g., installing filtration systems at nearby sensitive receptors). Nonetheless, the Final EA adopted CARB's conservative approach and concludes these potential indirect impacts, while uncertain, are significant and unavoidable.
- **Conservative Findings from Cumulative Impacts.** Cumulative impacts were assessed based on a 'worst-case' relocations analysis and were based on the highly unlikely scenario that all operators would choose to fulfill their WPCO through a single compliance option, every compliance year, for 10 years. The cumulative impact analysis also assumed that there may be some cargo owners who decide to ship their cargo to a different port to avoid the cost of compliance even though cargo shipping diversions are not reasonably foreseeable. As a result, the actual cumulative impacts are not expected to be as great as considered in the EA.

B. Benefits of the Proposed Project

The South Coast AQMD region continues to experience ozone and fine particulate matter levels that exceed federal air quality standards. This poor air quality is among the worst, if not the worst, in the nation and is a key reason why the proposed project is needed. The proposed project will bring about the following benefits:

1. **NO_x and PM Emissions Reductions.** NO_x is the primary pollutant that needs to be reduced to meet federal and state air quality standards, and mobile sources associated with goods movement make up about 52 percent of all NO_x emissions in the South Coast Air Basin. Trucks are the largest source of NO_x emissions in the air basin and for the emissions associated with warehouses. Diesel particulate matter (DPM) reductions would also help meet federal and state air quality standards for fine PM (PM_{2.5}). The main objective of the proposed project is to reduce NO_x and PM emissions, including DPM, thus contributing to reducing emissions from the goods movement sector by requiring warehouse operators to take actions to reduce

emissions directly through their own actions, or through taking actions to facilitate emissions reductions. It is expected that PR 2035 will result in 3,200 to 8,600 tons of NO_x reductions and 48 to 64 tons of PM reductions over the compliance period (2022-2031).

2. **Regional Public Health Benefits.** The Final Socioeconomic Impact Assessment for the proposed project estimated the public health benefits resulting from compliance with the proposed project. The Socioeconomic Impact Assessment estimated the proposed project would result in 150 to 300 fewer deaths, 2,500 to 5,800 fewer asthma attacks, and 9,000 to 20,000 fewer work loss days from 2022-2031. Additionally, the Socioeconomic Impact Assessment conducted a monetary valuation of reductions in adverse health outcomes (see Table 41 of the Socioeconomic Impact Assessment) for each compliance scenario summed over the entire compliance period (2022- 2031).¹¹ Total discounted monetized health benefits are expected to range from \$1.2B to \$2.7B over the compliance period.
3. **Public Health Benefits to Disadvantaged Communities.** The population within 0.5-mile of a large warehouse has a population-weighted average CalEnviroScreen 3.0 (CES 3.0) Score of 46.6 (85th percentile statewide), while the South Coast AQMD jurisdiction has a population-weighted average CES 3.0 Score of 33.9 (67th percentile statewide). The Final Socioeconomic Impact Assessment for the proposed project identified that risks posed from PM_{2.5} and diesel PM are also higher for populations located within 0.5-mile of warehousing facilities. Communities within 0.5-mile have an average asthma rate of 56 per 10,000 individuals (64th percentile) and experience heart attacks at a rate of 9.2 per 10,000 individuals (65th percentile). Comparably, the district-wide percentiles for asthma and cardiovascular incidence rates are 53rd and 57th, respectively. Warehouse-adjacent communities are 62.1 percent Hispanic and 7.6 percent African American, while the district-wide population is 45.4 percent Hispanic and 6.5 percent African American. In addition, the warehouse-adjacent communities experience poverty at a higher rate (46.7%) than non-warehouse-adjacent communities (38.2%). Trucks are the largest source of NO_x emissions in the air basin and truck activity is focused at warehouses, which as the Socioeconomic Impact Assessment identifies, are disproportionately located in disadvantaged communities. Therefore, the proposed project would have a beneficial impact on these communities.
4. **Ozone Attainment.** The primary goal of the 2016 AQMP is to reduce NO_x emissions, as one of many local, state, and federal strategies to meet the 1997 and 2008 8-hour ozone National Ambient Air Quality Standards (NAAQS). If these standards are met, then all other federal and state ozone and PM standards within South Coast AQMD should be achieved. In order to meet these air quality standards, total NO_x emissions in the SCAB must be reduced by

¹¹ South Coast Air Quality Management District, March 2021, Draft Socioeconomic Impact Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305, <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/proposed-rules>, accessed March 25, 2021.

approximately 45 percent below ‘baseline’ 2023 levels, and 55 percent below ‘baseline’ 2031 levels. Existing regulations are not sufficient to meet either the 2023 or 2031 federal ozone attainment standard dates. Even newly proposed regulations from CARB and U.S. EPA will not reduce NOx emission enough to be able to meet these air quality standards on their own, and additional actions are needed. No single regulation could achieve federal air quality standards on its own, including the proposed project. However, the WAIRE Program will effectively contribute to additional emissions reductions and enhance emission reductions from other programs and is part of the collective of actions needed to meet air quality standards.

5. **Implements the Control Strategies of the AQMP.** The proposed project would implement Control Measure MOB-03, Emission Reductions at Warehouse Distribution Centers, of the 2016 AQMP. The goal of this measure is to assess and identify potential actions to further reduce emissions associated with emission sources operating in and out of warehouse distribution centers. The proposed project directly implements MOB-03, which was intended to result in emissions reductions at warehouse distribution centers. Additionally, the 2016 AQMP estimated that at least one billion dollars per year in incentive funding to clean up vehicle and engine fleets would be needed – absent any further regulations – to meet the 2023 and 2031 attainment dates. Although incentive funding has increased, it has not reached a level sufficient to turn over enough vehicles to meet air quality standards. The proposed project will work with existing and future incentive programs. The requirements in the WAIRE Program are expected to increase the industry’s interest in incentive programs in order to reduce the cost of compliance. This will help ensure that all incentive funds are spent and spread incentives to a broader segment of industry if more recipients sign up for funding. A regulatory requirement may increase requests for funding from the legislature by many stakeholders, which has the potential to further increase the amount of funding available and reduce the cost of compliance to industry.
6. **Supports Statewide Efforts to Increase the Number of NZE and ZE Vehicles (e.g., CARB’s Mobile Source Strategy and 2017 Scoping Plan Update).** The proposed project provides support for statewide policies and objectives to increase the number of NZE and ZE vehicles. There are many actions occurring across state government to increase the use of ZE vehicles to satisfy many goals, including meeting federal and state air quality standards, reducing localized air quality impacts, reducing GHG emissions, etc. The South Coast AQMD is uniquely positioned to contribute to this effort with its indirect source authority. The proposed project encourages NZE and ZE vehicle use at warehouse facilities as one of many options of compliance. By compliance year 2031, implementation of the proposed project could result in a daily reduction in diesel truck VMT above the cumulative baseline of 2,281,476 miles for Scenario 13, to 10,520 for Scenario 6. Despite the net increase in daily truck VMT from the 'worst-case' potential warehouse relocations of 11,896, this hypothetical increase would be offset by the potential emissions benefits associated with a decrease in

diesel-fueled truck VMT in the South Coast AQMD region for all scenarios except one (the WAIRE Points Scenario 6). Overall, the proposed project is expected to result in a substantial decrease in diesel-fueled truck VMT and an increase in use of NZE and ZE vehicles. Reducing VMT from diesel-fueled trucks is consistent with CARB's Mobile Source Strategy, and state's long-term GHG emissions reduction goals such as those set forth in SB 743 and the 2017 Scoping Plan Update to reduce GHG emissions and traffic-related air pollution.

7. **Ensures that State Actions to Require Cleaner Vehicles Actually Occur in the South Coast AQMD Region.** The proposed project encourages the purchase and use of cleaner vehicles within South Coast AQMD's jurisdiction. The recent ACT and Low NOx Omnibus regulations assume a certain number of new truck sales every year. However, while these regulations ensure that lower emissions will occur *if* trucks are sold, they do not require that these trucks be sold or operate within the South Coast AQMD's jurisdiction. Similarly, the upcoming Transport Refrigeration Unit (TRU) regulation is expected to require that newly manufactured trailer TRUs meet lower PM standards, yet will not mandate that fleets purchase these TRUs. The proposed project would place requirements on warehouse operators within South Coast AQMD's jurisdiction that will encourage them to use cleaner vehicle with an estimated 22,778 Class 6 and 8 trucks purchased for compliance under Scenario 6. This ensures that the potential benefits from new state regulations occur within South Coast AQMD's jurisdiction.
8. **Reduces Localized Air Pollution Proximate to Environmental Justice Communities.** In addition to the regional pollution that exceeds federal air quality standards from emission sources associated with warehouses, there are serious localized health effects from air pollution. Communities have repeatedly expressed concern about these impacts, including through the AB 617 process. An analysis of communities in South Coast AQMD shows that those living within 0.5 miles of a warehouse subject to PR 2305 rank in the 80th percentile according to CalEnviroScreen¹², whereas the average community in South Coast AQMD has much lower burden ranking in the 61st percentile. The WAIRE Program will reduce this local pollution burden on environmental justice communities. Some of these disadvantaged communities with local pollution issues were selected to be part of the AB 617 Program, and all three Year 1 communities requested that the warehouse ISR be developed due to concerns about carcinogenic DPM.¹³ Additionally, funds generated by the proposed project's mitigation fee program are expected to result in economic benefits in the surrounding community.

¹² This tool ranks communities based on their pollution burden (e.g., air pollution levels), as well as community characteristics that can make them more susceptible to impacts from pollution (e.g., socioeconomic status). Communities are given a percentile score (out of 100%) to show how they compare with the rest of the state – higher scores mean they experience higher burden. (<https://oehha.ca.gov/calenviroscreen>).

¹³ Each year AB 617 requires CARB's governing board to consider selecting communities for participation in the Community Air Protection Program. Year 1 communities include the communities CARB selected for the first year (2018) of the Community Air Protection Program.

9. **GHG Emissions Co-Benefits.** The proposed project is projected to have substantial long-term air quality benefits, which will result in GHG emissions co-benefits. By compliance year 2031, implementation of the proposed project could result in potential GHG emission reductions of up to 1,644,880 MTCO₂eq. GHG emissions co-benefits were identified for Scenario 6 (ZE truck acquisition and use), Scenario 11 (solar panel installation and usage), Scenario 12 (hydrogen fueling infrastructure and trucks), Scenario 13 (ZE Class 2b-3 truck acquisitions and visits), Scenario 14 (ZE Class 2b-3 truck visits from non-owned fleets), and Scenario 18 (ZE cargo handling equipment acquisition and use).
10. **Supports the State's Carbon Neutrality Initiatives.** The WAIRE Program incentivizes the purchase and use of NZE and ZE vehicles, the construction of alternative fuel vehicle charging stations, and the installation of solar panels. This transition to an alternative energy future is anticipated by utility providers and provides an overall energy benefit. Additionally, the expansion of hydrogen fueling infrastructure is supported through AB 8 and EO B-48-18, and state programs such as CARB's LCFS Hydrogen Refueling Infrastructure credit provision and the CEC's Grand Funding Opportunity 19-602 grant solicitation, and the CEC's Clean Transportation Program. In addition, there is also opportunity to offset grid energy impacts through installation of solar panel systems.
11. **Expedites Transition to NZE and ZE Trucks.** The WAIRE Program would allow for purchase of new NZE and ZE trucks as a way for warehouse operators to meet their WPCO. It is anticipated that these operators would replace their trucks with new NZE and ZE trucks and that the older trucks would be retired (i.e., scrapped) or transitioned to other uses or warehouses outside of the South Coast AQMD's jurisdiction for trucks that are no longer eligible to access the San Pedro Bay Ports. It is estimated that up to 22,778 Class 6 and 8 trucks would be purchased for compliance under Scenario 6. However, even where the trucks are transitioned to other uses, the Final EA reasonably assumes that they would replace even older, higher emissions trucks in an operator's truck fleet. This assumption is based on the fact that the proposed project does not generate an increase in the national or international demand for trucks used in the goods movement sector. Thus, operators that purchase the trucks replaced by NZE and ZE trucks pursuant to the proposed project would be replacing an existing truck that has aged out of or is nearing the end of its useful life. Accordingly, the proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without implementation of the proposed project.
12. **Encourages Truck Efficiency.** The WAIRE Program would require warehouse operators to satisfy an annual WPCO, which is based on the reported number of annual truck trips serving the warehouse. Therefore, there is an incentive to potentially increase efficiency of truck movements to reduce the number of truck trips generated by a warehouse facility, if those truck

movements are not currently at peak efficiency. Reducing truck trips and enhancing efficiency of truck movements would be a beneficial effect of the proposed project.

C. Conclusion

In balancing the project's benefits described above against the significant unavoidable adverse environmental impacts, South Coast AQMD's Governing Board finds that the project's substantial and far-reaching environmental and health benefits, including up to 300 reduced mortalities over the ten-year compliance period, which aim to meet the goals and policies of the 2016 AQMP, outweigh and override the potentially significant unavoidable adverse environmental impacts associated with the project, and these impacts, therefore, are considered acceptable in the light of the project's benefits. South Coast AQMD's Governing Board finds that each of the benefits described above is an overriding consideration, independent of the other benefits, that warrants approval of the project notwithstanding the project's potentially significant unavoidable adverse environmental impacts.

IX. RECORD OF PROCEEDINGS

For purposes of CEQA and these Findings, the Record of Proceedings for the proposed project consists of the following documents and other evidence, at a minimum:

- The NOP/IS and all other public notices issued by South Coast AQMD in conjunction with the proposed project.
- The Final EA for the proposed project, including appendices and technical studies included or referenced in the Final EA, and all other public notices issued by South Coast AQMD for the Final EA.
- The Draft EA for the proposed project including appendices and technical studies included or referenced in the Draft EA, and all other public notices issued by South Coast AQMD for the Draft EA.
- All written comments submitted by agencies or members of the public during the public review comment period on the NOP/IS and Draft EA.
- All responses to written comments submitted by agencies or members of the public during the public review comment period on the NOP/IS and Draft EA.
- All written and verbal public testimony presented during a noticed public hearing for the proposed project.
- The reports and technical memoranda included or referenced in the Response to Comments.

- All documents, studies, EIRs/EAs, or other materials incorporated by reference and tiered off in the Draft EA and Final EA.
- The Resolution adopted by South Coast AQMD in connection with the proposed project, and all documents incorporated by reference therein, including comments received after the close of the public review and comment period and responses thereto.
- Matters of common knowledge to South Coast AQMD, including but not limited to federal, state, and local laws and regulations.
- Any documents expressly cited in these Findings.
- Any other relevant materials required to be in the record of proceedings by Public Resources Code Section 21167.6(e).

A. Custodian and Location of Records

The documents and other materials which constitute the administrative record for South Coast AQMD's actions related to the proposed project are at the South Coast AQMD at 21865 Copley Drive, Diamond Bar, California. The Deputy Executive Officer of the Planning, Rule Development, and Area Sources Division is the custodian of the administrative record for the proposed project. Copies of these documents, which constitute the record of proceedings, are and at all relevant times have been and will be available upon request. This information is provided in accordance with Public Resources Code Section 21081.6(a)(2) and CEQA Guidelines Section 15091(e).

ATTACHMENT G

(Proposed Adoption May 7, 2021)

PROPOSED RULE 2305 WAREHOUSE INDIRECT SOURCE RULE – WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS (WAIRE) PROGRAM

(a) Purpose

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter.

(b) Applicability

This rule applies to owners and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building.

(c) Definitions

For the purpose of this rule, the following definitions shall apply:

- (1) **ALTERNATIVE ENERGY GENERATION EQUIPMENT** means systems at a warehouse facility capable of generating electricity without the use of diesel or gasoline.
- (2) **ALTERNATIVE-FUELED VEHICLE** means a vehicle or engine which is not powered by gasoline or diesel fuel.
- (3) **ALTERNATIVE FUELING STATION** means fuel dispensing equipment for alternative-fueled vehicles.
- (4) **CLASS 2B TRUCK** means a truck with a Gross Vehicle Weight Rating (GVWR) of 8,501 to 10,000 pounds.
- (5) **CLASS 3 TRUCK** means a truck with a GVWR of 10,001 to 14,000 pounds.
- (6) **CLASS 4 TRUCK** means a truck with a GVWR of 14,001 to 16,000 pounds.

- (7) CLASS 5 TRUCK means a truck with a GVWR of 16,001 to 19,500 pounds.
- (8) CLASS 6 TRUCK means a truck with a GVWR of 19,501 to 26,000 pounds.
- (9) CLASS 7 TRUCK means a truck with a GVWR of 26,001 to 33,000 pounds.
- (10) CLASS 8 TRUCK means a truck with a GVWR of greater than 33,001 pounds.
- (11) COLD STORAGE WAREHOUSE means a warehouse that temporarily stores perishable goods which are required to be either refrigerated or frozen.
- (12) COMPLIANCE PERIOD means the 12-month period during which a warehouse facility or land owner, or operator is required to earn Points, as specified in paragraph (d)(1).
- (13) DIESEL PARTICULATE MATTER (DPM) means the particles found in the exhaust of diesel fueled internal combustion engines. DPM is a component of fine particulate matter.
- (14) DWELL TIME means the number of hours per day a truck or tractor is parked at a warehouse.
- (15) ELECTRIC CHARGER means an electric charging station for vehicles that can operate at 208 Volts or greater. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers/plugs are operating, counts as one electric charger. This equipment is also referred to as Electric Vehicle Supply Equipment (EVSE).
- (16) FUEL TYPE means the fuel used to power a vehicle, such as electricity, hydrogen, natural gas, gasoline, or diesel fuel.
- (17) MERV 16 means the minimum efficiency reporting value of filters used in heating, ventilation, and air conditioning units that remove at least 95% of particles 0.3 microns and larger as stated in the American Society of Heating, Refrigerating and Air-Conditioning Engineers Standard 52.2.
- (18) NEAR-ZERO EMISSIONS (NZE) TRUCKS means trucks or tractors with engines meeting the California Air Resources Board's lowest non-zero optional NOx standard applicable at the time of manufacture as defined in the California Code of Regulations Title 13, section 1956.8.

- (19) NITROGEN OXIDES (NO_x) mean the sum of nitric oxides and nitrogen dioxides emitted, calculated as nitrogen dioxide.
- (20) PARENT COMPANY means a company or other entity that owns a controlling interest in a company directly or through one or more subsidiaries.
- (21) STRAIGHT TRUCK means a truck that carries cargo on the same chassis as the power unit and cab.
- (22) TRACTOR means a heavy-duty Class 7 or 8 truck designed to pull a semi-trailer.
- (23) TRANSPORT REFRIGERATION UNIT (TRU) means a refrigeration system designed to control the environment of temperature sensitive products transported in trucks or trailers.
- (24) TRUCK CLASS means the size of a truck based on its GVWR.
- (25) TRUCK TRIP means the one-way trip a truck or tractor makes to or from a site with at least one warehouse to deliver or pick up goods stored at that warehouse for later distribution to other locations. A truck or tractor entering a warehouse site and then leaving that site counts as two trips.
- (26) VEHICLE MILES TRAVELED (VMT) means total annual miles of vehicle travel.
- (27) WAREHOUSE means a building that stores cargo, goods, or products on a short- or long-term basis for later distribution to businesses and/or retail customers.
- (28) WAREHOUSE FACILITY means a property that includes a warehouse as well as accessory uses such as parking areas and driving lanes for trucks, trailers, or passenger vehicles; entry and exit points for vehicles; accessory maintenance or security buildings; and fueling or charging infrastructure for vehicles.
- (29) WAREHOUSE FACILITY OWNER means the legal, beneficial, and/or equitable owner or owners of a warehouse facility.
- (30) WAREHOUSE LAND OWNER means the legal, beneficial, and/or equitable owner or owners of the land beneath a warehouse facility.
- (31) WAREHOUSE OPERATOR means the entity who conducts day-to-day operations at a warehouse, either with its employees or through the contracting out of services for all or part of the warehouse operations. A warehouse operator can be, but is not necessarily the warehouse owner.

- (32) WAREHOUSE SIZE means the indoor floor space, measured in square feet, of an individual warehouse building that may be used for warehousing activities.
- (33) WAREHOUSING ACTIVITIES means operations at a warehouse related to the storage and distribution of goods, including but not limited to the storage, labelling, sorting, consolidation and deconsolidation of products into different size packages. Supporting office administration, maintenance, manufacturing areas, or retail sales areas open to the general public, within the same warehouse building, that are physically separate from the warehouse area, are not considered warehousing activities for the purpose of this rule.
- (34) YARD TRUCK means a mobile utility vehicle, that operates as either an on- or off-road vehicle, used to carry cargo containers with or without a chassis; also commonly known as a terminal tractor, utility tractor rig, yard tractor, yard goat, or yard hostler.
- (35) ZERO-EMISSION (ZE) TRUCK has the same meaning as “zero emission vehicle” defined in California Code of Regulations, Title 13, Section 1963.

(d) Requirements

(1) WAIRE Points Compliance Obligation

Beginning with the Initial Reporting Date in Table 1, a warehouse operator shall earn the applicable WAIRE Points, for the prior 12-month period from January 1 through December 31, in the amount specified in subparagraph (d)(1)(A). WAIRE Points shall only be earned for actions and investments completed during the compliance period while the warehouse operator used the warehouse, except as specified in paragraph (d)(6). Only warehouse operators in buildings with greater than or equal to 100,000 square feet of floor area that may be used for warehousing activities and who operate at least 50,000 square feet of the warehouse for warehousing activities are required to earn WAIRE Points.

- (A) The number of WAIRE Points that a warehouse operator must earn in the applicable compliance period shall be calculated according to the following equation.

$$WPCO = WATTs \times Stringency \times \left(\frac{Annual}{Variable} \right)$$

Where:

WPCO = WAIRE Points Compliance Obligation, or the number of WAIRE Points that a warehouse operator must earn every year

WATTs = Weighted Annual Truck Trips as calculated in subparagraph (d)(1)(B) or (d)(1)(C), as applicable

Stringency = 0.0025 WAIRE Points per WATT

Annual Variable = As specified in Table 2

- (B) The Weighted Annual Truck Trips (WATTs) at a warehouse include all actual truck trips that occurred at a warehouse while the warehouse operator was responsible for warehousing activities during the compliance period. If a warehouse is used by more than one warehouse operator, the WATTs are calculated only for truck trips to or from that operator. As specified in the WAIRE Program Implementation Guidelines, actual truck trip data to a warehouse shall be collected by the warehouse operator using methods that provide a verifiable and representative record, and WATTs shall be calculated according to the following equation.

$$WATTs = [Class\ 2b\ to\ 7\ truck\ trips] + [2.5 \times Class\ 8\ truck\ trips]$$

Where:

Class 2b to 7 truck trips = All trucks or tractors entering or exiting a warehouse truck gate(s) or driveway(s) that are truck Class 2b, 3, 4, 5, 6, or 7. If truck class information is not available, Class 2b to 7 trucks are all straight trucks that entered or exited a warehouse truck gate(s) or driveway(s).

Class 8 truck trips = All Class 8 trucks or tractors entering or exiting a warehouse truck gate(s) or driveway(s). If truck class information is not available, Class 8 trucks are all

tractors that entered or exited a warehouse truck gate(s) or driveway(s).

- (C) If a warehouse operator does not have information about the number of truck trips at a warehouse due to a force majeure event such as a destruction of records from a fire, the WATTs shall be calculated according to the following equation.

$$WATTs = Days\ per\ Year \times Warehouse\ Size \times WTTR$$

Where:

Days per Year = The number of days that the warehouse operator has operational control of the warehouse during the compliance period

Warehouse Size = Warehouse size in thousand square feet (tsf), as defined in subdivision (c)

WTTR = Weighted Truck Trip Rate, where:
Warehouses $\geq 200,000$ = 0.95 trips/tsf/day
Warehouses $\geq 100,000$ = 0.67 trips/tsf/day
Cold Storage Warehouses = 2.17 trips/tsf/day

(2) Earning WAIRE Points

WAIRE Points shall only be earned through completing actions in the WAIRE Menu in Table 3 and as described in (d)(3), or by completing actions in an approved Custom WAIRE Plan as described in (d)(4), or by choosing to pay a mitigation fee as described in (d)(5), or using any combination from (d)(3), (d)(4), or (d)(5).

(3) WAIRE Points Earned Using the WAIRE Menu

WAIRE Points may be earned for actions completed in the WAIRE Menu in Table 3 and based on the point values specified therein.

- (A) WAIRE Points may not be earned from WAIRE Menu items in Table 3 if those same actions or investments are required by separate United States Environmental Protection Agency (U.S. EPA), California Air Resources Board (CARB), or South Coast AQMD rules and regulations during the compliance period in paragraph (d)(1). Actions or investments that go beyond U.S. EPA, CARB, or South Coast AQMD rules and regulations can earn WAIRE Points.

- (4) WAIRE Points Earned Using a Custom WAIRE Plan
 - (A) Warehouse facility or land owners, or operators may apply to earn WAIRE Points through a customized plan for their facility. The Custom WAIRE Plan application shall follow the WAIRE Implementation Guidelines and the criteria below.
 - (i) Custom WAIRE Plan applications must demonstrate how the proposed action will earn WAIRE Points based on the incremental cost of the action, the NOx emission reductions from the action, and the DPM emission reductions from the action, relative to baseline conditions if the warehouse operator had not completed the action in that compliance period.
 - (ii) The methodology to determine the total WAIRE Points for an action in a Custom WAIRE Plan application shall be consistent with methods in the WAIRE Program Implementation Guidelines.
 - (iii) Any WAIRE Points earned from a Custom WAIRE Plan for emission reductions must be quantifiable, verifiable, and real as determined by the Executive Officer and consistent with the WAIRE Implementation Guidelines.
 - (iv) Custom WAIRE Plan applications must include the elements described below:
 - (I) A description of how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but no later than three years after plan approval; and
 - (II) A quantification of expected NOx and/or DPM emission reductions from the proposed actions within the South Coast AQMD and within three miles of the warehouse; and
 - (III) A description of the method to be used to verify that the proposed actions will achieve NOx and/or DPM emission reductions; and
 - (IV) A schedule of key milestones showing the increments of progress to complete the proposed actions; and

- (V) A description of the location and a map of where the proposed actions will occur; and
 - (VI) Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the Custom WAIRE Plan.
 - (v) Any Custom WAIRE Plan that relies on VMT reduction must demonstrate that these reductions are surplus to what is included in the most recently approved Regional Transportation Plan (RTP) and Air Quality Management Plan (AQMP).
- (B) Review of Custom WAIRE Plan Applications
 - (i) A Custom WAIRE Plan application must be submitted at least 270 days before an Annual WAIRE Report is due for the compliance period in which the Plan will earn Points.
 - (ii) Within 30 days of receipt of the Custom WAIRE Plan, the Executive Officer will conduct an initial review of the Custom WAIRE Plan and confirm receipt.
 - (iii) The Executive Officer shall approve or reject the Custom WAIRE Plan within 90 days of submittal. If no formal approval or rejection is received by the applicant, the application is presumed rejected unless otherwise provided for by the Executive Officer in writing. Approval or rejection will be based on whether:
 - (I) The Custom WAIRE Plan was prepared consistent with paragraph (d)(4)(A) and in accordance with the WAIRE Program Implementation Guidelines; and
 - (II) The information provided was complete and accurate.
 - (iv) Within 30 days of disapproval of a Custom WAIRE Plan application as specified in (d)(4)(B)(iii), a warehouse facility or land owner, or operator may revise and resubmit a Custom WAIRE Plan application that corrects all identified deficiencies. If the Executive Officer does not approve the subsequent revised plan within 45 days of resubmission,

then no WAIRE Points may be earned from the Custom WAIRE Plan in the current compliance period.

- (v) A Custom WAIRE Plan application shall be made available by the Executive Officer for public review no less than 30 days prior to approval.
- (C) For any Custom WAIRE Plan that requires implementation beyond the subsequent Annual WAIRE Report, a progress report must be provided every 180 days after Custom WAIRE Plan approval. The progress report shall follow the WAIRE Program Implementation Guidelines and include at a minimum, all of the following:
 - (i) The key milestones from the approved Custom WAIRE Plan that were achieved and a schedule indicating dates for future increments of progress; and
 - (ii) Identification of any milestones that have been or will be achieved later than specified in the approved Custom Plan and the reason for achieving the milestones late. The progress report must describe how each late milestone will be achieved and when WAIRE Points are anticipated to be earned from that action.
- (D) If the Executive Officer determines that a warehouse facility or land owner, or operator is not making adequate progress to complete an approved Custom WAIRE Plan, then the Executive Officer may rescind approval of the plan 30 days after notifying the plan applicant of the proposed rescission. The notice to the plan applicant shall contain a description of the identified deficiencies in the Custom WAIRE Plan implementation.
 - (i) If the warehouse facility or land owner, or operator does not subsequently demonstrate to the Executive Officer's satisfaction that the deficiencies in implementing the plan have been corrected, then the Executive Officer will rescind approval of the Custom WAIRE Plan and notify the owners or operators of the rescission.
- (E) If the expected WAIRE Points from an approved Custom WAIRE Plan are not earned during the applicable compliance period, the warehouse facility or land owner, or operator whose Custom WAIRE Plan was approved shall be in violation of this rule unless

the owner or operator demonstrates that they have met their Warehouse Points Compliance Obligation by the date that they submit their Annual WAIRE Report using WAIRE Points earned through requirements in paragraphs (d)(3) or (d)(5).

(5) Mitigation Fee

In lieu of earning the required number of WAIRE Points in paragraph (d)(3) or (d)(4) a warehouse facility or land owner, or operator may choose to satisfy all or any remaining part of their WAIRE Points Compliance Obligation through payment of a mitigation fee in the amount of \$1,000 for each WAIRE Point. The mitigation fee shall be paid no later than when the applicable Annual WAIRE Report for that compliance period is due.

(6) Transferring WAIRE Points

WAIRE Points are not transferable, except as specified below.

(A) Transferring WAIRE Points to a Different Warehouse

If a warehouse operator conducts warehousing activities at more than one warehouse during any single compliance period, then WAIRE Points earned for one warehouse may be used at the other warehouse(s) under the operational control of that same warehouse operator. Only those points earned in excess of a warehouse operator's WAIRE Points Compliance Obligation at that site may be transferred, and only for the current compliance period. Any WAIRE Points transferred to a different warehouse shall be discounted as specified in the WAIRE Menu in Table 3.

(B) Transferring WAIRE Points to a Different Compliance Period

If a warehouse operator earns more WAIRE Points than is required for its annual ~~Warehouse-WAIRE~~ Points Compliance Obligation, then it may use those remaining WAIRE Points at the same warehouse to satisfy its ~~Warehouse-WAIRE~~ Points Compliance Obligation in any of the following three years.

- (i) WAIRE Points may not be transferred to a subsequent compliance period if the WAIRE Menu items used to earn WAIRE Points are required by U.S. EPA, CARB, or South Coast AQMD rules and regulations in that subsequent year.
- (ii) Warehouse facility or land owners, or operators transferring WAIRE Points to a different compliance period shall demonstrate that any onsite improvements or equipment

installations that were used to earn the WAIRE Points being transferred are still operational at that warehouse facility in the year that WAIRE Points are used.

- (iii) WAIRE Points earned prior to a warehouse operator's first compliance period pursuant to paragraph (d)(1) may be banked and transferred up to three years after the warehouse operator's first compliance period. This early compliance must be documented in an Annual WAIRE Report immediately following the year in which the action or investment was completed.

(C) Transferring WAIRE Points Between a Warehouse Facility or Land Owner and a Warehouse Operator

A warehouse facility or land owner may earn WAIRE Points during a compliance period using the methods specified in paragraphs (d)(3), (d)(4), or (d)(5) or may have WAIRE Points transferred to them from the warehouse operator at that site. The warehouse facility or land owner may transfer these WAIRE Points to any warehouse operator at the site where the WAIRE Points were earned within a three-year period after the points were earned. Points used in this three-year period are subject to clause (d)(6)(B)(ii).

(7) Reporting

(A) Warehouse Operations Notification

Warehouse facility owners shall notify the South Coast AQMD in the manner specified in paragraph (e)(1) on September 1, 2021 and subsequently thereafter when any of the following conditions occur:

- (i) Within 14 calendar days after a new warehouse operator has the ability to use at least 50,000 square feet of a warehouse that has greater than or equal to 100,000 square feet used for warehousing activities;
- (ii) Within 30 calendar days after a renovated warehouse has received a certificate of occupancy from the local land use agency such that the total warehouse space that may be used for warehousing activities has increased or decreased; or
- (iii) Within three calendar days of a request from the Executive Officer.

(B) Initial Site Information Report

Warehouse operators shall submit an Initial Site Information Report in the manner specified in paragraph (e)(2) no later than July 1 of the year that they must submit their first annual WAIRE Report for their operations at that warehouse facility, or within 30 calendar days of a written request by the Executive Officer.

(C) Annual WAIRE Report

Warehouse operators who are required to earn WAIRE Points, or warehouse facility or land owners who earn WAIRE Points as applicable, shall submit an Annual WAIRE Report in the manner specified in paragraph (e)(3) no more than 30 calendar days after January 1, beginning with the Initial Reporting Date in Table 1. The Annual WAIRE Report, in accordance with the WAIRE Program Implementation Guidelines, shall include the information described in paragraph (e)(3) to demonstrate how the warehouse operator satisfied the requirement of paragraph (d)(1) in the preceding compliance period.

(D) If a warehouse operator vacates a warehouse prior to the Annual WAIRE Report submission date in subparagraph (d)(7)(c) in any year that they must satisfy an annual WAIRE Points Compliance Obligation, then the Annual WAIRE Report shall be submitted to South Coast AQMD no later than the date that they vacate the warehouse.

(e) Reporting, Notification, and Recordkeeping Requirements

(1) Warehouse Operations Notification

The notification required pursuant to subparagraph (d)(7)(A) shall be made in the manner specified by the Executive Officer and the WAIRE Program Implementation Guidelines. The notification shall include:

- (A)** The legal name and contact information of any entity leasing at least 50,000 square feet of space at that warehouse and of the warehouse facility owner and land owner, or an affirmation if no entities lease at least 50,000 square feet of space at that warehouse;
- (B)** The duration of the current lease term, if applicable;

- (C) The warehouse size(s) and the square footage that may be used for warehousing activities by each entity leasing at least 50,000 square feet of space at a warehouse; and
- (D) The last known legal name and contact information of the previous entity or entities leasing at least 50,000 square feet of space at that warehouse and the end date of the previous entity's lease, if applicable; and
- (E) How many square feet of the warehouse is used by the warehouse facility owner for warehousing activities.

(2) Initial Site Information Report

The Initial Site Information Report required in subparagraph (d)(7)(B) shall be made in the manner specified by the Executive Officer and the WAIRE Implementation Guidelines, and shall include the following information:

- (A) Warehouse size, and the square footage that may be used for warehousing activities within their operational control.
 - (i) If the warehouse building has less than 100,000 square feet that may be used for warehousing activities, then no additional information pursuant to subparagraphs (e)(2)(B) through (e)(2)(G) is required.
 - (ii) Any operator leasing less than 50,000 square feet of warehouse space that may be used for warehousing activities is not required to report additional information pursuant to subparagraphs (e)(2)(B) through (e)(2)(G), unless the same parent company owns or controls multiple operators in the same building who collectively use greater than or equal to 50,000 square feet of warehousing space for warehousing activity.
- (B) Actual truck trip data, including:
 - (i) Number of truck trips in the previous 12-month period for the warehouse operator at that warehouse;
 - (ii) Number of truck trips anticipated for the next applicable 12-month compliance period in subdivision (d); and
 - (iii) For the purposes of this subparagraph, truck trips shall be reported in two categories. The first category shall include all trucks or tractors using a facility's truck gate or driveway that are truck Class 2b through truck Class 7, or straight

trucks if truck class information is not available. The second category shall include all trucks and tractors that are truck Class 8, or all tractors if truck class information is not available.

- (C) If the warehouse operator owns or leases on-road trucks or tractors that serve that warehouse, the Initial Site Information Report shall include fleet data, for the previous 12-month period including:
 - (i) Number of trucks and tractors in the fleet serving that warehouse, by truck class, and fuel type;
 - (ii) Total VMT by truck class and fuel type; and
 - (iii) Typical dwell time at the facility by truck class; and
 - (iv) Information about which trucks or tractors are owned or leased.
- (D) If the warehouse has an alternative fueling station(s) or electric charging station(s) located onsite, the Initial Site Information Report shall include:
 - (i) Number of electric chargers/alternative fueling stations installed and the date of installation. The report must include the level for each electric charging station. For alternative-fueling stations, the report must include the fuel type, maximum fuel dispensing rate, the maximum amount of fuel that can be dispensed daily, and the pressure of the fueling system, if applicable;
 - (ii) Types of vehicles served;
 - (iii) Total fuel dispensed and/or charging provided in the previous 12-month period.
- (E) If the warehouse operator has yard trucks that are used at that warehouse facility, the Initial Site Information Report shall include:
 - (i) Number of yard trucks used in the previous 12-month period, and indicate which of these are registered as motor vehicles under Vehicle Code section 4000, et seq.;
 - (ii) Fuel type and engine size; and
 - (iii) Total annual hours of operation of all yard trucks for the previous 12-month period.

- (F) If the warehouse has onsite alternative energy generation equipment and/or onsite energy storage equipment, the Initial Site Information Report shall include:
 - (i) The type and rated capacity of the alternative energy generation system in kilowatts and kilowatt-hours per year, and/or rated capacity of the energy storage system in kilowatt-hours, as applicable.
 - (ii) The total energy generation and/or usage of the energy storage system in kilowatt hours expected during the next applicable compliance period in subdivision (d).
- (G) The Initial Site Information Report shall include whether the warehouse operator anticipates earning WAIRE Points from the WAIRE Menu, from a Custom WAIRE Plan, or by choosing to pay a mitigation fee, or the combination thereof, for the next applicable compliance period in subdivision (d). If the warehouse operator anticipates using the WAIRE Menu, the anticipated actions in the WAIRE Menu shall be reported. The actual WAIRE Menu items used for compliance can be from the methods reported in the Initial Site Information Report, or from any other category in the WAIRE Menu, or any other method to earn WAIRE Points in paragraph (d)(2).

(3) Annual WAIRE Report

Annual WAIRE Reports required pursuant to subparagraph (d)(7)(C) or (D) shall be made in the manner specified by the Executive Officer and as specified in the WAIRE Implementation Guidelines, and shall include the following information:

- (A) The Annual WAIRE Report shall include truck trip data, including:
 - (i) Number of actual truck trips during the compliance period described in paragraph (d)(1); and
 - (ii) Truck trips shall be reported in the same manner as described in subparagraph (e)(2)(B)(iii)
- (B) The Annual WAIRE Report shall include how many WAIRE Points were earned from the WAIRE Menu specified in paragraph (d)(3), an approved Custom WAIRE Plan specified in paragraph (d)(4), from mitigation fees specified in paragraph (d)(5), or from transferred WAIRE Points specified in paragraph (d)(6).

(C) For every WAIRE Menu item used to earn WAIRE Points, the WAIRE Annual Report shall contain information about the Reporting Metric specified in Table 3.

(D) Every Annual WAIRE Report shall include current contact information for the warehouse operator.

(4) Recordkeeping

Records which document the accuracy and validity of all information submitted to the South Coast AQMD as required by this rule shall be kept by the warehouse facility or land owner, or operator as applicable, for a minimum of seven years from the reporting deadline, and made available upon request during normal business hours.

(A) A warehouse operator relying on WAIRE Points transferred from a warehouse facility or land owner pursuant to subparagraph (d)(6)(C) must possess records for how the WAIRE Points were earned if they are used to satisfy a WPCO.

(B) Records documenting how WAIRE Points were earned must have been collected contemporaneously with the action itself.

(5) All reports in this rule shall be certified by an authorized official. For purposes of reporting, an authorized official is defined as an individual who has knowledge and responsibility for actions required by this rule, and who has been authorized by an officer of the warehouse facility or land owner, or operator, as applicable, to submit and certify the accuracy of the data presented in these reports on behalf of the owner or operator, based on best available knowledge.

(f) WAIRE Implementation Guidelines

The Executive Officer shall periodically publish guidelines for implementing the WAIRE Program.

(g) Exemptions

(1) Operators In Warehouses That Have Less Than 50,000 Square Feet That They May Use For Warehousing Activities

Warehouse operators who can only use less than 50,000 square feet of a warehouse that is greater than or equal to 100,000 square feet, for warehousing activities due to terms of their lease, are not subject to the requirements in subdivision (d)(1) unless the same parent company owns or

controls multiple operators in the same building who collectively use more than 50,000 square feet of space for warehousing activity.

(2) Warehouse Operators ~~w~~With a WPCO Less ~~t~~Than 10

A warehouse operator with a WPCO that is less than 10 in any compliance period is exempt from the requirement to earn WAIRE Points in paragraph (d)(1) for that compliance period. The WPCO shall be calculated using methods in paragraph (d)(1). The warehouse operator shall document their WPCO and exemption in an Annual WAIRE Report.

(3) Unforeseen Circumstances

In instances where investments or actions completed by an owner or operator perform at a level significantly lower than anticipated due to unforeseen circumstances beyond the control of the warehouse facility or land owner, or operator and such that the anticipated WAIRE Points for that action can-not be fully earned, the owner or operator may apply for a partial or complete exemption to the Executive Officer following procedures in the WAIRE Program Implementation Guidelines. The application must specify what portion of the WPCO determined by subparagraph (d)(1) that the malfunctioning equipment would have satisfied, and relevant details about why the anticipated action was unable to earn the expected WAIRE Points.

(A) The Executive Officer shall grant an exemption from the applicable WAIRE Points requirement only if the following criteria are met:

- (i) The vehicle or equipment does not perform at the level specified by the manufacturer due to a manufacturing defect or a defect in the installation of equipment using manufacturer-approved methods, and
- (ii) The warehouse operator demonstrates that despite their good faith effort to have the vehicle or equipment repaired, either via warranty or through other manufacturer and/or installer-approved methods, that the repair was not completed in a timely manner.

(h) Sunset Date for Rule

The WPCO requirements in (d)(1) shall expire 45 days after the end of the compliance period during which the latter of (h)(1) and (h)(2) has been met.

- (1) A final action becomes effective from the U.S. EPA that finds that all air basins within the South Coast AQMD have attained the 2015 National Ambient Air Quality Standards (NAAQS) for ozone of 70 parts per billion.
- (2) Pursuant to Health and Safety Code 39608, CARB has identified that all air basins in the South Coast AQMD have attained the state ozone standard of 70 parts per billion.
- (3) All reporting requirements for warehouse facility and land owners and operators shall remain in effect for the final compliance period specified in (h), but no reporting shall be required for future compliance periods.
- (4) At least one year prior to the anticipated rule expiration in (h), the Executive Officer shall report to the South Coast AQMD Governing Board on the efficacy of Rule 2305 and recommend which portions of the rule should be retained or amended, if any. This report shall evaluate the potential need for the rule with respect to any applicable Clean Air Act requirements such as anti-backsliding and maintenance plans, other regulations from U.S. EPA and CARB, the state of the market of zero emission and near zero emission technologies serving warehouses, and the existing and anticipated emissions associated with warehouses covered by the rule.

(i) Severability

If any provision of this rule is held by judicial order to be unlawful or otherwise invalid, such order shall not affect the operation or implementation of the remainder of this rule. If any provision of this rule is held by judicial order to be inapplicable to any person or circumstance, such order shall not affect the application of such provision to other persons or circumstances. The severability provided for in this subsection shall include, but is not limited to, invalidation of any exemption in subsection (g) or any of the compliance options in subsections (d)(3), (d)(4), or (d)(5) or the actions in Table 3.

Table 1 – Initial Requirement Date

Phase	Warehouse Size (square feet)	Initial Reporting Date (Annual WAIRE Report)	Initial Compliance Period
1	$\geq 250,000$	January 31, 2023	January 1, 2022 to December 31, 2022
2	$\geq 150,000$ - $<250,000$	January 31, 2024	January 1, 2023 to December 31, 2023
3	$\geq 100,000$ - $<150,000$	January 31, 2025	January 1 2024 to December 31, 2024

ATTACHMENT H

(Proposed Adoption May 7, 2021)

PROPOSED RULE 316 FEES FOR RULE 2305

(1) Purpose

California Health and Safety Code Section 40522.5 provides authority for the South Coast Air Quality Management District to adopt a fee schedule for areawide or indirect sources of emissions which are regulated, but for which permits are not issued, to recover the costs of programs related to these sources. The purpose of this rule is to recover the South Coast AQMD's cost of implementing Rule 2305.

(a) Applicability

This rule applies to owners and operators of facilities subject to Rule 2305 that submit an Annual WAIRE Report, a Custom WAIRE Plan application, an Initial Site Information Report, a Warehouse Operations Notification, or that pay a Mitigation Fee.

(b) Definitions

For the purpose of this rule, the following definitions shall apply:

- (1) ANNUAL WAIRE REPORT is the annual report submitted by a warehouse operator or owner demonstrating how they satisfied their Warehouse Points Compliance Obligation pursuant to Rule 2305 (d)(7)(C).
- (2) CUSTOM WAIRE PLAN APPLICATION is the application submitted by a warehouse operator or owner that describes the customized method that they propose to use to satisfy their Warehouse Points Compliance Obligation pursuant to Rule 2305 (d)(4).
- (3) INITIAL SITE INFORMATION REPORT is the report submitted by a warehouse operator pursuant to Rule 2305 (d)(7)(B).
- (4) MITIGATION FEE is the fee paid by a warehouse operator or owner pursuant to Rule 2305 (d)(5).
- (5) WAREHOUSE has the same definition as in Rule 2305 (c)(27).
- (6) WAREHOUSE OPERATIONS NOTIFICATION is the report submitted by a warehouse owner with information about the warehouse building and any business leasing the warehouse pursuant to Rule 2305 (d)(7)(A).
- (7) WAREHOUSE OPERATOR has the same definition as in Rule 2305 (c)(31).

- (8) WAREHOUSE FACILITY OWNER has the same definition as in Rule 2305 (c)(29).
- (9) WAREHOUSE LAND OWNER has the same definition as in Rule 2305 (c)(30).
- (10) WAREHOUSING ACTIVITIES has the same definition as in Rule 2305 (c)(33).

(c) Annual WAIRE Fees

Warehouse operators and owners who submit reports or notifications required by Rule 2305 shall pay fees according to Table 1. These fees are due at the time that the applicable report or notification must be submitted pursuant to Rule 2305.

Table 1

Report or Notification	Fee
Annual WAIRE Report	\$392.50
Initial Site Information Report	\$140.68
Warehouse Operations Notification	\$29.51

(d) Custom WAIRE Plan Application Evaluation Fee

- (1) Warehouse owners who submit a Rule 2305 Custom WAIRE Plan Application shall be charged fees on a time and materials basis. The amount charged shall be an amount equal to the total actual and reasonable time incurred by South Coast AQMD staff for evaluation of the application, assessed at the hourly staff rate or prorated portion of \$161.25 per hour. The initial fee shall be \$806.25 for each plan, and shall be paid when the Custom WAIRE Plan application is submitted.
- (2) The adjustment to plan application evaluation fees will be determined at the time a plan is approved or rejected and may include additional fees based upon actual review and work time billed. Notification of the amount due or refund will be provided to the applicant, and any additional fees due to the adjustment to plan evaluation fees will be billed following project completion.

(e) Mitigation Program Administrative Fee

Warehouse owners or operators who pay a mitigation fee pursuant to Rule 2305 (d)(5) shall pay an additional fee to cover the reasonable costs incurred by South Coast AQMD staff and/or its consultants to administer the Mitigation Program. This administrative fee shall be equal to 6.25 percent of the mitigation fee paid by the warehouse owner or operator, and shall be paid when the mitigation fee is paid.

(f) Payment Due Date

Payment of all applicable fees in subdivision (d) shall be due at the time that the applicable report must be submitted, and in subdivision (e) hourly fees shall be due in sixty (60) days from the date of personal service or sending by mail, electronic mail, or other electronic means, of the notification of the amount due. For the purpose of this paragraph, the fee payment will be considered to be received by the South Coast AQMD if it is delivered, postmarked, or electronically paid on or before the expiration date stated on the billing notice. If the expiration date falls on a Saturday, Sunday, or a state holiday, the fee payment may be delivered, postmarked, or electronically paid on the business day following the Saturday, Sunday, or the state holiday with the same effect as if it had been delivered, postmarked, or electronically paid on the expiration date.

(g) Exemptions

- (1) Any warehouse facility owner who submits a Warehouse Operations Notification for a warehouse that has less than 100,000 square feet of floor area dedicated to warehousing activities that year is not required to pay fees described in subdivisions (d) through (g).
- (2) Any warehouse operator who operates less than 50,000 square feet of a warehouse for warehousing activities and for which Rule 2305 (e)(2)(A)(ii) applies is not required to pay fees described in subdivision (d).

INTRODUCTION

Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and PR 316 – Fees for Rule 2305 would apply to operators and owners of existing and new warehouses with floor space greater than or equal to 100,000 square feet within a single building. These warehouses are used to receive, store, and serve as a distribution point for goods. The majority of emissions associated with warehouses are from on-road vehicles such as trucks that deliver goods, and off-road vehicles such as cargo handling equipment. PR 2305 would require warehouses subject to the rule to annually take actions that either reduce emissions regionally and locally or that facilitate emission reductions.

More specifically, PR 2305 requires warehouse operators of warehouses subject to PR 2305 to earn a certain number of points each year from emission-reducing activities or payment of a mitigation fee. This program would work similarly to the LEED system by the United States Green Building Council in that actions are assigned a specified level of points based on a menu.¹ For PR 2305, the amount of points every warehouse operator must earn annually depends upon the number of truck trips to their warehouse.² Second, an operator may choose to apply to implement a site-specific custom plan that incorporates actions that are not on the menu, plan approval is required prior to being able to earn points. Custom plans could include onsite and offsite measures within the control of the operator that can be demonstrated to reduce emissions of NO_x and/or diesel PM. Third, an operator may choose to pay a mitigation fee to South Coast AQMD. The funds generated from the mitigation fee will be used to provide financial incentives for truck owners to purchase NZE or ZE trucks, or for the installation of fueling and charging infrastructure, with priority given for projects in the communities near warehouses that paid the fee. In addition, warehouse operators and owners would also have reporting and recordkeeping requirements. Finally, warehouse operators would pay fees as established by PR 316 to reimburse South Coast AQMD for administrative costs associated with ensuring compliance with PR 2305.

There are many factors that go into determining the stringency of proposed rules. For PR 2305, the draft stringency recommended here considered the following points: the need for emission reductions, the significance of emissions associated with the warehousing industry, the potential emissions reductions from PR 2305 when considering other measures, and the impact to industry. The analysis included in this Draft Staff Report and in the accompanying Draft Environmental Assessment (CEQA analysis) and Draft Socioeconomic Impact Assessment describe the information used to develop the proposed rule approach.

AIR QUALITY MANAGEMENT PLAN

The South Coast Air Quality Management District (South Coast AQMD) is the regional air quality regulatory agency for all of Orange County, and large portions of Los Angeles, Riverside, and San Bernardino counties. It is responsible for developing and enforcing air pollution control rules and regulations and implementing strategies to meet attainment standards for the South Coast Air Basin (SCAB) and the Riverside County portions of both the Salton Sea Air Basin (SSAB) and the

¹ There are two important distinctions between LEED and PR 2305. First, the point values between the two systems are completely separate and do not relate to each other. Second, PR 2305 requires annual compliance whereas LEED typically is accomplished on a one-time basis during building construction/design or during renovation.

² Point values consider regional and local emission reductions and cost, but warehouse operators do not need to calculate these values. See Chapter 2 for additional detail.

Mojave Desert Air Basin (MDAB). The federal Clean Air Act (CAA) requires the submission of State Implementation Plans (SIP) for nonattainment areas that do not meet the federal National Ambient Air Quality Standards (NAAQS). Additionally, the California Clean Air Act (CCAA) imposes further requirements on meeting state ambient air quality standards for criteria pollutants. South Coast AQMD's jurisdiction is currently classified as being in extreme nonattainment status for the federal NAAQS ozone standards, and serious nonattainment for the federal fine Particulate Matter (PM 2.5) standards.

Per the California Health and Safety Code, the South Coast AQMD is required to adopt an Air Quality Management Plan (AQMP) to demonstrate compliance with both federal and state ambient air quality standards for South Coast AQMD's jurisdiction.³ The AQMP is a blueprint for meeting federal and state air quality standards, which include the NAAQS for the South Coast AQMD jurisdiction. On March 3, 2017, South Coast AQMD's Governing Board adopted the 2016 AQMP.⁴ Based on analysis in the 2016 AQMP, in order to attain the 8-hour ozone standards by the NAAQS deadlines, the total SCAB emissions of NOx must be reduced to approximately 141 tons per day in 2023 and 96 tons per day in 2031. This represents an additional 45% reduction in NOx beyond baseline 2023 levels, and an additional 55% NOx reduction beyond baseline 2031 levels. As seen in Figure 1, approximately 80% of NOx emissions in 2023 and 2031 will be from mobile sources. The control strategy in the 2016 AQMP includes many stationary and mobile source measures that will be carried out by the South Coast AQMD and the California Air Resources Board (CARB) (Figure 2). To attain the federal ozone and PM 2.5 NAAQS, the 2016 AQMP relies on reducing regional NOx emissions as a primary strategy (NOx is a precursor to the formation of both ozone and PM 2.5), but also includes measures to reduce directly emitted PM 2.5.

CARB is committed to achieving emission reductions with its state Mobile Source Strategy (MSS) in the State Implementation Plan (SIP). However, the majority of these emission reductions come from measures titled as "Further Deployment of Cleaner Technologies" (Further Deployment Measures), which were not fully defined. The Further Deployment Measures are expected to reduce 108 tons per day of NOx emissions beyond baseline by 2023 and 88 tons per day beyond baseline by 2031.

⁴ South Coast AQMD, Final 2016 Air Quality Management Plan, March 2017. <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>

Figure 1: South Coast Air Basin Baseline NO_x Emissions and Reductions Needed to Achieve Federal 8-Hour Ozone NAAQS

Figure 2: NO_x Control Strategy in the 2016 AQMP

RULEMAKING BACKGROUND

Implementation of the Further Deployment Measures described above is based on a combination of incentive funding and development of new regulations. In the 2016 AQMP, the South Coast AQMD committed to assist CARB and U.S. EPA in developing the Further Deployment Measures, including through the development of local Facility Based Mobile Source Measures (FBMSMs). One of the FBMSMs includes MOB-03 – Emissions Reductions at Warehouse Distribution Centers.

The 2016 AQMP described a year-long process for staff to evaluate potential emissions reduction strategies for the FBMSMs and report back to the Governing Board on the most promising approach. South Coast AQMD staff convened a working group to explore potential voluntary and regulatory approaches for warehouses,⁵ consistent with what was outlined in the 2016 AQMP for control measure MOB-03. After considering the results of that year-long process, in May 2018, the Governing Board directed staff to initiate rulemaking for a warehouse Indirect Source Rule (ISR),⁶ namely Proposed Rule (PR) 2305 and PR 316.

Other South Coast AQMD Air Quality Plans

The South Coast AQMD Governing Board has approved several other plans since adoption of the AQMP that would also benefit from adoption of PR 2305 and PR 316. These include the Contingency Measure Plan for the 1997 8-hour Ozone Standard⁷, and multiple Community Emission Reduction Plans (CERPs) prepared pursuant to Assembly Bill (AB) 617.

The Contingency Measure Plan describes the measures that must be implemented to meet the 2023 attainment deadline for the federal ozone standard. This plan lays out in greater detail many of the strategies included in the 2016 AQMP, in particular for the Further Deployment Measures. With the approval of this plan, the South Coast AQMD Governing Board committed to achieving between 14.4 and 16.4 tons per day of NO_x reductions by 2023.⁸

Assembly Bill (AB) 617 is a program established to address the disproportionate burden of air pollution on environmental justice communities, by providing funding and enabling selected communities to shape the actions to reduce emissions. In December 2018, CARB approved the South Coast AQMD Year 1 admission of the communities of San Bernardino/Muscoy, East Los Angeles/Boyle Heights/West Commerce, and Wilmington/Carson/West Long Beach into the AB 617 Program. These AB 617 Year 1 communities established Community Steering Committees (CSCs) to work on the development of CERPs to serve as a road map on how to address each respective community's air quality concerns, and in September 2019, the South Coast AQMD Governing Board adopted the AB 617 CERPs. All three of the South Coast AQMD Year 1 AB 617 communities requested that a warehouse ISR be developed due to their concerns regarding air

⁵ Presentation materials from this process are available here: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtngs>

⁸ <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2019/2019-dec6-028.pdf>

pollution impacts from trucks and diesel PM.⁹ Similar to the Year 1 AB 617 communities, the Year 2 AB 617 community of South East Los Angeles also included in their CERP a request for continued development of the warehouse ISR to reduce emissions in their community.¹⁰

State Goals

Several state goals have focused on the need to accelerate the adoption of lower emission technologies, in particular Zero Emissions (ZE) vehicles. Two notable examples include CARB's Draft Mobile Source Strategy (MSS)¹¹ and a recent executive order from the governor.¹²

CARB's Draft MSS is an integrated planning effort designed to meet state goals for criteria pollutants, greenhouse gases, and toxics. One of the key conclusions from this analysis is that a significant portion of the existing mobile source fleet (trucks, cars, off-road equipment, etc.) will need to convert to ZE technologies quickly to meet multiple state goals, including attainment of federal air quality standards. While some strategies like the recently adopted Advanced Clean Trucks (ACT) regulation¹³ have been more clearly defined in the Draft MSS and through CARB rulemaking efforts, other strategies are still undefined and rely on unspecified "accelerated turnover" to ZE technologies, including for emissions sources associated with warehouses, such as trucks and cargo handling equipment. Further, in September 2020, the governor of California signed an executive order directing state agencies to pursue ZE goals for mobile sources. This includes a goal of a 100% ZE truck fleet by 2045, a 100% ZE drayage truck fleet (trucks that visit ports and railyards) by 2035, and 100% ZE off-road equipment operations by 2035. Although this goal sets out potential targets, it does not include any enforceable mechanism and funding programs and regulations (such as PR 2305) that are needed to achieve the targets.

Public Process

Since the South Coast AQMD Governing Board voted to initiate rulemaking in May 2018, staff has held 12 working group meetings, presented five updates to the Mobile Source Committee and two updates to the full South Coast AQMD Governing Board. Written materials include the Preliminary Draft Staff Report, this Draft Staff Report, three drafts of PR 2305 and two drafts of PR 316, and three draft technical reports on the WAIRE Menu. Dates for each of these activities is listed in Table 1.

CEQA Notice of Preparation	Nov. 13, 2020
CEQA Draft Environmental Assessment	Jan. 20, 2021

The following potential options for reducing emissions from warehouses were discussed in the Warehouse ISR Working Group:

- Facility Caps: Allow emissions at each warehouse distribution center to be capped so each warehouse distribution center would have the flexibility to individually determine how to reduce emissions.
- Local Government Measures: Local governments may decide to tailor emission reduction strategies to address local needs (e.g., through their land use authority).
- Clean Fleets Crediting/Banking Program: Allow clean fleets to generate credits that would be managed through a bank while requiring ISR facilities to regularly purchase and apply the credits to offset emissions from individual warehouse distribution centers.
- Voluntary Fleet Certification Program: Allow fleet owners to certify their fleets are cleaner than what would otherwise be required by CARB regulations while requiring facilities to use a prescribed amount of certified fleets.
- Best Management Practices (BMPs):- Allow facilities to choose from an assortment of BMPs such as utilizing ZE or NZE equipment on site, and/or installing ZE/NZE fueling and charging infrastructure, or solar energy storage.
- Mitigation Fees:- Allow facilities to pay mitigation fees if other options are not chosen and apply collected funds to subsidize the purchase and use of ZE/NZE equipment or the installation of fueling/charging infrastructure.

Of these options, only the Best Management Practices (now the WAIRE Menu and Custom WAIRE Plan option) and the Mitigation Fee options have been carried forward to PR 2305. These options were found to be the least administratively burdensome for facilities and South Coast AQMD compliance staff and ensured that emission reductions would be focused in the communities near warehouses. The menu-based approach is similar to other rules that allow multiple options of compliance, such as South Coast AQMD Rule 2202 - On-Road Motor Vehicle

Mitigation Options¹⁴ that focuses on reducing emissions from employee commutes, Rule 403 – Fugitive Dust¹⁵ that focuses on reducing particulate matter emissions from activities like earth moving. Both rules allow multiple options to comply with overall requirements in each rule. PR 2305 will also include a points-based system that is similar to programs widely used in South Coast AQMD’s jurisdiction for development projects including LEED for green building design,¹⁶ and San Bernardino’s Greenhouse Gas Reduction Plan¹⁷. Both programs assign points based on actions taken from a menu, and assign a rating based on the total number of points earned. PR 2305 will take a similar approach to these successful programs (and additionally includes many menu items that can be used in LEED and San Bernardino’s GHG Reduction Plan). PR 2305 and PR 316 are described in greater detail in Chapter 2.

EMISSIONS INVENTORY OF PR 2305 WAREHOUSES

The sources of emissions associated with warehouses include the trucks that deliver goods to and from the facilities, yard trucks located at warehouses that move trailers, transport refrigeration units (TRUs) located on trucks and trailers that keep cargo, like food, cold, and the passenger vehicles for warehouse employees. Additional emissions sources can include onsite stationary equipment (e.g., diesel backup generators or manufacturing equipment), and emissions from power plants that provide electricity for the warehouse – though these sources have not been included in the baseline emissions inventory. Most of these vehicles are diesel powered, except for passenger vehicles which are typically gasoline powered.

The emissions inventory established in the 2016 AQMP provides a platform from which to develop a baseline inventory for the universe of warehouses that would be subject to PR 2305 and PR 316. However, there are several developments that have occurred since the approval of the 2016 AQMP. First, the on-road mobile emissions inventory developed by CARB that was used in the 2016 AQMP is EMFAC 2014. However, a newer version of that model has since been approved by U.S. EPA (EMFAC 2017) with updated emission rates. Second, the CARB Board has approved two key regulations that will affect trucks that travel to warehouses called the Advanced Clean Trucks regulation¹⁸ and the Low NOx Omnibus regulation.¹⁹ Finally, CARB and U.S. EPA are continuing to develop additional regulations, but many are too speculative to consider at their current level of development. One future regulation, the Heavy-Duty Inspection and Maintenance (I/M) regulation,²⁰ is considered here as there is statutory direction for CARB to develop and adopt it²¹ and the regulation has been developed sufficiently to provide a preliminary quantification of the impact. The emissions data from these more recent regulations are included either in the META tool that CARB developed to support their Draft Mobile Source Strategy, and/or within the documentation that CARB has prepared for each regulation. The key data parameters and the associated data sources are listed in Table 2 below.

The NO_x and diesel PM baseline emissions in the South Coast AQMD associated with warehouses in key milestone years is shown in Table 3 below. As seen in this table, heavy duty trucks are the largest source of emissions, comprising more than 90% of the total PR 2305 inventory.

Table 3: PR 2305 Warehouse NO_x and Diesel PM Emissions²³ (tons per day)

Emission Source	2019		2023		2031	
	NO _x	DPM	NO _x	DPM	NO _x	DPM
Heavy Duty Trucks	41.67	0.67	20.20	0.14	16.81	0.12
Passenger Vehicles	1.14	0.02	0.70	0.02	0.39	0.01

AIR QUALITY NEED

There are six key reasons why PR 2305 and PR 316 are needed. First and foremost, the SCAB region continues to experience ozone and fine particulate matter levels that exceed federal air

²² Additional details regarding the universe of PR 2305 warehouses is described in Chapter 3 and Appendix A.

²³ Baseline emissions estimates for 2023 and 2031 are lower than previous estimates. The primary difference here is how CARB's Heavy Duty I&M regulations is included. Previous drafts included Heavy Duty I&M in the emission reductions, but not in the baseline inventory.

quality standards. This poor air quality is among the worst, if not the worst in the nation.²⁴ Attaining the air quality standards yields monetized health benefits that are estimated to be about \$173 billion.²⁵ NOx is the primary pollutant that needs to be reduced to meet federal air quality standards, and mobile sources associated with goods movement make up about 52% of all NOx emissions in the SCAB.²⁶ Trucks are the largest source of NOx emissions in the air basin and also for the emissions associated with warehouses. Any diesel PM reductions brought about by PR 2305 and PR 316 will also help meet federal air quality standards for fine PM. PR 2305 and PR 316 would reduce emissions from the goods movement sector by requiring warehouse operators to take actions to reduce emissions directly or through facilitating emissions reductions.

Second, existing regulations are not sufficient to meet either the 2023 or 2031 attainment dates. Even newly proposed regulations from CARB and U.S. EPA (as shown in CARB's Draft MSS) will not be able to meet these air quality standards on their own, and additional actions are needed. No single regulation could achieve federal air quality standards on its own, including PR 2305 and PR 316. However, these proposed rules are designed to contribute their own additional emissions reductions and enhance emission reductions from other programs, and are part of the collection of actions needed to meet air quality standards.

Third, the 2016 AQMP estimated that at least \$1 billion per year in incentive funding to clean up vehicle and engine fleets would be needed – absent any further regulations – to meet the 2023 and 2031 attainment dates. Although incentive funding has increased, reaching between about \$100 to \$200 million per year over the past few years,²⁷ it has not reached a level sufficient to turn over enough vehicles to meet air quality standards. Many incentive programs are oversubscribed,²⁸ with demand far exceeding funding availability. However, some programs are undersubscribed.²⁹ PR 2305 and PR 316 are designed to work with existing and future incentive programs, and can help encourage greater levels of incentive funding and encourage applicants to apply for funding. The regulatory requirements in PR 2305 and PR 316 are expected to increase industry's interest in incentive programs in order to reduce the cost of compliance. This can help ensure that all incentive funds are spent and can potentially spread incentives to a broader segment of industry if more recipients sign up for funding. Finally, much of the incentive funding that South Coast AQMD distributes is allocated annually as part of the state legislature's budgetary process. A regulatory requirement may increase the request for funding from the legislature by many stakeholders, which has the potential to further increase the amount of funding available and reducing the cost of compliance to industry.

A fourth air quality need for PR 2305 and PR 316 is to support statewide efforts to increase the number of ZE vehicles. There are many actions occurring across state government to increase the use of ZE vehicles to satisfy many goals, including meeting federal and state air quality standards, reducing toxics and greenhouse gas emissions, encouraging manufacturing of ZE vehicles in the

²⁸ <http://www.aqmd.gov/docs/default-source/Agendas/Technology/technology-committee-agenda-12-18-20.pdf#page=6>

²⁹ <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2020/2020-dec4-005.pdf>

state, reducing the dependence on fossil fuels and the related impacts from extracting and producing these fuels, etc.³⁰ The South Coast AQMD is uniquely positioned to contribute to this effort with its authority to regulate indirect sources. PR 2305 and PR 316 provide a mechanism to require warehouse operators to encourage ZE vehicle use at their facilities as one of many options of compliance.

A fifth air quality need is to ensure that state actions to require cleaner vehicles actually occur in the South Coast AQMD region. The recent ACT and Low NOx Omnibus regulations assume a certain amount of new truck sales every year, and also assume that the activity of those newer, cleaner trucks will occur consistent with past behavior as demonstrated in EMFAC. However, the nature of those two regulations ensures that lower emissions occur only *if* trucks are sold. It does not require any certain number of trucks to be sold, or to operate within the South Coast AQMD.³¹ Similarly, the upcoming TRU regulation is expected to have requirements for newly manufactured trailer TRUs to meet lower PM standards, yet will not mandate that fleets purchase them, nor will it direct sales in certain parts of the state.³²

For comparison, CARB mandates a certain percentage of light duty vehicle sales to be zero emission vehicles (ZEVs) or plug-in hybrid electric vehicles (PHEVs)³³ as part of its Advanced Clean Cars (ACC) regulation.³⁴ CARB has reported that all vehicle manufacturers subject to ACC are in compliance as of 2019.³⁵ However, the distribution of ZEVs and PHEVs throughout the state does not coincide with the areas with highest air pollution. Figure 3 shows county-level median Air Quality Index (AQI)³⁶ compared with the percent of the light duty vehicle population that is ZEV or PHEV³⁷. This figure shows that three of the four counties in the South Coast AQMD jurisdiction have the highest AQI in the state, and that ZEVs and PHEVs are not preferentially located in areas with higher AQI.³⁸ PR 2305 and PR 316 would place requirements on warehouse operators in South Coast AQMD that will encourage them to ensure that the potential benefits from statewide regulations occur here.

³⁰ <https://static.business.ca.gov/wp-content/uploads/2019/12/2018-ZEV-Action-Plan-Priorities-Update.pdf>, <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-text.pdf>, <https://www.ca.gov/archive/gov39/2012/03/23/news17472/index.html>, <https://www.ca.gov/archive/gov39/2018/01/26/governor-brown-takes-action-to-increase-zero-emission-vehicles-fund-new-climate-investments/index.html>, <https://www.ca.gov/archive/gov39/wp-content/uploads/2018/09/9.10.18-Executive-Order.pdf>

³¹ Neither of these regulations impose any requirements on trucks registered out of state. Warehouse operators would have the choice to use ZE or NZE technologies for out of state trucks too.

³² <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>

³³ ZEVs and PHEVs have lower tailpipe emissions than their conventional gasoline or diesel counterparts as they can run wholly or at least partially without using an internal combustion engine.

³⁴ <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program>

³⁵ https://ww2.arb.ca.gov/sites/default/files/2020-10/2019_zev_credit_annual_disclosure.pdf

³⁶ Air Quality Index is an indicator of overall air quality and considers all criteria air pollutants measured within a geographic area. Higher values indicate worse air quality.

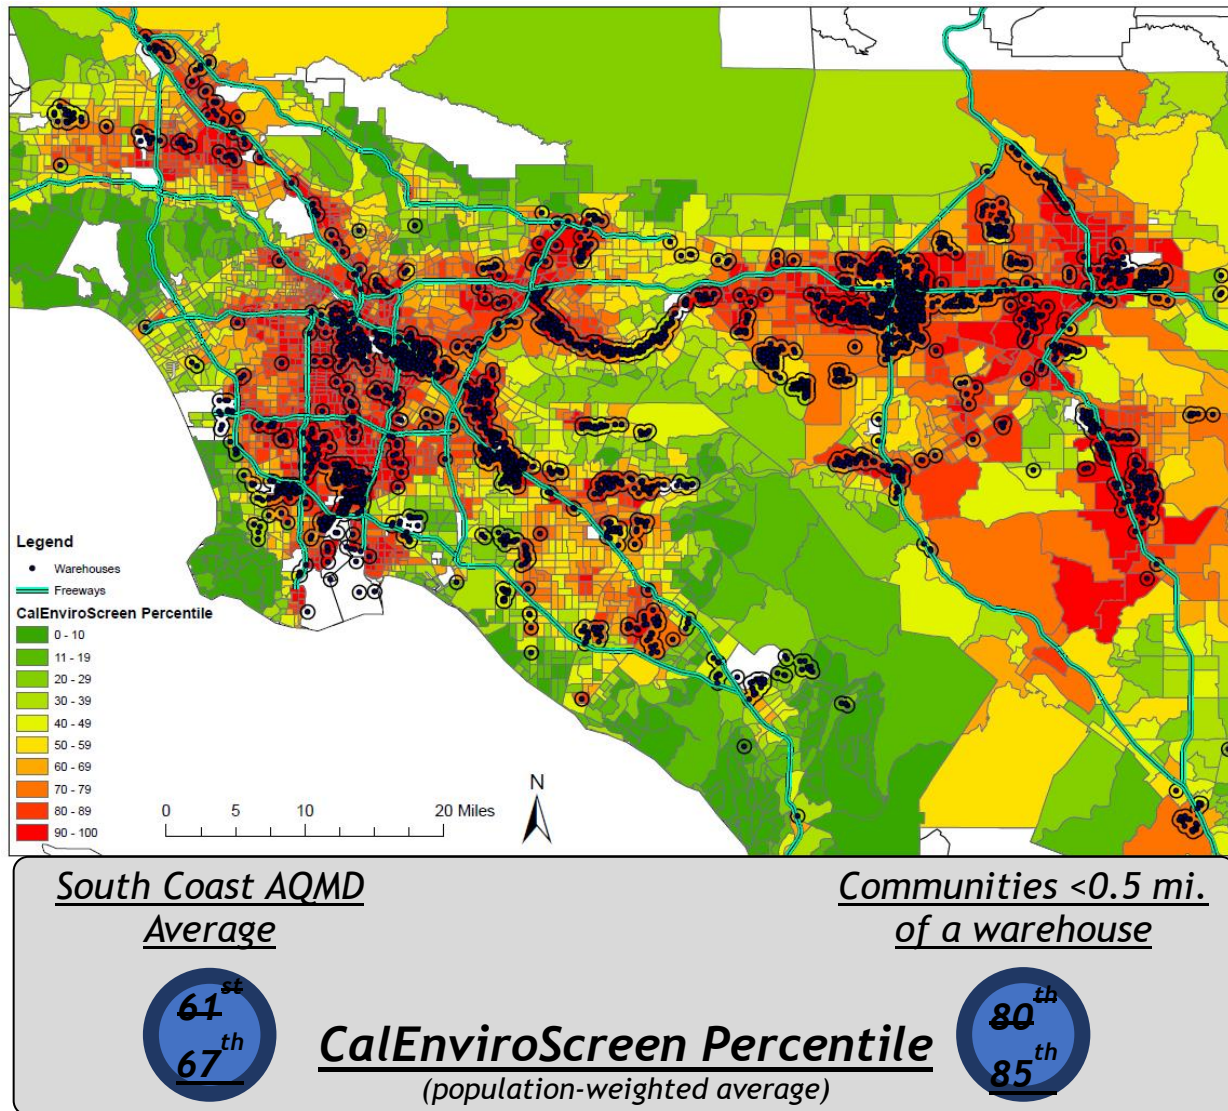

<https://www.epa.gov/outdoor-air-quality-data/air-quality-index-report>

³⁷ <https://www.energy.ca.gov/files/zev-and-infrastructure-stats-data>

³⁸ Of the 59 counties in California, Orange County ranks 6th in ZEV and PHEV share, Los Angeles County ranks 10th, Riverside County ranks 23rd, and San Bernardino County ranks 26th.

2305 and PR 316 would reduce this local pollution burden by requiring warehouse operators to take actions to reduce emissions and exposures from trucks and other emission sources associated with their facility (e.g., through NZE/ZE truck use, filters, etc.), as well as take actions to facilitate (e.g., ZE infrastructure) and enhance emission reductions from other programs (e.g., incentive programs, CARB regulations, etc.).

Figure 4: Environmental Burden on Communities Near PR 2305 Warehouses as Demonstrated by CalEnviroScreen

LEGAL AUTHORITY

The South Coast AQMD may adopt PR 2305 and PR 316 through the authority to “adopt and enforce rules and regulations to achieve the state and federal ambient air quality standards in all areas affected by emission sources under their jurisdiction...” (Health and Safety Code section

40001; *see also* section 40702.) Generally, CARB has primary authority over emissions from motor vehicles and the South Coast AQMD has primary authority over all sources in the basin, except motor vehicles. (Health and Safety Code section 40000.) However, Health and Safety Code section 40716 recognizes air districts may adopt and implement regulations that control emissions from indirect and areawide sources in order to meet state ambient air quality standards.

The key pollutants of interest for PR 2305 include nitrogen oxides (NO_x, a key precursor pollutant for ozone and fine PM) and diesel PM (a component of fine PM, and a toxic air contaminant). The South Coast AQMD is in nonattainment of the California Ambient Air Quality Standards (CAAQS) for both ozone and fine PM, referred to as PM 2.5. Notably, for ozone, the current 8-Hour CAAQS and the 2015 8-hour NAAQS are at an equivalent level and for PM 2.5, the current annual CAAQS and the 2012 annual NAAQS are also at an equivalent level. As a result, the South Coast AQMD relies on the same measures to meet both federal and state ozone and PM 2.5 standards.

In addition, the Clean Air Act allows a state to include “...as part of an applicable [state] implementation plan, an indirect source review program which the State chooses to adopt and submit as part of its plan.” (Clean Air Act section 110(a)(5)(A)(i); 42 U.S.C. §7410(a)(5)(A)(i).) An indirect source is defined as “...a facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution.” (Clean Air Act section 110(a)(5)(C); 42 U.S.C. §7410(a)(5)(C).) Also, the Clean Air Act acknowledges that states and their subdivisions have the right to “adopt or enforce any standard or limitation respecting emissions of air pollutants” and also “any requirement respecting control or abatement of air pollution” so long as it is not less stringent than a federal requirement. (Clean Air Act section 116; 42 U.S.C. § 7416.)

The South Coast AQMD Governing Board approved the 2016 Air Quality Management Plan (2016 AQMP) in March of 2017. The 2016 AQMP was subsequently approved by CARB, included into the State Implementation Plan (SIP), and approved by U.S. EPA in 2019. The 2016 AQMP included MOB-03, a facility-based mobile source control measure to reduce mobile source emissions associated with warehouse distribution centers, which has resulted in PR 2305 and PR 316.

By approving MOB-03 into the 2016 AQMP, the South Coast AQMD and CARB have committed to, and the U.S. EPA has authorized, the development of an indirect source rule to achieve emission reductions from mobile sources attributed to warehouse activities, in order to assist attaining the federal ozone NAAQS in 2023 and 2031. While MOB-03 was adopted as part of the NO_x emissions reduction strategy for ozone, the 2016 AQMP also recognized that the “NO_x strategy will assist in meeting the annual PM 2.5 as “expeditiously as practicable” earlier than the attainment year of 2025.” (2016 AQMP, pg. 4-52.)

Initially, the South Coast AQMD Governing Board authorized a one-year public process to identify if MOB-03 could be achieved through voluntary or regulatory measures, and then ultimately determined, in May of 2018, that staff should pursue a regulatory approach.

A California Attorney General Opinion from 1993 determined that a district could adopt a regulation to,

“...require the developer of an indirect source to submit the plans to the district for review and comment prior to the issuance of a permit for construction by a city or county. A district may also require the owner of an indirect source to adopt reasonable post-construction measures to mitigate particular indirect effects of the facility’s operation.”

The opinion acknowledged a district may adopt a regulation requiring new and existing indirect sources to submit plans to the district to mitigate mobile indirect source emissions from both construction and operations that are attributed to the source. The Clean Air Act does not contain any prohibition on the scope of an Indirect Source Rule adopted by a state, as confirmed by the opinion and Health and Safety Code section 40716, and a state indirect source rule may include reasonable post-construction measures. The opinion further acknowledged that under Health and Safety Code section 42311, the district could adopt a regulation to collect fees to recover the costs associated with the indirect source review program. A similarly worded section, Health and Safety Code section 40522.5, specifically authorizes the South Coast AQMD to collect fees to recover costs associated with regulatory programs for areawide or indirect sources. These are the types of fees contemplated by PR 316.

Implementation of PR 2305 and PR 316 will also meet the requirement for districts in extreme nonattainment to consider all feasible measures that have been implemented in other areas in order to meet state standards. (Health and Safety Code section 40920.5(c).) While the term “feasible” is not defined in the Health and Safety Code, it is defined in another state regulation as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.” (14 California Code of Regulations section 15364.)

There are several examples of indirect source rules that have already been adopted in California. For example, the San Joaquin Valley Unified Air Pollution Control District adopted Rule 9510, which requires new development projects that meet certain specifications to reduce emissions of PM 10 and NOx. In addition, indirect source programs have been implemented by Mendocino County AQMD, Great Basin Unified APCD, Colusa County APCD, Placer County APCD, Imperial County APCD, and Shasta County AQMD. As several California air districts have already adopted and implemented indirect source rules, policies, and/or the collection of reduction fees, this type of measure has been shown in a variety of areas to be “feasible.” Furthermore, the authority for air districts to set emission reduction targets from indirect sources was confirmed by the court in *NAHB v. San Joaquin Valley UAPCD* (9th Cir. 2010) 627 F.3d 730.

Health and Safety Code section 40717 further requires districts to “adopt, implement, and enforce transportation control measures for the attainment of state or federal ambient air quality standards....” The section defines transportation control measures as “any strategy to reduce vehicle trips, vehicle use, vehicle miles traveled, vehicle idling, or traffic congestion for the purpose of reducing motor vehicle emissions.” (Health and Safety Code section 40717 (g).) PR 2305 will encourage facilities to reduce motor vehicle emissions by requiring fewer points

from facilities that are able to employ certain transportation control measures, such as fewer truck trips (with additional subsequent reduced vehicle idling).

In addition to the above provisions, the South Coast AQMD may adopt rules or regulations that require “the owner or the operator of any air pollution emission source to take such action as the state board or the district may determine to be reasonable for the determination of the amount of such emission from such source.” (Health and Safety Code section 41511.) Even more specifically, under Health and Safety Code section 40701(g), the South Coast AQMD is authorized to collect information regarding a source, “...except a noncommercial vehicular source, to provide (1) a description of the source, and (2) disclosure of the data necessary to estimate the emissions of pollutants for which ambient air quality standards have been adopted, or their precursor pollutants....” These sections of the Health and Safety Code therefore authorize the South Coast AQMD to require owners and operators of warehouses to provide information that may be used to quantify emissions based on warehouse activity.

Programs reducing emissions of precursors to ozone and PM 2.5 for purposes of achieving and maintaining the NAAQS or CAAQS may also have concurrent benefits in reducing emissions of air toxics. The district may adopt rules to reduce emissions from sources that may affect public health. One of the duties imposed upon the district is the duty to enforce Health and Safety Code section 41700. That section provides:

“Except as otherwise provided in section 41705, no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.”

Accordingly, the South Coast AQMD may adopt regulations to prevent the potential health impacts from toxic air contaminants, including diesel PM, as well as to reduce the emissions of criteria air pollutants. The California Supreme Court has upheld the districts’ authority to regulate air toxic emissions from sources within their jurisdiction. (*Western Oil & Gas Assoc. v. Monterey Bay Unified Air Pollution Control Dist.* (1989) 49 Cal.3d 408.)

CHAPTER 2: SUMMARY OF PROPOSAL

INTRODUCTION

PROPOSED RULE 2305

PROPOSED RULE 316

WAIRE MITIGATION PROGRAM

INTRODUCTION

Proposed Rule (PR) 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program includes the requirements that regulated warehouse owners and operators must follow. These requirements include an obligation for applicable warehouse operators to earn a specified number of WAIRE Points every year using either a menu of options, developing and implementing a custom plan, or paying a mitigation fee. Warehouse operators that over-comply may transfer excess WAIRE Points earned in one year to a subsequent year or may transfer WAIRE Points to another site within their control. If they so choose, warehouse owners may also opt in and earn WAIRE Points and transfer them to an operator at that site. PR 2305 also requires reporting information about facility operations and recordkeeping. PR 316 is the companion rule to PR 2305 and establishes the administrative fees that PR 2305 warehouse owners and operators must pay to support South Coast AQMD compliance activities.

PROPOSED RULE 2305

Purpose – Subdivision (a)

The purpose of the proposed rule is to reduce local and regional emissions of NO_x and PM associated with warehouses in order to assist in meeting state and federal air quality standards. Actions required by PR 2305 can also work together with other regulations, incentive programs, and state policies to enhance their effect (e.g., clean air goals and zero emission vehicle goals). PR 2305 therefore also acts as a facilitating measure to achieve emission reductions from these other efforts. Reductions in NO_x and PM regionally will assist in meeting federal and state air quality standards, and concurrent reductions in diesel PM will also reduce air quality impacts to communities living near warehouses.

The proposed purpose is as follows:

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses, in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter.

Applicability- Subdivision (b)

In 2014, there were approximately 32,000 industrial warehouse buildings of any size in the counties of Los Angeles, Orange, Riverside, and San Bernardino counties. PR 2305 will apply only to the largest facilities in South Coast AQMD that have more than 100,000 square feet of indoor space in a single building. Warehouse owners often do not conduct day-to-day operations, and thus PR 2305 applies to both operators and owners of these facilities, however most requirements do not apply to owners unless they opt in (see Requirements discussion below). Some large industrial properties may also have buildings that exceed the 100,000 square foot threshold, but do not conduct any warehousing activities (e.g., they may conduct manufacturing instead). Finally, some facilities may have tenants that change through time. One year may include a tenant operating a facility as a church, and the next year a new tenant may change to a warehouse operator. The applicability of the rule is therefore tied to buildings that *may* be used for warehousing activities, however only limited reporting is required by PR 2305 if warehousing activities are not actually occurring.

The proposed applicability is as follows:

This rule applies to owners and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building.

Definitions – Subdivision (c)

PR 2305 includes definitions of specific terms related to the warehousing industry and mobile source technology. Some definitions are based on existing South Coast AQMD rules and regulations. There are technology terms such as electric charger levels or technology type that have range differences in the industry, but at time of inclusion were based on an existing source. Please refer to PR 2305 subdivision (c) for each specific definition.

Proposed Definitions:

Alternative Energy Generation Equipment	Yard Truck
Alternative-Fueled Vehicle	Zero-Emission (ZE) Truck
Alternative Fueling Station	
Class 2B Truck	
Class 3 Truck	
Class 4 Truck	
Class 5 Truck	
Class 6 Truck	
Class 7 Truck	
Class 8 Truck	
Cold Storage Warehouse	
Compliance Period	
Diesel Particulate Matter (DPM)	
Dwell Time	
Electric Charger	
Fuel Type	
MERV 16	
Near-Zero Emission (NZE) Trucks	
Nitrogen Oxides (NOx)	
Parent Company	
Straight Truck	
Tractor	
Transport Refrigeration Unit	
Truck Class	
Truck Trip	
Vehicle Miles Traveled (VMT)	
Warehouse	
Warehouse Facility	
Warehouse Operator	
Warehouse Facility Owner	
Warehouse Land Owner	
Warehouse Size	
Warehouse Activities	

Alternative Energy Generation Equipment: Some warehouses already operate solar panels that generate electricity. This is expected to be the dominant technology for alternative energy generation equipment at a PR 2305 warehouses. However, other onsite forms of energy generation may be possible (e.g., windmills). This definition only applies to reporting requirements, and warehouse operators will be required to specify which type of technology they operate onsite.

Alternative fueled-vehicles and fueling stations: Alternative fuels means fuels for vehicles besides diesel and gasoline. This is expected to be dominantly natural gas, electricity, and potentially other fuels like hydrogen or propane. Traditionally alternative-fueled vehicles have lower emissions than their gasoline and diesel counterparts. However, any requirements in the rule related to vehicle emissions refer to near-zero emissions or zero-emissions vehicles. These alternative-fuel definitions only apply to reporting requirements for alternative-fueling stations.

Class 2b to 8 trucks: These definitions use common classifications for trucks based on their gross vehicle weight rating.⁴² *Truck class* refers to these classes.

Cold storage warehouse: These warehouses store perishable goods (e.g., food) and typically have higher energy use due to onsite refrigeration, higher daily truck trip generation rates due to the need to move perishable goods quickly, including from trucks that have a transport refrigeration unit.

Compliance period: This is the 12-month period during which warehouse operators (and warehouse facility or land owners who opt in) need to earn WAIRE Points. These WAIRE Points are documented in the Annual WAIRE Report filed within 30 days after the compliance period ends.

Diesel Particulate Matter (DPM): DPM is the particulate matter that is emitted from diesel fueled engines that power trucks and equipment. It a component of fine PM, and also a toxic air contaminant and carcinogen.

Dwell time: This is the period of time that trucks stay parked at a warehouse.

Electric charger: This definition varies in different applications outside PR 2305. For the purposes of PR 2305, an electric charger is a plug that can be used to charge a vehicle independent of whether other plugs are operating, and that can operate at 208 Volts or greater. Some electric charging stations are designed with more than one plug, which can be concurrently attached to vehicles, however they cannot charge vehicles simultaneously. For example, high powered charging stations may not be able to deliver multiple high charges at the same time, but a station operator may not want to dedicate personnel to wait for one plug to finish before plugging in the next vehicle to charge, so multiple plugs may be plugged into vehicles, and sit idle. The station would then automatically cycle to the next plug when the first vehicle finishes charging. For purposes of PR 2305, this station would count as a single electric charger. Alternatively, if multiple plugs were able to operate simultaneously, then each plug would count as an individual electric charger.

⁴² <https://afdc.energy.gov/data/10380>

Fuel type: This refers to the different types of fuels used in vehicles and equipment.

MERV 16: This is equal to a 95% particulate matter efficiency rating for filters used in building heating, ventilation, and air conditioning systems as defined in Standard 52.2 from the American Society of Heating, Refrigerating and Air-Conditioning Engineers. WAIRE Points earned from the WAIRE Menu for filter system installations or filter replacements in residences, schools, daycares, hospitals, or community centers must meet this minimum efficiency level. Filters can reduce indoor exposure to particulate matter.

Near-zero emissions (NZE) trucks: This definition refers to the lowest optional low NO_x standard for truck engines in Title 13, Section 1956.8 of the California Code of Regulations. This level is currently set at 0.02 gram/brake horsepower-hour. CARB is proposing to change this standard to include new test cycles starting in 2024, and additionally lowering the level to as low as 0.01 g/bhp-hr in 2027 as part of its recent Low NO_x Omnibus rulemaking. The PR 2305 definition uses the Section 1956.8 definition, but slightly refines it by pointing to the “lowest non-zero optional NO_x standard applicable at the time of manufacture. This refinement is made to ensure that future lower standards are not applied to existing trucks who qualified for the near-zero definition at the time of manufacture.

Nitrogen oxides (NO_x): The definition in PR 2305 is the same definition that is used in South Coast AQMD Rule 2000.

Parent company: This term refers to the company or entity that owns another company either directly, or through a subsidiary.

Straight truck: This refers to smaller trucks that carry goods on the same chassis as the cab and engine. Typical examples include a box truck or a package delivery truck.

Tractor: This refers to larger Class 7 and 8 trucks that pull a trailer, often called “semis.”

Transport Refrigeration Unit (TRU): TRUs are typically diesel-powered refrigeration units commonly mounted on the front of a trailer near the tractor cab, or on the front of a straight truck just above the cab. The diesel engine providing power for the TRU is smaller than a truck engine, but TRUs commonly idle for long periods at a warehouse in order to keep the goods inside the straight truck or trailer at appropriate temperatures.

Truck trip: A one-way trip from a truck or tractor either from or to a warehouse. A truck entering a warehouse site, and then later leaving would count as two truck trips, and one truck visit.

Vehicle Miles Travelled (VMT): For PR 2305, this term refers to the total annual miles of travel made by trucks or tractors. VMT does not need to be tracked to earn any WAIRE Points from the WAIRE Menu. VMT only needs to be reported by warehouse operators in an Initial Site Information Report if they own a fleet that serves that warehouse.

Warehouse and Warehouse Facility: A warehouse refers to the building used to store goods, while a warehouse facility refers to the entire property that includes a warehouse, as well as the accessory uses such as the truck yard, parking, maintenance facilities, etc.

Warehouse Facility Owner and Warehouse Land Owner: These terms are separately defined because there are rare instances where the owner of the land beneath a warehouse facility is not the same as the owner of the warehouse building. Most parts of PR 2305 do not require anything of warehouse facility or land owners. However, they can opt in to certain parts of the proposed rule (e.g., they can opt in to earn WAIRE Points, and then transfer those to a warehouse operator at that site). In one instance, the Warehouse Operations Notification [see paragraph (d)(7)], there is a requirement of the warehouse facility owner that is not applicable to the warehouse land owner.

Warehouse Operator: Most of PR 2305 is applicable to the warehouse operator. The operator is the entity that has control of day-to-day operations at the site. Some operators will hire companies to take care of day-to-day operations for portions of the site, such as yard operations, or temporary laborers to load or unload trucks and trailers. In this instance, the warehouse operator is the entity that hires these companies or temporary laborers.

Warehouse Size: This term refers to the indoor floor space of a warehouse. A warehouse may have multiple floors, as well as mezzanine areas, used for warehousing activities. For example, a warehouse building may take up 100,000 square feet of ground area, and have 100,000 square feet of floor space on the first floor used for warehousing activity, and 50,000 square feet of floor space on a mezzanine, with 20,000 square feet of the mezzanine used for office space and the remainder used for warehousing activity. The warehouse size in this case would be 130,000 square feet.

Warehousing Activity: Warehousing activity refers to the activities related to the storage and distribution of goods. This can include many activities including sorting, labeling, repackaging, palletizing, applying SKUs, racking, various levels of automation, and other similar activities. There are also many different activities that can occur within the same building that would not be considered warehousing activities, including supporting office administration, manufacturing, vehicle maintenance, or ‘factory’ retail stores that are open to the general public. Standalone retail stores that are open to the general public are also not covered by PR 2305. These non-warehousing activities are not considered warehousing activity.

Yard truck: These trucks can be off-road or on-road vehicles and are used to transport trailers short distances around a warehouse facility, for example from a dock door to parking area. Some yard trucks also shuttle trailers short distances on roads to nearby warehouses.

Zero Emissions (ZE) truck: This term refers to the definition developed by CARB in its recent Advanced Clean Trucks regulation.

Requirements – Subdivision (d)

Subdivision (d) establishes the key requirements of the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. This includes establishing the WAIRE Points system, describing how Points can be earned or transferred, and laying out when specific reports are due.

Paragraph (d)(1)

This paragraph establishes a WAIRE Points Compliance Obligation (WPCO) for warehouse operators. Warehouse operators must earn WAIRE Points to comply with their WPCO by the initial reporting date in Table 1 of PR 2305.⁴³ Table 1 splits the universe of PR 2305 warehouses that are anticipated to earn Points into three phases, approximately one third each as shown in Figure 5 below.

Figure 5: Number of PR 2305 Warehouses Anticipated to Earn Points by Phase

Paragraph (d)(1) also describes a two-step test to determine if an operator needs to earn Points. First, operators in warehouses with greater than or equal to 100,000 sq. ft. of space that may be used for warehousing activities and who use at least 100,000 sq. ft. for warehousing activities are required to earn Points. Second, if an operator only uses a part of the warehouse, they are only required to earn Points if they operate at least 50,000 sq. ft. of that space for warehousing activities.

Paragraph (d)(1) also provides the fundamental calculations to determining the WPCO for each warehouse operator, including Equation 1 below.

$$\text{Equation 1: } WPCO = WATTs \times \text{Stringency} \times \left(\frac{\text{Annual}}{\text{Variable}} \right)$$

The WATTs parameter (Weighted Annual Truck Trips)⁴⁴ in Equation 1 presents the number of truck trips by truck class associated with a warehouse, and serves as a proxy for overall warehouse activity and emissions. Larger Class 8 trucks carry more goods and have higher emissions and are

⁴³ The most recent draft PR 2305 updates the compliance period to match the calendar year from January 1 through December 31. If PR 2305 is approved in May 2021, then Phase 1 warehouse operators would have more than seven months to prepare for their first compliance period.

⁴⁴ A parameter like emissions or vehicle miles travelled is not used to determine the WPCO in order to reduce the administrative burden on warehouse operators and South Coast AQMD compliance staff. Motor carriers have also expressed concern that they do not want to reveal where or how far they travel to warehouse operators or South Coast AQMD in order to keep their clients private.

thus weighted more heavily than smaller Class 2B to 7 trucks. The value of 2.5 was calculated by comparing the running exhaust emission rates of different truck classes in EMFAC that typically visit warehouses (Figure 6 below) for calendar year 2023 (after CARB's Truck and Bus rule is fully phased in). The ratio between individual truck classes varies but is approximately 2.5 overall when comparing Class 8 to Class 2B to 7.

Figure 6: NO_x and Diesel PM Emission Rates in 2023 for Different Truck Classes

Warehouse operators are required to submit actual truck trip data that is verifiable and representative of their operations to account for the amount of warehouse activity during the compliance period. Truck trip counts can be determined and accounted for by various methods such as warehouse personnel logging truck trips based on once-per month 24-hr long video surveys (one weekday and one weekend day), automated camera systems with recognition software, truck driver surveys, contractual records that provide sufficient details for truck activity, telematics systems, etc. Absent specific information about truck class, operators may simplify the analysis by just tracking straight trucks (as a proxy for Class 2b to 7) and tractors (as a proxy for Class 8). Truck trip data must be recorded and maintained, and the records and methods used to collect the truck trip data must be verifiable by South Coast AQMD compliance staff.

In the very rare case where an operator has lost their truck trip activity records due to a force majeure event (such as a fire), default truck trip rates based on truck trip generation rates from the Institute of Transportation Engineers and the Fontana Truck Trip study are also available.⁴⁵ These

⁴⁵ <http://library.ite.org/pub/a3e6679a-e3a8-bf38-7f29-2961becdd498>
<https://tampabayfreight.com/pdfs/Freight%20Library/Fontana%20Truck%20Generation%20Study.pdf>

default Weighted Truck Trip Rates (WTTR) are shown in Table 4 below. Only those trucks that use a warehouse's truck driveway must be included. Trucks that utilize the employee parking driveway for building servicing activities like mail delivery or trash pickup do not need to be included. Additional discussion of methods to record actual truck trips are provided in the WAIRE Program Implementation Guidelines (Appendix A).

Table 4: Truck Trip Generation Rates Used for Default WTTR in Case of Loss of Records due to Force Majeure

Warehouse Type	Class 8 / Tractor-Trailer / 4+ Axle (Average daily trips per 1,000 sq. ft. of warehouse building area)^	Class 2B-7 / 'Straight' Trucks / 2- and 3-Axle (Average daily trips per 1,000 sq. ft. of warehouse building area)^	Weighted Truck Trip Rate (WTTR) ($2.5 \times \text{Class 8} + \text{Class 4-7}$)
High Cube Transload & Short Term Storage ($\geq 200\text{k sf}$)	0.33	0.12	0.95
Warehouse ($100\text{k} - 200\text{k sf}$)	0.21	0.14	0.67
Cold Storage ($> 100\text{k sf}$)	0.75	0.29	2.17

The proposed stringency of PR 2305 in Equation 1 is 0.0025 WAIRE Points per WATT. The proposed stringency was developed by evaluating 18 different scenarios of potential PR 2305 compliance, described further in Chapter 3. The potential emissions benefits from this scenario analysis were evaluated alongside the potential costs and impact to industry.

The annual variable in Equation 1 is the ramp up schedule for the PR 2305 stringency. As proposed, the full stringency of 0.0025 would not be achieved until the third compliance period for each warehouse. The annual variable in Table 2 of PR 2305 is layered in with the warehouse Phases. All three Phases will be at full stringency in the fifth compliance period. New warehouses that are built after PR 2305 would be placed into the appropriate Phase based on warehouse size. The annual variable is established relative to when PR 2305 is adopted, and does not 'reset' for a new warehouse that is built after rule adoption. For example, a new warehouse built in September 2025 that is 125,000 sf with at least 100,000 sf usable for warehousing activities would need to submit its first Annual WAIRE Report 30 days after January 1, 2026. Their annual variable for their first compliance period would be 1.0.

Paragraph (d)(2)

Paragraph (d)(2) provides the three primary options available to earn WAIRE Points. This includes completing actions from the WAIRE Menu in paragraph (d)(3), completing actions from an approved Custom WAIRE Plan in paragraph (d)(4), or paying a mitigation fee from paragraph (d)(5). Points can be earned from any combination of these three options in any compliance period.

Paragraph (d)(3)

Paragraph (d)(3) and Table 3 include the WAIRE Menu option. The WAIRE Menu itself has 32 different actions or investments that can be completed. Points can be earned from any combination of Menu actions, at any level of implementation. Points can be earned only if they go beyond requirements in other U.S. EPA, CARB, or South Coast AQMD regulations in effect during that compliance period.⁴⁶ When determining if an action goes beyond requirements from another regulation, a comparison is made between the regulatory requirement on the entity itself earning Points (typically the warehouse operator), rather than requirements on a non-PR 2305 entity. For example, CARB's ACT regulation requires truck manufacturers to sell a certain fraction of ZE trucks beginning in 2024. ACT does not apply to any regulated entity covered by PR 2305. Therefore, a warehouse operator (or warehouse facility or land owner if they opt in) may earn Points for purchasing a ZE truck, regardless of any requirements in ACT. At this time, there are no regulations in place that limit what a warehouse operator or owner could implement from the WAIRE Menu. There is the potential that CARB's upcoming TRU regulation, its Advanced Clean Fleets (ACF) regulation, or potentially other regulations could impose requirements on warehouse operators or owners. Even if a new regulation comes into place that imposes requirements directly on a warehouse operator or owner, if the action is completed prior to the other regulation's mandated timeline, then Points could still be earned under PR 2305. For example, hypothetically if ACF requires a warehouse operator who owns a fleet to purchase ZE trucks by 2030, but the operator purchases ZE trucks early in 2029, then they would be able to earn WAIRE Points for that action in 2029.

Table 3 in PR 2305 includes specific WAIRE Points for each action. Warehouse operators (or owners who opt in) would earn Points relative to their level of implementation of an action with the Points associated with each annualized metric in Table 3. The basic equation that needs to be followed to earn Points from the Menu is shown in Equation 2 below. As an example, if a warehouse operator demonstrates that they had 520 ZE Class 8 truck visits⁴⁷ to their warehouse during a compliance period, they would earn 72.7 WAIRE Points for that action following the method below.

Equation 2:

WAIRE Points per Annualized Metric \times *Level of implementation* \div *Annualized metric* = *Points earned*

For ZE Class 8 visits example above: 51 Points \times *520 visits* \div *365 visits* = *72.7 Points*

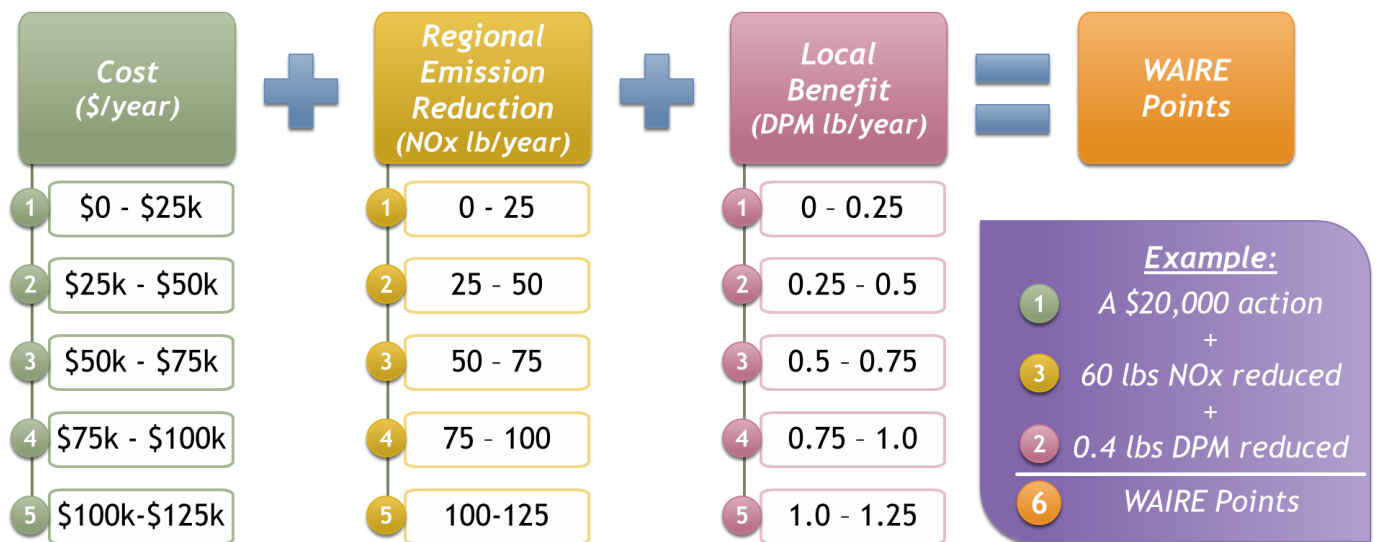

⁴⁶ Points can be earned even if local ordinances (e.g., from a city or county) or building codes include requirements for some of the actions covered by PR 2305. Local land use authorities also have the option to require higher compliance obligations under CEQA using the framework set up by PR 2305. For example, as a condition of approving a new warehouse project, a land use agency could require a warehouse operator to earn additional WAIRE Points beyond their WPCO in order to reduce air quality impacts. However there is no obligation on land use agencies under PR 2305 or PR 316 unless they are a warehouse owner or operator subject to PR 2305.

⁴⁷ 520 visits is the same as 1,040 one-way truck trips.

Figure 7 below shows the underlying calculation used to develop the number of WAIRE Points associated with each WAIRE Menu action. The details for these calculations are provided in Appendix B to this staff report. An earlier draft of this appendix was provided to the Working Group as the WAIRE Menu Draft Technical Report on March 3, 2020. This more detailed calculation approach is not used by warehouse operators or owners to earn WAIRE Points from the Menu. This approach is just the original analysis used to establish the balancing between different menu actions in PR 2305. In this approach, each WAIRE Point consists of three elements: the incremental cost to complete the action, the regional emission reduction of NO_x in lbs/year, and the local DPM emission reductions in lbs/year. Each of these elements is calculated for individual actions at a set level of implementation (i.e., the annualized metric), binned and then summed to simplify comparisons.

Actions are split primarily into two groups, one-time investments in technologies that can reduce emissions or facilitate the implementation of emission reductions, and ongoing use of these technologies. Points are earned separately for the investment and the ongoing use. Points can be earned from both a one-time investment in emission reduction technologies and use of that technology in the same compliance period. For example, a warehouse operator could install a charging station and earn Points from that action, and begin using that charging station to earn more Points in the same compliance period.

Figure 7: Approach to Develop WAIRE Points for Each WAIRE Menu Action*

**This approach is not used by warehouse operators or owners to earn Points. This is only the underlying methodology to the WAIRE Menu.*

Finally, PR 2305 does not prohibit operators from using incentive funding from South Coast AQMD, CARB, or other sources to earn WAIRE Points. However, many of these programs have express limitations in using their funds to comply with a regulation. Because these limitations are written into each specific program's requirements, they are not included in PR 2305 as those programs' requirements could change through time. Staff is unaware of any requirements in programs like Carl Moyer, AB 617 funding, or similar programs that limit the use of funds with

WAIRE Menu items associated with ongoing use (e.g., truck visits). However, there are commonly limitations in these funding programs associated with the purchase of vehicles or equipment.

Paragraph (d)(4)

Paragraph (d)(4) describes the Custom WAIRE Plan option, including the requirements for what needs to be included in a Plan and Plan application, and the process and criteria for approval or disapproval of the Plan application, or rescission of an approved Plan by South Coast AQMD. Custom WAIRE Plans are only potentially approvable if they include actions that are not already included in the WAIRE Menu in Table 3 of PR 2305. Points may only be earned from an approved Custom WAIRE Plan. The Custom WAIRE Plan only needs to describe how Points would be earned under the plan, not how all Points would be earned to meet the WPCO if the Plan only addresses part of the points compliance obligation. The methodology to calculate WAIRE Points in Custom WAIRE Plan applications is described in the WAIRE Program Implementation Guidelines, and will be consistent with the WAIRE Menu Technical Report methods in Appendix B. The general approach requires comparison of baseline conditions without the Custom WAIRE Plan to the NOx and DPM emission reductions and the incremental costs when the Plan is implemented. Emission reductions must be quantifiable, verifiable, real, and achieved as quickly as feasible, and no later than three years after Plan approval.

Key milestones need to be described in the Custom WAIRE Plan application and must be adhered to if approved. Approved plans that do not make adequate progress on these approved milestones may have their Plan approval rescinded 30 days after notification by the Executive Officer (EO) of identified deficiencies. If the deficiencies are not corrected in that period, the EO may then rescind the Plan approval. If a warehouse facility or land owner opts into the program and has a Custom WAIRE Plan approved by South Coast AQMD, then they are required to implement it. If the Plan is not implemented, then the entity who filed the Plan application shall be the entity who will be held in violation of the rule for any compliance period covered by the approved Plan for which a sufficient number of WAIRE Points was not earned as demonstrated in the Plan. If a warehouse operator (or owner who opts in) does not earn a sufficient number of WAIRE Points to satisfy their WPCO as demonstrated in a previously approved Plan, they may still satisfy their WPCO for that compliance period through the completion of actions from the WAIRE Menu, or by paying a mitigation fee pursuant to paragraph (d)(5), and document these actions in their Annual WAIRE Report.

Examples of potential Custom WAIRE Plans that some industry stakeholders have expressed potential interest in include: installing offsite charging/fueling infrastructure for ZE vehicles, installing and operating energy efficiency systems for cold storage warehouses, installing onsite ZE charging stations with higher power (i.e., above 350 kW) than is described in the WAIRE Menu, or overcompliance with upcoming CARB regulations should they be approved (such as the TRU regulation or ACF). Other custom approaches are also potentially approvable provided they meet the criteria described in paragraph (d)(4).

Custom WAIRE Plans that rely on VMT reductions will be limited to those projects that can show that these VMT reductions go beyond what is modeled in the latest Regional Transportation Plan (RTP) from the Southern California Association of Governments (SCAG). The Plan application itself would need to include the analysis showing how VMT reductions would be lower than RTP

modeled VMT. An example custom approach that may be disqualified from this includes an operator who moves operations from multiple smaller operations into a larger facility, thus reducing truck trips and VMT between the previous smaller warehouses. However, this reduction in VMT for that operator likely does not reduce VMT overall because the smaller warehouses are not expected to stay vacant given the low vacancy rates experienced by warehouses in the South Coast AQMD region.⁴⁸ Hence, while the operator's VMT declines, the region's VMT may actually increase. Similarly, a warehouse operator that demonstrates that they have a lower trip generation rate and VMT than would be calculated using default values has not demonstrated that overall VMT in the region is reduced. The RTP models average trip generation rates, and outputs average miles per trip. Some warehouses are therefore expected to be higher, and some lower than the average.

Although earning Points through VMT reduction programs may not be likely in most situations, PR 2305 is still expected to provide an additional motivation for warehouse operators to improve efficiency beyond normal market forces. Because the WPCO is tied to a warehouse's annual truck trips, if a facility can find ways to improve efficiency and reduce its number of truck trips, then its compliance obligation under PR 2305 will be lower. PR 2305 has no requirements for warehouse owners or operators to reduce or limit the number of truck trips to their facility.

Paragraph (d)(5)

If a warehouse operator does not earn a sufficient number of WAIRE Points to satisfy their WPCO from the WAIRE Menu or from an approved Custom WAIRE Plan, a warehouse operator may choose to pay a mitigation fee to the South Coast AQMD at a cost of \$1,000 per WAIRE Point. This value was determined by comparing the potential costs of implementing a variety of WAIRE Menu actions at an individual warehouse under different stringencies using methods described in the WAIRE Menu Technical Report (see Appendix B), and evaluating how many WAIRE Points were earned for each action. Although the costs vary across actions, many actions are approximately equal to \$1,000 per WAIRE Point.⁴⁹ Additional discussion about the WAIRE Mitigation Program that would spend the collected fees is included at the end of this chapter.

Paragraph (d)(6)

This paragraph describes the limited transfer of WAIRE Points under PR 2305. PR 2305 is not a credit trading system. Transferring WAIRE Points may only be allowed in three limited instances of overcompliance with rule requirements. First, if an operator conducts warehousing activities at multiple warehouses, it may be more feasible for them to make investments at a larger scale at one facility, compared to repeated smaller investments at several facilities. Under PR 2305, this operator could over-comply and earn extra Points at one warehouse, and then transfer the excess to another warehouse in their control. Because one of the purposes of PR 2305 is to reduce local emissions, the full value of any Points transferred from one warehouse to another is discounted by the amount of the WAIRE Points that were earned from local emission reductions of diesel PM.

⁴⁸ Vacancy rates in 2019 in South Coast AQMD warehouses are about 4%, about 50% lower than the vacancy rates of surrounding markets. Source: IEc Task 2 "Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Region"

⁴⁹ Examples are shown in slides 16-19 from the March 3, 2020 Working Group.

http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/whse_isr_slides_3-3-2020.pdf

Table 3 in PR 2305 already provides the discounted Point value, and operators (or owners who opt in) do not need to determine the amount to discount other than looking up values in that table.

The second transfer method involves a warehouse operator earning excess WAIRE Points in one year and banking those Points to transfer into a subsequent year. These Points are not discounted and can be banked for up to three years. For example, excess Points earned in the compliance period from January 1, 2022 to December 31, 2022 would be usable until the end of the compliance period ending December 31, 2025, and reported in the Annual Report no later than 30 days after January 1, 2026 (pursuant to subparagraph (d)(7)(C)). This three-year period could be shorter if the action that earned Points would have already been required by another regulation in the year in which the Points would otherwise be used. WAIRE Points may also be earned prior to a warehouse operator's first compliance period. For example, an operator of a 125,000 sq. ft. warehouse could earn Points in the 2022 compliance period, even though PR 2305 does not impose a WPCO on a warehouse of this size until the 2024 compliance period. The three-year banking clock in this instance would not commence until after their first compliance period in 2024. The extra time is meant to encourage early compliance and achieve emissions reductions sooner.

The final transfer method involves transfers between a warehouse facility or land owner and a warehouse operator, and vice versa. Warehouse facility or land owners may find it advantageous to improve their properties using options within PR 2305 on their own. Any Points earned from this activity may be transferred to an operator at that site over the subsequent three-year period. Operators may also transfer Points earned in excess of their WPCO back to a warehouse facility or land owner, who may then transfer those Points to a subsequent operator at that site.

Paragraph (d)(7)

This paragraph outlines the required reports and notifications that operators and owners must submit. Warehouse facility owners (not warehouse land owners) must submit a notification on September 1, 2021 or within 14 days after a new operator has the ability to use at least 50,000 sq. ft. of a warehouse with $\geq 100,000$ sq. ft. of floor space that may be used for warehousing activity. A typical date for this would be the start date of a lease. Notification is also required after a warehouse building has been modified such that it has new square footage. A report must also be submitted within three days of the EO's request.

Warehouse operators must submit a more detailed one-time Initial Site Information Report approximately six months before their first Annual WAIRE Report must be submitted for that site. As an example, if Operator A has recently moved to a new warehouse and has not been required to submit an Annual WAIRE Report before for that site, they are then required to submit the Initial Site Information Report. This is the only Initial Site Information Report that Operator A will need to submit for that site. If Operator A moves to another warehouse and has never submitted an Annual WAIRE Report for that second warehouse, they will need to submit an Initial Site Information Report for that warehouse. Initial Site Information Reports must also be submitted within 30 days of the request from the EO.

Warehouse operators who are required to earn WAIRE Points, and warehouse facility or land owners who earn WAIRE Points as applicable, are required to submit an Annual WAIRE Report within 30 days after January 1 of every year for which they must satisfy a WPCO (in the case of

operators), or earn WAIRE Points (in the case of owners opting in). The Annual WAIRE Report is the primary mechanism by which operators demonstrate how they have earned a sufficient number of WAIRE Points for the preceding compliance period. If an operator with a WPCO departs a warehouse before the end of that compliance period (e.g., if their lease ends), they are required to submit their Annual WAIRE Report no later than the date that they vacate the warehouse. No Annual WAIRE Reports are due before the applicable Initial Reporting Date in Table 1. Because the WPCO is tied to the number of truck trips at a warehouse while the operator was responsible for warehousing activities, the operator's Annual WAIRE report in this instance only needs to demonstrate how Points were earned for the portion of the compliance period when the operator was at that warehouse.

Reporting, Notification, and Recordkeeping Requirements – Subdivision (e)

This subdivision describes the information that must be included in the various reports and notifications required by PR 2305, as well as recordkeeping requirements. An online reporting portal is anticipated to be created if PR 2305 is approved by the Governing Board that will be used for all report and notification submissions. Reporting procedures will be further documented in the WAIRE Implementation Guidelines (Appendix A).

Paragraph (e)(1)

The Warehouse Operations Notification described in this paragraph includes basic information about the warehouse facility itself, whether the warehouse facility owner is also an operator, as well as information about any entities leasing the site, and how much of the site they have leased.

Paragraph (e)(2)

The Initial Site Information Report provided by a warehouse operator must include information about how many square feet they can use for warehousing activities. There are two cases when this is the only information that needs to be provided for this report. First, if the warehouse operator is in a building where the total square footage that can be used for warehousing activities is less than 100,000 sq. ft., then no more information is required. Second, some warehouse operators may lease only a portion of a warehouse with more than 100,000 sq. ft. that can be used for warehousing activities. In this situation, if the operator only can use <50,000 sq. ft. (e.g., due to lease conditions), then they do not need to report any further information. This second case does not apply where there are multiple operators under the ownership or control of a single parent company who each operate <50,000 sq. ft., but who collectively operate more than 50,000 sq. ft.

Apart from the two cases described above, Initial Site Information Reports must include information about actual truck trip data from the previous 12-month period, and the anticipated truck trips in the following 12-month period, by truck class or truck type (e.g., tractors or straight trucks). Trucks delivering or picking up goods from a warehouse are a proxy for total activity and emissions related to a warehouse and will use a truck entrance that is different than the employee vehicle entrance (that may also have minor use for mail trucks, or refuse pickup for administrative activities at the warehouse). In order to streamline reporting, only those trucks or tractors that use a warehouse's truck driveway must be included, with the intention of focusing on truck activity most closely aligned with total warehouse activity and emissions. Occasional truck traffic that utilizes the employee parking driveway for building services activities like mail delivery or trash pickup do not need to be included.

Additional data that must be reported includes information about any trucks owned by the operator that serve that warehouse, information about any onsite alternative fueling stations, information about any yard trucks operated at the site (owned or non-owned), and information about any onsite energy generation equipment. Finally, the report must include the anticipated options that the operator plans to use to earn Points for the current compliance period. These anticipated options might not end up being the actual options used to meet the WPCO, but they do provide an early planning step for operators to consider how they will comply with their WPCO in six months.

Paragraph (e)(3)

The Annual WAIRE Report shall include actual truck trip data used to determine the WPCO pursuant to paragraph (d)(1). The report shall also include how many WAIRE Points were earned from the WAIRE Menu and details about the reporting metric from the WAIRE Menu, the Points from a Custom Plan, and the Points from mitigation fees. Finally, the report shall include current contact information for the warehouse operator.

Paragraph (e)(4)

Records which demonstrate the accuracy and validity of any information reported to South Coast AQMD must be kept for a period of seven years after the reporting deadline and made available upon request during normal business hours.

Paragraph (e)(5)

Some warehouse facility or land owners, or operators may choose to hire consultants to complete some of the reporting requirements in PR 2305. This paragraph ensures that any reports are submitted by an official authorized by an officer of the warehouse owner or operator, as applicable. This authorized official may or may not be an employee of the warehouse owner or operator. The authorized official must certify that the information reported is accurate based on their best available knowledge.

WAIRE Implementation Guidelines – Subdivision (f)

This subdivision identifies that the EO will periodically publish the WAIRE Implementation Guidelines referred to throughout PR 2305 (Appendix A of this staff report).

Exemptions – Subdivision (g)

Three limited exemptions are described in this subdivision. First, similar to paragraph (e)(2), warehouse operators who cannot use more than 50,000 sq. ft. of a warehouse that is larger than 100,000 square feet, for warehousing activities due to lease conditions (e.g., they have leased <50,000 sq. ft.), are not required to earn any WAIRE Points. This exemption does not apply if the warehouse operator is under the control of a parent company of one or more lessees in the same building, and collectively the entities under the parent company's control operate more than 50,000 sq. ft. of a building that is 100,000 square feet or greater.

The second exemption states that warehouse operators with a WPCO <10 are not required to earn any WAIRE Points.⁵⁰ This exemption reduces the burden on the smallest warehouse operations that have a low volume of truck trips. No warehouse operations in the analysis of PR 2305 were identified to have a WPCO <10, but there is a possibility that a small number of warehouse operators may qualify and utilize this exemption. The warehouse operator would not be subject to the requirement to earn WAIRE Points in paragraph (d)(1), but the warehouse operator is still subject to the reporting requirements in paragraph (d)(7).

The third exemption relates to rare, unforeseen circumstances, beyond the reasonable control of the warehouse operator, or owner, who made an investment or took action to earn WAIRE Points, but due to a defect in their investment were unable to earn WAIRE Points. For example, if a warehouse operator purchases a zero emission truck and anticipates using this same truck to earn Points, but a malfunction in the powertrain due to an equipment manufacturer defect (e.g., malfunctioning electric motor, fuel cell stack, etc.) results in an inability to use the equipment, then the operator may apply for relief for the Points that would have been earned. The exemption shall be granted if the vehicle or equipment is shown to be due to a manufacturer defect or an installation defect.

Sunset Date for Rule – Subdivision (h)

PR 2305 will sunset upon final action by the U.S. EPA (e.g., when a final rule becomes effective) finding that all air basins within South Coast AQMD have attained the 2015 NAAQS for ozone (i.e., 70 parts per billion), and when CARB has determined that South Coast AQMD has met the state ozone standard (also 70 parts per billion).⁵¹ The sunset date for the WPCO will be 45 days after the end of the compliance period during which the latter of U.S. EPA or CARB makes the relevant finding. All reporting requirements associated with this final compliance period will remain in effect, however no reporting will be required for future compliance periods.

The 2015 standard requires ozone levels in South Coast AQMD to meet the standard in 2037. Before then, the 1979 (revoked, 1-hour standard), 1997 (revoked 8-hour standard) and 2008 ozone standards must be met in 2022, 2023, and 2031, respectively. Under section 175A of the Clean Air Act, when a nonattainment area is redesignated as meeting attainment, it must prepare a maintenance plan that ensures the area will continue to meet the air quality standard for another 10 years. In addition, anti-backsliding requirements may also apply.⁵² PR 2305 could potentially be applied to maintenance plan and anti-backsliding requirements for the 1979, 1997, and 2008 ozone standards prior to its sunset. Even with the sunset, PR 2305 is expected to assist in meeting the 2015 ozone standard. At this time, it is uncertain if PR 2305 would be needed for a maintenance plan or anti-backsliding requirements when the 2015 ozone standard is met because ZE and NZE technologies may be more widespread. As such, the Executive Officer shall prepare a report for the full Governing Board one year prior to the anticipated sunset that evaluates the need for the rule in light of these and any other applicable Clean Air Act requirements. The report shall also

⁵⁰ A WPCO of 10 is approximately equal to about two class 8 truck visits per day. Using default truck trip rates, a warehouse operator in a 100,000 sf warehouse would be required to earn about 61 WAIRE Points at a stringency of 0.0025 and annual variable of one.

⁵¹ The averaging period for the federal and state standards differ, so it is possible that they may not be achieved in the same year.

⁵² Implementation of the 2008 National Ambient Air Quality Standards for Ozone: State Implementation Plan Requirements, Final Rule. <https://www.govinfo.gov/content/pkg/FR-2015-03-06/pdf/2015-04012.pdf>

evaluate the state of NZE and ZE technologies used at warehouses, the emissions inventory of warehouses, and any other U.S. EPA or CARB regulations that apply to warehouses. Based on these findings, the Executive Officer shall make a recommendation whether any portions of the rule should be retained or amended.

Severability – Subdivision (i)

In the event a court holds that a portion or portions of PR 2305 are invalid or unenforceable, subdivision (h) allows the other portions of the rule to remain fully applicable and enforceable. Similarly, if the exemptions in PR 2305 are held by judicial order to be invalid, then the warehouse operators that had been covered by the exemption shall have to comply with the requirements of PR 2305.

PROPOSED RULE 316 – FEES FOR REGULATION XXIII

Purpose – Subdivision (a)

The purpose of the Proposed Rule 316 (PR 316) is to act as a companion rule to Proposed Rule 2305 (PR 2305) – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. PR 2305 requires reporting information about facility operations and recordkeeping. PR 316 establishes the administrative fees that PR 2305 warehouse operators and owners must pay in order to recover South Coast AQMD administrative costs associated with ensuring compliance with PR 2305.

The proposed purpose is as follows:

California Health and Safety Code Section 40522.5 provides authority for the South Coast Air Quality Management District to adopt a fee schedule for areawide or indirect sources of emissions which are regulated, but for which permits are not issued, to recover the costs of programs related to these sources. The purpose of this rule is to recover the South Coast AQMD's cost of implementing Rule 2305.

Applicability- Subdivision (b)

Warehouse owners and operators routinely move into or out of warehouses. As the applicability is tied to reports that must be submitted pursuant to PR 2305, any individual company may be required to pay multiple fees under PR 316 in any one year, then potentially not be subject to fees in the following year if they are not required to submit any of the applicable reports.

The proposed applicability is as follows:

This rule applies to owners and operators of facilities subject to Rule 2305 that submit an Annual WAIRE Report, a Custom WAIRE Plan application, an Initial Site Information Report, a Warehouse Operations Notification, or that pay a Mitigation Fee.

Definitions – Subdivision (c)

PR 316 includes definitions of specific terms related to the warehousing industry and aspects of implementing PR 2305. Most definitions refer back to definitions within PR 2305. Please refer to PR 316 subdivision (c) for each specific definition.

Proposed Definitions:

Annual WAIRE Report

Custom WAIRE Plan Application

Initial Site Information Report
 Mitigation Fee
 Warehouse
 Warehouse Operations Notification
 Warehouse Operator
 Warehouse Facility Owner
 Warehouse Land Owner
 Warehousing Activities

Annual WAIRE Fees – Subdivision (d)

Fees that will be established in this subdivision will be set at a flat level that is equal to the level of effort required by South Coast AQMD staff to conduct compliance activities related to the reports for which the fees are being paid. Fees must be paid at the time that the report must be submitted pursuant to PR 2305.

Custom WAIRE Plan Application Evaluation Fee – Subdivision (e)

Custom WAIRE Plans applications are expected to be unique, and require varying levels of effort by staff to review depending on the complexity of the application. Similar to other plan review fees in South Coast AQMD Rule 306, the fees in this subdivision are set consistent with the amount of staff time needed to complete an application review. An initial fee must be paid upfront as a deposit to cover a minimal amount of staff time, and subsequent fees may be assessed if more time is required. Staff will track time spent reviewing a Custom WAIRE Plan application, and if less cost is incurred than was paid in the initial fee, a refund will be issued.

Mitigation Program Administration Fee – Subdivision (f)

PR 2305 includes an option for warehouse operators (or owners who opt in) to pay a mitigation fee to South Coast AQMD to earn WAIRE Points. These collected fees will be used for a mitigation program to incentivize near-zero and zero emissions trucks and zero emissions charging infrastructure. Funds will be directed to projects in the communities near the warehouses that paid the fees. South Coast AQMD administers many incentive programs currently, including Carl Moyer, SOON, AB 617, etc. Prolonged experience with these programs has shown that some funds are needed to ensure efficient and accurate program administration. The amount set in PR 316 is 6.25 percent of the mitigation fee a warehouse operator or owner pays, and is consistent with recent program administration requirements for similar incentive programs.⁵³ Based on South Coast AQMD experience with current funding programs like Carl Moyer and Community Air Protection Program grants (i.e., AB 617), this level of funding is needed for the significant administrative effort to conduct outreach to industry, communities, and local governments, and to administer funds and track projects at a local scale (e.g., for each of about three dozen Source Receptor Areas).

Payment Due Dates – Subdivision (g)

Payment of fees for Custom WAIRE Plans are due no later than 60 days after an invoice has been provided. Fees for Annual WAIRE Reports, Initial Site Information Reports, and Warehouse

⁵³ AB 134 (2017): http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180AB134

AB 617 Incentives Guidelines:

https://ww2.arb.ca.gov/sites/default/files/2020-10/cap_incentives_2019_guidelines_final_rev_10_14_2020_0.pdf

Operations Notifications are due when the applicable report must be submitted. Requirements for payments in this subdivision are consistent with other South Coast AQMD fee programs in Rule 301.

Exemptions – Subdivision (h)

Two exemptions are provided in this subdivision. First, warehouse facility owners who submit a Warehouse Operations Notification for a warehouse that has less than 100,000 sq. ft. that can be used for warehousing activities are exempt from PR 316 fees. Second, warehouse operators who use <50,000 sq. ft. of a warehouse for warehousing activities are also exempt from PR 316 fees. The collection of this information will occur online, and no additional compliance with these components of the WAIRE Program is expected for these entities, hence staff costs are expected to be de minimis for this activity. This reported information is needed however to verify that the owner or operator does not have any further obligations under PR 2305.

WAIRE Mitigation Program

The main intent of the WAIRE Mitigation Program is to provide NO_x and DPM emission reductions for communities around warehouses that paid the mitigation fees. Any in-lieu mitigation fees paid to South Coast AQMD by a warehouse operator (or owner who opts in) would be targeted to projects in the surrounding area for NZE or ZE trucks, or ZE charging/fueling infrastructure.⁵⁴ Any solicitations for requests for funding, or funding allocations that would be spent from the WAIRE Mitigation Program must be approved by the South Coast AQMD Governing Board in a public meeting. The proposed incentives would be used toward the purchase of NZE and ZE trucks or the purchase and installation of ZE charging or hydrogen fueling infrastructure. The WAIRE Mitigation Program would be available to any applicant that has trucks domiciled and/or used in the same geographic area of the warehouses that paid the WAIRE Program mitigation fee or applicants who intend to purchase and install ZE charging or hydrogen fueling infrastructure to serve that same geographic area and county. Funds would be prioritized first to areas in the same Source Receptor Area (SRA)⁵⁵ as the warehouse. Should there be insufficient project applicants in any area for the amount of funding available, the funding may be redirected to an adjacent SRA in the same county as the primary SRA. Project funding solicitations would be issued within one year of receiving mitigation fees, and could potentially be coordinated with solicitations from other incentive programs. Incentive projects would be evaluated for cost effectiveness to maximize the potential for NO_x and DPM reductions of each incentive project. Because this funding program is wholly within the control of South Coast AQMD, funds may be combined with other incentive programs as allowable on a case-by-case basis.

⁵⁴ In order to avoid low quality workmanship and potential safety concerns, consideration may need to be made for a skilled and trained workforce. It is important that any installed infrastructure with the WAIRE Mitigation Program perform at a level that consistently meets the needs of the fleets it would serve and minimizes unnecessary impacts on the grid.

⁵⁵ <http://www.aqmd.gov/docs/default-source/default-document-library/map-of-monitoring-areas.pdf>

The WAIRE Mitigation Program incentives would be offered as a solicitation to receive enough applications similar to the existing incentive programs of Carl Moyer,⁵⁶ Proposition 1B,⁵⁷ or VW Mitigation Trust.⁵⁸ Similar to the existing incentive programs, there would be an application evaluation following the end of the solicitation. This would include evaluation of application documents, subsequent inspection of the NZE or ZE truck purchased or the ZE charging or hydrogen fueling infrastructure installed, and annual reports to follow the emission reductions of the incentive projects for the life of the incentive project contracts. The ultimate program design is not limited to matching these existing programs however, and other models may emerge after receiving stakeholder input as funding becomes available (e.g., voucher programs, a focus on grid upgrades on the utility side of the meter for some sites, consideration of small businesses, incorporation of community input and/or suggested projects that reduce NOx, etc.).

Finally, the incorporation of a well-trained and skilled workforce for ZE infrastructure installation is integral to the state's transportation electrification goals. According to a study commissioned by the state Workforce Development Board under AB 398 (2017), there is a strong relationship between high labor standards and investments in energy efficiency projects in both the installation and operations of ZE charging and fueling infrastructure. Workforce development, skilled training, and career development that addresses industry needs can lead to improved productivity and work quality, which are important considerations for PR 2305. ZE charging infrastructure projects funded by the WAIRE Mitigation Program will support equity and inclusion to ensure a well-trained and skilled workforce to comply with Public Utilities Code § 913.4(f) and the California Renewables Portfolio Standard Program. Skill standards such as specialized certifications in the installation, operation, and maintenance of zero emission technologies will be required to ensure safety and high performance.⁵⁹

Additional details to this mitigation program will be developed in a future public process as part of the development of funding solicitations. Solicitations and grant award decisions will be made by the Governing Board in public meetings, and the public will be encouraged to participate and provide feedback. In addition, the Resolution included in the Board package for PR 2305 and PR 316 will include specific language laying out requirements for the WAIRE Mitigation Program.

CHAPTER 3: IMPACT ASSESSMENT

INTRODUCTION

AFFECTED INDUSTRIES

BASELINE EMISSIONS INVENTORY

RULE STRINGENCY

SCENARIO ANALYSIS

FEASIBILITY

SOCIOECONOMIC ASSESSMENT

CALIFORNIA ENVIRONMENTAL QUALITY ACT

**DRAFT FINDINGS UNDER CALIFORNIA HEALTH AND
SAFETY CODE SECTION 40727**

COMPARATIVE ANALYSIS

INTRODUCTION

PR 2305 and PR 316 will apply to warehouses with greater than or equal to 100,000 square feet of indoor floor space. These warehouses are part of a larger goods-movement network of facilities located throughout the South Coast AQMD region that also includes marine ports, airports, rail yards, and smaller warehouses.

Warehouses serve as an intermediate storage facility for goods coming from manufacturing facilities, other warehouses, or food production sites that are ultimately destined for another location, including retail stores, other warehouses, customers (e.g., through e-commerce), or other manufacturing operations. Goods are transported to and from warehouses in trucks of a variety of sizes, including smaller Class 2b-7 trucks used for local delivery or larger Class 8 tractor trailers (typically diesel-powered) that can transport goods either locally or nationally. These trucks will back up to a warehouse's loading dock to load/unload their cargo in or out of the warehouse. Some warehouses also allow trailers to be parked within their truck yard for short periods of time. These trailers are moved around the yard or to/from a loading dock with a yard truck (typically diesel-powered).

Inside the warehouse, goods are stored on storage racks that may be more than 20 feet high. The level of automation varies inside each warehouse, but, if automation is present, can include conveyor systems, robotics, and scanners. Goods are commonly moved around inside a warehouse by employees operating pallet jacks or small industrial forklifts. Additional activities include sorting, labeling, repackaging, palletizing, applying scannable bar codes (SKUs), racking, and packing/unpacking trucks. Many additional activities can be present at a facility with a warehouse including supporting office administration, manufacturing, vehicle maintenance, or retail stores that are open to the general public. Some warehouses also support cold storage, typically for food products, and will have large refrigeration systems. Trucks distributing goods to/from these cold storage warehouses typically keep goods at their appropriate temperature with a small diesel-powered transport refrigeration unit (TRU) mounted on the truck or trailer.

AFFECTED INDUSTRY

Southern California is a major gateway for goods coming from Asia. A wide variety of industries have supply chains which relies on goods moving through Southern California. Approximately \$500 billion in goods were moved through the larger Southern California Association of Governments (SCAG) region in 2016, with imports accounting for about 75%. It is unclear how much of this total flow of goods move through warehouses subject to PR 2305 and PR 316. However about 69% of imports from the ports of Los Angeles and Long Beach (LA/LB) do not go directly onto rail, and therefore are expected to utilize warehouses within the South Coast AQMD region. Figure 8 shows the top commodities traded through the ports of LA/LB and through the Los Angeles and Ontario airports in 2018.⁶⁰

⁶⁰ https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf

Figure 8: Top Commodities Traded Through Long Beach and Los Angeles Ports (left) and Los Angeles and Ontario Airports (right)

Warehouses are operated by cargo owners or by third party logistics (3PLs) firms who manage warehouses on behalf of cargo owners.⁶¹ Warehouses are typically owned by a landlord⁶² who leases the facility for a short period (e.g., three years) either to a cargo owner or 3PL. All three groups of industries (i.e., cargo owners, 3PLs, and warehouse owners) will be affected by PR 2305 and PR 316. Some motor carriers may choose to update some of their business practices (e.g., using more NZE or ZE trucks) in response to shifting market conditions brought about by PR 2305 (or other CARB regulations or incentive programs), however they are not regulated by PR 2305.

As shown in the baseline emissions inventory below, most NO_x and diesel PM emissions associated with warehouses come from trucks. Trucks are owned and/or operated by motor carriers, and their services are provided on behalf of the owner of the goods they are carrying. Warehouse operators often do not own the goods in their warehouse, and in these cases they may not be directly involved in hiring all or any motor carriers that visit the warehouse.

Industry stakeholders have indicated that the business relationships between warehouse operators, cargo owners, and motor carriers can vary widely, even in a single warehouse. Some warehouses are more vertically integrated where the operator owns the goods in the warehouse, and directly contracts with motor carriers, or uses their own fleet, to transport the goods to retail establishments.⁶³ In this situation, the warehouse operator has a relatively high level of control of

⁶¹ https://scag.ca.gov/sites/main/files/file-attachments/task4_understandingfacilityoperations.pdf

⁶² In rare instances, the land beneath a warehouse building is owned by a different entity than the warehouse building itself.

⁶³ As estimated in Appendix C to this report, up to 40% of warehouse operators subject to PR 2305 may own a fleet. The number of warehouse operators who also directly arrange for some level of trucking services to their facility is unknown, but would increase the total number of warehouses who have a direct ownership or other business relationship with at least some trucks going to their facility. Staff conversations with warehouse operators have

the trucks and cargo flowing through the warehouse.⁶⁴ Other warehouse operators may not own any goods within the warehouse, or have a direct relationship with any motor carriers visiting the warehouse, or own a fleet themselves. The warehouse operator may have very little control over the trucks calling at the warehouse in this configuration.

One common relationship between all warehouse operators is they either own the goods in the warehouse themselves, or have a direct contractual relationship with the goods owner to manage the warehousing of those goods. The specific conditions in these contracts can vary widely depending on the needs of the two parties. For example, some warehouse operators have indicated their contracts with motor carriers have included air quality goals, such as providing incentives to fleets that met EPA SmartWay standards,⁶⁵ or requiring use of zero emission (ZE) trucks. Under PR 2305, some warehouse operators may choose to include contract provisions either with motor carriers or with goods owners who contract with motor carriers, that take into account the requirements of the rule. This could include requiring or incentivizing near zero emission (NZE) or ZE truck visits, or increasing the price charged for warehousing operations so that the operator can comply with PR 2305 in other ways.

Affected Facilities

There are approximately 45,000 industrial buildings of any size located in the South Coast AQMD region, totaling about 1.6 billion square feet. Warehousing makes up a significant fraction of this industrial space, with approximately 90% of these buildings classified as distribution, light distribution, cold storage, truck terminal, or warehouse.⁶⁶ Some industrial properties also include a combination of warehousing and manufacturing uses.

Most industrial properties are smaller in size, typically less than 100,000 square feet. However, the majority of the industrial building square footage occurs in larger buildings (Figure 9). The amount of industrial building space within South Coast AQMD's region has been growing substantially over the past several decades, with most of the growth occurring in the counties of San Bernardino and Riverside since the year 2000 (Figure 10).⁶⁷ Warehousing is anticipated to continue to grow in the SCAG region at a rate of ~1.8% annually.⁶⁸

indicated that while not ubiquitous, it is not uncommon for many warehouse operators to have at least some trucking companies that they directly work with.

⁶⁴ Note that even in this instance, the supplier of some of the goods to the warehouse may arrange to transport inbound shipments without involving the warehouse operator.

Figure 9: Industrial Building Count (left) and Square Footage (right) by Building Size in South Coast AQMD Jurisdiction

Figure 10: Industrial Building Growth by County

There are currently about 3,320 facilities with 100,000 square feet or more of building area that may be subject to PR 2305 and PR 316 (see Appendix C for a list of addresses and a discussion of how the number and type of facilities was determined). Of these facilities, an estimated 2,902 are expected to be required to earn WAIRE Points under PR 2305, with the remainder only subject to limited reporting (e.g., facilities with $\leq 100,000$ sq. ft. of warehousing activity in a building with $>100,000$ sq. ft.). Of the warehouses expected to be required to earn WAIRE Points, about 38% may have more than one operator in a single building (yielding a total of about 4,000 operators), about 45% may own a truck fleet,⁶⁹ and about 17% may be owner occupied (with any combination thereof).

⁶⁹ Data is not available for how many trucks from operator-owned fleets serve a warehouse.

BASELINE EMISSIONS INVENTORY

The discussion below provides the method for estimating baseline emissions of NO_x and diesel PM in 2019, 2023, and 2031 for the 2,902 warehouses expected to be required to earn WAIRE Points under PR 2305.⁷⁰ The estimate presented here relies on the substantial work previously conducted to estimate vehicular-related emissions, including work performed by:

- California Air Resources Board (CARB) both for the 2016 AQMP emissions inventory⁷¹ and for the Draft Mobile Source Strategy⁷²,
- SCAG for the 2016 Regional Transportation Plan, and
- South Coast AQMD for the 2016 AQMP

South Coast AQMD also sponsored a study to evaluate warehouse activities that affect air quality, co-sponsored with the National Association for Industrial and Office Parks (NAIOP).⁷³ The study was conducted by the Institute of Transportation Engineers (ITE) to update warehouse trip generation estimates for warehouses.⁷⁴

Methodology for Estimating NO_x Emissions from Warehouses

Trip Generation Rates

Data was obtained for three categories of warehouses from CoStar⁷⁵ including warehouses $\geq 100,000$ and $< 200,000$ sq. ft., $\geq 200,000$ sq. ft., and all cold storage warehouses $\geq 100,000$ sq. ft. Current warehouse data was projected to 2023 and 2031, using growth factors derived from SCAG's Industrial Warehousing report⁷⁶.

Trip generation rates for on-road vehicles were obtained from the High-Cube Warehouse Vehicle Trip Generation Analysis⁷⁷ by ITE and supplemented with data from the City of Fontana's Truck Trip Generation Study⁷⁸.

Table 5: Trip Generation Rates in Trips/Thousand Sq. Ft.

Warehouse Category	Class 8	Class 4-7	Passenger Vehicles
$\geq 200,000$ sq. ft.	0.33	0.12	1.000
$\geq 100,000 - < 200,000$ sq. ft.	0.21	0.14	1.385
Cold Storage ($\geq 100,000$ sq. ft.)	0.75	0.29	1.282

Table 6: Warehouse Square Footage for Each Warehouse Category

Warehouse Category	2019	2023	2031
≥200,000 sq. ft.	521,727,570	562,574,867	644,269,462
≥100,000 – <200,000 sq. ft.	214,795,154	231,611,979	265,245,630
Cold Storage (≥100,000 sq. ft.)	8,188,346	8,829,431	10,111,601

Trucks

Baseline composite truck emission rates⁷⁹ (ER) were calculated from EMFAC2017 for heavy duty trucks of Class 4-7 and Class 8 for calendar years 2019, 2023, and 2031. EMFAC2017 provides activity and emission rates for all on-road vehicles that operate within California, however, the analysis presented here is limited to those categories most likely to deliver goods to and from warehouses. EMFAC categories⁸⁰ in this analysis and their relationship to truck class are shown in Table 7 below.

Table 7: EMFAC Truck Categories

EMFAC Category	Description	Truck Class
T6 CAIRP Small	Medium-Heavy Duty Diesel CA International Registration Plan Truck with GVWR≤26,000 lbs	Class 4-6
T6 Instate Small	Medium-Heavy Duty Diesel Instate Truck with GVWR≤26,000 lbs	
T6 OOS Small	Medium-Heavy Duty Diesel Out-of-State Truck with GVWR≤26,000 lbs	
T6 CAIRP Heavy	Medium-Heavy Duty Diesel CA International Registration Plan Truck with GVWR>26,000 lbs	Class 7
T6 Instate Heavy	Medium-Heavy Duty Diesel Instate Truck with GVWR>26,000 lbs	
T6 OOS Heavy	Medium-Heavy Duty Diesel Out-of-State Truck with GVWR>26,000 lbs	
T7 CAIRP	Heavy-Heavy Duty Diesel CA International Registration Plan Truck with GVWR>33,000 lbs	Class 8
T7 NNOOS	Heavy-Heavy Duty Diesel Non-Neighboring Out-of-State Truck with GVWR>33,000 lbs	
T7 NOOS	Heavy-Heavy Duty Diesel Neighboring Out-of-State Truck with GVWR>33,000 lbs	
T7 POLA	Heavy-Heavy Duty Diesel Drayage Truck in South Coast with GVWR>33,000 lbs	
T7 Tractor	Heavy-Heavy Duty Diesel Tractor Truck with GVWR>33,000 lbs	

Vehicle miles traveled (VMT) per trip of 14.2 mi/trip and 39.9 mi/trip for medium-heavy (Class 4-7) and heavy-heavy duty trucks (Class 8) respectively, were derived from SCAG's 2016 Regional Transportation Plan modeling analysis (Table 8).

⁷⁹ This is the sum of each truck category's emissions rate multiplied by its corresponding VMT, and then divided by the total sum of VMTs.

⁸⁰ <https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-iii-technical-documentation.pdf>

Table 8. Truck activity data from SCAG's Heavy-Duty Truck Regional Travel Demand Model

Truck Class	VMT (mi/day)	Trips (trip/day)	Mile/trip
Class 4-7	7,744,000	544,000	14.2
Class 8	12,060,000	302,000	39.9

Class 8 truck emissions were discounted by 22.2% to account for the trips made in between warehouses by trucks.⁸¹ Total idling emissions in the South Coast Air Basin (SCAB) for these truck classes were proportioned by the VMT estimate associated with warehouse trucking to calculate potential idling emissions associated with warehouses. The equations below show how preliminary emissions estimates were calculated.

Equation [1]:

$$VMT \text{ Associated with Warehouses} = \text{Warehouse size (ksf)} \times \text{trip rates} \left(\frac{\text{trips}}{\text{ksf}} \right) \times \frac{\text{miles}}{\text{trip}}$$

Equation [2]:

$$\begin{aligned} \text{Running Exhaust Emissions Associated with Warehouses} \\ = ER_{\text{Class 8}} \times \text{Warehouse VMT}_{\text{Class 8}} \times (1 - 0.222) \\ + ER_{\text{Class 4-7}} \times \text{Warehouse VMT}_{\text{Class 4-7}} \end{aligned}$$

Equation [3]:

$$\begin{aligned} \text{Idling Exhaust Emissions associated with Warehouses} \\ = \left(\frac{\text{Warehouse VMT}_{\text{Class 8}}}{\text{Total VMT}_{\text{Class 8}}} \right) \times \text{Idling } ER_{\text{Class 8}} (1 - 0.222) \\ + \left(\frac{\text{Warehouse VMT}_{\text{Class 4-7}}}{\text{Total VMT}_{\text{Class 4-7}}} \right) \times \text{Idling } ER_{\text{Class 4-7}} \end{aligned}$$

CARB recently approved two regulations that are expected to lower the emissions from trucks beginning with model year 2024 trucks, including the Advanced Clean Trucks Regulation and the Low NOx Omnibus Regulation. Additional emission reductions are anticipated from the upcoming Heavy Duty Inspection and Maintenance (I/M) regulation⁸². CARB modified EMFAC 2017 to account for these regulations in the META tool that supports its Draft 2020 Mobile Source Strategy. These modifications were applied to the truck categories and VMT associated with warehouses under PR 2305. The anticipated emission reductions from these regulations associated with the 2,902 warehouses expected to earn WAIRE Points under PR 2305 is shown in Table 9.

⁸¹ https://scag.ca.gov/sites/main/files/file-attachments/task4_understandingfacilityoperations.pdf (pg 3-24)

⁸² <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-inspection-and-maintenance-program>

Table 9: Estimated Baseline Truck Emission (tpd) Associated with PR 2305 Warehouses Required to Earn WAIRE Points

Total	41.67	0.67	20.19	0.14	16.81	0.12

Passenger Vehicles

Similar to the methodology described for trucks, composite emission rates for running exhaust and start exhaust emissions for light duty cars and trucks from EMFAC2017, default car trip lengths from SCAG (10.6 mi./trip), and ITE trip generation rates for each warehouse category were used to estimate emissions from passenger car travel attributed to each warehouse category. No corrections outside of default values discussed above were made for passenger cars. Baseline emissions for this category are shown in Table 10 below.

Table 10: Estimated Baseline Passenger Car Emission (tpd) Associated with PR 2305 Warehouses Required to Earn WAIRE Points

	2019		2023		2031	
	NO _x	Diesel PM	NO _x	Diesel PM	NO _x	Diesel PM
Total	1.14	0.02	0.70	0.02	0.39	0.01

Cargo Handling Equipment

Two main types of cargo handling equipment are typically operated at warehouses. These include yard trucks and industrial trucks (including pallet jacks and forklifts). Emissions from industrial trucks are not estimated for PR 2305 warehouses.⁸³ Yard trucks operated at warehouses are typically powered by diesel engines, and can be certified as off-road (which restricts the yard truck to one warehouse's yard) or on-road (which allows for short trips to nearby warehouses). Some warehouses may have more than one yard truck operating onsite, while others may have none. Several data sources⁸⁴ were used to estimate the potential yard truck emissions associated with warehouses subject to PR 2305 including:

⁸³ Warehouses subject to PR 2305 have indoor areas that are nearly always above grade compared to the nearby truck and trailer yard to accommodate trucks backing up to a dock. Industrial trucks therefore operate almost exclusively in an indoor environment in these warehouses. During site visits, staff did not observe any industrial trucks powered by internal combustion engines (ICEs) at warehouses subject to PR 2305, and operators cited the desire to avoid operating ICEs in indoor environments.

⁸⁴ Population data for yard trucks operated at warehouses is not available from CARB.

- A business survey of warehouses commissioned by South Coast AQMD.⁸⁵ Respondents to this survey indicated that larger warehouses (>200,000 sq. ft.) operate an average of 3.6 yard trucks per million square feet of warehouse space, while smaller warehouses (100,000 to 200,000 sq. ft.) operate an average of 1.2 yard trucks per million square feet.
- Yard truck manufacturing data by calendar year was purchased from Powersys.⁸⁶ This data product includes an attrition model that estimates the retirement of older yard trucks through time. Both on-road and off-road data is available from this product.
- Activity data was provided by a yard truck manufacturer. On-road yard trucks are estimated to travel 2,145 mi/yr and off-road yard trucks are estimated to operate for 1,430 hrs/yr.
- Calendar year-specific emission rates for on-road and off-road yard trucks was obtained from the Carl Moyer Guidelines.⁸⁷

The estimated baseline NO_x and diesel PM emissions from yard trucks are presented in Table 11 below.

Table 11: Estimated Baseline Yard Truck Emissions (tpd) Associated with PR 2305 Warehouses Required to Earn WAIRE Points

	2019		2023		2031	
	NO _x	Diesel PM	NO _x	Diesel PM	NO _x	Diesel PM
Total	0.09	0.003	0.09	0.003	0.08	0.003

Transport Refrigeration Units (TRUs)

Updated emission estimates were based on CARB's current rulemaking effort affecting TRUs.⁸⁸ Half of all truck, trailer, and genset TRU emissions in the South Coast Air Basin were assumed to be associated with cold storage warehousing as refrigerated goods must travel to or from a warehouse for local delivery. This emission total was further reduced by the amount of cold storage warehousing square footage subject to PR 2305 WAIRE Point requirements relative to total cold storage warehousing in the South Coast AQMD jurisdiction (which is about 62%). Results of this analysis are presented below in Table 12.

Table 12: Estimated Baseline TRU Emissions (tpd) Associated with PR 2305 Warehouses Required to Earn WAIRE Points

Summary of Baseline Emissions

Table 13 presents a summary of total baseline emissions associated with the 2,902 warehouses expected to earn WAIRE Points under PR 2305. This emissions total represents about 19% and 28% of the South Coast AQMD carrying capacity⁸⁹ in 2023 and 2031, respectively.

Table 13: Summary of Baseline Emissions Associated With PR 2305 Warehouses Expected to Earn WAIRE Points

Emission Source	2019		2023		2031	
	NO _x	Diesel PM	NO _x	Diesel PM	NO _x	Diesel PM
Trucks	41.67	0.67	20.19	0.14	16.81	0.12
Passenger Vehicles	1.14	0.02	0.70	0.02	0.39	0.01
Yard Trucks	0.09	0.003	0.09	0.003	0.08	0.003
TRUs	1.82	0.08	1.64	0.07	1.61	0.06
Total	44.72	0.774	22.61	0.227	18.89	0.192

RULE STRINGENCY

Many factors go into considering the stringency of proposed rules. For PR 2305, the draft stringency recommended here considered the following points: the need for emission reductions (discussed in Chapter 1), the significance of emissions associated with the warehousing industry (discussed above in the Summary of Baseline Emissions), the potential emissions reductions from PR 2305 when considering other measures, and the impact to industry.

Potential Emission Reductions from PR 2305 and PR 316 When Considering Other Measures

As described in the baseline emissions inventory analysis above, recent CARB regulations have been quantified to the extent possible. In addition, CARB's Draft Mobile Source Strategy (Draft MSS) is designed to consider all the other measures that may be needed across every mobile source sector to meet various state goals, including attainment of federal air quality standards. This strategy includes very aggressive targets across all sectors, and any shortfall in one sector (e.g., ocean going vessels) would need to be made up by another sector (e.g., trucks).

South Coast AQMD staff submitted comments to CARB stating the Draft MSS needs to go even further, since emission reductions modeled in CARB's Draft MSS are not sufficient to meet either of the upcoming 2023 or 2031 federal deadlines for ozone reduction. Even in the most aggressive modeling in the Draft MSS,⁹⁰ in 2023 more than 95% of heavy-duty trucks will be no cleaner than 2010 engine standards assumed for all trucks in the baseline emissions inventory from the 2016 AQMP. This scenario projects these trucks will still make up about 57% of the truck fleet in 2031.

⁸⁹ The carrying capacity is the maximum amount of NO_x emissions that are allowable in the air basin while still meeting 2023 and 2031 federal ozone standards.

⁹⁰ The Draft MSS did not explicitly consider any emission reductions from PR 2305 and PR 316.

Since the 2016 AQMP requires a 45% and 55% reduction in NO_x by 2023 and 2031 respectively, the continued presence of large fractions of 2010 MY trucks in the fleet will hamper efforts to meet these deadlines. Any additional emission reductions provided by PR 2305 and PR 316 would assist in meeting the region's federal air quality attainment needs.

Impact to Industry

Some potential impacts to industry from PR 2305 include increased costs of warehouse operations and potential imposition of competitive disadvantages relative to warehousing in other regions. The potential cost impacts are described in the 'Compliance Costs' section below, and will be analyzed further in the socioeconomic analysis that will be released for public review at least 30 days prior to the public hearing to consider adoption of PR 2305 and PR 316.

The potential imposition of competitive disadvantages from air quality regulatory costs on the goods movement industry has been analyzed in two studies. First, one study was conducted by Industrial Economics Inc. (IEC)⁹¹ and funded by South Coast AQMD to analyze the potential for PR 2305 and PR 316 to cause warehouses to relocate to nearby areas in order to avoid compliance with the rules. The second study by Davies Transportation Consulting Inc. was funded by the ports of LA/LB to analyze how the logistics industry might respond to a new truck rate for imported goods at marine terminals. These studies will be discussed in greater depth in the socioeconomic analysis, but a brief synopsis of the results is included below.

IEC Warehouse Relocation Study

The IEC study found the warehousing industry in the South Coast AQMD is robust, and has grown at faster rates than surrounding areas (see Figure 10 and Figure 11), all while experiencing consistent increases in rent that have outpaced neighboring markets (see Figure 12). Since 2010, the rent increases in South Coast AQMD have average about \$0.47 per sq. ft. annually, all while growing in capacity by about 17 million sq. ft. per year. Nearby areas outside the South Coast AQMD jurisdiction have only increased their rents about \$0.06 per sq. ft. annually over the same period.⁹²

Industry stakeholders interviewed as part of the IEC study pointed to several benefits that warehouses rely on that are unique to this area, including the highly developed transportation network of multiple ports, railways, and interstate highways, along with a large labor pool that is difficult to access in more remote regions, and proximity to the large metropolitan customer base.

IEC modeled the potential costs that warehouses face with and without PR 2305 and PR 316 using two different methods. These analyses took into account different costs in neighboring markets such as rent, labor, utilities, transportation, etc., as well as costs associated with different potential stringencies of PR 2305 and PR 316. If costs are cheaper in a neighboring region compared to South Coast AQMD, then a warehouse would be motivated to relocate its operations. The analyses considered costs for existing building stock in neighboring areas, as well as hypothetical building stock assuming that existing vacant land that is industrially zoned could accommodate warehouses.

⁹¹ Study will be included as an appendix to the socioeconomic analysis and is also located here: www.aqmd.gov/fbmsm.

⁹² These annual \$0.47/sf increased rents result in an additional cost to industry in the South Coast AQMD jurisdiction of about \$11.4 billion from 2010-2019 compared to non-District \$0.06/sf increases in rents.

One method that assumed all warehouses serve all markets equally found that no warehouses would relocate even with compliance costs of up to \$2/sq. ft. of warehousing space. A more conservative modeling method found that up to 10 warehouses would have cheaper costs today (without PR 2305) in neighboring regions if the warehouses were solely dedicated to a single market (e.g., serving the national market only via inbound drayage trucks from the port and outbound trucking to intermodal railyards).⁹³ This same conservative model found that no additional warehouses would experience cheaper costs in neighboring areas (and hence potentially relocate) if compliance costs from PR 2305 were at or below \$1.50/sq. ft.

Figure 11: Annual Net Absorption⁹⁴ in Warehousing Space in South Coast AQMD Jurisdiction and Neighboring Areas

⁹³ As seen in Figure 10 and Figure 11, warehousing is preferentially growing in the South Coast AQMD jurisdiction compared to neighboring markets. One indication of the conservative nature of this modeling approach is that it finds that the opposite should be occurring in the baseline, and a small number of warehouses should relocate outside of the South Coast AQMD jurisdiction.

⁹⁴ Net absorption is a common metric used to track warehouse industry growth and is defined as the amount of warehouse space that tenants moved into minus the amount of warehouse space vacated in a given time period. Continually rising net absorption in South Coast AQMD indicates that more warehouses are being built and occupied than are being vacated. Negative net absorption indicates that more tenants are vacating warehouses than moving into warehouses during a given time period.

Figure 12: Warehousing Historical Rents in South Coast AQMD Jurisdiction and Neighboring Areas

Davies Transportation Consulting Port Study

The Davies study evaluated the potential for cargo diversion away from the ports of LA/LB if the ports implemented an update to its Clean Truck Program that would impose a new truck rate on loaded cargo containers that move through the port complex, with exemptions provided for NZE (through 2031) and ZE trucks. This study evaluated the different types and ultimate destinations throughout the country of cargo imported to the ports. A model was developed that evaluated the potential costs of using different ports, including the cost of increased time to travel from east Asia to ports in the eastern half of the United States.⁹⁵ This analysis found only a portion of goods are potentially subject to diversion to different ports, even at the maximum truck rate evaluated.⁹⁶ If the truck rate were set at \$70/TEU⁹⁷, the study found that the potential diversion of total containerized imports would only be up to 1.4%. The ports ultimately approved a truck rate of \$10/TEU,⁹⁸ though they have yet to implement the rate. Based on the Davies study, this rate level would result in 0.2% diversion of total containerized imports.

⁹⁵ As an example, the Davies study found that goods traveling from Shanghai to the New York/New Jersey port took more than 10 days longer than goods travelling from Shanghai to the ports of LA/LB.

⁹⁶ The Davies study found that 35% of imported goods would not relocate at all to a different port within the study parameters (i.e., up to \$70/TEU). These are goods that are goods destined for the local market or for markets within about an 800-mile trucking distance from the ports.

⁹⁷ Twenty-foot Equivalent Unit. Most marine containers that are trucked out of the ports are forty-foot equivalent units, equal to two TEUs.

⁹⁸ https://polb.granicus.com/MinutesViewer.php?view_id=77&clip_id=7245.

Potential Impact of PR 2305 and PR 316 on Industry Competitiveness

The two studies analyze the effect of diversion of the logistics sector away from the South Coast AQMD jurisdiction, but with important differences. The Davies study found cargo owners had limited choices if the ports implemented the Clean Truck Program. They could either pay for the cost of NZE or ZE trucks, pay the \$10/TEU rate, or relocate to a different port.⁹⁹ The study concluded that at \$70/TEU it would be more cost effective for the vast majority of goods (98.6%) to continue using the ports of LA/LB.

Because PR 2305 and PR 316 apply at warehouses, not at ports, a cargo owner has more options than simply paying the maximum cost of complying with these rules (through increased warehousing costs in the South Coast AQMD jurisdiction) or diverting their cargo to another port. Under PR 2305, cargo owners will have many options and they can implement the cheapest option for their business operation that may be significantly lower cost than the maximum cost option (see ~~Table 20: Total Cost Summary of Each Compliance Scenario (2022–2031) After Accounting for CARB’s ACT and Low NOx Omnibus Regulations~~ Table 20).

In addition, cargo owners could utilize warehouses just outside of the South Coast AQMD jurisdiction in neighboring areas, rather than shifting to a different port. The IEc study found the stringency of the rule would have to be more than \$1.50/sq. ft. for it to be more efficient to divert a small amount of cargo outside of the Basin to warehouses that are not subject to PR 2305 and PR 316. The cost of diverting cargo to other ports would be even higher than diverting it to warehouses outside the basin, due in large part to the increased travel times: moving cargo to a nearby region increases travel time by only a few hours,¹⁰⁰ rather than 10+ days from moving goods to a port on the east coast.

Finally, the Davies study and others¹⁰¹ have documented the ports of LA/LB have lost market share of containerized imports continuously since at least 2003. The reasons for this loss have been attributed to many macroeconomic causes that outweigh any increased regulatory costs in California, including labor stoppages in 2002 and 2014/2015, the widening of the Panama Canal in 2016, the recent shifting of some manufacturing from east China to southeast Asia in response to trade tensions,¹⁰² increased investments in infrastructure at competing ports, the lack of increased trade with areas outside of east Asia, etc.

Despite this longer term shift in global trade flows, containerized traffic at the ports of LA/LB has steadily increased¹⁰³ (Figure 13) and is still expected to reach 34 million TEUs by 2040.¹⁰⁴ Warehousing in the South Coast AQMD jurisdiction has grown rapidly (Figure 10 and Figure 11)

⁹⁹ The Davies study analyzed a variety of costs for goods travelling from Shanghai, China to Chicago, including from ocean shipping, rail shipping, trucking, port and rail fees, the value of time differences in shipping routes, etc.

¹⁰⁰ For example, travel time without traffic from the ports to Bakersfield is about 2.5 hours, while travel time from the ports to Ontario (located in the Inland Empire) is about 1 hour.

¹⁰¹ <https://www.pmsaship.com/wp-content/uploads/2019/12/Briefing-Paper-Loss-of-Market-Share-at-U.S.-West-Coast-Ports.pdf>

¹⁰² <https://www.freightwaves.com/news/freight-volumes-shift-east-as-supply-chains-move-out-of-china>

¹⁰³ <https://www.polb.com/business/port-statistics#latest-statistics>,
<https://www.portoflosangeles.org/business/statistics/container-statistics>

¹⁰⁴ https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf

to accommodate this increased goods movement activity and is expected to continue.¹⁰⁵ Thus, even with a loss of market share, given the significant and continued growth in the logistics industry in South Coast AQMD's jurisdiction, it is not clear that any logistics activity has relocated as opposed to experiencing faster growth in other areas.¹⁰⁶ Similarly, the warehousing industry has experienced significant increased costs (Figure 12), and yet has continued to grow faster than neighboring regions (Figure 11). PR 2305 and PR 316 would also impose additional costs on the industry, however relocation of warehousing due to these rules is not expected if costs are below \$1.75 per sq. ft. Similar to the port analysis, it is possible that the growth of warehousing may change in the future in response to many factors (regulatory costs from CARB and/or South Coast AQMD, land costs, labor availability, changing market conditions, etc.)¹⁰⁷

¹⁰⁵ https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

¹⁰⁶ As an example, in April 2021 Maersk (the largest container shipping line in the world, <https://www.forbes.com/sites/niallmccarthy/2021/03/29/the-world-largest-container-shipping-companies-infographic/>) increased its service for the Asia-US East Coast route, but did not reduce its service for the Asia-West Coast route (<https://www.freightwaves.com/news/maersk-adding-weekly-service-to-us-east-coast>). The stated reasons for this shift are strong market demand on the US East Coast, a desire to create a more reliable service to the US East Coast, and infrastructure bottlenecks on the US West Coast coupled, with no mention of air quality regulations.

¹⁰⁷ Although PR 2305 is not expected to result in relocation of logistics activity at the proposed level of stringency, CEQA analysis requires a different legal standard of review. To be conservative in that analysis, some relocation is therefore considered to be possible in order to evaluate any potential environmental impacts.

Figure 13: Containerized Trade Flows at the Ports of Long Beach and Los Angeles

Summary of Considerations For Determining PR 2305 Stringency

Because of the pressing need to meet federal air quality standards in 2023 and 2031, both from a public health perspective and from a public policy perspective (e.g., avoiding federal sanctions), the stringency of the rule should be set at a level that achieves emission reductions beyond what other regulations will require, and that is within South Coast AQMD's legal authority. The immediacy of the 2023 deadline also drives a need for a phase-in schedule that can achieve emission reductions early.

The logistics industry and warehousing in particular are robust in our region and have continued to grow rapidly despite experiencing headwinds such as continuously increasing rents and loss of market share to other ports. However, as demonstrated in the 'Compliance Costs' section below, there will be financial impacts to industry to implement PR 2305, and it will also require many warehouse operators and cargo owners to change their business practices to implement actions required by PR 2305. After balancing all of these factors, staff is proposing to set the stringency of PR 2305 at 0.0025 WAIRE Points per Weighted Annual Truck Trip (WATT),¹⁰⁸ phased in over

¹⁰⁸ As described in Chapter 2, warehouse operators must track their WATTs every year to determine their WAIRE points compliance obligation.

a three-year period after a warehouse operator's initial requirement date. The discussion below presents the potential impacts of PR 2305 and PR 316 based on this stringency and phase-in schedule.

SCENARIO ANALYSIS

In response to stakeholder feedback, PR 2305 provides a flexible suite of options for warehouse operators to comply. This proposed rule will require subject warehouse operators to annually earn WAIRE Points¹⁰⁹ by completing any combination of 1) implementing actions from the WAIRE Menu, 2) developing and implementing an approved Custom WAIRE Plan, or 3) paying a mitigation fee.

The WAIRE Menu includes 32 options to earn WAIRE Points, and any approved Custom WAIRE Plan would include additional options as it is limited to actions not on the WAIRE Menu. With about 4,000 warehouse operators and dozens of options available for compliance, it is not possible to determine the precise cost or emissions impact of PR 2305 and PR 316. In addition, due to annual compliance obligations, the potential compliance approach from one year may differ from the approach in a following year as technologies and markets evolve, and as early investments are utilized. Because of the variety of outcomes possible, annual updates on the implementation of PR 2305 and PR 316 will be provided to the South Coast AQMD Mobile Source Committee, and additional information will be made available on the South Coast AQMD website. This regular tracking, with opportunity for public input, will allow for timely adjustments to be made to the WAIRE Program should they be necessary.

There are other similar existing programs that also include multiple compliance options including South Coast AQMD Rule 2202 – On-Road Motor Vehicle Mitigation Options¹¹⁰ and San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 9510 – Indirect Source Review¹¹¹. Both of these rules allow facilities to comply through prescriptive measures in the respective rule, or through paying a mitigation fee¹¹². In the case of Rule 2202, approximately 8% of facilities pay the mitigation fee, and the remainder choose a different compliance option.¹¹³ In addition, Rule 9510 has shown as technologies advance, the compliance approaches change. As an example, when SJVAPCD Rule 9510 started in 2006, about 14% of projects reduced emissions using clean construction equipment, whereas the most recent report from 2020 shows 42% of projects chose this option.¹¹⁴

Notwithstanding the potential uncertain outcomes, a robust analytical approach has been conducted to estimate the potential impacts of PR 2305 and PR 316, including through the

¹⁰⁹ As described in Chapter 2 and in PR 2305 (d)(1), a facility's WAIRE Points Compliance Obligation (WPCO) is determined based on four parameters: 1) the number of truck trips to a facility in any given year, 2) the stringency of the rule, 3) an annual variable that determines how quickly the rule phases in, 4) a warehouse operator's Initial Reporting Date based on the size of the facility.

¹¹⁰ <http://www.aqmd.gov/docs/default-source/rule-book/reg-xxii/rule-2202.pdf>

¹¹¹ <http://www.valleyair.org/rules/currnrules/r9510-a.pdf>

¹¹² Called an Air Quality Investment Program fee for Rule 2202 and an Off-Site Emissions Reduction Fee for Rule 9510. Rule 9510 also allows compliance through a Voluntary Emissions Reduction Agreement that is similar to a mitigation fee.

¹¹³ <http://www.aqmd.gov/home/research/documents-reports/activity-report>

¹¹⁴ <https://www.valleyair.org/ISR/Documents/2020-ISR-Final-Annual-Report.pdf>

development of 19¹¹⁵ different scenarios designed to show the range of potential outcomes. A description of these 19 scenarios analyzed is included in Table 14 below. The scenarios were developed to show potential end-member impacts from all 32 WAIRE Menu actions,¹¹⁶ as well as using mitigation fees.¹¹⁷

Each scenario is structured to follow a series of choices a warehouse operator may make based on compliance choices from a previous year. For example, if a warehouse operator purchased an NZE Class 8 truck in their first year complying with PR 2305 to earn WAIRE Points, they were assumed to use that same truck in subsequent years to earn additional WAIRE Points.

As a bounding analysis approach, all 2,902 warehouses were assumed to only comply with a single scenario approach from 2022 through 2031. No single scenario in this bounding analysis is expected to occur. Rather, they present possible extreme compliance outcomes. In reality, a hybrid of all scenarios (or other compliance approaches encompassed within the range of scenarios analyzed) is expected to occur.

The scenario analysis included in this second draft staff report includes minor updates since the previously released draft staff report released on March 3, 2021. For these scenario analyses,¹¹⁸ all 2,902 warehouses potentially required to earn WAIRE Points were modeled for every year from 2022-2031 using their square footage and the applicable average trip generation rates¹¹⁹ to determine the amount of WAIRE Points they are required to earn in each year, referred to as their WAIRE Points compliance obligation (WPCO). The amount of warehousing space required to earn WAIRE Points was grown 1.8% per year, consistent with analysis from SCAG.¹²⁰ The prioritization steps below were used to determine how WAIRE Points would be earned for each scenario. If sufficient WAIRE Points were not earned for any of the previous steps to satisfy a warehouse operator's WPCO in a given year, WAIRE Points were assumed to have been earned from the next step.

- 1) Banked WAIRE Points earned in any of the previous three years¹²¹
- 2) WAIRE Points earned from using vehicles or equipment¹²² acquired or installed in any previous year¹²³
- 3) WAIRE Points earned from acquiring or installing vehicles or equipment

¹¹⁵ A new scenario was added since the Preliminary Draft Staff Report – Scenario 7a.

¹¹⁶ See Appendix B – WAIRE Menu Technical Report for supplemental details for each action.

¹¹⁷ Custom WAIRE Plans were not modeled as they are not expected to be used by most facilities. The potential costs and emissions impacts from Custom WAIRE Plan implementation is expected to be within the range of analysis shown for the 18 scenarios.

¹¹⁸ The updated spreadsheet that includes all calculations described here is available at: www.aqmd.gov/fbmsm

¹¹⁹ See PR 2305 (d)(1)(C)

¹²⁰ https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf

¹²¹ PR 2305 (d)(6)(B) allows extra WAIRE Points earned in any one compliance year to be transferred for use in any of the next three compliance years.

¹²² Trucks earning WAIRE Points were assumed to make 520 visits per year (10 per week), and travelled default distances of 39.9 miles per trip for class 8, and 14.2 miles per trip for all smaller trucks. Yard trucks were operated for 1,000 hrs/yr.

¹²³ As a simplifying assumption, the scenarios analyzed here include one half of a year's usage of equipment or vehicles in the year it was installed or acquired.

- 4) Mitigation fees were assumed paid to provide supplementary WAIRE Points if other prescribed actions within a scenario were not available or sufficient to satisfy the WPCO.

Table 14: Scenario Descriptions

#	Scenario Description	Notes
1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	
2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	One additional truck is acquired earlier than required, thus increasing WAIRE Points earned from truck visits in subsequent years.
3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	No WAIRE Points earned for truck acquisitions. Mitigation fees paid to earn WAIRE Points in first year of compliance.
4	NZE Class 8 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
5	ZE Class 8 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions. ZE Class 8 trucks are assumed to not be commercially available until late 2022. Mitigation fees paid to earn WAIRE Points until then.
6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	Chargers provide ~30,000 kWh/year per Class 6 truck, and ~90,000 kWh/yr per Class 8 truck. Class 8 trucks only acquired if 25 Class 6 trucks had been previously purchased for one warehouse.
7	Pay Mitigation Fee	
7a	Pay Mitigation Fee and account for NZE trucks visiting the facility incentivized from the WAIRE Mitigation Program	Incentivized trucks earn WAIRE Points and reduce mitigation fees paid.
8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	
9	NZE Class 6 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
10	ZE Class 6 truck visits from non-owned fleets	No WAIRE Points earned for truck acquisitions.
11	Rooftop solar panel installations and usage	Solar panel coverage limited to 50% of building square footage. Mitigation fees used to make up any shortfall in WAIRE Points.
12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	System installation in first year is followed by a truck acquisition. In subsequent years trucks are only acquired if needed to earn WAIRE Points.
13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	
14	ZE Class 2b-3 truck visits from non-owned fleets	
15	Filter System Installations	
16	Filter Purchases	
17	TRU plug installations and usage in cold storage facilities	Scenario is only applied to cold storage warehouses. Plugs limited to 1:10,000 sq. ft. of building space.
18	ZE Hostler Acquisitions and Usage	

Emission Reductions

The total potential emission reductions associated with PR 2305 and PR 316 from each scenario above are presented in and below.¹²⁴ The methods used to calculate the emission reductions are

¹²⁴ Appendix D includes a discussion of how 'SIP creditable' emission reductions can potentially be determined.

consistent with the baseline emissions inventory methodology described above, or with the WAIRE Menu Technical Report in Appendix B, as applicable.¹²⁵ Emission reductions from mitigation fees paid to earn WAIRE Points are assumed to achieve NOx emission reductions at \$100,000/ton in the year after the fee was paid (consistent with current criteria used for funding Class 8 NZE trucks). Although individual funded projects would vary in the amount of reductions and the duration over which the reductions occur, this simplified approach is sufficient to evaluate programmatic impacts of an ongoing WAIRE Mitigation Program. Emission reductions from the Mitigation Program would be lower than shown in these tables if a portion of the funding goes towards projects that facilitate emission reductions from other programs (such as ZE charging/fueling infrastructure). ~~Table 15: Total NOx Emission Reductions (tpd) for 19 Bounding Analysis Scenarios~~ ~~Table 16: Total Diesel PM Emission Reductions (tpd) for 19 Bounding Analysis Scenarios~~

As discussed in the Baseline Emissions Inventory section above, CARB regulations are expected to also reduce emissions from trucks going to PR 2305 warehouses. Tables ~~17-15~~ and ~~18-16~~ below show the ‘surplus’ emission reductions that would be expected for each scenario after taking into account emission reductions from CARB’s ACT, Low NOx Omnibus, and Heavy Duty I/M rules. As stated in the Air Quality Need section of Chapter 1, there is no requirement that the emission reductions from statewide rules will apply in the South Coast AQMD jurisdiction, and PR 2305 and PR 316 would ensure that higher emission reductions are actually achieved here, as demonstrated in Tables 15- and 16 .

Table 15: NOx Emission Reductions (tpd) for 19 Bounding Analysis Scenarios After Discounting Reductions from CARB Regulations

WAIRE Program Compliance Costs

There are five types of compliance costs warehouse operators may experience with PR 2305 and PR 316 including: 1) costs to implement actions from the WAIRE Menu, 2) costs to develop and implement a Custom WAIRE Plan, 3) optional mitigation fees, 4) administrative fees pursuant to PR 316, and 5) costs associated with reporting and recordkeeping. ~~The analysis presented here is a preliminary draft, and staff anticipates continuing to work on these estimates.~~ Costs can be analyzed in a number of ways with a rule that includes as many options as PR 2305. One approach is to calculate costs using the scenario analysis presented above. A discussion of cost estimates with this approach is below. Because of the variability in emissions estimates and cost estimates in the extreme bounding analyses presented in the scenarios, cost effectiveness calculations may appear different than typical rules and regulations that have less flexibility than PR 2305. Although the bounding analysis scenarios presented are not expected to occur, the analytic approach provides a sound methodology to estimate average costs for any warehouse operator who chooses a scenario approach, both in terms of dollars per square foot of warehouse, as well as cost effectiveness (dollars per ton NOx reduced).

Scenario Cost Analysis

~~Preliminary~~ Expected costs resulting from each of the 19 bounding compliance scenarios are discussed below. The majority of expected costs result from the capital cost associated with the

estimated number of equipment acquisitions (ZE and NZE trucks, solar panels, charger installations, etc.) and the operating and maintenance (O&M) costs associated with usage of the equipment (fuel and electricity consumption, truck maintenance, etc.) in each scenario. This analysis attempts to isolate and attribute capital and O&M costs for only the equipment incremental to current CARB regulations such as CARB's ACT and Low NOx Omnibus regulations.

~~Table 20: Total Cost Summary of Each Compliance Scenario (2022-2031) After Accounting for CARB's ACT and Low NOx Omnibus Regulations~~ Table 20_-at the end of this preliminary analysis shows discounted total costs over a ten-year compliance time horizon (2022 – 2031). The costs shown in this analysis are in 2018 dollars and have not been discounted to account for the time value of money. Unless specified otherwise in the discussion here, incremental capital and O&M cost estimates are based on the analysis in the WAIRE Menu Technical Report in Appendix B, and the references contained therein.

To facilitate the discussion of the cost calculations, scenarios are grouped based on their compliance strategy. The groupings are comprised of (1) mitigation fees only; (2) truck acquisition and associated visits; (3) truck visits from non-owned fleets; (4) equipment acquisition and associated usage, and; (5) equipment/truck acquisition and associated usage/visits.

Mitigation Fees Only - Scenario 7 and 7a

The cost calculation for Scenario 7: Pay Mitigation Fee is straightforward. In lieu of earning WAIRE Points from equipment acquisitions and usage, all facilities choose to pay a fee of \$1,000 for each WAIRE Point in their WPCO attributed to their facility in every year of compliance. The total cost associated with the mitigation fee presented here does not reflect earning any Points from any other actions, such as truck acquisitions and visits resulting from CARB's ACT regulation, and should be considered a conservative high-end estimate. It is likely trucks purchased and used due to CARB's ACT regulation will be used to earn WAIRE Points to reduce the total amount of mitigation fees collected.¹¹⁵ This scenario also conservatively does not include any Points that might be earned from any trucks that are incentivized through the WAIRE Mitigation Program. Including these assumptions would significantly lower the cost, and the potential emission reductions from this scenario. This scenario is presented in all of the summary charts below as a point of comparison.

Scenario 7a assumes that facilities pay the mitigation fee and also actively track NZE truck visits from trucks funded by the mitigation fees. Facilities earn Points from visits from trucks purchased with collected mitigation fee funds. These points help to reduce a facilities' future year compliance obligation that would have otherwise been met through mitigation fee payments.

Figure 14 below presents total costs in each compliance year (2022 – 2031) for each mitigation fee scenario in dollars per square foot.

Figure 14: Potential Bounding Analysis Costs from Mitigation Fee Scenarios

Truck Acquisition and Associated Visits - Scenarios 1, 2, 3, 8, 13, and 18

Each scenario in this compliance strategy grouping relies on earning Points through purchase of clean trucks (NZE Class 8, NZE Class 6, ZE Class 2b-3, and ZE hostlers) and their subsequent usage (i.e. visits to the warehouse facility). Only those vehicle purchases and visits incremental to existing CARB regulations are considered.

~~Figure 15: Potential Bounding Analysis Costs from Truck Acquisition and Subsequent Usage~~
~~Scenarios~~ Figure 15 below presents total costs (truck acquisition and usage) in each compliance year (2022 – 2031) for each scenario in dollars per square foot.

Figure 15: Potential Bounding Analysis Costs from Truck Acquisition and Subsequent Usage Scenarios

Table 17 below presents capital costs of Diesel and NZE trucks. These costs are assumed to remain constant across the entire compliance period.^{126,127} Per unit incremental costs of NZE Class 8 and Class 6 trucks are assumed to be \$65,000 and \$30,000, respectively. These costs are inclusive of state sales and federal excise taxes and based on analysis documented in the WAIRE Menu Technical Report and the references cited therein.

Capital costs of battery-electric ZE trucks are expected to decrease over time as a result of decreased battery costs. Projected capital costs over time for each ZE vehicle class can be found in Table 18: ~~Capital Cost by ZE Truck Class and Year~~ Table 18 below.^{128,129,130} The incremental acquisition cost is set equal to the difference between the capital cost of each ZE truck and it's

¹²⁶ Capital costs for diesel trucks can be found in Table C-6 of the CARB ACT Appendix C-1 – SRIA submitted to DoF: <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

¹²⁷ Capital costs for NZE Class 8 trucks can be found in Table 31 of the 2018 Feasibility Assessment for Drayage Trucks: <https://cleanairactionplan.org/documents/final-drayage-truck-feasibility-assessment.pdf>. Class 6 capital costs were calculated by taking the ratio of capital costs for NZE Class 6 and 8 trucks found in the WAIRE Menu.

¹²⁸ Capital costs for each ZE truck class (2b-3, 6, 8) for model years 2024-2030 are taken from CARB's ACT Appendix C-1 – SRIA as submitted to DoF (Table C-7): <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>.

¹²⁹ To fill in missing years (2022, 2023), ZE capital costs were linearized between 2018 and 2024. 2031 costs assumed to be equal to 2030.

¹³⁰ ZE Hostler capital cost projections are not available for future years. Staff applied a yearly cost multiplier based on ZE Class 2b-3 capital costs to the incremental cost of ZE Hostlers included in the WAIRE Menu. A cost multiplier is generated by taking ratio of difference in capital cost in each year (2022 -2031) to the difference in capital costs in year 1 (2022).

diesel equivalent. An 8% sales tax is also applied to each ZE truck acquisition and a 12% federal excise tax is applied to all ZE Class 8 acquisitions.

When the number of truck purchases in any compliance year for a given scenario falls below the expected number of truck purchases in CARB's EMFAC 2017 projections for that year, the incremental acquisition cost for each truck class and fuel type is used. However, if the number of truck purchases in a scenario exceeds EMFAC 2017 projections, the full capital cost associated with each truck type is used for those trucks above projections. No financing costs have been included in this analysis.

Scenario 3 assumes all trucks purchased are subsidized by Carl Moyer incentive funds and no WAIRE Points (or costs) are attributed to warehouse operators for these vehicle purchases. Because no Points are earned for NZE Class 8 truck acquisitions in Scenario 3, it is necessary for facilities to pay a mitigation fee for the additional WAIRE Points needed for compliance in each calendar year (2022 – 2031) in which visits from Moyer-funded trucks are not sufficient to meet the WPCO.

Table 17: Capital Costs for Diesel and NZE Truck Acquisitions

Vehicle Class	Diesel	NZE
Class 2b-3	\$50,000	N/A
Class 6	\$85,000	\$115,000
Class 8	\$130,000	\$195,000

Note: Capital costs for diesel trucks listed here are pre-tax.

NZE capital costs include sales taxes (Class 8 and Class 6) and federal excise taxes (Class 8 only).

Table 18: Capital Cost by ZE Truck Class and Year

Year	ZE Class 8	ZE Class 6	ZE Class 2b-3
2022	\$292,544	\$155,055	\$71,920
2023	\$246,948	\$143,904	\$68,318
2024	\$201,351	\$133,554	\$64,896
2025	\$194,134	\$128,321	\$63,635
2026	\$188,312	\$124,112	\$62,599
2027	\$183,371	\$120,563	\$61,684
2028	\$178,870	\$117,345	\$60,829
2029	\$174,809	\$114,456	\$60,035
2030	\$170,748	\$111,568	\$59,241
2031	\$170,748	\$111,568	\$59,241

Note: Capital costs for all ZE trucks listed here are pre-tax

Costs associated with the use/visits of facility-owned NZE and ZE trucks is done on a per-mile basis. Per-mile usage costs resulting from fuel consumption and other costs (including maintenance, fees, insurance, and mid-life costs) were calculated for all truck classes and fuel types and then multiplied by the expected VMT in each compliance year for each scenario.^{131,132,133} A breakdown of total usage costs for each truck class and fuel type can be found in Table 19 below. Per-mile usage costs (not considering capital costs) of Class 6 and 8 NZE trucks is slightly lower than diesel, and results in a modest net savings to facilities. Per-mile usage costs of Class 2b-3, 6, and 8 ZE trucks is significantly lower than diesel and results in a net savings to facilities. Additionally, for Scenario 18, the incremental cost associated with ZE hostler/yard truck usage is taken from the WAIRE Menu Technical Report in Appendix B (\$6,250/1000 hours), and the references therein.

Table 19: Annual Operating and Maintenance Costs by Vehicle Class and Fuel Type (in 2018 Dollars)

Vehicle Class	Fuel Type	Total Annual Fuel Cost	Total Annual Other Cost	Total Annual Miles	\$/mile
Class 8	Diesel	\$34,231	\$15,306	54000	\$0.92
	ZE	\$13,125	\$16,361	42000	\$0.70
	NZE	\$30,918	\$16,841	54000	\$0.88
Class 6	Diesel	\$12,130	\$7,844	24000	\$0.83
	ZE	\$3,923	\$7,238	24000	\$0.47
	NZE	\$9,219	\$8,525	24000	\$0.74
Class 2b-3	Diesel	\$2,418	\$4,221	15000	\$0.44
	ZE	\$1,508	\$3,843	15000	\$0.36

Truck Visits from Non-owned Fleets - Scenarios 4, 5, 9, 10, and 14

Scenarios associated with this compliance strategy grouping earn WAIRE Points solely from visits to their facilities from non-owned NZE or ZE trucks. Costs for these scenarios only include visits above and beyond those resulting from existing CARB regulations. To calculate expected costs due to PR 2305, the incremental cost associated with each visit by truck class and fuel type was calculated based on the total cost of ownership (TCO) and multiplied by the number of visits by non-owned trucks necessary to comply in all compliance years.

¹³¹ Data on maintenance costs, mid-life costs, fuel cost and fuel economy for diesel, ZE and NZE trucks is taken from the WAIRE Menu Technical Report in Appendix B.

¹³² Vehicle fees for all ZE and diesel truck classes are taken from CARB's ACT Total Cost of Ownership document: <https://ww3.arb.ca.gov/regact/2019/act2019/apph.pdf>. Fees for NZE trucks are assumed to be the same as diesel trucks.

¹³³ Annual insurance costs assumed to be equal to 3% of vehicle value. Vehicle value assumed to decrease by 10% in years 2-8 and an additional 5% in years 9-11. The average annual cost is included in the per mile cost analysis.

A TCO analysis was performed for each truck class and fuel type for each compliance year using the assumed acquisition and usage costs described above. A 4% financing rate was used over a five-year financing period. A 12-year useful life is assumed for all trucks and a 4% discount rate was used to discount all costs in years beyond 2022. The TCO for all diesel and NZE trucks is constant over the compliance period and does not vary based on the year purchased. Because capital costs for ZE trucks are assumed to decline over time, the TCO does vary by purchase year. For a more detailed discussion of the TCO analysis, please see the Compliance Costs section of the PR2305 Draft Socioeconomic Impact Assessment dated April 2021.

The analysis for scenarios 9 and 10 indicates that if all warehouse operators only complied using ZE or NZE Class 6 trucks as a bounding analysis, that the total VMT associated with WAIRE Points could exceed the VMT from these Class 6 trucks in EMFAC. To account for the shortfall in this bounding analysis, the analysis does not include WAIRE Points beyond existing VMT in EMFAC, and assumes that warehouse operators earn the remaining WAIRE Points necessary for compliance by paying the mitigation fee. ~~Figure 16: Potential Bounding Analysis Costs from Truck Visits from a Non-owned Fleet~~ Figure 16 below presents total costs, including non-owned truck visits and the mitigation fee (Scenario 5 only), in each compliance year (2022 – 2031) for each scenario in \$/sq. ft.

Figure 16: Potential Bounding Analysis Costs from Truck Visits from a Non-owned Fleet

Equipment Acquisition and Associated Usage - Scenarios 11, 15, 16, and 17

Facilities in these scenarios meet their WAIRE Point obligation by acquiring and using clean technologies, such as solar panels (Scenario 11), filter systems (Scenario 15), filters only (Scenario 16), and TRU plugs (Scenario 17). Costs associated with the acquisition and usage of these technologies, as well as construction and permitting costs for TRU plug installs are listed in the WAIRE Menu Technical Report in Appendix B. Usage of installed solar panels results in a cost savings equal to the assumed electricity price of \$0.17 per kWh. TRU costs were only applied to cold storage warehouses. Construction and permitting costs associated with TRU plug installations have been included. For Scenario 11 and Scenario 17 only, it is necessary for facilities to pay a mitigation fee for the additional WAIRE Points needed for compliance in each calendar years 2023⁴ – 2031. Figure 17: ~~Potential Bounding Analysis Costs from Non-truck Equipment and Associated Usage~~ Figure 17 presents total costs in each compliance year (2022 – 2031) for Scenarios 11, 15, 16, and 17 in \$/sq. ft.

Figure 17: Potential Bounding Analysis Costs from Non-truck Equipment and Associated Usage

Equipment/Truck Acquisition and Associated Usage/Visits - Scenarios 6 and 12

Scenarios 6 and 12 assume facilities use both ZE truck and charging/fueling infrastructure acquisitions and their associated usage to earn WAIRE Points. Scenario 6 combines Level 3 charger installations with Class 6 and 8 ZE truck purchases. Scenario 12 combines hydrogen station installations and Class 8 ZE truck purchases. Incremental acquisition costs for Class 6 and 8 ZE trucks can be found in Table 18. Level 3 charger and hydrogen station installation and usage

costs are also listed in the WAIRE Menu Technical Report in Appendix B, along with construction and permitting costs for charger installation projects. To avoid double-counting, no costs are accumulated for charger usage as electricity costs are already accounted for in the per-mile usage costs for Class 6 and 8 ZE trucks. This analysis also assumes hydrogen costs decline over time from roughly \$9.75/kg per in 2020 to \$6.20/kg in 2031.¹³⁴ Figure 18: Potential Bounding Analysis Costs from Equipment Acquisition (Truck and Non-Truck) and Associated Visits/Usage Figure 18 below presents total costs for both scenarios in each compliance year (2022 – 2031) in \$/sq. ft.

Figure 18: Potential Bounding Analysis Costs from Equipment Acquisition (Truck and Non-Truck) and Associated Visits/Usage

Table 20 below shows a cost summary for each compliance scenario including net present value (assuming 1% discount rate), average annual cost, and a weighted average annual cost per square foot of warehouse space after taking into account equipment acquisition from CARB’s ACT, Low NOx Omnibus. The total costs presented here are inclusive of all administrative costs and fees related to compliance. These administrative costs are explained in more detail in the next section of this report.

¹³⁴ Hydrogen cost projections can be found in CARB ACT Appendix C-1 – SRIA submitted to DoF (Figure C-5): <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

The costs presented here are default calculations broadly applicable to the industry, however individual warehouse operators may identify different specific costs for their operations. Warehouse operators are assumed to gravitate towards the lowest cost options for their specific situations. As such, the maximum cost that warehouse operators would be expected to incur is about \$0.83/sq. ft./yr. resulting from the mitigation fee-only scenario. However, based on the cost analysis, it is likely that in most situations warehouse operators will identify substantially cheaper options that work within their operations.

Table 20: Total Cost Summary of Each Compliance Scenario (2022-2031) After Accounting for CARB's ACT and Low NOx Omnibus Regulations

	Equipment	Discounted Total Costs - NPV (1%) (in millions)	Discounted Total Costs - NPV (4%) (in millions)	Average Annual Cost (in millions)	Average Annual Cost (\$/sq. ft)
Sc1	NZE Class 8	\$1,225.7	\$1,102.6	\$127.2	\$0.16
Sc2	NZE Class 8	\$1,345.1	\$1,219.9	\$139.2	\$0.17

WAIRE Program Administrative Costs

PR 316 Estimated Costs

PR 316 details the administrative fees that PR 2305 regulated entities must pay to fund South Coast AQMD compliance activities for PR 2305. The total annual cost for South Coast AQMD to administer and enforce the WAIRE Program was determined as a function of the fully burdened hourly rates for staff multiplied by the total staff time required to process the three types of reports required by PR 2305, including the Warehouse Operations Notification, Initial Site Information Report, and the Annual WAIRE Report – and all the associated auditing and enforcement activities for the WAIRE Program. In addition, reporting would be conducted through a new web portal, which includes an estimated \$25,000 annually to maintain. Warehouse Operations Notifications require significantly less information than the other two reports

There are 3,320 warehouse owners expected to initially submit a Warehouse Operations Notification, and about 4,000 initial warehouse operators across 2,902 warehouses that are expected to submit an Initial Site Information Report and Annual WAIRE Report during their first year that they would need to earn WAIRE Points. As described in Appendix C, an estimated 515 warehouse owners are operators who would need to submit a one-time Initial Site Information Report and Annual WAIRE Reports thereafter. The remaining warehouses are assumed to get a new operator every five years. Table 21 below shows how many reports are expected every year through 2031, including accounting for continued growth in the warehousing industry.

Table 21: Number of Reports Submitted by PR 2305 Warehouses Each Year

Year	Warehouse Operations Notification	Initial Site Information Report	Annual WAIRE Report
2021	3,320	0	0
2022	561	1,333	1,333
2023	561	1,894	2,695
2024	561	1,894	4,073
2025	578	578	4,120
2026	584	584	4,167
2027	591	591	4,214
2028	598	598	4,261
2029	604	604	4,308
2030	611	611	4,355
2031	617	617	4,402

Table 22 below shows the estimated average level of effort, burdened rates for staff, and costs for each report.

Table 22: PR 316 Fee Evaluation

Staff	Burdened Hourly Rate	Warehouse Operations Notification	Initial Site Information Report	Annual WAIRE Report
Planning & Rules Manager	\$141.29	0.05 hrs	0.1 hrs	0.2 hrs
Program Supervisor	\$126.57	0.05 hrs	0.2 hrs	0.6 hrs
Air Quality Specialist	\$110.28	0.1 hrs	1.0 hrs	1.75 hrs
Air Quality Inspector II	\$94.78	0 hrs	0.5 hrs	1.25 hrs
<i>Staff Cost per Report</i>		<i>\$24.42</i>	<i>\$135.59</i>	<i>\$387.41</i>
<i>Web Portal Cost per Report</i>		<i>\$5.09</i>	<i>\$5.09</i>	<i>\$5.09</i>
<i>Total Cost per Report¹³⁵</i>		<i>\$29.51</i>	<i>\$140.68</i>	<i>\$392.50</i>

Finally, Custom WAIRE Plan Application Evaluations will be assessed on a level of effort basis. A fee of \$161.25 will be assessed for every hour of review, consistent with plan review fees for other South Coast AQMD programs.¹³⁶ Reviews are expected to require multiple hours of staff time, and an initial fee will be assessed when the application is submitted equal to five hours of review (\$806.25). If review requires less than five hours, then a refund will be provided to the applicant.

Warehouse Operator Administrative Costs

Warehouse operators are expected to experience administrative costs associated with recordkeeping and reporting for PR 2305.¹³⁷ There are three main administrative costs that operators required to earn WAIRE Points will experience: reporting costs, total truck count costs, and NZE/ZE truck recording. The reporting associated with Initial Site Information Reports and Annual WAIRE Reports is expected to be similar to the kind of reporting required in CARB's ACT regulation, specifically for large entity reporting, and is estimated to be no more than 25 hours of work totaling \$1,250 per year.¹³⁸

The total truck count costs are associated with counting all truck trips to/from a warehouse in order to determine the WPCO. A variety of different methods exist to count trucks, such as security cameras that include a log of vehicles that pass the camera, in-road sensors which can count truck trips and identify the number of axles per truck, the use of an onsite personnel to check in all vehicles that enter, telematics systems, etc. Warehouse operators may already have measures in place for security and tracking purposes and would not experience additional costs from PR 2305 for installing new systems. To estimate administrative costs for this activity, the video recording method described in the WAIRE Implementation Guidelines is used as a default. This method allows a warehouse operator to record 24 hours of continuous video at each of their truck gates (assume an average of two per facility) one weekday and one weekend day per month that represent

¹³⁵ Similar to other South Coast AQMD fees in Regulation III, costs are expected to increase through time, consistent with the Consumer Price Index including for increased staff costs and overhead costs from inflation. All fees in PR 316 will therefore be adjusted periodically consistent with all other Regulation III fees pursuant to Rule 320.

¹³⁶ Rule 306(d)

¹³⁷ Engineering costs to implement specific WAIRE Menu actions (such as for charging infrastructure) have already been included in the compliance cost estimates above.

¹³⁸ <https://ww3.arb.ca.gov/regact/2019/act2019/isor.pdf>

a peak period during the respective days of the week. Onsite personnel could then review the video (using standard video tools on already available desktop computers, cell phones etc.), sped up so as to reduce the time needed to view, and then count truck trips over that time period. These video counts could then be applied to the rest of the days in that month to come up with the total truck traffic expected at the site. The time needed to do this work is estimated at 144 person-hours per year (48 hrs/month * 2 truck gates * 12 months/year, with video sped up between 8X-10X speed). This low technology solution to counting trucks could result in staff costs of about \$7,200 per year, however cheaper options may be used too as long as representative and verifiable methods are used.

If a warehouse operator chose to track NZE or ZE trucks that visited their facility in order to earn WAIRE Points, there are several potential methods available. If the trucks are owned by the warehouse operator, then delivery schedules or other paper records may suffice. Other methods could include telematics systems, automated license plate reader systems, contract data with trucking companies (if the operator contracts with a trucking company). This information may need to be supplemented with records that document that the truck used to earn WAIRE Points is an actual ZE or NZE truck. The simplest method could include truck driver check-ins where truckers could fill out a simple form that provides basic information about their truck, including license plate number, vehicle identification number, model year, weight rating (or class), fuel type, and trucking company name and contact information. This basic information could be compiled by onsite personnel and used as verification that a ZE or NZE truck visited the site. Supplementary information could also be kept if the operator chose to, such as photos or videos of the truck onsite. The number of ZE/NZE trucks visiting a site will vary, but a 250,000 square foot warehouse with an average truck trip rate would have about 42 Class 8 trucks visiting per day. Only five of these trucks per day would need to be NZE in order to meet that operator's WPCO at the proposed stringency of 0.0025. Onsite personnel could compile this info every week (one hour of effort) and use these records to demonstrate that they have met their WPCO. This type of reporting is expected to result in about \$2,600 in administrative costs. Other WAIRE Menu options are not expected to exceed the administrative costs listed here.

The socioeconomic impacts from administrative costs, PR 316 fees, and WAIRE Points costs are included in the Draft Socioeconomic Impact Assessment. Additional analysis of PR 2305 costs is also included below.

FEASIBILITY

The potential feasibility of PR 2305 and PR 316 have been evaluated using a variety of approaches. Staff considered the technical, economic, and market feasibility as described below. Many technical assessment studies have been conducted on NZE and ZE technologies that may be used to comply with PR 2305. These studies are referenced in the WAIRE Menu Technical Report in Appendix B. Additional information on technical feasibility was also obtained from industry sources who have used technologies in commercial service at warehouses, and results from South Coast AQMD funded projects.¹³⁹ The technical feasibility of some WAIRE Menu actions are not

¹³⁹ Examples: <http://www.aqmd.gov/docs/default-source/technology-research/clean-fuels-program/clean-fuels-advisory-agenda---september-17-2020.pdf>, <http://www.aqmd.gov/docs/default-source/technology-research/annual-reports-and-plan-updates/2019-annual-report-2020-plan-update.pdf>

considered technically feasible today (e.g., ZE Class 8 trucks), however they are expected to become commercialized in the next two years and are therefore included as a compliance option. While this one menu option is just beginning to be commercialized, most other WAIRE Menu are commercially available today, including NZE trucks (which have been available for years), smaller ZE trucks, ZE yard trucks, solar panels, charging/fueling infrastructure, and filtration systems.

Economic impacts are considered in more detail in the socioeconomic impact analysis report, however some preliminary analysis is included here. First, the proposed rule may impose annual average costs between about \$0-\$12.6 million per year and \$670 million per year,¹⁴⁰ which translates to a range of about -\$0.02 per sq. ft. to \$0.83 per sq. ft.

There are two points of comparison that illustrate the impact PR 2305 may have on industry. First, there are about \$500 billion worth of goods that flow through the SCAG region every year, with the vast majority flowing through the import and export points in the South Coast AQMD region.¹⁴¹ If only 31% of imported containerized goods at the ports of LA/LB go directly to rail, the majority of the remainder likely flows through the largest warehouses. The warehouses subject to PR 2305 include about 750 million sq. ft. of space, out of a total of about 1.2 billion sq. ft. of warehousing space in the entire SCAG region (all building sizes), or about 63%.¹⁴² Because PR 2305 warehouses include the largest facilities, an even greater fraction of goods is expected to flow through these warehouses with smaller warehouses sending or receiving goods from the larger facilities. At the low end, it is possible to estimate that the total value of goods flowing through PR 2305 warehouses is at least \$217 billion.¹⁴³ Using the ~\$670 million annual cost from the mitigation fee-only scenario (Scenario 7) as a proxy for the highest costs that could be imposed by PR 2305 at the proposed stringency, at the high end PR 2305 and PR 316 could therefore add ~0.3% to the total cost of goods handled by warehouses. The much lower cost example of a mitigation fee scenario (Scenario 7a) shows that total costs may be as low as \$114 million per year, which would be <0.05% of the total cost of goods handled by warehouses.

The potential cost effectiveness of PR 2305 is difficult to determine with the wide variety of options available for compliance. PR 2305 aims to reduce regional NOx emissions, as well as local emissions of diesel PM (to reduce regional PM and local toxics emissions), and local exposures to air pollution. Traditional cost effectiveness approaches are therefore not comparable to other programs focused solely on regional pollutant emission reductions that simply divide total cost by NOx emission reductions, or toxics rules that do not calculate cost effectiveness. Nevertheless, Table 23 below shows a cost-effectiveness in dollars per ton of NOx reduced after accounting for CARB's ACT, HD I/M, and Low NOx Omnibus regulations (using Table 20 and Table 15). These estimates are expected to be conservative because they don't account for all incentive programs that could help offset costs (e.g., Low Carbon Fuel Standard) and they only show a 10-year period (less than the useful life of a truck) of costs and

¹⁴⁰ The high end cost is set equal to the mitigation fee-only scenario.

¹⁴¹ https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf

¹⁴² Ibid.

¹⁴³ \$500 billion * 69% (non-rail) * 63% (PR 2305 whse sq. ft./SCAG whse sq. ft.) = \$217 billion

emission reductions. As shown in Figures 16 through 18, costs are much lower in later years, and emission reductions are expected to continue past 2031.

Table 23: Preliminary Estimates of Cost Effectiveness for Regional NOx Reductions After Considering CARB ACT, HD I/M, and Low NOx Omnibus Regulations

	Equipment	Total Nox Reductions (tons)	Discounted Total Cost - NPV (1%) (millions)	Discounted Total Cost - NPV (4%) (millions)	Cost-Effectiveness (1%)	Cost-Effectiveness (4%)
Sc1	NZE Class 8	8,609	\$1,226	\$1,103	\$142,371	\$128,075
Sc2	NZE Class 8	9,353	\$1,345	\$1,220	\$143,808	\$130,420
Sc3	NZE Class 8	11,623	\$430	\$374	\$37,015	\$32,213
Sc4	NZE Class 8	8,178	\$887	\$750	\$108,507	\$91,649
Sc5	ZE Class 8	8,502	\$1,067	\$942	\$125,534	\$110,781

Sc15	Filter System	-	\$5,986	\$5,057	-	-
Sc16	Filter	-	\$5,863	\$4,953	-	-
Sc17	TRU	579	\$54	\$46	\$93,567	\$79,083
Sc18	Yard Trucks	260	\$1,153	\$1,029	\$4,436,646	\$3,959,829

The cost effectiveness of recent mobile source regulations varies depending on the program, and depending on the timescale chosen. The table below summarizes recent key regulations from CARB and their cost effectiveness through about 2032 (dollars per ton of NOx). Costs are substantially lower for many of these regulations when considering cost savings that are projected to occur in the 2030s and beyond, however the shorter timeline is compiled here to show a similar end year as for the analysis for PR 2305 (analysis conducted through 2031). The cost effectiveness for various scenarios with PR 2305 as shown in Table 23 above is similar to the wide range of values shown in Table 24 below.

Table 24: Cost Effectiveness of CARB Regulations

CARB Regulation	Approximate Cost Effectiveness (through 2032)
Airport Shuttle Bus	\$430,000/ton NOx
Innovative Clean Transit	\$271,000/ton NOx
At Berth (Ocean Going Vessels)	\$83,000/ton NOx
Low NOx Omnibus	\$39,000/ton NOx
Advanced Clean Trucks	\$22,000/ton NOx

The market feasibility was evaluated by considering whether the proposed stringency of PR 2305 would result in a level of implementation that exceeds the potential ability of the market to respond. In an extreme hypothetical example, if the stringency of PR 2305 required ten billion miles of Class 8 ZE truck travel per year, but there is only a total of three billion miles of truck travel from all Class 8 trucks (fueled by diesel, electric, natural gas, etc.), then this would indicate that the stringency is infeasible.

The scenario analysis described above includes calculations to determine whether any bounding analysis scenario exceeded expected market conditions. The parameters that were evaluated include the number of new trucks purchased in a year, the amount miles travelled by trucks in a year, the amount of power required to charge trucks, and the amount of fossil fueled power generation in South Coast AQMD. In nearly all cases, PR 2305 would not exceed existing market capacity. In rare instances, some bounding analysis scenarios show that some new truck sales in early years of the program could be higher than is expected in EMFAC for those respective truck categories, assuming that every warehouse operator bought the same class of truck and technology (e.g., NZE or ZE) to comply with PR 2305. This is unlikely as no more than about 40% of warehouse operators are estimated to own truck fleets (and not every truck fleet owns all truck classes), and truck acquisitions to earn Points would necessarily be less than shown. Even in these extreme cases (which are not reasonably expected to occur), the amount of sales is typically no more than about double what is projected from EMFAC for our region. No scenarios were found to require total VMT for any truck class greater than what is included within EMFAC 2017. For example, no scenarios required more truck travel to earn Points than the total amount of truck travel in the air basin. Finally, the highest electricity demand for charging electric trucks (Scenario 6) is about 697 GWh per year. This level of charging is less than what CEC has preliminarily calculated for the total need for electric trucks in the South Coast AQMD region.¹⁴⁴

¹⁴⁴ As part of the development of the 2020 Integrated Energy Policy Report, CEC staff included a scenario that explicitly evaluates the electric power needed if >100,000 ZE trucks are deployed to assist in meeting 2031 ozone standards. This analysis showed the projected electricity demand from charging these trucks would be about 1,684 GWh in 2031, with a peak summer hourly load of about 164 MW for Southern California Edison, the region's largest utility. This results in about a 1-2% increase in electricity demand overall from SCE compared to the 'mid' case analysis in the 2019 IEPR, but is still within the range of expected demand as the additional load does not exceed CEC's modeled 'high' case.

Considering the many different compliance options and business models of warehouse operators, it is unlikely that any of the extreme scenarios discussed above would be expected to occur. With roughly three dozen options for earning WAIRE Points (32 Menu actions, a mitigation fee option, and additional options from Custom WAIRE Plans), it is unlikely any particular scenario modeled would be chosen by more than a small fraction of all warehouse operators in any given year. If these more realistic lower levels of implementation are assumed for each scenario, then none of the market capping conditions would be exceeded. It is also foreseeable that if some of the extreme examples discussed above began to materialize during a compliance period, with all operators choosing the same exact truck type and technology to implement, that warehouse operators would respond to these market conditions and pivot to implement other alternatives.

SOCIOECONOMIC ASSESSMENT

A draft socioeconomic analysis was prepared and released for public comment and review on March 3, 2021, more than 30 days prior to the South Coast AQMD Governing Board Public Hearing on PR 2305 and PR 316, which is anticipated to be heard on May 7, 2021. A second draft of the socioeconomic analysis will be released together with this second draft staff report. ~~This~~ The final second draft socioeconomic analysis includes updates based on a third-party peer review, among other updates.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

PR 2305 and PR 316 are considered a “project” as defined by the California Environmental Quality Act (CEQA). Pursuant to CEQA, the South Coast AQMD, as Lead Agency, prepared a Notice of Preparation (NOP) of the Draft Environmental Assessment (EA) and Initial Study (IS) to analyze environmental impacts from the project identified above pursuant to its certified regulatory program (Public Resources Code Section 21080.5, CEQA Guidelines Section 15251(l), and South Coast AQMD Rule 110). The NOP/IS was released for a 32-day public review and comment period that began Friday, November 13, 2020 and ended on Tuesday, December 15, 2020. In addition, because the proposed project could have statewide, regional or areawide significance, a CEQA Scoping Meeting was held on December 2, 2020 pursuant to Public Resources Code Section 21083.9(a)(2). The South Coast AQMD has also prepared a Draft EA (equivalent to a Draft EIR) which was and has circulated it for a 45-day public review and comment period from January 26, 2021 to ending March 12, 2021. The analysis in the Draft EA indicated that while reducing emissions is an environmental benefit, significant and unavoidable adverse environmental impacts may occur for the following environmental topic areas: 1) aesthetics; 2) agriculture and forestry resources; 3) air quality and greenhouse gas emissions; 4) biological resources; 5) cultural resources; 6) energy; 7) geology and soils; 8) hazardous materials and solid and hazardous waste;

<https://efiling.energy.ca.gov/getdocument.aspx?tn=235836>,
<https://efiling.energy.ca.gov/GetDocument.aspx?tn=230923>,
<https://efiling.energy.ca.gov/GetDocument.aspx?tn=230924>

9) hydrology and water quality; 10) mineral resources; 11) noise; 12) transportation; and 13) utilities and service systems. ~~The Draft EA can be accessed at the following address:~~
~~<http://www.aqmd.gov/home/library/documents-support-material/lead-agency-scaqmd-projects>~~

Seven comment letters were received relative to the Draft EA and the responses to comments have been included in Appendix E of the Final EA. ~~If comments are submitted, the letters and responses to comments will be incorporated into the Final EA which will be included as an attachment to the Governing Board package.~~ Prior to making a decision on the adoption of PR 2305 and PR 316, the South Coast AQMD Governing Board must review and certify the Final EA, including responses to comments, as providing adequate information on the potential adverse environmental impacts that may occur as a result of adopting PR 2305 and PR 316.

DRAFT FINDINGS UNDER CALIFORNIA HEALTH AND SAFETY CODE SECTION 40727

California Health and Safety Code Section 40727 requires that prior to adopting, amending or repealing a rule or regulation, the South Coast AQMD Governing Board shall make findings of necessity, authority, clarity, consistency, non-duplication, and reference based on relevant information presented at the public hearing and in the staff report.

Necessity

PR 2305 and PR 316 are needed to protect public health by reducing local and regional emissions of NO_x and diesel PM associated with warehouses and the mobile sources attracted to warehouses. By reducing these emissions, PR 2305 and PR 316 will also assist in meeting state and federal air quality standards for ozone and fine PM. NO_x is a precursor to the formation of ozone and PM_{2.5}, and diesel PM is a toxic air contaminant and component of fine PM.

Authority

Authority for the South Coast AQMD Governing Board to adopt PR 2305 and PR 316 may be found in sections 39002, 39650 through 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 40717, 40725 through 40728, 40910, 40920.5, 41508, 41511, and 41700 of the Health and Safety Code.

Clarity

PR 2305 and PR 316 are written or displayed so that its meaning can be easily understood by the persons directly affected by it.

Consistency

PR 2305 and PR 316 are in harmony with and not in conflict with or contradictory to, existing statutes, court decisions, or state or federal regulations.

Non-Duplication

PR 2305 and PR 316 will not impose the same requirements as any existing state or federal regulations. The proposed rule is necessary and proper to execute the powers and duties granted to, and imposed upon, the South Coast AQMD.

Reference

In adopting these rules, the following statutes which the South Coast AQMD hereby implements, interprets or makes specific are referenced: Clean Air Act Sections 110(a)(5)(C); 116; Health & Safety Code Sections 40440, 40716, 40717, and 40522.5.

COMPARATIVE ANALYSIS

California Health and Safety Code Section 40727.2 requires South Coast AQMD to perform a comparative written analysis when adopting or amending a rule or regulation that imposes a new or more stringent emission limit or monitoring, reporting, or recordkeeping requirement. The comparative analysis is relative to any existing federal or state requirements, existing or proposed South Coast AQMD rules and air pollution control requirements and guidelines which are applicable to the same sources as identified in the proposed rule or regulation. PR 2305 regulates warehouses as an indirect source that attract mobile sources of emissions, and PR 316 is the companion fee rule for PR 2305. Under California Health and Safety Code Section 40727.2(g), PR 316 does not in itself require a comparative analysis, but is included for completeness.

There are no comparable federal or state requirements or any comparable existing or proposed South Coast AQMD rules or requirements that apply directly to warehouses. However, there are many air quality regulations at the state and federal level that focus on emissions from the mobile sources associated with warehouses. These can broadly be placed into three categories. First are regulations that aim to reduce emissions through the engine standards for new vehicles. Second are regulations that aim to replace older vehicles with newer vehicles with cleaner technologies through fleet rules. Third are regulations that focus on air quality impacts from facilities that attract mobile sources, such as employee commutes. PR 2305 and PR 316 look at the activities associated with a warehouse facility and aim to reduce air quality impacts beyond what is already required by any existing or proposed regulatory requirement. PR 2305 and PR 316 are summarized below in Table 25.

.

Table 25: Proposed Rule 2305

Rules	Rule Elements		
	Applicability	Requirements	Reporting, Notification, and Recordkeeping
PR 2305	Owners and operators of warehouses located in the South Coast AQMD jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building (PR 2305(b)).	Warehouse operators are required to earn WAIRE Points annually, either by completing actions off the WAIRE Menu, a Custom WAIRE plan, or paying a mitigation fee based on truck trips. (PR 2305(d)).	Periodic reports on warehouse statistics and its operations. Recordkeeping requirements for all information submitted for rule compliance (PR 2305(e)).

A comparative analysis of other regulations that focus on emissions from the mobile sources associated with warehouses is presented below in Tables 28, 29, and 30. ~~26, 27 and 28.~~

OVERVIEW

Proposed Rule (PR) 2305 is the Warehouse Indirect Source Rule (ISR) which provides the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, a menu-based points system. The WAIRE Program determines a warehouse operator's WAIRE Points Compliance Obligation (WPCO) based on annual truck trips to each applicable new and existing warehouse that has at least 100,000 square feet of indoor floorspace within a single building that may be used for warehousing activities. Each warehouse operator must earn or obtain WAIRE Points to meet their WPCO on an annual basis. PR 316 establishes fees to fund South Coast AQMD compliance activities associated with PR 2305.

The WAIRE Program Implementation Guidelines (Guidelines) do not supersede the requirements specifically stated in PR 2305 and PR 316 but are meant to provide warehouse operators and owners with further guidance on complying with the rules. In any instance where an interpretation of requirements in these Guidelines conflicts with PR 2305 or 316, the rule language takes precedence. All owners and operators subject to PR 2305 and 316 should anticipate that the reports they submit and the records that they keep will be reviewed by South Coast AQMD staff in desktop audits and onsite field inspections, and are subject to public records act requests. Further, data regarding warehouse operator compliance will be made publicly available on South Coast AQMD's website. For any questions about this guidance document, please contact program staff at waire-program@aqmd.gov.

APPLICABILITY

Figure 1 – Applicability Flow Chart

The warehouse ISR applies to warehouse operators and owners of warehouses greater than or equal to 100,000 square feet of indoor floor space within a single building that may be used for warehousing activities. A warehouse operator or owner whose warehousing activity is not explicitly excluded from PR 2305 is presumed to be included in rule requirements. Figure 1 represents a simplified diagram of the requirements for warehouse owners and operators of applicable warehouses. Warehouse owners are only required to submit a Warehouse Operation Notification Report which detail the size and tenant status of the warehouse, further details are provided in the Reporting Section of these Guidelines. Warehouse operators are required to submit an Initial Site Information Report and are required to earn WAIRE points. Warehouse owners may choose to earn WAIRE points on behalf of the warehouse operator.

In addition to the warehouse size applicability, the warehouse ISR is implemented over time based on the applicable warehouse sizes. The warehouse size phase-in shown in Table 1, and details the date range for the Initial Compliance Period when warehouse operators must earn or obtain WAIRE Points to meet their WPCO, and also the due dates for Initial Site Information Report, and the first Annual WAIRE Report.

Table 1 – Implementation Schedule

Phase	Warehouse Size (square feet)	Initial Site Information Report Due Date	First Annual WAIRE Report Due Date	Initial Compliance Period
1	> 250,000	July 1, 2022	January 31, 2023	January 1, 2022 to December 31, 2022
2	> 150,000- <250,000	July 1, 2023	January 31, 2024	January 1, 2023 to December 31, 2023
3	> 100,000- <150,000	July 1, 2024	January 31, 2025	January 1, 2023 to December 31, 2024

CALCULATIONS¹⁵¹

The WPCO is the number of WAIRE Points a warehouse operator must earn or obtain to comply with PR 2305. Figure 2 represents a simplified diagram of how a WPCO is calculated based on the number and type of trucks that enter or exit a warehouse site.

Figure 2

Truck trips are defined as one-way trips that tractors and straight trucks make to a warehouse facility when delivering goods to or from another location.¹⁵² They are counted when a truck enters or exits a site. A single visit from a truck is equal to two trips. PR 2305 refers to the total calculated truck trips in a compliance period as Weighted Annual Truck Trips (WATTs) which is calculated by inputting the actual truck trip counts of the number and type of trucks in the following equation:

$$WATTs = [Class\ 2b\ to\ 7\ truck\ trips] + [2.5 \times Class\ 8\ truck\ trips]$$

As shown in Figure 2, the WATTs are multiplied by the Stringency factor and the Annual Variable to provide the WPCO for the warehouse. The Stringency factor is defined as 0.0025 WAIRE Points per WATTs, and the annual variable is determined by the phase-in schedule of the warehouse and is provided in Table 2.

Table 2 – Annual Variable

Annual WAIRE Report Year*	Annual Variable		
	Phase 1	Phase 2	Phase 3
2022	0.33	0	0
2023	0.67	0.33	0
2024	1.0	0.67	0.33
2025	1.0	1.0	0.67
2026 and beyond	1.0	1.0	1.0

*This is the compliance year period that for which a warehouse operator is first required to submit its Annual WAIRE Report.

¹⁵¹ The WAIRE Menu Technical Report, included as Appendix B in the PR 2305 staff report, is included as an appendix to these Implementation Guidelines to assist in determining how WAIRE Points are calculated.

¹⁵² A truck or yard truck delivering a trailer or goods from one part of a warehouse to another part of a warehouse is not considered a truck trip since it does not include delivery of goods to/from another location.

TRUCK TRIP COUNTS FOR DETERMINING WPCO

The WATTS calculation equation weighs the activity and emission contribution of a Class 2b-7 straight truck and that of a Class 8 tractor which emits approximately 2.5 times more NO_x emissions. Class 8 tractors are differentiated from Class 2b-7 straight trucks by their Gross Vehicle Weight Rating being greater than 33,001 pounds. Absent more specific data, all tractors that can pull a trailer should be counted as Class 8, and all straight trucks should be counted as Class 2b-7.

With the WPCO being closely tied to the number of actual truck trips entering and exiting the warehouse site, it is important to accurately document the total number of truck trips and whether they were Class 8 tractors or Class 2b-7 straight trucks. Truck trips must be counted and records must be verifiable, where date and time of the truck trips recorded may be tied to the compliance period records for review. Below are five examples of methods to count the number of truck trips. The key criteria for ensuring that the truck trip counts are accurate enough for determining a warehouse operator's WPCO is that the data needs to be collected using a method that provides reliable and verifiable truck trip counts that are either contemporaneous (e.g., daily) or extrapolated from a short term contemporaneous tracking during a representative peak period, as described below. Warehouse operators are responsible for maintaining data the support the truck trip count and the data must be made available to South Coast AQMD for verification. Verifiable data can be provided through the following methods:

1. Electronic Telematics Systems – These systems are used to track truck activity, typically through the use of on-board GPS systems and fleet management software. These systems can track when equipped vehicles are located at a warehouse.
2. In-Roadway or Driveway Sensors - Various sensor technologies are available to count vehicles such as pneumatic tubes, radar, or lasers installed at a driveway. These devices are used to count the number of vehicles passing a certain point and can provide truck classification data (e.g., straight trucks).
3. Video Monitoring – Many warehouse operators already employ security cameras to monitor their gates. Warehouse operators could use staff or software to identify the number and type of trucks that enter the gate and note truck Class (i.e. straight trucks vs. tractors) from video recordings. Video recordings and subsequent counts can be continuous but in no cases should be less than one weekday (Monday – Friday) per month and one weekend day (Saturday or Sunday) per month (if the warehouse is open on weekends). Each weekday and weekend day once-per-month sample must be taken at least three weeks apart from the next respective sample. With this less intensive once-per month sampling method, a representative peak weekday and weekend day must be recorded (with documentation indicating why those days of the week were chosen). The weekday count may then apply to all weekdays during that month, and the weekend count may then apply to all weekend days during that month.
4. Guardshack – Many warehouse operators employ a guard or other personnel to (incomplete sentence) Contracts or other similar records – Many warehouse operators are responsible for shipments to/from their warehouse, including with their own fleet or through third party fleets. Records such as contracts or manifests that document the loads delivered to or picked up from a warehouse can be used to determine truck trip information provided that all trips to a site are documented (which could include supplementary sources of data, such as through methods described above).

Loss of Truck Trip Count Data

In the event that there is insufficient truck trip data due to events beyond the warehouse operator's control such as with records destroyed in a fire or other force majeure event, an alternative WATTs calculation may be used as described below.¹⁵³ The WATTs must be calculated using the equation and table below.

Table 3 Weighted Truck Trip Rates (WTTR)

Warehouse Type	WTTR (trips/1,000 sf)
≥200,000 sf	0.95
>100,000 – 199,999 sf	0.67
Cold Storage (≥100,000 sf)	2.17

Example calculation for a 250,000 square foot (non-cold storage) warehouse that experienced a force majeure event and lost 30 days of records:

$$250 \text{ tsf} \times 0.95 \text{ trips/tsf} \times 30 \text{ days} = 7,125 \text{ WATTs}$$

These calculated WATTs would be added to the other WATTs counted during the rest of the compliance period to determine the warehouse operator's WPCO.

REPORTING

Report Submission

Warehouse operators and owners subject to PR 2305 are required to submit reports to South Coast AQMD to provide details on their applicable warehouse operations and compliance. PR 2305 requires that all records used to demonstrate compliance be maintained by warehouse operators or owners, as applicable, for a period of no less than seven years and made available to South Coast AQMD upon request during normal business hours in order to determine compliance. Table 3 provides an overview of the reporting requirements for PR 2305. Appendix A to these Guidelines will provide a user's guide to the WAIRE Program Online Portal (POP) through which warehouse operators and owners will submit their required reports and pay necessary fees.¹⁵⁴

¹⁵³ This alternative calculation can only be used in cases of force majeure. Normal practice requires the warehouse operator to count all truck trips. Further details on the alternative WPCO calculation are available at PR2305 (d)(1)(C).

¹⁵⁴ This appendix will be developed if the rule is approved and once the WAIRE POP has been developed. If the WAIRE POP system is not available, all reports should be submitted to waire-program@aqmd.gov.

Table 4 Reporting Overview

WAIRE Program Report	Reporting Entity	Information Required	Due Dates
Warehouse Operations Notification (WON)	Warehouse Owners	<ul style="list-style-type: none"> • Warehouse size and area that may be used for warehousing activity, • Warehouse operator(s) name and contact information, • Lease end date (if applicable), • Previous warehouse operator(s) information, • Square footage used by the warehouse owner for warehousing activities 	<ul style="list-style-type: none"> • <u>On or before September 1, 2021</u> • Within 14 days of a new warehouse operator having access to at least of 50,000 square feet of space for warehousing activities, • Within 30 days after a renovation that alters the size of the warehouse, • Within 3 days of a request for the report from South Coast AQMD
Initial Site Information Report (ISIR)	Warehouse Operators*	<ul style="list-style-type: none"> • Warehouse size and space used for warehousing activities,** • Number of truck trips in the previous 12-month period,*** • Number of truck trips anticipated during the compliance period for which the upcoming AWR must be submitted, • Anticipated actions to meet the WPCO for the current compliance period, • Details on the following potential onsite equipment: owned or leased truck fleet, onsite alternative fueling stations, yard trucks, and onsite energy generation systems (e.g., solar) 	<ul style="list-style-type: none"> • On or before July 1 of the first compliance period when the warehouse operator must submit their first Annual WAIRE Report for that warehouse • Within 30 days of a request for the report from South Coast AQMD
Annual WAIRE Report (AWR)	Warehouse Operators*	<ul style="list-style-type: none"> • Truck trip counts for the compliance period, • Number of WAIRE Points earned for each action, • Associated metrics for the WAIRE Menu actions used to earn WAIRE Points 	<ul style="list-style-type: none"> • No more than 30 days after January 1 of the compliance period • If an operator vacates a warehouse before <u>the AWR submission deadline</u> in any year, they must submit an AWR <u>no later than the date they vacate the warehouse.</u>

* The warehouse owner may choose to comply on behalf of the warehouse operator, or may be required to submit the report if they are also the warehouse operator.

** If the warehouse building size is <100,000 sf, or if the warehouse operator leases <50,000 sf for warehousing activities, then no further reporting is required. Multiple warehouse operators owned or controlled by a single parent company collectively leasing ≥50,000 sf for warehousing activities in a warehouse do not qualify for this exemption from additional reporting. Also, if an activity is not expressly exempt from rule requirements, it is presumed to be subject to the rule.

*** Warehouses submitting an ISIR before July 1 2022 are only required to report truck trips since July 1, 2021.

Warehouse Operations Notification Report

The Warehouse Operations Notification (WON) must be submitted by an authorized official of the warehouse owner through the WAIRE POP online system. The applicable administrative fee listed in PR 316 must be submitted via e-check or credit card at the same time as the WON.

Warehouses owners submitting a WON for a warehouse with less than 100,000 square feet of floor area dedicated to warehousing activities are exempt from the reporting fee.

Warehouse Renovation or Size Change

In the event there is a change in the applicable 100,000 square feet or greater of indoor floor space within a single building that may be used for warehousing activities, a WON must be submitted within 30 days of receiving a certificate of occupancy from the applicable local building department. Example renovations could include expanding the size of the building to add more warehousing space, or constructing more office space within the warehouse such that the indoor floor space that may be used for warehousing activities is now less than 100,000 feet.

New Warehouse Operator

Any time a new warehouse operator takes over operational control of at least 50,000 square feet of a warehouse building with more than 100,000 square feet that may be used for warehouse activities, a WON must be submitted within 14 days to report that change. A typical example would include a new tenant's starting date for their lease.

Initial Site Information Report

The Initial Site Information Report (ISIR) must be submitted by an authorized official of the warehouse operator through the WAIRE POP online system. ISIRs are only submitted during the first compliance period a warehouse operator is occupying the warehouse¹⁵⁵, and prior to the first AWR unless requested by the South Coast AQMD Executive Officer. The applicable administrative fee listed in PR 316 must be submitted via e-check or credit card at the same time as the ISIR.

Warehouse Size

The ISIR must include the total indoor floor square footage of the applicable warehouse building and the amount of space the warehouse operator leases that may be used for warehousing activities. Typical records used to determine this information will be the operator's lease, information from the warehouse owner, and/or property tax assessment data. The warehouse operator may need to make their own determination about how much of the warehouse facility they can use for warehousing activities.¹⁵⁶ Vacant areas that may be used for warehousing activities (e.g., empty storage racks, open floor space designed for warehousing, drive paths for

¹⁵⁵ Additional ISIRs would be required to be submitted by the warehouse operator should they relocate to a different warehouse subject to PR 2305.

¹⁵⁶ Areas that may be used for warehousing activities include indoor spaces related to the storage and distribution of goods, including but not limited to the storage, labelling, sorting, consolidation and deconsolidation of products into different size packages. Supporting office administration (e.g., employee break areas, restrooms, offices, etc.), maintenance (e.g., vehicle maintenance or charging/fueling areas), manufacturing areas, or retail sales areas open to the general public, within the same warehouse building, that are physically separate from the warehouse area, are not considered warehousing activities.

pallet jacks or forklifts used in warehousing activities) must be included in the square footage calculation.

No additional reporting is required in the ISIR if 1) the total square footage that may be used for warehousing activities in that facility is less than 100,000 square feet, or 2) the warehouse operator's lease does not allow them to use more than 50,000 square feet for warehousing activities.

Truck Trips

There are two sets of truck trip data that must be reported in the ISIR. First, truck trips from the previous 12-month period must be recorded using the same types of methods used to determine the operator's WPCO (see discussion beginning on page 5). Because the ISIR is due by July 1, the typical applicable period for this reporting would be from the previous June 1 through May 31 period. Trips only need to be reported from periods when the operator occupied the warehouse. For example, if an operator's lease only began in September of that previous year, then truck trips only need to be reported from that period on.

Second, the operator must provide an estimate of the number of truck trips that will be reported during the applicable period for their upcoming Annual WAIRE Report. This estimate could just be an extrapolation of the data reported above for the previous 12-month period, or could include an estimate based on expected business through the end of the compliance period.

These two sets of truck trip data can serve as a basis for the operator to estimate their WPCO for that compliance period. However, the final WPCO used in the Annual WAIRE Report must be based on the actual truck trip counts during the compliance period itself (see discussion below).

Onsite Warehouse Equipment

The Initial Site Information Report requires information on existing onsite equipment at the warehouse for onsite fleets, ZE charging/fueling station, yard trucks, and solar panels. Baseline information on the onsite equipment is required to assist in calculating future WAIRE Points that may be potentially earned from the usage of the existing onsite equipment.

Anticipated Approach for Earning WAIRE Points

Using the truck trip data provided in the ISIR (described above) and the subsequent estimated WPCO, the warehouse operator must also submit how they anticipate meeting that WPCO for the current compliance period. This could include any combination of approaches from the WAIRE Menu, a Custom Plan, transferred Points, or the mitigation fee. This portion of the report is a planning exercise to assist the operator and the South Coast AQMD on the anticipated mechanisms that will be used for compliance. Recognizing that conditions can change, the actual approach used to earn WAIRE Points in the Annual WAIRE Report does not need to follow the approach outlined in the ISIR.

Annual WAIRE Report

An Annual WAIRE Report (AWR) must be submitted by every warehouse operator who must satisfy a WPCO for every compliance period, beginning with their Initial Compliance Period (see page 4). Warehouse owners who intend to voluntarily want to earn WAIRE Points, on

behalf of a warehouse operator, must also submit an AWR at the end of the compliance period when the Points were earned. The AWR must be submitted by an authorized official of either the warehouse operator, or owner if the WAIRE Points are earned by the owner, through the WAIRE POP online system. The applicable administrative fee listed in PR 316 must be submitted via e-check or credit card at the same time as the AWR.

Truck Trip Counts

The number of truck trips for the compliance period must be reported specifying the number of Class 2b-7 straight trucks and Class 8 tractors that entered or exited the warehouse site, following the methods described beginning on page 5. Upon entering the truck trip data for the compliance period into the WAIRE POP system, the corresponding WPCO will be displayed using the equation shown on page 5.

Earned WAIRE Points

The warehouse operator must report how the WPCO was satisfied in terms of how many WAIRE Points were earned from:

- 1) Each WAIRE Menu action, and/or
- 2) Actions in an approved Custom WAIRE Plan, and/or
- 3) Points transferred from another site, the warehouse owner, or banked from a previous year, and/or
- 4) The mitigation fee.

For WAIRE Points earned from the WAIRE Menu, the warehouse operator must report the associated level of implementation using the reporting metrics for each WAIRE Menu action (see Table 3 of PR 2305). The applicable increments of progress must be reported for actions implemented from an approved Custom WAIRE Plan. For WAIRE Points that were transferred or banked, the original method used to earn those WAIRE Points must also be reported, including who originally earned the WAIRE Points and when and how the WAIRE Points were earned.

RECORDKEEPING

Adequate records that document all reported information must be maintained for seven years after the applicable report was submitted and be available upon request during normal business hours. While summarized information is reported in the WON, ISIR, and AWR, during audits and field inspections South Coast AQMD staff will require warehouse operators and owners to provide detailed records in order to verify the accuracy of the information submitted.

WAIRE MENU

The WAIRE Menu provides flexibility in a warehouse operator's ability to comply with the WPCO. Table 3 in PR 2305 provides the WAIRE Menu showing the actions, the annual metrics, and the WAIRE Points based on the listed annual metric. The following discussion describes the factors that South Coast AQMD staff will review during audits and inspections for each WAIRE Menu option. Table 4 below provides an overview of the reporting metrics that warehouse operators must report on their AWR to earn WAIRE Points from the WAIRE Menu.

Table 4 – WAIRE Menu Item Metrics

WAIRE Menu Action/Investment	WAIRE Menu Reporting Metric for Each Compliance Period
Acquire ZE/NZE Trucks	Number of ZE/NZE Trucks Acquired by Truck Class
Visit from ZE/NZE Trucks	Number of ZE/NZE Truck Visits
Acquire ZE Yard Trucks	Number of ZE Yard Trucks Acquired
Use ZE Yard Truck	Number of Hours a ZE Yard Truck Operated
Install Onsite Solar Panel System	Kilowatt Rating of Installed System
Use Onsite Solar Panel System	Number of kWh Generated by the Solar Panel System
Install Stand-Alone MERV 16 or Greater Air Filtration Systems	Number of Stand-Alone Air Filtration Systems Installed
Replace MERV 16 or Greater Air Filters	Number of MERV 16 or Greater Air Filters Replaced

NZE/ZE Truck Acquisition

Many warehouse operators already own and operate trucks, and they may acquire NZE or ZE trucks for their fleet to earn WAIRE Points. Vehicle Identification Numbers and records verifying that the truck was acquired by the warehouse operator must be kept. Acquisition could include purchasing, leasing, or renting trucks. If a truck is leased or rented, the WAIRE Points earned for that temporary acquisition are proportional to the amount of the compliance period that the truck is leased or rented. For example, if truck is leased for 6 months of a 12-month compliance period, the number of WAIRE Points earned would be one half of the amount shown in Table 3 of PR 2305. In the case of a Class 6 NZE truck, the warehouse operator would earn 13 WAIRE Points, instead of the 26 WAIRE Points shown in the WAIRE Menu for the full annual period.

NZE trucks fueled by natural gas have been commercially available for the past few years in a variety of Classes, with engines ranging from 6.7 liters to 11.9 liters to serve both medium duty and heavy duty applications.¹⁵⁷ NZE engines are defined as the lowest non-zero optional low

¹⁵⁷ <https://www.epa.gov/sites/production/files/2021-01/documents/420f21002.pdf>,
<https://ww3.arb.ca.gov/msprog/onroad/cert/cert.php#6>,
https://www.ngvamerica.org/vehicles/availability/?vehicle_type=heavy-duty-truck-oems

NOx standard at the time of the engine's manufacture, which is currently 0.02 g/bhp-hr. One benefit of NZE is that publicly accessible fueling infrastructure for trucks already exists throughout the region and beyond.¹⁵⁸

Many ZE trucks are also commercially available today in a variety of truck Classes, and many more are expected in the next few years.¹⁵⁹ In the near term, charging or fueling infrastructure may be installed at a warehouse facility (which also would earn WAIRE Points), or may be available from a truck leasing company. Additional ZE charging and fueling infrastructure is expected to be installed in the coming years.

If a warehouse operator earns WAIRE Points from the acquisition of ZE or NZE trucks, they will need to retain records of the purchase, lease, or rental of the truck (such as a purchase invoices, or lease agreement), and documentation (e.g., onsite video or photographs from multiple days) that the truck serves that warehouse facility (e.g., that it is domiciled at that site or regularly visits that site). The purchase, lease, or rental documentation must contain enough information to demonstrate that the truck is NZE or ZE, as well as the truck Classification (e.g., the gross vehicle weight rating).

Existing funding programs¹⁶⁰ like Carl Moyer, Proposition 1B, Hybrid Voucher Incentive Program, etc. cannot be used to purchase a truck and also earn WAIRE Points for truck acquisition due to statutory prohibitions preventing those incentive programs from being used to comply with a regulation. The warehouse operator therefore has the option of either receiving incentives to reduce the purchase price of a NZE or ZE truck or foregoing the incentives to earn WAIRE Points for the NZE/ZE truck acquisition.

NZE/ZE Truck Visits

WAIRE Points may also be earned for every visit to a warehouse by a NZE or ZE truck.¹⁶¹ It is important to note, that WAIRE Points for acquisition and visits from the same truck can be earned in the same compliance period. Trucks that were purchased using incentive funds from the previously described funding programs, can be used for crediting towards number of ZE or NZE truck visits. WAIRE Points are earned for each NZE or ZE truck visit, which includes the truck trip into and out of the facility. The number of truck trips to earn WAIRE Points can be more or less than the annualized metric in the WAIRE Menu. WAIRE Point values from the WAIRE Menu can be ratioed (for any WAIRE Menu action), as demonstrated in the following example. In the WAIRE Menu, 42 Points are earned for 365 visits from a Class 8 NZE truck. If a warehouse operator has 1,000 Class 8 NZE truck visits during their compliance period, the number of WAIRE Points earned would be:

$$\frac{42 \text{ Points}}{365 \text{ visits}} = \frac{XX \text{ Points}}{1,000 \text{ Visits}} \rightarrow 115.1 \text{ Points}$$

¹⁵⁸ https://afdc.energy.gov/fuels/natural_gas_locations.html#/analyze?region=US-CA&fuel=LNG&fuel=CNG&lng_vehicle_class=HD&show_map=true&cng_vehicle_class=HD

¹⁵⁹ <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/>

¹⁶⁰ <http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades>

¹⁶¹ Trucks that have been purchased through incentive programs can earn WAIRE Points at the same level as trucks that are not incentivized.

NZE and ZE truck visits can come from the warehouse operator's own fleet or by any other third party fleet (whether contracted by the warehouse operator or not). NZE and ZE truck visit counts must be made contemporaneously with the trips and records documenting the visits must be verifiable by South Coast AQMD staff. Example methods to record these truck visits are described below.

1. Trucker check-in – Many warehouses already require some type of check-in from truck drivers when they arrive onsite. As part of that check-in process, warehouse operators could fill out a short form with the following information for every ZE or NZE truck that visits the site¹⁶² (either themselves or through a form filled out by the truck driver):
 - a. The date and time that the truck arrived
 - b. Truck license plate number¹⁶³ and Vehicle Identification Number (VIN)
 - c. Truck fuel type (e.g., natural gas, electric, hydrogen)
 - d. Trucking Company Name, DOT number, and contact phone number (if not owned by the warehouse operator)
 - e. If filled out by a truck driver unaffiliated with the warehouse, the driver's name and signature confirming that the above information is accurate
2. Electronic Telematics System (ETS) – ETS systems are increasingly used to track truck activity, and warehouse operators that employ these systems can use the data it collects and supplement it with truck characteristics (i.e., items b. through d. above) to determine how many NZE and ZE visits occur.
3. Security Cameras – Cameras may be used to record the trucks entering or exiting a warehouse site and document the truck license plate number (using either manual or automated tracking), and potentially other information such as fuel type, trucking company name, and DOT number. Information from items (incomplete sentence)
4. Contractual Records – Some warehouse operators arrange for trucking services from third party fleets. Provisions within the contract requiring NZE or ZE trucks to be used (and resulting in a specified number of visits) could be used as one method of documentation. Additional documentation verifying that the NZE or ZE trucks have actually visited the warehouse must also be maintained.

ZE Yard Trucks

Yard trucks are utility trucks that can be classified as on-road or off-road vehicles and are typically used to move trailers and containers around a warehouse yard or to nearby locations. NZE yard trucks are not included as an option in the WAIRE Menu but may earn WAIRE Points in a Custom WAIRE Plan (further details are provided in the Custom WAIRE Plan section). WAIRE Points may be earned for the acquisition¹⁶⁴ as well as the use of the ZE yard truck within

¹⁶² As a point of reference, for a typical 250,000 sf warehouse that has about 42 Class 8 truck visits per day, only about 5 NZE Class 8 truck visits would be required per day on average (at a stringency of 0.0025) if this method was used to earn WAIRE Points.

¹⁶³ The license plate number of the truck/tractor, not the trailer.

¹⁶⁴ Similar to the discussion on truck acquisitions above, existing incentive programs cannot be used to acquire ZE yard trucks, due to limitations within the incentive funding programs.

the same compliance period. Proof of the acquisition of the ZE yard truck in the form of receipt, invoices, contract or similar documents must be kept by the warehouse operator.

Warehouse operators must keep records of the number of hours of ZE yard truck use during every compliance period for which it earns WAIRE Points. In most cases the operating hours for a yard truck can be obtained from an hour meter on the yard truck. If the yard truck does not have an hour meter installed, a warehouse operator could have one installed as a way to document the hours of operation needed to earn WAIRE Points, or the hours could be recorded through other means (like a time sheet). The hours of operation should be logged regularly either weekly or monthly to keep the records accurate and prevent errors in reporting the annual metric.

ZE Charging or Fueling Infrastructure

ZE charging or fueling infrastructure for on-road vehicles and yard trucks¹⁶⁵ can earn WAIRE Points when installed¹⁶⁶ and when used.¹⁶⁷ NZE fueling infrastructure installation or use is not included as an option in the WAIRE Menu and is prohibited from earning WAIRE Points in a Custom WAIRE Plan. Warehouse operators will need to consult with warehouse owners, local utilities, and local building departments prior to installing ZE infrastructure. Warehouse facility or land owners may also voluntarily install the ZE infrastructure and earn WAIRE Points, and subsequently transfer those WAIRE Points to the warehouse operator(s) at that site. Offsite installations can earn WAIRE Points, but only through a Custom WAIRE Plan.

Electric Charging Infrastructure Installation

A long lead time may be needed to install electric charging infrastructure at some sites, and WAIRE Points may be earned for several milestones that are achieved during project completion. The table below describes the milestones and examples of the documentation needed to verify that the milestone was achieved.

Electric Charger Installation Milestone	Examples of Documentation
Acquisition of the charger(s) (also called EVSE's)	Invoices and photo/video documentation that the chargers have been delivered to the site. Records of any incentives or rebates received for the chargers or charger installation.
Initiating onsite construction	Copies of permits and photo/video documentation showing that construction was initiated.

¹⁶⁵ ZE charging/fueling infrastructure installations or usage for industrial trucks used indoors (e.g., pallet jacks or forklifts) cannot earn WAIRE Points.

¹⁶⁶ In order to avoid potential problems of low quality workmanship and subsequent safety concerns, warehouse operators and owners earning WAIRE Points from installing ZE infrastructure are encouraged - though not required - to use a skilled and trained workforce as defined in Public Contract Code section 2601 for all construction work, and follow the Public Utilities Code section 740.20, subdivision (2) requirement that at least 25 percent of the total electricians working on an electric vehicle infrastructure project, at any given time, hold Electric Vehicle Infrastructure Training Program certification.

¹⁶⁷ Similar to truck acquisitions, most incentive funding programs from CARB, South Coast AQMD, and the Energy Commission cannot be used to install charging infrastructure used to earn WAIRE Points. However, utility programs like Southern California Edison's Charge Ready Transport program have different requirements and do not have the same restrictions.

The latter of final energization or permit sign-off for the system	Permit records and/or photo/video documentation of the system in use.
--	---

The WAIRE Menu only includes ZE charging infrastructure up to 350 kW. Chargers with higher ratings are not yet commercialized but are expected in the near future. Warehouse operators can earn WAIRE Points for these larger systems through a Custom WAIRE Plan. WAIRE Points can also be earned for installing chargers for Transportation Refrigeration Units (TRUs). As of February 2021, CARB is currently developing a new regulation that could mandate the installation and use of TRU chargers at cold storage warehouses covered by PR 2305. In order to earn WAIRE Points for TRU charger installations, if CARB’s proposed rule is adopted and goes into effect, warehouse operators would be required to either install more chargers than required by CARB’s rule in any given year, or install chargers before CARB’s rule requires them.

Electric Charging Infrastructure Usage

Warehouse operators earning WAIRE Points from charger usage¹⁶⁸ for on-road vehicles and/or yard trucks are required to report total kWh dispensed from charging stations at that site. Charger usage earns WAIRE Points equally for trucks owned by a warehouse operator and for third party fleets. Individual charger kWh are not required to be recorded or reported if a single master electrical meter is dedicated to all chargers and does not serve any other electrical loads (this is a common setup in charger installations). Records documenting this electrical usage would typically include electric utility bills, but could also include photo documentation of meter readouts, or charging software system reports.

Similar to the discussion above for TRU charger installation, if CARB’s proposed rule on TRU’s is approved and goes into effect, WAIRE Points may only be earned for TRU charging if it exceeds requirements in CARB’s rule. Records must be kept documenting how the usage goes beyond CARB requirements for any WAIRE Points earned in this situation.

Hydrogen Station Installation and Use

Hydrogen station installations are expected to occur on a faster timeline than electric charging infrastructure, and specific milestones are not included in the WAIRE Menu. WAIRE Points may be earned upon final station installation and availability for fueling. Records documenting the station installation can include permit records, invoices, and photo/video documentation of the station. The WAIRE Menu assigns 1,680 WAIRE Points for the installation of a hydrogen station capable of dispensing 700 kg/day for on-road vehicles and/or yard trucks. Similar to the ratio method described in the truck visit section, stations with higher or lower throughput capacities would receive proportionally more or less WAIRE Points than listed in the WAIRE Menu.

Hydrogen station use must be reported in total kilogram dispensed during the compliance period. The station can be used for the warehouse operator’s own fleet or for third party trucks. Records

¹⁶⁸ Warehouse operators may obtain Low Carbon Fuel Standard (LCFS) credits and/or revenue from those credits and still earn WAIRE Points for that dispensed electricity.

documenting this use should include a meter read-out and can also include invoices for delivered hydrogen, or other similar records.

Solar Panel System Installation and Use

Solar panel system installations can be installed either on the roof of the warehouse or as a carport configuration. Warehouse operators will need to consult with warehouse owners, local utilities, and local building departments prior to installing solar panel systems. Additionally, the warehouse facility or land owner may voluntarily install the solar panels and earn WAIRE Points that they can subsequently transfer to their warehouse operator(s). Proof of the installation of the solar panel system and its kilowatt (kW) rating in the form of receipt, invoices, contract, photos/videos, or similar documents should be maintained for future audits and inspections. WAIRE Points will be awarded upon the latter date of system energization or final permit sign-off.

The total energy produced by the solar system is typically recorded through software systems and may differ from reports provided by utilities. The total system energy production (measured in kilowatt-hours or kWh) is available to earn WAIRE Points, not just the net energy reported by the utility. Both the installation size and the system usage can be scaled using the ratio method described in the truck visits section.

Air Filtration Systems

Air filtration systems can be installed or air filters replaced at residences, schools, daycares, hospitals, or community centers within three miles of the warehouse in order to reduce exposure to particulate matter.¹⁶⁹ The minimum type of filters that can be installed or replaced are minimum efficiency reporting value (MERV) 16 or greater efficiency. Records documenting the number of systems installed or filters replaced could include invoices, contracts, photos/videos of installed systems, or similar documents. The documentation must include proof that the systems were actually installed, and not just purchased. Earning WAIRE Points with this approach will therefore require coordination with, and voluntary cooperation from other entities. Air filtration system installations and filter replacements can be scaled using the ratio method described in the truck visits section.

¹⁶⁹ Example systems are described here:

<http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf>

CUSTOM WAIRE PLANS

PR 2305 provides the option of proposing a Custom WAIRE Plan for actions that are not on the WAIRE Menu. WAIRE Points can only be earned upon approval of the Custom WAIRE Plan, any action or investments made prior to the approval of the Custom WAIRE Plan will not be considered for WAIRE Points. The process for applying for a Custom WAIRE Plan is shown in Figure 3 below. Custom WAIRE Plan Applications must be submitted through the WAIRE POP system, or as otherwise directed by South Coast AQMD, along with the applicable fee in PR 316.

Some examples of potential Custom WAIRE Plan proposals include jointly owned off-site ZE charging or fueling infrastructure, the use of battery storage systems or energy management that reduces emissions from local natural gas fired powerplants, and the acquisition and/or usage of NZE yard trucks. NZE yard trucks may be submitted as a Custom WAIRE Plan for consideration but only if they only utilize renewable fuels such as renewable natural gas (RNG), renewable propane, or other equivalents.¹⁷⁰ The section below provides an example of a Custom WAIRE Plan calculation methodology to earn WAIRE Points for NZE yard trucks.

NZE Yard Truck WAIRE Points Calculation Example

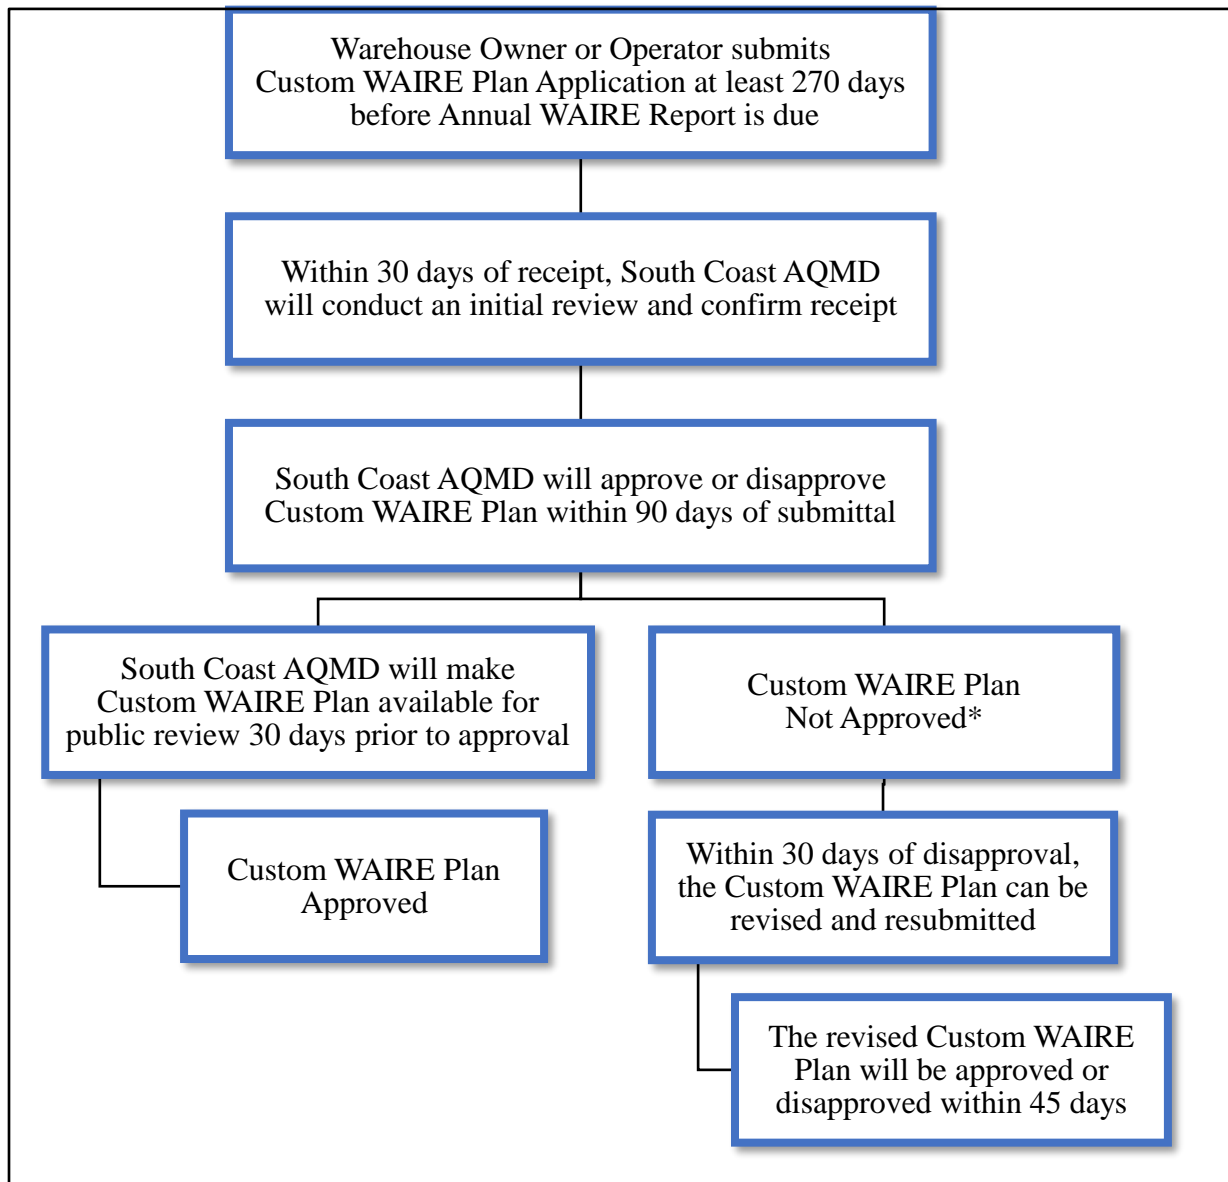

The acquisition and/or use of NZE yard trucks may be proposed as a Custom WAIRE Plan if the NZE yard truck's engine meets CARB's lowest Optional Low NOx standard (currently 0.02 g/hp-hr) applicable at the time of engine manufacture and is fueled with renewable fuels. The expected WAIRE Points for NZE yard trucks in a Custom WAIRE Plan are shown below, following the same methods as is described for ZE yard truck acquisition and usage in Appendix B – WAIRE Menu Technical Report.¹⁷¹

Acquire One NZE Yard Truck = 42 WAIRE Points

Use One NZE Yard Truck for 1,000 hrs in a year = 288 WAIRE Points

¹⁷⁰ Renewable fuels include any non-fossil fuel whose carbon intensity is lower than the applicable standard for that year as determined through CARB's Low Carbon Fuel Standards program.

¹⁷¹ The following key assumptions are used here: \$50,000 incremental acquisition cost relative to diesel counterpart, \$2,250 incremental annual usage cost relative to diesel (<https://cleanairactionplan.org/documents/final-cargo-handling-equipment-che-feasibility-assessment.pdf/>), 90% of the NOx emissions benefit as a ZE yard truck, and 100% of the Diesel PM benefit of a ZE yard truck.

Figure 3 – Custom WAIRE Plan Application Process

* A disapproval will identify the deficiencies in the application that must be revised before approval can be considered. Applications that have not been explicitly approved within the review period are presumed to be disapproved.

Custom WAIRE Plan actions must meet similar criteria to the analysis conducted for the actions and investments included in the WAIRE Menu. Custom WAIRE Plan Applications must include the following elements:

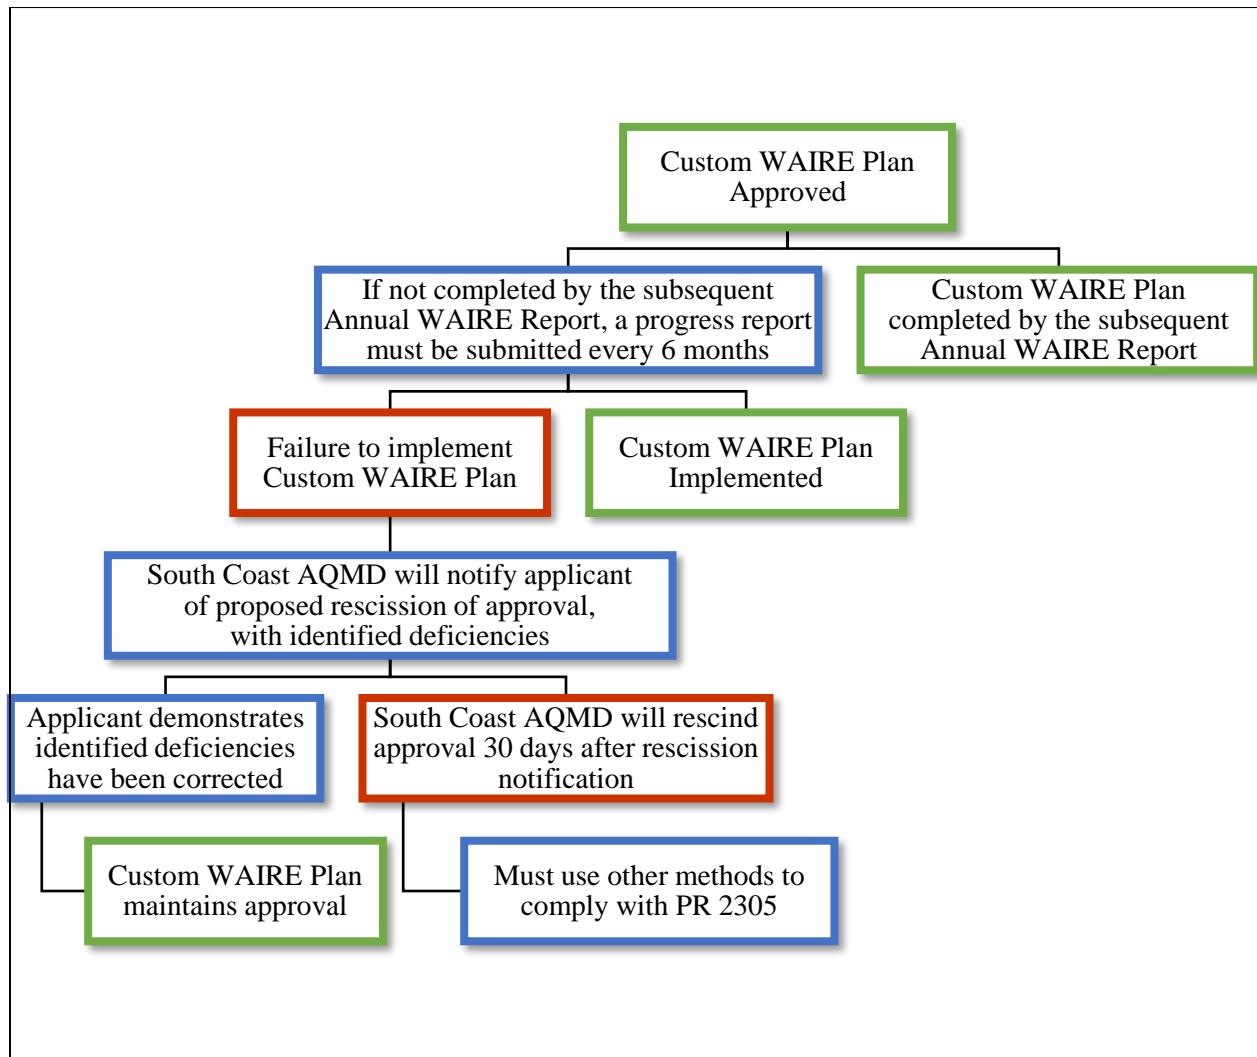

- A demonstration how the proposed action will earn WAIRE Points based on the incremental cost of the action, the NOx emission reductions from the action, and the DPM emission reductions from the action, relative to baseline conditions if the warehouse operator had not completed the action in that compliance period,
 - Baseline conditions should be calculated using the latest emissions estimation methodologies, such as those used in the most recently approved Air Quality Management Plan. The calculation of WAIRE Points from actions in a Custom WAIRE Plan should be consistent with the calculation methodologies included in the WAIRE Menu Technical Report included as Appendix B to the PR 2305 Staff Report. Emission reductions that go beyond baseline conditions must consider the effect of existing regulations that phase in through time, if applicable.
- A demonstration how WAIRE Points earned from the Custom WAIRE Plan for emission reductions are quantifiable, verifiable, and real,
- A description of how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but no later than three years after plan approval,
 - All Custom WAIRE Plans must result in emission reductions, or directly facilitate emission reductions. Examples of facilitating projects could include installation of ZE charging infrastructure at an offsite location or acquisition of ZE TRUs that go beyond CARB requirements.
- A quantification of expected NOx and/or DPM emission reductions from the proposed actions within the South Coast AQMD and within three miles of the warehouse,
 - All Custom WAIRE Plan projects, including facilitating projects, must result in verifiable NOx and/or DPM emission reductions within three miles of the warehouse.
- A description of the method to be used to verify that the proposed actions will achieve NOx and/or DPM emission reductions,
 - Example methods documenting how the effectiveness of an action can be verified are included in these Guidelines for WAIRE Menu items.
- A schedule of key milestones showing the increments of progress to complete the proposed actions,
- A description of the location and a map of where the proposed actions will occur,
- Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the Custom WAIRE Plan

Custom WAIRE Plan Milestones

The timetable of an approved Custom WAIRE Plan application allows for at least six months to implement the custom WAIRE Plan project (or three and a half months if the application was disapproved, resubmitted, and then approved). Some projects may take longer to implement and could extend beyond the compliance period when the Custom WAIRE Plan application was submitted. In these cases, a progress report must be submitted every six months after the Custom

WAIRE Plan was approved. In the event milestones are not reached, the progress report must explain the conditions that resulted in the milestone not being reached and propose a new milestone date. If in reviewing the progress report, South Coast AQMD staff determines that progress on the approved Custom WAIRE Plan is not adequate, a notice may be sent to the Custom WAIRE Plan applicant advising of the inadequate progress. The Custom WAIRE Plan approval may be rescinded 30 days after the notice if the applicant does not demonstrate how the identified deficiencies have been corrected. Figure 4 shows the Custom WAIRE Plan implementation process.

Figure 4 – Custom WAIRE Plan Implementation

WAIRE MITIGATION FEE

Warehouse operators may earn WAIRE Points by paying a mitigation fee at \$1,000 per WAIRE Point, but any of the other methods that can earn WAIRE Points (i.e., the WAIRE Menu, Custom Plans, transferring) can be used to fully satisfy a warehouse operator's WPCO so that no mitigation fees are paid. There is also an additional 6.25% administration fee charged on top of any mitigation fees paid to cover South Coast AQMD's costs of administering the WAIRE Mitigation Program. Mitigation fees and accompanying administrative fees must be submitted through the WAIRE POP system with the AWR. Payments less than \$300,000 can be made by e-check or credit card. Payments larger than this must be mailed to South Coast AQMD or submitted in person.

The WAIRE Mitigation Fee Program is expected to provide incentives toward the purchase of NZE and ZE trucks and ZE charging and fueling infrastructure. Warehouse operators may apply for the WAIRE Mitigation Fee Program funds. However, similar to other funding programs, the incentivized vehicle or equipment may not earn WAIRE Points for its acquisition, only for its subsequent use. Further, any ZE charging or fueling infrastructure funded by the WAIRE Mitigation Program must be publicly accessible and cannot solely be for the use of the operator's private fleet.

Projects funded by the WAIRE Mitigation Program will be approved annually or more often by the South Coast AQMD Governing Board and will follow the policies described in the Board Resolution that accompanies PR 2305 as well as subsequent requirements set out by the Board (e.g., in future solicitations).¹⁷²

WAIRE POINTS TRANSFERS

WAIRE Points can only be transferred under limited situations, and only WAIRE Points in excess of the warehouse operator's WPCO may be transferred. The following are the three sole instances when WAIRE Points may be transferred or banked:

1. Excess WAIRE Points transferred to a warehouse operator's other warehouses:
If a warehouse operator conducts warehousing activities at more than one warehouse during any single compliance period, then WAIRE Points earned for one warehouse may be used at the other warehouse(s) under the operational control of that same warehouse operator. Only those points earned in excess of a warehouse operator's WPCO at that site may be transferred, and only for the current compliance period. Any WAIRE Points transferred to a different warehouse shall be discounted as shown in the rightmost column in the WAIRE Menu in Table 3 of PR 2305.
2. WAIRE Points transferred between a warehouse owner and operator:
A warehouse facility or land owner may voluntarily earn WAIRE Points during a compliance Period using the WAIRE Menu, a Custom WAIRE Plan, by paying a mitigation fee, or may have WAIRE Points transferred to them from the warehouse operator at that site. The warehouse facility or land owner may then transfer these WAIRE Points to any warehouse operator at the site where the WAIRE Points were earned within a three-year period after the points were originally earned. Any warehouse operator using these transferred WAIRE Points to satisfy a WPCO during this three-year period must demonstrate that any onsite improvements or

¹⁷² A link to the resolution will be added here if the rule is approved.

equipment installations that were used to earn the WAIRE Points being transferred are still operational at that warehouse facility in the year that WAIRE Points are used.

- a. Warehouse operators that vacate a warehouse before the end of a compliance period may transfer any excess WAIRE Points to the warehouse owner. These Points may then be transferred to the next warehouse operator.
3. Excess WAIRE Points banked for future use at that site:
 WAIRE Points in excess of the warehouse operator's WPCO in one compliance period may be banked for use in any of the next three compliance periods. After this time, any remaining banked WAIRE Points will expire and can no longer be used. WAIRE Points banked for future use in this way cannot be transferred to another warehouse. WAIRE Points may not be transferred to a subsequent compliance period if the WAIRE Menu items used to earn WAIRE Points are required by U.S. EPA, CARB, or South Coast AQMD rules and regulations in that subsequent year. An example could include CARB's anticipated TRU rule that could require charging infrastructure at a future date. Installations earlier than CARB requirements could earn Points and be banked for future years. However, the banked Points can no longer be used in any year in which CARB requires those chargers to be installed. Further, if any onsite improvements or equipment installations that were used to originally earn the WAIRE Points are no longer functional, the banked WAIRE Points may not be used to satisfy a WPCO. Finally, if WAIRE Points are earned prior to a warehouse operator's first compliance period, the three-year clock on banked WAIRE Points does not begin until after their first compliance period.
 In order to use banked WAIRE Points, the WAIRE Menu item that generated the WAIRE Points must still be onsite and was used for the compliance period that the WAIRE Points are to be used to comply with the WPCO. (Incomplete sentence) For Phase 2 and 3, there is an early action provision that allows for earning WAIRE Points ahead of their initial compliance period, and include a provision for the clock on three year life of the WAIRE Points for those early action WAIRE Points to not begin until after the initial compliance period.

It is the responsibility of the warehouse operator who uses transferred or banked WAIRE Points to keep records documenting how and when the WAIRE Points were originally earned. If WAIRE Points are transferred between the warehouse owner and operator, both entities must keep records documenting the agreement to transfer the WAIRE Points. To avoid any potential disputes, the agreement should be signed by authorized officials for both entities.

EXEMPTIONS

Warehouse operators may be exempt from parts of PR 2305 in ~~two~~three limited instances. First, warehouse operators who can only use less than 50,000 sq. ft. of a warehouse for warehousing activities are not required to earn any WAIRE Points. However, if the warehouse operator has the same parent company as another warehouse operator in the same building, and collectively they may use more than 50,000 sq. ft., then the exemption does not apply.

Second, warehouse operators with a calculated WPCO <10 are not required to earn any WAIRE Points but will still need to submit required reporting. This exemption is in place to reduce the burden on small warehouse operations with only a small volume of truck trips to their warehouse.

Third, there may be rare instances when a warehouse operator invests in new technology to comply with PR 2305. If that equipment malfunctions through no fault of the operator, then they may apply for an exemption from the portion of their WPCO for which that action applies. An example could include a warehouse operator who purchases a ZE or NZE truck that experiences a significant manufacturer's defect that renders the truck inoperable for an extended period of time. Applications for this exemption should be submitted to waire-program@aqmd.gov. Applications should include a description of the investment that has the defect, relevant details about the defect, and the number of WAIRE Points anticipated during the current compliance period from that investment for which the operator is seeking an exemption. The warehouse operator's WPCO should not be assumed to be reduced unless South Coast AQMD staff submits an approval of the exemption in writing or email. The application will be reviewed based on evidence provided by the applicant that the vehicle or equipment had defects caused by the manufacturer of the vehicle or equipment, or a defect in the installation of equipment following manufacturer-approved methods. Further, the applicant must demonstrate that they made a good faith effort to have the equipment or vehicle repaired but was unable to do so or do so in a timely manner.

COMPLIANCE PROGRAM

South Coast AQMD will periodically conduct both desktop and field audits for compliance with the WAIRE Program. The South Coast AQMD staff may contact warehouse owners and operators to request further documentation or clarification on submitted WAIRE Program reports. Additionally, South Coast AQMD inspectors may conduct field visits of the warehouse facilities. South Coast AQMD inspections are generally unannounced, and a South Coast AQMD inspector may visit a warehouse facility any time during regular business hours to verify a facility is following recordkeeping requirements and other applicable requirements. Upon arrival, the South Coast AQMD inspector will present proper South Coast AQMD identification and inform a facility representative of the purpose and scope of the inspection. Most inspections are conducted to verify the information submitted on the required WAIRE Program reports. An inspector may also request a tour of the facility to verify the onsite presence of any equipment related to WAIRE Program compliance. It is helpful if a facility representative familiar with the WAIRE Program assist with the inspection, and that an organized collection of the WAIRE Program related documents be readily available either as a hardcopy or digitally.

Some of the records that a South Coast AQMD inspector could inquire about include:

- Current contact information of warehouse operator
- Truck trip count records
- WPCO calculation and plans to earn WAIRE Points
- Copy of Initial Site Information Report
- Copies Annual WAIRE Report(s)
- Copy of any approved Custom WAIRE Plan(s)
- Fleet data (invoices, vehicle registration, model year, fuel type, license plate numbers)
- Information about any onsite energy generation equipment
- Information about any onsite alternative fueling station(s)
- Information about any onsite yard truck(s)
- Information on any air filter systems or filters installed or replaced for the surrounding community

- Copies of exemption documentation
- Copies of lease agreement

If South Coast AQMD staff identify a discrepancy in the warehouse operator's WAIRE Program reporting such as a an issue with the truck trip counts, the reporting metrics submitted, or similar differences, the South Coast AQMD inspector will discuss the issue(s) with the warehouse operator to determine the cause of the issue(s) or require further documentation and enforcement action may be taken. For example, if the warehouse operator submits in the Annual WAIRE Report that there were 100 ZE tractor visits for the compliance period, and if after verifying the 100 tractor VINs the South Coast AQMD staff determines that only 50 of the truck visits were actually ZE tractors, more detail on the truck visits may be required or a further review of the method for accounting for ZE trucks would be needed. If sufficient proof cannot be provided to support the 100 ZE tractor visits reported, then the warehouse operator may need to obtain more WAIRE Points to satisfy their WPCO. Frequently updating and tabulating reporting metrics would limit discrepancies and provide more documentation to support submitted WAIRE Program reports.

Appendix B: WAIRE MENU TECHNICAL REPORT**DRAFT WAIRE Menu Technical Report****OVERVIEW**

This technical report describes the methodology used to determine how WAIRE Points are attributed to each of the actions on the WAIRE Menu provided in PR 2305. Section 1 of this report presents an overview of how the Points are determined within the Menu, while all subsequent sections presents detailed methodologies for each Menu item.

SECTION 1) WAIRE Points Calculation Methodology

This section describes the general methodology used to determine how WAIRE Points are attributed to each of the actions on the WAIRE Menu. While this methodology is used to determine the value of each WAIRE Menu action during the rulemaking process, warehouse operators and/or owners will not need to use this calculation methodology document to determine how to comply with the rule. For compliance, warehouse operators (and in some cases owners if they choose to comply on behalf of their operator) will only need to consult the WAIRE Menu itself to determine how many actions, or how much of each action to complete for compliance.

WAIRE Points may be earned in two ways, through the purchase of near-zero (NZE) and zero emission (ZE) equipment or equipment that facilitates its use, and through the usage of NZE and ZE equipment. WAIRE Points are assigned based on three key parameters, cost, regional emissions reductions, and local emissions reduction. The cost parameter is based on the incrementally higher cost a warehouse operator faces when choosing to purchase NZE/ZE equipment (compared to conventional diesel technology). The regional emissions reduction parameter is based on the reduction in nitrogen oxides (NOx) emissions from using ZE/NZE equipment. The local emissions reduction parameter is based on the reduction in Diesel Particulate Matter (DPM)¹ from using ZE/NZE equipment.

In practice, the actual costs and emission reductions of each implemented action will likely vary for each warehouse operator. Calculating these unique values on a case-by-case basis would impose a considerable administrative burden to both the regulated community and to South Coast AQMD. In order to simplify compliance and administration of PR 2305, WAIRE Points for each Menu action are determined using representative default values described in the calculation methodology summaries that follow.

Section 1a) WAIRE MENU ANNUALIZED UNITARY METRICS AND BINS
WAIRE Points values in the WAIRE Menu are determined for each action based on a single Annualized Unitary Metric (AUM). The AUM is the default level of implementation used for

¹ DPM is both a component of the criteria pollutants PM10 and PM2.5, and a toxic air contaminant. Emissions of DPM from warehouse indirect sources can contribute to high-level, localized pollutant concentrations that can significantly affect air quality and public health for populations near warehouses.

calculating each WAIRE Menu action's Points. For example, the AUM for the truck acquisition WAIRE Menu action is one truck acquired during the compliance year. The cost and regional and local emissions reductions are calculated for acquiring one truck and used to determine the default WAIRE Point value for that Menu action. Warehouse operators use these default Point values in the WAIRE Menu to determine how many Points they earned in total depending on their level of implementation. For example, the default Point value in the Menu for acquiring one ZE class 8 truck is 126 Points. If a warehouse operator acquired five ZE trucks, they would earn a total of 630 Points (126 Points for each truck acquisition). Similarly, for ZE class 8 truck visits, the AUM of 365 visits per year (one per day on average) yields 27 Points in the WAIRE Menu. If a warehouse operator only has 100 ZE class 8 truck visits during a compliance year, they would earn a total of 7.4 Points² $[(100 \div 365) \times 27 = 7.4]$. The AUM's for each WAIRE Menu action are described in the individual calculation methodology summaries that follow.

WAIRE Points are also calculated using a point binning system to simplify the merging of the cost, regional emission reduction, and local emissions reduction parameters. For the AUM, Points are earned for each \$25,000 incremental cost, 25-pound NOx regional emission reduction, and 0.25-pound DPM local emission reduction. Once these three parameters are calculated, their binned points are summed to yield the total default WAIRE Points earned for that action.

Section 1b) COSTS:

The costs for each WAIRE Menu action are based on the annualized incremental costs difference between the new ZE/NZE technology and the costs of the conventional diesel equivalent. Due to existing statutory or regulatory prohibitions, most state incentive funding programs used to offset the higher purchase price of ZE/NZE vehicles and equipment cannot be used to aid in complying with state or federal law or South Coast AQMD rules or regulations³, and incentive funds are not considered in these costs. However, WAIRE Points may be earned from the usage of incentivized vehicles/equipment. For example, if a warehouse operator owns a fleet of trucks, and they want to purchase a ZE or NZE truck, they will need to decide among two options. First, they could purchase the truck at full price and receive WAIRE Points for that action. Second, they could instead choose to receive incentive funding for that purchase but not earn any WAIRE Points for the truck purchase. In both instances, they would be allowed to receive WAIRE Points for the visits that this truck makes to their warehouse.

² WAIRE Points are calculated to no more than one decimal place.

³ California Health and Safety Codes 44281(b), 44391.4(a), 44271(c), CCR Title 13, Ch. 8.2 Sec. 2353 (c)(4), Moyer Guidelines Ch. 2, CA Beneficiary Mitigation Plan

Section 1c) REGIONAL EMISSION REDUCTIONS:

Regional emission reductions are calculated in two ways. First, NOx reductions are calculated from using ZE/NZE vehicles and equipment for activities associated with the warehouse. Second, regional NOx emission reduction Points are calculated for WAIRE Menu items affiliated with the acquisition of ZE/NZE vehicles/equipment at a rate of \$100,000 per ton of NOx. This is the cost effectiveness threshold that South Coast AQMD utilizes in its Carl Moyer incentive funding program. These regional emission reduction Points are assigned to these acquisition Menu items because if a facility chose to pay that level of funding as a mitigation fee, South Coast AQMD would likely spend the funds using the same cost effectiveness threshold.

Section 1d) LOCAL EMISSION REDUCTIONS:

Local emission reductions are calculated in a similar manner as regional emission reductions, except that Diesel Particulate Matter (DPM) is used instead of NOx.

Section 1e) EXAMPLE:

Figure 1, below, presents one example of how the calculation methods discussed above would yield the total WAIRE Points earned. In this example, an AUM would cost \$20,000 and result in a 60 lbs/year NOx reduction, and a 0.4 lbs/year DPM reduction. Combining the three together would result in a total of 6 WAIRE Points. Specific calculations for each WAIRE Menu action are included in the following sections.

Figure 1: WAIRE Points Calculation

SECTION 2) Zero and Near-Zero Emission Truck Visits and Truck Acquisitions

Description: Two key factors affect the analysis of ZE and NZE trucks – the definitions of ZE and NZE, and the truck class. In the context of PR 2305, the definition of a ZE truck is the same as CARB’s Advanced Clean Trucks Regulation definition. At the time of this writing, CARB’s draft definition for ZE truck is one “*with a drivetrain that produces zero exhaust emission of any criteria pollutant (or precursor pollutant) or greenhouse gas under any possible operational modes or conditions.*” For PR 2305 a NZE truck is one in which the engine meets CARB’s lowest Optional Low NOx standard at the time of manufacture, which is currently 0.02 g/hp-hr NOx.

In addition to drivetrain technology, trucks are commonly classified based on their Gross Vehicle Weight Rating (GVWR). Throughout this document Class 2b-7 refers to heavy duty trucks with GVWR of 8,501 – 33,000 lbs and Class 8 trucks with GVWR of greater than 33,000 lbs. Table 1 below presents truck classifications.

Table 1. Truck Classes

Truck Class	GVWR (lbs)
Class 2b	8,501 – 10,000
Class 3	10,001 – 14,000
Class 4	14,001 – 16,000
Class 5	16,001 – 19,500
Class 6	19,501 – 26,000
Class 7	26,001 – 33,000
Class 8	33,001 & over

Commercial Availability: The ZE truck market is beginning to grow rapidly with many models entering the commercial market today and many major manufacturers announcing plans for future commercialization of battery-electric and hydrogen fuel cell electric trucks.⁴ Some notable manufacturer announcements include: Daimler Class 8 eCascadia, Navistar battery-electric Class 8, Volvo battery-electric VNR Class 8, Tesla’s long range battery-electric tractor, BYD’s battery-electric Class 6 and 8, Nikola’s and Kenworth (in conjunction with Toyota) hydrogen fuel cell tractors, Sea Electric Class 4-8 battery-electric trucks, Lion Electric’s Class 6-8 battery-electric trucks, Amazon’s order of 100,000 Rivian’s battery electric trucks, etc. NZE engines are currently available in two sizes – 11.9 liter and 8.9 liter. Major truck manufacturers offer these engines in different truck classes, including for class 8 regional haul and/or drayage truck operations.

Operation: Trucks that visit warehouses may be owned by the warehouse operator, or by a motor carrier not affiliated with that warehouse. Arrangements for truck visits to the site to deliver or pick up goods is typically made by the owner of the goods, or someone acting on their behalf. As such, each individual truck visiting a warehouse can have a unique operating profile that may not be shared by any other truck visiting that site. One truck may travel 30 miles on the inbound trip, and only two miles on the outbound trip. Another truck may be loaded with goods from multiple warehouses or stores, and determining what portion of a trip to attribute to each warehouse would be impractical. Finally, trucks may idle their engines for short periods while at the

⁴ A useful reference is the online ZETI tool. <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/>

warehouse before or after the trailer is dropped off/picked up. For the emissions and cost analyses presented below, input parameters are meant to be broadly applicable and may not reflect any one individual truck trip or truck acquisition.

SECTION 2a) ZE/NZE Truck Acquisitions⁵

ZE/NZE Truck Purchase Prices: Several key references were consulted to estimate incremental purchase prices for NZE and ZE trucks relative to conventional diesel trucks including: CARB's Advanced Clean Truck Regulation (ACT), Standardized Regulatory Impact Assessment (SRIA)⁶ and Total Cost of Ownership Discussion Documents⁷, California Energy Commission's Revised Transportation Demand Forecast⁸, the Ports' Feasibility Study⁹, ICF's Intensive Literature Review for Medium and Heavy-Duty Electrification in California¹⁰, NACFE's TCO Calculator¹¹, as well as data from South Coast AQMD's Carl Moyer Grant Program and CARB's HVIP program. While cost estimates vary somewhat among these references, the single point estimates shown in Table 2 below are consistent with these previous analyses.

Table 2. Incremental Costs for NZE and ZE Truck Purchases

WAIRE Menu Item		Annualized Unitary Metric	Incremental Cost (\$/metric)
Class 8 Truck	NZE	1 truck purchased	\$65,000
Class 4-7 Truck			\$30,000
Class 8 Truck	ZE		\$150,000
Class 4-7 Truck			\$80,000
Class 2b-3 Truck			\$16,000

WAIRE Points for ZE/NZE Truck Acquisitions: Acquisition of NZE Class 8 and Class 4-7 trucks earns 3 and 2 WAIRE Points, respectively. Similarly, the acquisition of ZE Class 8, Class 4-7, and Class 2b-3 trucks earns 6, 4, and 1 WAIRE Points, respectively. In addition, using a cost-effectiveness of \$100,000 per ton of NO_x, WAIRE Points for regional emission reductions for Class 8 and 4-7 NZE truck acquisitions are 52 and 24 WAIRE Points, respectively. For ZE truck acquisitions, Class 8, 4-7, and 2b-3 earns 120, 64, and 13 WAIRE Points, respectively.

⁵ WAIRE Points can be earned from either truck purchases or truck leases. Points are calculated assuming trucks are purchased.

SECTION 2b) Truck Visits

Regional and Local Emission Reductions from ZE/NZE Truck Visits: Key parameters that can affect the emissions estimate from any one individual trip include: trip length, truck class, vehicle powertrain, and vehicle speed. Collecting all the necessary information to calculate precise emissions estimates for each trip is not feasible as it would require 1) instrumenting all trucks with telematics systems that report uniform data, 2) requiring detailed information reporting about truck loads (e.g., how much of the goods in each truck trailer is being transported to each location), and 3) conducting substantial data analysis to determine the emissions associated with each truck trip. Because of these challenges, various models are used to estimate emissions from trucking activity. In particular, CARB's EMFAC model and SCAG's Heavy-Duty Truck Regional Travel Demand model provide emissions estimates in the South Coast AQMD.

EMFAC2017 provides activity and emission rates for on-road vehicles that operate within California. EMFAC categories¹² and their relationship to truck class are shown in Table 3 below. EMFAC categorizes all truck types that are on the road, however the analysis presented here is limited to those categories that are most likely to deliver goods to and from warehouses.

Table 3. EMFAC Truck Categories

EMFAC Category	Description	Truck Class
LHD1 - DSL	Light-Heavy-Duty Trucks (GVWR 8,501-10,000 lbs)	Class 2b-3
LHD1 - GAS		
LHD2 - DSL	Light-Heavy-Duty Trucks (GVWR 8,501-10,000 lbs)	
LHD2 - GAS		
T6 CAIRP Small	Light-Heavy-Duty Trucks (GVWR 10,001-14,000 lbs)	Class 4-6
T6 Instate Small	Medium-Heavy Duty Diesel Instate Truck with GVWR<=26,000 lbs	
T6 OOS Small	Medium-Heavy Duty Diesel Out-of-State Truck with GVWR<=26,000 lbs	
T6 CAIRP Heavy	Medium-Heavy Duty Diesel CA International Registration Plan Truck with GVWR>26,000 lbs	
T6 Instate Heavy	Medium-Heavy Duty Diesel Instate Truck with GVWR>26,000 lbs	Class 7
T6 OOS Heavy	Medium-Heavy Duty Diesel Out-of-State Truck with GVWR>26,000 lbs	
T7 CAIRP	Heavy-Heavy Duty Diesel CA International Registration Plan Truck with GVWR>33,000 lbs	
T7 NNOOS	Heavy-Heavy Duty Diesel Non-Neighboring Out-of-State Truck with GVWR>33,000 lbs	Class 8
T7 NOOS	Heavy-Heavy Duty Diesel Neighboring Out-of-State Truck with GVWR>33,000 lbs	
T7 POLA	Heavy-Heavy Duty Diesel Drayage Truck in South Coast with GVWR>33,000 lbs	
T7 Tractor	Heavy-Heavy Duty Diesel Tractor Truck with GVWR>33,000 lbs	

¹² <https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-iii-technical-documentation.pdf> (Table 6.1-1)

Baseline weighted averages of NOx and PM10 emission rates¹³ for calendar year 2023 for running exhaust (RUNEX), exhaust from engine startups (STREX), and idling exhaust (IDLEX) of the above-mentioned truck categories are presented below.

Table 4. Weighted average emission rates (g/mi for RUNEX, g/trip for STREX, g/vehicle/day for IDLEX)

Truck Class	NOx			DPM			Mile/trip ¹⁴	Trip/day/truck ¹⁵
	RUNEX	IDLEX	STREX	RUNEX	IDLEX	STREX		
Class 2b-3	0.727	0.888	0.290	0.008	0.013	0	15.3	1.3
Class 4-7	1.079	2.855	2.117	0.007	0.001	0	14.2	5.9
Class 8	2.372	76.203	2.028	0.020	0.027	0	39.9	5.2

The regional and local emission reductions achieved by switching to ZE trucks relative to baseline emissions are calculated using Equation 1 below. While regional emission reductions from switching to NZE trucks is assumed to equal 90% of the reduction compared to ZE trucks, local emission reductions are assumed to be the same between ZE and NZE as NZE trucks are fueled by natural gas and do not emit DPM.

Equation [1]:

$$\begin{aligned}
 & \text{Emission Reduction } \left(\frac{\text{lb}}{\text{trip}} \right) \\
 &= \left[\left(\text{RUNEX} \left(\frac{\text{g}}{\text{mi}} \right) \times \frac{\text{mi}}{\text{trip}} \right) + \left(\text{STREX} \left(\frac{\text{g}}{\text{trip}} \right) \right) + \left(\frac{\text{IDLEX} \left(\frac{\text{g}}{\text{day.truck}} \right)}{\frac{\text{trip}}{\text{day.truck}}} \right) \right] \times \frac{1 \text{ lb}}{453.592 \text{ g}}
 \end{aligned}$$

Results of the calculation for the two truck class categories are presented in Table 5 below.

Table 5. NOx and DPM emission reductions for a single truck trip

Truck Class	ZE Truck		NZE Truck	
	NOx lb/trip	DPM lb/trip	NOx lb/trip	DPM lb/trip
Class 2b-3	0.027	0.0003	N/A	N/A
Class 4-7	0.040	0.0002	0.036	0.0002
Class 8	0.247	0.002	0.222	0.002

¹³ VMT-weighted, population-weighted and number of starts-weighted averages were computed to equalize the frequency of the values for RUNEX, IDLEX and STREX emission rates, respectively, in the data set by multiplication of each truck category emission rates to its corresponding VMT, population or number of starts and then dividing by the sum of total VMT, population or number of starts.

¹⁴ SCAG 2016 RTP mileage rates for medium-heavy (Class 4-7) and heavy-heavy trucks (Class 8)

¹⁵ Truck populations from EMFAC and trips/day from SCAG 2016 RTP. A trip is a one-way trip, while a 'visit' to a warehouse includes the incoming trip and the outgoing trip.

Table 6 below illustrates the method used in determining point values based on regional and local emissions reductions using results in Table 5.

Table 6. NOx and DPM emission reductions for the Annualized Unitary Metric

WAIRE Menu Item		Annualized Unitary Metric (AUM)	Annualized Regional Emission Reductions (lb NOx/AUM)	Annualized Local Emission Reductions (lb DPM/AUM)
Class 8 Truck	NZE	365 truck visits	$0.9 \times 180.3 = 162.3$	1.3
Class 4-7 Truck			$0.9 \times 29.2 = 26.3$	0.1
Class 8 Truck	ZE		$0.247 \times 2 \times 365 = 180.3$	$0.002 \times 2 \times 365 = 1.3$
Class 4-7 Truck			$0.040 \times 2 \times 365 = 29.2$	$0.0002 \times 2 \times 365 = 0.1$
Class 2b-3	ZE		$0.027 \times 2 \times 365 = 19.7$	$0.0003 \times 2 \times 365 = 0.2$

WAIRE Points from ZE/NZE Truck Visit Emission Reductions: For the annualized regional NOx emission reductions, 365 truck visits from Class 8 ZE and NZE trucks will earn 8 and 7 WAIRE Points. Similarly, Class 4-7 ZE and NZE will earn 2 WAIRE Points, and Class 2b-3 ZE will earn 1 WAIRE Point. The associated local DPM emission reductions will earn 6 WAIRE Points for both ZE and NZE Class 8 truck visits, 1 WAIRE Point for both ZE and NZE Class 4-7 truck visits, and 1 WAIRE Point for ZE Class 2b-3.

Costs from ZE/NZE Truck Visits: The incremental cost of a truck visit used in the WAIRE Menu is based on the total cost of ownership of a ZE or NZE truck compared to an equivalent conventional diesel truck, taking into account the estimated total number of trips that truck will take in its useful life. The total cost of ownership (TCO), assuming a 12-year life, for Class 3, 4, 6 and 8 conventional diesel, battery electric, and hydrogen fuel cell trucks were obtained from CARB's Advanced Clean Truck Total Cost of Ownership Discussion Documents. The key components of the TCO include:

- (1) Capital cost: vehicle capital cost, taxes associated with the vehicle purchase, financing costs for the vehicle
- (2) Fuel cost¹⁶: The cost of the fuel
- (3) Other cost: maintenance costs, midlife costs¹⁷, vehicle registration, and residual values at the end of the truck's operating life

Tables 7, 8, 9, and 10 below present the base TCO data used in this analysis for Class 3, 4, 6, and 8 diesel, battery-electric, and hydrogen fuel cell trucks. The total cost of ownership for Class 6

¹⁶ Low Carbon Fuel Standard credits were not included in the analysis presented here.

¹⁷ Midlife costs are the cost of rebuilding or replacing major propulsion components due to wear or deterioration. For diesel vehicles, this would be a midlife engine rebuild, for battery-electric vehicles this would be a battery replacement, and for a hydrogen fuel-cell vehicle this would be a fuel cell stack refurbishment.

CNG shown in Table 8 was estimated using a similar approach as Table 9, with modifications made to the incremental purchase cost, fuel cost¹⁸ and fuel economy^{19,20}. Maintenance cost of natural gas vehicles were assumed to be about one to two cents per mile greater than for diesel vehicles due to more frequent oil changes and inspections, and higher replacement costs for spark plugs and injectors²¹. A summary of the analyses in Tables 7, 8, 9, and 10 is shown in Table 11.

Total Other Cost	\$107,576	\$128,308	\$212,192	
Total	\$571,456	\$874,044	\$1,485,498	\$624,925

Table 11. Summary of TCO Analyses from Literature Review

Truck Class	Ownership period	Annual Mileage	Diesel	Low-NOx CNG	Battery-Electric	Hydrogen Fuel Cell
Class 3	12	15,000	\$97,782		\$113,657	\$410,258
Class 4	12	15,000	\$124,229 ¹		\$177,345 ¹	
Class 6	12	24,000	\$243,306 ²	\$340,176	\$248,171 ²	\$596,603 ²
Class 8 (Ports Study)	12	68,383	\$598,122 ³	\$624,925 ³	\$1,063,000 ³	
Class 8 (CARB TCO)	12	54,000	\$571,456 ²		\$874,044 ²	\$1,485,498 ²

1. <https://nacfe.org/future-technology/medium-duty-electric-trucks-cost-of-ownership/>
2. <https://ww3.arb.ca.gov/regact/2019/act2019/apph.pdf>
3. <https://cleanairactionplan.org/documents/final-dravage-truck-feasibility-assessment.pdf/>

Using the reported annual mileages shown in Table 11, costs were calculated on a dollar per mile basis, as shown in Equation 2.

²⁵ <https://nacfe.org/future-technology/medium-duty-electric-trucks-cost-of-ownership/>

Equation [2]:

$$TCO \left(\frac{\$}{mi} \right) = \frac{TCO (\$)}{12 (yr) * Annual Mileage \left(\frac{mi}{yr} \right)}$$

Table 12. Total Cost of Ownership calculated as \$/mi

Truck Class	Diesel	Low-NOx CNG	Battery-Electric	Hydrogen Fuel Cell
Class 3	0.54		0.67	2.28
Class 4	0.69		0.99	
Class 6	0.84	1.18	0.86	2.07
Class 8 (Ports Study)	0.73	0.76	1.30	
Class 8 (CARB TCO)	0.88		1.35	2.29

SCAG's Heavy-Duty Truck Regional Travel Demand model provides an estimate of heavy-duty truck activities within South Coast Air Basin. TCO values on a dollar per trip basis are estimated using SCAG's VMT and trip rates in Table 13.

Table 13. Truck activity data from SCAG's Heavy-Duty Truck Regional Travel Demand Model

Truck Class	VMT (mi/day)	Trips (trip/day)	Mile/trip
Class 2b-3	7,456,000	488,000	15.3
Class 4-7	7,744,000	544,000	14.2
Class 8	12,060,000	302,000	39.9

Equation 3 below illustrates the method used to determine TCOs on a dollar per trip basis using the TCOs (\$/mi) in Table 12 and SCAG's mileage rates in Table 13, with results shown in Table 13 equation [3]:

$$TCO \left(\frac{\$}{trip} \right) = TCO \left(\frac{\$}{mi} \right) \times \frac{mi}{trip}$$

Table 14. Total Cost of Ownership (\$/trip)

Truck Class	Diesel	Low-NOx CNG	Battery-Electric	Hydrogen Fuel Cell
Class 3	8.31		10.28	34.96
Class 4	9.80		13.99	
Class 6	12.00	16.77	12.24	29.42
Class 8 (Ports Study)	29.08	30.39	51.69	
Class 8 (CARB TCO)	35.19		53.82	91.47

Although the TCO analyses above assume a 12-year useful life for a truck, motor carriers may require shorter periods over which they absorb the incrementally higher costs of ZE or NZE trucks compared to diesel. The analysis here therefore assumes that this incremental cost is absorbed over a 3-year period, instead of the full 12-year useful life. The incremental cost is therefore multiplied by four ($12 \div 3 = 4$) to determine the default cost for truck visits.

Table 15. Annualized Incremental Costs

Truck Class		Annualized Unitary Metric	Annualized Incremental Cost (\$/metric)
Class 8	NZE	365 truck visits**	$(\$30.39 - \$29.08) \times 4 \times 2 \times 365 = \$3,825$
Class 4-7*			$(\$16.77 - \$12.00) \times 4 \times 2 \times 365 = \$13,928$
Class 8	ZE		$(\$53.82 - \$35.19) \times 4 \times 2 \times 365 = \$54,400$
Class 4-7*			$(\$12.24 - \$12.00) \times 4 \times 2 \times 365 = \701
Class 2b-3			$(\$10.28 - \$8.31) \times 4 \times 2 \times 365 = \$5,752$

*In this analysis, Class 6 TCOs were used for the Class 4-7 category in the WAIRE Menu

** One visit equals two one-way trips

WAIRE Points for ZE/NZE Truck Visit Costs: Based on the costs presented in Table 15, the number of WAIRE Points earned for ZE Class 8, Class 4-7, and Class 2b-3 truck visits are 3, 1, and 1, respectively. One WAIRE Point is earned for both NZE Class 8 and Class 4-7 truck visits.

Total WAIRE Points for ZE/NZE Truck Visits: The total WAIRE Points for truck visits includes Points from the cost, regional emission reductions, and local emission reductions. In addition, because most of the emissions associated with warehouses comes from trucks visits, a multiplier of three is applied to the summed Points to encourage operators to choose this option, and to promote a more rapid return on investment for the purchase of ZE/NZE trucks. For example, for 365 class 8 ZE truck visits, a warehouse would earn: 8 Points for regional, 6 Points for Local, and 3 Points for cost, with a sub-total of 17 Points. The final total for this Menu item would be 51 Points (17×3).

SECTION 3) Electric Charger Usage and Installation

Description: ZE battery electric trucks require specialized charging infrastructure. Installing this infrastructure can require facility electrical upgrades, dedication of space for electrical equipment and vehicle parking, permitting with local authorities, and plans to optimize charger usage. The charging stations themselves range in size and are typically rated based on the amount of kW that can be dispensed. Higher powered charging stations (≥ 350 kW) are just now entering the market, and may require significant construction. On the usage side, the cost of the electricity can vary depending on the time of day when trucks are charged, the kW charging level, and the level of demand charges. Utilities are introducing new rate structures for the use of these stations to address this new market need. Trucks that would use charging infrastructure at a warehouse are likely to travel to destinations unrelated to the warehouse itself, and providing this infrastructure can facilitate greater usage of ZE trucks.

Commercial Availability: Several different manufacturers sell EVSE at a variety of power levels (e.g., Level 2, higher rate chargers, etc.), including with optional power management software that govern how trucks are charged. At the current early stage of commercialization and demonstration of electric trucks, the higher power chargers used for heavy duty vehicle charging have not yet followed a common standard, and proprietary charging systems are commonly tailored to each vehicle. This is expected to change in the near future with the development of a common High Power Charging for Commercial Vehicles standard by the CharIN²⁶ organization. In addition, local utilities and land use agencies are developing programs specifically focused on charging infrastructure upgrades. Notable examples include the Charge Ready Transport program from Southern California Edison (SCE)²⁷, the Commercial EV Charging Station Rebate Program from the Los Angeles Department of Water and Power (LADWP)²⁸, and permit streamlining efforts from many local permitting agencies²⁹. SCE and LADWP collectively provide power to >80% of warehouses that may be included in PR 2305 (see chart).

²⁶ <http://www.charinev.org/hpccv> - CharIN members include most major vehicle manufacturers as well as many major energy and charging infrastructure companies.

²⁷ <https://www.sce.com/business/electric-cars/charge-ready-transport>

²⁹ <http://www.business.ca.gov/ZEVReadiness>

SECTION 3a) Charger Usage

Emissions: While charging infrastructure on its own does not reduce emissions, this equipment does facilitate emissions reductions by providing additional locations for electric vehicles to obtain power and making it possible for their increased use. However, similar to the calculations for truck acquisitions, regional emission WAIRE Points are earned at a \$100,000 per ton of NO_x cost effectiveness level. Both regional and local emission reductions Points are earned when charging stations are used. The amount of regional NO_x emissions reductions is tied to the total amount of dispensed electricity, using default electric vehicle efficiencies and emission rates. The amount of local DPM emissions reductions is set equal to six miles of travel for every charging event³⁰. The Annualized Unitary Metric (AUM) is set at 165,000 kWh, equal to about 450 kWh per day, or enough for five separate two hour-long charging events per day on a 50 kW charger, or to recharge one truck with a 500 kWh battery.

The tables and equations below illustrate the methods used to determine Point values based on regional and local emissions reductions.

Table 16. Electric Vehicle Efficiencies³¹, Emission Rates³², and Emissions Reductions

Truck Category	Efficiency	Emission Rate		Emissions Reductions	
	mile/kWh	NO _x g/mile	DPM g/mile	lb NO _x /kWh	lb DPM/kWh
Class 4-5	1.26	1.08	0.007	0.003	0.00002
Class 6-7	0.8	1.08	0.007	0.002	0.00001
Class 8	0.62	2.37	0.02	0.003	0.00003

³¹ CARB Advanced Clean Truck – Draft Standardized Regulatory Impact Assessment (SRIA), 8/8/2019
<https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

³² <https://www.arb.ca.gov/emfac/2017/>, emission rates are from calendar year 2023

Equation [4]: NOx reductions = (mile/kWh) × (g/mile) × 165,000 kWh/yr ÷ 453.59 (g/lb)

Equation 1 (Class 4-5): $1.26 \times 1.08 \times 165,000 \div 453.59 = 495 \text{ lb NO}_x$

Equation 1 (Class 6-7): $0.8 \times 1.08 \times 165,000 \div 453.59 = 314 \text{ lb NO}_x$

Equation 1 (Class 8): $0.62 \times 2.37 \times 165,000 \div 453.59 = 535 \text{ lb NO}_x$

Equation [5]: DPM reductions = (mile/kWh) × (g/mile) × 165,000 kWh/yr ÷ 453.59 (g/lb)

Equation 2 (Class 4-5): $1.26 \times 0.007 \times 165,000 \div 453.59 = 3.2 \text{ lb DPM}$

Equation 2 (Class 6-7): $0.8 \times 0.007 \times 165,000 \div 453.59 = 2.0 \text{ lb DPM}$

Equation 2 (Class 8): $0.62 \times 0.02 \times 165,000 \div 453.59 = 4.5 \text{ lb DPM}$

WAIRE Points from Charging Station Usage Emission Reductions: Emission reductions vary for each class of truck. For the WAIRE Menu, the regional and local emission reductions from class 8 trucks are used. Regional emission reductions therefore result in 22 WAIRE Points, while local emission reductions result in 18 WAIRE Points.

Costs of Using Charging Stations: Over the past year staff worked closely with multiple utilities to understand their new commercial EV charging rate structures and developed estimates of the average cost of electricity per kWh. As noted above, about three quarters of all warehouses potentially subject to the rule are located within SCE's jurisdiction. For this analysis, multiple scenarios were evaluated for a five concurrent two hour long charging events per day on a 50 kW chargers. Table 17 reflects the expected charging rate and the average electricity rate for two most appropriate SCE rate schedule for heavy-duty EV charging. The average cost assumes an equal amount of charging in each time window.

Table 17. Annual Average Cost of Electricity* – Two Key SCE Rate Schedules for Charging Stations South Coast AQMD Staff Analysis

Charging Window	SCE TOU-EV-9	SCE TOU-8-RTP
	\$/kWh *	\$/kWh **
On-Peak	0.34	0.28
Mid-peak	0.16	0.25
Off-peak	0.14	0.23

* Demand charges and voltage discount are zero for TOU-EV-9

**Demand charges contributes to 40% of total annual electricity cost – Voltage discount included

***These costs do not account for any LCFS revenue that a facility may receive. The LCFS value may vary depending on market conditions but can be more than \$0.10/kWh.³³

In LADWP jurisdiction the electricity rate can range between \$0.11-0.3 \$/kWh for charging heavy-duty vehicles depending on load factor, daily charging hours, and charging capacity. The provided range by LADWP staff is consistent with the rates provided in Table 5.

Using the \$0.21 \$/kWh rate above, and AUM of 165,000 kWh per year for a charging station, the total annual cost of electricity for the warehouse is \$34,650, equal to two WAIRE Points.

³³ <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

SECTION 3b) Charger Installation

Costs to Install Charging Stations: Charging infrastructure costs can vary greatly from site to site. The analysis presented here was informed by staff discussions with charger providers, utilities, other industry stakeholders, data from current South Coast AQMD funded projects, and multiple studies (referenced below). Table 18 presents a summary of the range of costs for purchasing and installing different EVSEs.

Electrification projects require site-specific planning and sometimes can take more than one year to implement. Because of this potentially extended period, the charging infrastructure installation WAIRE Menu item includes project milestones to allow warehouses to earn Points for partial completion of charger installation during a compliance year. Three milestones that are common to all charging station projects include purchasing the Electric Vehicle Supply Equipment (EVSE), construction mobilization, and final permit sign off & charger energization. In order to account for splitting charger installations into two separate milestones, it is assumed that the construction mobilization milestone will require up to \$10,000 of the total installation cost, and the remaining cost is incurred during construction and prior to final permit sign-off.

Table 18. Charging Infrastructure Installation Cost Ranges, and Key Incentives/Rebates Programs

Charging Installation Activity	Charger Ranges	Cost Range ^{A-D}
		\$ per charger
EVSE Purchase	150-350 kW	60,000 – 140,000
	51-149 kW	30,000 – 60,000
	19.2-50 kW	10,000 – 30,000
	Up to 19.2 kW	3,000 – 5,000
Charger Installation ¹	19.2-350 kW	10,000 – 80,000
	Level 2	5,000 – 10,000

Notes:

1. Installation cost for one charger includes electrical service extension, permitting, labor costs, and trenching to lay cables

WAIRE Points from Charging Station Installations: Table 19 below summarizes the Points that a warehouse would earn for purchasing an EVSE and installing it. Similar to truck acquisitions, regional emission Points are assigned at a \$100,000 per ton of NOx cost effectiveness.

Table 19. Summary of WAIRE Points Earned for Installing Charging Infrastructure

Charger Installation Activity	Cost Points	Regional Emissions Points	Total WAIRE Points
1 EVSE Purchased	6	112	118
	3	48	51
	2	24	26
	1	4	5
1 construction project/ Construction Mobilization	1	8	9
	1	48	5
1 construction project/ Final Permit Sign Off & Charger Energization	3	56	59
	1	48	59

SECTION 4) Hydrogen Fueling Station Installation and Usage

Description: Hydrogen refueling stations (HRS) are used to supply fuel to vehicles with hydrogen fuel cell drivetrains. An HRS is composed of storage and dispensing units and can sometimes include a production unit if the hydrogen is produced on site. If the hydrogen is produced on site or delivered to the station at an intermediary pressure or in liquid state, intermediary storage is also needed along with a compression system.

Commercial Availability: While construction of hydrogen fueling stations has been increasing, with 43 now operating in the state³⁴, they are primarily focused on the light duty vehicle market, or in some cases for transit buses. However, some Class 8 truck manufacturers are actively pursuing the development and commercialization of hydrogen fuel cell trucks over the next few years, including Toyota, Kenworth, Hyundai, and Nikola. Fueling infrastructure will be a critical component to facilitate these new ZE trucks.

Hydrogen Station Installation Costs: Hydrogen prices are influenced by the cost of production, distribution, and sales, among other factors. In addition to AB 8 and CARB's Scoping Plan, the recently-updated Low Carbon Fuel Standard, Executive Orders B-16-2012 and B-48-18 provide strong policy drivers for accelerating commercialization of fuel cell vehicles and their associated hydrogen fuel station network.

Table 20 below presents a summary of costs associated with developing a hydrogen fueling station from literature review and discussion with stakeholders. In this context, total capital cost includes site design and engineering, permitting, equipment, project management, and labor costs.

³⁴ www.veloz.org

Table 20. Hydrogen Fueling Station Costs

	Capacity (kg/day)	Cost (\$)	\$/Capacity (\$/kg/day)	Source
			5000-10,000	CARB Total Cost of ownership Discussion Documents ³⁵
Gaseous H2 LDV fueling system at 700 bar	250	1,725,000	6,900	Moyer Granted Project for Sunline Transit- EPC Design
Gaseous H2 Station- 700 bar Cascade dispensing	700	3,065,724	4,380	Argonne National Lab Heavy Duty Refueling Model, (2016 Dollar) ³⁶
Gaseous H2 Station- 700 bar Booster compressor	700	3,140,211	4,486	
Gaseous H2 Station- 350 bar Cascade dispensing	700	2,029,488	2,899

Liquid H2 Station- 350 bar via vaporization/compression	700	1,430,748	2,044	
Liquid H2 Station- 700 bar via LH2 pump/vaporization	700	1,541,243	2,202	
Liquid H2 Station- 350 bar via LH2 pump/vaporization	700	1,145,634	1,637	
Onsite H2 Production	7257.5	16,500,000	2,274	Industry stakeholder input
Onsite H2 Production	600	5,000,000	8,333	Industry stakeholder input

WAIRE Points for Hydrogen Station Installation: For the WAIRE Menu an onsite hydrogen fueling station with a capacity of 700kg/day with delivered hydrogen was assumed to cost \$2 million. This would yield 80 WAIRE Points. At a cost effectiveness of \$100,000 per ton of NOx, an additional 1600 Points are earned for regional emissions.

Emission Reductions from Hydrogen Usage: Annualized regional NOx emission reductions and local DPM emission reductions were set to be same as the reductions achieved by usage of onsite electric charger stations at 535 lb NOx/yr and 4.5 lb DPM/yr. Details of the calculation can be found in Section 3 of this report.

Hydrogen Fuel Costs: To determine the annualized unitary metric (AUM) for dispensed hydrogen, a back calculation was conducted based on the amount of regional NOx emissions:

Equation [6]:

$$\begin{aligned}
 \text{Total kg of Dispensed } H_2 &= 535 \left(\frac{\text{lb}}{\text{yr}} \right) \times 453.59 \left(\frac{\text{gr}}{\text{lb}} \right) \times \frac{1}{2.372 \left(\frac{\text{g}}{\text{mi}} \right) \times 16.63 \left(\frac{\text{mi}}{\text{kg } H_2} \right)} \\
 &= 6,152 \frac{\text{kg}}{\text{yr}}
 \end{aligned}$$

Where, 2.372 (g/mi) is the VMT weighted average of NOx running exhaust emission rate of Class 8 trucks considered in this analysis including T7 CAIRP, T7 NNOOS, T7 NOOS, T7 POLA and

³⁵ <https://ww3.arb.ca.gov/regact/2019/act2019/apph.pdf>

³⁶ <https://hdsam.es.anl.gov/index.php?content=hdsam>

T7 Tractor. 16.63 (mi/kg) is the reported fuel economy for a class 8 fuel cell truck³⁷. Given the total kg of dispensed hydrogen calculated above and a retail price of \$10/kg, the annual cost will be \$61,520.

WAIRE Points for Dispensed Hydrogen: Based on the emission reductions stated above, 22 and 18 Points are earned respectively for regional NOx and local DPM. Cost Points would contribute another 3 Points, for a total of 43 Points for 6,152 kg of H₂ dispensed.

³⁷ <https://ww3.arb.ca.gov/regact/2019/act2019/appc.pdf>

SECTION 5) Zero Emissions Yard Truck Acquisition and Usage

Description: Yard trucks (also called yard tractors, terminal trucks, hostlers, yard jockeys, or yard goats) move trailers and containers around warehouse facilities. Most yard trucks at warehouse facilities are diesel fueled and emit NO_x, DPM, and other pollutants. Duty cycles for yard trucks vary depending on use, with heavier use at railyards and port facilities and lighter use typically at warehouses and manufacturing plants, as defined by hours of use and diesel consumption rates. CARB has limited population data for about 1,100 yard tractors operating statewide through its DOORS reporting program for off-road vehicles, but it is unclear how many of these operate at warehouses in South Coast AQMD. In addition, many yard tractors can be on-road vehicles, which are not required to be reported through the DOORS system. For example, about two thirds of the roughly 1,600 yard tractors at the ports of Los Angeles and Long Beach are on-road vehicles.

Commercial Availability: Many battery-electric yard tractor demonstration projects have taken place in the past several years, including in the South Coast AQMD. Following these efforts, multiple manufacturers have begun offering battery-electric ZE yard trucks for sale commercially including OrangeEV, Kalmar Ottawa, and BYD.

Operation: Operation of yard trucks can be tracked by hours of use, with hourly usage varying from <1,000 hours/year up to 6,000 hours/year. The diesel reductions were calculated by using the horse power, hours of use, the load factor, and the pollutant emission factor.

SECTION 5a) ZE Yard Truck Acquisition

WAIRE Points from ZE Yard Truck Acquisition: ZE yard trucks currently cost about \$310,000 while their diesel equivalent costs about \$100,000³⁸. This incremental cost of \$210,000 would earn nine WAIRE Points per ZE yard truck purchased. Similar to the methods used for on-road truck acquisitions, at \$100,000 per ton cost effectiveness, a ZE yard truck acquisition would earn 168 Points for regional emission reductions.

SECTION 5b) ZE Yard Truck Usage

Emissions: From the DOORS data, the most common yard trucks operate a 175 hp, Tier 3 engine. Table 21 below shows the emission factors from the Carl Moyer Guidelines³⁹ for this type of yard truck. Assuming that this type of yard truck operates 1,000 hours per year, and has operated for ten years, the emission reductions from switching to a ZE yard truck are shown in Equation 7 below.

Table 21. Emission Factors for a Tier 3 Yard Truck

Pollutant	Emission Factor (EF) g/hp-hr	Deterioration Rate (DR) g/hp-hr-hr	Load Factor (LF)
NO _x	2.32	0.00003	0.39
DPM	0.088	0.0000044	

³⁸ <https://cleanairactionplan.org/documents/final-cargo-handling-equipment-che-feasibility-assessment.pdf/>

³⁹ <https://ww3.arb.ca.gov/msprog/moyer/guidelines/current.htm>

Equation [7]

$$Emissions = (hp) \times (LF) \times [((total\ hrs\ of\ use) \times (DR)) + (EF)] \times (hrs\ of\ use) \div 453.59 \left(\frac{g}{lb}\right)$$

Equation 7 NOx: $175 \times 0.39 \times [((10 \times 1,000) \times 0.00003) + 2.32] \times 1,000 \div 453.59 = 394\ lbs$

Equation 7 DPM: $175 \times 0.39 \times [((10 \times 1,000) \times 0.0000044) + 0.088] \times 1,000 \div 453.59 = 19.9\ lbs$

Costs: Although purchase prices for ZE yard trucks are higher than their diesel equivalent, once purchased the operational costs are expected to be lower. An analysis by the ports of Long Beach and Los Angeles evaluated the Total Cost of Ownership (TCO) for battery-electric ZE yard trucks in comparison to diesel⁴⁰. This analysis found a TCO for ZE yard trucks to be about \$450,000 (not including infrastructure costs) while equivalent diesel had a TCO of about \$375,000. Assuming a ~12,000 useful life of a yard truck, the annual incremental cost of operating a ZE yard truck for 1,000 hours is shown in Equation 8.

Equation [8]: $(\$450,000 - \$375,000) \times 1,000\ hrs \div 12,000\ hrs = \$6,250$

WAIRE Points from Using ZE Yard Trucks: Following the results from Equation 6, using a ZE yard truck would earn 16 Points for regional emission reductions and 80 Points for local emission reductions. One cost Point would be earned following the results of Equation 7. Similar to the approach for on-road truck visits, a multiplier of three is applied to the sum of cost, regional, and local Points. Therefore the total Points for 1,000 hours of ZE yard truck usage is: $(16 + 80 + 1) \times 3 = 291\ Points$.

⁴⁰<https://cleanairactionplan.org/documents/final-cargo-handling-equipment-che-feasibility-assessment.pdf/>

SECTION 6) Transport Refrigeration Unit Plug (TRU) Acquisition and Usage**Description:**

TRUs are truck or trailer installed refrigeration systems used at cold storage and distribution center warehouses to transport and temporarily store perishable goods and products. Most of the 7,400 truck and 166,000 trailer TRUs that operate in California are powered by diesel-fueled internal combustion engines (ICEs)⁴¹ which emit about 5.5 tons of NOx and 0.2 tons of diesel particulate matter (DPM) daily⁴². Newer TRU technology allow zero emission operations by plugging hybrid and battery electric models into TRU charging infrastructure at warehouses and other destinations. CARB is currently developing a new truck TRU regulation as well as a separate trailer TRU regulation which, among other requirements, could mandate:

- installation of charging infrastructure, and
- truck TRU fleets to annually turn over a portion of their fleet to full ZE technology.

WAIRE Points may only be earned for actions beyond any adopted rules and regulations from U.S. EPA, CARB, or South Coast AQMD. If CARB's previously proposed truck TRU regulation is adopted in the coming years,⁴³ WAIRE Points could only be earned for the installation of TRU plug infrastructure and TRU plug usage beyond CARB requirements, or potentially through a Custom WAIRE Plan thereafter that would demonstrate how actions taken go beyond CARB rules.

Commercial Availability:

Current zero emission operation capable TRUs are: plug-in and hybrid (eTRU); battery-electric; cryogenic; and hydrogen fuel cell. All except the hydrogen fuel cell technologies are commercially available, and are offered for sale commercially by such manufacturers as Advanced Energy Machines, Air Liquide, Boreas, Carrier, Electric Reefer Solutions, and Thermo King. Additionally, there are manufacturers and firms that focus solely on the electric plug-in infrastructure such as CleanFutures and Shorepower Technologies⁴⁴.

Operation: Electric zero emission trailer TRUs and truck TRUs operate using an onboard battery, or via power from the electrical grid if they are plugged into a charger. Hybrid trailer TRUs may operate via a diesel engine when in transit, and in zero emissions mode while plugged into a charger. Charger operators may claim LCFS credits for the electricity dispensed for TRUs, potentially at a level that fully offsets the cost of electricity.⁴⁵ Charger operators are therefore expected to track the total amount of kWh of charger usage for TRUs when they obtain LCFS credits. Plug usage can be tracked by hours of use, 1,460 hours of annual usage or approximately 4 hours per day of TRU plug usage was determined from the 2023 baseline of the TRU ATCM. The 4 hour average use is attributed to truck dwell time at warehouses or delivery destinations.

⁴¹ <https://ww2.arb.ca.gov/sites/default/files/classic/cc/cold-storage/documents/slidesworkshop82019.pdf>

⁴² <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

⁴³ CARB has proposed bifurcating the TRU regulation, with rulemaking in 2021 focusing on TRU trucks, and new emission standards, and later rulemaking focusing on ZE trailers.

⁴⁴ https://ww2.arb.ca.gov/sites/default/files/classic/cc/cold-storage/documents/clean_tru_technology_webinar_slides_handout.pdf

⁴⁵ <https://ww2.arb.ca.gov/sites/default/files/2020-08/Preliminary%20TRU%20Cost%20Doc%20082020.pdf>

Diesel emission reductions were be-calculated by using the horse power, annual hours of use, the load factor, and the pollutant emission factor⁴⁶.

SECTION 6a) TRU Plug Acquisition and Installation

WAIRE Points from TRU Plug Acquisition and Installation: A TRU plug installation costs approximately \$13,600 which includes a Level 2 charger, equipment, design, construction, and installation costs⁴⁷. Using a similar methodology as is described for installing chargers for vehicles in this document, acquisition and installation of a single TRU plug could earn a total of 15 WAIRE Points, with 1 Point for each TRU plug purchased, beginning construction, and receiving final permit sign-off/charger energization. Similar to truck acquisitions, regional emission Points are assigned at a \$100,000 per ton of NOx cost effectiveness, resulting in an additional 12 Points.

SECTION 6b) TRU Plug Usage

Emissions: The 2023 calendar year weighted average emission factors for the South Coast AQMD was used in Equation 1, to calculate the default annual NOx and DPM emission reductions from trailer and truck eTRUs plugging in. The AUM is set at 10,658 kWh, equal to an eTRU plugged in 4 hours per day for 365 days and drawing 7.3 kW of power.⁴⁸

Equation [1]

$$Emissions = (annual\ hours\ of\ use) \times (Pollutant\ Emission\ factor) \div 453.59(\frac{g}{lb})$$

Equation 1 NOx: $1,460 \times 12.60 \div 453.59 = 40.6\ lbs$

Equation 1 DPM: $1,460 \times 0.53 \div 453.59 = 1.7\ lbs$

Costs: Using the AUM of 10,658 kWh, and the \$0.18/kWh rate for electricity calculated for charging station usage in this document (and not considering any potential offset from LCFS credits), the average annual cost to operate a TRU plug is shown in Equation 2.

Equation [2]: $(\$0.21 /kWh) \times 10,658\ kWh = \$2,238.18$

WAIRE Points from Using ZE TRUs: Following the results from Equation 1, using a TRU plug would earn 2 Points for regional emission reductions and 7 Points for local emission reductions. One cost Point would be earned following the results of Equation 2. Similar to the approach for other WAIRE action usage or visits, for replacing diesel-fueled equipment/vehicles, a multiplier of three is applied to the sum of cost, regional, and local Points. Therefore, the total Points for 10,658 kWh from TRU charging is: $(2 + 7 + 1) = 10\ Points$.

SECTION 7) Solar Panel System Acquisition and Usage

Description:

Solar panel systems are electric energy generation systems that are composed of the solar panels which collect and convert solar radiation to direct current (DC) power, the racking system which mount the panels and equipment to a rooftop or carport, and the inverter which convert the DC power to alternating current (AC) power. The installations of solar panel systems on warehouse rooftops and carports is an increasing trend which provide renewable power for both warehouse usage and for sale back to the grid. Many commercial buildings with significant rooftop or parking area spaces are incorporating solar panel systems into their operations for financial savings. California is leading the nation with over 600,000 commercial buildings being equipped with solar panel systems, with a solar market penetration of about 2.5%⁴⁹. In the last several years, there have been many technology advancements in solar panels that have made them lighter, more efficient, and more flexible which allows for them to be installed in more applications that have led to a decrease in overall installation costs.

Commercial Availability:

Solar panel systems have wide commercially available throughout California with hundreds of manufacturers and installers who offer a range options for system sizes and component configurations.

Operation:

To analyze the installation and use of solar panel systems, the median solar panel system size was set at 100 kW based on a literature review of Lawrence Berkeley National Laboratory's (LBNL) annual Tracking the Sun Report⁵⁰. The 100 kW solar system parameter was inputted into the National Renewable Energy Laboratory's (NREL) PVWatts⁵¹ calculator specifying a region in the South Coast AQMD jurisdiction which resulted in an annual estimated electrical generation of 165,000 kWh. The 100 kW solar panel system and the 165,000 kWh estimated electrical generation serve as the annual unitary metric (AUM) for solar panel system installation and usage, respectively.

SECTION 7a) Solar Panel System Acquisition and Installation

WAIRE Points from Solar Panel System Acquisition and Installation: Based on LBNL's Tracking the Sun study⁵² the price per kW for a rooftop solar panel system was \$2.60 per kW and a carport solar panel system was estimated to cost \$3.74⁵³. Carport solar panel systems have higher costs due to structural costs to elevate the solar panels to provide the carport or truck shade structure. WAIRE Points are calculated based on the total cost of the installation of the 100 kW solar panel system. Applying the \$2.60 per Watt costs for rooftop installation for the 100 kW solar panel system results in a total acquisition and installation cost of \$260,000. For carport solar panel system installation, the \$3.74 per Watt for carport solar panel system installation for the 100 kW

⁴⁹ <https://emp.lbl.gov/webinar/commercial-rooftop-solar-energy-market>

⁵⁰ <https://emp.lbl.gov/tracking-the-sun>

⁵¹ <https://pvwatts.nrel.gov/>

⁵² https://eta-publications.lbl.gov/sites/default/files/tracking_the_sun_2018_briefing.pdf

⁵³ Based on a confidential data obtained from industry source that requested non-attribution.

solar panel system which results in a total acquisition and installation cost of \$374,000. Using a similar methodology as is described for installing chargers for vehicles in this document, acquisition and installation of a rooftop solar panel system could earn 15 WAIRE Points for a 100 kW rooftop solar panel system, and 19 WAIRE Points for a 100 kW carport solar panel systems.

SECTION 7b) Solar Panel System Usage

Emissions: Using emissions data from local power plants which potentially provide power to warehouses within the South Coast AQMD jurisdiction, a peak rate NOx emission factor of 0.087 lbs/MWh was calculated⁵⁴. The combustion of natural gas at the local power plants do not generate DPM so only NOx is considered in this analysis. The calculated NOx emission factor is used with the AUM of the estimated generation of 165,000 kWh for a 100 kW solar panel system installed on a structure in the South Coast AQMD jurisdiction. Equation 1 shows the calculated the default annual NOx emission reductions from solar panel system usage.

Equation [1]

$$\text{Emissions} = (\text{Power Plant NOx Emission Factor lbs/MWh}) \times (\text{Total Estimated KWh generated}) / 1,000$$

$$\text{Equation 1 NOx: } 0.087 \times 165,000 \div 1,000 = 14.3 \text{ lbs}$$

Costs: No cost is considered for the operation of the solar panel system. After the initial installation costs, the minimal maintenance costs are negligible considering the cost saving from solar electric power generation in comparison to purchasing grid power.

WAIRE Points from Solar Panel System Usage: Following the results from Equation 1, using a solar panel system would earn 1 Point for regional emission reductions. There are no cost or local benefit WAIRE Points contributions.

⁵⁴ Power plant emission calculations were derived from CEMS, eGRID, and EIA data to calculate for the South Coast AQMD jurisdiction

SECTION 8) Installation of Air Filter Systems or Air Filters in Community Facilities**Description:**

The installation of air filter systems or the installation/replacement of air filters is provided on the WAIRE Menu to provide a community benefit in reducing exposure for the communities near warehouses. Air filters have been shown to successfully remove black carbon (BC) and particulate matter (PM) which include ultrafine particles (UFP) (particles with a diameter < 0.1µm), diesel particulate matter (DPM), PM_{2.5} (particles with a diameter < 2.5µm), and PM₁₀ (particles with a diameter < 10µm) of outdoor particles formed from the combustion of fossil fuels that permeate into the indoors.⁵⁵ Exposure to PM contaminants may lead to potential health hazards such as asthma, lung inflammation allergies, and other respiratory or cardiovascular problems⁵⁶. DPM is an air toxin and classified human carcinogen which account for more than 80% of the total cancer risk from air toxics in the south coast air basin (SCAB)⁵⁷. Air filters can be integrated to a heating, ventilation, and air conditioning (HVAC) system or standalone, where the use of high-performance panel filters (HP-PF) resulted in up to 90% removal of UFP, DPM, PM_{2.5}, and PM₁₀, where HP-PF used were minimum efficiency reporting value 16 (MERV 16) filters⁵⁸. The American Society of Heating, Refrigerating, and Air-Conditioning Engineers defines MERV 16 as filters used for HVAC units that remove at least 95% of particles 0.3 microns or larger.

Commercial Availability:

Air filter systems and air filters have wide commercially available throughout California with numerous manufacturers and installers who offer a range options for system sizes and air filter types.

Operation:

Air filters can be installed on existing HVAC units or as standalone units at residences, schools, daycares, hospitals, community centers, and other community locations. The integration of air filters with HVAC units does lead to a decrease in the HVAC pressure as caused by the increased resistance of the filters that captures particles. In time the air filter media becomes saturated with particles leading to further HVAC pressure decreases and decreased particle capture efficiency. For standalone systems that uses its own fan the energy demand to operate at top speed is 100 watts/hr or about 5 kWh for 10 hours of operation for a 5 day week⁵⁹. General service maintenance on the air filters involves replacement, on a set interval period or depending on the activity at the location the filters are installed.

⁵⁸ Polidori A, Fine PM, White V, Kwon PS. Pilot study of high-performance air filtration for classroom applications. *Indoor Air*. 2013

⁵⁹ Energy draw is based on a vendor estimate for a school installation (Email dated October 11, 2019 to Victor Juan)

WAIRE Points from Air Filter or Air Filter System Installation:

With the emission reductions from the installation of air filter systems or the replacement of air filters being much less than the emission reductions associated with truck purchase, the regional WAIRE Points are related the cost effort considering the same cost effectiveness. The annual metric for the number of air filter systems with MERV 16 air filters installed is 25 systems, and the annual metric for the replacement of air filters is 200 MERV 16 air filters. With the annual metrics and the estimated emission reduction, the installation of 25 air filter systems with MERV 16 air filters equates to 55 WAIRE Points, and the installation/replacement of 200 MERV 16 air filters equates to 51 WAIRE Points.

Costs: The costs for air filter systems with MERV 16 air filters were obtained from vendors and contractors that South Coast AQMD has worked with to install air filter systems and air filters at schools and other facilities as part of mitigation and settlement projects. The estimated costs analyzed for the installation of 25 air filter systems with MERV 16 air filters is \$65,000 and cost for the replacement/installation of 200 MERV 16 air filters is \$60,000. Using the \$0.21 \$/kWh electricity rate that is used in other WAIRE Menu actions and assuming 10 hours of use each day for 365 days, the estimated electricity costs for a standalone air filter system for 365 kWh would be \$76.65.

Appendix C: WAREHOUSE POPULATION METHODOLOGY

The analysis of the population of warehouses subject to PR 2305 was compiled between February 2020 – October 2020. Sources for this population of PR 2305 warehouses include the datasets of: CoStar; Dun & Bradstreet (DNB); Fleetseek; InfoUSA; and Leonard’s List, as well as a visual review with Google Maps. CoStar was the primary dataset used to compile the population of PR 2305 warehouses;¹ this CoStar dataset was cross-referenced against the other datasets listed above, which offered additional warehouse information.

The population of PR 2305 warehouses described in this methodology is a snapshot in time, and is expected to update over time to adjust to changes such as warehouse operators moving in and out of warehouse facilities, operational changes, new warehouses construction, etc. Reporting requirements from PR 2305 will provide more detailed information about warehouse properties, operations, and their characteristics upon the adoption of PR 2305. Although there may be some differences between the statistics determined here and actual warehouse operations at every site, the analysis presented below is believed to provide a representative portrayal of the operators subject to PR 2305 and PR 316. The reporting requirements within PR 2305 will ensure that information used to ensure compliance is up to date and more accurate than can be provided from solely relying on third party commercial data products. The list of warehouses potentially subject to PR 2305 and PR 316 are included in the table following this methodology write-up. This list should not be considered exhaustive, as there may be a small number of additional warehouses that are subject to the requirements of PR 2305 that were not identified in this rulemaking analysis.

Total Population (3,320 warehouses are anticipated to submit a Warehouse Operations Notification Report)

CoStar is a subscription online database for commercial real estate information. According to CoStar data, the total number of industrial facilities potentially covered by PR 2305 could be up to 52,000 facilities, though the actual number that would be classified as warehouses is unclear. CoStar allows the user to utilize a search function to find properties, either through their “Property” search database or their “Tenant” search database. The dataset was exported from CoStar using the “Property” search. CoStar’s search function utilizes filters to help find properties or tenants with specific characteristics. The CoStar filters used to define the characteristics of warehouse facilities applicable to PR 2305’s warehouse inventory are: “Property Type” (industrial and flex), “Building Status” (existing and under renovation), Rentable Building Area, or “RBA” (greater than or equal to 100,000 square feet), “Secondary Type” (distribution, light distribution, light manufacturing, manufacturing, refrigeration/cold storage, truck terminal, and warehouse), and “Market Name” (Inland Empire (California), Orange County (California), and Los Angeles). The submarkets of Mojave River Valley, San Bernardino Outlying, Antelope Valley Industrial, East Los Angeles County Outlying Industrial, and North East Los Angeles County Outlying Industrial were excluded from the property search as they fall outside of South Coast AQMD’s jurisdiction.

¹ All CoStar data contained herein speaks only as of the date referenced, may have materially changed since such date, and was provided “as is” with no guarantee or warranty of any kind. CoStar has no obligation to update or verify any of the CoStar data contained herein. None of the CoStar data contained herein should be construed as investment, tax, accounting or legal advice from CoStar.

Tenants

The CoStar Tenant dataset was exported from CoStar using the “Tenant” search. This dataset was exported to assist in identifying operators at the 3,320 warehouses applicable to PR 2305. Filters used from CoStar to define the characteristics are the same as those selected for the “Property” search, as described above, for consistency. To the extent possible, the Tenant and Property datasets were cross-referenced with each other via the property address. Due to discrepancies and missing information (data provided in CoStar is based on reporting from brokers and researchers), not all the data from these two datasets were able to be matched.

Warehouse Operator Names

The warehouse operators for the 3,320 warehouses were derived from several data sources as each dataset provides different information on tenants, owners, businesses, and companies that differ in definition:

- “Owner Name”, “Property ID”, “Property Address”, “Property Name”, “Company Name”, “City”, and “Zip” from CoStar.
- “Company” from InfoUSA. This dataset is cross-referenced using property addresses.
- “Business Name” from DNB. This dataset is cross-referenced using property addresses.
- “Company” from Leonard’s List. This dataset is cross-referenced using property addresses.

Datasets were refined using the criteria below:

1. If CoStar had data for a property tenant, this was considered to be the correct operator name.
2. If CoStar did not have data for a property, multiple matches between InfoUSA, DNB, and Leonard’s List would be considered the correct operator name.
3. Absent CoStar property tenant data, and no matching data as described in step 2., InfoUSA, DNB, and Leonard’s List were considered the correct operator name in that order of priority.
4. CoStar “Owner Name” was considered the correct operator name if the above steps did not result in an operator.
5. If steps 1-4 did not yield an operator name, or yielded an operator name that appeared to not be a name for a company that would engage in warehousing activities (such as the name of a church), Staff used Google Maps to do a visual verification using Google Maps’ street view to determine an operator name by searching for signage with the operator name on the addressed property or building. If the Google Maps visual verification showed that the property was not for warehouse use (through the name of the property operator or the nature of the property itself, or was a vacant lot), this was considered a potentially inapplicable property for earning WAIRE Points and likely only subject to PR 2305 reporting.

Note that because this dataset was created in order to identify the single most correct operator for each warehouse, this process results in one warehouse operator identified per warehouse. Some warehouses may have multiple operators; identifying warehouses with multiple operators is discussed below.

Facilities Potentially Only Subject to Reporting Under PR 2305 (418 facilities from the total population of 3,320 warehouses)

247 facilities are expected to only need to satisfy PR 2305 reporting requirements because these facilities have less than 100,000 square feet of warehouse space in a single building after excluding CoStar-reported office space. An additional 171 facilities potentially may only be subject to reporting requirements in PR 2305 as visual review with Google Maps indicated that they may not conduct warehousing activities. For example, some facilities were considered inapplicable if they appeared to be mostly used for manufacturing, and unlikely to have 100,000 square feet dedicated to warehouse use.

To aid in this evaluation, only facilities with the “Secondary Type” column designation of “Manufacturing” and “Light Manufacturing” from CoStar were analyzed in this step. Buildings with less than one dock door per 10,000 square feet of building area were further screened out. These facilities with less than one loading docks per 10,000 square feet were visually reviewed with Google Maps to look for visual cues of warehousing use (such as dock doors) or lack thereof (such as manufacturing equipment taking up the majority of the site) to determine if on site warehousing use would be potentially applicable to PR 2305.

From the additional analysis described below, all applicable warehouse statistics considerations are out of the 2,902 applicable warehouses, unless stated otherwise.

Warehouses That Potentially Have Multiple Operators (1,093 warehouses)

CoStar identified the tenancy of warehouses as single, multiple, or unknown number of operators, and also in many cases identifies the last known tenant. However, the accuracy of the businesses identified as tenants within CoStar was not always considered reliable, as historical tenant data could not always be distinguished from multiple current tenants. Based on a review of all available information within CoStar, out of 2,902 warehouses potentially required to earn WAIRE Points, staff identified 1,093 warehouses that potentially have multiple operators, 1,777 potentially have single operators, and 32 are unknown.

Warehouses Whose Operators Potentially Own a Fleet (1,313 warehouses)

Staff identified 1,313 warehouses with operators that potentially own their own truck fleets. To determine this information, staff cross-referenced the warehouse operator names determined above with “Fleet Name” data from the Fleetseek dataset. Because the names of operators and fleets did not exactly match across the two datasets, a fuzzy lookup tool² was used that showed the similarity between operator name and fleet seek name. Operators’ potential fleet ownership was further verified by using data from the Federal Motor Carrier Safety Administration Company Snapshot tool³ and information from company websites. Examples of potential fleet matches that were excluded from the final tally include small fleets (e.g., <3 trucks) that are registered on the east coast who may only share a name with an operator of a warehouse, or fleets who carry cargo not considered likely for warehousing activities under PR 2305 (e.g., refuse).

Although this analysis shows that perhaps ~40% of warehouse operators own a fleet, it is not possible to determine the extent to which any operator’s fleet serves a particular warehouse. The

² Source: <https://www.microsoft.com/en-us/download/details.aspx?id=15011>

³ <https://safer.fmcsa.dot.gov/CompanySnapshot.aspx>

reporting requirements under PR 2305 will provide additional information about warehouse operators who own or lease trucks that serve that warehouse.

Warehouses within Phases of Rule Implementation

PR 2305 would be implemented in three phases: warehouses larger than or equal to 250,000 square feet will be required to comply with PR 2305 in Phase 1; warehouses larger than or equal to 150,000 square feet and less than 250,000 square feet will be added in Phase 2; and warehouses larger than or equal to 100,000 square feet and less than 150,000 square feet will be added in Phase 3. Using the Rentable Building Area data from CoStar, of the 2,902 warehouses potentially required to earn WAIRE Points, 919 warehouses are in Phase 1, 931 warehouses are in Phase 2, and 1,052 warehouses are in Phase 3. For the 418 facilities that are potentially only subject to PR 2305 reporting requirements there are 37 warehouses in Phase 1, 57 warehouses in Phase 2, and 324 warehouses in Phase 3.

Owner-Operators (515 warehouses)

There are 515 warehouses potentially operated by the owners of the warehouse. The applicable warehouse operated by the owners was determined by cross-referencing CoStar warehouse “Owner Name” data with DNB’s “Business Name” data for that same address.

Warehouses Near Ports (202 warehouses)

Staff identified 202 warehouses that are located near the Ports of Los Angeles and Long Beach. Warehouses determined to be Warehouses Near Ports were designated on “Submarket Name” column of the CoStar property dataset as: Carson Industrial; Long Beach South East Industrial; Long Beach South West Industrial; Rancho Dominguez Industrial; San Pedro Industrial; and Wilmington Industrial.

Warehouses with Existing Solar Panels (214 warehouses)

Staff identified 214 applicable warehouses with solar panel systems installed. Google Maps satellite view was used to identify which applicable warehouses that had solar panels systems installed. “Property Address” data from the CoStar property search were searched in Google Maps to complete a visual review of each property to determine the presence of solar panel systems.

Facilities by Secondary Type

The CoStar property search data set provided a secondary industry type designation. These designations are provided under the “Secondary Type” column in the property search dataset. The following breakdown shows the “Secondary Type” designations for the 2,902 warehouses potentially required to earn WAIRE Points under PR 2305: Distribution: 824 facilities; Light Distribution: 5 facilities; Light Manufacturing: 13 facilities; Manufacturing: 419 facilities; Refrigeration/Cold Storage: 42 facilities; Truck Terminal: 33 facilities; and Warehouse: 1,566 facilities.⁴

⁴ These ‘Secondary Types’ were one of the parameters used by IEC in their study of warehouses that may relocate with PR 2305 (“Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule”). That study analyzed 2,638 warehouses that were considered most likely to relocate. The Technical Memorandum on Real Estate Markets Neighboring the South Coast AQMD Region from that study describes the methodology it used relative to these datasets.

Low Floor Area Ratio (FAR) (870 warehouses)

Staff identified 870 warehouses with FARs less than 0.45. The FAR describes the ratio of indoor floor area relative to the total square footage of a property. For single story buildings, lower FARs indicate a large outdoor area, which in the case of warehouses typically indicates a large yard for truck and trailer parking. The lower the FAR, the more likely it is that space could be identified onsite for larger scale ZE charging/fueling infrastructure installations. Warehouses with FARs <0.45 were identified as this is a common value used by local land use agencies for new warehouse developments. The FAR alone is not the sole determinant if a facility can install ZE charging/fueling infrastructure. Facilities with FARs higher than 0.45 may also have the ability to install ZE charging/fueling infrastructure, and conversely some facilities with FARs <0.45 may not have sufficient access to electrical utility infrastructure connections onsite or nearby.

List of Warehouse Addresses Potentially Subject to PR 2305

Property Address	City	State	Zip	Property Address	City	State	Zip

Appendix D: POTENTIAL SIP CREDIT APPROACH FOR PR 2305

Introduction

What is the purpose of PR 2305?

As stated in PR 2305, its purpose is to reduce local and regional emissions, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to help achieve state and federal ambient air quality standards and to reduce exposure to diesel particulate matter.

What is the State Implementation Plan?

The federal Clean Air Act requires areas with levels of ozone, particulate matter, and other pollutants that exceed National Ambient Air Quality Standards (NAAQS) to develop State Implementation Plans (SIPs). SIPs are comprehensive plans that describe how an area will attain the NAAQS. SIPs are not single documents. They are a compilation of new and previously submitted plans, programs (such as monitoring, incentives, permitting, emissions inventory, etc.), local air district rules, state regulations, and federal controls. State law makes CARB the lead agency for all purposes related to the SIP. Local air districts prepare SIP elements and submit them to CARB for review and approval. CARB then forwards these SIP revisions to the EPA for approval.

What is 'SIP credit'?

SIP credit is the general term given for emission reductions that are creditable towards commitments in the SIP.

Why is SIP Credit needed?

The SIP contains a detailed accounting of the expected emissions inventory in future milestone years with Clean Air Act deadlines. This emissions inventory includes a baseline scenario (i.e. business-as-usual) and a control scenario (if the SIP's proposed measures are all adopted). The 2016 AQMP from South Coast AQMD and the companion State SIP Strategy from CARB includes substantial emission reductions tied to 'further deployment of cleaner technologies' control measures that are not yet fully defined. Emission reductions from these control measures are needed to both meet the NAAQS and to ensure that federal sanctions are not imposed under the federal Clean Air Act. If adopted, PR 2305 will provide emission reductions that can help meet these 'further deployment' commitments. This document provides the background for how PR 2305 emission reductions will be SIP creditable.

What are the requirements for SIP credit?

There are a variety of guidance documents¹ and regulations that address how emission reductions can be credited towards the SIP. In general, SIP creditable emission reductions must satisfy five

¹ Voluntary Mobile Source SIP Programs, www.epa.gov/sites/production/files/2016-05/documents/vmep-gud.pdf
Improving Air Quality with Economic Incentive Programs (2001),
www.epa.gov/sites/production/files/2015-07/documents/eipfin.pdf
Voluntary and Emerging SIP Measures,

Energy Efficiency and Renewable Energy SIP Measures,
www.epa.gov/sites/production/files/2016-05/documents/erescerem_gd.pdf

key ‘integrity elements’. Namely, the emission reductions must be quantifiable, enforceable, verifiable, surplus, and real.

Which emission source categories can achieve SIP-creditable emission reductions with PR 2305?

The emission sources that may have SIP-creditable emission reductions from PR 2305 include on-road trucks, hostlers (both on-road and off-road vehicles), Transport Refrigeration Units (TRUs), light duty vehicles, and power plants.

What is the role of scrapping in SIP-creditable mobile source measures?

Scrapping is the process by which older vehicles that are replaced by newer, cleaner vehicles are scrapped and taken out of service to ensure that the emission reductions from the newer vehicle are achieved. Scrapping ensures that the new vehicle is not just accommodating growth in the vehicle fleet. SIP-creditable emission reductions can be achieved both with and without a scrappage program. Examples of SIP-creditable programs with scrapping requirements include many voluntary incentive programs like Carl Moyer, or AB 617 funding. These programs are implemented on an individual truck basis (through grant funding contracts), and without a scrappage requirement it would not be possible to discern whether any one individual truck would result in eventual scrappage of a truck somewhere in the entire truck fleet, or if the newer, cleaner truck is actually adding emissions due to growing the truck fleet.

Other SIP-creditable measures do not require scrapping, such as CARB regulations like the Low NOx Omnibus Rule or the Advanced Clean Trucks Rule. These rules rely on assumptions about future truck sales and future truck activity (e.g., miles travelled per year). Importantly, these rules broadly affect large sections of the truck fleet instead of individual trucks, and the rulemaking analysis for these rules consider how each rule will affect the entire truck fleet, including growth and rates of vehicle turnover. These assumptions are subsequently verified through the regular updates to the EMFAC model.

What is EMFAC?

EMFAC is an emissions model developed and used by CARB to assess emissions from on-road vehicles including cars, trucks, and buses in California, and to support CARB's regulatory and air quality planning efforts to meet the Federal Highway Administration's transportation planning requirements. U.S. EPA approves EMFAC for use in the State Implementation Plan and transportation conformity analyses.

How does SIP credit work for incentive funding programs?

Programs like Carl Moyer or AB-617 funding programs provide subsidies to offset the higher purchase price of near-zero and zero emission vehicles. In some cases, these types of voluntary

Incorporating Bundled Measures in a SIP,

Diesel Retrofit SIP Programs, <http://nepis.epa.gov/Exe/ZyPDF.cgi/P100HP2S.PDF?Dockey=P100HP2S.PD>

incentive programs can result in prospective SIP creditable emission reductions.² While incentive funding programs have been included as control measures within the 2016 AQMP, they are not included in the baseline emissions inventory, nor are their effects included within EMFAC. PR 2305 is designed to work together with incentive programs. Although some incentive programs are oversubscribed³, others are undersubscribed⁴. PR 2305 can help ensure that incentive funds are fully utilized, and can also potentially spread incentives to additional vehicles by lowering the amount that vehicle purchasers are willing to accept due to the requirements within PR 2305 on warehouse operators.

Background on Obtaining SIP Credit for Mobile Source Emission Reduction Measures

SIP creditable emission reductions are typically obtained through three key processes.

- 1) Regulations adopted at the local, state, or federal level that meet the ‘integrity elements’ described above can achieve prospective SIP credit at the time that the regulation is adopted. Prospective SIP credit is a projection of how emission reductions will occur in the future due to a control measure.
 - a. Example: CARB’s Truck and Bus Regulation⁵ requires fleets to only utilize trucks that meet or exceed 2010 truck engine standards (with some limited exceptions) by 2023. Those fleets may include older, higher-emitting trucks today, but the future emission reductions from the existing regulation provides prospective SIP credit. As shown below, not all emission reduction measures can be credited towards the SIP prospectively.
- 2) For some regulations or control measures, actual emission reductions achieved may be higher or lower than originally estimated at the time the regulation was adopted. A later analysis may evaluate how a rule is actually being implemented and adjust the amount of SIP creditable emission reductions. These retrospective emission reductions evaluate how emissions changed in the past, and then project how that will affect the future.
 - a. Example: EPA’s Heavy Duty Engine Standards⁶ required all truck engine manufacturers to meet a NOx emission standard of 0.2 g/hp-hr by 2010 (with some limited exceptions). SIP creditable prospective emission reductions were assumed in the EMFAC 2007 emission model at the time assuming that engines would meet these standards in real world conditions.⁷ However, subsequent testing of these engines has shown that engines that meet the EPA standard (based on a test cycle) do not achieve the previously assumed level of emission reductions in real world conditions.⁸ One example includes during periods when the engine exhaust controls

are operating at lower temperatures than necessary to fully reduce NO_x emissions.⁹ As a result, a more recent EPA-approved emissions inventory for trucks in EMFAC 2017 has subsequently been updated to incorporate this more recent real world data.¹⁰ The table below shows a comparison of NO_x emission rates for the same model year truck between the EPA-approved EMFAC 2007 and EMFAC 2017 emissions inventory models. The more recent EMFAC 2017 model used more recent real-world data, and the subsequent SIP creditable emission reductions from the EPA Heavy Duty Engine Standard have been revised to incorporate real-world conditions.

Table 1: Zero-Mile NO_x Emission Rates for Model Year 2015

EMFAC 2007 ¹¹	EMFAC 2017 ¹²
1.14	2.68

- 3) Finally, real-world emissions from some sources are often affected by multiple factors. For example, on-road vehicle emissions are affected by multiple regulations, market forces (e.g., the state of the economy, the price of fuel, etc.), financial incentive programs (e.g., the Carl Moyer program), and private sector policies (e.g., corporate sustainability goals). In order to account for all of these competing influences, every few years the baseline mobile source emissions inventory used for the SIP is updated, including through updates to CARB's mobile source inventories (e.g., the EMFAC model, off-road equipment inventories, etc.), updates to the Regional Transportation Plan (RTP) from the Southern California Association of Governments (SCAG), and new South Coast AQMD Air Quality Management Plans (AQMPs). Because SIP creditable emission reductions cannot always be separately assigned to each unique factor, the holistic evaluation of the on-road mobile source sector in EMFAC updates (or equivalent off-road sector updates) conducted by CARB ensures that the SIP inventory is as comprehensive, accurate, and current as possible.
 - a. Example: Every four years SCAG updates its forecast for the transportation system in the RTP. This modeling analysis includes a forecast of vehicle miles travelled in the freight sector based on a number of factors including: activity data from the ports of Los Angeles and Long Beach, national commodity flow surveys, land use patterns, developments in the roadway network, etc. These modeled outputs (e.g., vehicle miles travelled, vehicle speeds, location of vehicle activity) are combined with emission factors from EMFAC to establish the SIP creditable emissions inventory in the subsequent AQMP.

Expected Mechanisms to Obtain SIP-Creditable Emission Reductions with PR 2305

If PR 2305 is adopted, SIP-creditable emission reductions can be achieved prospectively, retrospectively, and through holistic mobile source inventory analysis. Because other existing and forthcoming mobile source measures will reduce emissions from the same sources, not all emission reductions achievable from PR 2305 can be fully quantified at time of rule adoption. As described in CARB's Mobile Source Strategy¹³, additional future measures may be developed that would affect emission sources at facilities covered by PR 2305, but it is too speculative at this stage to determine how they may or may not overlap with PR 2305.

Prospective Emission Reductions from PR 2305

Emissions reductions are expected from all of the emissions sources covered by PR 2305, however not all of the emission reductions can be fully quantified at time of rule adoption. This is primarily because some emission reductions from PR 2305 will at least partially overlap with other SIP-creditable measures. The table at the end of this section lists the key existing and future mobile source measures that also reduce emissions sources addressed by PR 2305, and describes how the overlap is addressed. Even if prospective SIP creditable emission reductions are not achievable at the time of rule adoption, other means of obtaining SIP credit are possible (see below). Further, through the implementation of the WAIRE Mitigation Program, it may be possible to develop prospective SIP creditable emission reductions at a future date.

Retrospective Emission Reductions from PR 2305

The PR 2305 WAIRE Program will be tracked by South Coast AQMD staff to evaluate how it is implemented every year, reported publicly to the Governing Board Mobile Source Committee, with results also made available on the South Coast AQMD web page. A key component of this analysis will be to evaluate which menu options are being chosen by every facility, and comparing that to the original analysis conducted during the rulemaking process. If trends emerge that show greater or lesser emission reductions than envisioned in the rulemaking analysis, then adjustment may be made in subsequent revisions to the SIP inventory (e.g., as part of a future AQMP).

Holistic Analysis of Emission Reductions from PR 2305

Some emission reductions may be attributable to PR 2305, but will not be captured in either a prospective or retrospective analysis. This could include emissions from trucks purchased to comply with PR 2305, but that make truck trips between facilities that aren't regulated under PR 2305. These truck trips are not accounted for in the rulemaking analysis, or in subsequent annual reviews of the WAIRE Program. In addition, if many warehouse operators decide to install zero emission charging/fueling infrastructure, this is expected to make it easier for truck owners to decide to switch to zero emission technologies as finding a fueling location will become less of a concern. This potential increased zero emission technology penetration into the overall truck fleet is not accounted for in the rulemaking analysis except for zero emissions truck visits to regulated facilities. Further, the assumptions included in the rulemaking analysis about other mobile source measures (e.g., CARB's Low NOx Omnibus Rule or ACT Rule) will likely be revised based on future, unknown conditions. In particular, the level of future truck sales, future activity per truck, future costs to operate trucks, etc. all may require updates as part of a normal EMFAC update. As is currently practiced, this holistic analysis will provide the mechanism to ensure that all

¹³ <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

overlapping mobile source measures are captured across the entire truck fleet. This is the primary mechanism by which the San Joaquin Valley Air Pollution Control District receives quantifiable ‘SIP credit’ for its Indirect Source Review program (Rule 9510).¹⁴

¹⁴ When EPA approved Rule 9510 into the SIP, it specifically did not allow the rule to be used for prospective SIP credit (76 FR 26609). Notwithstanding this approach, the most recent Annual Report for Rule 9510 shows that since its inception the rule has resulted in 15,617 tons of NOx and PM10 that have been avoided, with another 12,147 tons of NOx and PM10 that has been reduced through use of its mitigation fee program (<https://www.valleyair.org/ISR/Documents/2020-ISR-Final-Annual-Report.pdf>).

Table 2: Existing and Future Measures that Have Overlapping SIP-Creditable Emission Reductions with PR 2305

Emission Reduction Measure	Measure Summary	Existing or Future Measure	Potential Overlap with PR 2305 Requirements	Calculation Method to Address Potential Overlap for Prospective SIP Credit
Incentive Funding Programs	Various state and federal programs (e.g., Carl Moyer, AB 617 funding, DERA, etc.) provide subsidies to offset the higher cost of NZE and ZE vehicles.	Existing and Future	Potential overlap for existing state and federal funding programs. Uncertain overlap for any new funding programs.	Because incentive programs are not included within EMFAC, no adjustments are made to the PR 2305 calculation.
EPA Heavy Duty Engine Standards	Requires manufacturers nationwide to only sell trucks meeting specified emission standards by 2010 (e.g., 0.2 g/hp-hr NO _x)	Existing	Partial overlap due to CARB Truck and Bus Rule.	Overlap calculated as part of CARB Truck and Bus Rule.
CARB Truck and Bus Rule	Requires truck fleets to only operate trucks meeting EPA's 2010 engine standard by 2023. Measure is phased in before 2023.	Existing	Partial overlap before 2023. No overlap after 2023.	Any emission from NZE or ZE truck activity associated with PR 2305 are compared against baseline truck emission rates that are the average for that truck type in any calendar year from EMFAC 2017 (which includes the Truck and Bus Rule).
CARB Advanced Clean Truck (ACT) Rule	Requires truck manufacturers to ensure that a portion of their new vehicle sales in CA are zero emissions. Measure phases in from 2024-2035.	Existing	No overlap before 2024. Partial overlap after 2024.	Before 2024, any ZE truck activity attributable to PR 2305 that aren't funded by Incentive Programs provide prospective SIP creditable emission reductions. As a conservative approach ¹ , after 2024 any emission reductions from ZE truck activity associated with PR 2305 will be reduced by the amount of applicable ZE truck activity

Emission Reduction Measure	Measure Summary	Existing or Future Measure	Potential Overlap with PR 2305 Requirements	Calculation Method to Address Potential Overlap for Prospective SIP Credit
				associated with ACT ² in addition to any potentially incentive funded trucks.
CARB Low NO _x Omnibus Rule	Requires manufacturers to only sell trucks in CA meeting specified emission standards. Updates warranty, useful life, certification testing procedures, etc. Measure phased in from 2024-2027.	Existing	No overlap before 2024. Partial overlap after 2024	Before 2024, any NZE truck activity attributable to PR 2305 that aren't funded by Incentive Programs provide prospective SIP creditable emission reductions. As a conservative approach ¹ , after 2024 any emission reductions from ZE truck activity associated with PR 2305 is reduced by the amount of applicable NZE truck activity associated with Low NO _x Omnibus ² in addition to any potentially incentive funded trucks.
CARB Transport Refrigeration Units (TRU) Air Toxics Control Measure (ATCM)	Requires TRUs to meet in-use particulate matter standards, phased in through 2021.	Existing	No overlap.	No adjustment necessary as rule is completely phased in.
CARB In-Use Off-Road Diesel Rule	For PR2305, this measure applies to yard trucks. This rule requires fleets to meet specified in-use emission levels, depending on fleet size. The rule is phased in from 2014-2029.	Existing	Potential overlap.	Average baseline emission rate for yard trucks is based on industry estimate of yard truck age. This age profile results in baseline emissions that are lower than the most stringent standard in the In-Use Offroad Rule. SIP-creditable emission reduction calculations for yard trucks therefore assume less emission reductions than if only considering this measure.

Emission Reduction Measure	Measure Summary	Existing or Future Measure	Potential Overlap with PR 2305 Requirements	Calculation Method to Address Potential Overlap for Prospective SIP Credit
EPA Cleaner Trucks Initiative	Proposal would require manufacturers nationwide to only sell trucks meeting specified emission standards. Level of control and timing uncertain, though it may match CARB's Low NOx Omnibus Rule in 2027.	Future	Potential overlap after any new standards go into place.	No analysis currently possible as measure has not yet been sufficiently developed or approved. SIP credit for this measure in relation to PR 2305 will be determined at a later date if PR 2305 is approved.
CARB Advanced Clean Fleets Rule	Proposal would require fleets to increasingly use ZE trucks. Goal is a 100% ZE truck fleet by 2045, with interim goals before then.	Future	Potential overlap after any new standards go into place.	No analysis currently possible as measure has not yet been sufficiently developed or approved. SIP credit for this measure in relation to PR 2305 will be determined at a later date if both PR 2305 and ACF are approved.
CARB Proposed TRU ATCM Amendments	Proposal will transition straight truck TRUs to ZE from 2024-2031. A second rule amendment will target transitioning trailer TRUs to ZE by 2035.	Future	Potential overlap after any new standards go into place.	No analysis currently possible as measure has not yet been sufficiently developed or approved. SIP credit for this measure in relation to PR 2305 will be determined at a later date if both PR 2305 and the TRU ATCM are approved. PR 2305 (d)(3)(A) also prohibits earning WAIRE Points in any year that a CARB or EPA rule applies.
CARB Proposed ZE Forklift Rule	Proposal would require fleets to phase in ZE forklifts from 2025-2040.	Future	Potential overlap after any new standards go into place.	No analysis currently possible as measure has not yet been sufficiently developed or approved. Emission reductions not calculated for forklifts in PR 2305 as these are not included in the WAIRE Menu.

Emission Reduction Measure	Measure Summary	Existing or Future Measure	Potential Overlap with PR 2305 Requirements	Calculation Method to Address Potential Overlap for Prospective SIP Credit
CARB Heavy Duty Inspection & Maintenance (HD I/M) Rule	Proposal would require truck owners to routinely test their trucks to ensure they operate within acceptable standards.	Future	Potential overlap as emission reductions from this measure are not yet accounted for in EMFAC.	Expected effect of HD I/M is calculated in CARB META tool. Baseline truck emissions (i.e. trucks that would go to warehouses absent PR 2305) will be reduced to account for HD I/M before calculating the difference due to ZE and NZE trucks visiting PR 2305 warehouses.

Notes:

- 1) There are no requirements in this measure that ensure that mandated statewide sales targets will result in emission reductions specifically in the South Coast Air Basin.
- 2) Emissions from this measure are derived from CARB's Mobile Emissions Toolkit and Analysis (META) tool that was developed for CARB's Mobile Source Strategy as a means of evaluating how all mobile source strategies will interact in the future. The analysis in META assumes that truck sales will match the sales targets in Table A-1 of California Code of Regulations (CCR) Title 13, Section 1963.1, but does not consider the impact of the vehicle weight modifiers in Table A-2 or the credit/trading provisions of the regulation in Section 1963.2. Based on experience with similar provisions in the Advanced Clean Cars (ACC) regulation from CARB (CCR Title 13 Section 1962.2), this assumption results in a high-end estimate of ZE vehicles that will be sold, and the emission reduction estimates due to PR 2305 in this staff report may be higher than shown. For example, the target for light duty sales in ACC is 22% in 2025 and beyond [Section 1962.2 (b)(1)(A)], however EMFAC 2017 only assumes 6.3% based on actual sales that are expected to occur (Table 4.5-5 in EMFAC 2017 Technical Documentation).²⁵⁰ If crediting provisions in ACT similarly result in either lower sales percentages, or a focus on sales of truck types that do not visit PR 2305 warehouses, then less ZE trucks will visit warehouses in the baseline, and more WAIRE Points will need to be earned.

²⁵⁰ <https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-iii-technical-documentation.pdf>

Appendix E: NZE ALTERNATIVES FOR CUSTOM WAIRE PLANS

The Draft Environmental Assessment provides an alternative analysis which considered NZE technology alternatives. As a continuation of that analysis the inclusion of NZE yard trucks and NZE fueling infrastructure is discussed below if it were to be included as Custom WAIRE Plan submissions. In the currently proposed rule, the submission of NZE yard truck fueling infrastructure and NZE on-road truck fueling infrastructure are prohibited from being considered as Custom WAIRE Plans.

NZE YARD TRUCKS

NZE yard trucks are fueled with CNG, LNG or Propane resulting in a 90% or better reduction in NOx emissions and 100% DPM reductions. In addition to the 10% or less NOx emission reduction difference between the ZE and NZE yard trucks, NZE yard trucks may have local public health impacts as they may idle similar to conventional diesel yard trucks, especially as yard trucks typically do not leave the warehouse site and may be used solely for off-road applications. During the analysis of NZE yard trucks, no off-road CARB certified yard trucks were identified, which would otherwise have provided a cost saving at the time of purchase for off-road vehicles. The NZE yard trucks that are used for demonstration projects at the Port of Los Angeles include Capacity trucks with CWI 6.7 and 8.9 liter engines which performed well with the heavier duty cycles of port application. NZE yard trucks have been demonstrated for several years and were not commercial status, but recent advancements have resulted in commercially available NZE yard trucks that are on-road CARB certified to 0.02 g/bhp-hr. Recent innovations of a propane “pony” system allows propane NZE yard truck models to quickly switch propane tanks with minor interruptions to service, which may result in wider use for warehouse, port, and railyard applications.

There are multiple NZE yard truck manufacturers including Capacity, Autocar, and TICO with different engine manufacturers including Cummins, PSI, and Ford. According to the Ports’ Feasibility Study²⁵¹ the cost for an NZE yard truck is currently about \$150,000, with conventional diesel models costing about \$100,000 which makes the incremental cost about \$50,000. The incremental costs for NZE yard trucks can vary depending on the engine size and whether the yard truck is fueled with CNG, LNG, or Propane. Another potential cost to the NZE yard trucks are the NZE infrastructure that would be used to fuel the NZE yard trucks with CNG, LNG, or Propane. Costs for the NZE yard truck fueling infrastructure is another potential investment that could be proposed should Custom WAIRE Plan submissions be allowed for NZE yard trucks, as the cost for the infrastructure would vary depending on the type of natural gas.

NZE FUELING INFRASTRUCTURE

NZE fueling infrastructure is not included in the currently proposed WAIRE Menu as there is an established network of NZE fueling stations in California, with 295 public stations and

²⁵¹ San Pedro Bay Ports, 2018 Feasibility Assessment for Cargo-Handling Equipment, September 2019, <https://cleanairactionplan.org/documents/final-cargo-handling-equipment-che-feasibility-assessment.pdf/>

another 184 private stations²⁵². The typical equipment required at CNG and LNG stations include a compressor, storage, dryer, and fueling posts, with the system design based on capacity determining the number of each type of equipment. Based on the station design the costs of CNG or LNG station can range from \$1.1 million to nearly \$2 million depending on the system design²⁵³. Some of the companies that design and install CNG and LNG stations include SoCal Gas, TruStar Energy, Ozinga, and Clean Energy.

**Re: Update on Development of Facility-Based Mobile Source Measures in
2016 AQMP**

Dear Chair Parker and Members of the Committee:

On behalf of the undersigned organizations, we file comments on the facilities-based measure update that is before your committee. Communities have been fighting pollution from the freight industry for decades. The communities surrounding ports, railyards, warehouses, and freight corridors continue to suffer disproportionately from this industry. And the impacts are serious and grave. Given the contribution of this industry in concentrating pollution in neighborhoods in the region and its regional contribution to air pollution, it is critical that the South Coast Air Quality Management District do everything within its authority to control pollution from freight facilities. We understand that other agencies must do their part (i.e. the California Air Resources Board and the Environmental Protection Agency), but we also need our local air district to do everything it can given the seriousness of the freight pollution crisis.

1-1

As this Committee hears the updates on the various work in addressing pollution from freight facilities, we want to provide some initial input for this committee to consider.

Ports: Given community concerns with a Memorandum of Understanding (MOU) approach, it is vital that any MOU effort be fully vetted in public. As such, it is critical to start the outreach and vetting of these documents now. People concerned with breathing safe air will need time to understand how these contracts are enforceable and set forth strong metrics for emissions reductions at the largest fixed source of pollution in the region.

Warehouses: Staff should continue to examine strategies like facility caps, even if it prefers fleet certification and mitigation fees as a tool. We fear that options for legal approaches are being taken off the table prior to the requisite analysis being completed. While some strategies may aid in reductions region-wide, we remain concerned with approaches that could allow for picking winners and losers in some communities getting cleaner air and others not. We think a strong facility cap could be effective in ensuring warehouses clean up their pollution in all communities.

1-2

Railyards: We continue to find out more about the harmful impacts railyards impose on communities. The air district should pursue a strong rule to combat these facilities that impose so much health burden on communities. We are excited to start this rulemaking process in earnest.

We appreciate your consideration of these comments, and we look forward to working with the Air District to bring clean air to the communities who've been harmed by the freight industry for decades.

Re: Comments on the August 23rd Warehouse Indirect Source Rule Working Group

Dear Mr. MacMillan, Mr. Juan, and AQMD Staff:

Clean Energy appreciates the opportunity to comment on the latest staff presentation provided during the August 23rd Warehouse Indirect Source Rule (ISR) Working Group. We also would like to commend South Coast Air Quality Management District (AQMD) staff on your collective efforts to seek deeper NO_x reductions from mobile sources that demonstrably have a disproportional impact upon the South Coast Air Basin and disadvantaged communities. If the South Coast is ever to reach clean air attainment under the federal Clean Air Act's ozone standards or improve upon the health of impacted communities, the AQMD must be in the best position to transition the basin's fleet to near zero and, as they become available, zero emission medium and heavy-duty truck strategies. As a long-time partner of the AQMD, we offer our support and provide the following comments and recommendations designed to improve upon the agency's ability to move regional warehouse operations toward a cleaner future.

2-1

Near Zero Trucks must be based and have full access to In-Basin Warehouse Facilities

If warehouses located within the South Coast Air Basin are to meaningfully reduce truck-related emissions in the near- to mid-term, low NO_x trucks must be able to both access and be domiciled at warehouse facilities. In short, full access of such trucks that significantly cut diesel exhaust pollution – both smog and carcinogenic diesel particulate emissions – must be a part of the AQMD's emissions reduction strategy portfolio.

During the August 23 workshop, a stakeholder suggested that only zero emission vehicles should be allowed to either access or be domiciled at a warehouse, especially if said facility is located near or adjacent to a disadvantaged community. Adopting such a position, however, would deny any immediate air pollution relief to a heavily impacted community as the default would likely be a dirtier diesel truck. Conversely, providing incentives for warehouse operators and the fleet owners that serve them over to low NO_x trucks using renewable natural gas would deliver 90 percent fewer smog-forming emissions and potentially carbon negative emissions reductions immediately.

2-2

The South Coast AQMD Must Transition Away from Diesel Trucks as Quickly as Possible

Today's diesel trucks not only fail to meet the most stringent low NOx standard, but likely exceed the current NOx emission standard for heavy-duty truck engines if they use a selective-catalytic reduction (SCR) system. Specifically, diesel trucks using SCR devices were found to be ineffective in cutting NOx emissions when operating at low speeds (i.e., drayage). In fact, we would recommend that AQMD staff review recent literature published by the California Air Resources Board clearly stating that emissions from base-line diesel trucks could be up to 9 times above the current heavy-duty truck engine standard for NOx emissions during low speed operations.ⁱ

2-3

Low NOx trucks powered by natural gas, however, do not depend on an SCR system and have been certified to NOx emissions levels that are 90% below the current heavy-duty truck engine standards (i.e., 0.02 g/bhp-hr NOx v. 0.2g/bhp-hr, respectively). Recent studies by the University of California at Riverside also have demonstrated that in-use NOx emissions by natural gas low NOx trucks actually show up to a 99% reduction of NOx emissions compared to the current heavy-duty truck standards set by the US Environmental Protection Agency (EPA) and CARB.ⁱⁱ Additionally, when a low NOx truck is powered with renewable natural gas (RNG), carbon emissions performance for a low NOx truck can actually be carbon negative depending upon the fuel source.ⁱⁱⁱ It should be noted that the two leading providers of natural gas as a transportation fuel in the South Coast Air Basin and the State of California only sell RNG at the pump thanks to the Low Carbon Fuel Standard.

Clearly, low NOx strategies powered by RNG should play an unapologetic and prominent role in the final Warehouse Indirect Source Rule.

2-3
(continued)

Include Renewable Natural Gas Fueling Stations in the Ongoing Warehouse ISR Mitigation Menu

After reviewing the August 23rd Warehouse ISR Working Group presentation, we strongly recommend that AQMD Staff add RNG fueling infrastructure investments on the ongoing mitigation menu as additional fueling infrastructure will be needed to fully address the South Coast's truck pollution crisis.

A few stakeholders have argued against the inclusion of RNG fueling infrastructure with the hope that AQMD would only support zero emission fueling infrastructure projects from this point forward. They even claim that such RNG fueling investments would become stranded assets with the promise of zero emission technology on the horizon. However, RNG fueling infrastructure investments would largely make use of private capital (not public funds) and a return on investment would easily be achieved within 5 to 10 years. Further, while the desire to achieve zero emission strategies now is not lost upon us, it is highly unlikely that the region can make a regional transition for several decades due to both cost, infrastructure and logistical issues.

2-4

For example, Los Angeles County Metro's Board of Directors committed the agency to make a full transition to zero emission buses by 2030 and Metro is now required to do so by 2040 under the California Air Resources Board's Innovative Clean Transit rule. Despite this momentum and receiving massive federal and state public subsidies, Metro staff is quickly learning the herculean challenges of adopting a strategy that has yet to be fully commercialized. For example, Metro's Operations, Safety and Customer Experience Committee is recommending on Thursday, September 19, to purchase 259 Contract Option forty-foot CNG buses because the transit authority cannot get the necessary zero-emission charging infrastructure in place to run more ZEBs in Metro's fleet.^{iv} Further, there are numerous complications associated with certain zero emission bus technologies in terms of weight and range that remain unresolved and are steadily pushing out Metro's target implementation date to no fault of Metro staff's efforts.^v The reality

is zero emission strategies face multiple logistical, technical and cost challenges that go well beyond the operator.

Finally, while we highly dispute the statements pertaining to the NGV industry’s ability to quickly build out public or private RNG fueling infrastructure in the 2018 Drayage Truck Feasibility Assessment released by the San Pedro Bay Port Authorities, failing to include RNG fueling infrastructure as an ongoing menu option under the proposed Warehouse ISR will result in delayed emissions reductions for the region.^{vi} For example, an agency could fail to act on adopting policies that are supportive of AQMD’s Warehouse ISR if they determine that there is insufficient fueling stations to support a clean fleet policy or transition. The AQMD’s final Warehouse ISR should take progressive steps to deny such an outcome by promoting fueling infrastructure that supports low NOx trucks using renewable and climate friendly fuel today.

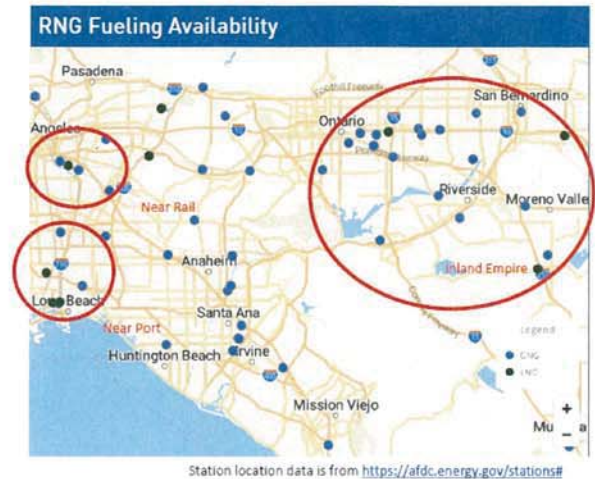

2-5

Substantial RNG Fueling Is Already Available Where Port Trucks Travel

33 existing stations are located near the port, along the 710 corridor to Commerce rail yards and the Inland Empire.

Clean Energy Wilmington station has 6 dispensers. Assuming the remaining 32 stations have 2 dispensers, this gives 70 total dispensers for port trucks. Assuming 50% utilization (actual is less than 50%), the existing network can support $70 \times 116 \text{ to } 165 \text{ trucks} \times 50\% = 4,060 \text{ to } 5,775 \text{ trucks}$.

In actuality, near port stations have 12 dispensers that can handle $12 \times 116 \text{ to } 165 = 1,392 \text{ to } 1,980 \text{ trucks}$ (current utilization goes to zero as the legacy LNG trucks retire). However, to be conservative, this study uses 50% utilization.

Area	Existing Capacity to Serve Additional Trucks
Near-Port	1,392 to 1,980 Trucks
LA Basin	4,060 to 5,775 Trucks

Conclusion:

Clean Energy would like to thank and support AQMD staff's efforts to develop a meaningful Warehouse ISR. The Final Warehouse ISR must: (1) embrace low NOx trucks powered by RNG as a key mitigation strategy and (2) add RNG fueling infrastructure to the ongoing mitigation menu of the Warehouse ISR. Falling short of adopting these two progressive action items in the final Warehouse ISR's strategy would not only deny regional warehouses and fleet operators a key tool to combat both air and climate pollution generated by trucks, it would run contrary to the AQMD's own 2016 Air Quality Management Plan which heavily relies upon low NOx natural gas truck adoption as a core and central strategy to achieve the necessary NOx ton reductions to meet federal ozone attainment.

In fact, we believe both the San Joaquin Valley and South Coast air districts recently said it best in a letter to the California Air Resources Board urging CARB staff to retain low NOx funding under HVIP by stating:

"Both air districts have prioritized the need to replace a large number of long haul and other diesel (Class 7 & 8) trucks by 2024 with zero and near-zero emission technologies through transformational changes in the heavy-duty trucking sector. Additionally, both air districts, with grant funding from CARB, are working on developing and demonstrating zero emission heavy-duty (Class 7 & 8) trucks, and recognize that large scale deployments can provide a valuable option as they continue to become

2-6

commercially available and feasible for fleets, especially with consideration or varying duty cycles. **However, these trucks are not yet commercially available.** Therefore, to reach both regions' and state's air quality goals, near-term large-scale emission reductions are required that can only be achieved by deploying currently available near-zero low NOx technologies today, with immediate reductions needed in AB 617 communities and broader regions.

Towards that end, both districts support continued HVIP funding for zero and near-zero heavy duty (Class 7 & 8) trucks that reduce greenhouse gas and criteria pollutant emissions, especially when combined with renewable fuels that have increasing in-state production as a result of state funding. Both air districts have communities that are heavily impacted by goods movement due to the significant amount of heavy-duty diesel vehicles transporting materials on a daily basis. Bringing about significant additional reductions in freight emissions will be essential for reaching attainment with ever-tightening federal ozone and particulate standards. The development and implementation of near zero-emission low NOx technologies in the freight sector will also provide for significant reductions in toxic air contaminants that affect residents.^{vii}

If you should have any questions or would like to have further input from our team, please do not hesitate to contact me directly.

Sincerely,

Todd R. Campbell

Re: Comments on the November 13th Warehouse Indirect Source Rule Working Group

Dear Mr. MacMillan, Mr. Juan, and South Coast Air Quality Management District Staff:

Clean Energy appreciates the opportunity to comment on the latest staff presentation provided during the November 13th Warehouse Indirect Source Rule (ISR) Working Group. We also would like to commend South Coast Air Quality Management District (AQMD) staff on your collective efforts to seek deeper NOx reductions from mobile sources that demonstrably have a disproportional impact upon the South Coast Air Basin and its disadvantaged communities. If the South Coast is ever to reach clean air attainment under the federal Clean Air Act's ozone standards or improve upon the health of impacted communities, the AQMD must be in the best position to transition the basin's fleet to near zero and, as they become available, zero emission medium and heavy-duty truck strategies.

3-1

As a long-time partner of the AQMD, we offer our support and provide the following comments and recommendations designed to improve upon the agency's ability to move regional warehouse operations toward a cleaner future.

The following comments are being made after review of the newly proposed language:

Warehouse Size Must be Clarified in Rule Language:

Clean Energy recommends that language referring to warehouse size be consistent with the calculations on warehouse size made throughout the document. To do so, we recommend changing the draft language's references to warehoused size located in the AQMD from:

"with greater than 100,000 square feet of indoor floor space in a single building"

to:

"with equal or greater than 100,000 square feet of indoor floor space in a single building"

Instances where "equal or" should be amended into the draft rule's language are on pages: 2305-1, section (b); 2305-3, section (d)(1); and, 2305-7, section (e)(1)(A).

3-2

Implementation of Warehouse Rule based on Warehouse Size

Staff is recommending that this rule be phased in over a three-year period covering 2021-2023 based on three warehouse sizes: $\geq 250,000$ sq. ft. (2021); $\geq 150,000$ sq. ft. (2022), and $\geq 100,000$ sq. ft. (2023). Clean Energy questions why there would be any delay in adopting mitigation measures for sources of pollution at warehouses, especially when the South Coast Air Basin needs to come into attainment with the federal Clean Air Act for ozone in 2023. Given this sense of urgency, it seems to make more sense to require all warehouses equal or greater than 100,000 sq. ft. subject to rule starting in July of 2021. In that way, the rule may see some economies of scale benefits come into play over compliance costs if more, not less, regulated warehouses need to purchase advanced clean trucks and other warehouse mitigation strategies to meet rule obligations. Has staff done any type of analysis as to what the benefits and costs would be to stretch out this rule as currently proposed? Given the enormous costs associated with air pollution and the real possibility of federal sanctions if we fail to meet federal attainment deadlines under the Clean Air Act, it would make more sense for AQMD to implement this rule forward as soon as possible.

3-3

Other Considerations for Rule Acceleration

As staff develops values for WAIRE points, another way to accelerate proactive action would be to reward early action. For example, actions done in advance by warehouse owners or operators who do not currently have any WAIRE obligations would receive a multiplier of WAIRE points that could be used toward compliance. This option certainly should be considered if staff insists on staggering warehouse compliance of the regulation based on size. One recommendation would be, actions taken two years in advance of obligations receive a 2X multiple and actions taken one year in advance would receive a 1.5X multiple.

3-4

Default WATTs Calculation due to a Force Majeure

Staff suggests that if a warehouse operator fails to know the number of annual truck trips made to a warehouse due to a force majeure or for whatever reason, a default WATTs calculation shall be used to determine an owner or operator's compliance requirements. Such calculations should be used only as a last resort and be heavily weighted in favor of public health. In other words, a default WATTs calculation should be set in such a way that a warehouse owner or operator would prefer to voluntarily report out the actual WATTs values at each warehouse facility over taking the default WATTs calculation. This principle would be similar to default pathways established under the Low Carbon Fuel Standard (LCFS) whereas the default would not generate the level of credits that one would normally expect at a fuel production facility. By doing so, the producer is motivated to submit a detailed pathway to maximize a plants low carbon fuel accreditation.

3-5

Mitigation Fee

Although no fee has been set by Staff in the proposed language, it goes without saying that such a fee must serve as a real deterrent to a warehouse owner or operator who would otherwise opt to violate the rule if the penalty was inconsequential. We will be very interested in the rationale behind whatever figure staff ultimately proposes for the \$XX amount for each WAIRE point.

3-6

Warehouse Activities Definition

We are concerned about the potential abuse that could occur if staff allows supporting office administration, maintenance or manufacturing areas within a warehouse, etc., not count as warehouse activities. It is quite possible that such areas could be created permanently or temporarily to intentionally avoid obligations under the proposed warehouse rule. Further, the AQMD's ability to enforce and prosecute those who take advantage of this loophole with fraudulent intent would be a challenge for Staff. We highly recommend the removal of these exemptions to warehouse activities.

3-7

Near-Zero Emission (NZE) Trucks Definition

We strongly support this definition as it ensures that the rule will put the cleanest low NOx truck option onto the South Coast Air Basin's roads.

3-8

WAIRE Menu

We highly recommend the following changes to the WAIRE Menu to make sure that the AQMD achieves meaningful reductions in air pollution from warehouse operations.

- Acquire ZE/NZE Truck: Support
- NZE/ZE Truck Visits: Support
- Acquire ZE Yard Truck: Support if amended to include NZE Yard Truck to this item as NZE trucks, as defined by the rule, now come in 6.7L, 8.9L and 11.9L engine options.
- Install Onsite ZE Charging or Fueling Stations: Oppose. We recommend this option's removal from the WAIRE menu. The usage of such stations at the facility is what helps achieve emissions reductions at a warehouse. The actual act of installing a charging or fueling station does not reduce emissions in or around a warehouse if there is no volume exhibited. This action therefore should not receive WAIRE credit.
- Use Onsite ZE Charging or Fueling Stations: Oppose unless amended to include NZE fueling stations. Clean Energy believes that the state LCFS already incentivizes the use of low carbon charging or fuel use by volume. However, if staff elects to maintain this action item under the WAIRE menu, it should also include the usage of renewable fuel at NZE fueling stations located at or near warehouses. The value of the WAIRE credit value should also be determined by the CI value of the renewable fuel at a charging or fueling station using the CI values under the California Air Resources Board's LCFS program.
- Install Onsite Energy Systems: Oppose. We recommend removing this action from the WAIRE menu as it does nothing to reduce air pollution at warehouse facilities which is the rule's objective.
- Use Onsite Energy Systems: Oppose. We recommend removing this action from the WAIRE menu as it does not actually reduce air pollution at a warehouse which is the rule's objective.
- Community Benefits: Support. Any action that better informs the community on the health risks and impacts is important information to collect and share with the community.

3-9

3-10

3-11

3-12

3-13

Conclusion:

Clean Energy would like to thank and support AQMD staff's efforts to develop a meaningful Warehouse ISR. If possible, we would like to meet with you to discuss the above amendments and recommendations in person prior to the next Warehouse Workshops in December.

3-14

Also, if you should have any questions or would like to have further input from our team, please do not hesitate to contact me directly.

Sincerely,

Todd R. Campbell

Re: Comments on Preliminary Draft Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. MacMillan:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the preliminary draft warehouse indirect source rule proposed by South Coast Air Quality Management District staff during the November 13, 2019 meeting of the warehouse working group. Our coalition is actively involved in this group because communities adjacent to warehouses are consistently and disproportionately harmed by the freight industry every day. We have advocated *for years* for a strong and equitable warehouse rule that will achieve necessary emissions reductions. Indeed, it is well past time for the warehouse industry to see effective and meaningful regulation, and to finally be a good neighbor to the communities burdened by dirty air and unacceptable health risks. The Air District must therefore use this opportunity to pass a strong rule that advances both short- and long-term solutions for the air quality and health crises caused by this industry. The health burden placed on current and future generations of children, pregnant mothers, and our elders and families as a whole must stop now. The time for delay is long over.

4-1

While we appreciate the robust work done so far to develop a strong warehouse rule, and commend the Air District's decision to move away from a credit trading program that would simply amount to pollution trading and we know would not work, the draft rule can do more to better reflect the reality of warehouse operations and the pollution crisis in the region. The Inland Empire has seen a proliferation of these facilities in recent years, and the Southern California Association of Governments projects even more warehouse space will be built or retrofitted in

4-2

the future.¹ These facilities continue to be sited in neighborhoods throughout the South Coast air basin that routinely show high levels of ozone and fine particulate matter. In fact, the region continues to rank as one of the most polluted areas of the country, recently receiving an "F" from the American Lung Association for ozone and fine particulate matter pollution.² After operating for years under a business model that places industry over our health, this industry must be held accountable for business decisions that contribute to consistent and toxic pollution in our neighborhoods.

4-2
(continued)

And there is no question that the Air District can ensure accountability here, under its considerable legal and regulatory authority to develop a strong warehouse rule that tackles the freight pollution crisis. Under the California Health and Safety Code, the Air District is expressly required to provide a warehouse facility-based measure that addresses "high-level, localized concentrations of pollutants" throughout the South Coast air basin.³ Thus, we request that Air District staff update the draft rule to reflect our comments below prior to submitting it to the Air District's Governing Board for adoption in May 2020.

I. The Rule Must Apply to Warehouses 100,000 Square Feet or Larger in Size.

Throughout the draft rule, the language indicates it applies to warehouses that are either greater than 100,000 square feet in size, or greater than *or equal to* 100,000 square feet, shifting between the two interchangeably. (Compare Proposed Rule 2305(b), (d)(1), and (e)(1)(A) with Proposed Rule 2305(d)(1)(C), (e)(3)(A).) Given that the former option likely exempts from the rule many facilities that the rule actually intends to cover, the final rule should clearly and consistently state it applies to warehouses that are greater than or equal to 100,000 square feet.

4-3

In addition, the draft rule defines a warehouse as a "facility consisting of one or more buildings that stores cargo," yet notes it only applies to "a single building" that meets its size requirements. (Proposed Rule 2305(b), (c)(22).) We have seen many facilities in our communities that consist of smaller buildings clustered near each other, however, with one operator running all the warehousing activities in each building. A limitation to single buildings thus may not reflect the reality of warehouse operations, and may again unintentionally exempt certain facilities that should be regulated. The final rule must account for warehousing activities spanning several neighboring buildings that together may meet the 100,000 square feet requirement.

4-4

II. The Points Compliance Obligation Must Reflect the Disproportionate Impacts on Environmental Justice Communities.

The specifics of the warehouse points compliance obligation are still left largely undefined in the draft rule. The stringency value, annual variable, and points for each menu item are critical to creating a strong rule, and we anticipate participating in the technical working

4-5

¹ So. Cal. Assn. of Governments, [Industrial Warehousing in the SCAG Region](#) (Apr. 2018) at p. 81.

² Am. Lung Assn., [State of the Air 2019](#) at pp. 69-70.

³ Health & Saf. Code, § 40440(b)(3).

group and providing more detailed comments once these factors are defined. We want to ensure at this point, however, that the points obligation for each warehouse accounts for nearby sensitive receptors, and that facilities located in environmental justice communities and/or neighbor sensitive receptors must receive a higher points obligation. A just and equitable warehouse rule must ultimately aid in region-wide emissions reductions and avoid approaches that could allow for picking winners and losers, with some communities getting cleaner air and others not. A compliance obligation that reflects the disproportionate impacts faced by disadvantaged communities will be effective in ensuring warehouses clean up their pollution in *all* communities.

4-5
(continued)

The draft rule further fails to specify exactly how warehouse owners and operators will determine their final points compliance obligation each year. We presume the Air District will provide owners and operators their precise obligation using the equation in Proposed Rule 2305(d)(1), however, the draft rule does not describe this process. We suggest the final rule lay out the process, including how and when the Air District will communicate the final obligation, in order to ensure consistency in the rule's application.

4-6

Finally, and again for the sake of clarity, the final rule should also define "sensitive receptors" as used in the table of menu items, e.g., residential areas, schools, hospitals, daycare facilities, nursing homes, parks, or other areas where occupants are more susceptible to the negative impacts of pollution.

4-7

III. The Mitigation Fee Option Should Be Minimal.

As with the points compliance obligation, the draft rule does not specify the mitigation fee rate. (Proposed Rule 2305(f).) Yet it is imperative that the mitigation fee option not become a "pay to pollute" alternative, with facilities simply paying their way out of their compliance obligation each year rather than investing in the on-site menu items. The current draft rule language seems to allow for just such an alternative, simply making the fee progressively more expensive each year that an operator fails to meet its compliance obligation using on-site menu items. Unfortunately, we have seen time and time again that the industry would rather pay more than change their operations or invest in meaningful emissions reduction measures. Thus, the final rule must properly limit the role of a mitigation fee in an operator's compliance obligation.

4-8

To that end, the mitigation fee must appropriately cost more than the menu options in order to incentivize on-site investments, and the points generated per dollar must be further discounted for those facilities located near sensitive receptors and/or in environmental justice communities. The final rule should also specify how and where the mitigation fees generated each year will be used. Given that our members bear the brunt of this industry's operations, we expect such fees will fund emissions reduction projects in our communities.

4-9

IV. The Freight Sector Must Move to Zero-Emissions.

We want to be abundantly clear that our community members want zero-emissions technology as part of any warehouse rule, in order to truly address the air quality and health crises caused by the warehouse industry. Any investment in "near-zero" equipment and

4-10

infrastructure at this point is counterproductive and should not be included in this rule. The on-site menu items still include the purchase of near-zero trucks as one of many options to earn points, yet near-zero technologies ultimately delay the development and implementation of the zero-emissions equipment necessary to clean up pollution in our communities.

We continue to hear industry representatives push near-zero technology in our working group meetings, but near-zero is often used as code for traditional combustion technologies burning methane gas. These technologies provide no bridge to advancing zero-emissions technologies, and ultimately create barriers to the transition to and implementation of zero-emissions infrastructure. Moreover, the communities listed on this letter are those that bear the brunt of the natural gas and oil infrastructure that supports these combustion technologies. These communities do not want the continued negative climate and health impacts that accompany the propagation of fossil fuel technology, equipment, and infrastructure.

4-10
(continued)

Near-zero advocates talk about their technologies being available now as an argument why the region should invest robustly in natural gas infrastructure and vehicles. We remind the Air District that zero-emissions technologies are developing rapidly and by the time compliance obligations start for this rule, we expect significant further developments in the zero-emissions technologies space.

4-11

The freight sector must move to zero-emissions to meet not only our greenhouse gas reduction targets, but also to be consistent with the directives and plans adopted at the regional, State, and even global level. Indeed, the transition to zero-emissions will happen, and the Air District is wise to begin planning and demonstrating a clear foundation for it.

4-12

V. The Final Rule Must Address CEQA Obligations.

The draft rule does not address the interplay between compliance with the final warehouse rule, and facilities' compliance with obligations under the California Environmental Quality Act (CEQA). Yet we anticipate seeing future CEQA documents where warehouse owners and operators claim they will address air pollutant emissions, for example, through the warehouse rule, thereby punting their CEQA obligations rather than properly analyzing and mitigating the impacts of their projects through the CEQA process. The Air District must clarify and formalize in the final rule that owners and operators cannot use future compliance with this rule as satisfying CEQA's disclosure and mitigation requirements, regardless of the warehouse rule's application.

4-13

VI. Our Communities Cannot Afford Further Delays in the Rulemaking Process.

The warehouse rule should have been before the Air District's Governing Board in December of this year. Instead, the rule is now tentatively scheduled to go to the Governing Board in mid-2020. We cannot keep pushing the adoption of this rule further into the future, even as pollution continues to envelop our communities. We want to remind the Air District that we expect a finalized and adopted warehouse rule by May 2020.

4-14

We appreciate your consideration of these comments, and reiterate our support for the important work done so far to develop a meaningful warehouse rule. We look forward to working with the Air District to lift up the voices of our community members and tackle the harms caused by the warehouse industry.

Re: First Draft of Proposed Rule 2305 – Warehouse Indirect Source Rule

Dear Mr. MacMillan:

Thank you for the opportunity to review and provide comments on the first draft of the South Coast Air Quality Management District (SCAQMD) Facility Based Mobile Source Measure – Warehouse Indirect Source Rule (Warehouse ISR). We appreciate how much work you and the other SCAQMD staff have put into this proposed rule, and look forward to continuing to work with you on an effective rule for full implementation.

5-1

Founded in 1971, the Coalition for Clean Air protects public health, improves air quality, and prevents climate change. We submit these comments in the hopes that they will be taken in the cooperative spirit in which they are offered.

I. Necessary Details of Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program Must Be Clarified

Under section (d) (1) (A) Requirements, the SCAQMD has left much undefined and without the ability for the public to determine how the WAIRE points will be calculated. The equation to calculate annual WAIRE program points required per warehouse includes the following:

$$WPCO = WATTs \times Stringency \times (Annual\ Variable)$$

However, “Stringency” is completely undefined, leaving interested members of the public wondering exactly how SCAQMD will calculate the required WAIRE points according to its own equation. Similarly, the “Annual Variable” is to be determined according to Table 1 (Proposed Warehouse ISR, 2305-11). When reviewing Table 1, however the Annual Variables in that table are also undefined.

5-2

Without hypothetical or placeholder values to insert into SCAQMD’s proposed equation, it is impossible to determine what a proposed WAIRE point value would be for warehouses. Without some indication of what SCAQMD is proposing for both Stringency values and Annual Variables, the first draft of the Warehouse ISR is frustratingly vague and ambiguous. We hope that these values will be much

more fully fleshed out by SCAQMD staff before our next Warehouse ISR meeting on Tuesday, December 10.

5-2
(cont.)

II. The Initial Requirement Dates Are Too Far Out

In table 2, the initial reporting dates are listed as follows:

Warehouse Size (sq. ft.)	Initial Reporting Date
Greater than or equal to 250,000	July 30, 2021
Greater than or equal to 150,000	August 2, 2022
Greater than or equal to 100,000	August 1, 2023

5-3

However, from the draft rule, it is unclear why such a large range of reporting dates is included. If the rule is voted upon and implemented next year, why would smaller warehouses have approximately three years to provide their initial reports? Why can't the warehouses be required to report their initial information sooner, so that the SCAQMD can begin implementation expeditiously? I hope this can be addressed at our next Working Group Meeting.

III. The Mitigation Fees Must be Increased Annually by a Larger Percentage

Again, as with the values of the equation discussed above, the proposed rule provides no value for each WAIRE point. (Proposed ISR, 2305-9, section (f)(1).) Further, the SCAQMD proposes that if a warehouse operator does not complete at least 50% of their WAIRE points obligation, the mitigation fee will rise by 10% the following year. (Proposed ISR, 2305-9, 10, section (f)(2).) We propose that the fee rise by **20%** in the event of deficient compliance in a WAIRE year. This way, the operator will have even more incentive to comply with the WAIRE compliance rule. This is also to ensure that warehouse operators will simply pay the mitigation fee rather than make good faith efforts to comply with the WAIRE points SCAQMD rule.

5-4

5-5

Conclusion

Again, we appreciate the opportunity to comment and provide constructive criticism on the SCAQMD proposed Warehouse ISR. We understand that an element of uncertainty is part of the development of the Warehouse ISR, as it is new to SCAQMD. However, to make the rulemaking meaningful to public stakeholders, SCAQMD must do a better job of providing enough information about the proposed Warehouse ISR so that we can have appropriate input into it. In its current form, it is very difficult to determine if the proposed Warehouse ISR has developed a useful way to measure WAIRE points for warehouses in the South Coast Basin.

Re: PROPOSED RULE 2503 - WAREHOUSE INDIRECT SOURCE RULE

SoCalGas appreciates the opportunity to comment on the South Coast Air Quality Management District (SCAQMD) Proposed Rule 2305: Warehouse Indirect Source Rule (ISR) – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program (Proposed Rule). SoCalGas would like to offer the following comments for consideration for the Proposed Rule.

6-1

WAIRE Points Should Prioritize State Implementation Plan (SIP) Creditable Actions and Investments.

The Working Group presentation given on November 13, 2019, states that the number of WAIRE points earned for each menu item will be based on cost, direct emission reduction, and local benefit. While these are important considerations, SoCalGas recommends that SIP creditable emission reductions also be a top priority when determining WAIRE point values. Warehouse ISRs and the other Facility Based Mobile Source Measures were identified as control strategies in the 2016 Air Quality Management Plan to meet the 2023 attainment deadline for ozone. This can only be achieved through SIP creditable emission reductions. While other actions or investments that reduce exposure or enable emission reductions, such as installing filtration systems or electric vehicle chargers, are beneficial, they do not help to achieve the purpose of the Facility Based Mobile Source Measures of producing emission reductions that can be counted towards the SIP. Therefore, SIP creditable reductions should be prioritized.

6-2

Early Actions Should Receive Weighted WAIRE Points

With the federal Clean Air Act ozone attainment deadline quickly approaching in 2023, it is important to achieve as many emission reductions as possible and as soon as possible to meet attainment. Early action would be those that can be deployed immediately with commercially available technologies, such as heavy-duty trucks that meet the California Air Resources Board Optional Low Nitrogen Oxide (NOx) standard of 0.02 grams per brake horsepower hour. Early SIP creditable actions should be given weighted WAIRE points to encourage early action.

6-3

A Standardized Process to Add Actions and Investments to the WAIRE Menu Should be Developed

The WAIRE menu included in the Proposed Rule language contains only nine actions and investments that receive WAIRE points. While this is the first version and will certainly be expanded, SoCalGas recommends developing a continuous, standardized process to add items to the WAIRE menu. A standardize process may include:

- Streamlined application process.
- Technical review committee with regularly scheduled meetings.
- Acceptance guidelines.
- Minimum requirements/criteria guidance document

6-4

Providing requirements and WAIRE point methodologies will give technology developers and solution providers an opportunity to pursue solutions with some amount of certainty that it will be eligible for WAIRE points.

Hydrogen Production Should Receive Additional WAIRE Points

Hydrogen fueling is mentioned in the WAIRE menu, which will achieve emission reductions for the WAIRE program. In addition to fueling, onsite hydrogen production should generate additional WAIRE points. Producing hydrogen on site reduces emissions from transporting the fuel and is a significant financial investment.

6-5

Natural Gas Fueling Infrastructure Should be Included in the WAIRE Menu

The WAIRE Menu includes the addition of alternative fuel infrastructure and specifically states electric and hydrogen infrastructure. Gas infrastructure should also be eligible to generate WAIRE points. Natural gas trucks are the only commercially available Class 8 trucks suitable for goods movement. Supporting the immediate deployment of Low NOx natural gas trucks would significantly assist the region to meeting the 2023 attainment deadline.

6-6

Thank you again for the opportunity to comment on the Proposed Regulation. If you have any questions, please feel free to contact me.

6-7

Respectfully submitted,

Kevin Maggay
Energy and Environmental Affairs Program Manager

To: Ian MacMillan and Victor Juan, South Coast Air Quality Management District
From: Britta McOmber, UCLA Luskin Center for Innovation
Date: December 6, 2019
RE: Proposed Rule 2305 Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

LCI commends the South Coast Air Quality Management District for crafting a Warehouse Indirect Source Rule. We would like to support SCAQMD in development of the final rule that would reduce GHG emissions and harmful diesel emissions from associated heavy-duty truck (HDT) traffic while incentivizing the transition to the cleanest available HDTs. We believe a well-designed Warehouse ISR could improve air quality, public health, and quality of life for communities with concentrated warehousing development. Our potential ability to help quantifiably estimate some of these benefits will depend on the level of specificity available from SCAQMD pertaining to the proposed rule. Thus, please consider these questions for future revisions and workshops of Proposed Rule 2305.

7-1

Sensitive Receptors and Local Benefit Weighting

We would appreciate a better understanding of how the rule will define “Sensitive Receptors” within (c) Definitions. Working group meetings^{1, 2} have discussed the proximity of warehouses to sensitive receptors as an important component of the weighted Localized Benefit in the equation that will determine the value of WAIRE points. There should be a clear definition of this term in the draft rule itself, as it is referenced in the WAIRE Menu. The definition could include a specific description of the populations most vulnerable to the impacts of poor air quality (who), and the types of land uses or facilities where vulnerable populations are located or concentrated (type). SCAQMD could further consider a definition of what is meant by “Local Benefit” in the draft rule; for example, defining the distance from a warehouse at which Sensitive Receptors would influence the value of WAIRE Points (proximity).

7-2

1. Will “Sensitive Receptors” and/or “Sensitive Sites” be defined under (c) Definitions in a future version of Proposed Rule 2305?
2. Will “Sensitive Receptors” be defined separately from “Residential Receptors” and “Worker Receptors”? Does SCAQMD intend to include “Residential Receptors” and “Worker Receptors” as components of the weighted Localized Benefit?
3. When is the expected timeline for release of the Supplemental Handbook that will include default calculations of Costs, Local Benefits, and Direct Emission Reductions for each menu item?

7-3

7-4

¹ Facility-Based Mobile Source Measures Warehouse Working Group. (Aug 23, 2019). *South Coast Air Quality Management District*.

² Facility-Based Mobile Source Measures Warehouse Working Group. (Sep 19, 2019). *South Coast Air Quality Management District*.

Reporting, Notification, and Recordkeeping

We are not aware of text in the draft rule regarding who bears the responsibility of identifying or reporting the number of “Sensitive Receptors” in close proximity to warehouses and distribution centers. It would be useful to specify the role of SCAQMD or some other independent entity in doing so under a uniform approach. This metric could follow the format of other initial site information required in the report, including the number, type, and proximity of Sensitive Receptors (i.e., there are two schools within one mile of the Facility A).

7-5

4. Will identification of “Sensitive Receptors” be the responsibility of SCAQMD staff, the responsibility of the warehouse owner/operator, or another entity?

Transferring WAIRE Points to a Different Warehouse

We also have a question about Section (d)(3)(A) Transferring WAIRE Points to a Different Warehouse. It states “If a warehouse operator conducts warehousing activities at more than one warehouse, then WAIRE Points earned for one warehouse may be used at the other warehouse(s) under the operational control of that same warehouse operator. Only those points that are earned in excess of a warehouse operator’s WAIRE Points Compliance Obligation at that site may be transferred. Any WAIRE Points transferred to a different warehouse shall be calculated using the values specified in the WAIRE Menu in Table 3.” We are unsure if this provision could unintentionally weaken a key goal underpinning the Rule, namely the *local* in “[t]o facilitate local and regional emission reductions through actions and investments at warehouses.”³

7-6

5. Could there be some mechanism or language added to this section of the Proposed Rule that would restrict the transferring of WAIRE Points between warehouses with the same operator in a way that maximizes local benefits?

Transparency

Finally, an attendee of the November 13th Warehouse ISR working group raised a question about transparency of Proposed Rule 2305: What information from the Annual WAIRE Reports would be available to the public? While we appreciate there may be industry-sensitive information in the Annual Reports that warehouse owners/operators may want to protect, LCI as a public serving research entity would appreciate having access to information about the associated investments. We also recognize that it is important that communities with high concentrations of warehousing activities and residents in close proximity to warehouses have the ability to know which warehouse owners/operators are, and are not, in compliance with the Rule.

7-7

³ Facility-Based Mobile Source Measures Warehouse Working Group. (Sep 19, 2019). “Warehouse ISR Working Group.” South Coast Air Quality Management District. Slide 28.

Thank you for your substantial effort to prepare the Proposed Warehouse Indirect Source Rule. I also appreciate the consideration of SCAQMD staff in reviewing these questions, and look forward to further discussions and working group meetings on the content of the rule.

Re: Comments on Preliminary Draft Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Chair Burke and Members of the Committee:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the preliminary draft warehouse indirect source rule that is before your Committee. Our coalition represents the communities who live and work adjacent to warehouses and who are consistently and disproportionately harmed by the freight industry every day. After years of advocating for a strong and equitable warehouse rule that will achieve necessary emissions reductions, our communities can no longer afford a business model that places industry over our health. We need our Air District to use its considerable legal and regulatory authority to develop a strong warehouse rule that tackles the region's freight pollution crisis. Indeed, the warehouse industry must be held accountable for business decisions that contribute to consistent and toxic pollution in our neighborhoods.

8-1

As this Committee hears updates today on the progress of the warehouse rule, we provide the following input for the Committee's additional consideration:

I. The Freight Sector Must Move to Zero-Emissions.

As we have repeatedly emphasized to Air District staff, our community members expect zero-emissions technology as part of any warehouse rule, in order to truly address the air quality and health crises caused by the warehouse industry. Any investment in "near-zero" equipment and infrastructure at this point is counterproductive and should not be included in this rule. Although we commend the staff's decision to not grant points for near-zero infrastructure in the "WAIRE" menu of in-site investment items, the current menu still includes the purchase of near-zero trucks as one of many options to earn points toward compliance. In addition, we are deeply concerned that zero-emissions truck trips earn the same number of points as near-zero truck trips in the current menu. Given that the lion's share of air quality benefits from the rule stem from the use and operation of trucks, zero-emissions trucks must be elevated and granted a greater points value in the final menu. Near-zero technologies only delay the development and implementation of the zero-emissions equipment necessary to clean up pollution in our communities.

8-2

We continue to hear industry representatives push near-zero technology in our working group meetings, but near-zero is often used as code for traditional combustion technologies burning methane gas. These technologies provide no bridge to advancing zero-emissions operations, and ultimately create barriers to the transition to and implementation of zero-emissions infrastructure. Moreover, the communities listed on this letter are those that bear the brunt of the natural gas and oil infrastructure that supports these combustion technologies. These communities do not want the continued negative climate and health impacts that accompany the propagation of fossil fuel technology, equipment, and infrastructure.

8-3

Near-zero advocates talk about their technologies being available now as an argument why the region should invest robustly in natural gas infrastructure and vehicles. We remind the Air District that zero-emissions technologies are developing rapidly and by the time compliance obligations start for this rule, we expect significant further developments in the zero-emissions technologies space. We must take this opportunity to elevate zero-emissions technology and infrastructure in this rule—and begin phasing out near-zero—in order to ensure effective and meaningful regulation of the warehouse industry.

8-4

The freight sector must move to zero-emissions to meet not only our greenhouse gas reduction targets, but also to be consistent with the directives and plans adopted at the regional, State, and even global level. Indeed, the transition to zero-emissions will happen, and the Air District is wise to begin planning for it.

8-5

II. The Points Compliance Obligation Must Reflect the Disproportionate Impacts on Environmental Justice Communities.

The specifics of the warehouse points compliance obligation are still being finalized in the warehouse working group. The stringency value, annual variable, and points for each menu item are critical to creating a strong rule, and we anticipate providing more detailed comments as these factors are further developed. We want to ensure at this point, however, that the points obligation for each warehouse accounts for nearby sensitive receptors, and that facilities located in environmental justice communities and/or neighbor sensitive receptors must either receive a higher points obligation or attain zero-emissions operations on an accelerated timeline. A just and equitable warehouse rule must ultimately aid in region-wide emissions reductions and avoid approaches that could allow for picking winners and losers, with some communities getting cleaner air and others not. A compliance obligation that reflects the disproportionate impacts faced by disadvantaged communities will be effective in ensuring warehouses clean up their pollution in *all* communities.

8-6

Although the preliminary draft rule does not define "sensitive receptors," any final rule should include a definition that encompasses residential areas, schools, hospitals, daycare facilities, nursing homes, parks, or other areas where occupants are more susceptible to the negative impacts of pollution. Thus, for example, the rule would require that any facilities built near schools receive a greater warehouse points compliance obligation, or attain zero-emissions operations faster. Whether by its stringency or accelerated implementation, the rule must accommodate an evolving points system that truly reflects the reality of warehouse operations in the region.

8-7

We also note that the current menu of on-site investment items does not include designated on-site resting areas for workers and truck drivers that prevent parking and idling in nearby communities. This item would address one of the major impacts of freight operations in our communities.

8-8

III. Our Communities Cannot Afford Further Delays in the Rulemaking Process.

The warehouse rule should have been before the Air District's Governing Board in December of this past year. Instead, the rule is now tentatively scheduled to go to the Governing Board in mid-2020. We cannot keep pushing the adoption of this rule further into the future, even as pollution continues to envelop our communities. We want to remind the Air District that we expect a finalized and adopted warehouse rule by May 2020. We appreciate the Air District's staff pushing hard on this rule, and we encourage Committee members to support staff meeting the May 2020 deadline given the importance of this rule.

8-9

We appreciate your consideration of these comments, and appreciate the robust work done so far to develop a meaningful warehouse rule. We look forward to working with the Air District to lift up the voices of our community members and tackle the harms caused by the warehouse industry.

8-10

Re: Comments on the December 10 Warehouse Indirect Source Rule Working Group

Dear Mr. MacMillan, Mr. Juan, and South Coast Air Quality Management District Staff:

Clean Energy appreciates the opportunity to comment on the latest staff presentation during the Warehouse Indirect Source Rule (ISR) Working Group on December 10, 2019. We would like to provide the following comments on the proposed WAIRE point system:

WAIRE methodology must prioritize actual, quantifiable and SIP creditable emissions reductions.

We believe there is too much emphasis in the proposed WAIRE menu system to make investments that do not necessarily result in real, tangible, and quantifiable emissions reductions. Given that the South Coast airshed must reach federal clean air attainment standards in less than 3 years, WAIRE points should be focused and heavily weighted on the emissions reduction side of the equation.

We therefore recommend that AQMD staff place greater emphasis and weight on the action side of the menu and less on the investment side of the menu. We would also recommend that WAIRE points allocated toward investments be held until the regulated party can demonstrate to AQMD staff that the investment is helping the related facility to generate WAIRE points on the action side of the menu.

Using your example on slide 5, company A makes a \$20K investment but cannot demonstrate a regional emissions reductions or local benefit.

Company B makes a \$20K investment and can demonstrate a 60 lb. NOx reduction and a 0.4 DPM reduction.

Under our proposal, company A would be eligible for 1 WAIRE point but does not receive that WAIRE point until company A can demonstrate to AQMD staff that the investment was being used as intended. Company B, however, would receive 5 WAIRE points because company B can demonstrate to AQMD staff that their investment is being used.

The last thing the South Coast air basin needs is a rule that promotes stranded asset investments that achieve no real emissions reduction. By making the credit for an investment dependent upon usage, the rule will incentivize the regulated party to proactively plan for

system installation and usage in advance. The way the WAIRE system is currently proposed, the AQMD staff did not develop the rule in such a way that compels the regulated party to make investments that will lead to real reductions.

9-2
(continued)

Early Adopter Bonus

We strongly encourage AQMD staff to consider an “early adopter bonus” for facilities that commit to achieving emission reductions prior to rule capture of the regulated party. While we do not have any specific recommendations on what multiplier should be used, one possible starting point could be as follows:

9-3

- 2x credit generation for actions completed 3 or more years in advance of rule capture;
- 1.5x credit generation for actions completed 2 or more years in advance of rule capture;
- 1.25x credit generation for actions completed 1 year or less in advance of rule capture.

Equal Treatment

Near-zero (defined as 0.02 NOx) should be treated equally as zero emissions technologies for onsite mitigation and under the Warehouse ISR for that matter. It is widely known that so-called zero emission strategies are not free of polluting emissions when the power generation is not from renewable sources. In fact, the South Coast Air Quality Management District expressed on numerous occasions that low NOx trucks certified at 0.02 grams NOx are essentially equivalent to zero emission battery electric trucks and buses based on the profile of the regional electrical grid. Of course, powerplants within the region are often located in disadvantaged communities and this pollution should not be overlooked. Additionally, in-state sources of renewable natural gas are increasingly coming online and have the ability of delivering up to minus 400 carbon intensity levels for low NOx trucks which could result in low NOx trucks being better on climate emissions than zero emission platforms. It is for all of these reasons that we believe the Warehouse ISR should not treat zero and near zero (low NOx trucks) any differently when it comes to credits or as options on the WAIRE menu.

9-4

Project Costs Do Not Equate to Emissions Reductions

Project cost tiers shown in the point system approach are too low if cost should be included at all. Including cost provides a path to accumulate points without a corresponding level of emissions reductions. It would be better to have an optional mitigation fee that can then be used to fund real quantifiable emission reductions. If costs are used to generate points then the costs should be amortized over the useful life of the equipment rather than upfront, and they should be awarded based on actual use of the equipment. Using cost as a point parameter may prevent the regulated party from using public funding.

9-5

Specific Comments on the Draft WAIRE Menu

- Add NZ as an option to every item that only shows ZE.
- Eliminate points for purchasing vehicles and only award points for actual use.
- Eliminate points for car charging, car charging does not eliminate DPM or other truck emissions.

9-6

9-7

9-8

- Allow trucks to be purchased by a 3rd party to address businesses that do not own/operate trucks, but they could fund 3rd party trucking companies. 9-9
- Points should only be earned upon completion of infrastructure projects, not over incremental development milestones. Even better, infrastructure points should be earned based on use. 9-10

Conclusion:

Clean Energy would like to thank and support AQMD staff's efforts to develop a meaningful Warehouse ISR. The development of the WAIRE menu in terms of how actions are valued, how WAIRE points are generated, and how the WAIRE menu incentivizes regulated parties to comply is critical to the rule's success. We hope AQMD staff takes our comments under full consideration so that the Warehouse ISR can achieve the maximum amount of emissions reductions in the shortest period of time. 9-11

If you should have any questions or would like to have further input from our team, please do not hesitate to contact me directly.

Sincerely,

Todd R. Campbell
Vice President, Public Policy and Regulatory Affairs

February 12, 2020

Mr. Ian MacMillan
Mr. Victor Juan
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: Warehouse Indirect Source Rule

Dear Mr. MacMillan, Mr. Juan, and South Coast Air Quality Management District Staff:

Thank you for the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD) development of the Warehouse Indirect Source Rule (ISR) and WAIRE program aimed at reducing and facilitating local and regional emission reductions associated with warehouses and mobile sources attracted to warehouses. The Western Propane Gas Association (WPGA) seeks to be a valuable contributor in both the development of the rule and the policies and procedures that may emerge as a result of these discussions.

10-1

WPGA would like to commend SCAQMD staff on your efforts to seek deeper NOx reductions from mobile sources that have a disproportional impact upon the South Coast Air Basin and disadvantaged communities. We believe as the South Coast strives to reach federal clean air attainment and improve upon the health of impacted communities, near-zero and low-NOx technologies using renewable fuel are the most efficient and cost-effective way to address GHG and NOx emissions, especially in the near-term.

10-2

10-3

When looking toward the future, the propane industry is investing heavily in renewable propane, derived from sustainable sources like beef tallow or vegetable oil. The carbon intensity for renewable propane is on par with that of electric and prioritizing near-zero and low-NOx technologies, such as those using renewable propane, in the ISR will play an important role by sending a signal to the market of the importance of in-state production of renewable propane and the continued production of low-NOx engines to help reduce greenhouse gas emissions for decades to come.

The Western Propane Gas Association appreciates your work in this area and hope AQMD staff take a holistic view of the role near-zero and low-NOx technologies using renewable fuels can play in reducing emissions associated with warehouses and mobile sources attracted to warehouses.

Sincerely,

Ben Granholm
Regulatory Affairs Specialist

RE: Comments on the Draft WAIRE Menu Technical Report

Dear Victor,

The Lion Electric Co. appreciates the opportunity to provide comments on the Draft WAIRE Menu Technical Report for Warehouse Indirect Source Rule (ISR). Lion strongly supports the South Coast Air Quality Management District's continued efforts to accelerate the deployment of zero-emission vehicles and infrastructure to reduce harmful GHG and criteria pollutant emissions in our state's most impacted communities.

11-1

Lion is a leading Original Equipment Manufacturer of all-electric vehicles, including zero-emission school buses and zero-emission trucks and shuttle buses, with deployments in California, New York, Massachusetts, and other states across the nation. Today, there are currently over 300 Lion electric school buses in operation in North America that have been carrying kids to school every day safely for the last three years, with over six million miles of service provided.

Please see below for our comments.

The estimated incremental cost for a Class 8 zero-emission (ZE) truck is listed as being \$150,000 in Table 2 of the draft report. However, with the average diesel Class 8 truck costing about \$150,000 and a typical ZE Class 8 truck costing roughly \$500,000 for a longer range truck (a cost more accurately outlined in Table 9), the incremental cost is actually closer to \$350,000. This is a substantial increase from the initially proposed \$150,000 and of course results in the proposed WAIRE points achieved per ZE Class 8 truck purchase being lower than reasonably expected. With a more accurate incremental cost being closer to \$350,000, this would mean that the WAIRE points earned for a ZE Class 8 truck purchase should be 14 ($\$350,000 / \$25,000 \text{ AUM} = 14$). With more WAIRE points earned by warehouses for choosing ZE truck options, not only will this incentivize warehouse owners/operators to begin transitioning their fleets to zero-emission, it will also accelerate the emissions reductions realized by the Warehouse ISR.

11-2

11-3

Lion appreciates the inclusion of the Lion8 on the list of commercially available ZE trucks on page 4 of the draft report. We would like to request the inclusion of our Class 6 and 7 electric

11-4

trucks as well – the Lion6 and Lion7. In addition, we also offer the Lion8 Tractor and Lion8 Straight-body Truck. These trucks represent our other commercial electric truck offerings and are available to suit the needs of a variety of fleets, including those that serve warehouses. Lion thanks South Coast Air Quality Management District (SCAQMD) for considering our vehicles.

The total cost of ownership (TCO) charts (Tables 7-10) present a default operating life of 12 years for all vehicle types and classes listed. As part of the operating life, a “midlife cost” is included, which is defined as a battery replacement for battery electric vehicles (BEVs). Lion would like to point out that with our three years of on-road BEV experience, we have noticed less than 0.5% rate of battery life degradation per year in our vehicles. What this means is that, at this current rate, these vehicles would not need a “midlife” battery replacement before 12 years of use because the batteries will have had only minor reductions to capacity through wear and tear. This would result in a lower TCO for BEVs as presented in Tables 8-10 specifically, because the estimated large cost of a battery replacement event would likely be factored out. In order to further protect the battery life of our vehicles, we offer a standard battery warranty of eight years, and an optional extended warranty of 12 years.

11-5

Lion strongly supports SCAQMD’s proposal to apply a multiplier of three to truck-related actions taken by warehouses to gain WAIRE points. This is an effective way to incentivize warehouse owners/operators to begin transitioning their fleets to zero-emission and to accelerate emissions reductions in the most impacted communities in the SCAQMD region. To further this, Lion respectfully recommends that the multiplier be increased to 5 for ZE truck-related actions specifically (and to keep the multiplier at 3 for near-zero emission (NZE) truck actions). This would help distinguish between the greater costs required for warehouses to acquire ZE trucks as opposed to NZE trucks, and would reward warehouse owners/operators for choosing the cleanest available technology to accelerate emissions reductions.

11-6

Lion is proud to support SCAQMD as it works to pass the Warehouse ISR. This ISR will greatly improve the air quality and health of the communities surrounding warehouses in the region and will prove a successful case study for other regions and communities across the state.

11-7

Lion appreciates the opportunity to provide comments on the Draft WAIRE Menu Technical Report and looks forward to continuing to work with SCAQMD on projects to reduce emissions in our state’s most impacted communities.

Sincerely,

Nate Baguio

Subject: Comments on Draft WAIRE Menu Technical Report and Proposed Rule 2305 –
Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce
Emissions (WAIRE) Program

Dear Mr. MacMillan:

In reviewing the WAIRE Menu Technical Report and the draft Rule, staff is concerned that the complexity of the methodology would make it costly for operators to administer and comply with the rule. While staff understands that the subject is complex, a more streamlined methodology would reduce administrative costs for operators. It is also important to build into the methodology an incentive for buying or using zero or near-zero emissions equipment. Unless there is a financial advantage of buying and/or using the zero or near-zero emissions equipment, operators may simply not buy or upgrade equipment, and will instead choose to pay the mitigation fee. Since the objective is to reduce air quality emissions, it would seem to be most beneficial to encourage the purchase and use of zero and near-zero. Based on the details in the Technical Report and the draft Rule, there is not enough information to evaluate the impacts and costs of implementation for operators. The WAIRE Menu Technical Report should not be finalized until the draft Rule is further refined, and the mitigation fee is identified.

12-1

12-2

12-3

12-4

Staff requests to be notified of the availability of the draft Final Rule and the Socioeconomic Study, and all updates on the Rulemaking process. Also, just to let you know, the link to the Proposed Rule on the SCAQMD warehouse webpage is currently not working. Thank you for the opportunity to comment and we look forward to reviewing the forthcoming documents. If you have any questions or would like to discuss further, please feel free to contact Chris Ormsby, Senior Planner at (951) 413-3229, or by email at chriso@moval.org.

Re: Comments on Draft WAIRE Menu Technical Report for Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. MacMillan:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the draft “WAIRE” menu technical report released on March 3, 2020 for the warehouse indirect source rule. Our coalition continues to appreciate the robust work done so far to develop a strong warehouse rule. We also remain concerned, however, that the draft rule still does not reflect the reality of warehouse operations and the pollution crisis in the South Coast air basin. The Air District cannot afford to waste this opportunity to ensure effective and meaningful regulation of the warehouse industry, and our communities cannot afford a weak rule. Indeed, our lives literally depend on a strong and equitable warehouse rule that will achieve necessary emissions reductions in the region—particularly as the COVID-19 pandemic exacerbates the health impacts of air pollution in our communities.

13-1

We request that Air District staff update the draft rule and WAIRE menu to reflect our comments below prior to submitting them to the Air District's Governing Board for adoption. These comments emphasize again many of the concerns and nuances we have repeatedly raised throughout this rulemaking process, some of which continue to go unaddressed. We hope this additional input helps strengthen this life-saving regulation.

I. The Rule Must Prioritize Zero-Emissions Technology.

We have repeatedly emphasized to Air District staff that zero-emissions technology is the only solution to truly address the air quality and health crises caused by the warehouse industry. Any investment in "near-zero" equipment will likely slow the transition to a zero-emissions freight sector. Such investments will compete with the zero-emissions technologies we need, create concerns about stranding assets, and thus disincentive a zero-emissions future. We therefore commend the Air District’s decision to give nearly double the compliance points for the purchase of zero-emissions trucks compared to near-zero trucks in the current WAIRE menu

13-2

of on-site investments. We support this points distribution and encourage an even greater points value to reflect the sizeable emissions benefits possible from zero-emissions trucks.

13-2(cont'd)

Unfortunately, zero-emissions truck trips continue to earn nearly the same number of points as near-zero truck trips in the menu, particularly for Class 4-7 trucks. This is partly due to underestimating regional (NOx) emissions reductions from switching to zero-emission trucks, while overestimating the NOx reductions possible from switching to near-zero trucks. In addition, we oppose the fact that the assessment assumes the local (DPM) benefits of zero-emission trucks are the same as near-zero trucks. This is just not the case. Importantly, the current WAIRE menu also reflects overly conservative cost estimates for zero-emission truck trips, even in the face of more and more data on declining battery, maintenance, and fuel costs.¹ The Union of Concerned Scientists recently summarized the results of studies conducted by the California Air Resources Board, the International Council on Clean Transportation, and ICF, all of which concluded that the total cost of ownership for Class 6 and 8 electric trucks is competitive or lower than diesel today, and are estimated to be lower than diesel in the next decade, even without financial incentives.²

13-3

13-4

Ultimately, the gulf between zero and near-zero technologies is wider than industry representatives claim, with “near-zero” just a code for traditional combustion technologies burning methane gas. Our communities refuse to continue to bear the disproportionate burdens of the natural gas and oil infrastructure that propagates these combustion technologies.

13-5

The continuing development of zero-emissions technologies has been stunning, and the evidence is growing that these technologies will be more widely available and commercially feasible by the time compliance obligations begin for this rule. The Air District has the opportunity to take bolder action here, and implement a vision for transitioning to a zero-emissions future that reflects the directives and plans adopted at the regional, State, and global level. As currently drafted, the proposed rule and WAIRE menu give no indication for when communities can expect the complete phase-out of natural gas and combustion technologies that cause negative climate and health impacts.³ Without clear targets and goals, there is no reason to have confidence the final rule will meaningfully regulate the warehouse industry, or help us meet our greenhouse gas reduction targets and air quality requirements.

13-6

¹ See, e.g., Bloomberg, [How Big Will the Battery Boom Get? Try \\$548 Billion, BNEF Says](#) (June 19, 2018) (reporting “[b]attery prices are expected to fall to \$70 a kilowatt-hour by 2030, down 67 percent from today”).

² Union of Concerned Scientists, [Ready for Work: Now is the Time for Heavy-Duty Electric Vehicles](#) (Dec. 2019) at pp. 12-13 (“With California’s policies and incentives, however, the total cost of ownership is lower than diesel today for 19 of 20 vehicle scenarios examined in the three studies.”).

³ European Federation for Transport & Environment, [Do Gas Trucks Reduce Emissions?](#) (Sept. 2019) at p. 10 (“Gas vehicles deliver negligible GHG benefits compared to diesel.”).

II. Warehouses Near Environmental Justice Communities Must Reach Zero-Emissions Operations Faster.

We understand that Air District staff are still developing the stringency value and annual variable for the final rule. We want to ensure at this point, however, that these factors are adjusted appropriately so that the points obligation for each warehouse accounts for nearby sensitive receptors. In other words, facilities located in environmental justice communities and/or those neighboring sensitive receptors must either receive a higher points obligation or attain zero-emissions operations on an accelerated timeline. We appreciate the Air District's recognition that a just and equitable warehouse rule will require such facilities to clean up their operations faster by including compliance points for local emissions reductions.

13-7

Nonetheless, the current proposed range for the stringency factor creates potentially wide differences in the annual points compliance obligation for the same facility, with lower stringencies allowing facilities to comply using just one WAIRE menu item annually.⁴ Providing such compliance pathways renders the menu useless in the face of otherwise low points obligations and will ultimately fail to reduce region-wide emissions. Our communities should not be forced to accommodate low stringency values from the get-go because facilities want to skirt meaningful compliance as long as possible. We have waited long enough for warehouses to clean up their toxic pollution in our neighborhoods.

13-8

The draft rule materials still do not define "sensitive receptors," which should encompass residential areas, schools, hospitals, daycare facilities, nursing homes, parks, or other areas where occupants are more susceptible to the negative impacts of pollution. We also note that the current menu of WAIRE items continues to omit designated on-site resting areas for workers and truck drivers that prevent parking and idling in nearby communities. This item would address one of the major impacts of freight operations in our communities.

13-9

13-10

III. Facilities Should Not Be Allowed to Pay Their Way Out of Compliance.

The latest draft rule materials indicate a mitigation fee set at \$1000 per WAIRE point. We are deeply concerned that this fee option will become a "pay to pollute" alternative, with facilities simply paying their way out of their compliance obligation each year rather than investing in the on-site menu items. The compliance examples provided by Air District staff alarmingly seem to provide for just such an alternative, listing fee totals that would satisfy a facility's entire points obligation for a compliance year.⁵ Some of these total fees are as low as a few thousand dollars for a facility to comply.⁶ In the face of such a generous compliance option, we do not doubt that facilities will choose to pay rather than change their operations or invest in long-term emissions reduction measures.

13-11

⁴ SCAQMD, *Warehouse ISR Working Group Presentation* (Mar. 3, 2020), slides 16-18.

⁵ *Id.* at slides 16-20.

⁶ *Id.* at slides 19-20.

The mitigation fee must therefore be limited, and designed to incentivize meaningful investments in technologies that can instead address the region's freight pollution crisis. Importantly, any points generated per dollar must be appropriately discounted for those facilities located near sensitive receptors and/or in environmental justice communities. And we reiterate that the final rule should also specify how and where the mitigation fees generated each year will be used. Given that our members bear the brunt of this industry's operations, we expect such fees will fund emissions reduction projects in our communities.

13-12

IV. The Rule Must Prioritize Zero-Emissions Charging Infrastructure.

We appreciate the inclusion of compliance points for zero-emissions charging infrastructure, which will serve as a necessary push for the freight sector to invest now in zero-emissions technology. We request the inclusion of additional cost points for charger installation activity that includes installation of onsite generation, distributed energy resources, and battery energy storage for electric transportation. This will reduce grid demand, support peak shaving, and support increased and efficient integration of renewables into our transportation system.

13-13

V. The Socioeconomic Analysis Should Address Community Impacts.

We understand the Air District's socioeconomic analysis must include costs to industry and potential industry responses as part of this rulemaking process. Yet any analysis of this industry is incomplete without consideration of its real health impacts on surrounding communities. Any discussion of potential impacts to jobs and the local economy must reflect data on health risks from ozone and fine particulate matter pollution and the reality that our community members are falling ill and dying because of this industry. Moreover, the analysis should include job benefits from implementation of cleaner technologies at warehouses. For example, the Los Angeles Economic Development Corporation recently determined that jobs in the electric vehicle space are a significant source of employment in Los Angeles County.⁷ We cannot focus on impacts to the industry alone at the exclusion of understanding the demographics and health data in nearby communities.

13-14

VI. This Rulemaking is Critical for Public Health.

Our coalition has advocated for years for a strong warehouse rule. It is a critical rule to protect communities adjacent to warehouses. We understand that Air District staff are working hard to push this rule forward, however, we also live in communities long burdened by disproportionately high levels of air pollution and are now more than ever at greater risk of serious illness and death in the ongoing COVID-19 pandemic.⁸ We ask that this rule be adopted by March of 2021.

Re: Comments on Draft WAIRE Menu Technical Report for Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. MacMillan:

Thank you for the opportunity to submit these comments on the draft “WAIRE” menu technical report released on March 3, 2020 for the warehouse Indirect Source Rule. Undoubtedly, voluminous work has been done to get us to this point. We provide the following comments to continue to move us toward better air quality, health outcomes and clean job careers as follows:

14-1

I. The Rule Must Prioritize Zero-Emission Charging Infrastructure and Related Resiliency technologies:

The Rule should allocate points for zero emission charging infrastructure and allocate additional points for warehouses that install distributed energy resources (“DER”), such as on-site solar generation, battery energy storage and micro-grids. These related technologies will offset the costs of their fuel (electricity). DER can and will provide opportunities to peak shave, as well as provide much-needed resiliency. SCAQMD can and should help encourage warehouses to invest in clean technologies that provide cost, climate, and job creation benefits.

14-2

II. The Rule Should Prioritize Projects that are done via a Project Labor Agreement with local and targeted hiring provisions:

Moving away from fossil-fuel dependent transportation necessitates considering workforce development in the clean, green economy. SCAQMD can encourage apprenticeship-based job creation by allocating a high point value to jobs that commit to using a Project Labor Agreement that includes features such as prevailing wage, Veteran hire, Disadvantaged Community member, and local hiring commitments. The latter (local hiring) ensures targeted efforts to ensure that the workforce is derived from communities around the warehouse, ensuring less driving by workers to get to a job site. Put simply: less workers driving from far away distances to a job site results in less emissions, specifically nitrogen oxides.

14-3

While the AQMD is considering how an Indirect Source Rule and other actions impact goods movement industry, we respectfully request it similarly consider the tremendous workforce potential these actions can have on local job creation and take a leadership role accordingly

III. The Mitigation Fee should be higher and cost-prohibitive.

The latest draft indicates a mitigation fee set at \$1000 per WAIRE point. An incredibly low fee ensures companies will likely consider the cost-benefit analysis of simply paying the fee versus taking meaningful action in the right direction to improve good air quality and simultaneously create good green jobs along the way.

14-4

Finally, any Mitigation Fees earned should be joined with the Port of Los Angeles and Port of Long Beach's Clean Trucks Program for purposes of transitioning our goods movement trucking fleet to a zero-emission fleet.

14-5

We appreciate your consideration of these comments, and look forward to continuing to work with the Air District to strengthen the warehouse rule.

Sincerely,
Jennifer J. Kropke, Esq.

Re: Discussion Draft Rule 2305, Warehouse Indirect Source Rule (ISR) and
Draft WAIRE Menu Technical Report

Dear Messrs. MacMillan and Juan:

Lineage Logistics (“Lineage”) is the world’s largest temperature-controlled logistics company handling the storage and distribution of significant portions of the nation’s food supply from harvest to local distribution centers. Lineage’s business operations include cold storage, packaging solutions, and transportation management for over 5,000 customers. Lineage owns and/or operates over two hundred warehouse facilities globally, including over 40 facilities within the State of California, a majority of which are within the South Coast Air Basin.

Lineage is at the forefront of efficiency and technological advances in the logistics industry, striving to operate its facilities as efficiently and sustainably as possible. The Lineage Applied Sciences team, consisting of scientists, mathematicians and engineers, designs and applies cutting-edge technology at Lineage facilities. Lineage looks forward to working with the South Coast Air Quality Management District (“District”) on promulgation and implementation of Proposed Rule (“PR”) 2305, Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (“WAIRE”) Program (“Warehouse ISR”) and seeks an open and constructive dialogue with District Staff.

The logistics sector in Southern California represents over 580,000 jobs¹ and contributes \$224.6 billion per year of economic activity.² It is essential that the Warehouse ISR does not

¹ Institute for Applied Economics, Los Angeles County Economic Development Corporation, *Goods on the Move! Trade and Logistics in Southern California* at ii (May 2017). This total includes Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties, with roughly 90% of those jobs in Los Angeles, Riverside and San Bernardino counties.

² *Id.* at iii.

adversely impact the logistics sector's ability to maintain and grow those jobs and sustain their critical role in the region's economy.

15-2
(continued)

As part of the PR 2305 rulemaking, the District released preliminary draft rule language for PR 2305 on November 13, 2019. The District also released the Draft WAIRE Menu Technical Report ("Technical Report") on March 3, 2020, and requested comments by April 3, 2020. Due to the ongoing COVID-19 crisis, that comment deadline was extended to May 1, 2020. Lineage would like to thank the District for extending the comment deadline due to these unusual and trying circumstances. As the logistics industry is designated as one of a handful of critical infrastructure sectors, Lineage has continued its work in the face of this global pandemic to ensure our customers' products are safely and efficiently stored and distributed, contributing to the security of the world's food supply chain.

15-3

Lineage respectfully submits the following comments on the Technical Report and the preliminary draft rule language for PR 2305.

I. DRAFT WAIRE MENU TECHNICAL REPORT

The Technical Report provides the underlying basis for how WAIRE Point values are calculated for each action on the WAIRE Menu. PR 2305 operates by requiring each warehouse operator to accumulate sufficient WAIRE Points to meet its WAIRE Points Compliance Obligation ("WPCO") for the annual compliance period. As such, proper calculation of WAIRE Points is critical in two respects. First, the ability to earn WAIRE Points for particular activities and capital expenditures provide a key incentive for warehouse operators. Second, environmental benefits sought by PR 2305 could be diminished if the WAIRE Menu incentivizes inefficient activity and investment.

15-4

A. Role of Utility Incentives

Section 1b of the Technical Report states that the costs for each WAIRE Menu action do not include incentive funds. Certain available incentive funds are limited by statute or regulation such that they may only be used for actions that are above and beyond any existing regulatory requirements, and thus may not be used to purchase equipment for compliance with the Warehouse ISR.³ Lineage requests clarification that this limitation depends on the source of the incentive funds, and it is not a limitation of the Warehouse ISR itself that incentive funds may not be used to earn WAIRE Points. For instance, certain facilities may receive incentives or rebates from electric or gas utilities and wish to use those funds to purchase equipment that would earn WAIRE Points. Lineage would like to ensure that if the utility does not place restrictions on how the funds may be used, those funds may be put toward WAIRE Menu items to earn WAIRE Points.

15-5

³ See Health & Saf. Code §§ 44281(b) (Carl Moyer Memorial Air Quality Standards Attainment Program), 44391.4(a) (Greenhouse Gas Reduction Fund), 44271(c) (Alternative and Renewable Fuel and Vehicle Technology Program); 13 CCR § 2353(c)(4) (AB 118 Air Quality Improvement Program Funding Plan).

B. When Are WAIRE Points Earned?

Certain equipment that could be purchased and installed at a warehouse to earn WAIRE Points and comply with the WPCO may require a significant lead-time between the time of purchase and the time of delivery. WAIRE Menu items for installing onsite zero-emission (“ZE”) charging or fueling infrastructure include three milestones to account for the lengthy process and to award WAIRE Points for partial completion of installation during a compliance year.

However, it is unclear when WAIRE Points are earned, and thus available for compliance, for other potentially long-term items, such as installing onsite energy systems. Lineage proposes that all current and future WAIRE Menu items that involve purchasing equipment earn the associated WAIRE Points at the time of purchase, regardless of the time for delivery, which is not fully within the control of the warehouse. For complex WAIRE Menu items that involve purchase, construction, and permitting similar to installing ZE charging infrastructure, Lineage requests that the District similarly break the WAIRE Menu item down into milestones to provide for WAIRE Points throughout the process. This segmentation would encourage these larger-scale WAIRE Menu items by rewarding warehouse operators for incremental progress achieved during a compliance period.

15-6

C. Staff Analysis of Annual Average Cost of Electricity

The costs of using charging stations provided in Table 17 of the Technical Report appear to represent a simplified accounting of energy costs. The given scenarios assume fleets of three (3) to twenty (20) trucks utilizing 150-kilowatt (“kW”) chargers, with equal amounts of charging in each time window. The actual energy consumption of large warehouse facilities with dozens to hundreds (depending on Facility throughput) of different vehicle visits per day will be much more complex.

Demand charges will be important for the loads considered in these scenarios, and it is not clear from the Technical Report whether these charges have been included. Although the SCE TOU-EV-9 rate schedule currently waives demand charges until March 1, 2024, demand charges will be phased-in after that time.⁴ Additionally, the SCE TOU-8-RTP rate schedule is more nuanced than the “on-peak,” “mid-peak,” and “off-peak” breakdown presented in Table 17, as the prices for a given hour of a given day are set based on the previous day’s temperature in Los Angeles. For example, the listed demand charge for SCE’s TOU-8-RTP rate schedule is \$12.61/kW. Applying that demand charge to the aforementioned scenarios presented in the Technical Report would result in demand charges of approximately \$5,674 to \$37,830/month, assuming the TOU-EV-9 rate schedule will be similar to the TOU-8-RTP rate schedule.

15-7

Lineage respectfully requests additional detail on the charging scenarios used to determine the annual average cost of electricity. In particular, Lineage requests the

⁴ See SCE Schedule TOU-EV-9, March 22, 2019 (available at: https://library.sce.com/content/dam/sce-doclib/public/regulatory/tariff/electric/schedules/general-service-&-industrial-rates/ELECTRIC_SCHEDULES_TOU-EV-9.pdf).

comprehensive set of information used to arrive at the costs presented in Table 17 of the Technical Report. If Lineage were to receive the requested information, then it would be happy to calculate a more precise estimate of demand charges and share that estimate with the District.

15-7
(continued)

II. PROPOSED ADDITIONAL ITEMS FOR WAIRE MENU

Lineage has vast experience and has invested extensive resources in identifying the most efficient equipment and modes of operation at their warehouses. Based on Lineage's experience designing and applying cutting-edge technology at its facilities, Lineage would like to propose additional items for the WAIRE Menu. These actions and investments will reduce emissions and accordingly should be eligible to earn WAIRE Points. Lineage welcomes further discussions with the District to discuss these proposals, and any technical questions, in more detail.

15-8

A. Installation and Use of Non-Diesel Emergency Generation

In order to address the growing wildfire risk in California, and to reduce the likelihood of utility infrastructure igniting fires, the State's investor-owned utilities have begun to implement Public Safety Power Shut-offs ("PSPS") to protect public safety when fire risk is high. The nature of Lineage facilities is that the goods stored in its warehouses are required to be maintained in cold storage to meet food safety standards, and such storage conditions require power. As the occurrence of PSPS becomes more common, warehouse owners and operators, including Lineage, are currently and will continue to be required to invest in backup generation systems that were not previously necessary.

15-9

While diesel-fueled emergency generators are common, Lineage is evaluating potential non-diesel emergency generation systems. Such systems are efficient and have lower emissions than diesel generators. However, they also are significantly more expensive than diesel-fired systems. Lineage proposes that warehouse owners or operators who choose to invest in non-diesel emergency generation systems should earn WAIRE Points in order to incentivize the installation of these lower-emitting generation systems despite their increased cost. Lineage proposes WAIRE Menu items for: (1) purchase and installation of a non-diesel emergency generator, based on the incremental cost beyond that of a traditional diesel-fired system; and (2) usage of the non-diesel emergency generator, based on the annual hours of operation and the quantifiable reductions in nitrogen oxides ("NO_x") and diesel particulate matter ("DPM") compared to equivalent operation of a diesel-fired system.

B. Measures to Improve Efficiency of Refrigeration and Reduce Facility Power Consumption

Significant emissions can be associated with the energy consumption of cold storage warehouses depending on the mix of generation sources on the grid at the time energy is consumed. One of the main drivers for proposing the Warehouse ISR is the need for greater NO_x reductions in the South Coast Air Basin to meet state and federal ambient air quality standards.⁵ The most recent version of the WAIRE Menu would award WAIRE Points for

15-10

⁵ See SCAQMD, Warehouse ISR Working Group Presentation at 9 (March 3, 2020).

installation and use of onsite solar panel energy systems, though the quantity of WAIRE Points remains “to be determined.” Lineage assumes the WAIRE Points will be assigned based on the emissions reductions realized by utilizing onsite solar power that displaces power from the electricity grid. Just as use of onsite solar panels will reduce a warehouse’s grid electricity consumption and thereby reduce indirect emissions from electricity generating facilities, reductions in a warehouse’s electricity consumption similarly will achieve regional emission reductions.

Lineage has studied several aspects of its operations that could deliver energy savings. For instance, the primary point of heat entry into a refrigerated warehouse, which then requires additional thermal work by the refrigeration system to maintain the necessary temperature, are warehouse dock and room doors. Lineage has performed studies to assess the thermodynamic impact of cold storage doors, and developed the means to improve doors and reduce facility power consumption, albeit at significant cost.

Additionally, blast freezing is an energy-intensive process that occurs at the beginning of the supply chain, shortly after harvest. Lineage has been using airplane and automobile design methodologies to increase the efficiency of blast cells at its facilities. The benefits of this method for blast freezing are that it cycles trucks faster through the facility, reduces overall facility power consumption, and decreases food waste.⁶ Improved blast cells for more efficient freezing have many emission-reducing benefits, but adoption of such improved technology would not currently earn WAIRE Points.

15-10

Lineage proposes the addition of two new WAIRE Menu items to account for the emission reductions due to reducing overall facility energy consumption at cold storage facilities. First, Lineage proposes a WAIRE Menu item to earn WAIRE Points for the installation of equipment that will increase facility energy efficiency and reduce energy demand. This item would be based on the incremental cost of the high-efficiency investment, such as the higher cost of efficient room doors compared to a standard room door.

Second, Lineage proposes a WAIRE Menu item for usage of the high-efficiency improvements. Just as the use of onsite solar energy systems would earn WAIRE Points based on the kilowatt-hours of energy consumed onsite, and thus reducing an equivalent amount of demand from the grid, Lineage proposes that the WAIRE Menu include an item based on improved facility energy efficiency, measured by normalizing facility energy consumption by facility square footage, which is a metric already utilized by the U.S. Energy Information Administration (“EIA”) in their periodic Commercial Buildings Energy Consumption Survey to compare cold storage warehouses of different sizes.⁷ This measurement would focus on relevant

⁶ Reducing food waste reduces emissions associated with growing, harvesting, and transporting food. In addition, reducing food waste avoids methane emissions from landfills where wasted food often decomposes anaerobically.

⁷ See <https://www.eia.gov/consumption/commercial/>.

warehouse load such as for refrigeration, but exclude any increased electricity consumption due to electric vehicle charging and utilization of transport refrigeration unit (“TRU”) plugs.

The WAIRE Menu item would incentivize energy efficiency by classifying facilities into energy performance levels according to annualized kWh per square foot, awarding more WAIRE Points to higher performing facilities. Facilities are able to achieve higher energy performance ratings, and thus more WAIRE Points, by seeking means through which to reduce their energy usage. The WAIRE Points would be calculated based on NO_x emissions reductions (“Regional Benefit”) and DPM emissions reductions (“Local Benefit”) created by energy savings, using the same methodology that the District proposes for calculating WAIRE Points earned by the usage of onsite solar energy systems.⁸

15-10
(Cont'd)

C. Expanding “Battery Storage” to “Energy Storage”

The WAIRE Menu currently includes items for both installation and use of battery storage. Lineage requests that this item in the WAIRE Menu be broadened beyond traditional battery systems (e.g., lithium-ion batteries) to include the different types of energy storage, including thermal energy storage.

Thermal flywheeling is a means of scheduling energy consumption by essentially turning the cold storage warehouse into a thermal battery. The warehouse is super-cooled during off-peak hours – the thermal battery “charging.” During times of peak energy demand on the grid (particularly times when natural gas peaker plants are operating), the warehouse is able to lower or turn off the refrigeration system, relying on the “excess cold” of the warehouse contents to maintain temperatures in compliance with food quality and safety requirements – the thermal battery “discharging.” This flywheeling enables a cold storage facility to avoid drawing power from the grid during periods of peak demand—and peak emissions—on the grid.

15-11

While typically utilized to reduce energy costs by avoiding peak electricity rates, thermal flywheeling could be deployed to also shift energy usage to times of day when the mix of energy sources on the grid is cleanest, and away from times of day when emissions associated with the grid are highest. Cold storage warehouses require significant amounts of energy for refrigeration. Based on the estimated square footage of cold storage warehouses⁹ and the EIA’s reported energy consumption metrics for “large cold storage areas,”¹⁰ cold storage warehouses consume approximately 200,000,000 to 300,000,000 kWh per year in the South Coast Air Basin. Utilizing those warehouses as thermal batteries would achieve substantial regional emission reductions. The annualized metric for thermal energy storage could be the same as for lithium-ion battery storage, with a warehouse operator presumably reporting to the District the capacity

⁸ The Technical Report does not address the calculation methodology for “Usage of onsite energy systems” and the Point values in the WAIRE Menu currently are “TBD.”

⁹ See http://www.scag.ca.gov/Documents/Task2_FacilityInventory.pdf.

¹⁰ See <https://www.eia.gov/consumption/commercial/data/2012/c&e/cfm/c14.php>.

of the battery installed, the charge/discharge rate, and the kWh per year of usage.¹¹ In other words, WAIRE Points for thermal energy storage could be awarded according to the same methodology that the District ultimately adopts for lithium-ion battery storage.

15-11
(Cont'd)

Lineage welcomes discussions with the District regarding the potential for cold storage warehouses across the South Coast Air Basin to use thermal flywheeling to reduce regional emissions and how such actions could generate WAIRE Points.

III. WAIRE MENU SHOULD ALLOW FOR EVOLVING TECHNOLOGY

A mechanism should be included in the WAIRE Menu that will allow warehouse operators to utilize new, or newly affordable, emissions reduction technology. As it stands, the WAIRE Menu is static and means of compliance are limited to implementing pre-determined items. Over time this approach is likely to become inefficient and more costly than necessary, and potentially unworkable. As technology evolves, a process for updating the WAIRE Menu over time will allow facilities the flexibility to choose the most efficient and affordable emission reduction actions.

15-12

One potential approach is to use the existing framework that District Staff is considering for calculating WAIRE Points and apply it to novel emission-reducing actions over time. Recent Staff presentations have proposed a calculation methodology that would assign the WAIRE Menu item's cost, Regional Benefit, and Local Benefit to a "bucket" of WAIRE Point values, which are summed for a total WAIRE Point value for that item.¹² A mechanism could be built into the WAIRE Menu that would allow an operator to approach the District with a proposed action, documentation of its cost, documentation of NO_x and DPM emission reductions, and proposed WAIRE Points based on the established and pre-approved calculation methodology. In this way, the WAIRE Point values assigned to cost and emission reductions are pre-approved through the PR 2305 rulemaking process, and the flexibility of allowing for novel WAIRE Menu items can be achieved without overly taxing District resources.

15-13

Lineage believes that some mechanism to account for the evolution of technology, and the changing costs of compliance, is necessary and would welcome discussions with the District on how best to achieve this flexibility.

IV. REMOVAL OF LIMITATIONS ON TRADING AND BANKING

The purposes of the Warehouse ISR can best be achieved if the limitations on trading and banking of WAIRE Points are removed or modified. These modifications can be achieved without reducing the effectiveness of the PR 2305, will minimize overall costs of compliance, and all WAIRE Points used for compliance would continue to represent real, surplus emission reductions.

15-14

¹¹ Lineage notes that the discharge rate of a thermal battery likely is not subject to the same constraints as discharge rates for lithium-ion batteries.

¹² See WAIRE Menu Technical Report_DRAFT_3-3-20.pdf at p. 3.

Limiting a warehouse operator's ability to comply with the Warehouse ISR by restricting the trading and banking of WAIRE Points does not ensure greater emission reductions; it only serves to increase the cost of compliance. Time and again it has been shown that market-based mechanisms can effectively and efficiently achieve emission reductions. SCAQMD's own RECLAIM program, a market-based compliance program for the largest sources of NO_x and oxides of sulfur, achieved greater reductions at RECLAIM sources than non-RECLAIM sources. In the period of 1994 – 2012, reported emissions of NO_x decreased by 69% at RECLAIM sources, and 44% at non-RECLAIM stationary sources.¹³

The ability to trade compliance instruments in cap-and-trade programs has shown numerous benefits to the regulated community as well as consumers, in particular the ability to achieve the set amount of emission reductions at the lowest cost.¹⁴ Both the US Acid Rain Program and the EU Emissions Trading System have demonstrated in practice that emission reductions can be achieved at a lower cost than expected when trading is allowed and encouraged.¹⁵ Such trading allows individual facilities to assess whether the cost of purchasing a compliance instrument (similar to WAIRE Points) is more or less economical than actions they can take themselves that would achieve the same amount of emissions.

Trading mechanisms in the Warehouse ISR will set a price signal against which warehouse operators can measure the WAIRE Menu items that are potentially feasible at its facility, and thus determine the most economical way to meet its WPCO. The level of overall emission reductions is achieved at the lowest cost possible because the WAIRE Point price provides an economic incentive to find the mix of on-site emission reductions and WAIRE Point purchases that minimize costs.¹⁶

Lineage understands that the District and other stakeholders may have concerns that trading could reduce the benefits of PR 2305 in communities in close proximity to warehouses under the theory that emission reduction activities may not be conducted at such facilities. To alleviate these concerns, Lineage proposes that the District: (1) prohibit trading of any WAIRE Points earned from Local Benefit; and (2) require each warehouse operator to satisfy a specified percentage of its WPCO using WAIRE Points earned from Local Benefit. This would require that operators and the District track two buckets of WAIRE Points – those from the “Cost” and “Regional Benefit” columns (“Tradable”) in the WAIRE Menu, and those from the “Local

15-14

¹⁴ See IETA, *Benefits of Emissions Trading*, <https://www.ieta.org/resources/Resources/101s/Benefits%20of%20Emissions%20Trading.pdf> (March 2019).

¹⁵ *Id.*

¹⁶ Mac Taylor, Legislative Analyst's Office, *Cap-and-Trade Revenues: Strategies to Promote Legislative Priorities 10-11* (Jan. 21, 2016).

Benefit” column (“Non-Tradable”). Thereafter, only Tradable WAIRE Points could be traded to other operators or warehouses.¹⁷

15-14
(cont'd)

To ensure emission reduction benefits to local communities, at the end of each compliance year a warehouse operator would need to satisfy a specified percentage of its total WPCO with Non-Tradable Points, and could satisfy the remaining portion of the WPCO using WAIRE Points earned on-site or purchased Tradable Points from other warehouse owners or operators. In this way, the local benefits of PR 2305 are protected, while allowing trading to help drive emissions reductions at the lowest cost.

Below is a table of requested modifications to PR 2305 that would facilitate compliance flexibility for warehouse operators, increasing the likelihood that PR 2305 achieves its regulatory goals.

15-15

PR 2305 Citation	Current Content	Lineage Recommendation	Reasoning
(d)(3)(A)	Allows a warehouse operator to transfer excess WAIRE Points in a given compliance year to another warehouse under the same operational control	Allow for transfer to owners or operators in other warehouses under different operational control, subtracting WAIRE Points earned from Local Benefit	Operational control should not limit the trading of WAIRE Points. Free trading among warehouse operators will encourage more numerous, larger, and earlier actions to earn WAIRE Points, and should be encouraged.
(d)(3)(B)	Allows a warehouse operator to bank excess WAIRE Points in the same warehouse in any of the next three compliance years	Allow banking of WAIRE Points without a temporal limit, subject to the requirement that the banked WAIRE Points be surplus when used for compliance.	Certain WAIRE Menu items may provide substantial emission reductions and more WAIRE Points than a warehouse operator requires. A temporal limit of three years may eliminate the incentive to take larger actions if the warehouse operator is not able to utilize all of the WAIRE Points within three years.

¹⁷ Lineage notes that Cost, Local Benefit, and Regional Benefit of WAIRE Menu likely will be tracked for purposes of compliance with the Air Quality Management Plan (AQMP). Therefore, the incremental demand on District Staff resources would be marginal and outweighed by the economic benefits trading would accrue.

PR 2305 Citation	Current Content	Lineage Recommendation	Reasoning
(d)(3)(C)	Allows a warehouse owner to earn WAIRE Points or have WAIRE Points transferred to them from an operator in the same warehouse; also allows a warehouse owner to transfer WAIRE Points to any operator in the warehouse where the WAIRE Points were earned, within three years	Allow warehouse owners to transfer WAIRE Points to any owner or operator, even if unrelated to the owner, in any future compliance year. If the WAIRE Points are utilized at a different warehouse, subtract WAIRE Points earned from Local Benefit.	For the reasons stated above, free trading among different warehouse operators and the ability to bank WAIRE Points over time will encourage more numerous, larger, and earlier actions to earn WAIRE Points and thus achieve greater emission reductions.

15-15
(cont'd)

V. POTENTIAL OVERLAP WITH CARB TRU REGULATION

The California Air Resources Board (“CARB”) currently is promulgating a new TRU Regulation that would apply to warehouses or distribution centers with a building size greater than 20,000 square feet (“Applicable Facilities”). The most likely means of compliance with the TRU Regulation for warehouse will be the installation of TRU Plugs, and to ensure that Trailer TRUs and TRU Generator Sets on-site utilize those TRU Plugs when stationary for more than 15 minutes.

15-16

The majority of Lineage’s facilities in California are in the South Coast Air Basin. In order to assess its regulatory burden and means of compliance with all relevant state and local regulations, Lineage requests clarification regarding the potential overlap between the TRU Regulation and the Warehouse ISR. At what point would an action become ineligible for WAIRE Points because the District would interpret it to be an “action or investment required by a separate USEPA, CARB, or South Coast AQMD regulation during the compliance year”?¹⁸

For instance, facilities subject to both Warehouse ISR and the TRU Regulation may purchase and install TRU Plugs. However, it is not clear at what point such an action and investment would be considered “required” for compliance with the TRU Regulation, and thus ineligible for WAIRE Points. Would submitting a compliance plan to CARB stating that the facility intends to comply with the TRU Regulation by installing TRU Plugs be enough to render that action no longer eligible for WAIRE Points?¹⁹ Or would the action be “required” by CARB

¹⁸ PR 2305(d)(2)(A).

¹⁹ See TRU Regulation, Discussion Draft Section 2478.14 (stating that by December 31, 2022, Applicable Facility Owners shall submit a compliance plan to CARB).

only once the Applicable Facility is required to provide infrastructure for TRUs to utilize a mode of Zero-Emission Operation?²⁰

15-16
(cont'd)

Additionally, the draft WAIRE Menu released as part of the WAIRE User Calculator on March 3, 2020, notes that for the WAIRE Menu Item “Use onsite ZE charging or fueling infrastructure” the reporting metric is “kWh of dispensed electricity beyond CARB requirements.” Lineage respectfully requests clarification as to what dispensed electricity would be “beyond CARB requirements.”

15-17

VI. CONCLUSION

We would like to thank the District for this opportunity to submit comments on the Draft WAIRE Menu Technical Report and PR 2305. Lineage looks forward to continued collaboration with District Staff on this rulemaking.

15-18

Best regards,

Joshua T. Bledsoe
Latham & Watkins LLP

²⁰ See TRU Regulation, Discussion Draft Section 2478.10(a)(2) (stating that by December 31, 2023, Applicable Facility Owners shall not permit a new Trailer TRU or TRU Gen Set to operate longer than 15 minutes while stationary unless in Zero-Emission Operation).

May 8, 2020

Ian MacMillan, Manager
South Coast Air Quality Management District
2165 Copley Dr.
Diamond Bar, CA 91765

Submitted Electronically

Dear Mr. MacMillan:

Thank you for the opportunity to submit comments on the South Coast Air Quality Management District Air Quality Management District (SCAQMD) Draft WAIRE Menu Technical Report.

16-1

First, we would like to thank SCAQMD for extending the comment period in response to the ongoing COVID-19 crisis. We are glad for the opportunity to submit technical comments, however, the CTA continues to have serious concerns about the legality and efficacy of the proposed rule. These comments should not be construed to indicate support or an endorsement of this flawed approach.

Furthermore, we submit these comments in the midst of a generational economic crisis.

COVID-19 Crisis is Unprecedented

The still unfolding COVID-19 pandemic and associated economic crises are unlike anything our State and Nation have faced in its history. While the full scope of the economic impact from this sudden, unplanned shuttering of large swaths of commerce is yet to be fully understood, there are some clear warning signs already emerging.

16-2

As of mid-April 2020:

- 30 million Americans have filed for initial unemployment since mid-March. The 4-week moving average, which removes week-to-week volatility, jumped to an all-time high of 5.509 million, while continuing jobless claims hit a record 11.976 million in the week ended April 4th.

Fig. 1: Initial Jobless Claims 1967–2020 *Note: shaded regions = recessions*
(Source: Macrotrends.net)

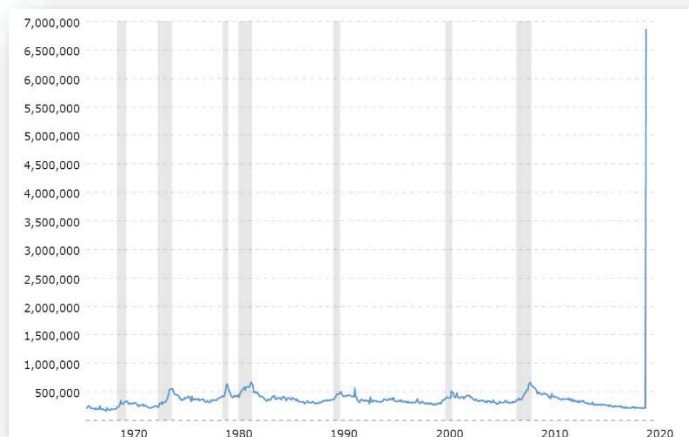

Fig. 2: Load-to-Truck Ratio (Source: DAT)
National Load-to-Truck Ratio

- After a several week-long spike in demand, general economic conditions have taken its toll on freight demand, with demand and rates falling precipitously.
- CTA has been made aware of furloughs already occurring in the trucking industry.
- Market analyst IHS estimates that 2020 Class 8 tractor sales will fall by 50% compared to 2019¹. How quickly the economy will recover is dependent on many factors which cannot be easily predicted at this time. The Legislative Analyst Office² preliminary assessment states that California is already in a recession and forecasts a possible “L-shaped” recovery marked by prolonged depressed economic activity and high unemployment.

¹ <https://www.ttnews.com/articles/commercial-vehicle-production-fall-20-globally-ihs-says>

² <https://lao.ca.gov/handouts/FO/2020/Preliminary-Assessment-of-the-Economic-Impact-of-COVID-19-041620.pdf>

- The Department of Finance (DOF) projects a \$54.3 billion budget deficit through FY 20-21. DOF states that: “The rapid onset of the COVID-19 pandemic has had an immediate and severe impact on the global, national, and state economies. In California, COVID-19 has led to the following:
 - In the last one-week reporting period, nearly 478,000 claims were filed in California for state and federal unemployment benefits. Since mid-March, more than 4.2 million claims have been filed.
 - Job losses that have occurred disproportionately in the lower-wage sectors of the economy—amplifying the wage disparity that existed before the pandemic. Finance projects that the 2020 unemployment rate will be 18 percent, a much higher rate than during the Great Recession.”³

16-2
(cont'd)

Technical Comments (by Section)

Please see the below substantive comments on the Draft WAIRE Menu Technical Report.

16-3

Section 1a) WAIRE MENU ANNUALIZED UNITARY METRICS AND BINS

- Please explain the rationale of the relative weight given to NOx vs. PM reductions. Given the use of Carl Moyer Guidelines throughout the document, it is of note that the Carl Moyer Program applies a 20x weighting factor for PM reductions⁴ while the proposed WAIRE program would apply a 100x weighting factor to NOx reductions.
- AQMD’s proposed point system includes specific points for specific emission reduction technologies. However, there is no clear avenue or method for new or emerging technologies that may also reduce emissions. The proposal should create a clear and expedient pathway for allowing new technologies to be included in scheme without adding unnecessary barriers or hurdles.

16-4

Section 1b) COSTS

- Please elaborate on why staff believes NZE/ZE trucks purchased with restricted use state grants, such as the Carl Moyer Program, would be able to obtain WAIRE points for the usage, but not purchase, of that vehicle? Programs such as Carl Moyer typically have minimum annual usage for the life of the contract. Any usage up to the required annual minimum miles would not be considered surplus for the purposes of such a determination. And requiring such a determination by regulated entities would be infeasible for the purposes of this program.

16-5

Section 1c) REGIONAL EMISSION REDUCTIONS:

- What is the justification for using the Optional Advanced Technology Moyer cost-effectiveness threshold as the basis for calculating the value of WAIRE points? We are not aware of any statutory authority to use this cost-effectiveness threshold to set a price on NOx in the context of a regulation.

16-6

³ http://www.dof.ca.gov/Budget/Historical_Budget_Publications/2020-21/documents/DOF_FISCAL_UPDATE-MAY-7TH.pdf

⁴ https://ww3.arb.ca.gov/msprog/moyer/guidelines/2017gl/2017_gl_appendix_c.pdf

- \$100,000 per ton of NOx is out of line with recent regulations to reduce NOx. The most recent version of the California Air Resources Board's Statewide Truck and Bus Rule's cost-effectiveness was \$3,820 per ton of NOx⁵.

16-7

SECTION 2) Zero and Near-Zero Emission Truck Visits and Truck Acquisitions

- Please cite the authority under which the SCAQMD seeks to establish regulatory standards relating to the control of emissions from new motor vehicles or new motor vehicle engines.
- Please indicate whether the SCAQMD intends to pursue a Section 209 waiver.

16-8

16-9

SECTION 2b) Truck Visit

- The approach of using an average of the EMFAC inventory for the cited subcategories to establish baseline emissions for the purpose of calculating the value of zero and near-zero emission truck acquisitions and use may be problematic as early as 2024. Due to the impact of CARB's Low NOx and Advanced Clean Truck (ACT) Regulations, assumptions about the acquisition of these vehicles through natural turnover and mandated sales percentages, respectively, will be incorporated into the baseline year emissions in future revisions of EMFAC. Functionally, it will be impossible to distinguish emission reductions attributed to mandated sales percentages under the ACT and a truck visit to a regulated facility under the WAIRE program.
- The value of each truck visit will decrease on an annual basis as the weighted annual emissions of the fleet decreases.
- It is also unclear whether SCAQMD is in fact proposing the above approach or simply utilizing a baseline year of 2023. A static baseline also creates issues of additionality. In any event, SCAQMD should be clear as to how this calculation will work.
- Related to the use of EMFAC, this adds just another (more opaque) level of uncertainty for the regulated community. There are several aspects of the rule that present a moving target, as they are subject to change during the life of the rule. At the time of promulgation, a rule should provide the regulated community with a level of understanding and certainty of what their obligations are, and this rule will not do that.
- How will the SCAQMD determine deterioration for truck visits?
- As the purpose of the rule is to accelerate fleet turnover and preferentially replace retired vehicles with electric vehicles, the use of incremental cost is inappropriate, because it assumes that a fleet was already planning to purchase a new truck, at a given time. The rule is designed to use warehouse operators to pressure fleets to purchase vehicles on a timeline that is most beneficial to the

16-10

16-11

16-12

16-13

16-14

16-15

⁵https://www.arb.ca.gov/msprog/onrdiesel/background/2014/2014_pm_nox_cost.xls?_ga=2.54243629.481378052.1588276844-228088285.1525364940

warehouse achieving compliance, rather than by the business needs of the fleet. Therefore, calculations should be based on the total purchase price.

16-15
(cont'd)

- The variation in in duty cycles and applications has always presented issues when trying to estimate emissions and apply regulation to on-road trucks. A homogeneous treatment of the sector results in a disconnect between the costs and emission reductions as translated into points, and the reality of the costs and emissions associated with each truck purchase. This is exacerbated by the calculations of point values across the “bins.” There is an inconsistent application of metrics and methodologies across the bins (e.g. annual mileage). The extensive use of averaging and various assumption result in a methodology that it is impossible to as it applies to an individual regulated entity. In the effort to simplify the rule, its application seems almost arbitrary at the facility and fleet level.

16-16

SECTION 3) Electric Charger Usage and Installation and SECTION 4) Hydrogen Filling Station Installation and Usage

- AQMD’s proposed point system has not clearly outlined how points will be assigned for investments made to reduce emission not located on the site of a warehouse. For example, if a warehouse operator develops a charging hub for multiple vehicles or hydrogen fueling station offsite, how will points be assigned for those investments?
- AQMD’s proposed point system has not included methods for assigning points to entities that work together to deploy zero emission infrastructure which are not on-site. For example, we can foresee an instance where several warehouse operators work together to finance or develop a fueling station for low or zero emission fuel vehicles. If this project is offsite and shared between warehouse operators, it is unclear how points would be assigned to the different actors involved in the project.

October 7, 2020

Recommendation to Include NZE Yard Tractors as Compliance Option Under Proposed Rule 2305

Dear Mr. MacMillan and Mr. Juan,

The Propane Education & Research Council (PERC) is pleased to provide input about how to best achieve fast, cost-effective NOx reductions under SCAQMD's Proposed Rule 2305. We submit these comments in advance of the Warehouse ISR Working Group Meeting scheduled for Friday October 9, 2020. We appreciate that SCAQMD staff has been willing to consider alternative ways to accomplish your essential end goal: to restore healthful air quality to the South Coast Air Basin and attain the federally mandated National Ambient Air Quality Standard for ozone.

Authorized by the U.S. Congress in 1996, PERC (<https://propane.com/>) is a nonprofit organization that invests in research, development and commercialization of clean-burning low-emission propane-powered technologies. PERC partners with a variety of trade associations, advocacy groups, and government agencies to promote safety and the adoption of propane as a clean domestic fuel source. Our organization supports clean-fuel/low-emission programs in applications that include transportation, agriculture, commercial landscaping, residential, and commercial buildings. For decades we have helped regional government agencies like SCAQMD to identify, assess, and widely deploy clean propane engines in these applications (see additional details at <https://propane.com/environment/>).

SCAQMD's webpage addressing facility-based mobile source measures (FBMSMs) states that the goal of PR 2305 *"is to assess and identify potential actions to further reduce emissions associated with emission sources operating in and out of warehouse distribution centers"* in the South Coast Air Basin. Our comments and inputs submitted today are fully compatible with -- and designed to strongly advance -- that important goal.

Proposed Expansion of PR 2305 to Allow NZE Yard Trucks as Compliance Options

As you know, CARB-certified near-zero-emission (NZE) propane engines are now available as commercially proven powerplants for HDVs that can deliver 90 percent (or better) NOx reductions in the two key mobile sources targeted under PR 2305: 1) Class 8 on-road heavy-duty trucks and 2) their off-road counterparts, yard trucks. Because PR 2305 already includes allowance for warehouse operators to comply using NZE on-road trucks, our recommendation to SCAQMD is to adopt a similar and parallel inclusion for NZE off-road yard trucks.

Our comments are not meant to be exclusionary about other ultra-clean fuel-technology platforms for HDVs. In fact, OEMs that manufacture NZE yard trucks are also working to commercialize ZE yard trucks using battery-electric and/or fuel cell architectures. Similarly, NZE yard truck OEMs are designing their products to

interchangeably use either NZE propane or natural gas engines, depending on their customers' site-specific needs and considerations. In summary, when it comes to OEM development and commercialization efforts, there is *significant synergy* between ZE yard tractors and NZE yard trucks, whether fueled by propane or natural gas. PERC is specifically advocating for inclusion of propane-fueled yard trucks as a compliance option under PR 2305, but our position is fuel neutral and mutually supportive of ultra-clean natural gas yard trucks as a compliance option.

Why does PERC believe that inclusion of propane yard trucks is especially important to help SCAQMD achieve its goals for PR 2305? Simply put, NZE propane vehicle technology offers the fastest, easiest, most-cost-effective, infrastructure-friendly way for warehouse operators to rapidly deploy terminal tractors that emit NOx at levels equivalent to (or lower than) the grid-related emissions of battery-electric tractors.¹ Moreover, there is important synergy between deploying NZE yard trucks in the Basin and deploying NZE school buses. For example, the PSI 8.8L NZE propane engine that is now being incorporated into an OEM yard truck (from TICO) is also being incorporated into at least one OEM school bus model. In both cases, the specific focus of commercialization and deployments are on the South Coast Air Basin.

17-2
(cont.)

Collateral Benefits Major Fuel-Cycle GHG Reductions

We recognize that PR 2305 is focused on reducing NOx to help the Basin attain ozone standards. However, NZE yard trucks can also deliver a major collateral benefit: full-fuel-cycle GHG reductions. This is achieved by fueling NZE engines with drop-in renewable versions of conventional propane (or natural gas), which are CARB-verified to have very low carbon intensity. As you know, renewable natural gas is already widely used to fuel heavy-duty NGVs in California, and renewable propane is already co-produced at biofuel plants like the World Energy plant in Paramount. Renewable propane is now becoming available for transportation uses like terminal tractors and school buses. In fact, the propane fuel industry has committed to use 100 percent renewable propane in California transportation applications by 2030 (see the Western Propane Gas Association press release of September 25, 2020²).

17-3

And in another significant development, Suburban Propane recently announced a deal to purchase a 39 percent stake in Oberon Fuels, Inc. (Oberon) based in San Diego.³ Oberon's development-stage production of low-carbon renewable dimethyl ether (rDME) as a transportation fuel has important synergy with the propane industry's efforts to develop a practical and affordable pathway for low-pressure renewable fuels that can be "dropped in" to NZE propane engines.

Details About Our Proposed Changes to PR 2305

Accompanying this cover letter are the following attachments, designed to assist SCAQMD staff in reviewing our recommendation to add NZE yard trucks as compliance options under PR 2305:

17-4

Announces Deal to Acquire 39% Stake in Oberon Fuels and Additional Investments to Support the Ongoing Development of Innovative Solutions to Reduce Carbon Emissions," press release, September 17, 2020, <https://www.prnewswire.com/news-releases/suburban-propane-partners-lp-announces-deal-to-acquire-39-stake-in-oberon-fuels-and-additional-investments-to-support-the-ongoing-development-of-innovative-solutions-to-reduce-carbon-emissions-301133443.html>.

1. MS Word document with suggested modifications to “WAIRE Technical Menu Report” (March 3, 2020)

Using the “Track Changes” feature, we have modified this draft Staff report to add narrative incorporating NZE yard trucks as a compliance option under PR 2305. As you will see, we marked up only “SECTION 5) Zero Emissions Yard Truck Acquisition and Usage.” We used parallel language and rationale as applied by Staff in allowing NZE on-road trucks to serve as compliance options, along with a ZE on-road trucks. Just as Staff made the case for the commercial maturity and product availability of ZE yard trucks, we have proposed parallel language as rationale for adding NZE yard trucks, using credible documentation. We believe our proposed mark-up and additions provide Staff with a solid and accurate head-start on language to make this modification to PR 2305. As noted above, this will significantly enhance the District’s ability to rapidly attain cost-effective NOx reductions through implementation of this important new FBCM.

2. MS Excel spreadsheet “WAIRE User Calculator with NZE Yard truck calculations”

Using Staff’s information provided in SCAQMD’s slide presentation “WAREHOUSE ISR WORKING GROUP” dated March 3, 2020, we have reproduced in MS Excel the District’s WAIRE point system. We created a parallel, justifiable point system for adding NZE yard trucks as a compliance option. As you will see in the middle tab titled “Waire Menu,” we have added two new lines of calculations under “Acquire NZE Yard Truck” and “Use NZE Yard Truck.” We used the same methodology and formulas that Staff used to establish the relative WAIRE points for NZE on-road trucks versus ZE on-road trucks. This results in calculated total points for Acquiring and Using NZE yard trucks. The result is that -- in similar fashion to the on-road case-- NZE yard trucks get significantly fewer points than ZE yard trucks for the “Acquire” category, but nearly the same points for the “Use” category. We believe our methodology and calculations are both logical and defensible. Of course, our team would be pleased to discuss this recommendation and the methodology in a follow-on virtual meeting with Staff, if deemed useful.

PERC greatly appreciates the District’s willingness to review our proposed modifications to PR 2305’s technical documentation and the WAIRE points system, designed to improve the speed and cost-effectiveness of achieving NOx reductions by introducing NZE yard trucks as compliance option. For all the reasons described above, we believe it represents good, defensible public policy for the District to pursue under the new in-direct source rule. We look forward to participating in Friday’s Working Group meeting, and our team will be pleased to meet with Staff to further work through the concept laid out in this letter and attachments.

If you have any questions about our proposed changes to PR 2305, please give me a call. I can be reached at 804.338.0202 (cell) and 202.452.8975 (main).

Sincerely,

Tucker Perkins
President & Chief Executive Officer

17-4

Definition of NZE Yard Truck – SCAQMD states the following in the technical report:

"For PR 2305 a Near Zero Emission (NZE) truck is one in which the engine meets CARB's lowest Optional Low NOx standard of 0.02 g/hp-hr NOx."

Thus, this is an easy extrapolation to the very synonymous case of NZE yard trucks:

*"For PR 2305 a Near Zero Emission (NZE) **yard** truck is one in which the engine meets CARB's lowest Optional Low NOx standard of 0.02 g/hp-hr NOx."*

SECTION 5) Zero Emissions (ZE) and Near Zero Emissions (NZE) Yard Truck Acquisition and Usage

Description: Yard trucks (also called yard tractors, terminal trucks, hostlers, yard jockeys, or yard goats) move trailers and containers around warehouse facilities. Most yard trucks at warehouse facilities are diesel fueled and emit NOx, DPM, and other pollutants. Duty cycles for yard trucks vary depending on use, with heavier use at railyards and port facilities and lighter use typically at warehouses and manufacturing plants, as defined by hours of use and diesel consumption rates. CARB has limited population data for about 1,100 yard tractors operating statewide through its DOORS reporting program for off-road vehicles, but it is unclear how many of these operate at warehouses in South Coast AQMD. In addition, many yard tractors can be on-road vehicles, which are not required to be reported through the DOORS system. For example, about two thirds of the roughly 1,600 yard tractors at the ports of Los Angeles and Long Beach are on-road vehicles.

Commercial Availability:

ZE Yard Tractors: Many battery-electric yard tractor demonstration projects have taken place in the past several years, including in the South Coast AQMD. Following these efforts, multiple manufacturers have begun offering battery-electric ZE yard trucks for sale commercially including OrangeEV, Kalmar Ottawa, and BYD.

NZE Yard Tractors: Natural gas and propane yard tractors have been also been demonstrated for many years; until recently, this was done in a pre-commercial status. However, key advancements were achieved in 2019, and as of mid-2020, OEM-built models are commercially available with NZE engines (certified to CARB's lowest tier OLNS of 0.02 g/bhp-hr). For example, UPS already operates (or has ordered) at least 300 propane-fueled NZE yard tractors built by TICO.¹ A 2019 feasibility assessment released by the San Pedro Bay Ports found that natural gas NZE yard tractors – even when used in very tough marine terminal duty cycles – achieve “all four parameters that collectively define commercial feasibility.” The Ports’ joint assessment rated “overall feasibility” for NZE yard tractors (across technical, operational, infrastructure, and economic parameters) as equivalent to ZE yard tractors. Since that report was released, twenty-two natural gas NZE yard tractors (built by Capacity Trucks, with 6.7 and 8.9 liter CWI engines) have been demonstrated at the Port of Los Angeles for more than a year, enabling the “technology readiness” rating of this fuel.

Formatted: Font: Bold

17-9

¹ Freight Waves, “UPS to add 6,000 natural gas vehicles over next 3 years,” October 9, 2019, <https://www.freightwaves.com/news/ups-to-add-6000-natural-gas-vehicles-over-next-3-years>.

technology platform to move into the threshold of full commercialization.² In mid-2020, the University of California-Riverside conducted chassis dynamometer emissions testing on a natural gas NZE yard tractor, documenting that the in-use NOx emissions benefits of NZE yard tractors (relative to a state-of-the-art diesel control tractor) was even greater than the 90% reduction derived by comparing certification levels.³

A variety of different NZE engines – using either natural gas or propane – are now being equipped in OEM yard tractors. In addition to Capacity's incorporation of two different Cummins Westport NZE natural gas engines (L9N and B6.7N) in yard tractors, TICO has joined with engine provider Power Solutions International (PSI) to develop and commercialize NZE propane yard tractors for typical warehouse and distribution center service. Roush CleanTech's NZE 6.8L propane engine can also be sourced by OEMs for their yard tractor models. And, Cummins is working on an advanced-technology propane yard tractor engine that will meet the NZE threshold, as well.⁴

While PR 2305 is focused on reducing NOx to help the Basin attain federal ozone standards, NZE yard tractors can also deliver an important collateral benefit: full-fuel-cycle GHG reductions. This is achieved by fueling NZE engines with drop-in renewable versions of conventional natural gas or propane that are verified to have very low carbon intensity. Renewable natural gas is already widely used to fuel heavy-duty NGVs in California, and renewable propane is now becoming available. The propane fuel industry has committed to use 100% renewable propane in California transportation applications by 2030.⁵

Operation: Operation of yard trucks can be tracked by hours of use, with hourly usage varying from <1,000 hours/year up to 6,000 hours/year. The diesel reductions were calculated by using the horse power, hours of use, the load factor, and the pollutant emission factor.

SECTION 5a) ZE Yard Truck Acquisition

WAIRE Points from ZE Yard Truck Acquisition: ZE yard trucks currently cost about \$310,000 while their diesel equivalent costs about \$100,000⁶. This incremental cost of \$210,000 would earn nine WAIRE Points per ZE yard truck purchased. Similar to the methods used for on-road truck acquisitions, at \$100,000 per ton cost effectiveness, a ZE yard truck acquisition would earn 168 Points for regional emission reductions.

WAIRE Points from NZE Yard Truck Acquisition: NZE yard trucks currently cost about \$150,000 while their diesel equivalent costs about \$100,000⁷. This incremental cost of \$50,000 would earn three WAIRE Points per NZE yard truck purchased. Similar to the methods used for on-road truck

acquisitions, at \$100,000 per ton cost effectiveness, a NZE yard truck acquisition would earn 40 Points for regional emission reductions.

SECTION 5b) ZE Yard Truck Usage

Emissions: From the DOORS data, the most common yard trucks operate a 175 hp, Tier 3 engine. Table 21 below shows the emission factors from the Carl Moyer Guidelines⁶ for this type of yard truck. Assuming that this type of yard truck operates 1,000 hours per year, and has operated for ten years, the emission reductions from switching to a ZE yard truck are shown in Equation 7 below.

Deleted: ¶

Pollutant	Emission Factor (EF) g/hp-hr	Deterioration Rate (DR) g/hp-hr-hr	Load Factor (LF)
NOx	2.32	0.00003	0.39
PM	0.088	0.000044	

Equation [7]

Equation [7]

$$\text{Emissions} = (\text{hp}) \times (\text{LF}) \times [((\text{total hrs of use}) \times (\text{DR})) + (\text{EF}) \times (\text{hrs of use})] \div 453.59 (\text{g/lb})$$

Emissions Benefits of ZE Yard Truck

$$\text{Equation 7a NOx: } 175 \times 0.39 \times [((10 \times 1,000) \times 0.00003) + 2.32] \times 1,000 \div 453.59 = 394 \text{ lbs}$$

$$\text{Equation 7a DPM: } 175 \times 0.39 \times [((10 \times 1,000) \times 0.000044) + 0.088] \times 1,000 \div 453.59 = 19.9 \text{ lbs}$$

Thus, since a ZE yard truck eliminates all the emissions of the baseline diesel yard truck, 394 lbs of NOx and 19.9 lbs of PM are the emissions benefits that are eligible for WAIRE points under the two categories of regional and local emissions reductions, respectively.

Analogous to the on-road truck case in Section 1, regional emission reductions from switching to NZE yard trucks are assumed to equal 90% of the reduction compared to ZE yard trucks. Local emission reductions are assumed to be the same between ZE and NZE platforms; this is because NZE yard trucks (whether fueled by natural gas or propane) do not emit DPM.

Equation 7b (a version of Equation 7a for the baseline diesel vs. ZE yard truck) confirms the emissions benefits of an NZE yard truck. As indicated, the EF for NOx has been adjusted to be 90 percent lower than the baseline diesel EF. The DR used in Equation 7b had also been adjusted, to account for spark-ignition engine technology used for NZE engines (natural gas or propane) relative to a baseline diesel engine to which it is being compared. For the new DR, the same 90 percent factor is used, yielding a DR of $0.0003 \times .1 = 0.000030$. Below, we plug these changes into Equation 7b.

Emissions Benefits of NZE Yard Truck

$$\text{Equation 7b NOx: } 175 \times 0.39 \times [((10 \times 1,000) \times 0.00003) + 2.32 \times .1] \times 1,000 \div 453.59 = 39.2 \text{ lbs}$$

$$\text{Equation 7b DPM: } 175 \times 0.39 \times [((10 \times 1,000) \times 0.000044) + 0.088] \times 1,000 \div 453.59 = 19.9 \text{ lbs}$$

⁶ <https://ww3.arb.ca.gov/msprog/moyer/guidelines/current.htm>

Thus, since an NZE yard truck eliminates 90% of the NOx emissions and 100% of the DPM emissions relative to the baseline diesel yard truck, the emissions benefits that are eligible for WAIRE points under the two categories of regional and local emissions reductions, respectively are as follows:

Regional Emission Reductions = 394 lbs NOx – 39.4 lbs NOx = 354.6 lbs NOx

Local Emission Reductions = 19.9 lbs DPM – 0 lbs DPM = 19.9 lbs DPM

ZE Yard Truck Costs: Although purchase prices for ZE yard trucks are higher than their diesel equivalent, once purchased the operational costs are expected to be lower. An analysis by the ports of Long Beach and Los Angeles evaluated the Total Cost of Ownership (TCO) for battery-electric ZE yard trucks in comparison to diesel. This analysis found a TCO for ZE yard trucks to be about \$450,000 (not including infrastructure costs) while equivalent diesel had a TCO of about \$375,000. Assuming a ~12,000 useful life of a yard truck, the annual incremental cost of operating a ZE yard truck for 1,000 hours is shown in Equation 8.

Equation [8]: $(\$450,000 - \$375,000) \times 1,000 \text{ hrs} \div 12,000 \text{ hrs} = \$6,250$

NZE Yard Truck Costs: Similarly, the purchase price for NZE yard trucks are higher than their diesel equivalent yard trucks, but operational costs are expected to be lower. The same analysis by the ports of Long Beach and Los Angeles evaluated the Total Cost of Ownership (TCO) for natural gas NZE yard trucks in comparison to diesel. This analysis found the TCO for NZE yard trucks to be about \$402,000 (not including infrastructure costs) while equivalent diesel had a TCO of about \$375,000. Assuming a ~12,000 useful life of a yard truck, the annual incremental cost of operating an NZE yard truck for 1,000 hours is shown in Equation 8.

Equation (8): $(\$402,000 - \$375,000) \times 1,000 \text{ hrs} \div 12,000 \text{ hrs} = \$2,250$

WAIRE Points from Using ZE Yard Trucks: Following the results from Equation 7a, using a ZE yard truck would earn 16 Points for regional emission reductions and 80 Points for local emission reductions. One cost Point would be earned following the results of Equation 7. Similar to the approach for on-road truck visits, a multiplier of three is applied to the sum of cost, regional, and local Points. Therefore the total Points for 1,000 hours of ZE yard truck usage is: $(16 + 80 + 1) \times 3 = 291$ Points.

WAIRE Points from Using NZE Yard Trucks: Following the results from Equation 7b, using a NZE yard truck would earn 15 Points for regional emission reductions and 80 Points for local emission reductions. One cost Point would be earned following the results of Equation 7b. Similar to the approach for on-road truck visits, a multiplier of three is applied to the sum of cost, regional, and local Points. Therefore the total Points for 1,000 hours of NZE yard truck usage is: $(15 + 80 + 1) \times 3 = 288$ Points.

Re: Comments on the Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. Nastri:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the warehouse indirect source rule. Our coalition represents the communities living and working adjacent to warehouses, who continue to be disproportionately harmed by the freight industry every single day. We appreciate the Air District staff's continued work on the warehouse indirect source rule and request that the agency move expeditiously in the development and adoption of this important regulation.

18-1

For decades, the freight industry has been polluting communities living near warehouses. These communities are exposed to toxic pollution from the warehouse industry and face unacceptable health risks as a result. While the covid-19 pandemic continues to exacerbate health impacts to communities most affected by this industry, warehouses have been profiting – and polluting – more than ever due to consumers' increased reliance on e-commerce,¹ further compounding existing health risks in nearby communities. These trends make clear that it is time to hold warehouses accountable for the harms imposed on countless residents living near these facilities. The warehouse indirect source rule is a critical measure that will address these growing disproportionate pollution burdens and provide communities

18-2

¹ See Justin Ho, *As imports boom, warehouses fill up, and businesses face a storage shortage*, Marketplace (Oct. 1, 2020), <https://www.marketplace.org/2020/10/01/imports-boom-warehouses-fill-up-businesses-face-storage-shortage-online-shopping-covid19/>.

with the basic health protections they deserve. A rule that meaningfully regulates this industry must ensure that warehouses clean up pollution in all communities.

18-2
(cont'd)

An effective warehouse rule must prioritize zero-emissions technology and infrastructure, and create a real pathway to a zero-emissions future. Zero-emissions technology is the only solution that will meaningfully address this industry's air quality and health impacts. Our coalition does not support a rule that promotes investment in near-zero technologies, as this will only serve to slow the transition to a zero-emissions freight sector. Not only will the use of near-zero technology create barriers for zero-emissions operations and infrastructure, it will continue to perpetuate the harms imposed on our communities by the natural gas and oil industry and exacerbate the serious climate and health impacts. This rule must identify clear targets for the complete phase-out of natural gas and combustion technologies. The majority of air quality benefits will be attributable to the use and operation of trucks, and the Air District should take advantage of this opportunity to incentivize the shift towards zero-emissions trucks.

18-3

18-4

The Air District must also ensure the rule starts with sufficient stringency to provide relief to communities now. We remain concerned the compliance obligations will be paltry, which will not provide the necessary relief to communities breathing some of the dirtiest air in the nation. The industry will fight a regulation at whatever level it is set, so the Air District should let public health protection guide the stringency.

18-5

Moreover, the Air District must expand and clarify their concept of a "mitigation fund." As advocates concerned with seeing real change in communities suffering the worst impacts of air pollution, it is imperative that the mitigation fund is not used as a "pay to pollute" scheme. We need details on the Air District's strategy to ensure that warehouses actually adopt pollution abatement strategies, rather than paying their way to compliance. If the mitigation fund is used, we would like the Air District to consider requiring that the mitigation fund dollars enter the communities in which they are coming out of to provide real community benefits, such as EV subsidies for local residents.

18-6

Finally, we urge the Air District to move forward with this rule quickly. There have been numerous delays with this rulemaking process. Communities cannot continue paying for industry with their health, especially while we are still in the midst of a pandemic that puts communities suffering from poor air quality at even greater risk of serious illness and death. We respectfully request that the District ensure that community stakeholders are included in the rulemaking process, and to adopt the rule by March 2021.

18-7

We appreciate your consideration of these comments, and the staff's hard work on this important rule. We look forward to working with the agency to develop a strong warehouse indirect source rule that takes into account community needs and cleans up the warehouse industry.

Subject: Warehouse rule - PR 2305
Date: Wednesday, November 04, 2020 5:21:34 PM

Ian,

I have following suggestions for you to consider.

- (1) To eliminate possible perplexity in rule applicability. I suggest to revise the rule applicability as:

(b) Applicability

This rule applies to owners and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building that is ~~may be~~ used for warehousing activities by one or more warehouse operators.

19-1

- (2) For situations when a large building (>100,000 sq.ft.) owner installed a physical barrier or established policy to limit floor space for warehouse activity to less than 50,000 sq.ft., rule should exempt this as well.

(g) Exemptions

(1) Operators In Warehouses That Have Less Than 50,000 Square Feet That They May Use For Warehousing Activities

Warehouse operators who can only use less than 50,000 square feet of a warehouse for warehousing activities due to physical limitation, self-imposed administrative control or terms of their lease are not subject to the requirements in subdivision (d)(1) unless the same parent company owns or controls multiple operators in the same building who collectively use more than 50,000 square feet of space for warehousing activity.

19-2

- (3) To assist regulated warehouses in complying with rule recordkeeping requirement, I suggest AQMD to create a recordkeeping template for warehouse to use.

19-3

Chair Burke and Members of the Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: Warehouse Indirect Source Rule

Dear Chair Burke and Members of the Governing Board:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments on the warehouse indirect source rule. Our coalition represents the communities living and working adjacent to warehouses, who continue to be disproportionately harmed by the freight industry every single day. We appreciate the Air District staff's continued work on the warehouse indirect source rule and request that the agency move expeditiously in the development and adoption of this important regulation.

20-1

For decades, the freight industry has been polluting communities living near warehouses. These communities are exposed to toxic pollution from the warehouse industry and face unacceptable health risks as a result. The Governing Board's agenda is replete with information showing that mandatory programs to clean up the freight industry should be a top priority for 2021. First, the draft Community Emission Reduction Plan (CERP) for Southeast Los Angeles in Agenda Item 28 identifies the warehouse indirect source rule as a critical element of the effort to address truck and traffic pollution.¹ This is similar to all the other CERPs the agency has completed under AB 617. Second, Agenda Item 5 notes that large quantities of incentive dollars targeted towards the freight industry have largely gone unused. This indicates that voluntary approaches are not sufficient because even when the Air District can pay industry to clean up, it does not necessarily avail itself of these funds. The fact that no marine projects in our region applied for the millions of dollars of available funding is offensive to communities forced to breathe the dirty diesel soot emanating from the ports. Finally, we are reminded in Agenda Item 30 that we have failed yet again to meet another federal air quality standard. These factors all point to the need for mandatory programs to clean up the freight industry with no rule more urgent to adopt than the warehouse indirect source rule.

20-2

20-3

20-4

While the covid-19 pandemic continues to exacerbate health impacts to communities most affected by this industry, the freight industry is expanding greatly. For example, the San Pedro Bay Ports have hit historic milestones of freight volumes during several months this year. In addition, warehouses have been profiting – and polluting – more than ever due to consumers' increased reliance on e-

20-5

commerce,² further compounding existing health risks in nearby communities. During the last Working Group meeting the AQMD Staff presentation included this graphic showing warehouse vacancy rates are very low even as lease rates are hitting the highest levels seen in a decade in the Inland Empire.

20-5
(cont'd)

These trends make clear that it is time to hold warehouses and other freight facilities accountable for the harms imposed on countless residents living near these facilities. The warehouse indirect source rule is furthest along and is a critical measure that will address these growing disproportionate pollution burdens and provide communities with the basic health protections they deserve.

20-5
(cont'd)

We appreciate your consideration of these comments, and the staff's hard work on this important rule. We look forward to working with the Governing Board to develop a strong warehouse indirect source rule that takes into account community needs and cleans up the warehouse industry.

20-6

Sincerely,

Ivette Torres

Ian MacMillan
Planning & Rules Manager
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Dear Mr. MacMillan,

Thank you for the opportunity to provide comments on the Proposed Rule 2305: Warehouse Indirect Source Rule (ISR Rule). SoCalGas looks forward to working with the South Coast Air Quality Management District on this effort. While the rule is not in a formal comment period, SoCalGas would like to provide the following comments to assist in its further development.

21-1

Early emission reductions should be weighted

The concept of an ISR Rule was included in the 2016 Air Quality Management Plan (AQMP) with the purpose of achieving 2023 attainment. The early focus of the ISR Rule should remain on achieving State Implementation Plan (SIP) creditable emission reductions to meet 2023 attainment. With that in mind, the ISR Rule should include provisions that heavily weight actions to achieve early, creditable emission reductions. Truck trips with technologies cleaner than baseline diesel would be an example of an action that would get immediate SIP creditable emission reductions to help meet 2023 attainment and should therefore be awarded weighted Warehouse Action and Investments to Reduction Emissions (WAIRE) points. Actions to reduce greenhouse gases or that merely enable emission reductions such as solar panels and infrastructure, respectively, should not be eligible for weighted points because they do not directly achieve SIP creditable emission reductions.

21-2

The incremental cost of hydrogen is not included in the WAIRE point calculations

Zero emission trucks are grouped together regardless of the technology – plug-in or hydrogen – and generate the same number of WAIRE points per trip. However, the number of WAIRE points generated

21-3

are partly determined by the incremental cost. Hydrogen, which has a higher incremental cost than plug-in technologies should therefore generate more WAIRE points. The WAIRE menu should include a separate line item for hydrogen powered trucks and the WAIRE points should be recalculated based on its incremental cost.

21-3
(cont'd)

Emissions reduction calculations may be overestimated when relying on EMFAC assumptions

The emission calculations for heavy-duty truck trips are developed using EMFAC vehicle mile travelled (VMT) data based on existing diesel trucks. Plug-in heavy-duty trucks are significantly limited in the number of miles they can travel because of range capabilities as well as charging downtime. It is not realistic to believe that current plug-in truck technologies can do the same number of daily or annual VMTs as diesel trucks, therefore the emission reductions would be overstated. The amount of WAIRE points a plug-in truck can generate should be limited by its mileage. Other zero and near-zero emission technologies that have long range capabilities should be assumed to achieve the same VMT as diesel.

21-4

Entities should have options to claim more emission reductions and WAIRE points based on operations

The ISR Rule should include provisions that allow entities to claim more emission reduction and WAIRE points than the default based on operations. As an example, VMT is the metric that drives emissions and emission reductions. Trucks in longer range operations inherently achieve more emission reductions when being done by cleaner technologies. Operations that travel more miles than the default EMFAC VMT should have a mechanism to demonstrate that they are achieving more mileage and therefore more emission reductions. Achieving more emission reductions should then result in more WAIRE points.

21-5

Thank you again for the opportunity to comment and we look forward to working with you on this rule.

21-6

Sincerely,

Kevin Maggay

TESLA Summary of Comments on Draft Proposed Rule 2305

Page: 1

PROPOSED RULE 2305 WAREHOUSE INDIRECT SOURCE RULE – WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS (WAIRE) PROGRAM

(a) Purpose

The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter.

(b) Applicability

This rule applies to ¹ owner and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than equal to 100,000 sq ar feet of indoor floor space in a single building dedicated to that may be used for warehousing activities by one or more warehouse operators.

Number: 1 Author: nderrickson Subject: Sticky Note Date: 12/16/2020 11:11:48 AM

One key issue we see here is if a warehouse owner/operator leases or contracts for (but doesn't own) an all-electric fleet and uses off-site charging, there would not qualify for earning points. Could the owner/operator be in compliance if they demonstrate use of electric vehicles and charging without owning them on site?

Relatedly, since points can't be earned for activities required by CARB, would warehouse owners/operators already required to electrify their fleets and charging have to go above the CARB requirement for locating charging stations and vehicles at specific locations?

22-1

tractor is parked at a warehouse.

1 ELECTRIC CHARGER means an electric charging station for vehicles. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers/plugs are operating, counts as one electric charger. This equipment is also referred to as Electric Vehicle Supply Equipment (EVSE).

FUEL TYPE means the fuel used to power a vehicle, such as electricity, hydrogen, natural gas, gasoline, or diesel fuel.

(12)(16) 2 LEVEL 2 CHARGER means electric vehicle supply equipment (EVSE) that can deliver an electric charge up to a rate of 19.2 kilowatts (kW).

(13)(17) LEVEL 3 CHARGER means EVSE that can deliver an electric charge between 19.2 and 50 kW

(14)(18) LEVEL 4 CHARGER means an EVSE that can deliver an electric charge between 51 and 150kW

(15)(19) LEVEL 5 CHARGER means an EVSE that can deliver an electric charge above greater than 151 kW.

(16)(20) NEAR-ZERO EMISSIONS (NZE) TRUCKS means trucks or tractors with engines that meeting the California Air Resources Board's

PR2305 - 2

(Version 10/6/2020)

Number: 1 Author: nderrickson Subject: Highlight Date: 12/16/2020 10:58:12 AM
This definition is confusing around unique plug. Some charging station stalls have two plugs, CCS and Chademo, and only one of the plugs can be used at a time to charge an EV.

We recommend using the definition outlined in the California Energy Code or something more similar to:

"Electric Vehicle Charging Station" or "Electric Vehicle Supply Equipment" means any level of equipment outlined in Article 625 of the California Electrical Code for the purpose of delivering electricity from a source outside an electric vehicle into a plug-in electric vehicle."

Number: 2 Author: nderrickson Subject: Highlight Date: 12/4/2020 6:05:51 PM

Number: 3 Author: nderrickson Subject: Sticky Note Date: 12/16/2020 11:00:42 AM
There are already legally established EV charging levels. These levels should be consistent with them.

LEVEL 1 CHARGER means EVSE that can deliver an electric charge at a rate up to 120-volts. Typically 1kW - 1.4 kW rating.

LEVEL 2 CHARGER means EVSE that can deliver an electric charge at a rate up to 240-volts. Typically 4.8kW to 17.3kW rating.

LEVEL 3 CHARGER or DIRECT CURRENT FAST CHARGER means EVSE that can deliver an electric charge at a rate up to above 480-volts. Typically up to 120+kW.

There may be a desire to also include a higher level charger that serves the Class 7/8 trucks which need charging beyond ~300kW. We should discuss this more given that the industry is working collaboratively on a universal high powered charger.

22-2

22-3

(d) Requirements

(1) **Warehouse Points Compliance Obligation**

Beginning with the Initial Reporting Date in Table 21, a warehouse operator shall earn the applicable **3 WAIRE Points**, for the prior 12-month period from July 1 through June 30, in the amount identified in Table 1-2 as specified in subparagraph (d)(1)(A). WAIRE Points shall be earned for actions and investments completed during the compliance period while the warehouse operator occupied the warehouse, except as specified in paragraph (d)(36). ~~Subdivision (d) only applies to~~ Only warehouse operators in buildings with greater than or equal to 100,000 square feet of floor area ~~dedicated to warehousing that may be used for warehousing activities and who operate~~

PR2305 - 4

(Version 10/6/2020)

 Number: 1 Author: nderrickson Subject: Highlight Date: 12/16/2020 11:08:20 AM

One conceptual issue is that the program seems to capture all trips to and from a warehouse, but doesn't distinguish between trucks that are or aren't actually domiciled at that warehouse. If, for example, a long-haul truck brings goods to a warehouse from 600 miles away, that would count as one trip even though there's currently no cost-effective way to electrify that trip (it would require a public charging network, which is outside of the scope of the operator). Similarly, if you're going back and forth between two warehouses in their jurisdiction, would that count as 2 trips for each warehouse, 4 trips total?

22-4

 Number: 2 Author: nderrickson Subject: Highlight Date: 12/4/2020 6:08:59 PM

It might be helpful to spell out what WAIRE stands for in the definition section. Does WAIRE mean Warehouse Compliance Obligation Points?

22-5

Proposed Rule 2305

- (B) The Weighted Annual Truck Trips (WATTs) at a warehouse include all actual truck trips that occurred at a warehouse while the warehouse operator was responsible for operations during the 12-month compliance period. If a warehouse is occupied by more than one warehouse operator, the WATTs are calculated only for truck trips to or from that operator. Actual truck trip data to a warehouse shall be collected by the warehouse operator and WATTs shall be calculated according to the following equation and as specified in the WAIRE Program Implementation Guidelines.

$$WATTs = [Class 4-2b to 7 truck trips] + [2.5 \times Class 8 truck trips]$$

Where:

Class 4-2b to 7 truck trips = All trucks or tractors that entered or exited a warehouse truck gate(s) or driveway(s) that are truck class 2b, 3, 4, 5, 6, or 7. If truck class

PR2305 - 5

(Version 10/6/2020)

Number: 1 Author: nderrickson Subject: Highlight Date: 12/4/2020 6:13:44 PM

Does this mean all truck trip that occurred to and from the warehouse? Only from vehicles that are engaged in warehouse commercial operation? All trucks that leave or arrive at the warehouse? There could be some loop holes depending on how you write this.

Perhaps add in what is outlined below: "trucks are all straight trucks that entered or exited a warehouse truck gate(s) or driveway(s)."

22-6

Number: 2 Author: nderrickson Subject: Highlight Date: 12/4/2020 6:12:58 PM

Is 2.5 based off of something particular? Or just a general approximation of emissions differences between lower classes and class 8?

22-7

- (C) If a warehouse operator does not have information about the number of truck trips at a warehouse due to a force majeure event such as a destruction of records from a fire, the WATTs shall be calculated according to the following equation. 

$$WATTs = Days\ per\ Year \times Warehouse\ Size \times WTTR$$

Where:

Days per Year = The number of days that the warehouse operator has operational control of the warehouse during the 12-month compliance period

Warehouse Size = Warehouse size in thousand square feet (tsf), as defined in subdivision (c)

WTTR = Weighted Truck Trip Rate, where:
 Warehouses $\geq 200,000$ = 0.95 trips/tsf/day
 Warehouses $\geq 100,000$ = 0.67 trips/tsf/day
 Cold Storage Warehouses = 2.17 trips/tsf/day

(2) Earning WAIRE Points

WAIRE Points shall only be earned through completing actions in the WAIRE Menu in Table 3 and as described in (d)(3), r by completing actions in an approved Custom WAIRE Plan as described in (d)(4), or by choosing to pay a mitigation fee as described in (d)(5) in lieu of completing actions in the WAIRE Menu or in an approved Custom WAIRE Plan.

PR2305 - 6

(Version 10/6/2020)

 Number: 1 Author: nderrickson Subject: Sticky Note Date: 12/4/2020 6:17:10 PM

Should we add in an option for those warehouses who don't have the current capacity to track and report this data to also be able to use the formula? We could add in something like "or lack of internal capabilities". We would need to think through if companies would default to this and if this equation under estimates. It may be a good concession for some of the business interests on burdensome reporting.

 Number: 2 Author: nderrickson Subject: Highlight Date: 12/4/2020 6:17:28 PM

- (A) A description how the proposed actions will achieve quantifiable, verifiable, and real NOx and DPM emission reductions as quickly as feasible, but later than three years after plan approval; and
- (B) A quantification of expected NOx and/or DPM emission reductions from the proposed project within the South Coast AQMD and within three miles of the warehouse; and
- (C) A description of the method to be used to verify that the proposed project will achieve NOx and/or DPM emission reductions; and
- (D) A schedule of key milestones showing the increments of progress to complete the proposed project; and
- (E) A description of the location and a map of where the proposed project will occur; and
- (F) Any expected permits or approvals required by other private parties, or South Coast AQMD, or other federal, state, or local government agencies to implement the proposed plan.
- (iv) Any proposed plan that relies on VMT reduction must demonstrate that these reductions are surplus to what is included in the most recent approved Regional Transportation Plan (RTP) and Air Quality Management Plan (AQMP).
- (B) Review of Custom Option Plan Applications
 - (i) A Custom WAIRE Plan application must be submitted at least 9 months before an Annual WAIRE Report is due for the year in which the Plan will earn Points.
 - (ii) Within 30 days of receipt of the Custom Option Plan, the Executive Officer will conduct an initial review of the Custom Option Plan and confirm receipt.
 - (iii) The Executive Officer shall approve or reject the Custom Option Plan within 3 months of submittal. If no formal approval or rejection is received by the applicant, the application is presumed rejected unless otherwise provided

That is quite a long time before. I wonder if there will be push back on this timing from business interests.

(4)(5) Mitigation Fee

In lieu of earning the required number of WAIRE Points in paragraph (d)(3) or (d)(4) If a warehouse ~~operator~~ does not earn a sufficient number of WAIRE Points to may choose to satisfy all or any remaining part of their WAIRE Points Compliance Obligation in (d)(1), they shall pay through payment of a mitigation fee to make up the difference according to the schedule below The mitigation fee rate shall be equal to in the amount of ~~1,000XX~~ for each WAIRE Point.

(A) In any one compliance year, if a warehouse operator does not complete at least 50% of their WAIRE Points Compliance Obligation through the earning of WAIRE points from Table 3, the following year the mitigation fee rate shall be ten percent more than the dollar value per WAIRE Point that the warehouse operator paid in the previous year.

(5)(6) Transferring WAIRE Points

WAIRE Points are not transferable, except as specified below.

(A) Transferring WAIRE Points to a Different Warehouse

~~3~~ a warehouse operator conducts warehousing activities at more than one warehouse, then WAIRE Points earned for one warehouse may be used at the other warehouse(s) under the operational control of tthat am warehouse operator. Only those points that are earned

- (D) 1 the warehouse has an alternative fueling station(s) or electric harging station(s) located onsite, the Initial Site Information Report shall include
- (i) Number of electric chargers/alternative fueling stations installed. The report must include the level for each electric charging station. For alternative-fueling stations, the report must include the fuel type, maximum fuel dispensing rate, the maximum amount of fuel that can be dispensed daily, and the pressure of the fueling system, if applicable.
 - (ii) Types of vehicles served;
 - (iii) Total fuel dispensed and/or charging provided in the previous 12-month period.
- (E) If the warehouse operator has yard trucks that are based-used at that site-warehouse facility, the Initial Site Information Report shall include:
- (i) Number of yard trucks, and indicate which of these are registered as motor vehicles under Vehicle Code section 4000, et seq. by onroad and offroad classification;
 - (ii) Fuel type and engine size; and
 - (iii) Total annual hours of operation of all yard trucks.
- (F) If the warehouse has onsite alternative energy generation equipment and/or onsite energy storage equipment, the Initial Site Information Report shall include:
- (i) The type and rated capacity of the alternative energy generation system in kilowatts and kilowatt-hours per year, and/or rated capacity of the energy storage system in kilowatt-hours, as applicable.
 - (ii) The total energy generation and/or usage of the energy storage system in kilowatt hours expected during the next applicable 12-month compliance period in subdivision (d).

PR2305 - 19

(Version 10/6/2020)

T Number: 1 Author: nderrickson Subject: Highlight Date: 12/16/2020 11:04:37 AM

This should be updated to the levels of charging based off of the aforementioned already established charging levels 1- 120V, 2 - 240V, 3 or DCFC - 480+V and perhaps adding a high powered charger as well for Class 7/8 trucks.

22-15

The way points are calculated may be best and fairly determined through a scaled \$/kWh charge rate for the different levels of charging and also a scaled cost for the different construction costs for different levels of charging. For example, the point calculation should not disincentivize higher powered, more expensive charging stations.

T Number: 2 Author: nderrickson Subject: Highlight Date: 12/16/2020 11:12:50 AM

Can you explain what a "TRU Plug EVSE Purchase" is?

22-16

T Number: 3 Author: nderrickson Subject: Highlight Date: 12/16/2020 11:21:57 AM

The hydrogen fueling station is worth much more than points for an EV charging station. Usage points should be scaled so they are equivalent between vehicle miles traveled.

Re: Comments on the Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. MacMillan,

On behalf of the undersigned coalition of organizations, we submit these comments on Proposed Rule 2305. We appreciate staff's continued work on the warehouse indirect source rule, but we remain concerned that the current proposal will not meaningfully regulate an industry that has polluted communities for years. As demonstrated in the figure below, the warehouse industry has grown steadily in the South Coast Air Basin in the past two decades,¹ and nearby communities continue to be disproportionately impacted by the polluting trucks visiting these facilities.

23-1

Figure 10: Industrial Building Growth by County

¹ SCAQMD, Preliminary Draft Staff Report, 45.

The ongoing covid-19 pandemic has exacerbated the unacceptable health risks that these frontline communities face every day. Last year, this public health crisis coincided with one of the worst smog seasons in the South Coast Air Basin in decades – with a total of 157 days of ozone pollution levels exceeding state and federal air quality standards.²

Meanwhile, the warehouse industry has reported record-breaking profits during the pandemic as consumers increasingly rely on e-commerce. Last year, the San Pedro Bay Ports hit record freight volumes for several months. At the Port of Long Beach, December 2020 was the Port’s busiest month in its 110-year history, and 2020 was the Port’s “all-time busiest year.”³ This increased port activity has only accelerated the expansion of an already booming warehouse industry, further compounding the health burdens on nearby communities.⁴ In the Inland Empire, warehouse vacancy rates have reached their lowest in a decade while lease rates have increased.

A strong warehouse indirect source rule will address these growing disproportionate pollution burdens, provide basic health protections to our communities, and put the South Coast on track to attain federal and state ambient air quality standards. But the Air District must prioritize public health and take into account community needs in the development of this rule.

I. The Air District must increase the proposed stringency in order to meaningfully address public health concerns.

We oppose the current proposed stringency value of 0.0025 WAIRE points/WATT and urge the Air District to evaluate and consider higher stringency values for the final rule. The undersigned

⁴ See Justin Ho, *As imports boom, warehouses fill up, and businesses face a storage shortage*, Marketplace (Oct. 1, 2020), <https://www.marketplace.org/2020/10/01/imports-boom-warehouses-fill-up-businesses-face-storage-shortage-online-shopping-covid19/>.

organizations have repeatedly asked for a rule that starts with sufficient stringency to provide relief to communities sooner.

The Air District has identified several factors that were taken into consideration in determining the stringency.⁵ We disagree with the agency's approach of "balancing all factors." Public health concerns are unequivocally of greater importance than the financial impact to an industry that profits at the expense of our communities' health. As the Air District has acknowledged, the warehouse industry is experiencing record profits and all-time low vacancies. Despite increasing rents and cargo diversion, the industry continues to grow in the region and facilities are not choosing to leave the area.⁶ The industry can, and must, shoulder these regulatory costs. A transformation of the warehouse industry is long overdue, and public health must be the single most important factor in guiding the stringency of this rule.

The current range of stringency values, if implemented, is far too low to bring about meaningful change to warehouse operations.⁷ The lowest stringency value studied by the Air District (0.0001) would only reduce, at a maximum, 1.5 tons per day of nitrogen oxide emissions and 0.01 tons per day of diesel particulate matter emissions.⁸ Due to the annual variable and phase-in schedule, the full stringency would not even apply to many warehouses for years.⁹ These emissions reductions will not be sufficient to bring relief to communities living adjacent to warehouse facilities in the near future. We request that the agency analyze a stringency value of 0.0075 WAIRE points per WATT at a minimum. The Air District's analysis shows that a stronger rule would not result in warehouses leaving the region, and a higher stringency value is necessary to bring about a transformation of this industry.

While we appreciate that staff has provided the scenario analysis tool and WAIRE calculator for public use, these tools are inaccessible to community members. The calculator, scenario analyses, and draft staff report do not clarify the specific factors used to calculate the stringency value and, ultimately, a regulated facility's points obligation. It is unclear whether the agency's analysis accounts for demographics in affected communities, data that is critical to identifying environmental justice communities and sensitive receptors located near facilities. We have repeatedly emphasized that facilities located in environmental justice communities and neighboring sensitive receptors must receive a higher points obligation or attain zero-emissions operations on an accelerated timeline. The draft proposed rule does not account for this, and we request that the Air District include a demographic variable in the points obligation calculation.

23-2
(cont'd)

II. A strong warehouse ISR must prioritize zero-emissions technology.

As noted in our previous comment letters, a strong warehouse indirect source rule must prioritize zero-emissions technology and infrastructure, the only solution that will effectively address the air quality and health impacts caused by this industry. Yet, the Air District's scenario analysis continues to overestimate the emissions reductions for near-zero technologies. For example, facilities earn the same amount of points for NZE class 4-7 truck visits and ZE class 4-7 truck visits.¹⁰ This obscures the real costs of near-zero technologies – further investment in natural gas and oil infrastructure that will

23-3

⁵ Preliminary Draft Staff Report, 6.

⁸ *Id.* at slide 22.

⁹ Preliminary Draft Staff Report, 29.

¹⁰ *Id.* at 97.

perpetuate harm in frontline communities. We request that the Air District update the WAIRE menu to incentivize investment in zero-emissions technology and infrastructure.

A rule that incentivizes zero-emissions technology will protect the health of our communities and create quality jobs. The transition towards zero-emissions will require the installation of charging infrastructure, on-site solar panels, and the manufacturing of electric vehicles – all of which will lead to meaningful job opportunities in the implementation of cleaner technologies at warehouses. The manufacturing of zero-emission buses and solar panel installation on larger commercial buildings have created and broadened access to unionized jobs with quality wages and benefits for workers. The warehouse indirect source rule can facilitate a similar transformation that will further increase demand for quality jobs in the greening energy, transportation, and manufacturing sectors. The Air District should not waste an opportunity to develop a rule that will lead to significant emissions reductions and create access to good jobs.

23-3
(cont'd)

III. The rule must not allow for a “pay-to-pollute” compliance option.

We remain concerned about the mitigation fee option as it allows regulated facilities to pay their way into compliance, rather than invest in on-site WAIRE menu items to clean up operations. Although the scenario cost analysis estimates that the mitigation fee will be a more costly option and not frequently used, the agency’s projections show that the \$1000/point fee remains a cheaper compliance pathway in the initial phases of the rule.¹¹

Figure 14: Potential Bounding Analysis Costs from Truck Acquisition and Subsequent Usage Scenarios

23-4

In order to incentivize investment in the WAIRE menu items, we ask that staff consider a higher mitigation fee. In the event that warehouses opt to pay their way into compliance, the Air District should require that these funds are spent in the communities surrounding those facilities.

IV. The Air District should release data on warehouse facilities that is relevant to compliance.

¹¹ *Id.* at 66.

In order to ensure proper public engagement, the Air District must make certain information relevant to compliance available to the public. Specifically, we request that the agency release the following data: the number of truck trips to each regulated facility; the number of trucks and tractors serving a warehouse, by truck class and fuel type; the trucking companies servicing the regulated facilities; and the truck routes to and from each facility.

23-5

This information is critical to understanding the impacts of warehouses in nearby communities. There is no legal rationale to withhold this information from the public. Such data does not constitute confidential business information and will be essential for proper enforcement of the rule.

V. We cannot afford further delays of the warehouse indirect source rule.

Finally, the Air District must adopt the warehouse indirect source rule as expeditiously as possible, and no later than April. We appreciate staff's continued work on this critical regulation, but the rule has experienced numerous delays while the freight industry continues to pollute communities living near warehouses. The Air District has the opportunity to adopt a strong and equitable warehouse indirect source rule that will provide significant health benefits to frontline communities. We ask that staff continue to engage with community members so that community needs and concerns can be addressed in the development of this rule.

23-6

We appreciate your consideration of these comments and the staff's work on this important rule. We look forward to continuing to work with the Air District to develop a regulation that prioritizes public health.

Sincerely,

Regina Hsu

RE: Inclusion of Near-Zero Emission Terminal Tractors Under Proposed Rule 2305 (WAIRE)

Dear Chairman Burke and Members of the South Coast AQMD Board's Mobile Source Committee:

The signatories to this letter represent a broad coalition employing many hundreds of people who live and work throughout Southern California. Our companies and organizations manufacture, sell, service, support, operate and/or provide renewable and traditional fuels for heavy-duty vehicles (HDVs) powered by state-of-the-art, ultra-low-emission engines. These commercially available on- and off-road HDVs – which are certified to CARB's lowest-tier "Optional Low-NOx-Standards" (OLNS) – are fueled by propane or natural gas. As you know, such engines are commonly referred to at the South Coast AQMD as being "Near-Zero Emission" (NZE). All NZE engine types can routinely use renewable low-carbon fuels as "drop-in" replacements for their fossil-fuel versions. The result is that NZE HDVs deliver 90+ percent NOx reductions relative to current heavy-duty engine standards, along with deep greenhouse gas (GHG) reductions when renewably fueled.

We appreciate the opportunity to comment on South Coast AQMD's Proposed Rule (PR) 2305. It appears likely that staff will propose this Indirect Source Rule (ISR) for Board adoption at your April 2021 meeting.

Our coalition of companies and organizations does not oppose the spirit and intent of PR 2305. In fact, we strongly support your efforts to dramatically reduce NOx emissions from HDVs (both on- and off-road) serving large warehouse and distribution centers in the South Coast Air Basin. Our coalition members have made – and will continue to make – major contributions to reducing HDV NOx emissions in the SCAB.

24-1

We are writing to urge you to make a simple, logical, and important modification to the currently defined rule. Specifically, for all the compelling reasons described below, we ask that you direct staff to add NZE terminal tractors (aka yard hostlers, yard tractors, etc.) as a compliance pathway under PR 2305.

24-2

NZE Terminal Tractors Will Provide Highly Cost-Effective NOx Reductions at Warehouse Facilities

We note and appreciate that your staff has embraced NZE on-road trucks as a compliance pathway in drafting PR 2305. Staff has acknowledged that NZE HDVs (regardless of fuel or technology) provide the most cost-effective and expedient means to dramatically reduce (90+ percent) HDV NOx emissions in the SCAB. Most importantly, staff has recognized that the same cost-effective NOx-reduction benefits are achievable from NZE off-road terminal tractors. Unfortunately, PR 2305's draft language does not currently allow NZE terminal tractors as a compliance pathway within the "WAIRE" point system.

In effect, staff appears set on pursuing a specified technology mandate for off-road HDVs under PR 2305. *This diverges from the South Coast AQMD's longstanding practice of, and support for, promulgating emissions-performance requirements to reduce HDV emissions, without unfairly favoring any particular type of HDV fuel/technology.* As has been recognized by Board members and executive management at the District, natural gas and propane fueled HDVs (on- and off-road) are now achieving NOx emission levels as low as the grid-generated emissions that result from charging comparable battery-electric HDVs. Yet, the draft rule's current composition disallows compliance with terminal tractors powered by these two types of commercially available NZE engines.

Simply stated, this policy is contrary to the District's urgent mission to restore healthful air quality in the SCAB, and expeditiously achieve ozone attainment. Additionally, it will unnecessarily impose hardship on the entities regulated under the rule. Specifically, if PR 2305 allows only ZE off-road HDVs, it will impose higher infrastructure costs on terminal tractor fleets. This is because the draft rule provides only two compliance options for terminal tractors, as follows:

- 1) Battery-electric terminal tractors are important early-commercial platforms that will work well in many warehouse and distribution center applications. Heavy-duty battery-electric vehicles are very promising for off-road use (including terminal tractors), but adopting facilities will need to overcome significant challenges involving charging infrastructure, site upgrades and permitting.
- 2) Hydrogen fuel cell tractors are also very promising, although they are several years behind battery electric tractors for commercial maturity. Essentially, they are pre-commercial products in the late stages of R&D. Similar to the case of battery-electric HDVs, facilities seeking to deploy fuel cell HDVs will need to overcome significant challenges associated with fuel and fueling infrastructure. In particular, hydrogen fuel is not yet readily available for use in the transportation sector, especially in HDV applications.

Expanding PR 2305 to allow NZE terminal tractors (regardless of fuel type) will provide additional lower-cost compliance options, for both capital costs and fueling infrastructure. NZE propane and natural gas terminal tractors entail relatively modest incremental capital costs over their baseline terminal tractor counterparts. They are likely to provide lower total cost of ownership (TCO) than either type of ZE platform noted above (Staff's analysis for on-road NZE trucks in Table 9 of the PR 2305 Technical Report acknowledges this). Many warehouses and distribution facilities already have access to propane or natural gas fuel. Propane-fueled NZE terminal tractors can use innovative "pony tank" systems that enable quick tank swaps, with no new infrastructure required.

Board Action is Needed to Support Staff in Modifying PR 2305 for this Simple Change

Unless your Board intervenes to redirect staff, PR 2305 will prevent fleets and facility operators from choosing the most expeditious, lowest total-cost-of-ownership pathway to dramatically reduce NOx (and carcinogenic diesel particulate emissions) from terminal tractors serving large warehouse and distribution centers. PR 2305 will unnecessarily restrict compliance pathways and prescribe a rigid, uneconomic approach that fails to capitalize on

24-2
(cont'd)

24-3

cost-effective NOx benefits that are readily obtainable from NZE tractors. And as noted, when fueled with drop-in renewable fuels (natural gas or propane), NZE terminal tractors will provide exceptionally low GHG emissions.

Staff clearly needs help from your Board to rectify this situation and improve PR 2305 as a means to rapidly obtain HDV NOx reductions. For many months, our coalition members have engaged with Staff to describe the cost-effective clean-air benefits that can be realized with use of NZE terminal tractors. We have suggested specific (yet modest) changes to PR 2305. To their credit, Staff members have listened to our concerns. We believe Staff genuinely seeks a more diverse, performance-oriented final Rule 2305 that will achieve fast, cost-effective NOx reductions, as strongly needed for timely ozone attainment. Unfortunately, they indicate that any decision to modify PR 2305 language to include NZE terminal tractors must come at the direction of Board members. This is apparently due to intense, sustained pressure on Staff exerted by certain factions demanding the rule contain an exclusionary, “ZE-only” compliance pathway for terminal tractors regardless of the emission and cost-effectiveness advantages provided by NZE terminal tractor platforms.

24-3
(cont'd)

Respectfully, we request that you direct Staff to modestly revise PR 2305 to include NZE terminal tractors as compliance pathways. To reiterate, our coalition members support the **non-exclusive** use of ZE terminal tractor platforms as ISR compliance pathways. In fact, some of our coalition members are also developing and/or supporting battery-electric and/or hydrogen fuel cell terminal tractor products and technology. Nonetheless, we believe that – for all the important and compelling reasons further discussed herein – the Board should immediately intervene to allow both ZE and NZE terminal tractors. As noted, Staff has already adopted this exact rationale in allowing NZE on-road trucks as compliance pathways under PR 2305.

NZE Off-Road HDVs Are Fully Consistent with Past and Emerging AQMP Control Measures

Below are additional compelling reasons to permit use of NZE terminal tractors for compliance under PR 2305; all are based on the South Coast AQMD’s long-standing policies and world-leading technology advancement efforts.

1. For the emerging 2022 Air Quality Management Plan, the District has initiated development of new mobile source strategies that will help achieve SCAB attainment of the 2015 8-hour ozone standard (70 ppb). To support development of these critical 2022 AQMP strategies, the District established “Mobile Source Working Groups” in conjunction with CARB. Notably, draft MOU Elements for the 2022 AQMP emphasize the need to “accelerate Zero Emission (ZE) and Near Zero Emission (NZE) cargo handling equipment (CHE).”¹
2. South Coast AQMD’s Resolution No. 17-2,² used for adopting the 2016 AQMP and submitted into the California SIP, includes the following critical statements (emphasis added):

“WHEREAS, an accelerated deployment of current and emerging near-zero emission natural gas engine technologies will provide significant, cost-effective and near-term benefits to regional and local air quality, energy supply security, and public health;” (Page 4, amended 3/3/17)

“BE IT FURTHER RESOLVED, that the mobile source incentive program for heavy-duty vehicles outlined in the 2016 AQMP place priority on the most cost-effective technologies to reach short-term air quality goals such as current and emerging near-zero emission natural gas engine technologies.” (Page 10, amended 3/3/17)

3. The 2016 (most-current) AQMP³ includes nearly 70 individual references to NZE vehicles and equipment. It repeatedly emphasizes the high importance assigned by Staff for rapid, near-term deployment of NZE HDVs to meet ozone attainment goals. Specific examples of such passages in the AQMP include the following (emphasis added):

24-4

¹ South Coast Air Quality Management District and California Air Resources Board, “An Overview of CARB’s Mobile Source Strategies: 2022 AQMP Mobile Source Working Group, staff presentation, December 16, 2020, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/presentation-2022-aqmp-mobile-sources-wg-final.pdf?sfvrsn=12>.

² South Coast AQMD, “Attachment A, Resolution No. 17-2,” adopted by the Board, March 3, 2017, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/resolution.pdf?sfvrsn=6>.

³ South Coast AQMD, “Final 2016 Air Quality Management Plan,” March 2017, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

- “More stringent mobile source emission standards are desperately needed to spur further development and production of zero- and near-zero emission technologies.” (Preface)
- “Given the fast-approaching deadlines – as early as 2022 and 2023, and given that the majority of the zero and near zero technologies needed for attainment have already or will soon be commercially available, it is now possible to specify the technologies and the implementation pathways to attainment” (Page ES-4)
- “The 2016 AQMP control strategy strongly relies on a transition to zero and near-zero emission technologies in the mobile source sector, including automobiles, transit buses, medium- and heavy-duty trucks, and off-road applications. The plan focuses on existing commercialized technologies and energy sources including their supporting infrastructure, along with newer technologies that are nearing commercialization based on recent demonstration programs and limited test markets. Prioritizing and expanding funding in Environmental Justice (EJ) areas will be sought.” (Page ES-5).
- “Additional demonstration and commercialization projects will be crucial to help deploy and reduce costs for zero and near-zero emission technologies. A key element of Plan implementation will be private and public funding to help further the development and deployment of these advanced technologies. Many of the same technologies will address both air quality and climate goals, such as increased energy efficiency and reduced fuel usage.” (Page 4-1)
- “The SCAQMD will continue to support technology demonstration projects for both mobile and stationary sources and will work to create new or expanded funding opportunities for earlier deployment of cleaner technologies, thus contributing to a smooth transition to zero and near-zero emission technologies in the mobile and stationary source sectors. The SCAQMD will prioritize distribution of incentive funding in environmental justice (EJ) areas and seek opportunities to expand funding to benefit the most disadvantaged communities.” (Page 4-3)
- “Mobile sources such as trucks, locomotives, and cargo handling equipment have technological potential to achieve zero- and near-zero emission levels.” (Page 4-8)
- “All technologies and fuels should be able to compete on an equal footing to meet environmental needs. This policy is consistent with the current priority on maximizing emission reductions utilizing zero emission technologies in all applications that are shown to be cost-effective and feasible. In other applications, near-zero technologies remain essential to meet all attainment goals.” (Page 4-9)
- “In the longer-term, there is a need to significantly increase the penetration and deployment of near-zero and zero-emission vehicles, greater use of cleaner, renewable fuels (either alternative fuels or new formulations of gasoline and diesel fuels), and additional emission reductions from federal and international sources such as locomotives, ocean-going vessels, and aircraft.” (Page 4-23)
- “Lastly, one measure seeks to recognize the criteria pollutant emission reduction benefits of existing incentives programs such as the Carl Moyer Memorial Air Quality Standards Attainment Program and Proposition 1B – Goods Movement Emission Reduction Program. The measures call for greater emission reductions through accelerated turnover of older vehicles to the cleanest vehicles and equipment currently available and increased penetration of commercially-available near-zero and zero-emission technologies through incentives programs in the near-term.” (Page 4-24)
- “However, additional research and demonstration are needed to commercialize zero- and near-zero emission technologies for the heavier heavy-duty vehicles (with gross vehicle weight ratings greater than 26,000 pounds).” (Page 4-24)
- “MOB-13 – OFF-ROAD MOBILE SOURCE EMISSION REDUCTION CREDIT GENERATION PROGRAM: This measure seeks to accelerate the early deployment of near-zero and zero-emission off-road equipment through the generation of MSERCs that can be used for purposes of recognizing mobile source emission reductions at facilities affected by proposed AQMP measures MOB-01 through MOB-04 and EGM-01.” (Page 4-33)
- “FURTHER DEPLOYMENT OF CLEANER TECHNOLOGIES: OFF-ROAD EQUIPMENT: This measure is designed to achieve further emission reductions for the Basin’s attainment needs through a suite of additional actions,

24-4
(cont'd)

including greater penetration of near-zero and zero-emission technologies through incentive programs, and emission benefits associated with the potential for worksite integration and efficiency, as well as connected and autonomous vehicle technologies. These emission reductions will be achieved through a combination of actions to be undertaken by both CARB and the SCAQMD.” (Page 4-41)

- “Given the significant NOx emission reductions needed to attain the federal ozone air quality standards by 2023 and 2031, a combination of public funding incentives along with regulatory actions are needed. In the near-term, there is a need to commercialize zero and near-zero on-road trucks and off-road equipment as early as possible.” (Page 4-64)
- “Actions to promote ZEVs in these heavy-duty applications are underway and are important to further reduce regional and near-source toxics exposure, especially as it relates to reducing risk from DPM. In the off-road sector, the 2016 AQMP mobile source control strategies stress the need to reflect this same type of transformation to a mix of zero and near-zero technologies operating on renewable fuels.” (Page 9-11)
- TABLE 9-3 (2016 AQMP CARB Mobile Source Control Measures and Concurrent Key Toxic Air Contaminants Reduced) includes “Cleaner engine technology transfer from on-road to off-road applications” and “Incentive funding to achieve further deployment of cleanest engine technologies” (Page 9-12)

24-4
(cont'd)

South Coast AQMD is the Leading U.S. Supporter of / Champion for NZE HDVs

For more than three decades, the South Coast AQMD’s Technology Advancement / Clean Fuels Program has led the nation (and the world) in providing essential cost-sharing and/or general support to advance progressively lower-emitting HDV technology. In fact, it is largely due to the District’s support over the last decade that natural gas and propane engines (manufactured by our coalition members) are certified by CARB today at NZE levels. Similarly, the District’s financial and technical support has been instrumental in bringing diesel engine technology to the brink of achieving NZE certification. We thank the South Coast AQMD Board and Staff; without such support, it may not have been possible for our coalition members to achieve these very important milestones.

As documented above, wide-scale deployment of NZE HDV technologies and fuels is critical to the District’s overall AQMP control strategy and ability to achieve its air quality goals. If the District now finalizes PR 2305 to exclude NZE terminal tractors, it will be contrary to – and a major blow against – all these successful efforts to develop and deploy NZE HDVs in the SCAB, as strongly needed for ozone attainment. The attached appendix contains specific recent quotes and statements from the District’s Clean Fuels program and related technical documents⁴ that corroborate strong synergy between developing NZE HDV platforms so they can be subsequently deployed in the SCAB, via regulatory mechanisms and/or incentive programs.

24-5

Conclusions and Requested Actions by the Board

Our coalition of companies and organizations respectfully asks the Board to urgently intervene on PR 2305, by directing staff to allow NZE terminal tractors as compliance pathways. This simple modification – which Staff is ready to implement at your direction – will significantly improve PR 2305’s ability to expeditiously achieve its intended NOx reductions. It will provide the regulated community with additional compliance options that are very cost effective for reducing NOx, while also delivering low total cost of ownership. Our recommended action is in full accord with your Board’s longstanding fuel-neutral policies to rapidly deploy emerging clean HDV platforms. It will perpetuate and strengthen the decades-long synergy between the District’s world-class HDV technology advancement program and your efforts to rapidly deploy the cleanest-available HDV fuel-technology platforms, as they emerge into the marketplace.

24-6

Sincerely,

Joy Alafia, President and CEO, Western Propane Gas Association

Tom Swenson, P.E., Business Development Manager, Cummins Inc. – Natural Gas Group

Ashley Remillard, Vice President, Legal, Agility Fuel Solutions

Thomas Lawson, President, California Natural Gas Vehicle Coalition

Todd Campbell, Vice President of Public Policy, Clean Energy

Julie Johnson, President, Ted Johnson Propane

Scott Graham, General Manager, Expo Propane

Mike Caldarera, P.E., Sr. Vice President, Regulatory and Technical Affairs, National Propane Gas Association

APPENDIX

- “The South Coast AQMD Clean Fuels Program cost-shares projects to develop and demonstrate zero, near-zero and low emissions clean fuels and advanced technologies to push the state-of-the-technology and promote commercialization and deployment of promising or proven technologies not only for the Basin but Southern California and the nation as well. As noted, these projects are conducted through public-private partnerships with industry, technology developers, academic and research institutes and local, state and federal agencies.”
- “The South Coast AQMD continually seeks to support the deployment of lower-emitting technologies. The Clean Fuels Program is shaped by two basic factors: 1) Zero, near-zero and low emission technologies needed to achieve clean air standards in the Basin; and 2) Available funding to support technology development within the constraints imposed by that funding.”
- “One function of the Clean Fuels Program is to help expedite the deployment and commercialization of zero, near-zero and low emission technologies and fuels needed to meet the requirements of the AQMP control measures. In many cases, new technologies, although considered “commercially available,” require assistance to fully demonstrate the technical viability to end-users and decision-makers.”
- “More than ever before, the Clean Fuels Program must both foster and accelerate advancement of transformative transportation, and off-road technologies where possible, with an emphasis on zero and near-zero emissions vehicle and fuel technologies. This is especially true given the region’s economic dependence on thriving goods movement, along with the corresponding impact of that industry on environmental justice communities.”
- “It is important to note here that South Coast AQMD’s Technology Advancement Office (TAO) administers not only the Clean Fuels Program but also the Carl Moyer Program (and other significant incentive programs, such as Proposition 1B-Goods Movement and the Community Air Protection Program). These two programs produce a unique synergy, with the Carl Moyer Program providing the necessary incentives to push market penetration and commercialization of zero and near-zero emission technologies developed and demonstrated by the Clean Fuels Program. This synergy enables the South Coast AQMD to act as a leader in both technology development and commercialization efforts targeting reduction of criteria pollutants and GHG reduction co-benefits.”
- District policies “will help both regulatory agencies and OEMs to expedite introduction of zero and near-zero emission vehicles in the Basin, which is a high priority of the AQMP.”
- “Although no near-zero emission diesel technology is commercially available today, South Coast AQMD has been working closely with CARB and others on defining technology pathways via several projects . . . (that) show near-zero emission diesel technologies are feasible via advanced engine and aftertreatment or optimized engine design and calibration. The (Clean Fuels) Plan Update continues to incorporate pursuit of cleaner engines for the heavy-duty sector. Future projects will support the development, demonstration and certification of engines that can achieve these massive emission reductions using an optimized systems approach.”
- “Currently, on-road heavy-duty natural gas engines are increasingly being certified to CARB’s optional low-NOx standards which are significantly lower in NOx than the current on-road heavy-duty standard. This technology category seeks to support the expansion of OEMs producing engines or systems certified to the lowest optional NOx standard or near-zero emissions and useable in a wide variety of medium- and heavy-duty applications, such as Class 6 vehicles used in school buses and in passenger and goods delivery vans, Class 7 vehicles such as transit buses, waste haulers, street sweepers, sewer-vector trucks, dump trucks, concrete mixers, commercial box trucks, and Class 8 tractors used in goods movement and drayage operations and off-road equipment such as construction vehicles and yard hostlers.”
- “The deployment of near-zero emission vehicles would significantly further emission reductions relative to the state’s current regulatory requirements.”

- “The South Coast AQMD relies on a significant increase in the penetration of zero and near-zero emission vehicles in the South Coast Basin to attain federal clean air standards by 2023 and 2032. This project would help develop a number of renewable transportation fuel production and distribution facilities to improve local production and use of renewable fuels to help reduce transportation costs and losses that can reduce total operating costs of zero and near-zero emission vehicles to be competitive with comparable diesel fueled vehicles. Such advances in production and use are expected to lead to greater infrastructure development. Additionally, this project could support the state’s goal of redirecting biomass waste for local fuel production and reduce greenhouse gases associated with these waste biomass feedstocks.”
- “Nonetheless, while the state and federal governments have continued to turn a great deal of their attention to climate change, South Coast AQMD has remained committed to developing, demonstrating and commercializing zero and near-zero emission technologies. Fortunately, many, if not the majority, of technology sectors that address our need for NOx reductions also garner greenhouse gas (GHG) reductions. Due to these “co-benefits,” the South Coast AQMD has been successful in partnering with the state and federal government. Even with the leveraged funds, the challenge for the South Coast AQMD remains the need to identify project or technology opportunities in which its available funding can make a difference in achieving progressively cleaner air in the Basin.”
- “Although both announcements (separate initiatives on clean HDVs by EPA and CARB) are welcome news, the timing is too late to help the South Coast AQMD meet its 2023 federal attainment deadline. So, despite progress, commercialization and deployment of near-zero engines are still needed.
- “Because of Assembly Bill (AB) 6171, which requires reduced exposure to communities most impacted by air pollution, TAO conducted additional outreach to AB 617 communities regarding available zero and near-zero emission technologies, as well as the incentives to accelerate those cleaner technologies into their communities.
- SCAQMD’s Clean Fuels Plan 2020 Update includes projects to develop, demonstrate and commercialize a variety of technologies to meet emission control needs identified in the 2016 AQMP. Emphasis is on getting significant near-term reductions “using near-zero and zero emission technologies,” including “for high horsepower applications.”
- “More than ever before, the Clean Fuels Program must both foster and accelerate advancement of transformative transportation, and off-road technologies where possible, with an emphasis on zero and near-zero emissions vehicle and fuel technologies. This is especially true given the region’s economic dependence on thriving goods movement, along with the corresponding impact of that industry on environmental justice communities.”
- “The Clean Fuels Program and the Carl Moyer Program provide a unique synergy, with the Carl Moyer Program providing the necessary incentives to push market penetration of the technologies developed and demonstrated by the Clean Fuels Program. This synergy enables the South Coast AQMD to act as a leader in both technology development and commercialization efforts targeting reduction of criteria pollutants.”

RE: Inclusion of Near-Zero Emission Terminal Tractors Under Proposed Rule 2305 (WAIRE)

Dear Chairman Burke and Members of the South Coast AQMD Board's Mobile Source Committee:

The signatories to this letter represent a broad coalition employing many hundreds of people who live and work throughout Southern California. Our companies and organizations manufacture, sell, service, support, operate and/or provide renewable and traditional fuels for heavy-duty vehicles (HDVs) powered by state-of-the-art, ultra-low-emission engines. These commercially available on- and off-road HDVs – which are certified to CARB's lowest-tier "Optional Low-NOx-Standards" (OLNS) – are fueled by propane or natural gas. As you know, such engines are commonly referred to at the South Coast AQMD as being "Near-Zero Emission" (NZE). It appears that NZE diesel engines may also be on the cusp of commercialization. All three NZE engine types can routinely use renewable low-carbon fuels as "drop-in" replacements for their fossil-fuel versions. The result is that NZE HDVs deliver 90+ percent NOx reductions relative to current heavy-duty engine standards, along with deep greenhouse gas (GHG) reductions when renewably fueled.

We appreciate the opportunity to comment on South Coast AQMD's Proposed Rule (PR) 2305. It appears likely that staff will propose this Indirect Source Rule (ISR) for Board adoption at your April 2021 meeting. Subsequent to that, staff will initially introduce PR 2305 to the Board at its Mobile Source Committee meeting (expected to be no later than March 2021).

Our coalition of companies and organizations does not oppose the spirit and intent of PR 2305. In fact, we strongly support your efforts to dramatically reduce NOx emissions from HDVs (both on- and off-road) serving large warehouse and distribution centers in the South Coast Air Basin. Our coalition members have made – and will continue to make – major contributions to reducing HDV NOx emissions in the SCAB.

25-1

We are writing to urge you to make a simple, logical and important modification to the currently defined rule. Specifically, for all the compelling reasons described below, we ask that you direct staff to add NZE terminal tractors (aka yard hostlers, yard tractors, etc.) as a compliance pathway under PR 2305.

25-2

NZE Terminal Tractors Will Provide Highly Cost-Effective NOx Reductions at Warehouse Facilities

We note and appreciate that your staff has embraced NZE on-road trucks as a compliance pathway in drafting PR 2305. Staff has acknowledged that NZE HDVs (regardless of fuel or technology) provide the most cost-effective and expedient means to dramatically reduce (90+ percent) HDV NOx emissions in the SCAB. Most importantly, staff has recognized that the same cost-effective NOx-reduction benefits are achievable from NZE off-road terminal tractors. Unfortunately, PR 2305's draft language does not currently allow NZE terminal tractors as a compliance pathway within the "WAIRE" point system.

In effect, staff appears set on pursuing a specified technology mandate for off-road HDVs under PR 2305. *This diverges from the South Coast AQMD's longstanding practice of, and support for, promulgating emissions-performance requirements to reduce HDV emissions, without unfairly favoring any particular type of HDV fuel/technology.* As has been recognized by Board members and executive management at the District, natural gas and propane fueled HDVs (on- and off-road) are now achieving NOx emission levels as low as the grid-generated emissions that result from charging comparable battery-electric HDVs. Yet, the draft rule's current composition disallows compliance with terminal tractors powered by these two types of commercially available NZE engines. Additionally, PR 2305 as currently drafted will disallow potential use of NZE diesel terminal tractors, when and if they are commercialized.

25-2
(cont'd)

Simply stated, this policy is contrary to the District's urgent mission to restore healthful air quality in the SCAB, and expeditiously achieve ozone attainment. Additionally, it will unnecessarily impose hardship on the entities regulated under the rule. Specifically, if PR 2305 allows only ZE off-road HDVs, it will impose higher infrastructure costs on terminal tractor fleets. This is because the draft rule provides only two compliance options for terminal tractors, as follows:

- 1) Battery-electric terminal tractors are important early-commercial platforms that will work well in many warehouse and distribution center applications. Heavy-duty battery-electric vehicles are very promising for off-road use (including terminal tractors), but adopting facilities will need to overcome significant challenges involving charging infrastructure, site upgrades and permitting.
- 2) Hydrogen fuel cell tractors are also very promising, although they are several years behind battery electric tractors for commercial maturity. Essentially, they are pre-commercial products in the late stages of R&D. Similar to the case of battery-electric HDVs, facilities seeking to deploy fuel cell HDVs will need to overcome significant challenges associated with fuel and fueling infrastructure. In particular, hydrogen fuel is not yet readily available for use in the transportation sector, especially in HDV applications.

Expanding PR 2305 to allow NZE terminal tractors (regardless of fuel type) will provide additional lower-cost compliance options, for both capital costs and fueling infrastructure. NZE propane and natural gas terminal tractors entail relatively modest incremental capital costs over their baseline terminal tractor counterparts. They are likely to provide lower total cost of ownership (TCO) than either type of ZE platform noted above (Staff's analysis of on-road NZE trucks for PR 2305 acknowledges this). Many warehouses and distribution facilities already have access to propane or natural gas fuel. Propane-fueled NZE terminal tractors can use innovative "pony tank" systems that enable quick tank swaps, with no new infrastructure required.

Board Action is Needed to Support Staff in Modifying PR 2305 for this Simple Change

Unless your Board intervenes to redirect staff, PR 2305 will prevent fleets and facility operators from choosing the most expeditious, lowest total-cost-of-ownership pathway to dramatically reduce NOx (and carcinogenic diesel particulate emissions) from terminal tractors serving large warehouse and distribution centers. PR 2305 will unnecessarily restrict compliance pathways and prescribe a rigid,

25-3

uneconomic approach that fails to capitalize on cost-effective NOx benefits that are readily obtainable from NZE tractors. And as noted, when fueled with drop-in renewable fuels (natural gas, propane or diesel), NZE terminal tractors will provide exceptionally low GHG emissions.

Staff clearly needs help from your Board to rectify this situation, and improve PR 2305 as a means to rapidly obtain HDV NOx reductions. For many months, our coalition members have engaged with Staff to describe the cost-effective clean-air benefits that can be realized with use of NZE terminal tractors. We have suggested specific (yet modest) changes to PR 2305. To their credit, Staff members have listened to our concerns. We believe Staff genuinely seeks a more diverse, performance-oriented final Rule 2305 that will achieve fast, cost-effective NOx reductions, as strongly needed for timely ozone attainment. Unfortunately, they indicate that any decision to modify PR 2305 language to include NZE terminal tractors must come at the direction of Board members. This is apparently due to intense, sustained pressure on Staff exerted by certain factions demanding the rule contain an exclusionary, “ZE-only” compliance pathway for terminal tractors regardless of the emission and cost-effectiveness advantages provided by NZE terminal tractor platforms.

25-3
(cont'd)

Respectfully, we request that you direct Staff to modestly revise PR 2305 to include NZE terminal tractors as compliance pathways. To reiterate, our coalition members support the ***non-exclusive*** use of ZE terminal tractor platforms as ISR compliance pathways. In fact, some of our coalition members are also developing and/or supporting battery-electric and/or hydrogen fuel cell terminal tractor products and technology. Nonetheless, we believe that – for all the important and compelling reasons further discussed herein – the Board should immediately intervene to allow both ZE and NZE terminal tractors. As noted, Staff has already adopted this exact rationale in allowing NZE on-road trucks as compliance pathways under PR 2305.

NZE Off-Road HDVs Are Fully Consistent with Past and Emerging AQMP Control Measures

Below are additional compelling reasons to permit use of NZE terminal tractors for compliance under PR 2305; all are based on the South Coast AQMD’s long-standing policies and world-leading technology advancement efforts.

1. For the emerging 2022 Air Quality Management Plan, the District has initiated development of new mobile source strategies that will help achieve SCAB attainment of the 2015 8-hour ozone standard (70 ppb). To support development of these critical 2022 AQMP strategies, the District established “Mobile Source Working Groups” in conjunction with CARB. Notably, draft MOU Elements for the 2022 AQMP emphasize the need to “accelerate Zero Emission (ZE) and Near Zero Emission (NZE) cargo handling equipment (CHE).”¹
2. South Coast AQMD’s Resolution No. 17-2,² used for adopting the 2016 AQMP and submitted into the California SIP, includes the following critical statements (emphasis added):

“WHEREAS, an accelerated deployment of current and emerging near-zero emission natural gas engine technologies will provide significant, cost-effective and near-term benefits to regional and local air quality, energy supply security, and public health;” (Page 4, amended 3/3/17)

“BE IT FURTHER RESOLVED, that the mobile source incentive program for heavy-duty vehicles outlined in the 2016 AQMP place priority on the most cost-effective technologies to reach short-term air quality goals such as current and emerging near-zero emission natural gas engine technologies.” (Page 10, amended 3/3/17)

25-4

¹ South Coast Air Quality Management District and California Air Resources Board, “An Overview of CARB’s Mobile Source Strategies: 2022 AQMP Mobile Source Working Group, staff presentation, December 16, 2020, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/presentation-2022-aqmp-mobile-sources-wg-final.pdf?sfvrsn=12>.

² South Coast AQMD, “Attachment A, Resolution No. 17-2,” adopted by the Board, March 3, 2017, [aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/resolution.pdf?sfvrsn=6](http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/resolution.pdf?sfvrsn=6).

3. The 2016 (most-current) AQMP³ includes nearly 70 individual references to NZE vehicles and equipment. It repeatedly emphasizes the high importance assigned by Staff for rapid, near-term deployment of NZE HDVs to meet ozone attainment goals. Specific examples of such passages in the AQMP include the following (emphasis added):

- “More stringent mobile source emission standards are desperately needed to spur further development and production of zero- and near-zero emission technologies.” (Preface)
- “Given the fast-approaching deadlines – as early as 2022 and 2023, and given that the majority of the zero and near zero technologies needed for attainment have already or will soon be commercially available, it is now possible to specify the technologies and the implementation pathways to attainment” (Page ES-4)
- “The 2016 AQMP control strategy strongly relies on a transition to zero and near-zero emission technologies in the mobile source sector, including automobiles, transit buses, medium- and heavy-duty trucks, and off-road applications. The plan focuses on existing commercialized technologies and energy sources including their supporting infrastructure, along with newer technologies that are nearing commercialization based on recent demonstration programs and limited test markets. Prioritizing and expanding funding in Environmental Justice (EJ) areas will be sought.” (Page ES-5).
- “Additional demonstration and commercialization projects will be crucial to help deploy and reduce costs for zero and near-zero emission technologies. A key element of Plan implementation will be private and public funding to help further the development and deployment of these advanced technologies. Many of the same technologies will address both air quality and climate goals, such as increased energy efficiency and reduced fuel usage.” (Page 4-1)
- “The SCAQMD will continue to support technology demonstration projects for both mobile and stationary sources and will work to create new or expanded funding opportunities for earlier deployment of cleaner technologies, thus contributing to a smooth transition to zero and near-zero emission technologies in the mobile and stationary source sectors. The SCAQMD will prioritize distribution of incentive funding in environmental justice (EJ) areas and seek opportunities to expand funding to benefit the most disadvantaged communities.” (Page 4-3)
- “Mobile sources such as trucks, locomotives, and cargo handling equipment have technological potential to achieve zero- and near-zero emission levels.” (Page 4-8)
- “All technologies and fuels should be able to compete on an equal footing to meet environmental needs. This policy is consistent with the current priority on maximizing emission reductions utilizing zero emission technologies in all applications that are shown to be cost-effective and feasible. In other applications, near-zero technologies remain essential to meet all attainment goals.” (Page 4-9)
- “In the longer-term, there is a need to significantly increase the penetration and deployment of near-zero and zero-emission vehicles, greater use of cleaner, renewable fuels (either alternative fuels or new formulations of gasoline and diesel fuels), and additional emission reductions from federal and international sources such as locomotives, ocean-going vessels, and aircraft.” (Page 4-23)

25-4
(cont'd)

³ South Coast AQMD, “Final 2016 Air Quality Management Plan,” March 2017, <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>

- “Lastly, one measure seeks to recognize the criteria pollutant emission reduction benefits of existing incentives programs such as the Carl Moyer Memorial Air Quality Standards Attainment Program and Proposition 1B – Goods Movement Emission Reduction Program. The measures call for greater emission reductions through accelerated turnover of older vehicles to the cleanest vehicles and equipment currently available and increased penetration of commercially-available near-zero and zero-emission technologies through incentives programs in the near-term.” (Page 4-24)
- “However, additional research and demonstration are needed to commercialize zero- and near-zero emission technologies for the heavier heavy-duty vehicles (with gross vehicle weight ratings greater than 26,000 pounds).” (Page 4-24)
- “MOB-13 – OFF-ROAD MOBILE SOURCE EMISSION REDUCTION CREDIT GENERATION PROGRAM: This measure seeks to accelerate the early deployment of near-zero and zero-emission off-road equipment through the generation of MSERCs that can be used for purposes of recognizing mobile source emission reductions at facilities affected by proposed AQMP measures MOB-01 through MOB-04 and EGM-01.” (Page 4-33)
- “FURTHER DEPLOYMENT OF CLEANER TECHNOLOGIES: OFF-ROAD EQUIPMENT: This measure is designed to achieve further emission reductions for the Basin’s attainment needs through a suite of additional actions, including greater penetration of near-zero and zero-emission technologies through incentive programs, and emission benefits associated with the potential for worksite integration and efficiency, as well as connected and autonomous vehicle technologies. These emission reductions will be achieved through a combination of actions to be undertaken by both CARB and the SCAQMD.” (Page 4-41)
- “Given the significant NOx emission reductions needed to attain the federal ozone air quality standards by 2023 and 2031, a combination of public funding incentives along with regulatory actions are needed. In the near-term, there is a need to commercialize zero and near-zero on-road trucks and off-road equipment as early as possible.” (Page 4-64)
- “Actions to promote ZEVs in these heavy-duty applications are underway and are important to further reduce regional and near-source toxics exposure, especially as it relates to reducing risk from DPM. In the off-road sector, the 2016 AQMP mobile source control strategies stress the need to reflect this same type of transformation to a mix of zero and near-zero technologies operating on renewable fuels.” (Page 9-11)
- TABLE 9-3 (2016 AQMP CARB Mobile Source Control Measures and Concurrent Key Toxic Air Contaminants Reduced) includes “Cleaner engine technology transfer from on-road to off-road applications” and “Incentive funding to achieve further deployment of cleanest engine technologies” (Page 9-12)

25-4
(cont'd)

South Coast AQMD is the Leading U.S. Supporter of / Champion for NZE HDVs

For more than three decades, the South Coast AQMD’s Technology Advancement / Clean Fuels Program has led the nation (and the world) in providing essential cost-sharing and/or general support to advance progressively lower-emitting HDV technology. In fact, it is largely due to the District’s support over the last decade that natural gas and propane engines (manufactured by our coalition members) are certified by CARB today at NZE levels. Similarly, the District’s financial and technical support has been instrumental in bringing diesel engine technology to the brink of achieving NZE certification. We thank

25-5

the South Coast AQMD Board and Staff; without such support, it may not have been possible for our coalition members to achieve these very important milestones.

As documented above, wide-scale deployment of NZE HDV technologies and fuels is critical to the District's overall AQMP control strategy and ability to achieve its air quality goals. If the District now finalizes PR 2305 to exclude NZE terminal tractors, it will be contrary to – and a major blow against – all these successful efforts to develop and deploy NZE HDVs in the SCAB, as strongly needed for ozone attainment. The following are specific recent quotes and statements from the District's Clean Fuels program and related technical documents⁴ that corroborate strong synergy between developing NZE HDV platforms so they can be subsequently deployed in the SCAB, via regulatory mechanisms and/or incentive programs.

- “The South Coast AQMD Clean Fuels Program cost-shares projects to develop and demonstrate zero, near-zero and low emissions clean fuels and advanced technologies to push the state-of-the-technology and promote commercialization and deployment of promising or proven technologies not only for the Basin but Southern California and the nation as well. As noted, these projects are conducted through public-private partnerships with industry, technology developers, academic and research institutes and local, state and federal agencies.”
- “The South Coast AQMD continually seeks to support the deployment of lower-emitting technologies. The Clean Fuels Program is shaped by two basic factors: 1) Zero, near-zero and low emission technologies needed to achieve clean air standards in the Basin; and 2) Available funding to support technology development within the constraints imposed by that funding.”
- “One function of the Clean Fuels Program is to help expedite the deployment and commercialization of zero, near-zero and low emission technologies and fuels needed to meet the requirements of the AQMP control measures. In many cases, new technologies, although considered “commercially available,” require assistance to fully demonstrate the technical viability to end-users and decision-makers.”
- “More than ever before, the Clean Fuels Program must both foster and accelerate advancement of transformative transportation, and off-road technologies where possible, with an emphasis on zero and near-zero emissions vehicle and fuel technologies. This is especially true given the region's economic dependence on thriving goods movement, along with the corresponding impact of that industry on environmental justice communities.”
- “It is important to note here that South Coast AQMD's Technology Advancement Office (TAO) administers not only the Clean Fuels Program but also the Carl Moyer Program (and other significant incentive programs, such as Proposition 1B-Goods Movement and the Community Air Protection Program). These two programs produce a unique synergy, with the Carl Moyer Program providing the necessary incentives to push market penetration and commercialization of zero and near-zero emission technologies developed and demonstrated by the Clean Fuels Program. This synergy enables the South Coast AQMD to act as a leader in both technology development and commercialization efforts targeting reduction of criteria pollutants and GHG reduction co-benefits.”
- District policies “will help both regulatory agencies and OEMs to expedite introduction of zero and near-zero emission vehicles in the Basin, which is a high priority of the AQMP.”

25-5
(cont'd)

⁴ South Coast Air Quality Management District, Board Agenda No. 28, “Approve and Adopt Technology Advancement Office Clean Fuels Program 2019 Annual Report & 2020 Plan Update,” March 2020.

- “Although no near-zero emission diesel technology is commercially available today, South Coast AQMD has been working closely with CARB and others on defining technology pathways via several projects . . . (that) show near-zero emission diesel technologies are feasible via advanced engine and aftertreatment or optimized engine design and calibration. The (Clean Fuels) Plan Update continues to incorporate pursuit of cleaner engines for the heavy-duty sector. Future projects will support the development, demonstration and certification of engines that can achieve these massive emission reductions using an optimized systems approach.”
- “Currently, on-road heavy-duty natural gas engines are increasingly being certified to CARB’s optional low-NOx standards which are significantly lower in NOx than the current on-road heavy-duty standard. This technology category seeks to support the expansion of OEMs producing engines or systems certified to the lowest optional NOx standard or near-zero emissions and useable in a wide variety of medium- and heavy-duty applications, such as Class 6 vehicles used in school buses and in passenger and goods delivery vans, Class 7 vehicles such as transit buses, waste haulers, street sweepers, sewer-vector trucks, dump trucks, concrete mixers, commercial box trucks, and Class 8 tractors used in goods movement and drayage operations and off-road equipment such as construction vehicles and yard hostlers.”
- “The deployment of near-zero emission vehicles would significantly further emission reductions relative to the state’s current regulatory requirements.”
- “The South Coast AQMD relies on a significant increase in the penetration of zero and near-zero emission vehicles in the South Coast Basin to attain federal clean air standards by 2023 and 2032. This project would help develop a number of renewable transportation fuel production and distribution facilities to improve local production and use of renewable fuels to help reduce transportation costs and losses that can reduce total operating costs of zero and near-zero emission vehicles to be competitive with comparable diesel fueled vehicles. Such advances in production and use are expected to lead to greater infrastructure development. Additionally, this project could support the state’s goal of redirecting biomass waste for local fuel production and reduce greenhouse gases associated with these waste biomass feedstocks.”
- “Nonetheless, while the state and federal governments have continued to turn a great deal of their attention to climate change, South Coast AQMD has remained committed to developing, demonstrating and commercializing zero and near-zero emission technologies. Fortunately, many, if not the majority, of technology sectors that address our need for NOx reductions also garner greenhouse gas (GHG) reductions. Due to these “co-benefits,” the South Coast AQMD has been successful in partnering with the state and federal government. Even with the leveraged funds, the challenge for the South Coast AQMD remains the need to identify project or technology opportunities in which its available funding can make a difference in achieving progressively cleaner air in the Basin.”
- “Although both announcements (separate initiatives on clean HDVs by EPA and CARB) are welcome news, the timing is too late to help the South Coast AQMD meet its 2023 federal attainment deadline. So, despite progress, commercialization and deployment of near-zero engines are still needed.
- “Because of Assembly Bill (AB) 6171, which requires reduced exposure to communities most impacted by air pollution, TAO conducted additional outreach to AB 617 communities regarding available zero and near-zero emission technologies, as well as the incentives to accelerate those cleaner technologies into their communities.

- SCAQMD's Clean Fuels Plan 2020 Update includes projects to develop, demonstrate and commercialize a variety of technologies to meet emission control needs identified in the 2016 AQMP. Emphasis is on getting significant near-term reductions "using near-zero and zero emission technologies," including "for high horsepower applications."
- "More than ever before, the Clean Fuels Program must both foster and accelerate advancement of transformative transportation, and off-road technologies where possible, with an emphasis on zero and near-zero emissions vehicle and fuel technologies. This is especially true given the region's economic dependence on thriving goods movement, along with the corresponding impact of that industry on environmental justice communities."
- "The Clean Fuels Program and the Carl Moyer Program provide a unique synergy, with the Carl Moyer Program providing the necessary incentives to push market penetration of the technologies developed and demonstrated by the Clean Fuels Program. This synergy enables the South Coast AQMD to act as a leader in both technology development and commercialization efforts targeting reduction of criteria pollutants."

25-5
(cont'd)

Conclusions and Requested Actions by the Board

Our coalition of companies and organizations respectfully asks the Board to urgently intervene on PR 2305, by directing staff to allow NZE terminal tractors as compliance pathways. This simple modification – which Staff is ready to implement at your direction – will significantly improve PR 2305's ability to expeditiously achieve its intended NOx reductions. It will provide the regulated community with additional compliance options that are very cost effective for reducing NOx, while also delivering low total cost of ownership. Our recommended action is in full accord with your Board's longstanding fuel-neutral policies to rapidly deploy emerging clean HDV platforms. It will perpetuate and strengthen the decades-long synergy between the District's world-class HDV technology advancement program and your efforts to rapidly deploy the cleanest-available HDV fuel-technology platforms, as they emerge into the market place.

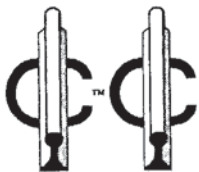

25-6

If you have any questions about the content of our letter, or if you would like to discuss this important issue with representatives from our coalition, please contact Ben Granholm at ben@westernpga.org or Jon Leonard at jon.leonard@gladstein.org.

Sincerely,

Thomas E. Knauff
CEO

Philip M. Fine, Ph.D.
Deputy Executive Officer
South Coast Air Quality Management District
Office of Planning, Rule Development & Area Sources
21865 Copley Drive
Diamond Bar, CA 91765

Dear Dr. Fine:

California leads the nation in environmental statutes, and the South Coast AQMD leads California. Your Proposed Rule 2305, the Warehouse Indirect Source Rule, is a good example. However, it has a glaring omission. It fails to foresee the greatest potential weapon in combating damage from urban trucks—railroads. The pick-up and drop-off of large-lot shipments in urban areas by rail sidings could greatly reduce air pollution, road congestion, and road accidents, as well as cut transportation costs. The fact that the large railroads do not yet themselves realize the vast sea of revenue potential from urban sidings only adds to the imperative for regulations that monetize the environmental, economic, and aesthetic advantages of railroad rights-of-way.

27-1

In other ways the South Coast AQMD has already been a leader in reducing pollution from locomotives with its support of the Pacific Harbor Line. You are administering a grant from the Carl Moyer Program to convert the last sixteen PHL locomotives from Tier 2 to Tier 3 emissions standards. PHL has also been working with Progress Rail to lease its Tier 4 switching locomotive and its zero-emission battery locomotive. Your neighbor, the San Joaquin Valley Air Pollution Control District, is administering a \$22.6 million grant from the Near Zero-Emission Board so that BNSF can test Wabtec's zero-emission battery-powered linehaul locomotives.

27-2

The Warehouse Indirect Source Rule should encourage the use of rail sidings to service the warehouse of the future. The reliability of railroad linehaul service has been recently revolutionized by Precision Scheduled Railroading, and it would be a short step to extend a high degree of reliability to switching service at the customer's private siding. Specifically, we would propose that Table 3 to Proposed Rule 2305 be amended so that WAIRE Points are awarded for each carload shipped or received (a boxcar generally carries 120,000-to-180,000 lbs. of lading) in accordance with the locomotive emissions standard met by the serving engine—a rising scale from Tier 1 to Tier 4 to a zero-emission battery-powered switching locomotive.

27-3

Railroads can help cities not just with moving people, but also with urban freight and the integration of environmentally-friendly urban industrial and warehouse jobs and corporate taxes.

Sincerely,

Thomas F. Erickson, Jr.
Proprietor

Subject: Warehouse Indirect Source Rule actions

Victor, Caitlin, Farimah, and Priscilla –

Thank you for your time yesterday during our Zoom call about WAIRE points that the South Coast Air Quality Management District proposes to award to warehouses that take specific actions to comply with new requirements for pollution abatement in your 4-county area. I hope to have tickled your interest in the huge potential for railroads to help reduce pollution while simultaneously relieving urban road congestion, accidents, and wear.

27-4

It is not often that our work can lead to groundbreaking improvements. The rest of the country, if not world, will be watching and learning from your efforts to monetize pollution abatement at the level of the individual warehouse. You can plant a seed with enormous positive repercussions by including the use of rail delivery and rail electrification initiatives into your incentive program.

Why do this?

- Because steel-wheel-on-steel-rail requires ¼ of the energy to do the same work as rubber-tire-on-pavement.
- Because it is only fair to reward rail electrification on the same basis as truck electrification.
- Because railroads need incentives to pursue emission reduction in locomotives.
- Because railroads need talking points to solicit warehouse business.

27-5

More specifically, we propose that lines be added to Table 3 in Proposed Rule 2305 as follows:

- Column 1—WAIRE Menu Item: “Use rail sidetrack”
- Column 2—WAIRE Menu Sub-item: “Switched by Tier 1 or 2 Locomotive” or “Switched by Tier 3 or 4 Locomotive” or “Switched by All-electric Locomotive”
- Column 3—Reporting Metric: Number of Cars (with higher points awarded for successive levels in Column 2)

27-6

I have copied Michael Sussman, Chairman & CEO of Strategic Rail Finance, since he brought your warehouse initiative to my attention and since he masterminded the 2020 update to Nevada’s State Rail Plan referenced under separate cover.

27-7

Regards, Tom Erickson, Proprietor, Rail Cents Enterprises, PA office: 610-565-8458

P.S. Would appreciate being advised of your individual titles and whether progress has been made in proposing point amounts for Columns 4, 5, and 6 of Table 3—WAIRE menu.

February 19, 2021

Chair Burke and Members of the Mobile Source Committee
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: Item No. 1 – Update on Proposed Rule 2305 Warehouse Indirect Source Rule

Dear Chair Burke and Members of the Mobile Source Committee:

On behalf of Earthjustice, we submit these comments on the warehouse indirect source rule. Earthjustice is working with a broad coalition that includes the communities living and working adjacent to warehouses, who continue to be disproportionately harmed by the freight industry every single day. We appreciate the Air District staff's continued work on the warehouse indirect source rule and request that the agency move expeditiously in the development and adoption of a strengthened regulation that focuses on zero-emissions.

28-1

The covid-19 pandemic has exacerbated health impacts to communities in the region just as we had one of the worst smog season in decades. Warehouses and ports have been profiting – and polluting – more due to consumers' increased reliance on e-commerce,¹ further compounding existing health risks in nearby communities. While those with ownership stakes in the freight system have profited handsomely, communities, particularly low-income communities and communities of color, have suffered the brunt of the air pollution harms.

28-2

Proposed Rule 2305 will mean significant benefits to our region in reduced smog-forming emissions and the need to put people to work to clean up warehouse pollution through retrofitting warehouses with clean transportation and clean energy resources. But, the rule remains too weak, and it should be at least tripled in strength to provide more emissions reductions. Moreover, we recommend the Air District make sure maximum credit is provided for zero-emission technologies and reject efforts by the natural gas and propane industries to use this rule to further expand their infrastructure.

28-3

¹ See Justin Ho, *As imports boom, warehouses fill up, and businesses face a storage shortage*, Marketplace (Oct. 1, 2020), <https://www.marketplace.org/2020/10/01/imports-boom-warehouses-fill-up-businesses-face-storage-shortage-online-shopping-covid19/>.

We appreciate your consideration of these comments, and the staff's hard work on this important rule. We look forward to working with the Governing Board to finally adopt this rule that has been such a vitally important one.

28-4

Sincerely,

A handwritten signature in black ink that reads "Adrian L. Martinez". The signature is fluid and cursive, with the first name "Adrian" and last name "Martinez" clearly legible, and a middle initial "L." in between.

Sarah Reese, SRees@aqmd.gov

Ian Macmillan, imacmillan@aqmd.gov

CC: Yassi Kevezade, yassi.kevezade@sierraclub.org

To the Governing Board of the South Coast Air Quality Management District and Senior Staff:

The Robert Redford Conservancy for Southern California Sustainability aims to increase socio-ecological justice and sustainability in our surrounding communities and beyond. We support projects that bolster multiple and interconnected systems (ecological, human, political, economic and cultural), and we foster collaboration and leadership for socio-ecological justice and sustainability.

29-1

We applaud the SCAQMD for its role in inviting community input regarding the impact of warehouses on life and health in Southern California. We believe that action must be taken now to combat climate change and solve the air quality issues of southern California. These environmental crises harm residents in our region every day. As we continue to contend with the ongoing COVID-19 pandemic, essential workers and their families - particularly in the logistics industry - are put at even greater risk due to unsafe work conditions and worsening air quality. Our workers deserve higher workplace standards so that they are able to breathe safely and power their business without creating harmful air pollution.

29-2

To date, the warehouse industry continues to operate without being subject to proper regulations, putting workers and communities at risk every day. We at the Robert Redford Conservancy believe that the **Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program Fees for Rule 2305** is an important rule that will stop this abuse in the goods movement sector.

29-3

The logistics industry is here to stay because of our coastal and inland port communities, and we must work together to clean up warehouses. The Warehouse Indirect Source Rule will be critical to holding these facilities accountable. We implore the South Coast AQMD to pass a rule that is strong enough to protect our communities' health and achieve broader climate benefits at the same time.

29-4

Warehouses have spewed toxic air pollution in nearby communities for years. A strong mandatory program, like the warehouse indirect source rule, is necessary to transform this industry. But to effectively clean up the warehouse industry, the rule must be stringent enough so that warehouses actually take the actions listed in the WAIRE menu to clean up their operations. This would require a stringency value of at least 0.0075. In addition, this rule should not simply be a "pay-to-pollute" scheme. The purpose of this rule is to reduce air pollution from

29-5

this industry and a low mitigation fee of \$1000 per point may lead to warehouses simply paying to comply.

29-5
(cont'd)

We also believe that warehouses must move towards zero emission technology and the warehouse indirect source rule should incentivize this shift. This will provide air quality benefits and a just transition that will create access to quality jobs by increasing demand for labor as the industry begins to implement zero emission technologies. These job opportunities have been proven to provide quality wages and benefits for workers, unlike many temporary low-wage warehouse jobs.

29-6

Part of our mission at the Conservancy is to promote environmental justice in the Inland Empire. Our support of a stringent Warehouse Indirect Source Rule is an integral step toward that goal. We hope the Board will pass a strong warehouse indirect source rule that serves public health, supports a new green economy, and provides regional air quality benefits.

29-7

Sincerely,

Susan A. Phillips
Professor of Environmental Analysis

February 18, 2021

South Coast AQMD Board Members, Mobile Source Committee

RE: Inclusion of Near-Zero Emission Terminal Tractors Under Proposed Rule 2305 (WAIRE)

Dear Chairman Burke and Members of the South Coast AQMD Board's Mobile Source Committee:

Origin Engines, by means of this letter, wish to endorse and support including that both on-road and off-road vehicles be included in the warehouse indirect source rule.

30-1

It is Origin Engines understanding that "The SCAQMD warehouse indirect source rule includes on road Near Zero Emissions vehicles - Nat Gas / Propane but excludes Near Zero for off-road. The only option for off-road is electric. The SCAQMD staff understand that Near Zero Emissions (Nat Gas / Propane) are the most cost-effective alternative for getting the NOx emissions reductions they need today. Yet the staff has not included NZE in the source rule for off-road applications.

30-2

Origin Engines has a history of developing natural gas and propane engines for use in off-road applications and look forward to the future where "Near Zero Emission Vehicles- Natural Gas / Propane" can be included for use.

30-3

Best Regards,

Shawn Sterling

Shawn Sterling
Chief Customer Officer

Sent Via Email: imacmillan@aqmd.gov / vjuan@aqmd.gov

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

The Long Beach Area Chamber of Commerce officially opposes the adoption of Rule 2305 (Indirect Source Rule). A significant portion of our membership is involved in the support and development of distribution warehouses that are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

31-1

We believe the District's proposed ISR is a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

31-2

The Long Beach Area Chamber of Commerce has the following comments in response to the District's Proposed Rule 2305 (Warehouse Indirect Source Rule):

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.
2. It is not feasible to comply with the ISR due to the following:
 - a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
 - b) Warehouses have no control over how truck engines are manufactured.
 - c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
 - d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

31-3

31-4

- | | |
|--|------|
| 3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are 100% viable from a technology and/or economically reasonable standard. | 31-5 |
| 4. Warehouses have been deemed to be essential businesses by the State for important reasons including: | 31-6 |
| <ul style="list-style-type: none"> a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc. | 31-6 |
| 5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known. | 31-7 |
| <ul style="list-style-type: none"> a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic. | 31-7 |
| 6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward mobility. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten. | 31-8 |
| 7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry. | 31-9 |

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.	31-10

RE: Proposed Rule 2305 – Warehouse Indirect Source Rule (ISR)

Chairman Burke and Members of the Board,

Clean Energy greatly appreciates this opportunity to comment on proposed rule 2305 (PR 2305) which establishes a warehouse ISR. With rapidly approaching attainment deadlines, Clean Energy applauds the South Coast AQMD for taking bold action. While this measure alone will not achieve attainment, if done in an effective manner, it could be a significant step towards that goal. Clean Energy is concerned that the current proposal deviates from the stated purpose of the rule, "...to reduce local and regional NOx and PM emissions...", and as a consequence, its effectiveness will be greatly diminished unless amended.

PR 2305 requires warehouse owners and operators to earn a certain number of WAIRE points in order to comply. Unfortunately, a significant portion of points are awarded based on costs and not actual emissions reductions. This approach is detrimental to the success of the rule for three main reasons: (1) It allows warehouse operators to earn fewer points based on actual emission reductions (2) it disincentivizes the market to reduce costs in the future and (3) it disincentivizes cost-effective emission reduction solutions.

Points should be awarded based on emission reductions and emission reductions should be treated equally and consistently regardless of how they are achieved. The current WAIRE menu provides more than twice as many points for the acquisition of a Class 8 ZE truck than it does a Class 8 NZE truck, 126 and 55 points, respectively. Both vehicle types provide similar emissions reductions as demonstrated by Table 6 on page 92 of the Preliminary Draft Staff Report:

Table 6. NOx and DPM emission reductions for the Annualized Unitary Metric

WAIRE Menu Item		Annualized Unitary Metric (AUM)	Annualized Regional Emission Reductions (lb NOx/AUM)	Annualized Local Emission Reductions (lb DPM/AUM)
Class 8 Truck	NZE	365 truck visits	$0.9 \times 180.3 = 162.3$	1.3
Class 4-7 Truck			$0.9 \times 29.2 = 26.3$	0.1
Class 8 Truck	ZE		$0.247 \times 2 \times 365 = 180.3$	$0.002 \times 2 \times 365 = 1.3$
Class 4-7 Truck			$0.040 \times 2 \times 365 = 29.2$	$0.0002 \times 2 \times 365 = 0.1$
Class 2b-3	ZE		$0.027 \times 2 \times 365 = 19.7$	$0.0003 \times 2 \times 365 = 0.2$

If only emission reductions were used for awarding points, a Class 8 ZE truck acquisition would receive roughly 10% more points. Shockingly, the current proposal provides ZE trucks with 129% more points than a NZE truck under this category.

In addition to air quality benefits, NZE trucks fueled by renewable natural gas, provide superior greenhouse gas emission reductions while also providing performance that is comparable to diesel in terms of range, power, and refueling time. This cost-effective, viable and equally clean alternative should not be penalized if the District's goal is emissions reductions.

32-3
(cont'd)

Amendment Request: Points for the acquisition and usage of NZE and ZE vehicles should be based solely on the emissions reduction potential of each technology such that an NZE measure achieves 90% of the WAIRE points as a ZE measure. On a NOx reduction basis, near zero emission trucks should deliver the same NOx emissions reductions per AQMD staff and are certified to be 90% cleaner than diesel.

32-3
(cont'd)

Example: Under the current proposal, a class 8 ZE truck acquisition receives 126 WAIRE points, therefore, based on CARB's 90 percent reduction certification of a low NOx engine, a class 8 NZE truck should receive 113 WAIRE points, not 55 points as currently proposed.

Discrimination against cost-effective solutions in the proposed rule is further illustrated by the exclusion of NZE yard trucks from earning WAIRE points. NZE yard trucks should be included as an approved activity for purposes of not only equity but also flexibility for warehouse operators. These vehicles have been proven in the field to both operate and reduce emissions thereby providing an option that warehouse operators can depend upon and reach the desired goal. Every opportunity for operators to move away from diesel should be encouraged. More pointedly, if NZE yard tractors are not incentivized and no one has confidence in zero emission yard tractors, the default is a diesel yard tractor which is counter to goal.

32-4

A third example of discrimination against cost-effective solutions is the exclusion of NZE infrastructure from earning WAIRE points while ZE recharging infrastructure can receive a significant number of WAIRE points. An investment in infrastructure can represent 50 percent or more of the total investment for adoption of a clean vehicle fleet. Excluding NZE infrastructure from earning points puts a key emissions reduction technology at a major disadvantage.

32-5

Amendment Request:

(1) Include NZE trucks on the WAIRE menu and provide them 90% of the WAIRE points ZE yard trucks receive for acquisition (159 WAIRE points) and annual hours of use (261 WAIRE points).

32-4
(cont'd)

(2) Provide compliance points for renewable natural gas station installations on the WAIRE menu.

32-5
(cont'd)

The Governor's Executive Order N-79-20 does not require PR 2305 to discriminate against NZE technology and the South Coast AQMD's 2016 Air Quality Management Plan (AQMP) prioritizes near zero natural gas engine technologies. The executive order proclaims that "*It shall be a further goal of the State that 100 percent of medium- and heavy-duty vehicles in the*

32-6

State be zero-emission by 2045 for all operations where feasible...” The warehouse ISR accelerates the adoption of zero-emission vehicles by including them as an activity eligible for WAIRE points. Additionally, the executive order establishes a non-binding goal that is over 20 years away. Therefore, discrimination against cost-effective NZE technology is not necessary for compliance with the executive order.

32-6
(cont'd)

Furthermore, penalizing NZE technology for being cost-effective is contrary to the AQMD’s 2016 Air Quality Management Plan’s Resolution No. 17-2 which states:

Whereas, an accelerated deployment of current and emerging near-zero emission natural gas engine technologies will provide significant, cost-effective and near-term benefits to regional and local air quality, energy supply security, and public health;

32-7

Be it FURTHER RESOLVED, that the mobile source incentive program for heavy-duty vehicles outlined in the 2016 AQMP place priority on the most cost-effective technologies to reach short-term air quality goals such as current and emerging near-zero emission natural gas engine technologies.

Conclusion

The 2016 AQMP states on page 4-9, “All technologies and fuels should be able to compete on an equal footing to meet environmental needs.” This guiding principle should be better reflected in PR 2305 by basing point allocations on emissions reductions rather than cost. In summary, we request the following changes:

➤ Points for the acquisition and usage of NZE and ZE vehicles should be based solely on the emissions reduction potential of each technology such that an NZE measure achieves 90% of the WAIRE points as a ZE measure. On a NOx reduction basis, near zero emission trucks should deliver the same NOx emissions reductions per AQMD staff and are certified to be 90% cleaner than diesel.

32-3
(cont'd)

➤ Include NZE yard trucks on the WAIRE menu and provide them 90 percent of the WAIRE points ZE yard trucks receive for acquisition (159 WAIRE points) and annual hours of use (261 WAIRE points).

32-4
(cont'd)

➤ Provide compliance points for renewable natural gas station installations on the WAIRE menu.

32-5
(cont'd)

With quickly approaching attainment deadlines and local residents suffering from poor air quality, PR 2305 must treat cost-effective solutions fairly. Thank you for considering our requests.

Sincerely,

Todd R. Campbell

Re: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan and Mr. Juan:

The Carson Dominguez Employers Alliance (CDEA) officially opposes the adoption of Rule 2305 (Warehouse Indirect Source Rule). A significant portion of our membership engages with the warehouse industry on a daily basis as an integral component of the Southern California logistics sector. The warehouse and trucking industries are playing a key role in our regional and national response to the COVID-19 pandemic.

33-1

We believe the District's proposed ISR is a misguided policy in the midst of the COVID-19 pandemic. The District is pursuing a regulation targeted at a sector that serves as a lifeline to our region and nation. The warehouse industry and the trucking industry work in tandem in delivering the goods that we all count on during this pandemic.

At this time, the CDEA has the following comments in response to the Proposed Rule 2305 (Warehouse Indirect Source Rule):

1. The proposed ISR clearly seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.
2. The proposed ISR would impose additional/permanent costs on warehouses of about \$.90 per square foot. This would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time, as it responds to the challenges of the pandemic.
3. It is not feasible to comply with the ISR due to the following:
 - a.) The proposed rule requires warehouses to control truck fleets and decrease truck emissions but warehouse operators are not able to accomplish this task.
 - b.) Warehouses have no control over how truck engines are manufactured.
 - c.) Warehouses do not own trucks fleets nor control what type of trucks shipping companies purchase.
 - d.) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from or any other variables related to truck trips.

RE: Proposed Warehouse Indirect Source Rule (ISR)

Dear SCAQMD Leadership,

On behalf of Weber Logistics, and in concert with many of my colleagues providing Third Party Logistics (3PL) service, one of the most dynamic industries in California, I wish to express our strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

Weber Logistics employs over 500 logistics workers and professionals in California, and is poised to grow, providing good, high-paying jobs.

However, our clients have long been concerned that further cost and regulatory actions in California may make it uncompetitive for them to continue to store and ship their product from here, and have suggested that we open facilities to serve them in Arizona and Nevada.

This potential loss of business to California directly impacts all our employees, their families, and the many industries with which purchase supplies and services. Please help us to keep our jobs in California!

I wish to reiterate many of the points that you know and are hearing now.

- California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.
- The goods movement system serves as the lifeblood of California's economy, delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to power of the modern supply chain, allowing Californians to shelter in place and abate the spread of COVID-19.
- Goods movement also powers high-paying blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry.

All this progress and vital infrastructure is jeopardized.

34-1

34-2

- | | |
|---|------|
| <ul style="list-style-type: none"> • The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions “WAIRE Points” that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators. This rule is a costly and duplicative effort that is not poised to achieve demonstrable improvements in air quality in the South Coast basin. | 34-3 |
| <ul style="list-style-type: none"> • As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country’s strictest emission laws, including adopting in July the world’s first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations that will require nearly every equipment type at warehouses to operate in a zero-emission mode within the next year. | 34-4 |
| <ul style="list-style-type: none"> • SCAQMD’s proposed Warehouse ISR is duplicative of these regulations and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit. | |
| <ul style="list-style-type: none"> • During presentations, SCAQMD justified the draft rule by stating that additional action is necessary to address ozone and NOx concentrations in the basin. With respect to NOx, a recent technical analysis of the draft staff report found that the report does not adequately demonstrate that the proposed Warehouse ISR will provide NOx reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule. | |
| <ul style="list-style-type: none"> • Further, as stated during AQMD’s Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NOx reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. One is left with the impression that the rule, instead of addressing environmental concerns, is being used as a funding mechanism. | 34-5 |
| <ul style="list-style-type: none"> • Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state’s resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom. | |

<p>Weber Logistics hopes SCAQMD will reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions that already will occur due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.</p>	34-6

Re: United Airlines Comments on *SCAQMD's Proposed Rule 2305 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program*

Messrs. MacMillan and Juan:

United Airlines, Inc. (United) submits the following comments on behalf of its cargo operations (United Cargo) at Los Angeles International Airport (LAX). United leases a warehouse building at LAX with greater than 100,000 square feet of indoor floor space dedicated to / that may be used for warehousing and other aviation activities by United Cargo and other United operational groups, and therefore would be subject to the Proposed Rule as it is currently drafted. United appreciates this opportunity to engage with the South Coast Air Quality Management District (SCAQMD) regarding the development of an indirect source rule (ISR) for warehouses and distribution centers. The following comments refer to the draft proposal dated January 15, 2021 (Proposed Rule).¹ United reserves the right to supplement or amend the following comments as appropriate.

35-1

1. The Clean Air Act's indirect source provisions do not authorize the SCAQMD's regulation of cargo activities at commercial airports.

As an initial matter, United is concerned that the SCAQMD does not have the legal authority to promulgate an indirect source rule to address emissions from mobile sources by regulating existing air cargo warehouses located at airports. While indirect source regulations are provided for under the Clean Air Act (CAA), they cannot be used to regulate sources that CARB and the SCAQMD are preempted from regulating.

35-2

In particular, the Federal Aviation Act and the Airline Deregulation Act ("ADA") preempt the Proposed Rule's regulation of air cargo warehouse operations. The Federal Aviation Act preempts states from adopting regulations relating to the movement and operation of aircraft. 49 U.S.C. § 40103(a). The ADA preempts any state requirement "related to a price, route, or service of an air carrier." 49 U.S.C. § 41713(b)(1). The Proposed Rule seeks to regulate airport activities and aircraft cargo operations and their associated emissions and this regulation is preempted by both the Federal Aviation Act and the ADA. *See City of Burbank v. Lockheed Air Terminal, Inc.*, 411 U.S. 624, 63 (1973) (finding state regulation of airport transportation activities is generally preempted by federal law); *Federal Express Corp. v. California Public Utilities Comm'n*, 936 F.2d 1075, 1078 (9th Cir. 1991) (holding that the ADA preempts state regulation of airport cargo

¹<https://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/proposed-rule-2305.pdf?sfvrsn=8>.

vehicles, because “the use of the trucks depends on the conditions of air delivery. The timing of the trucks is meshed with the schedules of the planes.”).

2. The Proposed Rule is inconsistent with the SCAQMD’s voluntary memorandum of understanding approach for addressing mobile source emissions at commercial airports.

Consistent with the 2016 Air Quality Management Plan (AQMP), adopted in 2017, the SCAQMD Board approved staff’s recommendation to pursue a voluntary Memorandum of Understanding (MOU) approach (instead of an ISR approach) for commercial airports. The recommendation was based on the airports’ willingness to develop airport-specific Air Quality Improvement Plans/Measures (AQIP or AQIM), to avoid issues of federal preemption as described above, and the fact that commercial airports contribute only about 8 tons per day of NO_x (excluding aircraft emissions).² Following the Board’s direction, the SCAQMD worked closely with the commercial airports and tenants to develop AQIPs, which included the airports’ comprehensive plans to reduce emissions from non-aircraft mobile sources related to airport operations (*e.g.*, ground support equipment, shuttle buses, and cargo delivery trucks). Based on the draft AQIPs or AQIMs, draft MOUs were developed for each of the five commercial airports. On December 6, 2019, the South Coast AQMD Governing Board approved the MOUs with the five commercial airports. The MOUs represent voluntary agreements between SCAQMD and each commercial airport with each party having specific responsibilities and commitments.³

The SCAQMD’s prior statements recommending against an ISR for commercial airports are equally applicable to the Proposed Rule. According to the SCAQMD:

While aircraft make up a substantial portion of airport-related emissions it has become evident through the working group process that this source of emissions presents a particularly unique challenge given the existing regulatory landscape for aircraft and the nature of aircraft activity (*e.g.*, interstate and international origins and destinations). The remaining (*i.e.*, minus aircrafts) emissions from this facility sector are about 8 tons per day, with about 5 of those tons coming from trucks serving the cargo operations at LAX and ONT.

Staff is recommending to pursue a voluntary MOU approach at this time because of the limited emissions reductions that may be available from the non-aircraft sources in this sector, the complications with regulating airports due to overlapping federal jurisdiction, the existence of many existing emission reduction programs, and the potential willingness of airports to enter into cooperative agreements. SCAQMD staff is proposing that commercial airport operators in the Basin each develop their own [AQIPs]. Given the unique challenges with reducing emissions from airports

² <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/facility-based-mobile-source-measures/airports-final-staff-report.pdf?sfvrsn=6>.

³ <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/commercial-airports-mous>.

an [AQIP] would provide airport operators with a level of flexibility that is desirable to develop suitable emissions reduction strategies that avoid interference with the regulatory landscape of aircraft related activity and the day-to-day operations of commercial airports affected by national and global commerce. Key elements of the [AQIPs] would include a detailed emissions inventory of all sources both under direct and indirect airport control, emission reduction measures (*e.g.*, incentives, fleet policies, etc.) and measurable goals.⁴

The commercial airports have already pursued and implemented many policies that reduce emissions. For example, LAX has implemented alternative fuel policy for vehicles >8,500 pounds GVWR, a ground support equipment emission standard, an electric vehicle purchasing policy, a clean construction policy, gate electrification projects, and a new Landside Access Modernization Program to reduce emissions from passenger vehicles.

35-3
(cont'd)

By approving the airport MOUs, the SCAQMD expressly rejected the development of an indirect source rule to achieve emission reductions from mobile sources attributed to cargo warehouse activities at commercial airports. The application of the Proposed Rule to warehouse cargo activities at the same commercial airports subject to MOUs undermines the commitments made by the airports and the SCAQMD. In this context, it is important to note that in its CEQA analysis the SCAQMD does not appear to have investigated and analyzed the potential environmental, economic and operational impacts the Proposed Rule may have on the existing airport AQIPs and MOUs.⁵

Furthermore, the Preliminary Draft Staff Report for the Proposed Rule makes clear that SCAQMD is seeking to achieve reductions of NOx and PM emissions primarily from trucks operating within the South Coast Air Basin region, in order to help meet federal air quality standards for ozone and particulate matter. It is not clear how the Proposed Rule will actually result in the desired emissions reductions when the compliance obligations are solely imposed on warehouse operators, particularly where such operators do not operate their own truck fleets. For warehouse operators that are not also truck operators, the WAIRE points menu provides extremely limited options for compliance, and none of the available options, such as installation of solar panels or installation of MERV 16 filters, would actually reduce mobile source NOx or PM emissions.

35-4

3. The proposed definition of “Warehouse” – Proposed Rule Section (c)(31) – is too broad and requires further clarification.

35-5

It is unclear what is intended by the terms “distribution” and “retail customers.” Given SCAMQD’s primary focus of reducing emissions associated with the operation of heavy-duty diesel trucks, United proposes that the term “warehouse” be limited to buildings that store goods for later distribution via truck. Buildings that are connected to, or part of, other transportation centers (such as a port, commercial airport or rail yard) should not be considered “warehouses”

⁴ <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2018/2018-may4-032.pdf> at 3-9 (emphasis added).

⁵ http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2021/draftea_pr2305and316.pdf?sfvrsn=12

under the Proposed Rule. Although such buildings temporarily store goods that may ultimately be distributed to a business or retail customer, the immediate distribution is often to a boat, plane or train – a transfer that does not create a significant amount of additional, localized truck-related emissions.

35-5
(cont'd)

In addition, the term “retail customer” should be deleted or further defined. Consider, for instance, that United sells its cargo products to individual customers, including by offering small package airport-to-airport service. It is unclear whether an individual who elects to ship a small package from LAX to an individual at another airport via United Cargo is a “retail customer” under the Proposed Rule, or whether SCAQMD intends to limit the applicability to warehouses that transport goods directly to business that operate retail stores.

35-6

United offers the following revisions to the definition of “warehouse” for SCAQMD’s consideration:

WAREHOUSE means a building that stores cargo, goods, or products on a short-or long long-term basis for later distribution, via truck or trailer, directly to a retail store ~~businesses and/or retail customers.~~

4. The proposed definition of “Warehouse Facility” – Proposed Rule Section (c)(29) – is unclear.

The Proposed Rule defines the term “warehouse facility” to mean “a property that includes a warehouse as well as accessory uses ...” Under this proposed definition, and given the broad definition of “warehouse” discussed above, LAX could be considered a “warehouse facility.” LAX is one property with multiple “warehouses,” each of which may be used by a different “warehouse operator.”

The obligations in the Proposed Rule are unclear with regard to “warehouse facilities,” such as LAX, that have multiple “warehouses” and “warehouse operators.” For example, per Section (d)(7) of the Proposed Rule, warehouse operators are responsible for submitting initial site information reports for their “warehouse facility.” The Proposed Rule should be revised to clarify that the warehouse facility for which an initial site information report must be submitted is only that portion of the warehouse facility leased by the warehouse operator. If SCAQMD requires information about an entire “warehouse facility,” such obligations should be imposed on the warehouse facility owners, rather than the warehouse operators, as the latter may not have access to information about all of the other warehouses and warehouse operators at the warehouse facility.

35-7

United requests that this provision and similar requirements throughout the Proposed Rule be revised to clearly allocate reasonability to warehouse owners and warehouse operators, as appropriate, in particular considering situations in which there may be multiple warehouses, each of which is leased by a different warehouse operator, at one warehouse facility. In addition to clearly allocating operator vs. owner requirements, the Proposed Rule should seek to incentivize owners in multi-tenant situations to take on the compliance obligation rather than placing the sole

burden on the operator and merely allowing the owner to earn WAIRE points voluntarily. Furthermore, where a warehouse operator is dependent upon the owner to earn the necessary WAIRE points, the Proposed Rule should provide for a process to seek a limited exemption or waiver of the requirements should the owner choose not to cooperate due to no fault of the operator.

35-7
(cont'd)

5. Calculating Weighted Annual Truck Trips (WATTs)

a. Proposed Rule Section (d)(1)(B)

As an initial matter, United notes that vehicle miles traveled (VMT) is not considered in the formula for calculating WATTs. Failing to consider the impact of VMT in determining the compliance obligation will lead to inequitable application of the rule. For example, warehouses with multiple operators, or warehouses located close together, could have similar compliance obligations to warehouses operated by single operators that attract trucks with much longer VMTs and therefore higher truck-related emissions. United does appreciate that the Proposed Rule specifies that “if a warehouse is occupied by more than one warehouse operator, the WATTs are calculated only for truck trips to or from that operator.” However, because the formula does not include consideration of the distance of each trip, the Proposed Rule should address how to calculate WATTs when a warehouse facility (i.e., LAX) is occupied by more than one warehouse and/or warehouse operator. If a truck visits a warehouse at LAX, but not United’s warehouse, United should not be held responsible for that truck trip. At the same time, if a truck visits both United’s warehouse and another warehouse / warehouse operator also located at LAX, the Proposed Rule should not consider each of those visits to be a separate truck trip. Such a formula would penalize co-located operations, which are inherently more efficient and result in fewer truck-related emissions.

35-8

United also understands that heavy-duty trucks may visit LAX for reasons that are wholly unrelated to warehouse activities (e.g., trucks associated with construction or trucks delivering provisions to airport vendors). Information about a truck’s purpose and overall movement at LAX, however, is not readily available to individual warehouse operators, and it would be inefficient and overly burdensome to ask each operator to separately seek to collect such information. The provisions in the Proposed Rule should be revised to specifically address WATTs calculations at warehouse facilities where there are multiple warehouses and warehouse operators, in addition to other non-warehouse operations. In such situations any warehouse points compliance obligation should be determined at the facility level by the warehouse facility owner.

35-9

b. Proposed Rule Section (d)(1)(C)

United appreciates that the Proposed Rule offers an option in the event that a warehouse operator does not have information about the number of truck trips at a warehouse due to a force majeure event such as a destruction of records from a fire. The Proposed Rule should also allow for a reasonably determined default calculation of truck trip rates in the event of other circumstances that are outside of the warehouse operator’s control. For instance, many of the technological solutions for counting and classifying truck trips are not feasible for United Cargo at LAX. United

35-10

Cargo's leasehold is almost entirely limited to its building footprint. United Cargo does not have exclusive control over all of the roads and other spaces existing prior to its dock doors. Space constraints therefore would make it difficult to install technology for counting / classifying trucks without approval from, and significant cooperation with, the warehouse facility owner (LAWA). United should not be penalized if such approval cannot be obtained, and should not be required to manually count trucks – a solution that would not be cost effective or practical.

35-10
(cont'd)

6. Transferring WAIRE Points – Proposed Rule Section (d)(6)(C)

United appreciates that the Proposed Rule allows the warehouse facility owner to transfer WAIRE points to the warehouse operators located within its facility, but asks that the rule be revised so that such points can be transferred without any discounting. This is particularly necessary where the warehouse facility owner has primary control over whether, and which type of, WAIRE points can be earned. As a lessee that does not own or operate a truck fleet, most of the WAIRE Menu projects that would be available to United (such as installing charging, fueling or solar infrastructure) would require United to obtain permission from, and otherwise cooperate with, LAWA and its other tenants. Some of the projects may not be feasible at United's warehouse building, but may be achievable at other LAX locations that are not controlled by United. If LAWA pursues such projects, a matter which is outside United's control, LAWA should be permitted to allocate any associated WAIRE points to the various warehouse operators on its property.

35-11

7. Mitigation Fee – Proposed Rule Section (d)(5)

United agrees that in lieu of earning WAIRE points a warehouse operator should be allowed to satisfy its compliance obligation through payment of a mitigation fee.

United suggests that the fee rate should change based on whether an operator chooses to pay a fee rather than earn WAIRE points (higher) or whether an operator was not able to earn WAIRE points due to circumstances outside of its control and the infeasibility of options available from the WAIRE menu (lower). For instance, if a landlord does not approve a WAIRE points project, or none of the WAIRE points projects are feasible in a given compliance year, the mitigation fee rate should be adjusted accordingly.

35-12

Mr. Ian MacMillan, Planning and Rules Manager
Mr. Victor Juan, Program Supervisor
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178

Mr. MacMillan and Mr. Juan,

Price Transfer, Inc. expresses its strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

36-1

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions "WAIRE Points" that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators. This rule is a costly and duplicative effort that is not poised to achieve demonstrable improvements in air quality in the South Coast basin.

The Ports of Long Beach and Los Angeles are the 10th largest ports in the world on a combined basis and largest in the nation. They are the key to the goods movement system that serves as the lifeblood of California's and the nation's economy by delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to power of the modern supply chain, allowing Californians and the rest of the nation to shelter in place and abate the spread of COVID-19.

36-2

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry. The logistics industry in Southern California is already under pressure from higher operating costs, taxes, and regulation than the rest of the nation. An additional layer of cost and regulation from the ISR could lead to the Ports of Long Beach and Los Angeles becoming less competitive and giving companies incentive to use other US ports. This would result in significant job loss, abandoned warehouses, and lost tax revenue for the region.

36-3

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.

36-4

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used

36-5

this power to adopt the country's strictest emission laws, including adopting in July the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations that will require nearly every equipment type at warehouses to operate in a zero-emission mode within the next year.

36-5
(cont'd)

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

During presentations, SCAQMD justified the draft rule by stating that additional action is necessary to address ozone and NO_x concentrations in the basin. With respect to NO_x, a recent technical analysis of the draft staff report found that the report does not adequately demonstrate that the proposed Warehouse ISR will provide NO_x reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

36-6

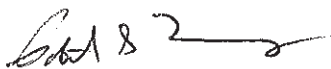

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NO_x reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. One is left with the impression that the rule, instead of addressing environmental concerns, is being used as a funding mechanism.

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom.

We hope SCAQMD will reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions that already will occur due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

36-7

Thank you for taking the time to consider my public comment.

Mr. Ian MacMillan, Planning and Rules Manager
Mr. Victor Juan, Program Supervisor
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178

Mr. MacMillan and Mr. Juan,

FCL Logistics, LTD. expresses its strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

37-1

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions "WAIRE Points" that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators. This rule is a costly and duplicative effort that is not poised to achieve demonstrable improvements in air quality in the South Coast basin.

The Ports of Long Beach and Los Angeles are the 10th largest ports in the world on a combined basis and largest in the nation. They are the key to the goods movement system that serves as the lifeblood of California's and the nation's economy by delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to power of the modern supply chain, allowing Californians and the rest of the nation to shelter in place and abate the spread of COVID-19.

37-2

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry. The logistics industry in Southern California is already under pressure from higher operating costs, taxes, and regulation than the rest of the nation. An additional layer of cost and regulation from the ISR could lead to the Ports of Long Beach and Los Angeles becoming less competitive and giving companies incentive to use other US ports. This would result in significant job loss, abandoned warehouses, and lost tax revenue for the region.

37-3

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.

37-4

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting in July the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations that will require nearly every equipment type at warehouses to operate in a zero-emission mode within the next year.

37-5

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

During presentations, SCAQMD justified the draft rule by stating that additional action is necessary to address ozone and NO_x concentrations in the basin. With respect to NO_x, a recent technical analysis of the draft staff report found that the report does not adequately demonstrate that the proposed Warehouse ISR will provide NO_x reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

37-6

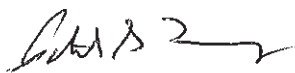

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NO_x reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. One is left with the impression that the rule, instead of addressing environmental concerns, is being used as a funding mechanism.

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom.

We hope SCAQMD will reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions that already will occur due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

Dr. William A. Burke, Chair
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

via email: clerkofboard@aqmd.gov

Support for Warehouse Indirect Source Rule

Dear Dr. Burke and members of the Governing Board:

On behalf of the American Lung Association, we are writing to provide comments in support of the adoption of a strong Indirect Source Rule by the South Coast Air Quality Management District. We appreciate the work you, District staff and stakeholders have put into ensuring community health protections through clear targets for reducing ozone-forming emissions from indirect sources. As the rulemaking continues, we respectfully urge the District to act quickly to adopt the strongest possible rule.

38-1

In large part due to the transportation sector, including trucks serving warehouses throughout the region, the American Lung Association's annual [State of the Air](#) 2020 report found that the Los Angeles metropolitan area is the most ozone-polluted region in the United States, and among the most impacted by particle pollution. Too many communities face a significant number of days with unhealthy ozone or particle pollution levels that contribute to a wide range of health impacts, including asthma attacks, heart attacks and strokes, lung cancer and premature deaths. We are deeply concerned with the disparities that exist in exposures to transportation pollution which often fall most heavily on lower-income communities and communities of color nearest major trucking routes, warehouses and other diesel hotspots, as well as with workers impacted at these sites. Fortunately, decades of policy innovation has spurred significant progress in reducing harmful emissions and we look to the district to continue to build on this foundation.

38-2

Now, a strong Indirect Source Rule for warehouses is urgently needed to protect public health from the growing pollution impacts of major warehouse operations throughout the region. We believe the district should strengthen the final rule to ensure that the greatest possible emission reductions and health protections are required. We encourage the district to move forward as rapidly as possible, and to elevate the role and requirements for zero-emission

38-3

trucks serving warehouses to help provide critical air quality relief for the impacted communities and warehouse industry workers. The American Lung Association's 2020 [Road to Clean Air](#) report found that the greater Los Angeles Area could experience the greatest public health benefits in the nation through a widespread transition to zero-emission transportation, including over \$14 billion in annual public health benefits, more than 1,200 fewer deaths and 16,000 asthma attacks due to cleaner air. The Indirect Source Rule represents an important opportunity to reduce local pollution impacts, advance zero-emission transportation, and provide meaningful health protections for heavily impacted communities and workers within the region.

38-3
(cont'd)

We look forward to working with the district to continue the important progress made and taking on the challenging work ahead to ensure clean, healthy air for all residents, especially for those most burdened by heavy trucking pollution today. Please don't hesitate to reach out Steven Jimenez at steven.jimenez@lung.org with any questions.

March 2, 2021

Dear Mr. MacMillan and Mr. Juan:

The California Taxpayers Association ("CalTax") is a nonprofit, nonpartisan research and advocacy association founded in 1926 to promote sound tax policy and government efficiency. In 2010, CalTax sponsored Proposition 26 to stop hidden taxes, after years of rising costs from government regulations and fees. Proposition 26 does not stop local agencies from raising revenue – but it does create a legal pathway for government to follow when imposing new taxes and fees.

39-1

The South Coast Air Quality Management District (SCAQMD) has proposed two new air quality rules: "Rule 2305: Warehouse Indirect Source Rule" and "Rule 316: Fees for Rule 2305." These proposed rules would require warehouses with more than 100,000 square feet of indoor space in a single building to reduce emissions or pay a tax-like "mitigation fee." Notwithstanding the "fee" labels, the proposed rules seek to impose a special tax that requires approval by a two-thirds vote of the electorate to take effect.

About CalTax

CalTax is the oldest and largest organization representing taxpayers in California, including individuals, small businesses and Fortune 500 companies. CalTax sponsored Proposition 26 in 2010, and co-chaired the Stop Hidden Taxes campaign.

CalTax has a great interest in this issue, which will have a direct impact on CalTax, its members, and taxpayers both regionally and across the state. Because of CalTax's broad-based membership and its expertise and experience -- in addition to that of its members -- concerning the legal and policy issues raised by this proposed rule, CalTax believes its perspective on the relevant issue will be of assistance to the District and its governing board in deliberating proposed rules 2305 and 316.

Brief History on Voter Approval for Local Taxes

Prior to the passage of Proposition 26, which was approved by the voters in November 2010, the California Constitution required special taxes to be approved by a two-thirds vote of the electorate. This vote requirement was added to the Constitution in 1978 after voters approved Proposition 13.

39-2

After passage of Proposition 13, state and local governments frequently turned to tax-like "fees" to raise revenue.

In 1991, the state Legislature approved a tax-like “fee” on paint manufacturers and manufacturers that produced lead-based products. This led to litigation, and the case eventually was decided by the California Supreme Court in *Sinclair Paint v. State Board of Equalization*, 15 Cal.4th 866 (1997). The Supreme Court opined: “In general, taxes are imposed for revenue purposes, rather than in return for a specific benefit conferred or privilege granted. Most taxes are compulsory rather than imposed in response to a voluntary decision to develop or to seek other government benefits or privileges.”¹ To the dismay of taxpayers, the Court ultimately held that the “fees” in the *Sinclair* case were valid regulatory fees, not taxes. The decision resulted in a 20-year effort to clarify the distinction between legitimate regulatory fees and taxes.

Addressing the legal history in the years that followed the *Sinclair* decision, Proposition 26 sought to codify certain decisions that address the characteristics and differences between taxes and fees:

- **Generating Revenue From Regulatory Programs Is Prohibited.** Regulatory programs cannot include a charge imposed primarily for the purpose of raising revenue. A regulatory-related charge can be considered a tax depending on how the charge is spent. State law requires a true regulatory charge to be spent in a manner that proportionately benefits those who pay. In *Northwest Energetic Services, LLC v. California Franchise Tax Board*, the court determined: “If revenue is the primary purpose and regulation is merely incidental the imposition is a tax.”²
- **Fees Must Provide a Specific Benefit to the Payor.** In 2008, the Fourth District Court of Appeal ruled in *Bay Area Cellular Telephone Co. v. City of Union City* that the 9-1-1 “fee” was a tax because “those who paid the Fee received no benefit not received by those who did not pay (and thus by the general public), thereby negating the distinguishing feature of a user fee.”³
- **Fees Must Be Fairly Apportioned Among Payors.** The California Supreme Court determined in *California Farm Bureau v. State Water Resources Control Board* that fees should be reasonably apportioned to the payors involved -- otherwise, the “fee” is a tax.⁴ While the Supreme Court asked a lower court to determine proportionality, the court's findings may impact other situations where payors are treated differently by the law, but benefit from the same service or privilege. The court wrote that the question in the case “revolves around the scope and the cost of the ... regulatory activity and the relationship between those costs and the fees imposed. It is further complicated by the fact that not all those who hold water rights are required to pay the fee.”⁵ The court concluded: “Focusing on the activity and its associated costs will allow the trial court to determine whether the assessed fees were reasonably proportional and thus not a tax. The court must determine whether the statutory scheme and its implementing regulations provide a fair, reasonable, and substantially proportionate assessment of all costs related to the regulation of affected payors.”⁶

¹ *Sinclair Paint v. State Board of Equalization*, 15 Cal.4th 866, 874 (1997).

² *Northwest Energetic Services, LLC v. California Franchise Tax Board*, 159 Cal.App.4th 841, 855 (2008).

³ *Bay Area Cellular Telephone Co. v. City of Union City*, 162 Cal.App.4th 686, 695 (2008).

⁴ *California Farm Bureau Federation v. State Water Resources Control Board*, 146 Cal.App.4th 1126 (2011).

⁵ *California Farm Bureau Federation v. State Water Resources Control Board*, 51 Cal.4th 421, 441 (2011).

⁶ *Id.* at 442.

The California Taxpayers Association was founded in 1926 as a nonpartisan, nonprofit research and advocacy association with a dual mission to promote sound tax policy and government efficiency. CalTax's members include individuals and many businesses operating in every sector of the California economy, ranging from small firms to Fortune 500 companies. CalTax is also dedicated to the uniform and equitable administration of taxes and minimizing the cost of tax administration and compliance.

1215 K Street, Suite 1250 | Sacramento, CA 95814 | (916) 441-0490 | www.caltax.org

- **Government Bears the Burden of Proving That a Fee Is Not a Tax.** Under Proposition 26, just as under *Sinclair*, government bears the burden of proving that a “fee” is not a tax. In *San Diego Gas & Electric*, the court found that “government should prove (1) the estimated costs of the service or regulatory activity, and (2) the basis for determining the manner in which the costs are apportioned, so that charges allocated to a payor bear a fair or reasonable relationship to the payor’s burdens on or benefits from the regulatory activity.”⁷ Further, in *California Association of Professional Scientists v. Department of Fish and Game*, the court found: “The government bears the burden of proof ... It must establish ... the estimated costs of the service or regulatory charges allocated to a payor bear a fair or reasonable relationship to the payor’s burdens on or benefits from the regulatory activity.”⁸
- **Fees Must Be Reasonable.** Revenue derived from regulatory fees cannot be used for unnecessary regulatory activities, nor should revenues be used for unnecessary administrative costs. In *San Diego Gas & Electric Company v. San Diego County Air Pollution Control District*, the court stated that government must show “estimated costs of the service or regulatory activity, and the basis for determining the manner in which the costs are apportioned, so that charges allocated to a payor bear a fair and reasonable relationship to the payor’s burdens on or benefits from the regulatory activity.”⁹

The Definition of a Legitimate Fee

The expansion of *Sinclair*-style tax-like “fees” eventually led to voters approving Proposition 26, which refined the definition of tax to ensure that state and local government could not circumvent the vote requirements for tax increases by labeling taxes as “fees.”

Effective January 1, 2010, all taxes and fees must comply with the requirements of Proposition 26. Fees adopted prior to 2010 may continue to be imposed under prior tax and fee definitions, such as the fees considered in *California Building Industry Association v. San Joaquin Valley Air Pollution Control District*, 178 Cal.App.4th 120 (2009).

Proposition 26 added Article XIII C, section 1 to the California Constitution, and defines a tax as “any levy, charge, or exaction of any kind imposed by a local government”¹⁰ except for specific enumerated exceptions. The enumerated exceptions:

- (1) A charge imposed for a specific benefit conferred or privilege granted directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of conferring the benefit or granting the privilege.
- (2) A charge imposed for a specific government service or product provided directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of providing the service or product.

⁷ *San Diego Gas & Electric Company v. San Diego County Air Pollution Control District*, 203 Cal. App. 3d 1132, 1146 (1988).

California Association of Professional Scientists v. Department of Fish and Game, 79 Cal. App. 4th 935, 945 (2000).

⁹ *San Diego Gas & Electric Company*, 203 Cal.App.3d at 1146.

¹⁰ Cal. Const. article XIII C, § 1

- (3) A charge imposed for the reasonable regulatory costs to a local government for issuing licenses and permits, performing investigations, inspections, and audits, enforcing agricultural marketing orders, and the administrative enforcement and adjudication thereof.
- (4) A charge imposed for entrance to or use of local government property, or the purchase, rental, or lease of local government property.
- (5) A fine, penalty, or other monetary charge imposed by the judicial branch of government or a local government, as a result of a violation of law.
- (6) A charge imposed as a condition of property development.
- (7) Assessments and property-related fees imposed in accordance with the provisions of Article XIII D.¹¹

39-2

Proposition 26 Placed the Burden of Proof on the Government

Proposition 26 placed the burden of proof on a local agency to prove “by a preponderance of the evidence that a levy, charge, or other exaction is not a tax, that the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor’s burdens on, or benefits received from, the governmental activity.”¹²

In this case, SCAQMD bears the burden of proof, by a preponderance of the evidence, to demonstrate that the proposal contained in Rules 2305 and 316 is not a tax, and that it complies with the provisions added by Proposition 26 in Article XIII C, section 1.

The South Coast Air Quality Management District’s Proposals Constitute a Tax

SCAQMD’s proposed rules would result in the imposition of a tax.

In *Morning Star Co. v. Board of Equalization*, the court deliberated whether a hazardous-materials “fee” imposed by the California Board of Equalization was a tax or a fee. The court opined: “[T]he section 25205.6 charge to the Company is not regulatory because it does not seek to regulate the Company’s use, generation or storage of hazardous material but to raise money for the control of hazardous material generally. The charge is therefore a tax. At its most basic level, the section 25205.6 charge is not a regulatory fee because it is not regulatory. It is monetary.”¹³

39-3

The facts and circumstances litigated in the *Morning Star* case are similar to the fees proposed by SCAQMD. Proposed rules 2305 and 316 do not seek to regulate the specific fee-payers’ indirect source emissions, but instead aim to raise money for the control of emissions in the South Coast region generally. The District’s stated purpose is to “reduce local and regional emissions of NOx and PM associated with warehouses in order to assist in meeting state and federal air quality standards.”¹⁴ The District also stated that proceeds from this new tax will be used “to provide financial incentives for truck owners to purchase NZE or ZE trucks, or for the

¹¹ *Id.*

¹² *Id.*

¹³ *Morning Star Co. v. Board of Equalization*, 201 Cal.App.4th 737, 755 (2011).

¹⁴ PRELIMINARY DRAFT STAFF REPORT PROPOSED RULE 2305 – WAREHOUSE INDIRECT SOURCE RULE - WAREHOUSE ACTIONS AND INVESTMENTS TO REDUCE EMISSIONS (WAIRE) PROGRAM AND PROPOSED RULE 316 – FEES FOR RULE 2305 (2021), <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf?sfvrsn=14>.

installation of fueling and charging infrastructure, with priority given for projects in the communities near warehouses that paid the fee.” The purpose and spending plan from SCAQMD do not appear to have any nexus to the specific fee-payers’ use or generation of indirect emissions, and the exaction therefore constitutes a tax.

39-3

The contemplated charge is monetary and not regulatory because, among other things, the proposed rules do not provide a sunset date for the charge. If the true purpose was regulatory and not monetary, the proposed rules would provide a mechanism for the charge to end. If the true goal of the District is to control local and regional emissions, the charge should end when that goal has been accomplished. By leaving an indefinite charge in place regardless of the emissions in the region, the purpose of the proposed rule appears more in line with a revenue-raising or monetary purpose.

39-4

Furthermore, in *California Chamber of Commerce v. State Air Resources Board*, the court ruled on whether the “Cap-and-Trade” auction was a tax that required two-thirds approval from the Legislature. In its analysis of the distinction between a tax and a fee, the court stated: “Although the term ‘tax’ has different meanings in different contexts, we find that, generally speaking, a tax has two hallmarks: (1) it is compulsory, and (2) it does not grant any special benefit to the payor.”¹⁵ (In this case, the court found that the cap-and-trade auction was valid law, given that it was imposed prior to the enactment of Proposition 26. In 2017, when lawmakers extended the auction to 2030 [AB 398, Chapter 135, Statutes of 2017], they approved the legislation with a two-thirds vote.)

39-5

To be properly classified as a “fee” under California law, the government activity funded by a specific charge must benefit only the individuals and entities that pay the charge. Governmental activity benefiting entire communities or populations, and charges that exclude or exempt certain segments of the population, are not evenly distributed and therefore constitute a tax that must be presented to the voters.

39-6

The SCAQMD’s proposed indirect source rules would apply only to a limited subset of taxpayers — those that operate warehouses above a specific size. Since the proposed rules apply to a limited segment of the population, the charge is not evenly distributed and therefore is a tax subject to voter approval requirements, according to California law.

In addition, warehouses that would pay the “fees” under the District’s proposed rules will not receive any specific benefits for doing so. Again, the District’s preliminary staff report states that the proceeds from the proposals will be used “to provide financial incentives for truck owners to purchase NZE or ZE trucks, or for the installation of fueling and charging infrastructure, with priority given for projects in the communities near warehouses that paid the fee.” This proposed spending of the funds generated through these new proposed rules provides no special benefit to the warehouse operators who would be paying these new taxes. As most warehouse operators do not own or have reason to own trucks, the incentives to purchase NZE or ZE trucks will be of little to no use to them. Furthermore, warehouse operators have little or no control over which vehicles come and go from their facilities. Therefore, the installation of fueling and charging infrastructure, even if they were in communities near the warehouses paying the fee, provides no specific benefits to the payors.

39-7

¹⁵ *California Chamber of Commerce v. State Air Resources Bd.*, 10 Cal.App.5th 604, 640 (2017).

California courts have repeatedly maintained that the two primary indicators of distinguishing whether a levy, exaction or charge is a tax or a fee is that taxes are mandatory and provide no special benefits to the payor. The SCAQMD's proposed Rules 2305 and 316 bear these "two hallmarks" of a tax because the proposed charge is mandatory and provides no special benefit to the payor. The charge therefore is a tax that would require voter approval (with a two-thirds threshold, as it constitutes a special tax).

Thank you for considering these comments. If you have any questions, please feel free to contact CalTax using the information provided below.

Sincerely,

Ben Lee

Re: Comments on Draft Rule 2305 and Draft Staff Report

Dear Mr. MacMillan and Mr. Juan:

NAIOP, the Commercial Real Estate Development Association, is the leading national organization of developers, owners, and related professionals in office, industrial and mixed-use real estate. NAIOP advances responsible commercial real estate development, researches trends and innovations, provides educational programs, and advocates for effective public policy. The NAIOP SoCal and Inland Empire Chapters serve Los Angeles, Orange, Riverside and San Bernardino Counties, with a membership of over 1,300 members. We appreciate this opportunity to comment on Proposed Rule 2305 and the Draft Staff Report and submit this as part of the official rulemaking record.

We wish to emphasize at the outset that NAIOP supports the District's vision and objectives of cleaner air and reducing greenhouse gas emissions. We look forward to the day when technological advances will make these goals a reality while supporting a sustainable, thriving and prosperous economy that will provide opportunity and a high quality of life for all. **While we support the District's laudable clean air goals, there are several major concerns requiring that the rule should not be adopted at this time.**

The SCAQMD does not have the legal authority to adopt PR 2305 on existing facilities. Furthermore, the mitigation fee constitutes an illegal tax. The rule has numerous infeasible, as well as arbitrary and capricious provisions. The potential for emissions and ozone reductions, as well as any SIP credit, is unknown at best and most likely the rule cannot achieve any such results. Additionally, warehouses have no control over the marketplace for heavy duty trucks and most have no control over which trucks may come to a warehouse, which makes it infeasible to get WAIRE points for ZE or NZE trucks. No one knows when low emissions trucks will be commercially available in sufficient supply to even be able to achieve any WAIRE points, among other issues. Finally, the targeted mobile sources are already regulated by other agencies.

We want to make it clear that although staff has requested comments to be submitted by today, the full public comment period remains open up until and including the final vote on PR 2305. This correspondence is a preliminary reply and we reserve the right to submit additional comments. Our initial concerns with Proposed Rule 2305 are set forth in detail below.

Warehouses are a Beneficial Essential Service

It is important to view this entire issue of PR 2305 with a balanced and thoughtful perspective. Warehouses play a key role in the complex system of systems that delivers to the public all the items needed to live their lives on a daily basis for the approximate 18 million people in this four-county region. Everything, including our food supply, clothing, medical supplies, vaccines and essentially everything required for residents to survive on a daily basis goes through a warehouse. The ability to rapidly deliver to residents their daily needs has become far more critical as the public is even more dependent today on e-commerce. The vital importance of warehouses has never been made clearer than during the COVID-19 pandemic in distributing medical supplies and equipment, as well as vaccines. Warehouses are vital to the health and quality of life of the people who live in Southern California, which is why the State and Federal governments declared the warehousing industry to be an essential business.

40-9

In addition to providing the vital goods everyone needs, as the Governor's Office of Business and Economic Development (Go Biz) stated, "California's freight network is a vital economic force...." The goods movement system accounts for about 1/3rd of the state and regional economy and is responsible for providing millions of direct and indirect jobs for people with a large range of skill sets.

The critical role the warehousing sector has in supplying jobs to people has been proven over the years and become even more obvious during the COVID-19 pandemic. Warehousing has been one of the very few job creators, which has been critical for so many people due to the dramatic decline in traditional blue-collar jobs that has occurred in this region over the last several years. Moreover, the economic distress of COVID-19 has resulted in additional job losses and shuttering businesses across many sectors. Particularly hard-hit are retail and hospitality businesses – many of these jobs and businesses are lost forever. This is especially important to the many people, over 50% in the Inland Empire, whose highest level of education is a high school degree or less. The warehousing sector provides entry level jobs at compensation levels that exceed other jobs that do not require a college degree and many of the lost service sector jobs, along with providing the ability for upward mobility.

40-10

Taxing the very sector that provides a significant number of career pathways to minorities and people of color is bad public policy. The proposed increases would substantially increase the cost of all goods and services, including groceries, for our region's residents and families. Higher prices would hurt Angelinos and small businesses at a time they are already struggling to put food on the table.

40-11

Warehouses and warehouse development have over the years, and will continue to do so in the future, provided numerous community benefits at no cost to the taxpayer. Just some examples are;

1. Providing new and upgraded streets, sidewalks, and other community infrastructure;
2. Funding for local schools and parks;
3. Funding for regional infrastructure and benefits; and
4. Increased sales and property tax revenue to local jurisdictions.

40-12

Lack of Legal Authority to Enact PR 2305

The SCAQMD does not have the legal authority to adopt PR 2305. The District is governed under the Lewis-Presley Air Quality Management Act, Cal. Health & Saf. Code, § 40400, et seq. The Lewis-Presley Act created the District. It provides the enabling legislation from which the District derives its powers, and it prescribes the limitations on those powers. The statute authorizing the District to adopt indirect source rules specifically provides that the District's indirect source controls must be limited to those areas of the South Coast district in which there are high-level, localized concentrations of pollutants or with respect to any new source that will have a significant effect on air quality in the South Coast Air Basin. Cal. Health & Saf. Code, § 40440(b)(3). In its current form, however, the SCAQMD is proposing that the rule apply to all distribution warehouses greater than or equal to 100,000 square feet irrespective of where they are located within the South Coast Basin, and irrespective of whether they are new or existing. Thus, Proposed Rule 2305 clearly exceeds the District's authority. Notably, in the Staff Report discussion of the District's legal authority for Rule 2305

40-13

staff omit any citation or discussion of section 40440, and instead rely entirely on authorities of other air pollution control districts. 40-13
(cont'd)

Additionally, Proposed Rule 2305 exceeds the scope of an “indirect source review program,” as defined in the federal Clean Air Act. The federal Clean Air Act defines an “indirect source review program” as “the *facility-by-facility review* of indirect sources of air pollution, including such measures as are necessary to assure, or assist in assuring, that a *new or modified indirect source* will not attract mobile sources of air pollution . . .” 42 U.S.C. § 7410(a)(5)(D) (emphasis added). Rule 2305 does not involve any “facility-by-facility review” and is not limited in scope to “new or modified” indirect sources. Thus, the rule is a regulation of mobile sources, rather than a true “indirect source” rule. 40-14

In several respects Rule 2305 is arbitrary, capricious, entirely lacking in evidentiary support, or unlawfully or procedurally unfair.” *California Building Industry Ass’n v. San Joaquin Valley Air Pollution Control Dist.* (2009) 178 Cal. App. 4th 120, 129. Under this standard “the agency must act within the scope of its delegated authority, employ fair procedures, and be reasonable. ‘A court must ensure that an agency has adequately considered all relevant factors, and has demonstrated a rational connection between those factors, the choice made, and the purposes of the enabling statute.’” *Ibid.* 40-15

The District’s stated purpose for the rule is to assist in meeting state and federal air quality standards—principally the US EPA’s 8-hour ozone standard. Yet many aspects of Rule 2305 are disconnected from this purpose. To the extent that the zero-emission and near-zero-emission trucks are not available on a scale to satisfy the industry’s collective WAIRE Points obligation, operators will be required to either: (1) adopt other technologies such as installing on-site electrical truck charging or hydrogen fueling infrastructure, solar panels, or air filtration systems in local residences, schools, daycares, hospitals, or community centers; or (2) paying the District the mitigation fee. Of course, if the zero-emission and near-zero-emission trucks are not widely available, installing charging and fueling infrastructure for them won’t reduce any emissions. Nor will installing solar energy panels or indoor air filters do anything to reduce truck emissions or ambient ozone concentrations. 40-16

We reserve our right to challenge the District’s legal authority to adopt and enforce Rule 2305 on these and any other legal or constitutional grounds. 40-17

Mitigation Fee/Tax

Rule 2305 also constitutes an illegal tax. The rule requires warehouse operators to satisfy their obligations by either adopting certain technologies (primarily by the purchase and use of zero-emission or near-zero-emission trucks or infrastructure for the same) or paying the District a “mitigation fee.” Currently, zero-emission and near-zero-emission technologies are not commercially available on a scale to enable warehouse operators to satisfy their collective compliance obligation. Therefore, warehouse operators will have no option but to pay the fee. The District concedes in its AQMP that “additional research and demonstration are needed to commercialize zero- and near-zero emission technologies for the heavier heavy-duty vehicles (with gross vehicle weight ratings greater than 26,000 pounds). [AQMP at 4-24.] Moreover, the District concedes in its staff report that some of the WAIRE menu technologies (including zero-emission class 8 trucks) are not currently technically feasible. 40-18
40-19
40-20

The District states that it will use the mitigation fees to subsidize the purchase of zero-emission and near-zero emission trucks and electric charging infrastructure. But if there are not enough zero-emission and near-zero-emission trucks to satisfy the warehouses’ collective WAIRE Points obligation, there won’t be clean trucks available to subsidize. 40-21

The District estimates that there are about 750,000,000 square feet of warehouse space that will be covered by this rule. Thus, warehouse operators could collectively pay the SCAQMD hundreds of millions of dollars per year in mitigation fees under Rule 2305 alone, up to \$630 million by the estimate of staff. For comparison, the SCAQMD's entire budget last year was \$173 million, and the budget for its Carl Moyer program was \$30 million. Thus, Rule 2305 is likely to bring in far more revenue for the District than it can spend reducing NOx and DPM from truck emissions.

40-22

Moreover, the District has not yet proposed any written subsidy plan or program to control expenditure of the mitigation fee, and it is not clear when, if ever, it will have such a plan. Furthermore, throughout the discussions of PR 2305 no copy of any plan has been provided for discussion by the Board or any of the stakeholders, even though there certainly have been various questions and comments of concern about this "program" by a broad spectrum of stakeholders.

The actual rule itself has just a short paragraph on page 10 that only sets out the amount of the "mitigation fee" at \$1,000 and says it is to be paid at the time of the Annual WAIRE Report. Nothing else. It does not even mention there will be any "WAIRE Mitigation Plan".

40-23

There is a less than a one-page reference of a "WAIRE Mitigation Program" on page 39 of the Draft Staff Report. This is where it is stated that it will use the mitigation fee proceeds to subsidize the acquisition of zero-emission and near-zero-emission trucks, or charging/fueling infrastructure. But, again, if those trucks are not widely available there is no assurance as to how much, if any, benefit the mitigation fee will have on air quality.

Moreover, this brief description on page 39 specifically states that "Because this funding program is wholly within the control of South Coast AQMD, funds may be combined with other incentive programs as allowable on a case-by-case basis." So, this sounds more like funds generated from a tax that can be used for a wide variety of purposes.

40-24

There are many other issues. like lack of any nexus, surrounding the tax issue, but, in conclusion, the District lacks legal authority to issue taxes. It may impose regulatory fees. But regulatory fees must be limited to the costs required to administer a regulatory program and may not be levied for unrelated revenue purposes. See Health & Saf. Code, § 40522.5(a). The District is proposing a separate regulatory fee in a companion rule (Rule 316) to cover its costs of administering Rule 2305. Thus, the mitigation fee imposed by Rule 2305 is a special tax requiring approval by a two-thirds majority of the voters within the south coast district. Cal. Const., art. 13A, § 4; art.13C §1; Govt. Code, § 53722; see also *Santa Clara County Local Transp. Authority v. Guardino* (1995) 11 Cal.4th 220, 231-233.

Truck Emissions Have and Will Continue to Decrease Dramatically

While PR 2305 claims to be about warehouses, there is no question the rule is solely about trucks and truck emissions, and really aimed at heavy duty truck (HDT) fleets. The organization in California that has the authority regarding truck emissions, the California Air Resources Board (CARB), has enacted numerous rules regulating truck emissions and many more are coming. Truck emissions have actually DECLINED and will continue to DECLINE.

40-25

40-26

40-27

The decline has been dramatic. All of the various rules from CARB and US EPA have reduced particulate matter (PM) emissions by 99% and NOx emissions by 90%. CARB has indicated that their own tests of the impact of requiring diesel particulate filters on trucks since 2014 demonstrate that "...PM filters virtually eliminate PM from truck exhaust and that the....air quality impacts following the adoption of PM filters into the on-road fleet have been substantial."

The reality is CARB has already adopted an entire suite of regulations requiring the trucking industry to meet the cleanest standards. They are the strictest rules in the country and cost the trucking industry about \$1 billion a year. CARB has stated the enhanced compliance provisions means 300,000 older diesel trucks will be cleaned up, which would be "...the equivalent of removing every single passenger car off California's roads in 2023."

Additional rules include the Drayage Truck Rule, the Tractor-Trailer Greenhouse Gas Reduction Measure, the 5-Minute Idling Rule, Refrigerated Trailer Rule, and the Periodic Smoke Inspection Program. Just this past summer CARB adopted the Low NOx Omnibus rule that will reduce NOx an additional 75% by 2024 and 90% by 2027 over and above the 90% plus reductions that have already been achieved, along with the Advanced Clean Trucks Rule.

In 2021, CARB is scheduled to adopt an Advanced Clean Fleets rule and a Truck Refrigerated Unit (TRU) rule, which will bring even further emissions reductions.

40-27
(cont'd)

These rules cover a wide variety of issues and approaches to decreasing truck emissions. Thus, there is no question that the entire field of decreasing truck emissions is being addressed and will continue to be aggressively pushed by the agency with the real authority to make a true impact, CARB. The reality of what is truly going on regarding decreasing truck emissions certainly calls into question the need for and role of PR 2305.

Most Warehouse Operators do not Control What Trucks are Bought or Used

It is also well known, and staff admits, that the vast majority of warehouses do not own trucks and have no need to buy them. This means an operator would have no reason to buy NZE or ZE trucks. So, this is not a realistic option.

Not only do the vast majority of warehouse operators not own any trucks, they also have no control over what trucks come and go to the facility. It is the shipping company that makes all the decisions about what trucks are used. The operator does not have any relationship to the shipping company. The operator cannot direct the shipper to only send a ZE or NZE truck to their warehouse. The operator does not even know what type of truck might arrive at the warehouse. It would be by complete chance that NZE or ZE trucks were used, even if there were any commercially available heavy-duty trucks. So, again, this is not a “feasible” option.

40-28

PR 2305 Negatively Impacts Incentive Funding of New Trucks

There is no question the primary focus of PR 2305 is to force the turnover of the truck fleet from diesel to ZE and NZE trucks. It has been repeated many times by the SCAQMD staff and the Governing Board that incentive money is the key to achieving that objective due to the much higher cost of lower emissions trucks. Yet, staff has admitted that any truck purchased with incentive funds could not get WAIRE points credit. Staff has stated that the only way to get WAIRE points for the purchase of a truck is to NOT use incentive funding. So, this ISR will actually serve as a disincentive to purchase lower emissions vehicles, the opposite of what is trying to be achieved.

40-29

Ability to Have Sufficient EV Truck Purchases and Visits is Speculative

While there is a lot of effort being undertaken to develop newer technology, it is widely known that there are no the commercially available Class 8 trucks, which are the ones that are the focus in relationship to warehouses. It is also unknown when they might become sufficiently commercially available for any type of widespread use. Even once they might begin to be available, in what quantity? Any electric trucks will be spread across the entire nation, not just the warehouses subject to this rule. You can't buy or use something that does not exist or is not realistically available.

40-30

Furthermore, most truck fleets are owned by small business operators with 1-5 trucks, and they don't have the capital to spend on newer trucks that will be significantly more expensive. So, again, the idea that there are going to be a lot of NZE or ZE trucks purchased in the near future is not reasonable.

40-31

The SCAQMD actually commissioned a study to look into transitioning truck fleets to electric trucks. This report, “Developing Markets for Zero Emissions Vehicles in Short Haul Goods Movement” (Report) was completed in February of 2020, but apparently never released and we do not know if the Governing Board has seen it. It is also not cited or referenced in any of the documents that have been released or any presentations given dealing with PR 2305. Yet, it raises many issues that impact this rule. Just a few points are noted below;

- Due to the different performance characteristics of electric trucks versus diesel trucks, namely range, load capacity, and refueling time, it is not a one for one trade-off between diesel and electric trucks. This can be as great as a near doubling of the fleet. Even as the technology improves, there will still be a need for additional trucks.
- The economic estimates of purchase cost of heavy-duty electric trucks are highly speculative due to lower production volumes.
- Many firms do not want to quick charge during a shift due to impacts in productivity; the long charging times mean a truck charging is one not working for quite a period of time.
- California’s diesel fleet is now relatively young due to all the upgrades that have recently occurred, which means that most diesel trucks will stay on the road for many years into the future.

40-32

Charging Station Installation and Usage is Speculative-

Once again, there is no real analysis about trying to force warehouses to build charging stations. Even the foundational question of where the best location for any charging facility is has not been answered. Would putting a charging facility at a warehouse actually lead to a quicker turnover of the fleet? Or would building facilities at publicly accessible areas similar to truck stops that are more easily accessible to all trucks be the way to push turnover of the fleet?

40-33

Additionally, there seems to be a lot of belief that because charging stations are installed they will be used. It must be remembered the warehouse operator cannot force any truck driver to use the charging station or the hydrogen station. That is entirely up to the decision of the truck driver, just as you decide when and where to refuel your car. So, the warehouse operator has to just hope the charging station or hydrogen station will be used. Thus, getting points for the use of the stations is completely arbitrary.

40-34

Simply mandating the installation of EV charging stations does not reduce emissions and ignores the nature of the warehousing business. First, the vast majority of warehouses are leased. Leases are short term, ranging from 3-5 years, and so the tenant is not inclined to go through the complicated process and cost of installing a charging station on a property they do not own. By the time the charging station is built, which staff admits can take years, the lease may end. Plus, once the lease ends, the tenant cannot take it with them, so they end up merely installing infrastructure on property they do not own. There is no incentive for the warehouse operator to install EV charging stations.

40-35

Also, as staff admits on page 13 of the WAIRE Menu Technical Report, currently “...the higher power chargers used for heavy duty vehicle charging have yet not followed a common standard, and proprietary charging systems are commonly tailored to each vehicle.” So, the operator does not know what charging infrastructure to install, and even if they did it may not work on the truck that shows up at the warehouse. This all increases the likelihood of stranded assets and added costs to replace a station. Thus, it is imperative that a common truck charging system be adopted before there are any rules focused on the installation or use of charging stations.

40-36

Currently, there are no commercially available heavy-duty electric trucks. So, one would not install a charger that will not be used. Even once there may be commercially available heavy-duty trucks, it is unclear how many over what period of time they will be manufactured. The proposed rule does not address this issue. It will take many years for sufficient for the manufacturers to produce a sufficient number of EV trucks that can use any charging stations on a daily basis or very frequently at all. So, again, the idea if getting WAIRE points to really count is not actually feasible and may not be for decades.

40-37

Since this rule only applies to existing buildings, SCAQMD is mandating the retrofit of facilities which were built to meet certain requirements of the city or county. All safety and building code requirements would still have to be met, such as parking spaces, which would be the most likely area to be used. There is the issue of whether there is even room to build EV infrastructure. Staff acknowledges that there would have to be a "...dedication of space for electrical equipment and vehicle parking..." Most existing warehouse sites were not developed with excess space that is not being used. Staff makes reference to the Floor Area Ratio (FAR) as an indicator, but that is not accurate. The FAR is set by the city or county at the time a warehouse is built to cover the requirements they have for landscaping, setbacks, auto parking, the needed area for trucks to safely maneuver on the property, trailer storage areas and more. It is not just vacant, available land.

40-38

Also, truck drivers do not have idle time to wait at a warehouse once the truck has been unloaded, and especially if they have taken on a load. They must quickly leave to get another load or deliver their cargo. Truck drivers do not get paid for waiting at a warehouse while hours of charging their vehicles are taking place.

40-39

There are additional challenges relating to the entire electrical infrastructure (i.e., trenches, transformers, switchboards, conduit, etc.) required to accept the additional power for the charging station. There is a great deal of accompanying infrastructure. Staff admits many facilities "may not have sufficient access to electrical utility infrastructure connections onsite or nearby." (Draft Staff report, page 117). This means the utilities will have to bring all that is needed to the property itself before any onsite work is even feasible, a huge expense. The tenant has no control over whether the utility might be willing to take on that expense and effort.

40-40

There are also growing concerns about the pressure put on electrical infrastructure that is in some cases already under stress, especially in congested areas such as Southern California. It is unknown what is the impact on the electrical power grid, and what improvements may be required to the grid.

Then there is the requirement to count each actual truck trip to the warehouse, and this has to be "collected using methods that contemporaneously record the truck trips and that are verifiable." (Page 5 of PR 2305) This is something that has never been done. Although staff tries to make this all sound easy, it is not, especially since you have to know if the truck is a ZE or NZE truck to get any WAIRE points. Plus, you cannot use the so-called "proxy" for determining the class of truck as the WAIRE menu has different points attributable to different classes of trucks. So, this would require setting up a check-in stand with employees stopping each truck to get all the needed information about each truck somehow. and contemporaneously record it. What would have to be done to make any such recording "verifiable"? Technical infrastructure would not be effective in getting the detailed information needed on if it is a diesel, ZE or NZE truck, and determine its class.

40-41

Furthermore, if a warehouse is used by more than one operator, which is about 40% of them, then this must be done by each individual operator. There certainly is not an ingress or egress assigned to any given operator. Now you have two or more check-in facilities set up to do the counting and additionally make sure which truck is going to which operator. This would take further time, decrease throughput and be inefficient. It could lead to trucks backing up into the streets, which is not wanted by anyone.

The Stringency Factor is Arbitrary

The Draft Staff Report says there were four points considered in coming to a stringency factor; a.) need for emissions reductions, b.) the significance of the emissions reductions associated with warehouses, c.) potential emissions reductions, and d.) impact to industry. Then, supposedly “After balancing all of these factors” they somehow came to a number, .0025.

What was done to take the general description of the items and turn them into a number? Is there some model, data, mathematical equations, or anything that somehow transformed what is written in the report into a number? If so, we have not seen anything that sets out how the number was created. It just seems to have appeared on paper.

40-42

This even becomes more concerning when, as described below, staff has admitted any emissions reductions have not been modelled and are “speculative”. The impact to industry, the costs, are based upon made up scenarios the staff has admitted will never happen. Based upon what has been presented, picking the number .0025 can only be seen as some arbitrary choice.

Emissions Reductions, if any, from PR 2305 are Unknown

While it is claimed there will be emissions reductions from PR 2305, the facts are no real reductions can be identified. The impact of the rule on any NOx, PM and ozone has not even been modelled, and is “speculative”.

40-43

In the comments provided by NAIOP to the Notice of Preparation (NOP) of the environmental document, the SCAQMD staff was specifically asked to quantify the NOx and DPM reductions that were expected to result from PR 2305. In response, staff stated:

40-44

“Potential changes in NOx and DPM concentrations would be speculative and have not been calculated as the underlying assumptions needed to conduct this analysis are too uncertain...” (emphasis added, Environmental Assessment (EA), C-41)

Staff was also asked to quantify the amount of any ozone reductions. Staff again stated:

“...ozone concentrations were not modeled. Ozone concentrations cannot be reasonably calculated for individual rules given the many variables needed to conduct this regional modeling analysis. (Emphasis added, C-41)

The draft staff report also admits that “it is not possible” to determine the emissions impacts of the rule. So, instead of trying to determine any potential emissions reductions, staff came up with 18 “scenarios” and “...all 2,902 warehouses were assumed to only comply with a single scenario approach from 2021 through 2031. No single scenario in this bounding analysis is expected to occur.” (emphasis added, pg. 60) This clearly means that any supposed emission reduction “estimates” are based upon imaginary scenarios that will never happen.

40-45

NAIOP also believes there are numerous questions about the baseline inventory analysis as is set out in the separate report from Ramboll that we incorporate by reference herein as though fully set forth. This could certainly lead to any claimed emissions reductions being overstated.

40-46

Cost of Compliance is Also Unknown

In the Draft Staff Report, the only “estimated” costs of compliance to date also solely come from the same 18 scenario exercise as the claimed emissions reductions. So, as with emissions projections, any reference to costs is based upon imaginary scenarios that will never happen and provide no information as to what the actual costs of PR 2305 will be.

40-47

SIP Credit is Also Unknown.

The Board made it very clear the ability to get SIP credit for any actions taken, voluntary or not, was a necessary key issue. As the discussion of any potential approach to warehouses began, many meetings were held where the topic of SIP creditability and how to achieve it was discussed. Staff made it very clear that any approach would have to show it resulted in achieving SIP credits. That seems to have been dropped.

40-48

As staff has repeatedly said throughout the discussion of an ISR, "SIP creditable emission reductions must satisfy five key "Integrity Elements". Namely, the emission reductions must be quantifiable, enforceable, verifiable, surplus, and real." (original emphasis, Draft Staff report, page 146) Staff has not even attempted to show that any of the requirements in PR 2305 meet those standards. So, how much SIP credit will the SCAQMD get for this rule, if any?

A careful analysis of Appendix D in the Draft Staff Report reveals that PR 2305 will not produce any Prospective SIP credit, meaning that the reductions in the regulation do not meet EPA's "Integrity Elements". Staff elaborates that the primarily reason there are no creditable emission reductions is "because some emission reductions from PR 2305 will at least partially overlap with other SIP-creditable measures." Staff does not indicate how much overlap there could be, and it is certainly possible that there will be 100% overlap. In addition, while the draft Staff Report speculates that retrospective SIP credits could be generated in the future, no estimate of the amount of credits is provided.

Installation and Use of Solar Panels and Filters in Existing Buildings

According to PR 2305, "The purpose of this rule is to reduce local and regional emissions of nitrogen oxides and particulate matter, and to facilitate local and regional emission reductions associated with warehouses and the mobile sources attracted to warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter." How do these items in the WAIRE menu reduce or facilitate local and regional emissions reductions or assist in meeting state and federal air quality standards? They don't, and are clearly far beyond the scope and purpose of this rule and any ISR.

40-49

Solar panels and filters will also not create any SIP credits. The Draft Staff Report makes it clear that these two WAIRE menu items are not sources that may lead to any SIP credit.

40-50

The true complexity of trying to use solar panels or install filters is not even discussed in the staff report and needs to be considered. First, as to solar panels, since this rule is solely aimed at existing warehouses there is the fact that most existing warehouse roofs do not have the load bearing capacity to handle solar panels. Thus, to place solar panels would require an entire rebuilding of the roof. You again have the situation where the operator is not the owner of the building with a short lease and does not want to improve someone else's building with an asset with a useful life of around 20 years for others to use. Additionally, it is complicated and takes a long time to get all parties to agree to the necessary approvals, especially from the utilities and may require system upgrades and an interconnection study, and the list goes on.

40-51

Installing high efficiency filter systems in schools, daycare centers, hospitals and community centers is obviously very expensive in such large buildings. Yet, you would only get two points for each system, so there is no cost-effective reason to think of this option. Warehouses are not in the business of installing filters and here the number of WAIRE points, about four per filter, does not make this a real option or in any way cost-effective.

40-52

Missing/Incomplete Documents

First, not all the relevant documents have been released, so it is impossible to provide a thorough analysis of the rule. It has been indicated the Socioeconomic Assessment and the Comparative Analysis of Rules will not be released until 30 days before the hearing, which would be today, and it appears there could be other documents released as well.

40-53

More importantly, throughout PR 2305 there are numerous references to the operator or owner having to comply with the "WAIRE Program Implementation Guidelines". While these "Guidelines" are an integral part of PR 2305, they have never even been described, presented or discussed in any way. The only thing we know is the name, and staff just recently indicated they may be released by March 3. So, obviously, we cannot comment on the "Guidelines" at this time, and even if they are released there is no time to analyze them, comment, and have any actual discussion of the Guidelines.

40-53
(cont'd)

As we analyzed the publicly available information, it became clear that an extensive amount of information was missing to fully understand and analyze PR 2305. Thus, Public Records Act requests were made, and we appreciate the large volume of information that has been provided to date, yet we have been told there is more information to be produced and some of it may not be provided until after the hearing on PR 2305.

40-54

There is also the Environmental Assessment (EA), a 654-page document to which comments are due March 12, 2021. We appreciate that staff does take comments seriously and they "...want to ensure responses are appropriate." Staff made it clear to the Warehouse ISR Working Group in discussing the responses to the Notice of Preparation (NOP) of the EA, a 133-page document, that "This takes time." And we agree. Since staff must review the comments, which will be far more extensive than responses to the NOP, it is difficult to understand how in three weeks they could properly analyze comments, make any needed revisions to the EA and still transmit it to the Board in time for them to properly analyze PR 2305.

40-55

Conclusion

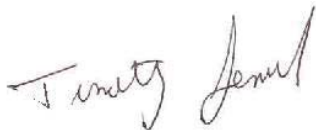

In light of the voluminous information that has been and is still being developed regarding this very complex, unusual rule, we are concerned about the Board truly having the proper amount of time to analyze everything surrounding PR 2305. The May 4, 2018 motion that was approved by the Board to proceed with a warehouse ISR included direction the Board was to receive progress reports every 4-6 months that should include information about key issues such as potential emissions reductions, cost of compliance, commercial availability, SIP credit and other matters. Unfortunately, the Board has not been kept apprised as promised. A sweeping rule with major consequences to jobs, the economy and with science needing careful analysis, it makes no sense the April 2, 2021 will mark the first time the full Governing Board will be thoroughly brought up to date on PR 2305.

40-56

We thank you for allowing us to comment on PR 2305. As you can see, there are many issues and concerns surrounding the rule as proposed. Based upon what is currently before us, we must respectfully submit that PR 2305 should not be approved.

40-57

Sincerely,

Timothy Jemal

Re: SCE Comments on Proposed Warehouse Indirect Source Rule

Dear Dr. Rees:

Southern California Edison (SCE) appreciates the opportunity to comment on the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

41-1

SCE supports the SCAQMD Warehouse ISR and improving air quality in the region.

SCE supports the Warehouse ISR and improving air quality in the region and especially appreciates the emphasis SCAQMD has placed on zero-emissions (ZE) technologies as a critical component of achieving significant emissions reductions in the warehouse sector, while still maintaining a flexible menu of other technology options for warehouse owners and operators to achieve compliance. SCE believes SCAQMD's continued encouragement to transition fleets to zero-emission vehicles (ZEVs) is especially important because procurement decisions made today will impact California for generations to come. SCAQMD's focus on ZEVs sends an important market signal. Encouraging transition to ZEVs could be an economic engine for California and our region in the coming decades and create thousands of good paying, skilled jobs.

41-2

With 42% of NO_x emissions in Southern California coming from goods movement,¹ transitioning to a ZE medium- and heavy-duty (MDHD) truck fleet has the potential to dramatically reduce local and regional air pollution impacts from this sector, particularly in communities disproportionately impacted by truck emissions. The Warehouse ISR would achieve emissions reductions from both the direct warehouse operations and indirect truck emissions. As a business member of the San Bernardino, Muscoy AB 617 Community Steering Committee (CSC), SCE recognizes and has heard directly from the community that reducing local emissions is critical. Specifically, the San Bernardino, Muscoy CSC, in its Community Emission Reduction Plan, prioritized the pursuit of indirect source rules that would require emission reductions from warehouse operations.² The CSC and residents of San Bernardino, Muscoy are counting

41-3

¹ "Zero-Emission Drayage Trucks Challenges and Opportunities for the San Pedro Bay Ports," p. 6, UCLA Luskin Center for Innovation, October 2019.

https://innovation.luskin.ucla.edu/wp-content/uploads/2019/10/Zero_Emission_Drayage_Trucks.pdf

² Assembly Bill (AB 617) Community Air Initiatives, Community Emissions Reduction Plan, San Bernardino, Muscoy, Chapter 5c: Warehouses: <https://www.aqmd.gov/docs/default-source/ab-617-ab-134/steering-committees/san-bernardino/cerp/carb-submittal/final-cerp.pdf?sfvrsn=9>

on the development of the Warehouse ISR to achieve emission reductions needed in their community. Addressing emissions from warehouses is vital for improving air quality to get closer to achieving attainment designations in the South Coast Air Basin, addressing the climate crisis, and addressing environmental justice issues in communities near warehouses.

41-3
(Cont'd)

SCE supports customers in transitioning truck fleets to zero-emissions electric alternatives.

SCE is committed to helping customers identify electric infrastructure solutions to meet regulatory compliance commitments while also minimizing costs. SCE's Charge Ready Transport program will help accelerate infrastructure deployment and reduce costs for fleet owners over a five-year period (2019 to 2024) by working with customers to install electric infrastructure at eligible sites to support MDHD electric vehicles. SCE appreciates that the Warehouse ISR allows Warehouse Actions and Investments to Reduce Emissions (WAIRE) points to be earned from electric infrastructure installed with Charge Ready Transport funding. With an approved total program budget of \$356.4M, the program will achieve a minimum of 870 sites supporting approximately 8,500 MDHD electric vehicles within SCE's service territory in Southern California, a majority of which are also within SCAQMD jurisdiction. A minimum of 40% of SCE's budget for this program must be spent in disadvantaged communities, and also a minimum of 25% of the budget must serve vehicles operating at ports and warehouses. SCE also provides a rebate toward the cost of the qualified charging stations for eligible customers.³

41-4

Additionally, SCE's commercial EV rates help to reduce costs for commercial fleet customers interested in fueling with electricity. Launched in 2019, the rates waive demand charges over a five-year period and then gradually re-introduce them in a graduated manner over the subsequent five years. The rate also provides price signals to create opportunities for maximizing savings while charging during low-price periods. Additional incentives, such as revenues from Low Carbon Fuel Standard credits, can serve as an offset to the costs of fueling with electricity, further increasing the favorable economics of electrifying fleets.

SCE also provides resources and assistance for customers to navigate questions and challenges associated with electrifying vehicle fleets. SCE offers fleet assessments that provide customers with reports of vehicle options for fleets, associated benefits for going electric, customized rate analyses to help customers understand potential fuel costs, an online publicly available fuel cost calculator,⁴ along with additional information on utility and non-utility programs and incentives. SCE also works onsite with customers to offer an assessment of the feasibility of installing infrastructure to serve potential EV fleet deployments. By providing consultation on infrastructure needs and siting, rates, charging needs and optimal siting of required charging infrastructure, SCE stands ready to help support customers utilize electrification as a means to comply with the Warehouse ISR.

Successful implementation of ZEV deployment requires continued forward-planning for infrastructure and electric system needs.

Utilities, the SCAQMD, and fleets and facilities increasingly need to work together to anticipate and assess impacts of growing EV-driven demand and proactively plan accordingly. A strong, resilient grid ready for mass EV adoption that can achieve significant emission reductions is attainable through advanced forward planning, increased industry coordination, and new collaborative approaches in data-

41-5

³ SCE Charge Ready Transport Program details: <https://crt.sce.com/overview>

⁴ SCE Electric Fleet Fuel Savings Calculator: <https://fleetfuelcalculator.sce.com/>

sharing and cooperation between public and private stakeholders. It is important to plan ahead in the early years to ensure that sufficient EV charging infrastructure needs are identified and addressed to meet longer-term policy and regulatory timelines, achieving important air quality improvement benefits. Electrification projects require site-specific planning and sometimes can take more than one year to implement. As such, SCE appreciates that the Warehouse ISR allows warehouses to earn WAIRE points from critical milestone steps such as purchase of Electric Vehicle Supply Equipment, construction mobilization and charger energization. Time for advanced planning is especially important for ensuring the grid is ready to support the increased EVs in sites and corridors affected by the Warehouse ISR which may require proactive grid expansion and upgrades that are potentially initiated to be ready to meet customer needs and regulatory timelines.

41-5
(cont'd)

SCE is assessing system and EV infrastructure planning needs in the region. SCE is currently evaluating when and where EVs are likely to appear as a charging load, the potential magnitude of that load, and what potential infrastructure and system solutions would be necessary to accommodate that load. These infrastructure assessment and planning activities will be greatly aided by more and better data and information related to where, when, and how EVs will charge. The data reported through the Warehouse ISR would be incredibly insightful for infrastructure assessment and planning within the South Coast Air Basin. SCE requests that the data gathered be shared in order to help shape a clearer, more reliable picture of future system needs for large-scale fleet transitions to EVs and ultimately help utilities and other charging support providers confidently plan and make decisions to provide the necessary infrastructure to support fleet and facility plans in the region.

41-6

Thank you for considering our comments regarding this important regulation. While there will be challenges as zero-emission electric vehicles increase in commercial fleets, SCE views these challenges and work ahead as a critical call to action. SCE is committed to doing its part and partnering with the Air District, communities, and our customers to ensure successful implementation of the Warehouse ISR as well as the related necessary deployment of zero-emission vehicle technology in the region.

41-7

Sincerely,

/s/ Laura Renger

Re: Comments on Proposed Rule 2305

Dear Mr. MacMillan:

On behalf of over 56,000 members of the Southwest Regional Council of Carpenters, I write to respectfully request the board postpone any adoption of Rule 2305 (Indirect Source Rule or ISR) in light of the current economic and public health crisis. We are concerned that the current language and timeline of Rule 2305 would add uncertainty to the market and respectfully request that more analysis is given to its economic impact, particularly on construction.

42-1

While we strongly support a just transition to a clean energy economy, a policy change this broad and at this time would be destabilizing for the industry. The COVID-19 pandemic is a once-in-a-century event that has upended Southern California's economy and construction sector. The impacts of the pandemic have particular relevance to the warehouse industry as the growth in e-commerce has led to a surge in warehouse demand.

42-2

To best implement this policy, we ask that the SCAQMD continue this item at least 90 days so that the industry and its labor partners can more accurately assess its long-term impact. A greater understanding of the role the pandemic and the sudden shift to e-commerce is needed before a change of this magnitude is implemented. Thank you again for your consideration of this important issue.

42-3

Sincerely,

A handwritten signature in black ink that reads "Daniel R. Langford". The signature is written in a cursive, flowing style.

REVIEW OF THE SOUTH COAST AQMD'S PRELIMINARY DRAFT STAFF REPORT FOR PROPOSED RULE 2305 AND PROPOSED RULE 316

Dear Mr. Juan:

March 2, 2021

On behalf of NAIOP, Ramboll US Consulting, Inc. (Ramboll) has reviewed South Coast Air Quality Management District (AQMD)'s Preliminary Draft Staff Report for the Proposed Rule (PR) 2305 and PR 316¹ dated January 2021. Our review included the supporting calculation spreadsheets (pr-2305-draft-baseline-emission-inventory.xlsx, pr-2305-draft-scenario-calculations.xlsm, and pr-2305-draft-truck-emission-rate-calculations.xlsx)² that were released in December 2020.

Ramboll
5 Park Plaza
Suite 500
Irvine, CA 92614
USA

SUMMARY OF FINDINGS/PURPOSE OF RULE

As stated in Chapter 1 of the Preliminary Draft Staff Report, the primary goal of PR 2305 and PR 316 is to achieve NO_x emissions to meet the near-term attainment deadlines in 2023 and 2031 for federal air quality standards for ozone, however the emission analysis presented in this report does not substantiate these NO_x reductions.

T +1 949 261 5151
F +1 949 261 6202
<https://ramboll.com>

- Table 17 of the Preliminary Draft Staff Report presents the range of NO_x reductions associated with the bounding scenarios for rule implementation as "zero" tons per day to 5.4 tons per day in 2023 and "zero" tons per day to 21.8 tons per day in 2031. Such a range of outcomes indicates that it is uncertain, and may be zero.
- The upper end of the range in 2023 is based on Scenario 5 (ZE Class 8 truck visits from non-owned fleet) which is not substantiated since ZE trucks are not currently commercially available. In 2031, the higher end of the range is based on Scenario 7 (Pay Mitigation Fee). As stated in the below in the section entitled WAIRE Mitigation Program, these reductions are likely overestimated.
- Further as noted subsequently in the section entitled Scenario Analysis, the discounting method used for the implementation of ACT, Omnibus, and HD I&M regulations is not accurate.

¹ Available at: <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-staff-report.pdf?sfvrsn=14>. Accessed: February 2021.

² Available at: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/fbmsm-mtns>. Accessed: February 2021.

Hence, the analysis presented in this report does not demonstrate with substantial evidence that PR 2305 will provide NO_x reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

43-5

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting³ on January 27, 2021, the small quantities of NO_x reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. A recent study by Parish et al.,⁴ indicates that it could take ~35 years of additional emission control efforts in the Los Angeles region to reach the federal ozone standard of 70ppb, because the background ozone concentration in the region is ~89% of the standard. Thus, it is unclear how this rule will help the basin attain the ozone standard by 2023, and unclear what the cost effectiveness of this rule is.

43-6

Our specific comments are summarized below and based on the information reviewed to date. To the extent new information becomes available, our comments may change.

BASELINE EMISSIONS INVENTORY

The following comments pertain to the baseline emissions inventory prepared for 2019, 2023, and 2031. We understand that emissions of oxides of nitrogen (NO_x) and diesel particulate matter (DPM) were developed for these three calendar years for heavy-duty trucks, passenger vehicles, transport refrigeration units (TRUs), and yard trucks.

43-7

Truck Emissions

Mobile Emissions Inventory Model

The AQMD mobile emissions were developed using EMFAC2017, while a newer version of the model with updated model assumptions, EMFAC2021, was released in Mid-January 2021.⁵

- This updated version includes the incorporation of the California Air Resources Board's (CARB's) Advanced Clean Trucks (ACT)⁶ and Low NO_x Omnibus⁷ regulations. While AQMD's analysis in the Preliminary Draft Staff Report performs outside-model adjustments for these regulations, it is not clear how their outside-model adjustments compare to the EMFAC2021 analysis. To ensure the AQMD has accounted for these so that there is not double counting of reductions, the ACT and Low NO_x Omnibus regulations should be accurately accounted for in the inventory.
- EMFAC2021 also includes several updates⁸ to the heavy-duty truck emission factors as noted below:
 - Running exhaust NO_x emission rates decrease,
 - Starting exhaust NO_x emission rates increase,

- NO_x for older fleets decrease due to new heavy-duty deterioration model, and
- NO_x decreases due to heavy-duty activity profile updates such as vehicle miles traveled (VMT) distribution by speed and number of starts by soak time, and extended idling hours.

43-9
Cont'd

AQMD should either use EMFAC2021, or confirm that these changes do not materially change the findings regarding the anticipated emission reductions.

META Tool for South Coast

The Preliminary Draft Staff Report states that the District's analysis incorporates the emissions reductions associated with the ACT and Low NO_x Omnibus Regulation using CARB's META tool. However, the version of CARB's META tool⁹ available to the public presents zero-emission/near-zero emission (ZE/NZE) population and VMT data only for the statewide fleet. While AQMD's scenario calculation spreadsheet pr-2305-draft-scenario-calculations.xlsm provides ZE/NZE population and VMT data for South Coast heavy-duty truck fleet, it fails to state how these were derived. Without this detail it is not clear if the method AQMD used to account for ACT and the Low NO_x Omnibus regulation is correct. AQMD should provide these details of the methodology for public review.

43-10

The Preliminary Draft Staff Report also stated that AQMD's analysis accounts for the reductions from the California Air Resources Board (CARB)'s proposed heavy-duty inspection and maintenance (HD I/M) program¹⁰ using the META tool, but details of how these reductions were derived are not clear. Without this detail it is not clear if the method AQMD used to account for the HD I/M program is correct. AQMD should provide additional documentation that shows how these reductions were estimated for public review.

43-11

ZE Drayage Truck Fleet

The conversion of the drayage truck fleet to 100% ZE by 2035 is not incorporated into the analysis. Several regulatory actions and activities such as Governor Newsom's Executive Order (EO) N-79-20,¹¹ CARB's proposed Advanced Clean Fleets (ACF) regulation,¹² and the Port's Clean Air Action Plan (CAAP)¹³ clearly indicate that the drayage truck fleet will be converted to a 100% ZE fleet by 2035. In order to achieve this conversion, beginning 2023 all new drayage trucks will have to be a zero-emission trucks.¹⁴ AQMD should update their analysis to incorporate the proposed regulations as this would reduce the estimates for the 2031 baseline inventory.

43-12

Trip Lengths

AQMD's analysis used a basin average trip length to estimate the emissions associated with trucks travelling to and from warehouses. While a basin average value provides a general estimate across truck trip types within the basin, it may not represent the actual trip lengths of trucks visiting a

¹⁴ Available at: https://ww2.arb.ca.gov/sites/default/files/2020-12/201209drayagepres_ADA.pdf. Accessed: February 2021.

<p>particular warehouse that would be regulated by PR 2305. As noted in Appendix B of the Preliminary Draft Staff Report, truck trip lengths can vary significantly from one warehouse to another. Therefore, using a basin average trip length does not appear to represent the actual activity for a regulated warehouse.</p>	<p>43-13 Cont'd</p>
<p>The basin average truck trip lengths and passenger car trip lengths used in AQMD's analysis to develop the baseline emission inventory are based on the 2016 Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The 2020 RTP/SCS was adopted in September 2020,¹⁵ and SCAG made major model enhancements from a trip-based model to an activity-based model for passenger vehicle trips. It does not appear that AQMD has assessed how this updated data would impact the analysis. We recommend that AQMD assess how the data in the 2020 RTP/SCS may affect the analysis, as it may greatly change the anticipated reductions.</p>	<p>43-14</p>
<p>Internalization</p> <p>As stated on Page 48 of the Preliminary Draft Staff Report, AQMD's analysis assumes a 22.2% internalization for all Class 8 truck VMT to account for the trips made between warehouses by trucks. This value is based on a study that is specific to drayage (T7 Port of Los Angeles (POLA): Heavy-Heavy Duty Diesel Drayage Truck near South Coast) trucks.¹⁶ However, drayage truck VMT accounts for ≤25% of the overall Class 8 truck VMT and the internalization rate may be very different at other warehouses. AQMD should provide more analysis to substantiate this assumption. Without further substantiation, the assumption is arbitrary.</p>	<p>43-15</p>
<p>Yard Truck Emissions</p> <p>AQMD does not provide sufficient documentation for the development of the baseline NO_x and DPM emissions for yard trucks (hostlers).</p> <ul style="list-style-type: none"> AQMD refers to the Powersys webpage (Reference 75 in the Preliminary Draft Staff Report) as a source for the activity data that is used to develop yard truck emission factors but does not provide a copy of the specific report or study from which the values were derived. Thus, we are unable to confirm their findings. 	<p>43-16</p>
<ul style="list-style-type: none"> AQMD fails to provide a source for the 1.2 hostlers per million square feet assumption for warehouses between 100,000 and 200,000 square feet. The cited source (i.e., AQMD business survey¹⁷) provides data only for warehouses greater than 200,000 square feet. <p>We recommend that AQMD provide the documentation for these assumptions used to develop the baseline inventory for yard trucks, otherwise the assumptions are arbitrary.</p>	<p>43-17</p>
<p>TRU Emissions</p> <p>Page 51 of the Preliminary Draft Staff Report states that the TRU emission estimates were based on CARB's current rulemaking efforts affecting TRUs but fails to provide details of how these estimates were made. A review of the calculation spreadsheet pr-2305-draft-baseline-emission-inventory.xlsx did not reveal any additional detail. AQMD should provide additional documentation for the NO_x and DPM</p>	<p>43-18</p>

¹⁵ Available at: <https://scag.ca.gov/read-plan-adopted-final-plan>. Accessed: February 2021.

¹⁶ Available at: https://scag.ca.gov/sites/main/files/file-attachments/task4_understandingfacilityoperations.pdf. Accessed: February 2021.

¹⁷ Available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/business-survey-summary.pdf>. Accessed: February 2021.

emissions factors for yard trucks that were used for the development of the baseline inventory for calendar years 2019, 2023, and 2031, otherwise the assumption is arbitrary.

43-18
Cont'd

Calculational Errors

The baseline inventory for 2019 has calculation errors in the NO_x and DPM emission factors for Class 4-7 and Class 8 heavy-duty trucks and for passenger vehicles.

- The 2019 Class 8 truck emission factors for NO_x and DPM use T6 utility, T7 Ag, T7 CAIRP, T7 CAIRP construction, and T7 single construction vehicle categories instead of T7 CAIRP, T7 NNOOS, T7 NOOS, T7 POLA, and T7 Tractor.
- The 2019 Class 4-7 truck emission factors for NO_x and DPM used SBUS, T6 CAIRP small, T6 instate construction (heavy & small), and T6 instate heavy vehicle categories instead of T6 CAIRP (Heavy & Small), T6 Instate (Heavy & Small), and T6 OOS (Heavy and small).
- The 2019 passenger vehicle emission factor for NO_x and DPM was missing the LDT2 category.

43-19

Fixing these errors will result in higher baseline NO_x emissions and slightly lower baseline DPM emissions in 2019 compared to those presented in Table 13 in Chapter 3 of the Preliminary Draft Staff Report for trucks and for passenger vehicles.

The calculations for baseline emission inventory for TRUs are erroneous. The factor applied to South Coast Air Basin TRU emissions to estimate emissions associated with cold storage warehouses in pr-2305-draft-baseline-emission-inventory.xlsx uses misaligned years (2019 square footage over the 2014 cold storage square footage). The impact of using data from aligned years (2014 data only) would be a lower fraction of cold storage square footage in SCAB in each calendar year.

43-20

SCENARIO ANALYSIS

Methodology Issues

The methodology used to estimate the emission reductions in the scenario analysis is separate and distinct from that used to prepare the baseline emission inventory.

- The differences in the approach used for the truck emission factors are particularly distinct.
 - While the baseline emission inventory applies reductions associated with ACT regulation, Low NO_x Omnibus regulation, and HD I/M program to the emission factors for trucks, the scenario analysis does not apply reductions associated with all three regulations to each of the 18 scenarios.
 - That said the issues related to the truck emissions noted under the baseline inventory section (mobile emissions inventory model, META tool for South Coast, ZE drayage truck fleet, trip lengths, and internalization) apply to the scenario analysis as well.
- Although the baseline inventory does not include emissions associated with electricity use at the warehouse facilities, Scenario 11 (Rooftop solar panel installations and usage) estimates emission reductions associated with replacement of the electricity from the grid with electricity generated by the solar panel. The electricity emissions should be included in the baseline, or the reductions from solar should be removed.

43-21

43-22

43-23

The eighteen scenarios analyzed in the Preliminary Draft Staff Report that are meant to represent the range of emissions reductions that can be achieved by PR 2305 are unrealistic. These scenarios do not consider how WAIRE points might be generated due to the implementation of the CARB regulations

43-24

(ACT regulation, Low NO_x Omnibus regulation, proposed ACF regulation) and Ports CAAP, i.e., WAIRE points presented in scenario analysis are not additional to what warehouses would earn from these regulations. More realistic scenarios should be developed to substantiate what reductions are realistic to expect from this rule.

43-24
(cont'd)

Discounting Method for CARB Regulations

The discounting method used to avoid double counting of the ACT regulation, Low NO_x Omnibus regulation, and HD I/M program are suspect and still potentially result in double counting. A summary of the issues noted in the calculation spreadsheet pr-2305-draft-scenario-calculations.xlsm are listed below:

43-25

- For scenarios that use NZE trucks (Scenario 1, 2, 3, 4, 8, and 9) to obtain WAIRE points, reductions associated with Low NO_x Omnibus regulation are discounted. However, reductions from the ACT regulation are not considered.
- For scenarios (Scenario 5, 6, 10, 12, 13, and 14) that use ZE trucks and ZE fueling infrastructure to obtain WAIRE points, reductions associated with ACT regulation are discounted. However, reductions from Low NO_x Omnibus regulation are not considered.
- Reductions associated with HD I/M are applied only to the discounted emissions associated with ACT/Low NO_x Omnibus regulation rather than the reductions associated with the use of ZE/NZE trucks for obtaining WAIRE points.
- For scenarios that do not use ZE/NZE trucks or ZE fueling infrastructure to obtain WAIRE points (Scenario 7, 11, 15, 16, 17, and 18), reductions associated with ACT/Omnibus/HD I&M are not discounted.

43-26

43-27

43-28

Calculation Errors

NO_x and DPM reductions calculations for Scenario 1 (NZE Class 8 truck acquisitions and subsequent visits from those trucks) shown in pr-2305-draft-scenario-calculations.xlsm have errors. These calculations are using truck emissions factors for calendar year 2023 and are therefore overestimating the reductions in the calendar years 2024 to 2027.

43-29

WAIRE MENU TECHNICAL REPORT

WAIRE Points Calculation Methodology

As noted in Figure 1 of Appendix B of the Preliminary Draft Staff Report, WAIRE points assigned to each item in the WAIRE menu (seen in Table 3 of PR 2305) are estimated as a function of the cost of the item, and the regional (NO_x) and local (DPM) emission benefit that the item would provide. The methodology used to estimate NO_x and DPM emission benefits for WAIRE menu items such as NZE truck purchase, NZE truck visits, ZE truck purchase, ZE truck visits, Charging Station Usage, and Hydrogen Fueling Station Usage, are based on the truck emission factors in calendar year 2023. As seen in the outputs from the EMFAC2017 model, emission factors for trucks are expected to reduce in the future years (beyond 2023) due to implementation of CARB Regulations and the general fleet turnover to cleaner vehicles. However, the WAIRE Menu in Table 3 of PR 2305 uses a static value for the WAIRE points assigned to these menu items. This approach does not represent how the changing fleet will impact the potential emission benefits and thus the cost effectiveness. AQMD should also include an evaluation that calculates WAIRE points for these menu items in future years (2023 and beyond) to more accurately demonstrate how WAIRE points may change in the future.

43-30

Total Cost of Ownership for Battery Electric Truck

The total cost of ownership analysis for the battery electric (BE) trucks presented in Appendix B of the Preliminary Draft Staff Report assumes that one battery electric truck can replace one diesel truck, thereby ignoring the operational implications of BE vehicle usage in the heavy-duty truck sector. Ramboll's study¹⁸ on HD BE vehicles, specifically Los Angeles Metro's bus fleet operations, has shown that due to limited battery range, long charging times and unfavorable charging windows, more than one battery electric bus (BEB) will be needed to replace a conventional diesel bus. This is further corroborated by National Center for Sustainable Transportation's 2020 Study,¹⁹ (that was funded by AQMD), on heavy duty trucks used for short haul goods movement. AQMD's assumption that a single battery electric truck can replace a diesel truck results underestimates the costs and therefore the WAIRE points that should be assigned to battery electric trucks in PR 2305. This should be corrected.

43-31

Annualized usage estimated for ZE infrastructure

Annualized usage estimated for ZE infrastructure (EV charger, Hydrogen Station, and TRU plugs) appear to be arbitrary. Appendix B of the Preliminary Draft Staff report presents the following annualized usage estimates for ZE infrastructure, without stating a source or basis for these assumptions:

43-32

- 165,000 kWh/year for an EV charger, which is equivalent to 10 hours of charging time per day on a 50 kW EV charger.
- 6,152 kg of hydrogen per year which is equivalent to the 165,000 kWh/year of EV charger usage.
- 10,658 kWh/year for TRU plugs which is equivalent to 4 hours of charging per day with an average power draw of 7.3 kW.

WAIRE MITIGATION PROGRAM

While Chapter 2 of the Preliminary Draft Staff Report states that the mitigation fee paid to AQMD by a warehouse operator will be used to fund NZE/ZE trucks or ZE charging/fueling infrastructure in the same geographic area that the warehouse is located, details of how this would be achieved are not presented. To understand how the NO_x and DPM emissions reductions associated with the mitigation fee are achieved with the implementation of PR2305, AQMD should present the following details of the WAIRE Mitigation Program along with roll out of the regulation:

43-33

- project eligibility and selection criteria,
- application process,
- annual timeline for project selection, and
- tracking and verification of funded projects.

Without further substantiation, the basis for the reductions associated with mitigation fee are inadequate and may overestimate NO_x reductions associated with Scenario 7 (Pay Mitigation Fee). As

Accessed: February 2021.

stated in the previous paragraph, AQMD plans to use the mitigation fees collected from warehouse operators to fund NZE/ZE trucks or ZE charging/fueling infrastructure. However, the cost-effectiveness value used of \$100,000 per ton of NO_x used to estimate the NO_x associated with Scenario 7 (Pay Mitigation Fee), is based on the "current criteria used for funding Class 8 NZE trucks". Since ZE trucks have a higher purchase price than NZE trucks, this cost effectiveness value is likely underestimated. Further, AQMD uses a cost effectiveness value of \$247,600,000 per ton of diesel particulate matter (DPM) to estimate the reductions in DPM associated with Scenario 7 in their calculation spreadsheet pr-2305-draft-scenario-calculations.xlsm. The basis for this assumption is not stated in the spreadsheet or the Preliminary Draft Staff Report. Without further substantiation, this assumption is arbitrary.

Re: Comments for Proposed Rule 2305 – Warehouse Indirect Source Rule - Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees for Regulation XXIII

Dear Mr. Bañuelos and Mr. Juan:

Our client, the California Trucking Association (“CTA”), appreciates the opportunity to submit comments on the South Coast Air Quality Management District’s (“SCAQMD” or “District”) Preliminary Draft Staff Report (“PDSR”) and Draft Environmental Assessment (“Draft EA”) for the Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program; and Proposed Rule 316 – Fees For Regulation XXIII (collectively, the “Proposed Rules”).

44-1

Many members of the CTA will be directly regulated by the Proposed Rules and many others will be compelled to assist the covered warehouses in achieving compliance with the Proposed Rules. This will require substantial capital investment by CTA members and will have far reaching environmental and economic effects. The Proposed Rules as drafted are preempted by federal law and extend beyond the authority granted to the District by the State. For this reason, the District must revise the Proposed Rules before continuing with its rulemaking process.

I. Statement of Interest.

“Truck driver” is one of the most common jobs in California. There are approximately 550,000 commercial vehicles registered in California and an additional 1.5 million commercial vehicles registered in other states to operate in California. Most of these vehicles are owned by small businesses: 50% of all trucks are owned by fleets of 3 or fewer trucks and 80% of all trucks are owned by fleets with fewer than 50 trucks.

44-2

The CTA is the largest state trade association representing trucking in the United States. Its 1,800 members include both large and small fleets with an average fleet size of 20 trucks. CTA members are actively participating in the development, piloting, and demonstration of alternative fuel and electric-drive capable vehicles. In fact, some member fleets have been working to bring electric-drive vehicles to market for nearly ten years. The CTA continues to support a coordinated and measured transition to alternative fuel and electric-drive capable vehicles.

44-2
(cont'd)

II. The District Does Not Have Authority to Adopt an Indirect Source Rule that Applies to Existing Warehouses.

Prior to the adoption of any regulation, the District must determine under Health and Safety Code section 40727 that it has the authority to adopt the regulation under state and federal law. Health and Safety Code (“HSC”) § 40727(a). The District cannot make such findings regarding the Proposed Rules. The District, as a creation of the Legislature, only possesses the authority specifically granted to it by state law. *PaintCare v. Mortensen* (2015) 233 Cal.App.4th 1292, 1305 (“An administrative agency ‘has only as much rulemaking power as is invested in it by statute’”); *Friends of the Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, 117 (similar). The District is an administrative agency which has no inherent “police power” nor any other “authority” beyond that explicitly conferred on the District by statute. *Candid Enterprises v. Grossmont Union High School Dist.* (1985) 39 Cal.3d 878, 885. “An air pollution control district, as a special district, has only such powers as are given to it by statute and it is an entity, the powers and functions of which are derived entirely from the Legislature.” 74 Cal. Atty. Gen. Op. 196 (1991) (citing *People ex rel. City of Downey v. Downey County Water Dist.* (1962) 202 Cal.App.2d 786, 795). “The powers of public [agencies] are derived from the statutes which create them and define their functions.” *Imperial Irr. Dist. v. State Water Resources Control Bd.* (1990) 225 Cal.App.3d 548, 567; *see also Carmel Valley Fire Prot. Dist. v. State of California* (2001) 25 Cal.4th 287, 299-300. “No matter how altruistic its motives, an administrative agency has no discretion to promulgate a regulation that is inconsistent with the governing statutes.” *Terhune v. Superior Court* (1998) 65 Cal.App.4th 864, 874. That an agency has been granted some authority to act within a given area does not mean that it enjoys plenary authority to act in that area. *Railway Labor Exec. Ass’n v. National Mediation Bd.* (D.C. Cir. 1994) 29 F.3d 655, 670 (en banc).

44-3

The District has identified no law that expressly grants it authority to adopt an indirect source rule (“ISR”) that regulates existing sources. Federal law allows, but does not require, states to adopt an “indirect source review program” as part of the state implementation plan. 42 U.S.C. § 7410(a)(5)(A)(i). However, an “indirect source program” is defined by statute to mean “the facility-by-facility review of indirect sources of air pollution, including such measures as are necessary to assure . . . that a *new or modified* indirect source will not attract mobile sources of pollution” that would cause or contribute to an exceedance of or prevent the maintenance of a National Ambient Air Quality Standard (“NAAQS”). *Id.* at § 7410(a)(5)(D) (emphasis added). The EPA expressly understood this to apply to the evaluation of indirect sources “effects on air

quality **prior to** their construction and modification.” 38 Fed. Reg. 9599 (1973) (emphasis added).¹ Nowhere does federal law grant states the authority to develop an indirect source program that applies to **existing** sources.

44-3
(cont'd)

The authority granted to Air Districts to promulgate indirect source rules under the California Clean Air Act is similar. Section 40716 of the Health and Safety Code provides that a district “may adopt and implement regulations” that **both** “[r]educe or mitigate emissions from indirect and areawide sources of air pollution” and “[e]ncourage or require the use of measures which reduce the number or length of vehicle trips.” The District does not substantiate its claim that the Proposed Rules will reduce the number or length of trips. But even if it did, the District’s authority is further proscribed. First, the statute specific to the District grants limited authority for the District to create an indirect source rule. It explains that the District shall provide for indirect source controls for “any **new** source that will have a significant effect on air quality in the South Coast Air Basin.” HSC § 40440(b)(3) (emphasis added).² “In the grants [of powers] and the regulation of the mode of exercise, there is an implied negative; an implication that no other than the expressly granted power passes by the grant; that it is to be expressed only in the prescribed mode....” *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 196. The express statutory authority of the District is thus to implement indirect source controls for **new** sources only, not existing, unmodified sources. “Any reasonable doubt concerning the existence of the power is to be resolved against the agency.” *California Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, 620. Second, the statute requires all air districts to adopt “indirect source control programs.” *Id.* at § 40918. This term is not defined in California law, but is identical to the term used under the federal Clean Air Act in which indirect source control programs are limited to **new or modified** indirect sources. 42 U.S.C. § 7410(a)(5)(D). Thus, the Legislature did not grant the District authority to require existing, unmodified sources to comply with an indirect source control program.³

¹ “It should be emphasized that the primary purpose of the review procedures is to insure that **proposed projects** are designed and located in a manner consistent with air quality requirements.” *Id.* (emphasis added).

² The District has also not demonstrated that “there are high-level, localized concentrations of pollutants” in the vicinity of covered warehouses. *See* HSC 40440(b)(3). The PDSR relies on an association between CalEnviroScreen rankings and warehouses. PDSR at 16-17. CalEnviroScreen uses a suite of 19 indicators to characterize pollution burden (12 indicators) and population characteristics (7 indicators). Each indicator is assigned a score for each census tract in the state based on the most up-to-date suitable data. Scores are weighted and added together within the two groups to derive a pollution burden score and a population characteristics score. Those scores are multiplied to give the final CalEnviroScreen score. These indicators are not limited to air quality, let alone to NO_x which is a basin-wide contaminant (not one of “localized concentrations”). Instead, the indicators include drinking water contaminants, pesticide use, toxic releases from facilities, lead risk from housing, clean-up sites, ground water threats, and numerous other factors wholly unrelated to “high-level, localized concentrations of pollutants.” *See* Office of Environmental Health Hazard Assessment, Indicators Overview, available at <https://oehha.ca.gov/calenviroscreen/indicators>.

³ It also appears no court has upheld such a program. *See National Association of Home Builders v. San Joaquin Valley Unified Air Pollution Control District* (2010) 627 F.3d 730 (upheld ISR program applied only to qualifying

The only support that the District references for its novel interpretation of its authority to adopt an existing source ISR is an Attorney General Opinion from 1993. Atty. Gen. Opinion 92-519 (1993). While opinions of the Attorney General are entitled to great weight, they are not binding law and may be “simply wrong.” *Building Industry Assn. v. City of Livermore* (1996) 45 Cal.App.4th 719, 730. In addition, the Attorney General cannot expand the authority granted to an entity created by state law via an advisory opinion. As explained above, the District’s authority only extends to the powers which it was expressly granted by the Legislature. *See PaintCare*, 233 Cal.App.4th at 1405; *Valero Refining Company-California v. Bay Area Air Quality Management District* (2020) 49 Cal.App.5th 618, 640 (same). Even if the Opinion were controlling law, it does not support the District’s claims of authority to adopt an ISR. The District apparently contends that because the Attorney General concluded that air districts may impose “reasonable post-construction measures,” the District’s authority to adopt ISRs extends to all indirect sources, even if they are long-standing and unmodified. However, nowhere in the Opinion does the Attorney General state that “reasonable post-construction measures” may be required for indirect sources that are neither new nor modified. The District’s strained interpretation is inconsistent not only with the law at the time the Opinion was issued, but also with the District’s own contemporaneous Air Quality Management Plan (“AQMP”).

44-3
(cont'd)

Both the California Clean Air Act and the AQMP anticipated the implementation of control measures that could only come into effect after an indirect source was constructed. In 1993, at the time of the Opinion, Section 40716 allowed the districts to implement post-construction measures such as “encourag[ing] or requir[ing] ridesharing, vanpooling, flexible work hours, or other measures to reduce the number or length of vehicle trips.” HSC § 40716 (1993). For traditional indirect sources such as shopping centers or stadiums, these measures could only be implemented post-construction. In its 1989 AQMP, the District itself included numerous similar measures it characterized as indirect source controls that would be implemented post-construction, including:

- (1) Alternative work weeks and flextime, *id.* app. IV-G at 47-52;
- (2) Telecommunications, *id.* at 53-62;
- (3) Employer rideshare and transit incentives, *id.* at 65-70;
- (4) Vanpool purchase incentives, *id.* at 77-82; and
- (5) Merchant transportation incentives, *id.* at 83-88.

In the context of the law at the time and the District’s own contemporaneous understanding, it is clear the Opinion was referring to these types of measures as “reasonable post-construction

new or modified development); *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120 (same).

measures,” not establishing a carte blanche authority for the District to impose an ISR program on existing, unmodified sources. Thus, while the District may impose reasonable post-construction measures on new or modified indirect sources, the District has identified no law granting it authority to extend these measures to indirect sources that are neither new nor modified.

44-3
(cont'd)

III. The Proposed Rules Are Preempted by Federal Law.

Under the U.S. Constitution’s Supremacy Clause, “Congress has the authority, when acting pursuant to its enumerated powers, to preempt state and local law.” *Oxygenated Fuels Association, Inc. v. Davis* (9th Cir. 2003) 331 F.3d 665, 667. “Congressional intent to preempt state law must be clear and manifest” (*Williamson v. General Dynamics Corp.* (9th Cir. 2000) 208 F.3d 1144, 1150), but congressional purpose is the “ultimate touchstone” of preemption analysis. *Cippollone v. Liggett Group, Inc.* (1992) 505 U.S. 504, 516. In this case, Congress has been clear in reserving to the federal government the ability to regulate purchase mandates under the Clean Air Act, the Federal Aviation and Administration Authorization Act (“FAAAA”), and the Energy Policy and Conservation Act (“EPCA”).

44-4

A. The Proposed Rules Are Preempted as Purchase Mandates Under the Clean Air Act.

The District may not adopt a purchase mandate under the guise of an ISR rule. Federal law preempts the adoption of such standards. While the District claims that the Proposed Rules provide sufficient flexibility to avoid a preempted mandate, the cost differential associated with the compliance pathways constitute an offer which cannot, in practical effect, be refused.

1. Rules Establishing Purchase Mandates Are Preempted.

Section 209(a) of the Clean Air Act (“CAA”) states:

“No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No State shall require certification, inspection, or any other approval relating to the control of emissions ... as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.” 42 U.S.C. § 7543(a).

This prohibition is interpreted broadly. As the Supreme Court explained, because “[t]he manufacturer’s right to sell federally approved vehicles is meaningless in the absence of a purchaser’s right to buy them,” the term “standard” is not limited to regulations on manufacturers. *Engine Manufacturers Assn v. South Coast Air Quality Management Dist.* (2004) 541 U.S. 246, 252, 255 (“EMA”). To that end, the Supreme Court found that, “A command, accompanied by sanctions, that certain purchasers may buy only vehicles with particular

emission characteristics is as much an ‘attempt to enforce’ a ‘standard’ as a command, accompanied by sanctions, that a certain percentage of a manufacturer’s sales volume must consist of such vehicles.” *Id.* at 255.

44-4
(cont'd)

The EPA has agreed and further explained that even if a standard is not a direct mandate, it may still be preempted under the CAA. Specifically in the context of ISR regulations, the EPA identified two ways that an ISR rule that on its face is authorized under CAA section 110(a)(5) could nonetheless be preempted. 76 Fed. Reg. 26609, 26611 (May 9, 2011). First, the ISR rule could be preempted if the rule in practice acts to compel either the manufacturer or user of a vehicle to change the emission control design of the engine or vehicle, or second, an ISR rule could be preempted if it creates incentives so onerous as to be in effect a purchase mandate. *Id.*

This was the exact question placed before the U.S. District Court of New York in 2009 in *Metropolitan Taxicab Bd. of Trade v. City of New York* (2009) 633 F. Supp. 2d 83 (“*MTB*”). The City of New York (“City”) adopted new regulations for taxis that were designed to encourage the transition to cleaner vehicles. Specifically, the City adopted a rule, the Lease Cap Rule, increasing the maximum allowable lease rate for hybrid vehicles while decreasing the maximum allowable lease rate for conventional vehicles. While the new maximum did not eliminate the profit margin for the leasing of conventional taxis, it rendered these conventional fleets substantially less profitable than hybrid fleets. *Id.* at 85. The Court first considered whether the Lease Cap Rule effected a purchase mandate, finding that “[t]he combined effect of the lease cap changes, and even the disincentive alone, constitutes an offer which can not, in practical effect, be refused.” *Id.* at 99. While the City argued that fleet operators could continue to utilize conventional taxis under the Lease Cap Rule, the Court found that the cost differential made it clear that “the Lease Cap Rules do not present viable options for Fleet Owners and instead operate as an effective mandate to switch to hybrid vehicles.” *Id.* at 100.⁴

2. The Intent of the Proposed Rules Is to Force the Acquisition of ZE/NZE Vehicles.

The District has made no secret of its dissatisfaction with the state-level progress on regulating emissions from mobile sources. In its comment letter on the Draft Mobile Source Strategy (“MSS”), the District called on CARB to “go even further” since CARB’s efforts to regulate

⁴ This is distinct from Rule 9510 considered by the Ninth Circuit in *National Assn. of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.* (2010) 627 F.3d 730 (“*NAHB*”). In that case, the ISR rule considered emissions that were “site-based,” rather than “engine- or vehicle-based.” Stated differently, Rule 9510 evaluated emissions from the whole of the development, including the emissions from the construction equipment used during development and from the vehicles of the final users of the site. While NAHB challenged the rule as a preempted purchase mandate, the court found that Rule 9510 “escape[d] preemption” because it did “not measure emissions by fleets or groups of vehicles”—the construction equipment—but rather the facility as a whole *Id.* at 740. The same cannot be said of the Proposed Rules which are entirely based on the emissions from vehicles that visit the site and for which the practical compliance mechanisms are limited to acquisition.

mobile sources were insufficient to meet upcoming 2023 and 2031 federal deadlines for ozone reduction. PDSR at 52. The District has explained the problem that the emissions reductions modeled in the Draft MSS were insufficient to meet federal deadlines and that, even in the most aggressive modeling in the Draft MSS, in 2023 more than 95% of heavy-duty trucks will be no cleaner than 2010 engine standards assumed for all trucks in the baseline emissions inventory from the 2016 AQMP and that these trucks will continue to make up about 57% of the truck fleet in 2031. PDSR at 52. In commenting on the Advance Clean Truck (“ACT”) regulation, the District explained that the 15% ZEV sales requirement in 2030 “will be insufficient and must be increased to generate the needed NOx reductions.” SCAQMD Letter to CARB, Comment Letter on Proposed Advanced Clean Trucks Regulation (Dec. 6, 2019).

With the Proposed Rule, the District is attempting to step into CARB’s shoes and regulate mobile sources by proxy, an action for which it lacks authority. The PDSR explains that the ACT Rule and the Low NOx Omnibus regulations have left a gap in that their “lower emissions occur only *if* trucks are sold.” *Id.* (emphasis original). The Proposed Rules are designed to fill this gap by forcing acquisition of lower emission trucks. Similarly, the District explained that while the upcoming TRU regulation is expected to require lower PM standards, it “will not mandate that fleets purchase them, nor will it direct sales in certain parts of the state.” *Id.* The Proposed Rules are designed to correct this deficiency by creating a de facto purchase mandate in the South Coast Basin. The District explains that NOx reductions are necessary to meet federal air quality standards and “mobile sources associated with goods movement make up about 52% of all NOx emissions” in the South Coast Basin. PDSR at 14. The Proposed Rules are intended “to support statewide efforts to increase the number of ZE vehicles.” *Id.* The Proposed Rules “provide a mechanism to require warehouse operators to encourage ZE vehicle use at their facilities.” *Id.* at 15. “The proposed project is intended to accelerate the use of ZE trucks and yard trucks that visit the warehouses in the South Coast AQMD region” and “encourage and incentivize the purchase and use of NZE and ZE vehicles instead of conventional gasoline and diesel vehicles.” Draft EA at 4.1-1, C-46.⁵ The purpose of the Proposed Rules is thus clearly to force the acquisition and deployment of ZE trucks in the Basin.

3. Beyond the District’s Clear Intent to Force Purchase of ZE/NZE Vehicles, the Cost Differential Associated with the Compliance Pathways Forces Acquisition in Any Event.

While the District has ostensibly designed the Proposed Rules to provide multiple compliance pathways, the actual effect is uniform—ZE trucks must be acquired. The PDSR analyzed 18 compliance pathways as shown in Table 14. Scenarios 1, 2, 3, 6, 8, 12, 13, and 18 require the acquisition and usage of ZE vehicles by the warehouse itself. Scenarios 4, 5, 9, 10, and 14 require ZE trucks to visit the warehouses, requiring non-warehouse fleet owners to acquire such

⁵ “[T]he proposed project would result in a greater turnover of diesel trucks to NZE and ZE trucks than would have occurred without the proposed project....” Draft EA at C-48–49.

vehicles. But, for the 45% of warehouses that own and operate their own fleet, relying on the indirect acquisition by non-covered fleet owners is not an option. The only scenarios that do not force an acquisition of a ZE vehicle are Scenarios 7 (pay mitigation fee), 11 (rooftop solar and mitigation fee), 15 (filter system installations) and 16 (filter purchases).⁶ However, the costs of these non-acquisition pathways are far higher than acquisition.

44-4
(cont'd)

Type	Sc. #	Description	Annual Cost per Year per Sq. Ft.
Direct Acquisition	1	NZE Class 8 truck acquisitions and subsequent visits from those trucks	\$0.08
Direct Acquisition	2	NZE Class 8 truck acquisitions and subsequent visits from those trucks (early purchase)	\$0.11
Direct Acquisition	3	NZE Class 8 truck acquisitions (funded by Carl Moyer program) and subsequent visits from those trucks	\$0.05
Direct Acquisition	6	Level 3 charger installations followed by ZE Class 6 & Class 8 truck acquisitions and subsequent visits from those trucks, using installed chargers	\$0.14
Direct Acquisition	8	NZE Class 6 truck acquisitions and subsequent visits from those trucks	\$0.16
Direct Acquisition	12	Hydrogen station installations followed by ZE Class 8 truck acquisitions and subsequent visits from those trucks, using the hydrogen station	\$0.82
Direct Acquisition	13	ZE Class 2b-3 truck acquisitions and subsequent visits from those trucks	\$0.04
Direct Acquisition	18	ZE Hostler Acquisitions and Usage	\$0.12
Average Annual Cost per Year per Sq. Ft. for Direct Acquisition Compliance			\$0.19
Indirect Acquisition	4	NZE Class 8 truck visits from non-owned fleets	\$0.05
Indirect Acquisition	5	ZE Class 8 truck visits from non-owned fleets	\$0.74
Indirect Acquisition	9	NZE Class 6 truck visits from non-owned fleets	\$0.79
Indirect Acquisition	10	ZE Class 6 truck visits from non-owned fleets	\$0.04

⁶ Scenario 17 requires TRU plug installations and usage in cold storage facilities but is applicable only to cold storage warehouses.

Indirect Acquisition	14	ZE Class 2b-3 truck visits from non-owned fleets	\$0.48
Average Annual Cost per Year per Sq. Ft. for Indirect Acquisition Compliance			\$0.42
Non-Acquisition	7	Pay Mitigation Fee	\$0.78
Non-Acquisition	11	Rooftop solar panel installations and usage	\$1.14
Non-Acquisition	15	Filter System Installations	\$0.92
Non-Acquisition	16	Filter Purchases	\$0.92
Non-Acquisition	17	TRU plug installations and usage in cold storage facilities	\$0.50
Average Annual Cost per Year per Sq. Ft. for Non- Acquisition Compliance			\$0.85

44-4
(cont'd)

Scenario 7 (Mitigation Fee) averages approximately \$0.90 per square foot in 2025, with an average of \$0.78 per square foot per year. PDSR at 66, 74. The estimated compliance cost for Scenarios 15 and 16 (Filter System Installations and Filter Purchases) is even higher at approximately \$1.00 per square foot in 2025, with an average of \$0.92 per square foot per year. *Id.* at 70, 74. Solar begins in 2025 at \$2.50 per square foot and an average annual cost of \$1.14 per square foot per year. *Id.* By contrast, the estimated compliance costs for “acquisition” based scenarios are less than \$0.20 in 2025, with an annual average cost per square foot typically ranging from \$0.04 to \$0.16 per square foot per year. *Id.* at 66, 74. This cost differential is of the District’s own making, by assigning a certain number of WAIRE points to each compliance action the District has intentionally chosen to compel acquisition by pricing other compliance pathways out of the running.

While the District may argue that the Proposed Rules are not a purchase mandate because of the varying compliance pathways, the non-acquisition pathways at least triple the compliance costs of covered warehouses. District staff acknowledged at the February 16, 2021 public workshop that facilities will find the “most cost-effective means to comply.” Just as the fleet owners in *MTB*, warehouse operators are “profit oriented and business owners trying to maximize profits” and will always choose the option that the District makes the least costly. *MTB*, 633 F. Supp. 2d at 100. Looking at all the evidence, it is clear that the Proposed Rules do not “present viable options” for warehouses other than acquisition and “instead operate[] as an effective mandate to switch to [ZE] vehicles.” *Id.* For this reason, the Proposed Rules are preempted as a purchase mandate.

B. The Proposed Rules Are Preempted Under the FAAAA.

The FAAAA “preempts a wide range of state regulation of intrastate motor carriage.” *Californians for Safe & Competitive Dump Truck Transp. v. Mendonca* (9th Cir. 1998) 152 F.3d 1184, 1187. It specifically provides that, “a State ... may not enact or enforce a law, regulation, or other provision having the force and effect of law related to a price, route, or service of any motor carrier ... with respect to the transportation of property.” 49 U.S.C. § 14501(c)(1). The terms “rates, routes, and services” were “used by Congress in the public utility sense; that is, service refers to such things as the frequency and scheduling of transportation, and to the selection of markets to or from which transportation is provided.... Rates indicates price; routes refers to courses of travel.” *Air Transport Ass’n of Am. v. City & Cnty. of San Francisco* (9th Cir. 2001) 266 F.3d 1064, 1071. Congress enacted this preemption provision because it “believed that across-the-board deregulation was in the public interest as well as necessary to eliminate non-uniform state regulations of motor carriers which had caused significant inefficiencies, increased costs, reduction of competition, inhibition of innovation and technology, and curtailed the expansion of markets.” *Id.* at 1187 (quotations omitted).

The Supreme Court has observed that state laws may be preempted “even if a state law’s effect on rates, routes or services is only indirect.” *Rowe v. New Hampshire Motor Transport Ass’n* (2008) 552 U.S. 364, 370. The District has acknowledged that the Proposed Rules will increase the costs for warehouses in the District, many of whom are fleet owners. PDSR at 58 (“there will be financial impacts to industry to implement PR 2305, and it will also require many warehouse operators and cargo owners to change their business practices to implement actions required by PR 2305”), 45 (“Of the warehouses expected to be required to earn WAIRE Points ... about 45% may own a truck fleet”). The District also acknowledges that the Proposed Rules incentivize changes to routes and service. PDSR at 33 (“Because the WPCO is tied to a warehouse’s annual truck trips, if a facility can find ways to improve efficiency and reduce its number of truck trips, then its compliance obligation under PR 2305 will be lower.”). Because the Proposed Rules have a force and effect that is related to the price, route, and service of motor carriers, they are preempted under the FAAAA.

C. The Proposed Rules Are Preempted Under the EPCA.

The EPCA authorizes the National Highway Traffic Safety Administration (“NHTSA”) to create fuel-efficiency standards in order “to conserve energy supplies through energy conservation programs, and, where necessary, the regulation of certain energy uses” and “to provide for improved energy efficiency of motor vehicles.” 49 U.S.C. § 6201. “[W]hile the primary focus of the EPCA was to regulate the country’s consumption of energy resources, Congress intended that passage of the EPCA would not unnecessarily restrict purchase options.” *Ophir v. City of Boston* (2009) 647 F. Supp. 2d 86, 93. To that end, NHTSA may only establish a fuel economy standard after evaluating four factors: “technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United

44-5

44-6

States to conserve energy.” *Id.* § 32902(f). In order to promote a uniform application, the EPCA preempts the authority of the states or any political subdivision of a state from “adopt[ing] or enforc[ing] a law or regulation *related to* fuel economy standards or average fuel economy standards for automobiles covered by an average fuel economy standard under this chapter.” *Id.* at § 32919 (emphasis added). “Fuel economy” is defined as “the average number of miles traveled by an automobile for each gallon of gasoline (or equivalent amount of other fuel) used.” *Id.* at 32901(a)(11). The EPA Administrator is directed by EPCA to “include in the calculation of average fuel economy ... equivalent petroleum-based fuel economy values determined by the Secretary of Energy for various classes of electric vehicles,” (*id.* at 32904(a)(2)(B)), which the EPA calculates in terms of miles per gallon equivalent, or MPGe. *Id.*

44-6
(cont'd)

As described above, it is the District’s intent to drive the acquisition of ZE/NZE vehicles in the District’s jurisdiction. The City of Boston had a similar objective when it adopted a taxi regulation requiring the acquisition of hybrid vehicles. A federal district court found the regulation preempted by the EPCA, even though the rule was adopted to “modernize and improve the quality of appearance” of the taxi fleet, not for purposes of increased fuel economy. *Ophir*, 647 F. Supp. 2d at 89, 94. Here, the District is compelling the acquisition of a certain type of vehicle, ostensibly to reduce vehicle emissions, but with the effect of mandating lower fuel economy standards. As the Supreme Court explained in *EMA*, “if one State or political subdivision may enact such rules, then so may any other; and the end result would undo Congress’s carefully calibrated regulatory scheme.” 541 U.S. at 255.

IV. The Proposed Rules Are An Improper Regulatory Fee.

There are three general categories of fees or assessments that are distinguishable from special taxes and thus can be imposed without a two-thirds majority vote: special assessments based on the value of benefits conferred on property, development fees exacted in return for permits or government privileges, and regulatory fees imposed under the police power. *California Building Industry Association v. San Joaquin Valley Unified Air Pollution Control District* (2009) 178 Cal.App.4th 120, 130. ISR fees are regulatory fees in that they are not associated with the issuance of a permit or government privilege.⁷ *Id.* However, a regulatory fee may not exceed the amount required to carry out the purposes and provisions of the regulation and cannot be levied for unrelated revenue purposes. *Id.* at 131.

44-7

In the first instance, the District has identified no authority allowing it to impose an ISR fee on existing, unmodified sources. See Part II, *supra*. The District has also not established a reasonable relationship between the fee charged and the activity the District seeks to regulate.

⁷ In the alternative, the fees under the Proposed Rules are an improper tax under Proposition 13. Unlike the allowances at issue in *Cal. Chamber of Commerce v. State Air Resources Board* (2017) 10 Cal.App.5th 604, the WAIRE points have no economic value that can be traded, a fixed price unchanged by market forces, and—as state and federal regulations phase in—will become compulsory. Thus, they are a tax subject to the requirements of Proposition 13, which have not been met.

The District states that the amount of the fee was calculated based on the cost-per-point of various other compliance actions. PDSR at 33. However, as the District acknowledges, these costs vary across the actions. *Id.* The District does not explain its methodology for determining the \$1,000 per point cost. Additionally, the District’s proposed cost is based on the cost of compliance for individual entities, not on the cost of the offsets the *District* would need to fund to offset total emissions from truck trips to warehouses in the Basin to achieve the emission reductions goals of the program. The District has acknowledged that there are economies of scale associated with the compliance pathways, which the District is uniquely positioned to access as the administrator of the mitigation funds. The District is required by law to perform an analysis of administering the costs of its own program, i.e., funding the offsets necessary to reduce emissions, rather than analyzing the cost of compliance actions of individual entities.

44-7
(cont'd)

In addition, the court in *California Building Industry Association* upheld an ISR fee where the covered entities could choose whether or not to pay the fee based on their activities. However, in light of the increasing requirements for ZE/NZE vehicles discussed *infra* and the additionality requirement found in Proposed Rule 2305(d)(3), it is very likely that covered warehouses will have no option but to pay the fee at some point. As District staff acknowledged during the February 17, 2021 community meeting, Proposed Rule 2305 has no sunset and no off-ramp available for even fully electric warehouses. Yet these warehouses will continue to accumulate a compliance obligation based on the trucks that visit their locations regardless of the type of truck. Thus, no true choice between paying the fee and other compliance pathways exists in the Proposed Rules.

V. The Goals of the Proposed Rules Are Presently Infeasible.

As explained in Parts III.B and III.C, *supra*, the intent of the Proposed Rules is to accelerate the transition to ZE trucks. Yet, the District specifically acknowledges that it “cannot predict and has no feasible way to identify” suppliers of items necessary to accumulate WAIRE points and that the “investment or the quantity of items is speculative.” Draft EA at 532. CARB recently rejected a proposal to require a higher sales percentage of ZE vehicles under the ACT Rule “due to concerns about the feasibility of manufacturers to comply with even higher sales requirements especially for Class 2b-3 vehicles and tractors.” Advanced Clean Trucks Regulation, Final Statement of Reasons (January 2021) at 99 (“ACT FSOR”). As CARB explained just last month:

44-8

“At this time, both Class 2b-3 and Class 7-8 tractors have more focused concerns about payload, range, towing, charging/refueling infrastructure, and model availability than other vehicles. These issues will present more challenges in identifying suitable applications for their deployment in the early market. Increasing the number of ZEV sales further also increases the likelihood that manufacturers would need to produce more costly long-range vehicles, and that vehicles may need to be placed in applications where they may not be fully

suitable. Therefore, the Board determined that the approved regulation is the most feasible path to meet ZEV deployment goals at this time.” *Id.*

44-8
(cont'd)

The District has not explained how its mandate to increase the use of ZE vehicles—which is intended to be in excess of CARB’s requirement (*see* PDSR at 15)—is in fact feasible when CARB determined it is not.

Additionally, the District has not contended with whether it is feasible to impose these accelerated requirements for trucks that leave the District. Industrial Economics, Incorporated determined that only 34% of goods moved within the District stay in the District; the vast majority are bound for destinations outside of the District’s authority.⁸ Yet the District has offered no evidence of whether the infrastructure exists in other jurisdictions to support the endpoint of these trips. A rule that is infeasible is necessarily arbitrary and capricious and unsupported by substantial evidence.

VI. The District Cannot Make the Findings Required by Health and Safety Code Section 40727.

Prior to the adoption of any new regulation, the District must make findings regarding “necessity, authority, clarity, consistency, nonduplication, and reference.” HSC § 40727. The District’s findings must be based on substantial evidence that is “reasonable, credible, and of solid value” (*Plastic Pipe and Fittings Ass’n v. Cal. Bldg. Standards Comm.* (2004) 124 Cal.App.4th 1390, 1407), and that bears a “rational connection” to the District’s ultimate determination (*Am. Coatings Ass’n v. South Coast Air Quality Dist.* (2012) 54 Cal.4th 446, 460). The District cannot make the necessary findings for the Proposed Rules.

44-9

“Authority” is defined to mean a provision of law or of state or federal regulation that permits or requires the regional agency to adopt the regulation. *Id.* As discussed in Part II, *supra*, the District has no authority to adopt a regulation imposing an ISR on existing, unmodified sources and, as discussed in Part III, *infra*, the Proposed Rules are preempted by federal law. The District cites to Health and Safety Code sections 39002, 39650 to 39669, 40000, 40001, 40440, 40441, 40522.5, 40701, 40702, 40716, 47017 to 40728, 40910, 40920.5, 41508, 41511, and 41700 for authority for the Proposed Rules. PDSR at 83. None of these provide authority for either an ISR for existing, unmodified sources or for a program effecting a purchase mandate of vehicle sources.

“Necessity” means that a need exists for the regulation as demonstrated by the record. HSC § 40727(b). The District has failed to demonstrate that there is a need for the Proposed Rules.

⁸ Industrial Economics, Inc., Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule (Dec. 23, 2020), available at [http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf?sfvrsn=8](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf?sfvrsn=8).

The District explains that the District will not meet federal standards for ozone and fine particulate matter, that NO_x is the primary pollutant needed to meet federal air quality standards, and that mobile sources associated with goods movement make up about 52% of all NO_x emissions in the Basin. PDSR at 13-14. But the District does not bridge the analytical gap between the projected NO_x emissions and the federal standards for ozone. For example, the District projects in Table 3 of the PDSR that NO_x emissions per day will decrease from 42.72 tons to 26.86 tons (PDSR at 13), but does not explain or quantify how these reductions will achieve federal ozone standards, the actual cited need. Further, the District does not explain what NO_x emissions are attributable to the specific entities it seeks to regulate. The Proposed Rules apply to the owners and operators of warehouses in the District's jurisdiction. Proposed Rule 2305(b). But the District has not demonstrated that the warehouses are a significant indirect source. While the District states that 52% of all NO_x emissions in the Basin are attributable to the movement of goods, this figure includes locomotives, cargo handling equipment, ocean going vessels and commercial harbor craft.⁹ Trucks themselves are responsible for only 58% of the 52% of NO_x emissions, or less than a third of the need originally cited by the District. In its later modeling, the District claims that NO_x emissions from trucks that visit warehouses account for less than 20% of the District's carrying capacity even before the Proposed Rules. PDSR at 52. The District's necessity finding is further undercut by its own scenario analysis which demonstrate that despite the enormous implementation costs, it is possible that the Proposed Rules will result in no reduced emissions of NO_x and PM at all. PDSR at 63-64.

The District has also claimed that the Proposed Rules are necessary because, while CARB's Draft MSS calls for a 100% ZE truck fleet by 2045, a 100% ZE drayage truck fleet (trucks that visit ports and railyards) by 2035, and 100% ZE off-road equipment operations by 2035, CARB's policy does not include any enforceable mechanism to achieve these targets. PDSR at 10. To reach this conclusion, the District ignores the effects of the ACT Rule requiring greater sales of ZE/NZE trucks and ignores CARB's further efforts to adopt the Advanced Clean Fleets ("ACF") rule, which CARB anticipates will be implemented from 2024 to 2045.¹⁰ During its public workshops, the District further discounted these regulations by emphasizing that the Proposed Rules will begin achieving emissions reductions beginning in 2023, where the ACT Rule and proposed ACF rule will not reach full implementation until 2035 and 2045 respectively. But the annual variable associated with the Proposed Rules indicates that they will not reach full implementation until after CARB's programs go into effect. The District thus has not demonstrated that it is necessary for it to usurp CARB's authority in this area.

Under section 40727, the District must also find that the regulation "is written or displayed so that its meaning can be easily understood by the persons directly affected by it," a required

44-9
(cont'd)

⁹ PDSR at 14, citing Southern California Association of Governments, Transportation System Goods Movement Technical Report (Sept. 2020) at 58, available at https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocial_goods-movement.pdf?1606001690.

¹⁰ CARB, Zero-Emission Fleet Rule Workshop, Advanced Clean Truck Fleets (Feb. 12, 2020), available at https://ww2.arb.ca.gov/sites/default/files/2020-02/200212presentation_ADA_1.pdf.

“clarity” finding. The District cannot make such a finding for the Proposed Rules because the means to comply with the Proposed Rules are based on a landscape of shifting sand. Specifically, each warehouse operator can only earn points toward their compliance obligation by taking actions beyond the requirements of U.S. EPA, CARB, and the District’s other regulations. Proposed Rule 2305(d)(3). But as described above, these regulations are becoming increasingly stringent and new rules are being evaluated continuously. Covered warehouses are therefore unable to evaluate how the Proposed Rules will specifically affect them or the level of compliance actions that may be necessary. This materially effects the ability of covered warehouses to operate and makes the District unable to make the required finding of clarity.

44-9
(cont'd)

VII. The Environmental Assessment Fails as an Informational Document.

The basic purpose of an EIR is to “provide public agencies and the public in general with detailed information about the effect [that] a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.” *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 511 (quoting Pub. Res. Code § 21061) (“*Friant Ranch*”). “If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees.” *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 392 (“*Laurel Heights*”). For environmental review to be successful, it must not only provide a comprehensive disclosure but also connect the analytical dots in order to explain to the decisionmakers and the public the effects of the agency’s decision.

44-10

While the District has significantly improved the discussion of the environmental impacts of the Proposed Rules from the Initial Study, the Draft EA still fails to provide a full picture of the reasonably foreseeable effects of the Proposed Rules.

A. The District Improperly Relies on Analysis from an Earlier Project.

The District has abandoned its attempt to fully divorce the Proposed Rules from their indirect effects and now provides a cursory discussion of the Proposed Rules’ hazards and hazardous materials, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. However, the analysis remains legally insufficient. The District’s analysis is largely limited to incorporating CARB’s analysis of the impacts associated with the ACT Rule in order to describe and assess the effects of the Proposed Rules. This is improper and misleading. The District has repeatedly explained that the Proposed Rules are designed to be in surplus of state and federal regulations, meaning that the effects of the Proposed Rules are also necessarily in surplus of the effects described in the ACT Rule Environmental Assessment.

44-11

To illustrate, the District acknowledges that the Proposed Rules will drive an increase in specialized hazardous waste, including various types of batteries and fuel cells as well as prematurely retired vehicles. The District relies on CARB’s description and assessment of the ACT Rule’s effects on the creation and management of hazards, but the District never explains how the specific effects of the Proposed Rule—e.g., how much more demand for recycling or solid waste disposal the Proposed Rules generate vis a vis the ACT Rule. Because the District will be driving additional fleet turnover and additional ZE/NZE deployment, the effects of the Proposed Rules are necessarily in excess of what CARB analyzed in its own assessment. The District has failed to meaningfully inform the public and the Board of the reasonably foreseeable effects of the covered warehouses’ compliance actions. These incremental effects are likely substantial. While CARB predicts total deployment of 100,000 ZE vehicles under the ACT Rule by 2032 (ACT Environmental Assessment at IX-6), the District’s bounding analysis indicates the Proposed Rules could add an additional 28,000 ZE trucks by 2031, a 28% increase. The District’s repeated reliance on CARB’s assessment thus fails to disclose the effects of the District’s action in adopting the Proposed Rules.

44-11
(cont'd)

A lead agency may reuse an EIR prepared for an earlier project for another separate project if the “circumstances of the projects are essentially the same.” CEQA Guidelines § 15153(a). An EIR from an earlier project “shall not be used” for a later project if any of the conditions for supplementation have been met. In *Save Berkeley’s Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, the court found that the university could not rely on a previously prepared EIR that analyzed an increase in enrollment when the proposed project would further increase student enrollment. The same principles apply to the District. The District cannot crib from CARB’s own analysis when the District intends its Proposed Rules to increase turnover and deployment beyond what CARB contemplated, particularly not when the District can reasonably foresee a 28% increase in deployment *in a single air district* beyond what CARB anticipated for the *entire state*.

44-12

This error is not unique to the hazards analysis, although the comparison is particularly apt. The same problem permeates the District’s analysis of other impact areas, including but not limited to, aesthetic, mineral, biological, air quality, greenhouse gases, biological resources, land use, and agricultural resources impacts. While the District argues that these impacts are speculative and subject to the permitting decisions of other agencies, the District has demonstrated it is capable of performing a bounding analysis to determine the maximum potential impacts associated with air emissions and electricity demand and could certainly use this scenario to forecast potential impacts across other impact areas.

1. Increased Grid Capacity.

The District has modeled 18 compliance scenarios to provide a “bracketing” of the fiscal impact associated with the Proposed Rules and should provide the same level of information for the environmental impacts. While the District now quantifies a high-electrification scenario, it does

44-13

not disclose what this means to the public or the environment. To meet the state's ambitious climate goals, nearly all of this new demand would be met by wind, solar and battery storage.¹¹ This would require the construction of 109,834 megawatts ("MW") of new solar capacity (a nearly 900 percent increase from current levels), 14,585 MW of new wind capacity (more than a 200 percent increase from current levels), and 73,933 MW of new available grid battery storage (a 15,560 percent increase from the current 478 MW).¹² The District can and should evaluate and disclose to the public the approximate amount of acreage required to generate the necessary electricity from wind and solar and should quantify the amount of emissions that would result from the use of natural gas power plants.

44-13
(cont'd)

2. Increased Need for Lithium Extraction.

The District could use its most battery-intense scenario along with projections of useful life to determine the demand for lithium and other necessary minerals and inform the public and decisionmakers of the potential real world impacts of the Proposed Rules, including the percentage increase over existing extraction to accommodate these Rules and other similar reasonably foreseeable electrification efforts.

44-14

3. Increased Disposal Facilities.

Using the same bounding scenario, the District could project the amount and type of waste the Proposed Rules would induce through accelerated transition. While the District indicates that conventional trucks replaced by ZE/NZE vehicles before the end of their useful life will likely replace older, dirtier trucks, the District must still contend with the disposal of these trucks. Additionally, the District's reliance on still-in-development battery recycling technology is speculative and lacks the support of substantial evidence. In order to succeed as an informational document, the District must provide an assessment of the foreseeable impacts, including increased demand for disposal facilities. This is not outside of the realm of reason. The District has demonstrated it is capable of preparing a bounding analysis and can use this, along with reasonable assumptions regarding useful life, to determine the rate of waste generation attributable to the Proposed Rules. This can and must be prepared and compared against existing disposal capacity in light of other reasonably foreseeable projects to inform the public of the potential scale of development necessary to accommodate the Proposed Rules.

44-15

¹² Ming et al., Long-Run Resource Adequacy under Deep Decarbonization Pathways for California, June 2019 https://www.ethree.com/wp-content/uploads/2019/06/E3_Long_Run_Resource_Adequacy_CA_Deep-Decarbonization_Final.pdf.

B. The District's Analysis of Air Quality Effects Relies on Outdated Modeling and Inconsistent Assumptions.

44-16

The District relies on a version of CARB's Emission Factor ("EMFAC") from 2017 to characterize emissions and reductions. While CARB applies some post-hoc modifications to approximate the effect of CARB's more recent regulations including the ACT Rule and Low NOx Omnibus, these are merely approximations. CARB has recently released EMFAC2021 which reflects CARB's own best estimates of the effect of these regulations on emissions. The District should re-characterize its analysis based on EMFAC2021 before taking action on the Proposed Rules. At the very least, the District should verify its modifications against the latest EMFAC modeling. Not doing so means that the District's analysis supporting adoption of the Proposed Rules is not based on the most up-to-date information and thus lacks substantial evidence. Similarly, the District relies on a version of the Southern California Association of Government's ("SCAG") Regional Transportation Plan/Sustainable Community Strategy ("RTP/SCS") that is a half-decade out of date. SCAG adopted its latest RTP/SCS in September 2020 which incorporates updated trip modeling. This information was plainly available the District long before it released its draft EA and thus there is no excuse for the District not to include the updated trip modeling information in the EA. The EA thus must be updated to reflect the most recent trip lengths analysis. *See Citizens to Preserve the Ojai v. County of Ventura* (1985) 176 Cal.App.3d 421, 430; *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 444-45 (court invalidated an EIR's analysis of farmland impacts because the agency relied on "a methodology with known data gaps, [which] produced unreliable estimates ... of the [project's] impacts").

The assessment of the Proposed Rules' air quality effects also rely on faulty assumptions. First, the scenario analyses do not account for increasingly strict state-level requirements that could reduce the emission reductions achieved by the Proposed Rules. These new requirements include the ACT Rule, the Low NOx Omnibus regulation, the ACF regulation, and the Ports Clean Air Action Plan. While these regulations are at least partially incorporated into an assessment of baseline emissions through the post-hoc modifications discussed above, the District does not carry these forward through its scenario analysis. This means that the range of emission reductions stated in the PDSR do not represent realistic assumptions of potential emission reductions from the Proposed Rules. Because all WAIRE points must constitute reductions that are additional to those generated by other federal and state laws, the District over counts potential reductions as attributable to the Proposed Rules, when they will actually be attributable to the enhanced state requirements and thus not eligible for WAIRE points. In this way, the District overstates the emission reductions the Proposed Rules will achieve. Second, the scenario analyses compares apples and oranges. The District claims as benefits of the Proposed Rules decreases in emissions associated from decreased demand for utility-based electricity as a result of the installation of on-site solar. But the District neglects to perform a similar analysis regarding the increased emissions from increased demand for utility-based electricity as a result of ZE vehicle deployment and charger installations. The District cannot adequately inform the

44-17

public by quantifying only the benefits and none of the costs. The District must quantify and disclose both halves of the equation, including whether compelling ZE deployment actually results in the scale of emissions reductions the District has predicted.

44-17
(cont'd)

C. The District Fails to Adequately Explain the Proposed Rules' Effects on the Environment.

It is not enough for an agency to declare that there is an environmental effect; “there must be a disclosure of the analytic route the ... agency traveled from evidence to action.” *Laurel Heights*, 47 Cal.3d at 403 (quotations and citations omitted); *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514-15 (“an EIR’s designation of a particular adverse environmental effect as ‘significant’ does not excuse the EIR’s failure to reasonably describe the nature and magnitude of the adverse effect”); *Berkeley Keep Jets Over the Bay Com. v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1371 (“The EIR’s approach of simply labeling the effect ‘significant’ without accompanying analysis of the project’s impact on the health of the Airport’s employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA.”). Unfortunately, the District has obfuscated the real impacts of the Proposed Rules and failed to provide a meaningful analysis of the effects.

44-18

For example, the District declares that “impacts associated with the need for new or substantially altered power utility systems, new and expanded infrastructure, and effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031” are conservatively considered a significant environmental effect of the proposed project, but it fails to provide a meaningful analysis of this effect. Like the agency in *Friant Ranch*, the District has analyzed the issue and disclosed the general effects, but it “did not connect the raw” energy numbers and their effects to specific adverse effects on the built environment. 6 Cal.5th at 518. After reading the EA, “the public would have no idea of the ... consequences that result from” dramatically increasing electricity demand. *Id.* at 519.

And the increase will be dramatic. The Draft EA discloses the electricity demands created by various compliance options, including Scenario 6 which would result in an additional 847 gigawatt hours per year of electricity demand. But the District never explains to the reader what this means for the electricity grid. The District predicts up to 28,569 new ZE/NZE trucks in 2031 as a result of the Proposed Rules (Draft EA at 4.1-24) and states that the California Energy Commission (“CEC”) assumed that 100,000 ZE trucks will be deployed by 2031 (Draft EA at 4.2-17), but fails to bridge the analytical divide and further fails to contextualize this increase. A cursory review of the ACT Rule Environmental Assessment indicates that CARB already anticipates driving the deployment of the full 100,000 ZE capacity assumed by the CEC by 2032 through the ACT Rule. ACT Environmental Assessment at IX-6. The additional 28,569 NE/NZE trucks that would occur from implementation of the Proposed Rules are thus wholly unaccounted

44-19

for in the CEC’s assumptions—as the District has gone to great pains to ensure that all trucks under the Proposed Rules will be in addition to those required by CARB. Thus, the District has failed the lead agency’s obligation to explain how the large increase in ZE/NZE trucks will affect electricity demand and energy supply, and lead to environmental impacts in California.

44-19
(cont'd)

Further, the District never explains what a nearly 30% increase in ZE/NZE trucks in a single air district means for the human environment. What are the “effects on peak and base period demands to accommodate the increase in demand from electric vehicles and refueling infrastructure by compliance year 2031”? The public and the Board are left—figuratively and possibly literally—in the dark.

44-20

This cursory conclusion without a full disclosure of the real effects on the human environment is widespread throughout the District’s analysis. “Because the [EA] as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time (and what limited translation is, in fact, possible)” (*Friant Ranch*, 6 Cal.5th at 521), the EA fails in its purpose as an informational document.

44-21

D. The Draft EA Fails to Adequately Analyze the Proposed Rule’s Impacts on the Transportation Sector.

As raised in CTA’s Scoping Comment letter, the Proposed Rules create significant uncertainty in commercial transportation. By compelling the early transition to ZE/NZE vehicles, the Proposed Rules drive rapid and premature fleet turnover for high-cost ZE/NZE vehicles while imposing the uncertain but often high costs of electricity and hydrogen fuel on the logistics sector. Additionally, while the Proposed Rules may incentivize the transition to ZE/NZE vehicles in the District’s jurisdiction, neither the Initial Study nor the Draft EA appears to have considered whether there is sufficient charging infrastructure to support these fleets outside of the District. Goods move across the air districts, but there is no analysis of whether the infrastructure exists for the anticipated ZE/NZE vehicles to complete these trips. Additionally, as California responds to increasing wildfire threats, public safety power shutoff (“PSPS”) events have become increasingly common.

44-22

In response to CTA’s Scoping Comment, the District first states that it is not feasible to anticipate the frequency of PSPS events or to analyze their effects. Draft EA at C-34. This is incorrect. Following each PSPS event, California utilities are required to file reports with the Public Utilities Commission disclosing what occurred. These reports are publicly available and the District can and should assess the number and coverage of PSPS events in its jurisdiction to understand, evaluate, and disclose the interaction between increased electrification and increasing grid instability. The District also deflects from the impacts of PSPS events by relying on the additional solar and battery technologies that it envisions will be implemented at covered warehouses. *Id.* at C-35. However, the District repeatedly explained throughout the PDSR and

44-23

the Draft EA that predicting the manner in which the warehouse may choose to comply would be pure speculation. The District's reliance on solar infrastructure to defray the potential significant effects of reliance on unstable grids thus is similarly pure speculation. Additionally, as discussed *supra*, the cost differential created by the District in fact disincentivizes the deployment of on-site solar in favor of ZE/NZE acquisition. Thus, there is evidence that the District's reliance on solar infrastructure to defray potentially significant effects on the grid is misplaced.

44-23
(cont'd)

While impacts to the State's logistics infrastructure are not specifically listed as impacts in Appendix G, the Appendix "is only an illustrative checklist and does not set forth an exhaustive list of potentially significant environmental impacts under CEQA or standards of significance for those impacts." *City of San Diego v California State University* (2011) 201 Cal.App.4th 1134, 1191; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1111. "Also, the lack of precise quantification or criteria for determining whether an environmental effect is 'significant' under CEQA does not excuse a lead agency from using its best efforts to evaluate whether an effect is significant. *City of San Diego*, 201 Cal.App.4th at 1191; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1370. The District provides no satisfactory explanation for its failure to analyze and disclose the effects of the Proposed Rules on the State's logistics infrastructure. The EA should consider the interaction between expedited electrification and PSPS events. It is reasonably foreseeable that the Proposed Rules will lead to significant disruptions to freight transportation, specifically in light of PSPS events.

44-24

E. The District Omits Projects from Its Cumulative Impact Analysis.

An EIR must discuss a cumulative impact if the project's incremental effect combined with the effects of other projects is "cumulatively considerable." CEQA Guidelines § 15130(a). This determination is based on an assessment of the project's incremental effects "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." *Id.* at § 15065(a)(3); *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1228.

44-25

The District contends that a cumulative impact analysis is not required because the Proposed Rules are consistent with the 2016 AQMP, the State SIP Strategy, and the ACT Rule. Draft EA at 4-11–12. However, the Proposed Rules are not consistent with the ACT Rule in that they are specifically designed to be additional to the requirements of the ACT Rule. Similarly, the District cannot rely on the analysis completed for the State SIP strategy since that analysis was focused on statewide emission control strategies adopted by CARB (including the ACT Rule), and did not contemplate further purchase mandates from local air districts.

44-26

As to the 2016 AQMP, the District may only rely on the cumulative analysis discussion to the extent cumulative effects were previously adequately addressed and there are no new significant cumulative effects. CEQA Guidelines § 15152(f). In the half decade that has elapsed since the

44-27

environmental review for the 2016 AQMP, numerous other proposals to reduce emissions through electrification have been proposed both within and outside the District’s jurisdiction that will impact the same electric grid and resources. For example, the cities of Santa Monica and West Hollywood have adopted Reach Building Codes driving full electrification. The cities of Culver City and Hermosa Beach are considering similar initiatives. The California Public Utilities Commission has initiated a rulemaking along with the CEC on building decarbonization (R.19-01-011) and on transitioning from natural gas (R.20-01-007). The cumulative effects of these and other electrification initiatives must be analyzed. CEQA Guidelines § 15130(a)(1); *City of Long Beach v. Los Angeles Unified Sch. Dist.* (2009) 176 Cal.App.4th 889, 907 (an EIR’s analysis of cumulative impacts must consider all sources of related impacts, not just similar sources or projects). While a lead agency has discretion to establish a reasonable cutoff date for future projects to include in its cumulative impact analysis, that determination must be supported by substantial evidence. *South of Market Community Action Network v. City & County of San Francisco* (2019) 33 Cal.App.5th 321, 336. The cumulative effects of mass electrification initiatives adopted and proposed since the 2016 AQMP may risk environmental disaster or severe environmental harm and require evaluation. *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d 397, 408; *San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 720. The EA must disclose these new projects and their cumulative effects.

44-27
(cont'd)

F. The Draft EA Unlawfully Rejects Alternative B.

The Draft EA impermissibly dismisses an alternative that, if appropriately analyzed and characterized, could reduce environmental impacts. “Pursuant to CEQA’s ‘substantive mandate,’ an agency may not approve a proposed project if feasible alternatives exist that would substantially lessen its significant environmental effects.” *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 520; see Pub. Resources Code § 21002. Despite identifying environmental benefits associated with Alternative B (Decreased Emissions Reductions), the Draft EA determines that it is not environmentally superior to the Proposed Rules. The Draft EA does not adequately support its conclusion that only Alternative C (Increased Emissions Reductions) is “environmentally superior.” Draft EA at 5-27.

44-28

The Draft EA indicates that the Proposed Rules would have significant and unavoidable direct impacts (1) on energy resources, (2) from hazardous materials and solid and hazardous waste, and (3) on transportation and significant and unavoidable indirect impacts on (1) aesthetics, (2) agriculture and forestry, (3) biological resources, (4) cultural resources, (5) geology and soils, (6) hydrology and water quality, (7) noise, (8) mineral resources and (9) utilities and service systems. Draft EA at 6-2–3. The Draft EA further acknowledges that **all** of these significant and unavoidable impacts are in fact **worsened** by Alternative C. *Id.* at 5-16–17. Yet the District paradoxically labels this as the environmentally superior alternative because the NOx and PM emissions will be lower than under the Proposed Rules. The District is measuring with the wrong yardstick. The environmentally superior alternative is an alternative that **lessens** the project’s **significant effects**. The District itself acknowledges that the Proposed Rules have a less than

44-29

significant effect on long-term air quality impacts. *Id.* at ES-4. There is no significant effect of the Proposed Rules that Alternative C in fact lessens.

44-29
(cont'd)

By contrast, Alternative B would “lead to less cargo growth potentially being diverted to other ports and resulting in less GHG emissions from cargo growth diversion than the proposed project,” “lead to a lower demand on utilities,” reduce infrastructure needs, “reduce the number of batteries that need to be recycled, and “have less adverse direct impacts to energy and hazardous materials and solid and hazardous waste.” *Id.* at 5-15. “Alternative B’s indirect adverse environmental impacts on air quality and GHG emissions, energy, hazardous materials and solid and hazardous waste, and transportation would likely be less than the proposed project.” *Id.* “The reduction in the number or intensity of development of new facilities and grid improvement would likely lead to less adverse indirect environmental impacts in the areas of Aesthetics, Agriculture and Forestry, Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality, Mineral Resources (with regards to long-term operational-related impacts from reduced demand for new mines and mining activities because of the reduced use and demand of lithium-based batteries in ZE vehicles), Noise, and Utilities than the proposed project.” *Id.* The only metric by which the District finds Alternative B insufficient is that “Alternative B’s ongoing, long-term, and permanent air quality and public health **benefits would be less** when compared to the proposed project.” *Id.* at 5-16. But as described above, this is not the standard—the question is whether the alternative would lessen the significant effects and the District has determined that the Proposed Rules’ effect on long-term air quality impacts is **less than significant**.

44-30

The only grounds on which the District may reject an environmentally superior alternative is if it is infeasible. The District evaluated five alternatives to the Proposed Rules, including a no project alternative. One of these, Alternative B, was a version of the Proposed Rules with a narrower application (only to warehouses greater than 200,000 square feet), a year delay in compliance obligations, and less aggressive emissions reduction targets as a result of a decreased rule stringency factor. Draft EA at 5-6. As noted in Table 5-2, Alternative B would accomplish **all** of the District’s objectives. Draft EA at 5-12. Despite the reduced environment impacts described above, the District rejected Alternative B because it did not reduce emissions quite as much. However, a lead agency cannot adopt artificially narrow project objectives that would preclude consideration of reasonable alternatives for achieving the project’s underlying purpose. *North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647, 669; *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 203. Alternative B accomplishes the District’s aims while reducing the environmental impacts.

44-31

VIII. Conclusion.

The District has not been granted the authority to impose a sweeping purchase mandate on existing, unmodified warehouses under the guise of an ISR regulation. While the District’s goals of reducing air emissions in the Basin are laudable, the District has only the rulemaking authority

44-32

Ryan Bañuelos
Victor Juan
March 2, 2021
Page 24

invested in it by statute. Even if the Legislature had granted the District such authority, it is preempted by federal law. The regulation as proposed fails to meet the standards specified by the Health and Safety Code and the accompanying Draft EA fails to meet the District's obligations under CEQA and fails as an informational document. For this reason, the District must revise the Proposed Rules and EA before adoption in order to bring them into compliance with state and federal law.

Re: Comments on Proposed Rule 2305

Dear Mr. McMillan & Mr. Juan:

The California Chapter of the International Warehouse Logistics Association (IWLA) would like to request that the comments in this letter be included in the administrative record in response to the Draft Staff Report for proposed rule 2305.

45-1

Members of the IWLA are an integral part of Southern California supply chain and face unique challenges as a frontline essential workforce. Our members provide warehouse and other logistics services in every sector of the economy: manufacturers, wholesalers and retailers, and handle all kinds of products ranging from food to pharmaceuticals, medical supplies to consumer goods, domestically and internationally. Approximately 18 million people who live in Southern California rely on warehouses and the goods movement system to get them the items they need to survive.

Comments for consideration:

- The SCAQMD has authority over stationary sources in our region and has reached outside their mandate with the proposed rule to regulate mobile sources as this authority resides with the California Air Resources Board (CARB).
- The proposed rule requires warehouses to control truck fleets and decrease truck emissions, but technology is not available for heavy-duty electric trucks at present.
- Warehouses don't control which trucks come to their facilities, when they arrive, where they come from or anything related to truck trips, so using truck trips as a way to meet the rule requirements is not feasible and arbitrary.
- Warehouses have no control over how truck engines are made and in most cases don't own trucks nor control what type of trucks shipping companies purchase.
- The Stringency factor seems to be arbitrary as there doesn't seem to be any rational, modeling or science behind how the number .0025 was derived. It's based off hypothetical cost emission reductions that don't appear to be practical.

45-2

45-3

45-4

45-5

45-6

- | | |
|--|-------|
| ➤ Warehouses provide a vast array of jobs for people of any level of education and skill set that provide upward mobility in the job market, especially in light of the economic downturn and the COVID-19 pandemic. | 45-7 |
| ➤ The proposed rule will impose a significant burden and expense in the hundreds of thousands for an average size 250 thousand square foot warehouse. This is at a time where over 18 million people who live in Southern California and rely on warehouses and the goods movement system to get them the items they need to survive will face increased costs that will be regressive and hit lower income communities the hardest. | 45-8 |
| ➤ Warehouses in SCAQMD coverage areas will be placed at a competitive disadvantage and beneficial cargo owners will look to divert their cargo to alternative areas in surrounding states or alternative ports of entry to warehouse and distribute their cargo. | 45-9 |
| ➤ Jobs are scarce now, and a mitigation fee/tax of \$1 per square foot of warehouse space will critically impact warehouse operator's ability to create new jobs or sustain existing ones. This would be a permanent increase that has no sunset clause or limits to how it could rise. Most if not all warehouses will end up paying the fee/tax due to the impossibility of compliance with this mandate. | 45-10 |

We appreciate your consideration and look forward to your response to our comments. Additionally we would like to be included in your distribution list for all future correspondence concerning Proposed Rule 2305.	45-11

Re: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan and Mr. Juan:

Watson Land Company is an owner and developer of master planned business and industrial centers in Southern California and the East Coast. The company strives to be a good corporate citizen by attracting quality companies that bring jobs and other economic benefits to the communities where Watson has real estate holdings.

As an owner of logistics facilities (“warehouses”), Watson Land Company provides needed infrastructure and is proud to be part of the supply chain industry that has been deemed essential by both state and federal governments. As you know, the warehouse industry has played a vital role in the regional and national response to the Covid-19 pandemic. Many of our customers are warehouse operators engaged in the delivery of much-needed goods and medicines to the population of Southern California during these difficult times.

We adamantly oppose the adoption of Proposed Rule 2305 (Warehouse Indirect Source Rule or “ISR”). We believe the District’s proposed ISR would have severe unintended consequences and is ill-timed in the midst of the COVID-19 pandemic and what will likely be a long economic recovery. The District is pursuing a regulation targeted at a specific sector that serves our region and nation, and which is experiencing enormous strains due to the challenges of the current pandemic.

The ISR will impose an entirely new regulatory compliance regiment onto distribution warehouse operators. Many warehouse operators are not structured or staffed with the systems and personnel needed to satisfy the oppressive compliance requirements embodied in the proposed rule. They generally lack the personnel and systems needed to gather the information required to be reported. Thus, the District’s rulemaking would divert industry resources and attention to this rule at a time when the industry needs to maintain focus on the efficient and reliable delivery of essential goods.

Watson Land Company has the following comments regarding the ISR:

1. The SCAQMD does not have the legal authority to adopt the ISR. The District has the authority to engage in such rulemaking with NEW Construction projects, but not EXISTING facilities. The proposed ISR seeks to regulate existing buildings/facilities. In addition, the District has not substantiated its jurisdiction/authority to regulate the trucking industry, which is integral part of interstate commerce. As noted in the name of the proposed rule, the proposed rule is an

<p>“indirect” means of regulating the trucking industry through warehouses. The District should publicly explain its rationale in seeking to regulate interstate commerce activity, thereby presenting Federal preemption issues with this proposed ISR.</p>	<p>46-4 (cont'd)</p>
<p>2. This rule would impose additional/permanent costs on our customers of approximately \$90,000 to over \$1 million annually. Many of these businesses are struggling to remain in California, given the current regulatory environment. The proposed ISR targets a specific essential industry with \$1 billion in annual taxes/fees during the worst possible time, as it responds to the challenges of the pandemic on behalf of our region and nation.</p>	<p>46-5</p>
<p>3. The District has not clarified how these “fees” would provide any benefit/service to the group from which it is collected (the warehouse industry). Thus, these “fees” may easily be classified as a tax. This presents a question of the District exceeding its jurisdiction/authority in imposing this tax.</p>	<p>46-6</p>
<p>4. It is not feasible for the warehouse industry to comply with the ISR due to the following: Under the current proposed rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021. The proposed rule requires warehouses to control truck fleets and decrease truck emissions but warehouse operators are not able to accomplish this task. Warehouses have no control over how truck engines are manufactured. Warehouse operators do not own truck fleets nor control what type of trucks shipping companies purchase. Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from or any other variables related to truck trips.</p>	<p>46-7</p>
	<p>46-8</p>
<p>5. The technology is not fully available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are 100% viable from a technology and/or economically reasonable standard.</p>	<p>46-9</p>
<p>6. Warehouses provide a broad range of jobs for people with diverse levels of education and skill sets, leading to upward mobility. The San Pedro Bay Ports are an economic engine responsible for approximately 3.1 million jobs throughout the nation. The warehouse industry serves as essential infrastructure to these ports. This socioeconomic benefit is threatened by the onerous costs imposed by the ISR.</p>	<p>46-10</p>
<p>Should you have any questions or wish to discuss our perspective, please feel free to contact me.</p>	<p>46-11</p>

Respectfully,

Jeffrey R. Jennison
President and Chief Executive Officer

Re: Proposed Rule 2305: Warehouse Indirect Source - WAIRE Program and Proposed Rule 316 - Fees for Regulation

Dear Mr. Juan,

On behalf of the [Los Angeles Cleantech Incubator](#) (LACI), thank you for providing the opportunity to comment on South Coast Air Quality Management District's (SCAQMD) *Proposed Rule 2305: Warehouse Indirect Source - Warehouse Actions and Investment in Reduction of Emissions (WAIRE) Program and Proposed Rule 316 - Fees for Regulation*. LACI supports passing an Indirect Source Rule focused on warehouses, as its enforcement is a necessary effort to reduce air pollution and climate emissions in the region. LACI also believes that a strong WAIRE Program will accelerate deployment of the zero emissions technology required to meet air pollution and climate goals of the state while also providing economic benefits to the local workforce and goods movement industry. These effects of the WAIRE Program align with LACI's efforts to advance transportation electrification in the greater Los Angeles region.

47-1

In May 2018, LACI convened the [Transportation Electrification Partnership](#) (TEP), an unprecedented regional public-private collaboration to accelerate deep reductions in climate and air pollution by the time of the 2028 Olympic and Paralympic Games by pursuing bold targets, pilots, initiatives, and policies that are equity-driven, create quality jobs, and grow the economy. The 30+ members of TEP represent state regulators, local government, utilities, industry leaders, labor organizations and startups, all of whom are working to achieve [bold transportation electrification targets](#) in Los Angeles County, including the following:

- 95,000 chargers installed for goods movements to enable 60% of medium-duty delivery trucks to be electric and 40% of short-haul and drayage trucks on the road to be zero emissions by 2028

Implementation of the WAIRE Program will provide a regulatory solution to difficult problems, including access to depot charging infrastructure for fleets that do not own the facilities on which they operate. To further advance reductions in air pollution and climate emissions, LACI wishes to offer the following specific support and recommendations to Proposed Rule 2305:

1. Maintain Zero Emission Yard Trucks as the Sole Acceptable Yard Truck Technology for Earning WAIRE Points

Zero emission yard trucks have been in commercial operation at warehouses and rail yards in SCAQMD territory since 2017, having long proved their economic and operational viability. As structured, acquiring and deploying zero emission yard tractors provides an opportunity to earn large quantities of WAIRE points, and SCAQMD should not distract from this incentive by including any ability to earn points from deployment of NZE yard tractors.

47-2

2. Consider Offering WAIRE Points per EVSE Successfully Installed and Energized

As structured, purchasing EVSE earns WAIRE Points for each unit acquired, while beginning and completing an installation chargers earns WAIRE Points per construction permit, whether the construction project entailed installing one or ten EVSE. We encourage SCAQMD to review this structure to ensure that the Program incentivizes timely completion of construction projects and energizing of EVSE, as well as maximizing the size of EVSE depots deployed.

47-3

3. Consider Increasing the Stringency Level

We consider the current proposed stringency value of 0.0025 WAIRE points/WATT as too low to accelerate deployment of zero emission vehicles and reduce air pollution in burdened communities, and urge the Air District to evaluate and consider higher stringency values for the final rule.

47-4

In the face of increasing rents and cargo diversion, the regional warehousing industry continues growing. Thus, the industry can, and must, shoulder regulatory costs aimed at reducing air pollution. We request that the agency adopt at least a 0.005 WAIRE points per WATT stringency and agree to revisit the effectiveness of this rule at a later date. The Air District's own analysis shows that a stronger rule would have a marginal result in warehouses leaving the region, and a higher stringency value is necessary to bring about a transformation of Southern California's goods movement industry.

4. Consider Increasing the Mitigation Fee to Further Encourage Investments in Zero Emissions Technology

Implementing too low of a mitigation fee option would allow regulated facilities to pay their way into compliance, rather than invest in on-site WAIRE menu items to clean up operations. This is proven by the agency's own projections showing that the \$1000/point fee remains a cheaper compliance pathway in the initial phases of the rule. In order to incentivize investment in the WAIRE menu items, we ask that staff consider a higher mitigation fee. Additionally, should warehouses opt to pay their way into compliance, the

47-5

Air District should require that these funds are spent in the communities surrounding those facilities.

5. Provide Transparency on Data Relevant to Enforcing Compliance

The Air District must make certain information relevant to Proposed Rule 2305 available to the public to ensure transparency in enforcement and compliance effectiveness. This type of information includes, but is not limited to, the number of truck trips to each regulated facility and those trucks' fuel types. This traffic information is critical to understanding the impacts of warehouses on adjacent communities and will be essential for proper enforcement of the rule, as well as targeted advancement of zero emission deployments.

47-6

We thank you for the opportunity to provide comment on Proposed Rule 2305. LACI believes this is an important step towards the region and the state realizing its air pollution and climate emissions goals, and supports an equitable and immediate implementation of the rule that maximizes the opportunities for the region to remain a leader in goods movement and clean transportation.

47-7

Sincerely,

Jack Symington

**RE: Comments Regarding Proposed Rule 2305 – Warehouse Indirect Source Rule
– Warehouse Actions and Investments to Reduce Emissions (WAIRE)
Program and Proposed Rule 316 – Fees for Rule 2305**

Dear Mr. Juan:

Los Angeles World Airports (LAWA) appreciates the opportunity to participate in the South Coast Air Quality Management District's (AQMD) Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 (proposed rule) rule making development. LAWA supports the need to develop programs to achieve applicable national ambient air quality standards (NAAQS) and reduce greenhouse gas emissions in the South Coast region. AQMD and LAWA recently entered into a Memorandum of Understanding with mutually agreed upon air quality emission reduction programs at Los Angeles International Airport (LAX) that will achieve State Implementation Plan (SIP) creditable emission reductions.

We would like to offer the following comments on the proposed rule as staff continues to develop the rule and emission reduction opportunities for the Warehouse Indirect Source Rule.

First, LAWA is concerned about the potential to overcount truck trips that visit cargo and warehouse facilities on a single campus like LAX. LAX has several cargo facilities in close proximity to one-another. Often, one truck will visit two different cargo operators within the same physical facility (physically moving from one loading dock to another) or visit multiple cargo facilities at LAX before departure. Under the proposed rule, where actual truck trips will be collected by each cargo operator and operators will accrue WAIRE points compliance obligations based on the number of truck trips to their facility, this may result in overcounting truck trips at LAX and unfairly penalize warehouse operators at LAX by inflating the number of WAIRE points compliance obligations as compared to warehouse operators at off-airport facilities. The counting of truck trips by each operator will also make it appear that there is far more truck traffic at LAX than

48-1

48-2

there actually is. LAWA requests AQMD refine its methodology for calculating an operator's Weighted Annual Truck Trips (WATTs) to eliminate the overcounting of truck trips to a single campus like LAX. Revising the methodology for calculating WATTs to account for trucks that pick-up cargo from multiple operators on a single campus will better represent the actual number of truck trips and the actual oxides of nitrogen (NOx) emissions from warehouse activity and thereby not unfairly burden cargo operators located on a single campus with excessive compliance obligations that require them to undertake additional mitigation actions.

48-2
(cont'd)

Second, LAWA would like additional flexibility to develop a custom WAIRE project to assist LAX cargo operators earn WAIRE points based on LAWA's modernization projects and electric infrastructure upgrades. LAWA is currently undergoing several large capital improvement projects, including the Landside Access Modernization Program (LAMP), that support emission reduction activities. A component of LAMP is the Automated People Mover, which will be a zero-emission electric train system connecting LAX to the regional rail system and transporting passengers, guests, and employees to and from the Central Terminal Area at LAX more efficiently. LAWA would like to be able to use these campus-wide upgrades, such as LAMP, as actions that count towards an individual operator's WAIRE points.

48-3

Third, LAX depends upon financial incentives, including the Federal Aviation Administration's Voluntary Airport Low Emission Program (VALE), to fund emission reduction programs. VALE funding supports a wide-range of emission reduction activities at airports and could include electrification of cargo operations. Projects recently funded under the VALE program include the purchase of electric buses and infrastructure to provide ground power to parked aircraft. In order to be eligible for VALE grant funds, airport emission reduction projects must be voluntary. If airport projects are the result of a regulatory program, such as the proposed rule, LAWA will lose eligibility for VALE funding, and important emission reduction projects may not be implemented as a result.

48-4

Fourth, the AQMD should consider potential preemption issues under 49 U.S.C. §§ 41713(b) [the Airline Deregulation Act] and 14501(c) [the Federal Motor Carrier Act], which, respectively, restrict the ability of local authorities to enact or enforce any regulation related to a price, route, or service of any air carrier or any motor carrier engaged in the transportation of property.

48-5

Lastly, consider clarifying or replacing the phrase "may be used" in the Requirements section on page 4, section (d)(1), from the proposed rule. This phrase is not defined and raises confusion about what constitutes "floor area" in a warehouse that "may be used" for warehousing activities and how warehouse operators apply the rule to their warehouses.

48-6

Section (d)(1) "...Only warehouse operators in buildings with greater than or equal to 100,000 square feet of floor area that may be used for warehousing activities and who operate at lease 50,000 square feet of the warehouse are required to earn WAIRE Points." (emphasis added).

LAWA supports the AQMD's goal to improve air quality in the region and would like to work with staff to create a framework that better reflects cargo operations at airports and does not unfairly penalize cargo operators on airport property. We believe these revisions to the proposed rule will provide greater visibility and understanding of cargo operations and related air quality improvement programs at airports and encourage the development of new programs resulting in

48-7

cleaner air. Active engagement between SCAQMD staff, airports, and other stakeholders can drive the change towards cleaner air.

48-7
(cont'd)

LAWA appreciates the opportunity to provide these comments and looks forward to continuing to work with SCAQMD staff and the Warehouse Indirect Source Rule Development Group to achieve emissions reductions through a collaborative approach. If you have any questions, please contact Tami Mccrossen-Orr of LAWA's Environmental Programs Group, at (424) 646-6734.

Re: Comments on the Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Mr. Juan,

On behalf of the undersigned coalition of organizations, we submit these comments on Proposed Rule 2305. We appreciate staff's continued work on the warehouse indirect source rule, but we remain concerned that the current proposal will not meaningfully regulate an industry that has polluted communities for years. As demonstrated in the figure below, the warehouse industry has grown steadily in the South Coast Air Basin in the past two decades,¹ and nearby communities continue to be disproportionately impacted by the polluting trucks visiting these facilities.

49-1

Figure 10: Industrial Building Growth by County

¹ SCAQMD, Preliminary Draft Staff Report, 45.

The ongoing covid-19 pandemic has exacerbated the unacceptable health risks that these frontline communities face every day. Last year, this public health crisis coincided with one of the worst smog seasons in the South Coast Air Basin in decades – with a total of 157 days of ozone pollution levels exceeding state and federal air quality standards.²

Meanwhile, the warehouse industry has reported record-breaking profits during the pandemic as consumers increasingly rely on e-commerce. Last year, the San Pedro Bay Ports hit record freight volumes for several months. At the Port of Long Beach, December 2020 was the Port’s busiest month in its 110-year history, and 2020 was the Port’s “all-time busiest year.”³ This increased port activity has only accelerated the expansion of an already booming warehouse industry, further compounding the health burdens on nearby communities.⁴ In the Inland Empire, warehouse vacancy rates have reached their lowest in a decade while lease rates have increased.⁵

Industry analysts have further noted that the industry is doing particularly well financially. “Major investors like Blackstone; and household tenants like Amazon; and landlords like Dedeaux Properties, Prologis, and Rexford Industrial Realty are raking in all the chips in the changing landscape brought on by the coronavirus crisis.”⁶

A strong warehouse indirect source rule will address these growing disproportionate pollution burdens, provide basic health protections to our communities, and put the South Coast on track to attain

⁶ *Id.*

federal and state ambient air quality standards. But the Air District must prioritize public health and take into account community needs in the development of this rule.

I. The Air District must increase the proposed stringency in order to meaningfully address public health concerns.

We oppose the current proposed stringency value of 0.0025 WAIRE points per WATT and urge the Air District to evaluate and consider higher stringency values for the final rule. The undersigned organizations have repeatedly asked for a rule that starts with sufficient stringency to provide relief to communities sooner.

The Air District has identified several factors that were taken into consideration in determining the stringency.⁷ We disagree with the agency's approach of "balancing all factors." Public health concerns are unequivocally of greater importance than the financial impact to an industry that profits at the expense of our communities' health. As the Air District has acknowledged, the warehouse industry is experiencing record profits and all-time low vacancies. Despite increasing rents and cargo diversion, the industry continues to grow in the region and facilities are not choosing to leave the area.⁸ The industry can, and must, shoulder these regulatory costs. A transformation of the warehouse industry is long overdue, and public health must be the single most important factor in guiding the stringency of this rule.

49-2

The current range of stringency values, if implemented, is far too low to bring about meaningful change to warehouse operations.⁹ The lowest stringency value studied by the Air District (0.0001) would only reduce, at a maximum, 1.5 tons per day of nitrogen oxide emissions and 0.01 tons per day of diesel particulate matter emissions.¹⁰ Due to the annual variable and phase-in schedule, the full stringency would not even apply to many warehouses for years.¹¹ These emissions reductions will not be sufficient to bring relief to communities living adjacent to warehouse facilities in the near future. We request that the agency adopt at least a 0.005 WAIRE points per WATT stringency and agree to revisit whether this is sufficient at a later date. The Air District's analysis shows that a stronger rule would have a marginal result in warehouses leaving the region (i.e. six warehouses leaving under a 0.005 stringency level and three for a 0.0025 stringency level), and a higher stringency value is necessary to bring about a transformation of this industry.

II. A strong warehouse ISR must prioritize zero-emissions technology.

As noted in our previous comment letters, a strong warehouse indirect source rule must prioritize zero-emissions technology and infrastructure, the only solution that will effectively address the air quality and health impacts caused by this industry. Yet, the Air District's scenario analysis continues to overestimate the emissions reductions for near-zero technologies. For example, facilities earn the same amount of points for NZE class 4-7 truck visits and ZE class 4-7 truck visits.¹² This obscures the real costs of near-zero technologies – further investment in natural gas and oil infrastructure that will perpetuate harm in frontline communities. We request that the Air District update the WAIRE menu to incentivize investment in zero-emissions technology and infrastructure.

49-3

⁷ Preliminary Draft Staff Report, 6.

⁸ *Id.* at 58.

⁹ SCAQMD, *Warehouse ISR Working Group Presentation* (Dec. 17, 2020), slides 21-22.

¹⁰ *Id.* at slide 22.

¹¹ Preliminary Draft Staff Report, 29.

¹² *Id.* at 97.

A rule that incentivizes zero-emissions technology will protect the health of our communities and create quality jobs. The transition towards zero-emissions will require the installation of charging infrastructure, on-site solar panels, and the manufacturing of electric vehicles – all of which will lead to meaningful job opportunities in the implementation of cleaner technologies at warehouses. The manufacturing of zero-emission buses and solar panel installation on larger commercial buildings have created and broadened access to unionized jobs with quality wages and benefits for workers. The warehouse indirect source rule can facilitate a similar transformation that will further increase demand for quality jobs in the greening energy, transportation, and manufacturing sectors. The Air District should not waste an opportunity to develop a rule that will lead to significant emissions reductions and create access to good jobs.

49-3
(cont'd)

III. The Air District must increase the mitigation fee to encourage investment in zero-emissions.

We remain concerned about the mitigation fee option as it allows regulated facilities to pay their way into compliance, rather than invest in on-site WAIRE menu items to clean up operations. Although the scenario cost analysis estimates that the mitigation fee will be a more costly option and not frequently used, the agency's projections show that the \$1000/point fee remains a cheaper compliance pathway in the initial phases of the rule.¹³

49-4

Figure 14: Potential Bounding Analysis Costs from Truck Acquisition and Subsequent Usage Scenarios

In order to incentivize investment in the WAIRE menu items, we ask that staff consider a higher mitigation fee. In the event that warehouses opt to pay their way into compliance, the Air District should require that these funds are spent in the communities surrounding those facilities.

IV. The Air District should release data on warehouse facilities that is relevant to compliance.

In order to ensure proper public engagement, the Air District must make certain information relevant to compliance available to the public. Specifically, we request that the agency release the

49-5

¹³ *Id.* at 66.

following data: the number of truck trips to each regulated facility; the number of trucks and tractors serving a warehouse, by truck class and fuel type; the trucking companies servicing the regulated facilities; and the truck routes to and from each facility.

This information is critical to understanding the impacts of warehouses in nearby communities. There is no legal rationale to withhold this information from the public. Such data does not constitute confidential business information and will be essential for proper enforcement of the rule.

49-5
(cont'd)

V. We cannot afford further delays of the warehouse indirect source rule.

Finally, the Air District must adopt the warehouse indirect source rule as expeditiously as possible, and no later than April. We appreciate staff's continued work on this critical regulation, but the rule has experienced numerous delays while the freight industry continues to pollute communities living near warehouses. The Air District has the opportunity to adopt a strong and equitable warehouse indirect source rule that will provide significant health benefits to frontline communities. We ask that staff continue to engage with community members so that community needs and concerns can be addressed in the development of this rule.

49-6

We appreciate your consideration of these comments and the staff's work on this important rule. We look forward to continuing to work with the Air District to develop a regulation that prioritizes public health.

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

BizFed opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

50-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

50-2

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

50-3

2. It is not feasible to comply with the ISR due to the following:

a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task

b) Warehouses have no control over how truck engines are manufactured.

c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase

d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

50-4

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

50-5

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:

a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

50-6

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.	50-7
a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.	
6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.	50-8
7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.	50-9
Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.	50-10

Victor Juan
Program Supervisor
South Coast Air Quality Management District
21865 Copley Drive Diamond Bar, CA 91765

Re: Comments Proposed Rule 2305 (the Warehouse Indirect Source Rule)

Dear Mr. Juan,

The Coalition for Clean Air (CCA) appreciates the opportunity to provide comments on Proposed Rule (PR) 2305. Southern California has long been a hub of the global goods movement industry. Nearly 40 % of all imports into the United States enter through the Ports of Los Angeles and Long Beach. Most of these imports are then transported via truck to warehouses in the Harbor Area, East Los Angeles, and increasingly, in the Inland Empire.

51-1

As a result, communities near goods movement corridors or facilities suffer disproportionately from emissions. Diesel particulate matter – a known carcinogen – is the primary air toxic contaminant in the South Coast Air Basin. This impact is even more severe in communities near goods movement corridors and facilities. Ozone continues to plague the South Coast Air Basin; not only is the district in Extreme Nonattainment of the National Ambient Air Quality Standards, but the district is also on track to fail meeting standards by the 2023 deadline. Meanwhile, residents near warehouses are impacted by emissions, traffic and other intrusions and disruptions.

Given the exponential growth of the warehousing industry and the associated impacts on air quality, SCAQMD should implement a strong, effective warehouse Indirect Source Rule (ISR.) Four of the five AB 617 Community Steering Committees in the South Coast Air Basin have explicitly identified ISRs as a strategy for reducing emissions from trucks. Failure to consider, adopt, and implement a warehouse ISR would break the commitments made to these communities. Further, failing to pass a strong warehouse ISR would create a bad precedent for other indirect sources, such as railyards, ports, and airports.

For the warehouse ISR to be effective, PR 2305 must prioritize public health and addressing community needs. To this end, we offer the following comments on how PR 2305 could be strengthened and improved.

1. The stringency value should be increased to maximize emissions reductions. Further, the WAIRE formula should consider cumulative impacts from warehousing and other emissions sources.

The proposed “stringency value” (.0025) in the Warehouse Actions and Investments to Reduce Emissions (WAIRE) points compliance obligation formula is insufficient and should be increased. Using this stringency value, SCAQMD staff anticipates emissions reductions of 2.5-4 tons per day (tpd) once PR 2305 is fully phased in by the district. This is not significantly higher than the lowest potential stringency value of .0001, which would yield emissions reductions of 1.5 tpd. As such, we join other environmental and air quality advocates in calling on the district to increase the stringency value to increase PR 2305’s emissions reductions.

51-2

Further, community advocates are concerned that PR 2305 does not address local needs. Warehouses do not operate in a vacuum – in many cases, communities are adjacent to multiple warehouses. These communities are also often impacted by other emissions sources, such as freeways, railyards, and industrial sources. As such, the district should revise the WAIRE formula to take cumulative community impacts in consideration.

51-3

2. The potential for loopholes, emissions trading and paper compliance must be eliminated.

We laud SCAQMD staff for explicitly stating WAIRE points will not be tradable among different warehouse operators. We remain concerned, however, that PR 2305 leaves the door open to game the system. In particular, the transferability of points between the same warehouse operator and the ability to pay a compliance fee in lieu of earning WAIRE points could result in loopholes and opportunities for paper compliance rather than actual emissions reductions.

51-4

Regarding the transferring of WAIRE points, we understand the district’s intent is to discount points based on their “vintage” (age) or from where the points are transferred. Yet, the district must take care to ensure benefits from emissions reductions are not being transferred out of disadvantaged communities. For example, a warehouse operator could transfer excess points from a warehouse in a non-disadvantaged community to a warehouse in a disadvantaged community. This would have the effect to reducing the emissions reductions in the disadvantaged community.

Further, we remain concerned that warehouse operators can buy their way out of compliance and merely pay a “mitigation fee.” While the proceeds of this compliance fee would result in some emissions reductions due to truck replacements or funding other actions, it does not truly maximize emissions reductions. Rather, allowing warehouses to pay a mitigation fee could result in a pay-to-pollute scenario where paying the fee is

incentivized over actual emissions reductions. As such, SCAQMD must ensure earning WAIRE points is the primary way to achieve compliance with PR 2305.

51-4
(cont'd)

3. We agree mitigation fee revenues should be used locally; however, SCAQMD must use the fee to support clean technology, infrastructure deployment, and other actions which will reduce emissions.

We appreciate SCAQMD Board Members expressing a desire to see mitigation fee revenues be used in the same communities from where they are collected. Using mitigation fee revenues will maximize PR 2305's benefits to warehouse-adjacent communities as well as deliver broader benefits to the South Coast Air Basin. Yet, we are concerned about the potential overreliance on air filtration. At the last Mobile Source Committee meeting, a Board Member cited filtration as an example of projects eligible for mitigation fee revenues. We do not believe; however, the comment should be construed as the Governing Board prioritizing air filtration over other projects. While air filtration may have a role, mitigation is no substitute for emissions reductions. As such, SCAQMD should commit to prioritizing projects which would reduce emissions in communities impacted by warehouses and the goods movement industry.

51-5

4. Any emissions reductions from the WAIRE program and PR 2305 must be above and beyond the reductions stemming from California Air Resources Board (CARB) regulations or state and local action.

To maximize emissions reductions, PR 2305 should exceed the reductions built into previously adopted regulations by CARB, SCAQMD and other governmental entities. While the draft staff report notes, at the current time, it is too speculative to determine if PR 2305 will result in State Implementation Plan (SIP)-creditable actions, SCAQMD should ensure that emissions reductions exceed pre-existing commitments.

51-6

Thank you for considering our comments.

51-7

Sincerely,

South Coast Air Quality Management District

Diamond Bar, CA 91765

Dear Ms. Rees:

The California Business Properties Association representing over 400 individual companies and every major commercial real estate association is opposed to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

CBPA is the designated legislative advocate for the International Council of Shopping Centers (ICSC), the California Chapters of the Commercial Real Estate Development Association (NAIOP), the Building Owners and Managers Association of California (BOMA), the Retail Industry Leaders Association (RILA), the Institute of Real Estate Management (IREM), and the Association of Commercial Real Estate – Northern and Southern California (ACRE) the National Association of Real Estate Investment Trusts (NAREIT), and AIR Commercial Real Estate Association (AIR CRE).

Our members believe the draft ISR Warehouse Actions and Investments to Reduce Emissions "WAIRE Points," is too complicated, costly, and duplicative of existing efforts, and will not achieve the stated desired outcomes.

California already regulates mobile sources pursuant to its waiver under federal Clean Air Act, and this power is unique in the nation. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting the world's first mandate to manufacture and sell zero-emission commercial vehicles.

CARB has also stated its intent to adopt regulations by the end of 2021 that will require nearly every equipment type at warehouses to operate in a zero-emission mode.

On behalf of the commercial real estate industry, I ask that SCAQMD not engage in duplicative rulemaking that will have a disastrous effect on the economy of the state, make goods more difficult and expensive to get to consumers, and will have marginal – if any – environmental benefit.

Thank you for taking our views into consideration.

Sincerely,

Rex S. Hime
President & CEO

To: Jiang, Hao <Hao.Jiang@disney.com>
Subject: RE: PR2305 Definition Electric Charger

In our experience, it appears that electric forklifts are the default for warehouses covered by PR 2305. They are therefore not included in the menu.

To: Ian MacMillan <imacmillan@aqmd.gov>
Subject: PR2305 Definition Electric Charger

Hi Ian,

I could not make it sure on whether or not an electric forklift charger is included in the definition of PR2305 for Electric Charger. We have e-forklift chargers that cannot charge EV truck.

Thank you
Hao

53-2

PR2305(c)(15):

ELECTRIC CHARGER means an electric charging station for vehicles. Each unique plug that can charge an individual vehicle at any time, regardless of whether other electric chargers/plugs are operating, counts as one electric charger. This equipment is also referred to as Electric Vehicle Supply Equipment (EVSE).

ATTN: Clerk of the Board, clerkofboard@aqmd.gov, Wayne Nastri, wnastri@aqmd.gov, Sarah Reese, SRees@aqmd.gov Ian Macmillan imacmillan@aqmd.gov

To the Governing Board of the South Coast Air Quality Management District and Senior Staff:

These comments are submitted on behalf of the Natural Resources Defense Council (NRDC) and our roughly 3 million members and activists. NRDC uses law, science, and the support of its members to ensure the rights of all people to the air, the water, and the environment.

We at NRDC believe that action must be taken now to combat climate change and solve the air quality issues of southern California, environmental crises that harm residents in the region every day. As we continue to contend with the ongoing COVID-19 pandemic, essential workers and their families - particularly in the logistics industry - are put at even greater risk due to unsafe work conditions and worsening air quality. Our workers deserve higher workplace standards so that they are able to breathe safely and power their business without creating harmful air pollution.

54-1

To date, the warehouse industry continues to operate in ways that put workers and communities at risk every day. My organization believes that the **Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program Fees for Rule 2305** is a critical step to addressing the air quality impacts of this sector of the goods movement industry.

54-2

We must work together to clean up warehouses. The Warehouse Indirect Source Rule will be critical to holding these facilities accountable, and we urge the South Coast AQMD to pass a strong rule that protects our communities' health.

Warehouses have spewed toxic air pollution in nearby communities for years and a strong program, like the warehouse indirect source rule, is necessary to transform this industry. But to effectively clean up the warehouse industry, the rule must be more stringent to provide relief for communities that breathe the most ozone-polluted air in the nation.

54-3

We also believe that warehouses must move towards zero emission technology and the warehouse indirect source rule should incentivize this shift. This will provide air quality benefits and create access to quality jobs by increasing demand for labor as the industry begins to

54-4

implement zero emission technologies. These job opportunities have been proven to provide quality wages and benefits for workers, unlike many temporary low-wage warehouse jobs.

54-4
(cont'd)

We hope the Board will pass a strong warehouse indirect source rule that serves public health, supports a new green economy, and provides regional air quality benefits.

54-5

Sincerely,

Heather Kryczka

Subject: Comments on Proposed Rule 2305 – Warehouse Indirect Source Rule and Related Fees and Staff Report

Submitted via email

Dear Ms. Rees, Mr. MacMillan and Mr. Juan:

Thank you for this opportunity to comment on SCAQMD's proposed Rule 2305 – Warehouse Indirect Source Rule and related Fees and Staff Report.

55-1

Maersk is an integrated international container logistics company. Our container vessels make over 500 calls in California ports each year, with both inbound freight and extensive exports of California agriculture and medical goods, technologies and the huge variety of materials and products essential to our lives. The goods brought to California by these vessels are unloaded in four California Ports, and we both operate and contract with a significant number of California trucking and warehousing companies to provide smooth inland supply chain flow.

Maersk has long been an environmental leader in goods movement and is committed to going beyond compliance to achieve environmental excellence. Some of our commitments include Net Zero Carbon Shipping by 2050, a 60% reduction in emissions by 2030, and launching our first carbon neutral biofuel/e-fuel vessel by 2023. As we continue to fine tune our inland capabilities to better serve our customers, we are bringing that same level of sustainability to the full end-to-end supply chain operation. More information on these programs is available on our website and in our annual sustainability reports at www.maersk.com/about/sustainability.

We have attended SCAQMD presentations on the Warehouse Indirect Source Rule (ISR) and reviewed materials provided. However, we have not had the opportunity to review the materials provided on the morning of March 3, when these comments are due. We therefore reserve the option to provide further comments on the proposal as it evolves or is better understood. We also participated in the

55-2

development of the industry coalition letter submitted to SCAQMD by the California Trucking Association and other stakeholders on the Warehouse ISR, and endorse and incorporate those more detailed comments by reference.

55-2
(cont'd)

We would like to particularly emphasize the following high-level concerns:

1. The California Air Resources Board (CARB) has the authority to regulate mobile sources and is already well into the process of regulating freight sources with several rules that are comprehensive, complex and costly. We question SCAQMD's authority to impose separate regulations on these same operations, and specifically with regards to existing freight and warehousing facilities.
2. The proposed SCAQMD rule has significant overlap with the many programs being actively implemented and developed at the state level by CARB.
 - a. It is unclear whether the proposed rule will achieve reductions beyond those that will be achieved by the CARB programs.
 - b. The proposed rule differs from the CARB approaches in metrics, management and reporting, adding significant cost and administrative burden.
3. The SCAQMD Warehouse ISR rules, and especially the WAIRE points system, are extremely complex, and highly variable in cost and opportunities based on facility locations. This will result in uneven competitive conditions for operations in a highly competitive market. Supply chain operations are highly fluid and very cost-sensitive; the business flows to the locations with the most efficient operations and lowest costs.

55-3

55-4

55-5

55-6

We therefore respectfully request that the SCAQMD Board and Staff take the time needed to fully understand the authority question, the probability of achieving additional reductions, the complexity of the approach and the cost-benefit analysis in light of CARB's existing and planned regulations.

55-7

I am available to discuss these concerns or provide further information if it will be helpful.

Sincerely,

A handwritten signature in dark ink, appearing to read "Lee Kindberg", with a stylized, flowing script.

RE: Warehouse Indirect Source Rule (ISR)

Dear Messrs. MacMillan and Juan:

I am one of the owners of Motivational Fulfillment & Logistics Services. We currently occupy four facilities in Chino and we would like to express our strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

56-1

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions "WAIRE Points" that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators. This rule is a costly and duplicative effort that is not poised to achieve demonstrable improvements in air quality in the South Coast basin.

56-2

The goods movement system serves as the lifeblood of California's economy, delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to power of the modern supply chain, allowing Californians to shelter in place and abate the spread of COVID-19.

56-3

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry.

56-4

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.

56-5

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting in July the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations that will require nearly every equipment type at warehouses to operate in a zero-emission mode within the next year.

56-6

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

56-7

During presentations, SCAQMD justified the draft rule by stating that additional action is necessary to address ozone and NO_x concentrations in the basin. With respect to NO_x, a recent technical analysis of the draft staff report found that the report does not adequately demonstrate that the proposed Warehouse ISR will provide NO_x reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

56-8

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NO_x reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. One is left with the impression that the rule, instead of addressing environmental concerns, is being used as a funding mechanism.

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom. We hope SCAQMD will reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions that already will occur due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

56-9

With kind regards,

Anthony Altman
Chief Operating Officer and General Counsel

Submitted electronically

The California Trucking Association, the California Chamber of Commerce, and the **55** undersigned organizations submit this letter in strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

57-1

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators or by turnover of already regulated mobile sources. This rule is a costly and duplicative effort that fails to achieve demonstrable improvements in air quality in the South Coast basin.

57-2

The goods movement system serves as the lifeblood of California's economy, delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to the power of the modern supply chain, allowing Californians to shelter in place and abate the spread of COVID-19.

57-3

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry.

57-4

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.

57-5

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations by the end of 2021 that will require nearly every equipment type at warehouses to operate in a zero-emission mode.

57-6

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

57-7

SCAQMD has justified the draft rule by stating that additional action is necessary to address ozone and NOx concentrations in the basin. With respect to NOx, a recent technical analysis of the draft staff report found that SCAQMD does not adequately demonstrate that the proposed Warehouse ISR will provide NOx reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

57-8

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NOx reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin.

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom. We ask SCAQMD to reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

Re: Warehouse Indirect Source Rule (Rule 2305)

Submitted via Email

On behalf of the California Retailers Association (CRA), I write to express our opposition to the adoption of Rule 2305. We believe the pursuit of such a policy is deeply misguided at this time given the enormous pandemic-related challenges already facing California's supply chain and goods movement. It would also create substantial new fees and other costs that will serve only to raise the cost of goods to consumers and displace local jobs.

58-1

The California Retailers Association is the only statewide trade association representing all segments of the retail industry including general merchandise, department stores, mass merchandisers, restaurants, convenience stores, supermarkets and grocery stores, chain drug, and specialty retail such as auto, vision, jewelry, hardware and home stores. CRA works on behalf of California's retail industry, which prior to the pandemic operated over 400,000 retail establishments with a gross domestic product of \$330 billion annually and employs over 3 million people—one fourth of California's total employment.

Localized emissions related to warehouse operations have fallen over 95% over the last decade. Given these substantial reductions plus the California Air Resources Board's (CARB) clean fleet rule and its stated intent to adopt regulations in the next year to require most warehouse equipment types to operate at zero emissions, we question what marginal additional benefit could be derived from the enormous costs and practical challenges posed by the ISR.

58-2

In pursuit of questionable benefits this proposal imposes considerable costs on warehousing. The proposed mitigation fee of \$.90/sf would add up to \$1 billion in new costs on warehouses which will impact which will be felt by everyone throughout the supply chain, including consumers. The ISR further punishes warehouse operators for circumstances out of their control. For instance:

58-3

- SCAQMD would implement these rules well before truck manufacturers can make zero or near-zero emission fleets available and affordable. The obligation to accrue substantive WAIRE Points will commence as soon as July 2021, yet these fleets are not anticipated to be widely available until sometime between 2025 and 2030. There is nothing that our retailers or warehouse operators can do to accelerate those timelines in order to comply.

58-4

- The proposed ISR establishes unrealistic timeframes for collecting and reporting of data that retailers and other warehouse owners or operators currently do not have. Under the current draft rule, reporting obligations begin only 60 days from rule adoption, and require reporting of information that either does not currently exist or is held by other entities and not readily accessible. Obtaining and reporting the necessary data will in some cases require significant changes to how facilities operate, particularly at cross-docking facilities where there is little to no storage of freight and drivers may visit multiple times per day. This requirement would be extremely challenging even on a much longer timeline.

58-5

This is both an inappropriate time and method for targeting a key part of our state's critical infrastructure. Approximately 18 million people who live in Southern California rely on warehousing as an integral part of the supply chain for items they need like food, medical supplies, and clothing. Warehouses also provide a broad range of jobs for people of every level of education and skillset – a benefit which this ISR would threaten.

58-6

Given its high costs, compliance challenges, questionable benefits, the massive challenges currently facing goods movement in our state as well as the current economic uncertainty, CRA urges the Board to reject this costly, duplicative rule.

58-7

Sincerely,

Steve McCarthy
Vice President, Public Policy
California Retailers Association

To: Ian MacMillan <imacmillan@aqmd.gov>
Subject: RE: another question

Ian,

Another thought, why the District do not offer activity threshold? Our warehouses are large in space (to store off season stuff like Christmas decos) but with very little traffic. So our warehouses are subject to R2305 solely due to the size. Tracking truck traffic at our warehouse will have significant impact to our operation cost. A low activity threshold would be reasonable.

Thank you
Hao

Subject: Warehouse Indirect Source Rule

To the Governing Board of the South Coast Air Quality Management District and Senior Staff:

We at Riverside 350 believe that we have a moral imperative to respond to climate change and improve the air quality of the Inland Empire. Our children breathe some of the most unhealthy air in the country, and our COVID-19 first responders are at increased risk because of their exposure to ozone-pollution. To fix these problems, we must identify the problem.

To date, the warehouse industry operates without being subject to any proper regulations, putting workers and communities at risk. My organization believes that the **Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program Fees for Rule 2305** is an important piece to stop this abuse in the goods movement sector.

The logistics industry wants to be here. They aren't leaving if we hold them to higher standards. Rather, we have the opportunity to ensure that they become good neighbors. The Warehouse Indirect Source Rule will be critical to holding these facilities accountable, but only if the South Coast AQMD passes a rule that is strong enough to protect our communities' health.

Warehouses have spewed toxic air pollution in nearby communities for years and a strong mandatory program, like the warehouse indirect source rule, is necessary to transform this industry. But to effectively clean up the warehouse industry, the rule must be more stringent to provide relief for our communities.

We also believe that warehouses must move towards zero emission technology and the warehouse indirect source rule should incentivize this shift. This will provide air quality benefits and create access to quality jobs by increasing demand for labor as the industry begins to implement zero emission technologies. These job opportunities have been proven to provide quality wages and benefits for workers, unlike many temporary low-wage warehouse jobs.

We hope the Board will pass a strong warehouse indirect source rule that serves public health, supports a new green economy, and provides regional air quality benefits.

Sincerely,

Sari Fordham

Thu 3/4/2021 10:48 AM

You forwarded this message on 3/4/2021 10:59 AM.

Good Morning Juan and Ian,

Please discard email questions I sent to Ian last week as I places them here together with a few new questions. I have to admit that I might over thought this and posted some stupid questions/concerns.

- (1) For PR 2305 a NZE truck is one in which the engine meets CARB's lowest Optional Low NOx standard **at the time of manufacture**, which is currently 0.02 g/hp-hr NOx. We own 4 CNG Class 8 tractors that purchased in 2011 with certified 0.1 g/hp-hr NOx. Do you have a resource for us to determine if they are meeting NZE in 2011? And if a 3rd party dispatched CNG trucks visiting our warehouses, shall we have to determine its NZE status in order for us to take credit from WAIRE menu? 61-1
- (2) I know the District would not endorse any product/service, but you did mention a few warehouse truck traffic monitoring systems. Do you mind to let me know the brands? Our WHs gates are not staffed 24x7. We only have security camera in use at this time. 61-2
- (3) Why the District does not offer low activity exemption threshold? Our warehouses are large in space (to store off season stuff like Christmas decos) but with very little traffic. So our warehouses are subject to R2305 solely due to the size. Tracking truck trips will have significant impact to our operational cost. A low activity exemption threshold would be reasonable. 61-3
- (4) Vehicle Miles Traveled (VMT) is required only for the Initial Site Information Report. It is not required nor used in Annual WAIRE Report, correct? If this is true, recording VMT is not required, right? 61-4
- (5) Per Truck Trip definition, one should not count for a truck trip if the truck entered the gate but did not deliver nor pick freight. For our home base where also is warehouse in Anaheim, we should not count truck trip if a truck left home base warehouse **empty**, we should count as one when it returns with goods, correct? 61-5
- (6) One of Disneyland operated WH has solar panels that were installed by property owner. Solar generated electricity is exported to utility grid. Disneyland has no operational control over it. Can we still claim is as WAIRE points? 61-6
- (7) Disneyland Resort operates a few warehouses that are leased by Disney using different business names. For example Disney Enterprises, Inc. and Walt Disney Parks and Resorts, U.S., Inc. My question is should the owner, in the **Initial Owner Notification Report**, disclose the relationships by stating something like "Disneyland Resort DBA Disney Enterprises, Inc."? 61-7

Again I thank you in advance.

Thank you

Hao

March 4, 2021

Sarah Rees, Deputy Executive Officer
South Coast Air Quality Management District
21865 Copley Dr.
Diamond Bar, CA 91765

SUBJECT: Opposition – Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Ms. Rees,

On behalf of the Los Angeles Area Chamber of Commerce (Chamber), one of the largest and most influential business organizations in the Los Angeles region, I am writing to express our opposition to the Warehouse Indirect Source Rule, Proposed Rule 2305 (PR 2305). Our organization represents over 1,400 organizations, which employ over 650,000 employees in the region. The logistics industry is critical to Southern California's economy, and warehouses are an integral part of that system. While we appreciated that SCAQMD's staff has discussed and engaged with the Chamber on this issue, the estimated \$1 billion in annual fees for this essential industry and compliance infeasibilities PR 2305 creates uncertainty in an increasingly uncertain economy.

62-1

The COVID-19 pandemic highlighted both the successes and limits of our regional and national supply chain, as people were forced to transform their daily lives and spending patterns to adapt to shelter in place measures. Goods movement was and continues to be the life blood of our modern economy, ensuring that vaccines and personal protective equipment necessary to save lives are delivered, and that our grocery stores and restaurants are stocked for customers. This industry, and the warehouses that are a part of them, rose to the challenge of COVID-19.

62-2

California's supply chain is one of the cleanest in the world, and certainly the cleanest in the United States. Cleanest available technology adoptions by the trucking and warehousing sectors have decreased localized emissions over the past decade. SCAQMD and CARB are creating duplicative regulations, with CARB's mandate that manufactures sell zero-emission commercial vehicle and SCAQMD's Warehouse ISR. As well, reports on direct investments and plans for a zero-emission transition required by Governor Newsom's EO-N-79-30 are due back to the legislature this summer.

62-3

Furthermore, it is exceedingly difficult for real world warehouses to comply with PR 2503. It puts the responsibility of reducing truck emissions on warehouse operators and owners that do not control truck fleets. Nor do warehouse operators control the types of trucks that utilize their facilities or the schedules of these vehicles. From a technological stand point, there are items on the WAIRE menu that are not available. One prominent example of this is the technological availability and economic feasibility of zero-emission trucks.

62-4

We appreciate SCAQMD's efforts to enhance our regional air quality, however we believe that the District should work closely with industry to develop regulations that appropriately address air quality, balance costs, and realistically account for technological feasibility. Thank you for your consideration. Please contact Senior Manager, Kendal Asuncion, with any questions at kasuncion@lachamber.com or 213-580-7518.

62-5

Thank you for your consideration.

Sincerely,

A handwritten signature in black ink that reads "Maria S. Salinas". The signature is fluid and cursive, with the first letters of the first and last names being capitalized and prominent.

Maria S. Salinas
President & CEO

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan and Mr. Juan:

The Western Electrical Contractors Association (WECA) opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

63-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

63-2

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

63-3

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

My name is Rachel Wang, from ViewSonic Corporation. I am writing this letter to oppose the adoption of Rule 2305 (Indirect Source Rule) ("ISR"). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

64-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

64-2

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

64-3

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

64-4

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:

- a) The approximately 18 million people who live in Southern California rely on

64-5

ViewSonic Corporation
10 Pointe Drive, Brea, CA 92821
<http://www.viewsonic.com>

warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc. 64-5 (cont'd)

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.

- a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic. 64-6

6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten. 64-7

7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry. 64-8

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above. 64-9

Chair Burke and Members of the Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: Item No. 2.B – Set Public Hearing April 2, 2021 to Adopt Proposed Rules 2305 and 316 (Warehouse Indirect Source Rule)

Dear Chair Burke and Members of the Governing Board:

On behalf of Earthjustice, we submit these comments on the warehouse indirect source rule, a critical regulation that will protect the health and safety of communities who live and work adjacent to warehouses and finally address the region's pollution crisis. Specifically, we request that the Governing Board set public hearing on April 2, 2021 to adopt Proposed Rules 2305 and 316. This rule has been years in the making, and all the while communities continue to suffer high levels of pollution from the freight industry. The agency's vision and leadership in the development and adoption of a strong regulation will advance the warehouse industry's long overdue transition to zero-emissions and prioritize the frontline communities who are disproportionately harmed by this industry every day.

65-1

As is well documented by now, the COVID-19 pandemic has devastated communities in our region and continues to exacerbate the health impacts of poor air quality, just as we had one of the worst smog seasons in decades. Meanwhile, warehouses and ports have had record-breaking profit levels as consumers increasingly rely on e-commerce,¹ further compounding the health risks that nearby communities are already forced to shoulder. While those with ownership stakes in the freight system have profited handsomely, reportedly "raking in all the chips in the changing landscape brought on by the coronavirus crisis,"² communities, particularly low-income communities and communities of color, have suffered the brunt of the air pollution harms.

65-2

Proposed Rule 2305 will mean significant benefits to our region in reduced smog-forming emissions and the creation of meaningful, good quality jobs that put people to work to clean up warehouse pollution through retrofitting warehouses with clean transportation and clean

65-3

energy resources. Moreover, it will mean the Governing Board finally delivering on its promise made years ago to adopt an indirect source rule to control pollution from freight facilities.

65-3
(cont'd)

We appreciate your consideration of these comments, and the Air District staff's hard work on this important, life-saving rule. We look forward to working together with the staff and Governing Board to prioritize public health, create good quality jobs, and help our region finally achieve clean air by adopting this vital rule on April 2.

Reply

Dear Mr. MacMillan:

The Orange County Business Council (OCBC) opposes the adoption of Rule 2305 (Indirect Source Rule). Please see the attached letter for further details. Thank you for your consideration.

Jennifer Ward
Sr. Vice President of Advocacy and Government Affairs
Orange County Business Council

2 Park Plaza, Suite 100 | Irvine, CA 92614
C: 530.219.1845 | O: 949.794.7215 | jward@ocbc.org

RESILIENT OC
ORANGE COUNTY
BUSINESS COUNCIL
THE LEADING VOICE OF BUSINESS
www.ocbc.org and www.local100.com

The California Trucking Association, the California Chamber of Commerce, and the **55** undersigned organizations submit this letter in strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions (WAIRE) Points that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators or by turnover of already regulated mobile sources. This rule is a costly and duplicative effort that fails to achieve demonstrable improvements in air quality in the South Coast basin.

The goods movement system serves as the lifeblood of California's economy, delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to the power of the modern supply chain, allowing Californians to shelter in place and abate the spread of COVID-19.

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry.

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade.

66-1

66-2

66-3

66-4

66-5

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations by the end of 2021 that will require nearly every equipment type at warehouses to operate in a zero-emission mode.

66-6

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

66-7

SCAQMD has justified the draft rule by stating that additional action is necessary to address ozone and NOx concentrations in the basin. With respect to NOx, a recent technical analysis of the draft staff report found that SCAQMD does not adequately demonstrate that the proposed Warehouse ISR will provide NOx reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

66-8

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NOx reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin.

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom. We ask SCAQMD to reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

The Multicultural Business Alliance opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

67-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

67-2

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

67-3

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

67-4

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

67-5

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:	
a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.	67-6
5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.	
a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.	67-7
6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.	67-8
7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.	67-9
Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.	67-10

Respectfully,

Roberto C. Arnold, Multicultural Business Alliance

Cc: Governing Board Members

March 8, 2021

I, Mosen Asgari being the President of Tabletops Unlimited Inc. known as one of the major distributor of houseware since 1983 in Carson California, express our strong opposition to the South Coast Air Quality Management District's (SCAQMD) proposed Warehouse Indirect Source Rule (ISR).

68-1

The draft ISR creates a complicated system of Warehouse Actions and Investments to Reduce Emissions "WAIRE Points" that must be earned by owners and operators of warehouses, mostly through a fee on warehouse operators. This rule is a costly and duplicative effort that is not poised to achieve demonstrable improvements in air quality in the South Coast basin.

68-2

The goods movement system serves as the lifeblood of California's economy, delivering essential goods, services, and medicines. Never has this industry been more important than during the COVID-19 pandemic. Grocery store shelves have been stocked, vaccines delivered, and small retailers kept alive by e-commerce thanks to power of the modern supply chain, allowing Californians to shelter in place and abate the spread of COVID-19.

68-3

Goods movement also powers blue-collar jobs vital to our economy. An estimated 1 in 22 jobs in Southern California are tied to the logistics industry.

68-4

California has the cleanest supply chain in the United States. Thanks to two decades of investment in the cleanest available equipment, including early adoption by our collective members, localized emissions associated with warehouses have never been lower, falling by over 95% in the last decade. The warehouse operators are paying millions of dollars in pier pass to help improve the South Coast Air Quality by helping the trucking companies to use new trucks to reduce the emissions.

68-5

As you know, California is the only state in the nation with the power to regulate mobile sources pursuant to its waiver under federal Clean Air Act. The California Air Resources Board (CARB) has used this power to adopt the country's strictest emission laws, including adopting in July the world's first mandate to manufacture and sell zero-emission commercial vehicles. CARB has also stated its intent to adopt regulations that will require nearly every equipment type at warehouses to operate in a zero-emission mode within the next year.

68-6

SCAQMD's proposed Warehouse ISR is duplicative of these regulations, exceeds the District's authority to regulate mobile sources, and will create burdensome, expensive requirements for the supply chain for questionable environmental benefit.

During presentations, SCAQMD justified the draft rule by stating that additional action is necessary to address ozone and NO_x concentrations in the basin. With respect to NO_x, a recent technical analysis of the draft staff report found that the report does not adequately demonstrate that the proposed Warehouse ISR will provide NO_x reductions beyond those generated by CARB regulations, despite the enormous costs that will be involved in complying with this rule.

Further, as stated during AQMD's Scientific, Technical & Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NO_x reductions generated by this rule will not be sufficient to decrease the ozone concentrations in the basin. One is left with the impression that the rule, instead of addressing environmental concerns, is being used as a funding mechanism.

68-7

Duplicative rulemaking by CARB and the SCAQMD that does not move the needle on environmental benefit in the basin not only wastes the state's resources, but unnecessarily increases the cost of compliance for an industry that is gearing up for the all-electric future envisioned by CARB and Governor Newsom. We hope SCAQMD will reconsider this untimely, duplicative, and costly regulation and work with industry to develop a rule that takes into account the emissions reductions that already will occur due to CARB rulemaking and appropriately addresses emissions that are within the bounds of SCAQMD authority.

Sincerely,

RE: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program

Dear Mr. MacMillan,

General Motors (GM) supports South Coast Air Quality Management District's innovative approach to begin the transition to zero emission trucks in the region through the implementation of Proposed Rules 2305 and 316.

69-1

GM owns and operates one warehouse in Rancho Cucamonga for smaller aftermarket auto parts and operates one warehouse in Fontana for bulk aftermarket auto parts. Both warehouses are roughly 400,000ft². These warehouses supply GM auto parts to much of the Pacific Coast region and are part of GM's Customer Care and Aftersales warehousing network. Globally, GM offers hundreds of thousands of parts, with about 8% of its annual volume flowing through California.

General Motors' vision is a world with Zero Crashes, Zero Emissions, and Zero Congestion. Our company's recent announcements show we are committed to our vision's emissions strategy by aspiring to only sell electric vehicles in our light-duty portfolio by 2035. Additionally, GM plans to achieve carbon neutrality by 2040. GM is also expanding its Zero Emissions vehicle strategy into the goods movement market through the addition of BrightDrop commercial electric vehicles and pallets and through collaborative agreements with Nikola and Navistar to produce fuel cell powered semi-trucks.

69-2

Clearly, GM cannot fulfill its vision of Zero Emissions without sound energy and environmental policies that encourage and enable the shift to electric vehicles. Accelerating the transition to a Zero Emission future will require a comprehensive suite of well-designed policies and incentives, including vehicle incentives, utility engagement and infrastructure support, and complementary policies to reduce costs and overcome hurdles.

69-3

Like many of the warehouses in operation in the South Coast District, GM does not own the fleets that service our warehouses and must work with our suppliers and partners to encourage this transition. The Warehouse ISR directs a gradual transition through a phased-in approach that allows warehouses both time to phase in the use of zero emission trucks and offers flexibility in

69-4

achieving WAIRE points obligations through other projects such as installing zero emission charging or fueling infrastructure, installing onsite solar panels, or through the use of an approved custom approach. As this is a first-of-its-kind regulation striving to encourage rapid uptake of vehicles that are in the early stages of pre-commercial or early commercial deployment, GM also believes the proposed stringency factor is appropriate to encourage this transition while providing needed flexibilities. Implementing this regulation now – in conjunction with complementary policies such as incentives and infrastructure support – will likely speed up the transition to cleaner air quality directly in the communities where warehouses are abundant providing a better quality of life for our employees and neighbors.

69-4
(cont'd)

Please reach out with any questions to Todd Rouse, Environmental Policy Manager, at todd.rouse@gm.com or 419-205-2667.

Diamond Bar, CA 91765

Re: Proposed Rule 2305: Warehouse Indirect Source - WAIRE Program

Dear Mr. Juan,

Orange EV looks forward to the upcoming implementation of the Warehouse ISR and the many benefits it will bring to Southern California's air quality. As the makers of 100% pure electric terminal tractors, we appreciate the SCAQMD's acknowledgement that zero-emissions (ZE) technologies offer the most proven and efficient way to enact comprehensive air quality advances for the benefit of community health.

70-1

We believe your preference for zero-emission vehicles within this rule is especially important as it sends a strong signal to fleets that ZE heavy-duty trucks are, indeed, the future of California's goods movement industry. Not only will ZE fleets prove invaluable for the state's economy, but – with 42% of NOx emissions in Southern California coming directly from goods movement – this transition stands to dramatically improve local and regional air conditions. Furthermore, including non-ZE vehicles in the program would only prolong the use of combustion vehicles in this application and would also perpetuate the pipeline of those vehicles to secondary markets.

70-2

Orange EV respects the goals of the San Bernardino/Muscoy AB 617 Community Steering Committee as key partners in your efforts to mitigate against the negative effects of mobile indirect sources powered by combustion engines. As stated unequivocally in their Community Emissions Reduction Plan (CERP), addressing emissions from warehouses is vital for improving neighborhood air quality throughout the specially designated community and beyond. We recognize the Warehouse ISR as an integral part of SCAQMD's efforts to address the larger climate crisis while simultaneously prioritizing environmental justice for those living communities near warehouses.

70-3

Orange EV's T-Series terminal tractor has been chosen by more than 85 fleets across 18 states, Canada, and the Caribbean, and our fleet has surpassed 734,000 key-on hours and driven over 2.3 million miles. In short, we have proven that 100% pure electric yard trucks can be successfully deployed in commercial operation at warehouses and rail yards. As such, we urge the SCAQMD not to be distracted from its goal of bringing about real and dramatic air quality improvements by allowing near-zero-emission and combustion engine-powered yard trucks to earn points from the WAIRE menu.

70-4

Thank you for considering these comments regarding this important regulation. While challenges may lie ahead for growing ZE fleets across the region, we appreciate that the SCAQMD is committed to this course of action and trust you shall remain so long into the future.

70-5

Diamond Bar, CA 91765

Re: Proposed Rule 2305: Warehouse Indirect Source – WAIRE Program

Dear Mr. Juan,

We would like to take this opportunity to provide feedback in support of our goal as an organization towards reducing emissions. At our Fontana campus we have replaced our gas forklifts and yard spotters and have now nearly completely replaced all movable equipment with electric powered units. We also installed two CARB compliant automatic generators to become self-sufficient when the GRID failed to function.

71-1

In collaboration with one of our large accounts located in Ontario, CA, we are in the process of converting our diesel yard spotters with new electric units. This transition will help this client meet its Corporate 2050 zero emissions objectives.

71-2

The benefits of zero emission yard spotter equipment in addition to reducing emissions are driver safety. Zero fuel exhaust, noise is minimal and ease of use due to minimal vibration during operation. With a goal of achieving zero emissions and reducing our carbon footprint, we will also be purchasing zero emission yard spotters for our new campus in Bloomington, CA.

71-3

Should you have any questions about our goals or experience with zero emission yard tractors, please do not hesitate to contact me directly.

71-4

To whom it may concern,

In response to: Proposed Rule 2305 WAIRE PROGRAM

Upon review of the proposed rule 2305 WAIRE PROGRAM as a business that employs over 500+ associates locally we strongly urge the SCAQMD to reconsider this rule. If passed this will not only jeopardize jobs but without doubt drive us to include other providers out of Southern California.

72-1

Sincerely,

David Nester

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

We oppose the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

73-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

73-2

The following further comments are provided in response to the District's Proposed Rule 2305:

73-3

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

2. It is not feasible to comply with the ISR due to the following:

73-4

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

73-5

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:

73-6

- a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.

- a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.

6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

73-7

7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.

73-8

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.

Re: Proposed Warehouse Indirect Source Rule ("ISR")

Dear Ms. Rees, Mr. MacMillan and Mr. Juan,

Howard Industrial Partners ("HIP") is a developer of warehouse and industrial buildings throughout the Southern California basin. The principals at HIP have a combined seventy years of experience working in the markets throughout the basin and we have dealt with an entitlement landscape over the years that has become more and more complicated. We have continued to be at the forefront of designing our buildings to meet stringent environmental standards. We believe, however, that the ISR is an overreach by SCAQMD that is complicated and costly and we question its ability to demonstrably improve air quality. That is why we strongly oppose the adoption of this rule.

75-1

There are so many ways that the expansion of the warehouse/industrial markets in Southern California is improving the quality of life for its citizens. This has been especially true during the COVID-19 pandemic as efficient goods movement provided by the influx of regional and local warehousing has allowed goods to be available for the multitude of people sheltering in place to avoid spreading COVID-19. The expansion has also created more blue-collar jobs in areas of the basin where unemployment has tended to be higher that are vital to our economy.

75-2

It is not an exaggeration to say that a rule like the ISR could have a profound negative effect on future development of warehouse space in the basin. Having worked in this area for the last 35 years, the principals of HIP have seen firsthand how the addition of a complicated system that penalizes tenants and landlords can dampen demand and supply alike. This would obviously reduce the benefits that increased warehouse development would provide.

75-3

California already has the most stringent requirements of any state, the cleanest supply chain of any state, and has seen a tremendous reduction in emissions associated with warehouse activities over the last decade at the same time there has been an influx of warehouse development. Given

75-4

the positive news coming from the warehouse sector, it seems like overkill to introduce another piece of legislation to further hinder its growth.

75-4
(cont'd)

HIP remains committed to developing warehouse projects that meet the needs of consumers in the Southern California markets but there is a real chance that rules like ISR could make our business virtually obsolete.

75-5

Sincerely,

A handwritten signature in black ink, appearing to read "Tim Howard", written in a cursive style.

Timothy J. Howard

Subject: Support for the Indirect Source Rule

Dear Governing Board of the South Coast Air Quality Management District,

I'm a resident of the city of Riverside, and I'm writing to voice my support for the Indirect Source Rule that is soon to be considered by the Mobile Source Committee.

76-1

As someone who has made financial sacrifices to utilize clean energy and improve the health of our community, I believe the business community should be willing to do the same. I understand the need to preserve jobs, but the warehouse industry isn't going to abandon the Riverside area. Empty land near major ports is not a readily available resource, and they need us more than we need them. To require them to make an investment in the health of their employees and the other residents of our community is not unreasonable. Indeed, it is the ethical thing to do.

76-2

I hope the Mobile Source Committee will recognize the value of the ISR. Thank you for your consideration.

76-3

Best,

Bryan Bradford

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Messrs. MacMillan & Juan:

Pacific Industrial opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry and the industry plays a crucial role in the supply chain from food, medical supplies, household goods, clothing, equipment, and raw materials to just about everything that is consumed. As the public grows increasingly more dependent on e-commerce which has been accelerated by the COVID-19 pandemic, the resulting tax if ISR is implemented, has the consequence of crippling Southern California's supply infrastructure which is already reeling from COVID impact shortages and disruptions.

78-1

The District's proposed ISR seems to be a misguided policy especially during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021 with insufficient time for the warehousing industry to plan and prepare for proper implementation.

78-2

More importantly, Rule 2305 is targeting an industry with a specific tax to reduce emissions in the region yet the subject of the tax in this case, a warehouse, has no power to regulate the indirect sources. This seems illogical and is frustrating and confusing to business owners as to why they are being singled out. While true that trucks and autos visit warehouses and create emissions through the trips generated, the same sources also visit grocery stores, shopping malls, restaurants, hotels, airports, entertainment centers, retail centers, farms, manufacturing facilities, agricultural fields and nearly every other activity or service. In only targeting warehouses for a special tax under Rule 2305, ISR is rendered even more punitive by the arbitrary nature of its application.

78-3

In response to the proposed Rule 2305, we implore you to consider the following:

1. This rule would impose additional and permanent taxes on warehouses of approximately \$.90-\$1.00 per square foot. This tax would create an unfair burden on the warehousing industry which is providing an essential benefit to the economy.	
2. The ISR impact could generate an estimated \$1 billion in annual fees but no information has been provided to date on how those funds will be spent or what the expected return will be.	78-4
3. Most warehouses impacted under Rule 2305 are not household names with deep pockets but local and regional suppliers of key goods and materials. Some of those warehouse operators will not survive the impact of this tax further worsening the unemployment rate.	
4. As presented, it is not feasible to comply with the ISR as the proposed rule will require warehouses to control truck fleets and decrease truck emissions, but warehouse operators are not able to accomplish this task due to the following:	
a) Warehouses have no control over how truck engines are manufactured.	
b) Warehouses largely do not own truck fleets, nor do they control what type of trucks shipping companies purchase.	78-5
c) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.	
d) The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.	
5. Warehouses have been deemed to be essential businesses by the State for important reasons as approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive.	78-6
6. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.	78-7
7. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.	78-8
8. The proposed ISR seeks to "indirectly" regulate the trucking industry through the warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.	78-9
While we live and work in Southern California and all support the goal of lowering emissions and promoting better health for our region and community, this is not the correct approach.	78-10

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.

78-10

Chair William Burke and Governing Board Members
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765-4178

Re: Comments to Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program (“PR2305”) and Proposed Rule 316 – Fees for Regulation XXIII (“PR316” and collectively with PR2305, the “Proposed Rules”)

Ladies and Gentlemen:

This firm represents Warland Investments Company and affiliated entities (collectively, “Warland”), which has real estate holdings consisting of over 3.5 million square feet of space within the South Coast area. Warland’s presence brings great value to the area by maintaining facilities that draw first-class operators. Warland is an interested party in that its holdings include numerous warehouses that would be impacted by the Proposed Rules referenced above. As such, Warland hereby respectfully submits its comments on the Proposed Rules prior to the final vote by South Coast Air Quality Management District (“SCAQMD”) regarding the same.

79-1

While Warland supports the SCAQMD’s intended objectives of reducing emissions of nitrogen oxides and particulate matter in order to improve air quality, Warland objects to adoption of the Proposed Rules as written for the reasons set forth below.

I. Lack of Legal Authority.

A. PR2035 Exceeds SCAQMD’s Indirect Source Rule Authority.

Section 40440 of the California Health and Safety Code authorizes SCAQMD to adopt indirect source rules that serve to provide controls (i) for areas of the South Coast District “in which there are high-level, localized concentrations of pollutants”, or (ii) related to “any new source that will have a significant effect on air quality in the South Coast Air Basin”.

79-2

Under PR2305 Section (b) (Applicability), PR2305 would apply to all owners and operators of warehouses located in the SCAQMD jurisdiction with at least 100,000 square feet of indoor floor space in a single building that may be used for warehousing activities by one or more warehouse operators. PR316 would apply to owners and operators of facilities subject to PR2305. Accordingly, as drafted, the Proposed Rules would apply to all warehouses of a certain size, without any regard to whether the warehouse in question is

either located in an area “in which there are high-level, localized concentrations of pollutants” or already exists and, therefore, is not a “new source”. This attempt to regulate warehouses based on size via an indirect source rule alone clearly exceeds SCAQMD’s authority pursuant to the California Health and Safety Code.

79-2
(cont'd)

B. SCAQMD Lacks Authority to Impose Special Taxes.

The Proposed Rules, if adopted, would require owners and operators of warehouses with at least 100,000 square feet of indoor space in a single building to either (i) reduce emissions through certain and arguably non-feasible methods, or (ii) pay a so-called “mitigation fee”. However, any such charge must meet certain requirements under the California Constitution to be deemed a permitted fee rather than a special tax. In this case, the proposed “mitigation fee” does not satisfy those requirements.

79-3

Proposition 26, approved by voters in 2010, expressly defined the distinction between taxes, which require a vote of two-thirds of the electorate in order to be enacted, and fees, which regulatory agencies have authority to impose. Any taxes or fees enacted on or after January 1, 2010 must comply with the requirements of Proposition 26, which became Article XIII C, section 1 to the California Constitution. The “mitigation fee” contemplated by the Proposed Rules is not a permitted fee under such section because it (i) does not provide a specific benefit to the payor, (ii) is not fairly apportioned among payors, (iii) generates money for a regulatory program, and (iv) is not reasonable. As such, the “mitigation fee” would be considered a special tax, rather than a fee, under the California Constitution. SCAQMD does not have authority to impose any special tax without first obtaining approval of two-thirds of the electorate, which approval has not yet been obtained.

II. The Proposed Rules Will Negatively Impact the South Coast Area.

The Proposed Rules unduly burdens warehouse owners and operators in that they would have to either assume substantial costs of upgrading their facilities and/or purchasing near-zero emission trucks, or assume an average annual compliance cost of approximately \$0.90/square foot as soon as the year 2025. Although improving air quality is important to South Coast businesses and residents, the Proposed Rules will substantially increase the costs to operate by warehouse owners and operators, which will in turn increase the costs of goods and services for those same businesses and residents. Even more critically, the Proposed Rules will almost certainly drive warehouse owners and operators, as well as jobs, out of the South Coast area. The potential negative economic impact of the Proposed Rules cannot be overstated and demands further evaluation.

79-4

79-5

III. Compliance with Proposed Rules is Not Feasible.

As noted by many other citizens and groups opposing the Proposed Rules, much remains unclear on how warehouse owners and operators would feasibly comply with the Proposed Rules. For example, numerous proposed scenarios in the Staff Report on the Proposed Rules (“PDSR”) suggest compliance could be achieved by purchasing near-zero emissions trucks with a gross vehicle weight rating of greater than 33,001 pounds; however, no such trucks are currently commercially available. As another example, the PDSR contemplates installing charging stations at warehouse facilities, but the PDSR lacks sufficient analysis on how warehouse charging stations would be built, where such charging stations would fit within existing warehouse properties, and how the existing electrical infrastructure is sufficient to support such charging

79-6

stations. In addition, the PDSR's "estimated" costs of compliance for the Proposed Rules are based on just eighteen (18) different theoretical scenarios; however, many other complicated compliance scenarios would be bound to arise and the projected cost of compliance for such scenarios remains unknown. Some potential credits are discussed in the PDSR and Proposed Rules, such as the State Implementation Plan Credit, but such credits are unclear and no defined guidelines exist to obtain such credits. At this time, compliance with the Proposed Rules appears generally unfeasible for most warehouse owners and operators, which suggests the proposed "mitigation fee" will ultimately serve as such parties' sole source of compliance. Adopting the Proposed Rules without first outlining reasonable metrics for compliance is unreasonable and will not achieve SCAQMD's stated objections of improving air quality.

79-7

79-8

79-9

In conclusion, the Proposed Rules should not be adopted as drafted. SCAQMD lacks legal authority to impose the PR2035 as an indirect source rule. The "mitigation fee" is not a permitted fee and, therefore, SCAQMD lacks authority to impose it. The Proposed Rules will profoundly impact warehouse owners and operators, which will, without question, negatively impact the South Coast economy as a whole. Finally, there are no feasible metrics for compliance outside of paying annual mitigation fees. We respectfully request that SCAQMD disapprove the Proposed Rules until the foregoing issues have been thoroughly and appropriately addressed and resolved.

79-10

Regards,

Allyssa J. Holcomb

Re: Comments on the Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Chair Burke and Members of the Governing Board,

We write to express our support for Proposed Rule 2305. GRID Alternatives is a nonprofit organization working towards a rapid and equitable transition to renewable energy. Solar power is key to promoting economic growth and alleviating environmental harms in communities most impacted by environmental harms such as air pollution.

80-1

The South Coast Air Basin is home to more than 1.4 billion square feet of warehouses and that number will continue to grow. These warehouses attract a large number of polluting trucks that contribute significant pollution in surrounding communities. The warehouse indirect source rule is an important tool that will help bring clean zero-emission trucks to southern California and reduce this toxic pollution. However, warehouses in the South Coast also use a significant amount of energy primarily generated by dirty power plants, which also negatively impacts air quality in one of the most polluted regions in the nation. The warehouse indirect source rule has the potential to shift over 800 million square feet of warehouses in southern California towards renewable energy. A transition to solar energy at these facilities will reduce our reliance on fossil fuels and provide significant economic and environmental benefits to overburdened communities sited near warehouses.

80-2

We appreciate that the Warehouse Actions and Investments to Reduce Emissions (WAIRE) program includes solar installation as a compliance option. Clean energy solutions like solar power are critical to lessening the environmental footprint of the warehouse industry. The installation and use of onsite solar panels at warehouses will reduce emissions from dirty power plants and provide much needed regional emissions reductions of nitrogen oxides. This rule will provide significant air quality benefits that will alleviate health risks imposed on residents by polluting industries.

As warehouses shift towards renewable energy, the region will also benefit from additional training and employment opportunities in the green-tech economy. GRID Alternatives is committed to creating a solar workforce that provides opportunities to all by ensuring access to groups traditionally underrepresented in the solar industry. Additionally, we partner with local solar companies to ensure that trainees learn through participation on real-world solar installations. GRID Alternatives stands ready to assist warehouses and support workers through hands-on training to help us all achieve a sustainable clean energy future.

80-3

Thank you for the opportunity to provide comments. We appreciate the Air District staff's hard work on this important rule and look forward to working with the agency to clean up our air and protect our workers.

80-4

Sincerely,

Stanley Greschner, Chief Policy Officer

Re: Opposition to Warehouse Indirect Source Rule

Dear SCAQMD Board Members,

My name is Marty Brogden and I am the CFO of a Southern California based warehouse operators (3PL) named Port Logistics Group urging you to NOT to adopt the proposed Indirect Source Rule.

81-1

Born in 1958, I was raised in the Western SGV until I left in 1978 to continue my college education in San Diego. I have witnessed first-hand the health benefits resulting from the efforts of the SCAQMD. For those of us who experienced the ill effects of the smog during the '60s and '70s and today to be able to see the San Gabriel Mountains from 50 miles away during the Summer and take a deep breath without choking is astonishing! This is due in large part to the work of the SCAQMD.

However, while I personally support the SCAQMD mission, the proposed Indirect Source Rule is imposed on 3PLs which (a) do not contractually control the vehicles that visit our warehouses, and (b) will cost hundreds of jobs at our company's 3.5 million square feet of 3PL facilities in Long Beach, City of Industry, and Chino. Our customers determine which logistics carriers deliver and pickup their products at our facilities and we have no legal or contractual right to pass on costs which would be imposed upon our company as a result of this proposed rule.

81-2

From a legal perspective, the mitigation “fee” imposed by the proposed rule is a special tax requiring voter approval. 81-3

The SCAQMD's proposed rule will impose a significant new tax on the broad Supply Chain at the worst possible time. First, due to almost 20 years of the California Air Resources Board (CARB) adopting strictest-in-nation regulations, emissions associated with warehouses have never been lower. Second, warehouses' operating costs are already at their highest due to the implementation of measures protecting essential workers from COVID exposure. Their safety has been our number one priority since the pandemic was announced. Finally, the Supply Chain & Logistics industry is supporting thousands of working-class jobs at a time where millions of Californians are unemployed and where other jobs are fleeing the State. 81-4
81-5
81-6

3PLs like our company and the broader Supply Chain in general are vital to Southern California's economy, distributing medicines, food and essential goods for approximately 18 million people. Our business specifically is comprised of fulfillment of products delivered directly to people's homes. 3PLs have played in a key beneficial role during the ongoing pandemic, enabling small businesses to remain afloat through e-commerce and allowing Southern California residents to stay safely at home (and thereby reducing harmful emissions). Taxing the sector that provides a significant number of career pathways to essential workers makes no sense. 81-7

The proposed rule would increase the costs of goods and services, including groceries, for our region's residents and families. Additionally, penalizing warehouses which already implemented solar or EV charging improvements is inappropriate. The proposed regulation should not be considered until such time as readily available trucking technology and infrastructure is in place to allow for logistics providers, not warehouse operators, to comply with the mandates. 81-8

Please oppose these costly new taxes and regulations that will kill jobs and harm our economy at a time we can least afford it. 81-9

PLEASE VOTE NO on the Warehouse Indirect Source Rule.

Thank you for your consideration.

Sincerely,

Martin K. Brogden
Chief Financial Officer

RE: South Coast Air Quality Management District Proposed Indirect Source Rule 2305
Anticipated Vote Date: May 7, 2021

Dear Ladies and Gentlemen:

Please allow this correspondence to serve as official opposition to the pending Indirect Source Rule (ISR) 2305, which is proposed by the South Coast Air Quality Management District (SCAQMD) and currently scheduled for Board vote on May 7, 2021.

82-1

The SCQAMD, by its charter, already has the responsibility to regulate stationary (operating facilities) sources in our region such as refineries and manufacturing plants. However, with this proposed rule, the SCAQMD is attempting to regulate mobile sources (trucks, cars) which are already regulated by both the US EPA and the California Air Resources Board.

82-2

This proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative requirements on warehouse Landlords/Owners and create substantial mitigation expenses on Tenants. As written, this rule is in essence a tax on the warehousing sector while indirectly regulating the trucking industry, which will create a substantial negative impact on the warehouse industry.

82-3

Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above. Thank you for your attention to these comments.

82-4

Sincerely,

Joseph Medlin
Executive Vice President

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

Operon Group opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

83-1

The District's proposed ISR is a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

83-2

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation and could possibly be a prop 13 violation.

83-3

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

83-4

OPERON GROUP

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

83-5

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:

- a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

83-6

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.

- a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.

83-7

6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

83-8

7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.

83-9

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.

83-10

Respectfully,

Operon Group

Chris Kwasizur,

President

Re: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan and Mr. Juan:

I write on behalf of the Building Owners and Managers Association Greater Los Angeles (BOMA/GLA), which represents over 135 million square feet of commercial office space throughout Los Angeles County. Our members contribute an estimated annual \$3.5 billion to California's economy.

85-1

Commitment to Sustainability

Advancing sustainability in commercial buildings has been a cornerstone of BOMA/GLA's mission since the 1990s.

For over two decades, our Sustainability Committee has been on the vanguard of developing educational programs, guides, and a written content to promote building sustainability practices and give building owners and operators the know-how to move the needle in their assets.

But BOMA/GLA has not only promoted a culture around sustainability in commercial real estate – we have taken concrete action and consistently advocating for bold sustainability policies. Recent actions include supporting LA County's Sustainability Plan and continuing to work with County staff on its implementation and working in partnership with LA City government and other stakeholders to help develop the Existing Buildings Energy and Water Efficiency (EBEWE) program into what it is today.

Our commitment to sustainability is guided by an industry-wide consensus: For example, Kilroy Realty Corporation announced that it has [achieved carbon neutral operations](#) just this year. And, many other major commercial building owners representing all types of assets and investors are following suit by making aggressive carbon neutrality commitments over the next decade.

As achieving aggressive sustainability goals has become the norm across commercial real estate, we welcome well-balanced policies that continue to yield both carbon reduction and economic growth.

However, we believe Rule 2305 (Indirect Source Rule) does not accomplish this objective. Further, we believe it will cause undue economic damage to the warehouses, their tenants, and the logistics industry at large, especially during the COVID-19 economic downturn.

85-2

Opposition to Rule 2305

We believe that Rule 2305 will lead to economic distress and create additional hurdles for warehouses to achieve greater sustainability right when the market demands are pointing them in that direction in that direction. BOMA Greater Los Angeles therefore officially opposes the adoption of Rule 2305 (ISR).

A significant portion of our membership is involved in the support and development of distribution warehouses that are integral to the Southern California logistics industry.

The logistics industry is playing a key role in our response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment, but also in the delivery goods to a public that has become increasingly dependent on e-commerce.

We believe the District's proposed ISR is an especially misguided policy in the midst of the COVID-19 pandemic and more broadly. The District is pursuing a regulation targeted at a sector that serves as a lifeline to our region and the nation, and which is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption, and the substantive WAIRE Points obligations will commence as soon as July, 2021.

85-3

Currently, BOMA/GLA has the following comments in response to the District's Proposed Rule 2305 (Warehouse Indirect Source Rule):

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time, as it responds to the challenges of the COVID-19 pandemic on behalf of our nation.
2. It is not feasible to comply with the ISR due to the following:
 - a. The proposed rule requires warehouses to control truck fleets and decrease truck emissions but warehouse operators are not able to accomplish this task.
 - b. Warehouses have no control over how truck engines are manufactured.
 - c. Warehouses do not own trucks fleets nor control what type of trucks shipping companies purchase.
 - d. Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from or any other variables related to truck trips.
3. The technology is not fully available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are 100% viable from a technology and/or economic reasonable standard.

85-4

85-5

85-6

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:
 - a. The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system, to get them the items they need to survive, like clothing, food, medical supplies, etc. 85-7
5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.
 - a. Uncertainty should not be created in this critical, essential business sector, especially in light of the current economic downturn/unemployment crisis associated with the COVID-19 pandemic. 85-8
6. Warehouses provide a broad range of jobs for people of every level of education and skill sets. Warehouses and the logistics industry as a whole, provide jobs that lead to upward mobility. This job creation is a socioeconomic benefit that would be threatened by the onerous costs imposed by the proposed ISR. 85-9
7. The “mitigating” measures of installing additional solar panels and EV chargers will increase pricing for the manufacturing and installation of them. This will put barriers to voluntary installation for other sites and facilities. The manufacturers would be hit by these same costs, which would increase their cost to make and distribute. This would be a major setback to buildings’ ability to elect into implementing long-term sustainability infrastructure and other measures. 85-10
8. The proposed ISR clearly seeks to “indirectly” regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry. 85-11

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above. 85-12

NOTICE OF OPPOSITION

Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305

Dear Chair Burke and Governing Board Members:

I am writing on behalf of the City of Cypress to express our opposition to Proposed Rules 2305 and 316 set for public hearing on April 2.

86-1

We were made aware of Proposed Rules 2305 and 316 by Warland Investments Company, which is one of the largest landowners in the Cypress Business Park and a crucial component of Cypress' local economy. Warland objects to the Proposed Rules for several reasons; however, the objection of most concern to the City is the burden on warehouse owners and operators to either assume substantial costs of upgrading their facilities and equipment or significant mitigation fees.

86-2

While the City supports the intended objectives of reducing emissions in order to improve air quality, the Proposed Rules as currently written will result in substantial operational cost increases to warehouse owners and operators, and are likely to result in increased costs of goods and services for businesses and residents. Even more critically, the Proposed Rules may drive warehouse owners and operators, as well as the jobs they provide, out of the South Coast area. For these reasons, we respectfully request you oppose Proposed Rules 2305 and 316.

86-3

86-4

Sincerely,

Jon E. Peat

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

87-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

87-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

87-3

87-4

87-5

87-6

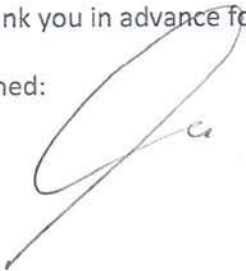

87-7

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

87-8

Thank you in advance for your time and consideration.

Signed:

Subject: Rule 2305: We OPPOSE the Warehouse Indirect Source Rule

Re: Rule 2305: We OPPOSE the Warehouse Indirect Source Rule

Dear Members of the AQMD Board:,

I am writing to you to express my opposition to the adoption of Rule 2305 (Indirect Source Rule).

89-1

Warehouses are integral to the Southern California logistics industry. The District's proposed ISR is a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments.

89-2

The following reasons highlight our primary concerns with the rule:

1. This rule will impose additional/permanent costs on warehouses that could range in the millions of dollars – which will be passed onto consumers, employees, businesses and elsewhere. The logistics industry is complex and tied to many different industries – the costs associated with this rule will have a ripple effect in the system.

89-3

2. The ISR requires warehouses to control what types of trucks make up their fleet or what types of trucks come to their warehouses – which is not feasible. The trucks the SCAQMD is asking warehouses to purchase are not in existence nor can warehouses control what trucks come to their facilities.

89-4

3. The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

89-5

4. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward mobility. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

89-6

5. Proposition 26 specifically states that governing bodies can only impose a "fee" on a business if that owner will receive a direct benefit from it. Otherwise, it MUST be considered a tax. We strongly believe that the "mitigation fee" associated with this rule is a tax that should be brought before voters.

89-7

6. It is unclear how many emissions will actually be reduced as a result of this rule. We believe the district is imposing a burdensome regulation with high costs with little to show for it. This is not how regulations should be adopted.

89-8

For these reasons, and more, I OPPOSE Indirect Source Rules.

Sincerely,
Bob Khalsa

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

91-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

91-3

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

91-4

Thank you in advance for your time and consideration.

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

92-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

92-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

Subject: Opposition to Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. Juan:

I am writing to express WestRock's opposition to the South Coast Air Quality Management District's, (SCAQMD) Proposed Rule 2305. We operate three warehouses within the district located in La Mirada, Fontana, and Montebello that would be subject to the rule. As currently written, the rule would likely increase operating costs on our three warehouses by nearly one-million dollars annually. In total, these warehouse operations exceed 865,000 square feet and serve as a vital part of WestRock's supply chain which is integral to delivering essential, sustainable paper and packaging products to our customers.

93-1

WestRock is a global manufacturer of sustainable paper and packaging products with approximately 50,000 team members across more than 300 manufacturing facilities, design centers, research labs and sales offices throughout the world. In California, we employ 1,308 people across 15 facilities with a payroll exceeding \$184 million. We pay \$13.3 million in taxes annually and invest over \$614 million through our supply chain network. Our essential products are used to ship and package food, beverages, health care, pharmaceutical, personal hygiene care, disinfectant products and other basic household supplies. As you know, the paper packaging industry was designated by the U.S. Department of Homeland Security's Cybersecurity and Infrastructure Security Agency as an essential critical infrastructure sector as part of the administration's Covid-19 response.

93-2

WestRock appreciates SCAQMD's efforts to reduce local and regional emissions and as one of North America's largest paper recyclers, WestRock has a long-standing commitment to innovation, environmental stewardship and sustainable business practices – they serve as the fiber of our company. However, Proposed Rule 2305, fails to consider the reality of the obligations requiring us, as warehouse operators, to shoulder the responsibility of reducing trucking emissions from which we have no control. Our business contracts with several trucking companies who utilize different models and configurations. We do not own these trucks and cannot control how these trucking companies operate their business.

93-3

WestRock looks forward to further discussions on this matter and commits to working with SCAQMD to advance our shared vision and environmental goals.

93-4

Respectfully,

A handwritten signature in black ink that reads "Jeff Chalovich". The signature is written in a cursive style with a large, stylized "J" and "C".

RE: CHBC Comments on Proposed Rule 2305 - Warehouse Indirect Source Rule

Dear Mr. Chairman and Members of the Board:

The California Hydrogen Business Council (CHBC)¹ appreciates the opportunity to comment on the SCAQMD's proposed Rule 2305 - Warehouse Indirect Source Rule (ISR).

94-1

The CHBC **supports** the proposed warehouse ISR rule and urges the Board to adopt the **most stringent alternative**. CHBC suggests a few changes to improve the effectiveness of the rule, discussed below.

The CHBC agrees with those in the environmental and EJ communities who have commented extensively about the health imperatives of a strong ISR rule. Indeed, the modern fuel cell industry was born out of the need to reduce air pollution in transportation and electricity production.

94-2

From a business standpoint, we believe that the proposed ISR sends a strong message to businesses around the world to invest in California, invest in reducing emissions in South Coast, and invest in improving zero-emission technology. And with that investment, to create jobs.

94-3

Towards those ends, the CHBC asks that the WAIRE menu be slightly modified to **remove** the one item that provides no emission reductions, nor provides infrastructure or support in any way for emission reductions - that item is indoor **air filtration**.

94-4

The CHBC believes that a SIP measure, like the ISR rule, must ensure that every element to meet emission reduction requirements do just that - reduce emissions. This is both a policy imperative and a federal requirement.

94-5

Only actual emission reductions or infrastructure that enables emissions reductions should generate credit toward compliance. SIP measures cannot provide emission reduction credit for masks or filtration. That is why the CHBC believes that allowing compliance credit in the WAIRE menu for installing air filtration is inappropriate. Every menu selection **MUST** reduce emissions or provide infrastructure support for emission reductions.

¹ The CHBC is comprised of over 100 companies and agencies involved in the business of hydrogen. Our mission is to advance the commercialization of hydrogen in the energy sector, including transportation, goods movement, and stationary power systems, to reduce emissions and dependence on oil. **The views expressed in these comments are those of the CHBC, and do not necessarily reflect the views of all of the individual CHBC member companies.** CHBC Members are listed here: <https://www.californiahydrogen.org/aboutus/chbc-members/>

The CHBC suggests other funding sources, like penalty dollars, are more appropriate for mitigation measures like air filtration at schools.

94-6

Secondly, CHBC recommends that the District provide **WAIRE points** for **onsite hydrogen generation**. For hydrogen use, part of the infrastructure piece is hydrogen supply. Indeed, in the last several years, drivers of hydrogen cell vehicles have seen what happens as production facilities go down for several reasons. The Governor's Office of Business and Economic Development (GO-Biz), for example, sees the resiliency and reliability of hydrogen supply to be of critical importance in addressing hydrogen infrastructure needs. Therefore, CHBC believes that providing WAIRE points for onsite hydrogen production is just as important as any of the other WAIRE menu infrastructure items.

94-7

Lastly, the CHBC wants to acknowledge the impressive work that went into developing this rule, and in particular, the creativity, and even brilliance by Ian MacMillan and the team that worked on proposed Rule 2305.

94-8

This rule may be the most important adopted by the District since the basin power plants were required to burn natural gas instead of fuel oil.

94-9

Implementation of the rule will certainly provide some challenges, and our industry can and will meet that challenge.

Sincerely,

A handwritten signature in dark ink, appearing to read 'W A Zobel', is written over the printed name.

Re: Response to Comment Letters on Draft Rule 2305 and Draft Staff Report

Dear Mr. MacMillan and Mr. Juan:

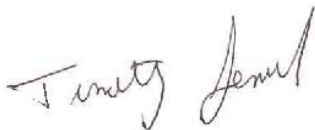

As you are aware, the NAIOP SoCal and Inland Empire Chapters on March 2, 2021, transmitted a joint comment letter to the SCAQMD regarding PR 2305 and the Draft Staff Report, and, on our behalf, Ramboll highlighted technical concerns. Although comments can be made up to the time of the actual hearing on the rule, we did submit our comments early to accommodate the SCAQMD Staff request to do so. You also received letters from CalTax, and Holland & Knight which raised numerous other important issues that are vital to a full analysis of the rule.

Other than a brief, general overview presentation to the Mobile Source Committee, no responses to those comments have been received to date. We noted in the Second Draft Staff report that there were detailed responses to some prior comment letters, but not those sent in March. We appreciate that the March and subsequent comment letters regarding PR 2305 have been posted on the website, but that site also does not contain any responses to the comment letters.

We believe the serious issues raised in the NAIOP and other three letters should receive the same type of detailed response as was done in the Second Draft Staff report. That type of analysis is necessary to provide not only us, but the public and the Governing Board with the type of information needed to fully evaluate and intelligently analyze PR 2305.

Please advise us when we will receive the responses to the comments and we look forward to their receipt.

Sincerely,

Timothy Jemal

April 16, 2021

Chair Burke and Members of the Mobile Source Committee
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

Re: Item No. 1 – Supporting adoption and strengthening of Warehouse Indirect Source Rule (Proposed Rules 2305 and 316)

Dear Chair Burke and Members of the Mobile Source Committee:

On behalf of the undersigned coalition of community and environmental organizations, we submit these comments in support of the warehouse indirect source rule with requests to adopt a strengthened rule. The Governing Board's adoption of Proposed Rules 2305 and 316 on May 7, 2021 will be the culmination of *six years* of agency work on a warehouse rule that will achieve necessary emissions reductions in the region. Together with the Air District's staff, we have spent thousands of hours participating in the process to develop a warehouse rule that is fair, inherently flexible, legally sound, and, importantly, long overdue. The Air District is required to use its legal and regulatory authority to deliver on its promise made years ago to adopt a warehouse facility-based measure that addresses "high-level, localized concentrations of pollutants" throughout the South Coast air basin.¹ Communities in the South Coast—who continue to suffer increasingly high levels of pollution from the freight industry every day—cannot afford any further delay.

96-1

¹ Health & Saf. Code, § 40440(b)(3).

Indeed, the warehouse industry has placed an unsustainable health burden on our neighborhoods and on current and future generations of children, pregnant mothers, and our elders and families for far too long. The Second Draft Socioeconomic Impact Assessment for the rule confirms that communities living within a half mile of a warehouse shoulder disproportionate harms, ranking in the 85th percentile of pollution burden statewide, in stark contrast to the rest of the region.² These communities also experience asthma and heart attack rates at much higher levels than the rest of the air basin.³ And it is no coincidence that warehouse facilities continue to be overwhelmingly sited in low-income communities and communities of color—in fact, nearly 70 percent of warehouse-adjacent communities in the South Coast are made up of people of color, and nearly 50 percent experience poverty.⁴ The warehouse indirect source rule will provide effective and meaningful regulation of an industry that has prioritized its profits over our health time and time again. The public health benefits of the rule are significant, resulting “in 150 to 300 fewer deaths, 2,500 to 5,800 fewer asthma attacks, and 9,000 to 20,000 fewer work [days missed due to air pollution] from 2022-2031. Expected total discounted monetized public health benefits range from \$1.2 to \$2.7 billion over the compliance period.”⁵

96-2

Industry continues its last minute and misleading opposition effort to this important, lifesaving rule. And these tactics come at a time when this industry, unlike many others, is thriving financially and expanding. The warehousing industry is now enjoying exploding profit levels as consumers increasingly rely on e-commerce during the COVID-19 pandemic.⁶ Even as the pandemic has devastated our communities and continued to exacerbate the health inequalities of how poor air quality harms our communities, those with ownership stakes in the freight system are “raking in all the chips in the changing landscape brought on by the coronavirus crisis.”⁷ Fulfilling the promises the Air District made to advance a mandatory warehouse regulation is critical given the massive expansion of the industry.

96-3

Although industry representatives continue to push “near-zero” technologies in the rule, near-zero is often used as code for further investment in natural gas infrastructure that will perpetuate harm in frontline communities and keep the South Coast locked in the past. The final rule must prioritize zero-emissions investments, the only solution that will effectively address the air quality and health impacts caused by this industry. The final rule must also increase the proposed stringency to 0.005 WAIRE Points per WATT in order to achieve greater emissions

96-4

² South Coast Air Quality Management District, Second Draft Socioeconomic Impact Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305 (Apr. 2021), at ES-2.

reductions and provide immediate relief to communities living near regulated facilities.

96-4
(cont'd)

We appreciate your consideration of these comments, and the Air District staff's hard work on this critical regulation. We look forward to working together to help our region finally achieve clean air by bringing this rule over the finish line on May 7th.

Subject: Indirect Source Rule

Hello,

My name is Jacob and I am a concerned resident of Los Angeles. I can't make the public comment call tomorrow so I am emailing you today to urge the air district board to please support and consider a rule to regulate pollution from indirect sources. The warehouse indirect source rule has been pushed back and delayed for months, even though my community feels the effects of goods movement like truck traffic and warehouse operations around the clock, even through COVID 19.

97-1

This summer we had over 100 unhealthy air days for smog in the South Coast Region. The air district must be proactive in ensuring industry polluters are held accountable for their historical environmental damage to our communities. The South Coast Air Basin is home to some of the worst air pollution in the country, primarily caused by emissions from warehouses and the goods movement industry and you have the power to positively affect hundreds of thousands of lives.

Please rule on a strong ISR!

Thanks,

Jacob Ruiz

Subject: [EXTERNAL]Public comment

Hello,

I am emailing in my public comment. I would have given this comment in person, however, due to technical difficulties I was unable to remain on the call. Below is my comment concerning the Indirect Source Rule:

My name is Shannon and I'm a Los Angeles resident. I'm commenting today to voice my support for a strong indirect source rule and urge the board to do the same. I feel that the delay or dilution of the rule is something we cannot afford. We need an indirect source rule in its strongest form and application to help electrify warehouses, keep polluting trucks out of our communities, and address our incredibly serious air quality problems.

Since corporate factories are not people, they do not have to live through and experience the burdens of their pollutants. This burden is instead handed down to communities, disproportionately communities of colour, who have to live with the negative health impacts of factory transport pollution. Because of this, industries working in our city and in our community must be held responsible for their pollutants through regulation that improves accountability and transparency, placing a sense of urgency on industries to decrease pollution.

A strong indirect source rule will be a step in the right direction to achieving this. I urge the support and commitment of your office to this end.

Thank you,
Shannon Labuschagne

Subject: [EXTERNAL]Public Comment for the Mobile Source Committee Meeting

Good Morning,

My name is Amy Vasquez and I am concerned that community voices are falling on deaf ears. Many of us have to work, children to care for, homework to complete, and yet we have all made time to be here to fight for our basic needs as humans. Please open your ears, hearts, and minds in order to provide us all your undivided attention.

Clean air is a basic human need and we have been subjected to the pollution dirty warehouses bring to our community for too long. The warehouse industry is highly unregulated and the time to end prioritizing profits over our health is now. As members of South Coast AQMD you should all be utilizing your authority to use an indirect source rule to reduce/eliminate the pollution caused by warehouses. Your support of the Warehouse ISR is critical to improving the air quality and health in the region. We all know that realistically the promise of warehouse jobs is temporary, the jobs that are currently available are dangerous, low wage, and often do not include much needed benefits. Allowing warehouses to continue to conduct business as is you are condemning us all to living conditions where the only option is poor health.

Please support a strong indirect source rule for all of us.

Thank you,

Amy Vasquez

Chair William Burke and Governing Board Members
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765-4178

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

100-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

100-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

100-3

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

100-4

Thank you in advance for your time and consideration.

Signed:

April 21, 2021

Wayne Nastri
Executive Officer
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765
wnastri@aqmd.gov

Dear Mr. Nastri:

This letter is in response to the Warehouse Indirect Source Rule (Proposed Rule 2305) and Fees for Rule 2305 (Proposed Rule 316).

101-1

Diesel pollution generated by transporting freight or cargo in the State continues to be the biggest contributor to the air toxics and criteria pollutants that affect everyone's quality of life. Communities near warehouses experience higher exposure to air pollution due to cumulative emissions from sources such as trucks, transport refrigeration units, and other freight equipment. The greater air pollution burden in these communities result in increased cases of asthma, hospitalizations, cancer, and even premature death related to heart and lung disease. Strategies for near-term emission reductions from freight facilities, such as the ones proposed in this rule, are especially needed to address the levels of ozone, and particulate matter that exceed National Ambient Air Quality Standards. Complementary mitigation strategies are needed at both the State and regional level to provide healthy air and to meet the 2023 and 2031 attainment deadlines. These strategies include the 2020 Mobile Source Strategy and Indirect Source Rules from air districts. The California Air Resources Board (CARB) supports the Draft Warehouse Indirect Source Rule (PR 2305) and Fees for Rule 2305 (PR 316) proposed by the South Coast Air Quality Management District (SCAQMD). The Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, created by these rules, represents an important action in addressing the region's air quality issues and minimizing the public health impacts that warehouse activities have on nearby communities that are disproportionately burdened by air pollution. CARB appreciates the hard work that SCAQMD put into developing the WAIRE Program. The WAIRE Program will be vital to protecting public health.

101-2

101-3

SCAQMD has clear authority under federal and California law to enact the WAIRE Program. The federal Clean Air Act explicitly permits any state to include an indirect source review program in its State Implementation Plan (SIP), 42 U.S.C. § 7410(a)(5)(A), and simply emphasizes that the United States Environmental Protection Agency (U.S. EPA) may not require a state to submit an indirect source review plan, even on new and modified facilities, see 42 U.S.C. § 7410(a)(5)(C). The indirect source review program is not limited to new or modified sources; rather it includes them, see 42 U.S.C. § 7410(a)(5)(D). Indirect source is broadly defined as any "facility, building, structure, installation, real property, road, or highway which attracts, or may attract, mobile sources of pollution," and regulation of such

101-4

sources is appropriate to meet key public health standards. See 42 U.S.C. § 7410(a)(5)(C)&(D). Indeed, a commitment to create such programs is a key part of the Air Quality Management Plan SCAQMD is using to attain federal air standards. This commitment needs to be put in place to comply with federal law.

101-5

As a State law matter, moreover, Air Districts have sweeping authority and obligations to regulate “air pollution from all sources” other than vehicles, and “shall adopt and enforce rules and regulations to achieve and maintain” air quality standards. Health & Safety Code § 40000 & 40001. The federal Clean Air Act operates as a floor, not a ceiling, on State authority, meaning that this sweeping State law authority fills in any gaps that might exist under federal law. See 42 U.S.C. § 7416. The federal Clean Air Act neither preempts nor limits State authority to impose an indirect source review program on new, modified, or existing sources. Finally, California law explicitly permits Air Districts, including SCAQMD, to impose indirect source requirements such as the requirements that the district proposes here (Health & Safety Code §§ 40717.5, 40716). This includes fee authority (Health & Safety Code §§ 40522.5, 42311).

101-6

The WAIRE Program offers multiple pathways to accelerate the deployment of clean technologies, including the purchase of zero-emission heavy-duty vehicles and heavy-duty vehicles that will be significantly cleaner than existing heavy-duty vehicles. CARB’s Advanced Clean Trucks and Low Oxides of Nitrogen (NOx) Omnibus regulations will require new 2024 and subsequent model heavy-duty vehicles that are sold in California to demonstrate compliance with increasingly stringent emission standards. The WAIRE Program encourages the purchase and use of such vehicles in the South Coast air basin, which would result in lower emissions in the basin, without increasing the number of new vehicles that must be offered for sale under CARB’s regulations.

101-7

CARB supports the immediate adoption of the WAIRE Program and sees it as an important step to protect people throughout the region with an emphasis on nearby communities. Given the rapid advancement in clean technologies, we believe there are opportunities to strengthen the rule in the future. Although the proposed WAIRE Program requirements include many options to accelerate the deployment of cleaner technologies throughout the region, the proposed rules should be further strengthened in the future in order to maximize near-term emissions reductions through the deployment of zero-emission vehicles and build out supporting zero-emission infrastructure. A major strength of the rule is that it allows for a diverse set of actions that warehouse owners/operators can take to meet their compliance obligation. However, a more focused emphasis on deployment of zero-emission technologies is crucial in meeting public health commitments to communities in your region. Below we identify some opportunities for strengthening the rule in the future and anticipate further options will become available given the rapid emergence of commercial zero emission solutions:

101-8

- Placing an increased emphasis on utilization of zero-emission technologies over combustion alternatives is necessary to achieve air quality, toxic, and climate goals.
- Raising the stringency, to ensure facility compliance obligations are commensurate with the negative public health impacts these facilities have on nearby communities.

101-9

101-10

- Deploying zero-emission vehicles, equipment, and supporting fueling/charging infrastructure should be prioritized over other options that would not directly reduce emissions produced at facilities. 101-11
- Decreasing the threshold for facility size would require smaller facilities to comply with this rule, which would help reduce the cumulative impacts and exposure. 101-12

Integrating an implementation review to account for the accelerated commercialization of zero-emission technologies and increased infrastructure deployment over time. As CARB and SCAQMD continue their longstanding partnership in protecting communities throughout the South Coast Air Basin, we encourage you to remain steadfast in working to achieve the goal of clean air for all. Developing an indirect source rule like this is very challenging, and I applaud the SCAQMD for developing an ambitious program that guarantees public health improvements that will be felt by local communities. CARB stands by to support you in this endeavor, and look forward to the implementation of the WAIRE Program. 101-13

Sincerely,

Richard W. Corey, Executive Officer

Re: OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

102-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

102-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

102-3

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

102-4

Thank you in advance for your time and consideration.

Sincerely,

Mark Ahlers
Engineering Manager

Re: Comments on Proposed Rule 2305

Dear Mr. MacMillan:

On behalf of over 56,000 members of the Southwest Regional Council of Carpenters, I write to respectfully request the board postpone, indefinitely, any adoption of Rule 2305 (Indirect Source Rule or ISR) in light of the current economic and public health crisis. The current language and timeline of Rule 2305 would add uncertainty to the market, and we respectfully request that more analysis be given to its economic impact, particularly on construction. The construction and maintenance of warehouse facilities provide vital, good paying careers to more than 3,000 local union Carpenters. These careers provide great wages, health benefits, and retirement security and allow our members to work closer to home, be impactful members of the community and provide for their families. This rule will directly affect the economic security of thousands of households and create even further uncertainty during this already uncertain time.

105-1

While we strongly support a just transition to a clean energy economy, a policy change this broad and at this time would be destabilizing for the industry. The COVID-19 pandemic is a once-in-a-century event that has upended Southern California's economy and construction sector. The impacts of the pandemic have particular relevance to the warehouse industry as the growth in e-commerce has led to a surge in warehouse demand. This surge has been key in keeping Southern Californians working in this sector at a time when other areas of our country were not as fortunate.

105-2

We ask that the SCAQMD postpone this item indefinitely so that there can be further research done into the effects of such rule and its impact on the economy. A greater understanding of how this rule will have a ripple-effect on our region, especially the construction industry, is something that I would ask each board member to prioritize before considering passing Rule 2305. Thank you again for your consideration of this important issue.

105-3

Sincerely,

RE: Comments on Proposed Rule 2305 – Warehouse Indirect Source Rule –
Warehouse Action and Investments to Reduce Emissions Program
(WAIRE)

Dear Mr. Banuelos and Mr. Juan:

We appreciate the opportunity to submit comments on the South Coast Air Quality Management District's ("SCAQMD") Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investment to Reduce Emissions (WAIRE) Program (the "Proposed Rule"). Scopelitis, Garvin, Light, Hanson & Feary is the

nation's leading transportation-focused law firm, and our clients include motor carriers, brokers, and warehouse operators that operate in interstate and intrastate commerce in California and nationwide and which regularly pick up from, and deliver to, warehouses in the SCAQMD. While we share many of the same concerns about the Proposed Rule expressed by the California Trucking Association, we specifically write to underscore the concern the Proposed Rule would be preempted under 49 U.S.C. § 14501.

Summary of the Rule As It Pertains to Trucking

Although the Proposed Rule applies directly to operators and owners of warehouses, SCAQMD has found that trucks delivering goods to and from warehouses contribute "[t]he majority of emissions associated with warehouses."¹ The Proposed Rule's purpose is to reduce local and regional NOx and PM emissions, and the Proposed Rule is founded on the premise that "[t]rucks delivering or picking up goods from a warehouse are a proxy for total activity and emissions related to a warehouse."² The premise is inextricably embedded in the calculation of a warehouse's WAIRE Points Compliance Obligation, which is determined, in part, by the number of truck trips to a facility in a given year.³ Finally, the first two actions or investments listed in the Proposed Rule's menu for earning WAIRE points are: 1) the acquisition of zero emissions ("ZE")/near zero emissions ("NZE") trucks in a warehouse operator's fleet; and 2) the number of ZE/NZE truck visits.⁴

The Proposed Rule Would Likely Be Preempted Under 49 U.S.C. § 14501

As part of its deregulation of the trucking industry, Congress enacted a provision in the Federal Aviation Administration Authorization Act of 1994 ("FAAAA") to "pre-

¹ Victor Juan *et al.*, Second Draft Staff Report ("Report"), Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305, April 2021, at 6. The Report also notes that up to 40% of warehouse operators may also be motor carriers, operate a fleet of trucks. *Id.* at 44, n. 64.

³ Proposed Rule, § (d).

⁴ *Id.* at Table 3.

empt state trucking regulation.”⁵ Modeled on deregulatory legislation enacted for the aviation industry, Congress provided that “[A] State ... may not enact or enforce a law, regulation or other provision ... related to a price, route, or service of any motor carrier ... with respect to the transportation of property.”⁶ As with the Maine law impacting delivery services in *Rowe*, the Proposed Rule would likely be preempted.

The Court has held that under the FAAAA: 1) a state law is preempted if it has a connection with or reference to motor carrier prices, routes, or services; 2) preemption can occur even if the state law’s effect is only indirect; 3) it makes no difference whether the state law is consistent or inconsistent with federal laws; and 4) preemption occurs, at least, where a state law has a significant impact on Congress’s deregulatory and preemption-related objectives.⁷ The Proposed Rule meets this criteria.

In *Rowe*, the Court struck down a Maine law that required tobacco retailers to use delivery services that followed particular delivery procedures. While the Court “concede[d] that the regulation here is less ‘direct’ than it might be, for it tells *shippers* what to choose rather than *carriers* what to do,” the Court still found that the law created a connection with motor carrier services, because those services made up a substantial portion of all delivery services.⁸ The Proposed Rule similarly recognizes truck deliveries are a substantial portion of the emissions to be curtailed and the first two options for earning WAIRE points either (i) regulates warehouse operators in their capacity as fleet operators (i.e., motor carriers) or (ii) tells warehouse operators to choose motor carriers that utilize ZE/NZE vehicles.⁹ In either instance, the result is the regulation dictating that motor carriers provide their services using equipment that “differ[s] significantly from [otherwise lawful equipment] that, in the absence of

⁵ *Rowe v. New Hampshire Motor Transport Ass’n*, 552 U.S. 364, 368 (2008).

⁶ 49 U.S.C. § 14501(c)(1).

⁷ *Rowe*, 552 U.S. at 370-71 (citing *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374 (1992) (internal quotation marks omitted)).

⁸ *Id.* at 371-72.

⁹ In neither instance is the Proposed Rule a generally applicable law, because it does not affect motor carriers “solely in their capacity as members of the general public.” *Id.* at 375.

the regulation, the market might dictate.”¹⁰ Given Congress’s overarching goal in passing the deregulatory provision was to “ensure transportation rates, routes, and services that reflect ‘maximum reliance on competitive market forces,’ thereby stimulating ‘efficiency, innovation, and low prices,’ as well as ‘variety’ and ‘quality,’” the Proposed Rule would significantly frustrate Congress’s objectives.¹¹

106-1

What the Court’s jurisprudence makes clear is that state law cannot require warehouses to do what the state cannot directly do itself. The Report anticipates that warehouse operators will contract with motor carriers to take into account the Proposed Rule by requiring ZE or NZE truck visits, resulting in a de facto requirement for motor carriers to use ZE or NZE trucks in lieu of trucks that are otherwise legally operable.¹² In addition to requiring the use of equipment that market forces do not currently support, the elevated cost of ZE and NZE trucks will undoubtedly cause motor carriers to increase prices in order to recoup the required additional investment. And although the Report recognizes that Class 8 trucks transporting goods to and from warehouses covered by the Proposed Rule can operate nationally,¹³ there is no discussion about how a requirement for motor carriers to use ZE or NZE trucks will impact the motor carrier’s national routes and networks in light of charging station scarcity and battery range restrictions. It is far too speculative to assume that interstate trucks will not be range-bound and/or subject to frequent service disruptions in order to re-charge trucks – precisely the type of state law impact on motor carrier routes and services that the FAAAA was intended to protect against.

106-2

SCAQMD cites the California Health and Safety Code as the statutory authority for the Proposed Rule. While we have no reason to doubt the Proposed Rule is being considered to further important public health and safety goals, there is no public health exception to FAAAA preemption.¹⁴ If the Court could find no such exception

106-3

¹⁰ *Id.* at 372.

¹¹ *Id.* at 370 (quoting *Morales*, 504 U.S. at 378).

¹² Report, at 45.

¹³ *Id.* at 43.

¹⁴ *Id.* at 375 (“The Act says nothing about a public health exception.”)

Mr. Ryan Banuelos

Mr. Victor Juan

for a law aimed to protect against sales of cigarettes to minors, it seems inconceivable the Court would find an exception here.

106-3

Conclusion

Thank you for the opportunity to express our concerns that the Proposed Rule, by indirectly regulating motor carriers, is likely preempted under federal law.

Very truly yours,

/s/ Gregory M. Feary

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

DCG Fulfillment opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses such as ours are integral to the Southern California logistics industry. The logistics industry played a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce. We remained open during the pandemic ensuring the supply chain was not broken and provided an income to all our Employees despite the challenges and dramatically increased costs to our company to keep them safe during the pandemic. This financial burden has compounded the challenges companies such as ours are facing having worked to support our employees to the “living wage” of \$15 per hour. This of course is a burden many of our competitors do not have to face as they reside in states outside of California. We love our state being life-long Employers in California and are not looking to be financially pushed out as our families all live here. However, we are not sure where these extra funds will be able to come from as we already work with very thin margins in our industry.

107-1

The District’s proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

The following further comments are provided in response to the District’s Proposed Rule 2305:

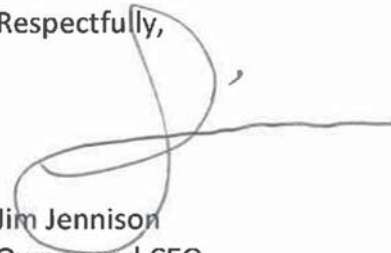

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic’s challenges on behalf of our nation.

107-2

- | | |
|--|-------|
| 2. It is not feasible to comply with the ISR due to the following: | |
| a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, we as warehouse operators are not able to accomplish this task. | |
| b) Our Warehouse has no control over how truck engines are manufactured. | 107-3 |
| c) Our Warehouse does not own truck fleets, nor do we control what type of trucks shipping companies purchase. | |
| d) Our Warehouse does not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips. | |
| 3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard. | 107-4 |
| 4. Warehouses have been deemed to be essential businesses by the State for important reasons including: | |
| a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc. | 107-5 |
| 5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known. | |
| a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic. | 107-6 |
| 6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten. | 107-7 |
| 7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry. | 107-8 |

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.	107-9

Sent Via Email: imacmillan@aqmd.gov / vjuan@aqmd.gov

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Messrs. MacMillan and Juan,

Pactiv Evergreen has serious concerns regarding the adoption of Rule 2305 (Indirect Source Rule). This proposed rule would be extremely costly for our company to implement at our warehouse in San Bernardino. We do not own our trucking fleet, and the mitigation measures offered in the proposed rule are beyond our control and would not reduce the company's fee exposure.

108-1

Pactiv Evergreen is the largest manufacturer and distributor of food and beverage packaging in North America with a diversified mix of customers, including restaurants, foodservice distributors, supermarkets, food and beverage producers, food packers and processors. We have seven manufacturing and warehousing facilities throughout California with over 1,100 employees. **Our San Bernardino distribution center (DC) is large enough to fall under this proposed rule.** This DC is used to distribute essential foodservice items across California, Nevada, Arizona, Utah, Oregon and Washington.

Pactiv Evergreen believes the District's proposed ISR is targeting a sector that has been deemed essential by federal and state governments and serves as a lifeline to the region and the nation. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

108-2

The threat of these potentially enormous fees and/or cost of mitigation measures will force us to consider other options, including potentially moving to a new location outside of the South Coast authority.

108-3

Additionally:

- Based on a calculation of ~\$.90 per square foot, the District's Proposed Rule 2305 would impose additional annual costs on our warehouse of over three-quarters of a million dollars during the worst possible time and while responding to the pandemic's challenges on behalf of our nation. Beyond just our warehouse, we understand that this extra cost would equate to an estimated \$1 billion each year for the all warehouses in the South Coast area.
- The proposed rule requires our warehouse to control truck fleets and decrease truck emissions. However, we do not own our truck fleet nor can we regulate what type of trucks our shipping companies purchase. We certainly do not have the power to mandate how truck engines are manufactured. Plus, we understand that "green" trucks are in short supply.

108-4

108-5

- | | |
|--|-------|
| • The technology is not available to accomplish items on the WAIRE menu. There are no heavy-duty electric trucks that are viable from a technology and/or economically reasonable standard to service our DC. | 108-6 |
| • Warehouses are deemed essential businesses by the State for important reasons including distribution of essential goods across the region. | 108-7 |
| • This rule creates tremendous uncertainty for the company as the full negative impact of this ISR is not known. And, uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic. | 108-8 |

Finally, it appears that the proposed ISR seeks to “indirectly” regulate our trucking service providers through the fees that would be collected from our warehouse/distribution center. We would like to know what authority the District has to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.	108-9

Re: United Airlines Comments on SCAQMD's Proposed Rules 2305 and 316 Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program & Associated Fees

Dear Mr. Juan:

United Airlines, Inc. (United) appreciates the opportunity to submit comments regarding the South Coast Air Quality Management District (SCAQMD) Proposed Rule 2305, a warehouse indirect source rule. United previously submitted comments on March 2, 2021, to an earlier version of Proposed Rule 2305 dated January 15, 2021. In addition to its previously submitted comments, United would like to provide the following additional feedback to SCAQMD regarding Proposed Rule 2305. Airlines for America (A4A) will also be submitting comments to SCAQMD on behalf of its members. United supports and incorporates by reference the A4A comments.

109-1

As indicated in our initial March 2 comment letter, United operates a cargo warehouse building at Los Angeles International Airport (LAX), pursuant to a lease agreement with Los Angeles World Airports (LAWA). United's LAX warehouse building has 100,000 square feet of indoor floor space. It is currently used for cargo warehousing and other aviation activities by United Cargo and other United operational groups, and therefore would be subject to the Proposed Rule as currently drafted. The following sets forth the reasons why United does not believe that SCAQMD has the legal authority to promulgate this rule as it applies to airlines and existing warehouses.

1. The Clean Air Act's indirect source provision does not authorize the SCAQMD's regulation of existing warehouses and distribution centers.

The SCAQMD lacks the legal authority to adopt an indirect source rule for existing air cargo warehouses located at airports. The SCAQMD's Draft Staff Report prepared for the proposed rule relies upon CAA section 110(a)(5)(A)(i) as providing the authority for states to include indirect source review programs as part of their state implementation plans. However, CAA section 110(a)(5)(D) defines an "indirect source review program as "the facility-by-facility review of indirect sources of air pollution, including such measures as are necessary to assure, or assist in assuring, that a *new or modified* indirect source will not attract mobile sources of air pollution, the emissions from which would cause or contribute to air pollution concentrations." (Emphasis added.)

109-2

The CAA limits the scope of an indirect source emission control measure to only those directed at new or modified indirect sources. Proposed Rule 2305 violates the acceptable scope of an indirect source review program under the plain language of the CAA by imposing obligations on existing, as opposed to new or modified warehouses. The Draft Staff Report asserts that “the authority for air districts to set emission reduction targets from indirect sources was confirmed by the [Ninth Circuit] in *NAHB v. San Joaquin Valley UAPCD* (9th Cir. 2020) 627 F.3d 730.” The SCAQMD’s reliance on *NAHB* is misplaced. The rule at issue in *NAHB* involved the regulation of emissions from nonroad vehicles at facilities *undergoing construction*. Such facilities are inherently either new or modified as a result of the construction activity. The court in *NAHB* did not consider whether a purported indirect source review program seeking to regulate existing facilities that had not undergone any construction activity was permissible under the CAA. As such, the SCAQMD cannot use the *NAHB* case as precedence for allowing Proposed Rules 2305 and 316.

109-3

2. The regulation of aviation activities under Proposed Rules 2305 and 316 is preempted under the Airline Deregulation Act (ADA) and other federal statutes.

As stated in our previous comment letter, the Federal Aviation Act and the ADA preempt the Proposed Rule’s regulation of air cargo warehouse operations. Not only are air cargo activities conducted at United’s LAX warehouse, but also aircraft maintenance training and cabin cleaning provisioning. These uses underscore that warehouses operated by airlines are subject to the ADA, which preempts state requirements related to prices, routes, or services of an air carrier. 49 U.S.C. § 41713(b)(1). SCAQMD is impermissibly seeking to restrict United’s air transportation services by requiring United to either change its operations to comply or pay a mitigation fee.

109-4

3. Proposed Rules 2305 & 316 are unnecessarily duplicative of, and potentially contradictory to, existing and forthcoming regulations requiring a transition to zero-emission (ZE) trucks.

In June 2020, the Office of Administrative Law approved the California Air Resources Board’s (CARB) Advanced Clean Trucks (ACT) regulation. The ACT regulation imposes zero emission vehicle sales requirements on truck manufacturers and has a one-time reporting requirement for large entities and fleets. The stated purpose of imposing the reporting requirement is to obtain details about individual fleet operations in order to drive future measures that would “ensure that fleets purchase available ZE trucks and place them in service where suitable to meet their needs.”¹ In addition, by 2035, truck manufacturers truck sales will be required to be 55% ZE for Class 2b-3 and 75% ZE for Class 4-8.

109-5

Proposed Rule 2305’s WAIRE menu allows warehouse owners and operators to earn WAIRE compliance points by implementing very similar actions to those that will eventually be necessitated by the ACT regulation. Where warehouses and truck fleets are operated by the same entity, the rule could have the benefit of accelerating the transition to ZE trucks, but this will not be the case for entities like United. Due to a lack of feasible emissions reduction options for earning WAIRE compliance points through their operations, operators like United **who do not own**

¹ CARB, Advanced Clean Trucks Fact Sheet, June 25, 2020.

or operate the fleets traveling to and from their facilities will only be able to pay mitigation fees to comply. According to the Draft Staff Report, those fees will be used to establish a mitigation program to provide funding to truck operators towards the purchase and installation of ZE charging or hydrogen fueling infrastructure. This will essentially lead to warehouse operators funding the transition towards ZE trucks by fleet owners/operators who would already be subject to future CARB ZE truck requirements. For entities like United, the rule does not provide any measurable reduction in emissions and just shifts the burden and associated costs from the responsible entity to another that has no control over the activities with resulting air emissions.

109-5
(cont'd)

Finally, the United States Environmental Protection Agency has stated that the indirect source rule at issue in the *NAHB* case “does not qualify for emission reduction credit for purpose of an attainment or progress demonstration” [ie, SIP revision] due to enforceability concerns (e.g., provisions allowing developers to pay a fee instead of implementing on-site pollution mitigation measure). *See* 86 Fed. Reg. 11484 (Feb. 25, 2021). Yet, SCAQMD references in its Preliminary Draft Staff Report the need to attain federal air quality standards as one of the primary drivers for these regulations. The fact that Proposed Rules 2305 and 316 will not qualify for emissions reduction credit in any attainment plan further demonstrates it would be inadvisable for the District to adopt these regulations given its questionable legal authority.

109-6

Re: Supporting adoption and strengthening of Warehouse Indirect Source Rule (Proposed Rules 2305 and 316)

Dear Chair Burke and members of the mobile source committee:

Environmental Defense Fund (EDF) writes you today to support the warehouse indirect source rule. As you are aware, the air quality in the South Coast Air District is amongst the worst in the country. One of the key contributors of this air pollution is from the use of diesel trucks and other heavy duty equipment operating at or near warehouses, or trucks that are delivering goods to and from these facilities.

110-1

Warehouses are an important focus for pollution reduction efforts in part because they tend to act as "hot spots" for local air pollution. The Second Draft Socioeconomic Impact Assessment for the rule confirms that communities living within a half mile of a warehouse shoulder disproportionate harms, ranking in the 85th percentile of pollution burden statewide, in stark contrast to the rest of the region. EDF's own analysis confirms the disproportionate nature of warehouse pollution on low income communities and communities of color. Simply put, warehouses attract vehicle traffic in a more concentrated manner, and emissions in neighborhoods with warehouses are significantly higher than in other neighborhoods. The communities around these warehouses are nearly 70 percent people of color and nearly 50 percent experience poverty, contributing to the fact that warehouses and disadvantaged communities tend to be co-located.

110-2

As proposed, the Warehouse Indirect source rule (ISR) creates the opportunity to drive the deployment of clean energy technology, including zero emissions medium and heavy duty vehicles and renewable energy generation equipment across Southern California. The ISR incents companies who own and utilize these facilities to pursue as many cost efficient emissions reductions opportunities as possible to convert their operations to zero emissions.

110-3

Recent studies by EDF and partners evaluate the market readiness of zero emissions vehicles and find nearly 125 models of vehicles either announced or in production¹ and document the significant cost benefits associated with pairing electric truck deployments with on-site energy generation and storage.²

110-4

Of course, the proposed indirect source rules are not a silver bullet – there will need to be several additional policy reforms and market transformations required, both local and statewide in nature. The Board should pursue this rule however because it can play a critical role in making people's lives better from improved air quality.

110-5

We thank you for your leadership on this issue and offer our support on the proposed rulemaking package.

Sincerely,

Michael Colvin

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

111-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

111-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

111-3

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

111-4

Thank you in advance for your time and consideration.

Signed:

Randall J. Steward

Re: Concerns related to Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. Burke and Governing Board Members,

We trust all is well. It has come to our attention that there are pending rules and regulations being considered by your office, specifically, Rule 2305, Warehouse Indirect Source Rule.

112-1

As we agree with improving the air quality in Southern California, we have been informed that this rule would affect affordable warehouse space in the area by increasing property taxes. Consequently, resulting in higher overhead operating expenses which would create economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any increases in taxes.

112-2

As a business that relies on affordable warehouse space, we are reaching out to you today to share our concerns and financial concerns.

While we understand Rule 2305 is well intended, we respectfully request that you consider the potential affects to our business, and businesses like ours, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays, and ordinances.

112-3

Thank you in advance for your time and consideration.

Subject: Rule 2305: We OPPOSE the Warehouse Indirect Source Rule

Re: Rule 2305: We OPPOSE the Warehouse Indirect Source Rule

Dear Members of the AQMD Board:,

I am writing to you to express my opposition to the adoption of Rule 2305 (Indirect Source Rule).

Warehouses are integral to the Southern California logistics industry. The District's proposed ISR is a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments.

115-1

The following reasons highlight our primary concerns with the rule:

1. This rule will impose additional/permanent costs on warehouses that could range in the millions of dollars – which will be passed onto consumers, employees, businesses and elsewhere. The logistics industry is complex and tied to many different industries – the costs associated with this rule will have a ripple effect in the system.

115-2

2. The ISR requires warehouses to control what types of trucks make up their fleet or what types of trucks come to their warehouses – which is not feasible. The trucks the SCAQMD is asking warehouses to purchase are not in existence nor can warehouses control what trucks come to their facilities.

115-3

3. The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

115-4

4. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

115-5

5. Proposition 26 specifically states that governing bodies can only impose a "fee" on a business if that owner will receive a direct benefit from it. Otherwise, it MUST be considered a tax. We strongly believe that the "mitigation fee" associated with this rule is a tax that should be brought before voters.

115-6

6. It is unclear how many emissions will actually be reduced as a result of this rule. We believe the district is imposing a burdensome regulation with high costs with little to show for it. This is not how regulations should be adopted.

115-7

For these reasons, and more, we OPPOSE Indirect Source Rules.

115-8

Sincerely,
Ryan Ole Hass

To: Paul Stroik

Cc: Victor Juan; Greg Owen

Subject: ZE Truck Cost

Mr. Stroik,

My comments are that the estimated cost for ZE truck is grossly understated. We have a quote that our cost will be in excess of \$500,000 per Class 8 tractor. This quote is from a major OEM. We have applied for VW funding and plan to move forward with some EV tractors if we are awarded funding. But the cost will be much higher than presented in this report.

117-1

Our opinion is that it may take two new ZE tractors to do the workload of one diesel tractor. What if any consideration was taken to account for this possibility in the socioeconomic assessment?

117-2

Additionally as an operator in the jurisdiction we do not agree with the conclusions that little to no cargo diversion will occur. Many of our customers are already pursuing alternative ports of entry and this is before this estimated 30% increase in operating rents happens.

117-3

Regards,

Mike

Diamond Bar, CA 91765

Subject: Comments on the Draft Socioeconomic Impact Assessment for Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program and Proposed Rule 316 – Fees for Rule 2305

Dear Mr. Stroik:

In reviewing the Socioeconomic Impact Assessment, staff is concerned that the complexity of the modeling presented in the draft Socioeconomic Impact Assessment makes it difficult to determine the estimated cost of implementation of Proposed Rule 2305. The cost of implementation is of particular concern considering the number of warehouse projects within Moreno Valley that would be subject to the Rule. Of the estimated 470 potentially affected facilities in Riverside County, Moreno Valley has 48 warehouses on the "Potentially Subject to PR 2305" list (or approximately 10% of Riverside County's total facilities). PR 2305 will raise the cost of operating a warehouse in the SCAQMD region, which would impact economic and job growth in the Inland Empire and region.

118-1

The costs to administer and comply with both PR 2305 and PR 316 are also difficult to determine from the 19 different scenarios which were provided to show the range of potential compliance outcomes. For these scenario analyses, all 2,902 potentially affected facilities in the SCAQMD Region were modeled using their square footage and the applicable average trip generation rates to determine a compliance obligation. While average annual cost of PR 2305 has been provided by square footage, it is still difficult to determine the impact of the rule. The administrative costs (PR 316) are additional to the compliance actions in the scenarios and provided in the draft Socioeconomic Impact Assessment. The costs to meet compliance obligations of Rules 2305 and 316 appear to be underestimated, especially for the time allocated for reporting and financially impact a facility further.

118-2

Thank you for the opportunity to comment and we look forward to reviewing the forthcoming documents. If you have any questions or would like to discuss further, please feel free to contact Chris Ormsby, Senior Planner at (951) 413-3229, or by email at chriso@moval.org.

Sincerely,

Manuel A. Mancha

Subject: [SPAM]Indirect Source Rule

Hello,

My name is Cora Went and I am a Physics PhD student at Caltech and a member of the Sunrise Movement Los Angeles. I cannot make public comment at the Mobile Sources Committee meeting today, so I am emailing to urge the air district board to adopt a rule to regulate pollution from indirect sources.

The South Coast Air Basin is home to some of the worst air pollution in the country, primarily caused by emissions from warehouses and the goods movement industry. The air district needs strong and enforceable requirements to get the industry to curb their dangerous emissions and finally clean up pollution in all communities.

Please protect the health and safety of our communities by adopting a strong warehouse indirect source rule.

Sincerely,
Cora Went

Re: Warehouse Indirect Source Rule (Proposed Rule 2305)

Dear Board Members,

We write to you in strong support of the approach taken by the Warehouse Indirect Source Rule, but we urge you to strengthen the rule. The Board should take advantage of the current economic landscape — record profits for warehouses, Southern California’s dominant position in the national warehouse market, and an increasing structural shift in market power to warehouse companies — to pass the strongest-possible regulations of this deadly industry.

For far too long, poor communities and communities of color have subsidized the international supply chain with their own health. This is true not only in the Inland Empire, where (according to a recent headline), “new ecommerce warehouses crowd out rural communities,”¹ but also in the Southeast L.A. County Gateway Cities, in the San Fernando and San Gabriel Valleys, and elsewhere. Each warehouse facility may see thousands of trucks and vans each day, generating tons of harmful emissions.² Frontline communities pay with their health, and the entire region suffers from poor air quality.³ The industry can afford the modest investment under the ISR. Further, the ISR must be strengthened to stay relevant.

The U.S. warehouse industry is posting record results

According to a recent analysis from *Logistics Management*, the warehouse industry “is not only withstanding the widespread economic impact of COVID-19, it’s thriving. In fact: it’s red hot.”⁴ At the start of the pandemic, warehouse was already “the darling of the real estate market,” and a record 224 million square feet came online in 2020.⁵ Still, it’s not enough.

120-1

120-2

- E-commerce requires more warehouse space than traditional brick and mortar stores; one industry player estimates that for every shift of just one percentage point from brick and mortar to online retail, an additional 46 million square feet of warehouse space are needed.⁶ In 2020 alone, the five-percentage-point shift suggests an additional 230 million square feet are needed.

- Further additional demand is expected as retailers who “were caught short-handed during the initial demand shock” increase inventory levels across the board. According to a Wells Fargo analysis, this factor could “drive 285–570 million square feet of incremental demand.”⁷

120-2
(cont'd)

Strong demand for industrial real estate has led to a decade’s worth of consistent — and increasing — rent growth.⁸ Increased demand is expected to lead to a significant *further* increase in rents in 2021. Wells Fargo “anticipate[s] an acceleration” to “high-single-digit rent growth in primary industrial markets.”⁹

Southern California warehouses are further outperforming

A 2021 headline in trade publication *Freight Waves* concluded, simply: “‘Insatiable demand’ drives Southern California warehouse boom.”¹⁰ According to the latest figures from CBRE, L.A. has the lowest vacancy rate (1.4 percent) in the nation.¹¹ (The Inland Empire is third with 1.9 percent.) The UCLA Anderson School Forecast reported in February 2021 that “industrial space sentiment has come roaring back.”¹²

An analyst from CBRE explains Southern California's dominance:

The industrial market had great fundamentals prior to Covid and now has better fundamentals in part due to Covid. In Southern California... we operate in a uniquely well-positioned geographical region with a deep business infrastructure in place, a huge densely populated area that has gigantic purchasing power, the most dominant ports in the U.S. to meet the demands of the customer and a very large inventory of industrial buildings to meet the needs of the companies storing and selling product. This is why retailers and business generally want to and need to be here.¹³

This dominance can be seen in occupancy and

120-2
(cont'd)

rental rates¹⁴:

Indeed, even as analysts expect additional supply to come online in 2021, many believe Southern California “won’t feel the reprieve as much” as the rest of the country because of such high demand.¹⁵

In February 2021, one industry CEO spoke bluntly about Southern California:

There is nothing short of astounding what we see in terms of rents. We typically forecast our rents each quarter. The team seems to be doing it now weekly. I mean it’s unbelievable. There’s such demand for space and rents are growing so quickly... [Y]ou’re talking about rents that literally changed \$0.05 or \$0.10 within the past month.¹⁶

This region is in fact so dominant that the industry is “unfazed” by the prospect of some marginal costs associated with the Indirect Source Rule, according to recent reporting.¹⁷ “You keep expecting regulation to take a toll on business,” the CBRE analyst observed about the ISR, “but when you look at the numbers and metrics,” it doesn’t.

Industry leaders already invest in innovation

An examination of market leader Prologis — “the bellwether of industrial real estate” according to a recent Wells Fargo report — provides insight into the fiscal health and stability of the industry.¹⁸ Not only is the company currently showing record leasing activity, but a UBS analysis notes the company’s “strong fundamentals for years to come.”¹⁹ Another analyst noted the company’s consistent “outsized financial results,” suggesting in the piece’s headline that Prologis’s biggest responsibility is to “Collect rent checks as Amazon.com’s landlord.”²⁰ Prologis has noted that the Southern California market “outperformed in 2020, [and] we expect them to outperform in 2021.”²¹

The company touts to shareholders that it is successful because it “invest[s] in innovation.”²² Indeed, in 2019 Prologis identified “Change through innovation and operational excellence” as one of the three pillars “to guide [Prologis] through our next phase of growth.”²³ Many of the options provided by the ISR seem not only consistent with — but anticipated by — Prologis’s existing approach.

Change Through Innovation & Operational Excellence is about embracing new challenges and using our global footprint and expertise to offer innovative solutions to our customers. As an example, we leveraged our scale to establish a dedicated manufacturing line of LED light fixtures that we can install through our Prologis Essentials LED program, which resulted in procurement cost savings of \$15 million in 2019. Also, as our customers come to us for our expertise in sustainable real estate solutions, we are always looking for ways to help them tap into the environmental and economic benefits of renewable energy.

120-2
(cont’d)

Rexford Industrial — another profitable Southern California market leader — similarly locates its success in “creat[ing] value through renovation and repositioning.” The company points to investments in sustainability as benefitting the triple bottom line: citing a \$1.6 million investment at one facility, the company claimed a nearly 300 percent return.²⁴

To be relevant, the rule must be more stringent

While we applaud the staff approach to the ISR, we believe some of the key thresholds are too weak, and will not sufficiently protect communities:

- **Square footage:** Warehouses are getting both smaller and closer to where people live. Amazon.com recently announced plans to open 1,500 “small delivery hubs in cities and suburbs.”²⁵ This means that just as residents will see increased exposure rates to dangerous emissions, these newer facilities are less likely to be covered by the indirect source rule. We believe that 100,000 square feet is insufficient as a threshold. We urge you to set the threshold at 50,000 square feet at some point in the future after the rule is adopted.
- **Stringency value:** The lowest stringency value studied by the Air District (0.0001) would only reduce, at a maximum, 1.5 tons per day of nitrogen oxide and 0.01 tons per day of diesel particulate matter, and the full stringency would not even apply to many warehouses for years (if at all).²⁶ The Air District should adopt a more stringent rule.

120-3

120-4

Thank you for your leadership. We appreciate your time and attention as you finalize and move forward with this critical rule.

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Gentlemen:

I oppose the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

121-1

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

121-2

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

121-3

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

121-4

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:
a) The approximately 18 million people who live in Southern California rely on

121-5

warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

121-5
(cont'd)

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.

121-6

- a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.

6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

121-7

7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.

121-8

Thank you for your attention to these comments. Please include these comments as part of the official record for Proposed Rule 2305 (Warehouse Indirect Source Rule) so that all SCAQMD Board Members may have the opportunity to review the above.

Subject: Comments on Proposed Rule 2305 (Warehouse Indirect Source Rule)

Dear Mr. MacMillan:

Logistics Property Company, LLC, opposes the adoption of Rule 2305 (Indirect Source Rule). Warehouses are integral to the Southern California logistics industry. The logistics industry plays a crucial role in the response to the COVID-19 pandemic—not only in the distribution of medical supplies, vaccines, and equipment but also in delivering goods to a public that has become increasingly dependent on e-commerce.

The District's proposed ISR seems to be a misguided policy during the COVID-19 pandemic. The District is pursuing a regulation targeting a sector that serves as a lifeline to our region and the nation and is deemed essential by federal and state governments. Under the current draft rule, reporting obligations begin only 60 days from rule adoption. The substantive WAIRE Points obligations will commence as soon as July 2021.

The following further comments are provided in response to the District's Proposed Rule 2305:

1. This rule would impose additional/permanent costs on warehouses of approximately \$.90 per square foot. This extra cost would amount to targeting a specific essential industry with \$1 billion in annual fees during the worst possible time and while responding to the pandemic's challenges on behalf of our nation.

2. It is not feasible to comply with the ISR due to the following:

- a) The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.
- b) Warehouses have no control over how truck engines are manufactured.
- c) Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase.
- d) Warehouse operators do not control which trucks come to warehouses, when they

arrive, where they come from, or any other variables related to truck trips.

3. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are viable from a technology and/or economically reasonable standard.

4. Warehouses have been deemed to be essential businesses by the State for important reasons including:

- a) The approximately 18 million people who live in Southern California rely on warehouses as an integral part of the goods movement system to get them the items they need to survive, like food, medical supplies, clothes etc.

5. This rule creates tremendous uncertainty in the economy as the full negative impact of this ISR is not known.

- a) Uncertainty should not be created in this critical, essential business sector, especially considering the current economic downturn/unemployment crisis associated with the COVID-19 pandemic.

6. Warehouses provide a broad range of jobs for people of every level of education and skillset. Warehouses and the logistics industry offer jobs that lead to upward ability. This job creation is a socioeconomic benefit that the proposed ISR's onerous costs would threaten.

7. The proposed ISR seeks to "indirectly" regulate the trucking industry through the Warehouse industry. The District should publicly explain how it has the jurisdiction/authority to regulate a mobile source that is such an integral part of interstate commerce as the trucking industry.

Chair William Burke and Governing Board Members
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765-4178

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently, there are pending changes concerning air quality regulation that are due to be voted on by you. As a business that relies on affordable warehouse space, we are deeply concerned what potential impacts Rule 2305 will have to our operating expenses. If Rule 2305 passes it will result in increased property taxes and consequently, higher overhead operating expenses creating economic hardship in an already difficult economic climate. Currently in our lease, we as the Tenant, are responsible for any resulting increases in taxes imposed through this new Rule.

123-1

We are very concerned about the potential negative impacts on the warehousing/logistics sector by the South Coast Air Quality Management District. We are reaching out to you today to encourage you to reconsider the implementation of Rule 2305. Although we are also concerned with improving the air quality in Southern California, this Rule could deeply hurt our business and effectively our employees.

123-2

In consideration of this, we believe this proposed rule is outside the authority of the local air district and it is not mission driven as it has no sunset date. Furthermore, it is poorly written, fails to understand the dynamics of the goods movement sector, and includes an arbitrary menu of options and credits. Furthermore, the rule has questionable projections on any actual emission reductions it will achieve. Additionally, it will impose significant administrative and mitigation expenses. As written, this rule is in essence a tax on the warehousing sector.

123-3

While we understand Rule 2305 is well intended, we believe it will cause significant harm to our business for the reasons mentioned above. As such, we respectfully request that you oppose Rule 2305, as the potential damages to our business, and businesses like ours, across Southern California could be economically devastating, particularly when considering the financial hardships many business owners are already experiencing due to COVID-19 related closures, delays and ordinances.

123-4

Thank you in advance for your time and consideration.

Signed:

John Pourmoradi, President

Rexford Industrial

April 14, 2021

Chair William Burke and Governing Board Members
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, California 91765-4178

Re: **OPPOSITION TO PROPOSED RULE 2305 (WAREHOUSE INDIRECT SOURCE RULE)**

Dear Mr. Burke and Governing Board Members,

Currently there are pending changes concerning air quality regulation that are due to be voted on by you. As one of the largest owners of industrial real estate throughout Southern California, encompassing approximately 32 million square feet, with 1,400 tenants in our portfolio, we are deeply concerned with the impact Rule 2305 will have to our tenants. If Rule 2305 passes it will result in increased property taxes and consequently higher operating expenses for our tenants across our properties. At all of our properties, the tenants are responsible for property taxes, *not landlord*.

124-1

Although we can certainly appreciate the important goal of improving air quality in Southern California, as we ourselves are committed to green leasing initiatives, we do not believe this rule is the proper means to achieve such goals. Mobile sources (trucks, cars) are already regulated by both the United States Environmental Protection Agency and the California Air Resources Board.

124-2

Unfortunately, this rule would cause economic harm to the majority of our tenants, whose primary business is the transportation and distribution of goods. Due to Rule 2305, tenants/businesses will end up paying the fee (tax) because it will not be feasible or possible for them to comply with the proposed standards. With proposed fees of up to (\$0.09) per square foot, this would cost potentially millions of dollars across our portfolio to our tenants.

124-3

While we understand Rule 2305 is well intended, we believe it will cause more harm than good for the reasons outlined above. As such, we respectfully request that you oppose Rule 2305. Otherwise, the potential damage to businesses across Southern California could be economically devastating.

124-4

Thank you for your time, consideration, and service.

David Lanzer
General Counsel
REXFORD INDUSTRIAL REALTY, L.P.

April 27, 2021

Incoming Chair Ben J. Benoit
Governing Board
South Coast Air Quality Management District
21865 Copley Drive
Diamond Bar, CA 91765

RE: Proposed Rule 2305 – Warehouse Indirect Source Rule (ISR)

Incoming Chair Benoit and Members of the Board,

Clean Energy supports the original intent of the Warehouse Indirect Source Rule: to “reduce local and regional NOx and PM emissions”. The proposed WAIRE (compliance) menu, however, does not solely factor in emission reductions but also includes project costs. Ironically, the inclusion of such costs penalizes cost-effective solutions and appears to do more for the California Air Resources Board’s (CARB) long-term ZEV transition goals than the South Coast AQMD’s goal to immediately improve air quality throughout the South Coast air basin.

125-1

Penalizing cost-effective strategies in the WAIRE menu is bad for the South Coast as it will have a material impact on the rule’s ability to reduce emissions. Given that CARB is focused on statewide policy through its Advanced Clean Truck rule to achieve long-term emission (2045+), shouldn’t the AQMD’s PR 2305 target emissions reductions required to meet the region’s 2023 and 2031 federal NOx attainment deadlines?

125-2

Clean Energy thereby requests that the Governing Board make a motion to remove the cost component from the WAIRE methodology used to determine WAIRE (compliance) points for each strategy. This change would guarantee that points are only awarded for much needed NOx and PM emissions reductions. Basing points on reductions alone is a simple, transparent and straightforward approach that provides greater flexibility for warehouse owners and operators, better air quality outcomes for the community, and avoids unnecessary market manipulation.

125-3

Thank you for your time and consideration. If you should have any questions, please contact me directly at your convenience.

125-4

Most sincerely,

A handwritten signature in black ink, appearing to read "Todd R. Campbell", written over a horizontal line.

Subject: Proposed Rule 2305

To Whom It May Concern;

We were just made aware of this proposed rule to the SCQAMD and vehemently oppose everything that is in it. As an owner of warehouses in the district we cannot fathom a possible need for a warehouse owner to report anything to the SCQAMD. We do not operate the warehouses nor do we operate the trucks that come to and from our warehouses. As a vacant warehouse we have 0% emissions and at all other times our tenants are solely responsible for the operation of the buildings including utilities consumed thereby.

126-1

As an operator of a warehouse of more than 100 SF (which is a number that is growing at a rapid pace) you don't have to be the biggest fish in the ocean anymore. This will be putting undue stress on our mom & pop operators who are already struggling to get by thanks to the Governor shutting down more than half of the state for almost one whole year. If you want the whole trucking industry to adopt fuel efficient trucks, focus on the trucking operators and not the building owners or the companies that warehouse in them.

126-2

Adopting electric trucks will only help to quicken the states already degrading electrical infrastructure that can be blamed for rolling blackouts during times of high demand, especially at night which is when everyone plugs in, as well as the public fiascos such as the massive fires up north and throughout SoCal for almost a decade. Half of our buildings aren't even supplied with enough power to allow for plugins and that can't be fixed by us as the utility never buried enough line in the city streets in order to serve that type of demand.

126-3

We already have tenants leaving the state in droves and I expect this will hurry that up over the next couple of years. If you want to keep the state's tax income rolling through the doors, start worrying about helping businesses grow and prosper and providing power to folks year round without blackouts or polluting fires. At this rate, there won't be anyone left here to breathe the air you purport to care about keeping clean.

MASTER RESPONSES

1. Response to comment that PR 2305 and PR 316 will have permanent costs of \$0.90 per square foot and \$1 billion per year.

The potential costs raised in some comment letters are inaccurate and significantly overstate the potential cost of PR 2305 and PR 316. The Final Staff Report and Socioeconomic Impact Assessment (SIA) analyzed the compliance costs of implementing PR 2305 and PR 316. The analysis modeled 19 scenarios using WAIRE Menu actions and the mitigation fee and found a range of potential costs of -\$0.02/sf/yr to \$0.83/sf/yr (Final Staff Report Table 20, SIA Table 27).¹ 13 of the 19 scenarios modeled were found to have costs less than \$0.23/sf/yr, or less than \$190 million per year. All estimates included the cost of implementing actions in the WAIRE Menu as well as reporting and recordkeeping costs associated with PR 2305 and PR 316.

The lowest-cost scenario (Scenario 10, visits from Class 6 zero emission trucks) resulted in a 10-year average net savings of \$12.6 million per year. Cost savings occurs in this scenario because the total cost of ownership of these trucks during the 10-year period analyzed is calculated to be cheaper than conventional diesel. Higher up-front capital costs for ZE technology is offset by lower fuel and maintenance costs. This dynamic is anticipated to become more prominent through time with ZE trucks, but the exact timing for when this cost savings will occur will vary by truck class and duty cycle. In the analysis conducted for PR 2305, the only ZE trucks with an overall cost savings are Class 6. As a conservative measure, some savings have not been folded into the analysis, such as any incentive funding or revenue from the Low Carbon Fuel Standard program.

The highest cost scenario (Scenario 7, 'inefficient' mitigation fee) over a 10-year period averaged \$670.2 million per year, equal to \$0.83/sq. ft. The 'inefficient' mitigation fee assumes that even though all warehouse operators only pay the mitigation fee to comply with the rule, they do not attempt to earn any WAIRE Points from visits from NZE and ZE trucks incentivized by those mitigation fees in the WAIRE Mitigation Program. This level of funding in the WAIRE Mitigation Program would result in a substantial turnover of trucks, and much higher public health benefits with emission reductions up to about 20 tons per day. However, because warehouse operators are expected to find ways to reduce their costs, it is expected that they would earn points for incentivized trucks. A more realistic scenario showing the interaction between a mitigation fee-only scenario and the WAIRE Mitigation Program was modeled. The same style of compliance approach whereby every warehouse operator pays a mitigation fee, but they earn WAIRE Points for NZE trucks incentivized by those fees (Scenario 7a, a 'high-efficiency' mitigation fee scenario) results in costs as low as \$0.14/sf/yr, equal to \$114 million annually.

Other higher cost scenarios were also analyzed, and some warehouse operators are anticipated to pursue those higher cost options (e.g., due to corporate sustainability goals). Some examples include installing and using a hydrogen station and fuel cell trucks (Scenario 12, \$1.04/sq. ft.) or installing solar panels (Scenario 11, \$1.21/sq. ft.). For the hydrogen station and fuel cell truck scenario, the costs are high relative to the level of implementation required for PR 2305, primarily due to the high capital costs for the trucks and station. However, some use cases that include greater levels of implementation may result in a hydrogen scenario becoming more cost effective than other technologies. For the solar panel scenario, cost savings are anticipated over the life of the panel system, but those may not be incurred during the 10-year period analyzed.

¹ \$/sf/yr = dollars per square foot of warehouse per year

Similar to the hydrogen scenario, some use cases may result in greater cost savings than shown here (e.g., through financing approaches designed to reduce up-front costs). By its design, PR 2305 does not mandate these higher-cost compliance options be used. Absent that mandate, we presumed that warehouse operators would choose the compliance option that works with their business model and is the lowest cost. Therefore the ‘inefficient’ mitigation fee option was selected as the cheapest high-cost option that any warehouse operator would be required to implement under PR 2305.

It is important to put these regulatory costs in context with other costs warehouse operators face. The worst-case ‘inefficient’ mitigation fee scenario cost of \$0.83/sf/yr is expected to be no more than about 3% of total operating costs for a typical warehouse operator. The ‘high-efficiency’ mitigation fee scenario results in costs about 0.5% of typical operating costs, which is similar to many other scenarios analyzed. This industry also sustains regular operating cost increases in the South Coast AQMD region, with rents rising about \$0.47/sf/yr on average since 2010 (about 1.7% of operating costs, and an increase of about 63% from 2012-2019), yet surrounding regions rental increases have averaged only about \$0.06/sf/yr. Simultaneously, warehouse vacancy rates in the South Coast AQMD region remain consistently low at around 4%,² and goods movement activity in the region is at an all-time high, with the ports of Los Angeles and Long Beach consistently setting records for cargo volume.³

Industry experts have also pointed to the continued strength of the warehousing industry. For example, Fran Inman (Senior Vice President at Majestic Realty, a warehouse owner, California Transportation Commissioner, and Executive Committee Member with NAIOP SoCal, a trade association for industrial property owners) recently stated in response to a question about the state of the warehousing industry in March 2021 “Consumer demand will stay strong...we have seen very little vacancy [in warehousing space], and that has held true since 2008 ...the sweet spot now relates to e-commerce ... and to do e-commerce we need more space.”⁴

Similarly, the Winter 2021 Commercial Real Estate Outlook report from Allen Matkins (a law firm specializing in commercial real estate) and the UCLA Anderson Forecast showed that a survey of industrial property developers believe that “the expectation was for lease rate increases to exceed the rate of inflation and for the already low vacancy rates to be even lower by 2023... [and] for a new wave of warehouse building over the coming three years.”⁵ Finally, in January 2021 Kurt Strasmann (Executive Managing Director for Orange County and Inland Empire Operations for CBRE, a commercial and industrial real estate company) stated, “You keep expecting regulation to take a toll on business, but when you look at the numbers and metrics, they keep going and going. Thus far I have not seen [regulation] affect demand.”⁶

2. Response to comment that it is not feasible to comply with PR 2305 because:

2a. The proposed rule requires warehouses to control truck fleets and decrease truck emissions. Yet, warehouse operators are not able to accomplish this task.

To comply with PR 2305, warehouse operators can choose to implement up to 32 different WAIRE menu actions, a Custom WAIRE Plan, pay the optional mitigation fee, or any combination of the three. Options are available that allow warehouses to comply with the regulation without controlling truck fleets or decreasing truck emissions. This includes installing or using solar panels, installing or using charging stations (including for cars, such as for their employees), installing filtration systems in nearby sensitive land uses like daycares or residences, implementing a Custom WAIRE Plan that avoids working with truck fleets, or paying a mitigation fee.

The PR 2305 Final Staff Report (Appendix C) documents that approximately 40% of warehouse operators are expected to own a truck fleet, and interviews with many warehouse operators have revealed that many warehouse operators also arrange for trucking services for at least some of the goods going to or leaving their warehouse. Therefore, there are many warehouses that could exercise control over a trucking fleet to reduce emissions. Furthermore, in instances where warehouse operators choose WAIRE Menu items that address trucks, these options do not require 100% control of trucking operations. As an example, an operator of a 250,000 sf warehouse would typically have about 41 Class 8 truck visits per day and 15 Class 2b-7 truck visits per day. If that warehouse operator averages about five Class 8 NZE truck visits per day, they would earn enough WAIRE Points to satisfy their compliance obligation at the highest proposed stringency. This is about 12% of all Class 8 truck visits, and less than 10% of all truck visits.

2b. Warehouses have no control over how truck engines are manufactured.

This comment misinterprets the proposed rule requirements for warehouse owners and operators. PR 2305 does not require warehouse operators or owners to control how truck engines are manufactured, nor does it place any requirements on truck or truck engine manufacturers. PR 2305 allows warehouse operators to satisfy their compliance obligation through options that rely on NZE or ZE truck acquisitions or visits. These NZE and ZE standards that apply to truck manufacturers are already defined by the California Air Resources Board in their Optional Low NO_x Regulation, and Zero Emissions Powertrain Certification Regulation.⁷ If a warehouse operator uses one of these truck options, they would rely on these existing standards for trucks that are commercially available.

2c. Warehouses do not own truck fleets, nor do they control what type of trucks shipping companies purchase. Warehouse operators do not control which trucks come to warehouses, when they arrive, where they come from, or any other variables related to truck trips.

The Final Staff Report (Appendix C) documents that approximately 40% of warehouse operators are expected to own a truck fleet, and interviews with many warehouse operators have revealed that many warehouse operators also arrange for trucking services for at least some of the goods going to or leaving their warehouse. In instances where warehouse operators choose WAIRE Menu items that address trucks, these options do not require 100% control of trucking operations. As an example, an operator of a 250,000 sf warehouse would

⁷ Both regulations are codified in California Code of Regulations Title 13, section 1956.8.

typically have about 41 Class 8 truck visits per day and 15 Class 2b-7 truck visits per day. If that warehouse operator averages about five NZE Class 8 truck visits per day, they would earn enough WAIRE Points to satisfy their compliance obligation at the highest proposed stringency. This is about 12% of all Class 8 truck visits, and less than 10% of all truck visits.

In conversations with staff during rule development, warehouse operators have also described business practices whereby environmental requirements have been placed on trucking companies delivering goods to their warehouse. For example, in periods when fuel prices have been high, warehouse operators have included contractual requirements that trucking companies are required to use EPA SmartWay fleets in order to pass on any fuel surcharges.^{8, 9} Another more recent example includes a warehouse operator who, as part of their corporate sustainability goals, works with both a trucking company and a truck rental company to ensure zero-emission trucks are used at their warehouse, even though neither the warehouse operator nor trucking company owns the trucks, and the operator does not employ the truck drivers.¹⁰ Additional business models that have emerged elsewhere include in Shenzhen, China, where the fleet of electric logistics vehicles increased from about zero to over 80,000 in just five years.¹¹ One of the key enabling mechanisms included the “emergence of leasing companies that bundle the provisions of vehicles, charging, maintenance, and at times, even drivers for a flat monthly or annual fee.”¹² For warehouse operators that do not own fleets or contract directly with any trucking companies, if they want to take actions to earn WAIRE Points from truck visits, they may have the ability to work with the goods owner (on whose behalf they are operating the warehouse) who is responsible for arranging for trucking services for their goods.

Finally, there are several complementary policies underway that support the widespread introduction of NZE and ZE trucks in the region. These complementary policies will assist warehouse operators in developing the market for NZE and ZE trucks if they choose to use these compliance options. Example policies include the following: CARB’s Advanced Clean Trucks regulation mandating increasing sales of ZE trucks beginning in 2024, the San Pedro Bay ports’ updated Clean Truck Program which will charge drayage operators without NZE or ZE trucks \$10 per TEU, and various existing incentive programs including Carl Moyer, Prop. 1B, Volkswagen Environmental Mitigation Trust, and AB 617.¹³

2d. The technology is not available to accomplish items on the WAIRE menu. For example, there are no heavy-duty electric trucks available that are 100% viable from a technology and/or economically reasonable standard.

Technology is available to accomplish items on the WAIRE Menu. The comment uses an incorrect standard to conclude that technology is not available by assuming PR 2305 compliance can only be accomplished with electric trucks that are “100% viable from a

⁸ The EPA SmartWay program is a voluntary system that “provides a comprehensive and well-recognized system for tracking, documenting and sharing information about fuel use and freight emissions across supply chains.” It includes a certification component for fleets to show that they meet emissions and fuel savings benchmarks.

¹³ <http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades>

technology and/or economically reasonable standard”. First, the statement is conclusory and provides no support for what is ‘economically reasonable’ or ‘100% viable’. The Socioeconomic Impact Assessment and Final Staff Report evaluated the potential costs of the rule and determined the expected cost-effectiveness of PR 2305 and PR 316 are in line with recently adopted CARB mobile source measures (Pages 77-78 and Table 24 of the Final Staff Report). Second, the comment focuses only on electric trucks, and ignores other menu options that are currently available. For example, commercially available options that are available today include acquiring or using NZE trucks, or NZE or ZE yard trucks, and installing and using solar panels, filtration systems, and charging stations.

Further, nearly all NZE and ZE trucks on the WAIRE Menu are commercially available today or are expected to be so during the first compliance year.¹⁴ For example, South Coast AQMD has already funded over 1,200 NZE trucks that are operating in commercial service today. NZE engines are currently available in two sizes – 11.9 liter and 8.9 liter. Major truck manufacturers offer these engines in different truck classes, including Class 8 long haul and/or drayage truck operations.¹⁵ The ZE truck market is starting to grow quickly, with many models entering the commercial market today and many major manufacturers announcing plans for future commercialization of battery-electric and hydrogen fuel cell electric trucks. Some notable manufacturer announcements are listed in the Final Staff Report (Appendix B). There are expected to be 62 models of medium duty (e.g., Class 4-7) ZE trucks commercially available during 2021,¹⁶ and ZE Class 8 trucks are expected to be introduced in late 2021 and 2022.¹⁷ Additionally, ZE yard trucks are commercially available today and have been operating at warehouses since 2015¹⁸. Manufacturers that have begun offering battery-electric ZE yard trucks for sale commercially including OrangeEV, Kalmar Ottawa, and BYD.

3. Response to comment that PR 2305 won’t result in emission reductions and won’t result in meeting air quality standards. As stated during South Coast AQMD’s Scientific, Technical, and Modeling Peer Review Advisory Group Meeting on January 27, 2021, the small quantities of NOx reductions generated by this rule will not be sufficient to decrease ozone concentrations in the basin.

The purpose of PR 2305 is to reduce local and regional emissions of NOx and PM associated with warehouses to assist in meeting state air quality standards “by the earliest practicable date” (Health and Safety Code 40913) and federal requirements to attain the 1997, 2008, and 2015 ozone standards (with attainment required in 2023, 2031, and 2037, respectively) and the 2012 fine particulate matter standard in 2025. The analysis in the Final Staff Report (Tables 15 and 16), implementing PR 2305 is estimated to result in approximately 1.5 – 3.0 tons per day of

¹⁴ <https://www.epa.gov/sites/production/files/2021-01/documents/420f21002.pdf>,

¹⁷ Examples: <https://www.volvotrucks.us/news-and-stories/press-releases/2020/december/volvo-trucks-introduces-the-volvo-vnr-electric-model-in-the-us-canada/>, <https://freightliner.com/trucks/ecascadia/>

¹⁸ Example: <https://orangeev.com/orange-ev-announces-initial-sales-of-its-t-series-zero-emission-electric-terminal-truck-an-industry-leading-first/>

NOx emission reductions beyond CARB regulations (CARB's Advanced Clean Trucks, Low NOx Omnibus, and Heavy Duty I/M rules), which is about a 10-15% reduction. Diesel PM reductions are also expected to be about 10-15% beyond CARB regulations.

While the PR 2305 will result in emission reductions, it will not on its own result in the attainment of any air quality standard. Nonetheless, PR 2305 is part of a larger comprehensive strategy described in the 2016 Air Quality Management Plan (AQMP) that is designed to meet both federal and state air quality standards. The 2016 AQMP found a NOx-focused emission reduction strategy is the only mechanism to achieve national ambient air quality standards for ozone.¹⁹ This approach requires NOx emissions reductions of about 108 tons per day to meet the 1997 ozone standard and about 88 tons per day to meet the 2008 ozone standard using 'further deployment measures' that were undefined and relied on flexibility provided by Clean Air Act section 182(e)(5) when the 2016 AQMP was adopted.²⁰ PR 2305 can assist in fulfilling some of these 'further deployment' emission reductions. In addition to reducing emissions, PR 2305 facilitates emission reductions for other regulations that are part of the comprehensive strategy, including by laying the groundwork for future emission reduction technologies such as facilitating development of zero-emission charging and fueling infrastructure for ZE trucks.

Finally, PR 2305 also helps ensure that statewide measures result in emissions reductions in the South Coast AQMD. The Final Staff Report (beginning on pg. 15) describes how statewide mandates for ZE light duty passenger car sales has not resulted in equal benefits throughout the state, and the three counties with the worst air quality (all in the South Coast AQMD region) do not have higher levels of ZE adoption, even with statewide mandates. PR 2305 can help facilitate ZE truck adoption in the South Coast AQMD region, in conjunction with CARB's statewide mandate for ZE truck sales in its Advanced Clean Trucks regulation.

The comment regarding what was presented during the Scientific, Technical, and Modeling Peer Review (STMPR) Advisory Group Meeting fundamentally misconstrues the results of the analysis in two ways. First, the presentation discussed recent regional air quality modeling conducted by South Coast AQMD staff, including the effects from emissions changes due to COVID-19. As discussed during the STMPR meeting, due to complex chemistry affecting ozone concentrations (with key parameters including meteorology, NOx emissions, Volatile Organic Compound [VOC] emissions, and the ratio of NOx to VOC), there are instances when reductions in NOx could cause increases in ozone. This well-understood scientific phenomenon is called the weekend effect because higher ozone has historically occurred on the weekends when NOx emissions are lower, relative to weekdays. After taking this phenomenon into account, the 2016 AQMP concluded that the only way to achieve the federal ozone standards throughout the South Coast AQMD region is to reduce NOx emissions.

Additionally, the comment assumes PR 2305 would be the only emission reductions that would occur. Since PR 2305 is part of a broader strategy to reduce emissions as outlined in the 2016 AQMP, ozone reductions and subsequent attainment of air quality standards are attributable to each measure. Therefore, the STMPR presentation is consistent with the conclusions of the 2016 AQMP, and the overall strategy to reduce NOx emissions to achieve federal and state ozone standards. After considering the scientific evidence, both CARB and U.S. EPA have

¹⁹ <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf>

²⁰ Table 3 here: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-iv-b.pdf>

approved this approach with their approvals of the 2016 AQMP, and these NO_x reductions are now a legally required element of meeting the requirements of the Clean Air Act.

4. Response to comment that warehouses are an essential industry that delivers goods, especially during the pandemic.

Warehousing is a key component of the broader goods movement industry and is an important part of the regional and national economy. During the ongoing COVID-19 pandemic, the warehouse industry has continued to assist in delivering goods to consumers and has experienced periods of record cargo volume. This trend is expected to continue as the economy is anticipated to rebound in the coming year after a slump to the broader economy brought on by the pandemic during 2020.²¹ The proposed phase-in schedule for PR 2305 will not impose any requirements for any warehouse operators to begin earning WAIRE Points until after January 1, 2022, long after vaccines became available for the entire adult population in the country on April 19, 2021.²² The proposed three-year phase-in to introduce warehouses into the PR 2305 WAIRE Points system further separates the regulation in time with the COVID-19 pandemic. Therefore, the warehousing industry that would be regulated by PR 2305 is not expected to be adversely impacted by COVID-19, especially in comparison to the impacts experienced during the height of the pandemic in late 2020. Further, cargo volumes have surged at the ports of Los Angeles and Long Beach during the pandemic,²³ and a resulting high level of truck travel and emissions associated with warehousing has continued.²⁴ It is therefore clear that warehousing and the goods movement industry in Southern California is thriving, and is expected to perform strongly into the future. Indeed, the growth experienced by this sector underscores the need to curb the rising emissions associated with it.

5. Response to comment that the proposed rule would create uncertainty in the economy. The economic impacts of PR 2305 and PR 316 is not known.

This comment does not acknowledge the extensive analysis conducted of the potential costs and economic impacts of PR 2305 and PR 316 that are included in the Socioeconomic Impact Assessment (SIA), the third party study of potential warehouse relocations in response to the proposed rule, or the third party peer reviews of these economic studies.²⁵ These studies fully analyze the range of potential

²¹ U.S. gross domestic product is anticipated to grow 6.5% in 2021.

<https://www.federalreserve.gov/monetarypolicy/fomcprojtabl20210317.htm>,

²³ <https://www.supplychaindive.com/news/california-port-congestion-los-angeles-long-beach-data/594715/>

²⁴ As an example, data from the CalTrans PeMS website (<https://pems.dot.ca.gov/>) shows that monthly truck vehicle miles travelled (VMT) on the SR-91 East freeway (a key linkage between the ports of Los Angeles and Long Beach and warehouses in the Inland Empire region) increased substantially after the lowest point of the pandemic in April 2020. Truck VMT in April 2020 was 8.8 billion miles, and by October 2020 was 11.8 billion miles, an increase of about 34%. Truck VMT has stayed at high levels since that time with 11.8 billion miles again travelled in March 2021. This current level of truck VMT is higher than any level reached in the 12 months prior to the onset of the pandemic.

²⁵ Assessment of Warehouse Relocations Associated with the South Coast Air Quality Management District Warehouse Indirect Source Rule, IEC, Dec. 23, 2020. ([http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-\(12-23-20\).pdf](http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/iec_pr-2305-warehouse-relocation-report-(12-23-20).pdf)), Peer Review of PR 2305

economic impacts, and conversely the monetized public health benefits of the proposed rules. These public health benefits are estimated to be about three times higher than the potential costs of the regulation for most scenarios analyzed (SIA, Table 42). Further, the costs potentially imposed by these proposed rules are not anticipated to cause warehouses to relocate outside of the region. This is supported by extensive modeling analysis in the study conducted by Industrial Economics, Inc., as well as consistent behavior in how warehousing has responded to increased costs in the past.

The warehouse industry has grown steadily in the South Coast AQMD region in the past several decades (Final Staff Report, page 45-46). Costs to this industry have steadily increased as well, demonstrated by persistent annual increases in rent of 5% or more paid by warehouse operators. These rents have increased faster in the South Coast AQMD region compared to outlying regions (Final Staff Report, Figure 12). Even with these increasing costs, warehouse owners and operators have found it advantageous to continue operating preferentially in the South Coast AQMD region, with net absorption increasing in our region faster than in adjacent regions (Final Staff Report, Figure 11).

6. Response to comment that PR 2305 and PR 316 would threaten jobs provided by warehouses.

The Socioeconomic Impact Assessment (peer reviewed by a third party) included an analysis of six different compliance scenarios to determine the potential range of impacts to jobs if PR 2305 and PR 316 are approved. This analysis concluded the level of job impacts varied depending on which compliance scenario warehouse operators choose, but in all cases future anticipated job levels are higher than current job levels. One scenario was found to result in an increase in the number of jobs by about 240 per year (if all warehouse operators earned WAIRE Points through ZE Class 6 truck visits). All other scenarios resulted in some reduced future job growth – jobs foregone – which is not a loss of existing jobs. An example of a sector that could see job gains includes electricians or others who would install charging infrastructure or solar panels.²⁶ The range of overall jobs foregone was as low as 410 jobs per year and as high as 11,141 jobs per year across all industry sectors in the worst-case scenario, about 0.1% of all jobs in the region. This worst-case scenario is not expected to occur as described in Master Response to Comments 1, since the level of incentive funding that would be available if every warehouse operator only complied with mitigation fees would yield substantial turnover of the truck fleet. If warehouse operators earn WAIRE Points for all the trucks incentivized by their mitigation fees, their remaining compliance obligation will be substantially reduced, and their subsequent costs will be substantially reduced. This more likely scenario would result in about 1,901 jobs forgone per year, less than 0.02% of all jobs in the region.

This economic impact of jobs foregone, as well as other economic impacts (e.g., reduced economic output) was compared with the anticipated monetized public health benefit due to emission reductions from PR 2305. The monetized public health benefit was found to be about

Draft Socioeconomic Impact Assessment (Appendix I of SIA), Peer Review of Industrial Economics, Inc. (IEC) Socioeconomic Analysis of Warehouse Relocations, IEC Response to Comments (Appendix II of SIA),

²⁶ Several studies have pointed to the shifting of job sectors and resulting economic benefits as the state transitions to zero emissions transportation. To the extent that PR 2305 helps facilitate that transition, some of the economic and jobs benefits described in these studies will also be expected to occur. Example studies include: <https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf>, <https://lincubator.org/wp-content/uploads/LACI-GREEN-JOBS-REPORT.pdf>, https://laedc.org/wp-content/uploads/2020/03/EV_Report_Digital_FINAL_Single_Page.pdf

three times higher than the costs of the rule in most scenarios analyzed. Some public health benefits for jobs were also identified, such as about 1,000 to 2,500 fewer lost work days.

7. Response to comment that South Coast AQMD should publicly explain its authority to adopt the proposed indirect source rule.

A discussion of South Coast AQMD's indirect source authority is included in Chapter 1 of the Final Staff Report (pages 18-20), and in the draft findings made pursuant to Health and Safety Code 40727 on page 80 of the Final Staff Report. Additional discussion of South Coast AQMD's legal authority is included in responses to comments 39, 40, and 44 (Caltax, NAIOP, CTA responses).

8. Response to comment that PR 2305 is duplicative with CARB regulations and is therefore a waste of resources. CARB has mobile source authority and is the more appropriate entity to develop regulations.

PR 2305 is not a duplicative measure, as it is part of a more comprehensive strategy for reducing emissions in the region and in the state.²⁷ U.S. EPA and CARB have primary authority in regulating mobile sources by setting new engine standards and in use standards, but South Coast AQMD was expressly given indirect source authority by the legislature (see Master Response to Comments 7 for further discussion of legal authority). PR 2305 is also designed to facilitate the early implementation of other regulations, for example by allowing installation of charging and fueling infrastructure to advance ZE technology toward meeting the state's goals. PR 2305 complements the state's strategy to reduce emissions from trucks that includes CARB's Advanced Clean Truck (ACT) rule, Low NOx Omnibus rule, Heavy Duty I/M rule, and other proposed regulations. As demonstrated in the 2016 AQMP, and in CARB's recent draft Mobile Source Strategy,²⁸ those three rules from CARB will not provide sufficient emission reductions from the trucking sector to meet air quality standards in 2023, 2031, or 2037. An additional regulation called the Advanced Clean Fleet (ACF) rule is also being proposed by CARB, however its final approval is not anticipated until late 2022. Further, even though the current concepts proposed by CARB for ACF are still in development, their preliminary indications are that significant emission reductions are not expected from that rule until the 2030s, too late to meet federal air quality standards in 2023 and 2031.

In order to account for these recent regulatory actions by CARB, the Final Staff Report includes a comprehensive analysis that quantitatively accounts for any emission reductions that would be achieved from the ACT, Low NOx Omnibus, and Heavy Duty I/M rules. Emission calculations using CARB's EMFAC2017 and the META Tool that was developed as part of their Mobile Source Strategy development were used to discount any potential overlapping emission reductions from PR 2305.²⁹ The result of this analysis that was conducted specifically

²⁷ Note that CARB in its comments (see Letter 101) supports the adoption of PR 2305 as "an important action in addressing the region's air quality issues and minimizing the public health impacts that warehouse activities have on nearby communities that are disproportionately burdened by air pollution."

²⁸ <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>. Additional discussion of the draft Mobile Source Strategy can be found in Chapter 1 of the Final Staff Report under the State Goals section (page 10) and in Chapter 3 under the Rule Stringency discussion (page 52).

²⁹ EMFAC 2017 is the most recent EPA-approved emissions inventory tool for use in California, but it does not include ACT, Low NOx Omnibus, or Heavy Duty I/M rules. The quantitative methods to estimate emission reductions from those rules are included in the Meta Tool.

to evaluate potential duplicative measures found that PR 2305 would reduce NO_x emissions beyond all existing CARB regulations by about 1.5 – 3.0 tons per day (Final Staff Report, Table 15). Any analysis of future regulations (e.g., ACF) was not possible as it is too speculative to determine what emission reductions may be achieved but additional emissions reductions are expected from PR 2305.

9. Response to comment that California has the cleanest supply chain in the US. Emissions from trucks have been reduced by 95% in the past, and emission reductions will continue without PR 2305.

The statement that California already has the cleanest supply chain is incorrect. Although there are many policies in the state to advance near zero or zero emission technologies, these technologies have not been widely adopted to date. Even with these policies in place, our region still ranks as the worst in the nation for ozone, and one of the worst for fine particulate matter.³⁰ Furthermore, a recent study found that California is ranked 40th out of 50 states in the penetration of 2010 engine standards into its truck fleets.³¹ Finally, the goods movement sector makes up about 52% of the NO_x emissions in the South Coast Air Basin.³² Total NO_x emissions must be reduced by 45% and 55% as of the attainment date in order to meet federal ozone deadlines in 2023 and 2031, respectively.

Notwithstanding these facts about the supply chain and its air quality impacts, truck emissions have shown welcome historical decreases in both Diesel Particulate Matter and NO_x, and additional reductions are expected in the future. However, as demonstrated in the 2016 AQMP and CARB's draft Mobile Source Strategy, even with these historic and anticipated reductions from existing regulations, substantially greater emission reductions are needed to achieve state and federal air quality standards. PR 2305 is designed to reduce emissions associated with warehouses beyond CARB regulations, while also facilitating additional local emission reductions by including options for ZE charging and fueling infrastructure.

10. Response to comment that PR 2305 appears to be more of a funding mechanism with the mitigation fee than anything that addresses environmental concerns.

PR 2305 provides many different options for compliance, including a mitigation fee. The purpose of the rule is to reduce emissions and facilitate emission reductions, which can be done by implementing measures on the WAIRE menu, implementing a Custom WAIRE plan, or paying an optional mitigation fee. The mitigation fee will be used to incentivize acquisition of NZE and ZE trucks and ZE charging infrastructure. Thus, the mitigation fee also addresses environmental concerns because it will be used to reduce pollution. Without the mitigation fee option, warehouse operators would have less flexibility in how they could comply with the rule. During development of the rule, industry repeatedly cited the need for maximum flexibility in compliance options. Warehouse operators could choose this option by itself, or in combination with any other options to satisfy their WAIRE Points Compliance Obligation (WPCO). This could prove helpful in that some of the other options would be more difficult to satisfy their WPCO without needing to over-comply with the rule. Because the mitigation fee can be

³⁰ <https://www.lung.org/research/sota/key-findings/most-polluted-places>

³¹ <https://www.dieselforum.org/California>

³² https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_goods-movement.pdf?1606001690

tailored precisely from 0.1 WAIRE Points on up to any level, warehouse operators can use it to fill in any remaining WAIRE Points in a simple way without using the WAIRE Menu.

The mitigation fee of \$1,000 per WAIRE Point has also been set at a level that is designed to achieve approximately the same level of compliance as other options in the WAIRE Menu in any one year. However, because the warehouse operator is not investing directly in their own operations when complying with PR 2305 through paying a mitigation fee, the costs in later years may be higher than other compliance options that allows early investments to be used. This can be seen in Figures 15 through 18 in the Final Staff Report where the cost of Scenario 7 is similar to other options in early years, then often exceeds the costs of other compliance options in later years.

As with any regulation, the regulated entities (i.e., warehouse operators) are expected to pursue the cheapest and/or easiest method of compliance possible. With many options yielding lower costs when looking over multiple years, many (if not most) warehouse operators would be expected to choose other options besides the mitigation fee as the primary compliance method. For warehouse operators that do choose the mitigation fee, the funding would go directly towards incentivizing NZE and ZE trucks and ZE charging and fueling infrastructure. Scenario 7a shows what would occur if all warehouse operators account for these incentivized trucks, and the mitigation fee would then become a much cheaper option (Final Staff Report, Figure 14), similar to other lower cost options. In addition, the Final Staff Report provides a description of the WAIRE Mitigation Program that would use the mitigation fees paid by warehouse operators. Finally, the Board Resolution accompanying PR 2305 will include a framework for components of the WAIRE Mitigation Program, though some details will be developed in the future during solicitations for projects. All solicitations and awarding of funds will be brought before the Governing Board for approval and will include a public process.

Responses to Comment Letter #1 CCAEJ - 2/14/2019

Response to 1-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to 1-2

Staff analyzed various strategies including from facility caps, fleet certifications, best management practices, and a mitigation fee., Staff ultimately deciding on a menu-based points approach that promoted the incorporation of cleaner NZE and ZE technologies to get the needed regional NOx and local DPM community benefit while preserving flexibility to accommodate a variety of warehouse business models. Facility caps were found to be an infeasible approach due to the difficulty in tracking the distances that every truck visiting a warehouse travels. Trucking companies consider this proprietary information as they will travel to warehouse competitors. Further, goods in a truck may be destined for multiple warehouses, and assigning mileage to specific warehouses is impractical. Finally, even if those difficult challenges could be addressed, the administrative burden on facilities and South Coast AQMD to calculate emissions for every facility is significant given the ~3,000 warehouses covered by the rule, and the hundreds of thousands of trucks that operate in the region every day. The proposed menu-based system approach was determined to be the most feasible to administer that also met the project objectives.

Response to 1-3

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Responses to Comment Letter #2 Clean Energy Fuels- 8/23/2019

Response to 2-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to 2-2

PR 2305 provides options for the purchase and usage of NZE and ZE trucks by warehouse operators, and provides WAIRE Points incentives to motivate the use of NZE and ZE trucks. NZE options are expected to have the lowest cost of compliance in the near term, in particular for NZE Class 8 trucks. This incentive within the rule is expected to generate interest from warehouse operators, however they are free to choose whichever option makes the most sense for their operations. The goal of including NZE and ZE trucks is to get regional and local NOx and PM emission reductions from the mobile sources that are attracted to warehouses. The proposed WAIRE Menu included in PR 2305 includes both NZE and ZE truck acquisition and usage.

Response to 2-3

South Coast AQMD staff agree with the comments that the diesel trucks are a significant NOx emission source, and potentially exceed the current NOx emission standard for heavy duty trucks. CARB has adopted several regulations adopted such as the Low NOx Omnibus and the Heavy Duty I&M regulations that will reduce the NOx emissions but also work to ensure prolonged engine performance and emission standard compliance. South Coast AQMD does not have the authority to set emission standards for new engines or in-use performance standards. However, South Coast AQMD does have indirect source authority to provide WAIRE Points incentives for warehouse operators to acquire or get visits from NZE and ZE trucks to help satisfy their compliance obligation under PR 2305WPCO. In providing NZE and ZE truck options on the WAIRE Menu, South Coast AQMD can get needed short term regional and local NOx and PM emission reductions toward the immediate emission reductions by upcoming 2023 and 2031 attainment deadlines, as well as facilitate early action on the implementation of other truck related rules and regulations that also result in emission reductions. Staff agrees that when an NZE truck is fueled with RNG, there can be GHG benefits in addition to the NOx and PM emission reductions as compared with diesel fueled trucks. As stated in the most recent Proposed Final Integrated Energy Policy Report from the California Energy Commission, renewable natural gas made up about 77% of the pipeline gas supply for vehicles in 2019.³³ NZE truck options present some of the lowest costs in the near term with the proposed rule, and are therefore expected to generate interest from warehouse operators as a compliance option.

Response to 2-4

The comment points out that a near-term ZE shift is unlikely due to cost, infrastructure, and logistical issues. is not yet readily available, and that installing this infrastructure will require more effort. This is also supported in a recent report from the California Energy Commissions that states that up to 157,000 chargers are needed for medium duty and heavy duty vehicles by 2030 in order to meet state goals, yet very few have been built to date.³⁴ PR 2305 provides a mechanism to encourage installation of this infrastructure at warehouses – a key destination for medium and heavy duty trucks. While NZE trucks are allowed in PR 2305 (and are an attractive compliance option), NZE fueling infrastructure has not been included. This is in part due to a

³³ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236905>, pg. 134. Accessed 2-28-21

³⁴ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236237>, Accessed 2-28-21

desire to work towards state ZE goals, and also because previous statements from the natural gas industry, and implied statements from this comment letter, have stated identified that government support is not needed for the fueling infrastructure for widespread deployment of natural gas fueled NZE trucks other than policy and funding support for the trucks themselves.³⁵ These previous comments have also stated that the natural gas industry is ready to quickly scale up fueling infrastructure to meet the demands of the trucking industry in southern California, and has a track record of previous successful rapid station developments by constructing 70 stations within one year.

There are currently about 66 CNG and LNG stations in the South Coast AQMD that can serve heavy duty trucks. The ports of Los Angeles and Long Beach estimated that up to 14 new stations could be needed to support up to 18,000 Class 8 NZE trucks serving the ports, however their analysis did not consider the use of any of the existing stations throughout the region.³⁶ At a stringency of 0.0025 WAIRE Points per WATT, the level of deployment of NZE Class 8 trucks in PR 2305 is no more than about 16,000 trucks over a ten year period in the extreme unlikelihood that all warehouse operators only chose NZE Class 8 trucks as a compliance option. Therefore, no more than 14 new stations are expected to be needed to support NZE trucks under PR 2305, and potentially could be much lower if the existing natural gas “station infrastructure is overbuilt for the current natural gas truck market in California”.³⁷ As a result of these factors – the high need for zero emissions charging/fueling infrastructure, the expressed willingness of the natural gas industry to build out fueling stations on its own, and the limited amount of natural gas fueling infrastructure needed to support any NZE trucks that might be introduced due to PR 2305 – natural gas fueling options are not included as a compliance option within PR 2305. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options within PR 2305, and the Governing Board will consider these alternatives as part of its overall consideration of PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to 2-5

See Response 2-4 above. The proposed approach in PR 2305 is expected to ultimately result in about 2.5 to 4 tons per day of NOx reduction, including providing near term emission reductions. Whether or not the Governing Board approves PR 2305, South Coast AQMD will continue to advocate with other agencies to adopt policies that promote cost-effective and near term emission reductions (as noted by the commenter in 2-6).

Response to 2-6

See Response 2-4 above. Further, while renewable natural gas (RNG) does have climate benefits relative to conventional diesel fuel, the primary focus of PR 2305 is the reduction of criteria pollutants to reduce regional and local air pollution, and to reduce localized exposure to air pollution sources related to warehouses. Although reducing greenhouse gases is an important goal, it is not one of the project objectives of PR 2305. PR 2305 is expected to result in increased

use of NZE Class 8 trucks fueled by RNG. Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment Letter #3 - Clean Energy November 26th 2019

Response to Comment 3-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 3-2

Staff agrees with the comment regarding consistency in the size applicability definition, which was also addressed during the November 13, 2019 working group meeting. Revisions were made to the rule language and other documents related to PR 2305 that now have the consistent language of “with greater than or equal to 100,000 square feet”.

Response to Comment 3-3

The proposed three-year phase-in for PR 2305 takes into account many factors. Key considerations included the number of new facilities entering into a regulatory program, the need for emission reductions, and the potential impact on industry. In order to ensure that South Coast AQMD staff can appropriately administer a new program with approximately 3,300 facilities (a more than 10% increase compared to the current permitted universe of about 28,000 facilities), 1,000 facilities will enter each year for three years to allow compliance staff the necessary time to create the program, including a new online reporting portal, field inspection program, auditing program, and making data available to the public. Staff is aware of the urgency in meeting the 2023 and 2031 federal ozone standards. PR 2305 on its own cannot achieve the emission reductions needed for South Coast AQMD to meet these deadlines. However, it is part of a comprehensive strategy described in the 2016 Air Quality Management Plan, and can make meaningful progress towards those goals. The proposed phase-in will allow for a successful roll out of a new program on an industry of warehouse operators that is largely unregulated by air quality agencies.

Response to Comment 3-4

Early action multipliers are not included in the proposed regulation, however PR 2305 does have early action provisions including one that allows that allows extra WAIRE Points earned in one year to be banked for up to three future years to satisfy future compliance obligations, and another that allows both warehouse operators and owners to earn WAIRE Points ahead of their warehouse size phase-in schedule. The banking clock on these pre-phase-in WAIRE Points does not begin until the warehouse operator’s first compliance period, providing an additional early action benefit.

Finally, the WAIRE Menu includes options that go above and beyond current regulations in order to earn WAIRE Points. Warehouse operators may also decide to take early action ahead of the implementation schedule of U.S. EPA or CARB rules and regulation in order to earn WAIRE Points.

Response to Comment 3-5

Staff agrees with the comment that the default WATT calculation serves as a last resort if something beyond the warehouse operator’s control resulted in the loss of truck trip count data. Many studies have shown that the correlation between number of truck trips and the size of a warehouse is poor.³⁸ Therefore, PR 2305 requires actual truck trip count data to obtain the most accurate WPCO for the warehouse operator. Staff’s intent is to obtain the most accurate and

³⁸ <http://library.ite.org/pub/a3e6679a-e3a8-bf38-7f29-2961becdd498>

representative data set on the actual truck trips counts, but to also have a mechanism to determine a facility's WPCO should something happen to their truck trip counts that was beyond its control, in other words, a *force majeure*.

Response to Comment 3-6

The WAIRE Menu options were compared based on their costs and their potential emission reductions. The mitigation fee of \$1,000 per WAIRE Point is similar to the cost of many of these WAIRE Menu options for any one individual warehouse operator in any given year (see page 33 of the Final Staff Report). Although in any one year the cost may be similar, the warehouse operator has not made the investment into the facility and therefore may not be entitled to earn points in future years attributed to usage of items on the WAIRE Menu. Because the investments are not made by a facility are not retained with a mitigation fee. As a result, the long term costs of the mitigation fee approach are likely higher. Further, many options in the WAIRE Menu are lower cost than the mitigation fee. Therefore, the mitigation fee approach is not expected to be the dominant mechanism of compliance, though there are no restrictions if warehouse operators choose to use that option.

Response to Comment 3-7

Staff agrees with the concern about the definition of warehousing space. Staff revised Revisions were made to the definition of "warehousing activities" to better address what could be discounted from the warehouse square footage and what square footage could be used for potential warehousing activities even on a temporary or seasonal basis. However, because South Coast AQMD does not have clear knowledge of all of the facilities subject to PR 2305, what may look like a warehouse from databases and limited information visible from an adjacent street, the indoor activity may not be related to warehousing at all. As the PR 2305 compliance options are tailored to warehousing activities, the applicability of the rule is designed to match this activity.

Additionally, the warehouse owner and warehouse operators would be required to submit information on the square footage of the building in the Warehouse Operations Notification, and the amount of square footage leased for actual warehousing activities that could be verified on the lease agreements. During facility audits, should a concern on the square footage arise, a South Coast AQMD inspector may require further documentation from the warehouse operator to confirm the square footage reported on the Warehouse Operations Notification, the Initial Site Information Report, or on the Annual WAIRE Report. In addition, in order to ensure that the suggested abuse does not occur, PR 316 has been included to provide funding for compliance staff to conduct on-site field inspections. As with other compliance activities conducted by South Coast AQMD, site inspections are typically unannounced in order to see how a facility operates during normal activities.

Response to Comment 3-8

The support for the definition of NZE trucks is noted.

Response to Comment 3-9

The WAIRE Menu includes both NZE and ZE on-road truck acquisition and use, but the WAIRE Menu only includes ZE yard trucks. There are key policy distinctions for why ZE yard trucks are the only option considered. First, in the on-road sector ZE trucks are not at the same stage of commercial development as NZE yard trucks, which have been operating in commercial service for several years, especially for Class 8 trucks. However, ZE yard trucks are commercially available today and have been operating at warehouses since 2015. Additionally, because ZE

yard trucks are located at an individual facility, they are well-suited to serve as an early beachhead for the longer term development of ZE vehicle solutions.³⁹ By focusing PR 2305 on ZE yard trucks, warehouse operators are introduced to ZE technology to see how it works in their operations.

Finally, because yard trucks primarily stay at the warehouse facility, their emissions can have a disproportionate impact on communities surrounding warehouses compared to on-road trucks with emission miles away from a facility. Many yard trucks idle as part of their operation at warehouse facilities, and the switch to ZE yard trucks would benefit public health of the communities surrounding the warehouse to being less by not being burdened by idling emissions. Although NZE engines have lower emissions than their conventional diesel counterparts, they do still have tailpipe emissions. Notwithstanding these issues, a CEQA alternative has been included that evaluates additional NZE compliance options (including for yard trucks) within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 3-10

The installation of ZE charging and fueling infrastructure facilitates the implementation of CARB regulations and supports the Governor's Executive Order N-79-20 as it relates to the ZE truck sales and fleet operation goals. Installing ZE charging or fueling infrastructure would help promote the usage of ZE trucks visiting the warehouse or for ZE trucks the warehouse operator owns or plans to acquire. Staff agrees with the comment that there is no emission benefit from the installation ZE charging or fueling infrastructure itself, but this option is included in the WAIRE Menu as it facilitates the usage of ZE technology. WAIRE Points can be earned separately for use of the ZE charging/fueling stations, similar to how WAIRE Points are earned separately for the acquisition of NZE trucks and use of NZE trucks. The splitting of WAIRE Points for both acquisition and usage of equipment and vehicles also allows greater flexibility for incentive funding to be used to offset compliance costs of PR 2305. For example, incentive programs that offset the purchase of a vehicle commonly are typically not allowed to be used for regulatory compliance, such as mandates to purchase vehicles. However, because PR 2305 allows vehicles to be used at a location to earn WAIRE Points, the incentive program restrictions do not apply, and trucks purchased with incentive funding can still earn WAIRE Points for their use. This same approach applies to ZE charging/fueling infrastructure.

Response to Comment 3-11

See Response to Comments 2-4. Further, carbon intensity values have not been considered as part of any WAIRE Menu item. Although reducing greenhouse gases is an important goal, it is not one of the project objectives of PR 2305. PR 2305 is expected to result in increased use of NZE Class 8 trucks fueled by RNG. This is due to the expected increase in use of NZE trucks due to their cost effectiveness relative to other options, and because 77% of natural gas used for transportation fuels in CA is renewable. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 3-12

³⁹ https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

The WAIRE Menu was revised and now only includes the installation of solar panel systems. While solar panels do not directly reduce emissions at a warehouse site, they do reduce emissions associated with a warehouse by reducing power produced from local natural-gas fueled power plants. Solar panel systems can provide electricity for warehouses to use for their operations, which could include EV or TRU charging that might otherwise have relied on electricity generated from local power plants that resulted in regional NOx emissions. Solar panel system installations also offer additional flexibility for warehouse operators, and this technology is also a common consideration for warehouse operators to meet their corporate sustainability goals.

Response to Comment 3-13

The WAIRE Menu was revised and now only includes the installation of MERV 16 or better air filter systems or the replacement of MERV 16 air filters at sensitive sites for the communities surrounding warehouses. Air filter systems benefits the public health of neighboring communities as it reduces exposure to particulate matter, a common pollutant associated with warehousing activity. The support for measures that better inform the community on the health risks and impacts from air pollution is noted.

Response to Comment 3-14

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment Letter – 4_CCAEJ – Draft Rule -12/6/19

Response to Comment 4-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 4-2

Staff recognizes the concerns expressed with a credit trading system and the structure of PR 2305 now requires all subject warehouse operators to take actions themselves that will reduce pollution and exposures in the communities near their warehouses, consistent with the authority granted to South Coast AQMD. Warehousing is also expected to continue growing in the region, and PR 2305 will apply to new warehouses as they are built.

Response to Comment 4-3

Staff agrees with the clarification of the minimum warehouse size applicable to PR 2305, as being warehouse facilities “with greater than or equal to 100,000 square feet of indoor floor space” rather than the 1st draft rule language stating “with greater than 100,00 square feet of indoor floor space”. The clarification statement incorporating the inclusive “greater than or equal to 100,000 square feet” will be revised and used from this point forward.

Response to Comment 4-4

PR 2305 does not include multiple buildings in the definitions of a warehouse and warehouse facility [PR 2305 (c)(31) and(c)(32)]. PR 2305 (b) states that the rule is applicable to “...owners and operators of warehouses located in the South Coast Air Quality Management District (South Coast AQMD) jurisdiction with greater than or equal to 100,000 square feet of indoor floor space in a single building.” Staff analyzed many different properties, and noted that complexes with multiple buildings may use auxiliary buildings for manufacturing, or maintenance and repair, but it is the large warehousing building that may dictate the level of mobile source emissions from on-road trucks and cargo handling equipment, therefore the rule applicability of greater than or equal to 100,000 square feet is applied to a single building. PR 2305 is applicable to about 3,300 warehouses, and there are perhaps another 30,000 warehouses that are below the applicability limits in PR 2305.⁴⁰ However, given the need to ensure the successful implementation of a new regulatory program of this scale, those warehouses with the biggest emission impact (i.e. the largest facilities with the most truck traffic) are the focus of the proposed rule. If PR 2305 is approved and successfully implemented, staff will follow the direction of the Board before proposing additional approaches to regulate these smaller facilities.

⁴⁰ https://scag.ca.gov/sites/main/files/file-attachments/final_report_03_30_18.pdf, Accessed 2-28-21

Response to Comment 4-5

Staff understands that key information regarding stringency, the annual variable, and points were still under development in the version of the draft PR 2305 as of the date of your comment letter date 12/6/19. The most recent version of the PR 2305 states the recommended stringency to equal 0.0025 WAIRE Points per WATT. The annual variable listed in the WPCO equation corresponds to the three-year phase-in of the stringency as listed in PR 2305, Table 2.

Impacts of air pollution on communities surrounding warehouses are considered in the structure of the WAIRE Points themselves. WAIRE Points for each WAIRE Menu item were determined by calculating the NO_x emission reductions (which affects regional air pollution) as well as Diesel PM emission reductions (which affects regional and local air pollution), and the cost. Further, all warehouse operators must take actions themselves that reduce emissions or facilitate emission and exposure reductions in the communities near their warehouses. This approach will necessarily benefit disadvantaged communities as about 85% of warehouses are in communities that are in at least the worst 70th percentile as determined with the CalEnviroScreen tool (see Figure 4 of the Final Staff Report for a map). Because of the high overlap between the vast majority of warehouses and communities with pollution burdens, the most practical approach to reduce these impacts is to ensure that all warehouse operators must take actions to benefit their local communities.

Finally, in order to ensure that any limited transferring of WAIRE Points that may occur under the rule does not disproportionately effect local communities, any WAIRE Points transferred from a different location are discounted by the number of WAIRE Points associated with local benefits from Diesel PM reductions.

Response to Comment 4-6

PR 2305 specifies how warehouse operators will determine their final WPCO each year. As written in PR 2305, $WPCO = WATTS \times Stringency \times Annual\ Variable$, where WATTS is calculated as specified in PR 2305 subparagraph (d)(1)(B) or (d)(1)(C), as applicable. The recommended stringency is 0.0025 WAIRE Points per WATT, and the annual variable is specified in Table 2 of PR 2305. The WAIRE Program Implementation Guidelines goes into further detail in methods of collecting and maintaining records of actual truck trip counts, as it is a key component of the WPCO calculation.

Response to Comment 4-7

While the rule itself addresses specific impacts to sensitive receptors as mentioned by the commenter, there is only one requirement within the rule specific to these kinds of land uses – the installation of air filters and filtrations systems. In the WAIRE Menu, sensitive site locations such as schools, hospitals, community centers, and residences are described explicitly as locations to install filter systems or replace filters (see PR 2305, Table 3).

Response to Comment 4-8

PR 2305 lists the optional mitigation fee to be \$1,000 per WAIRE Point [see PR 2305 section (d)(5)]. The mitigation fee provides additional flexibility to warehouse operators. The mitigation fee cost of \$1000 per WAIRE Point is designed to be within the range of cost of the WAIRE Menu actions and investments for warehouse operator in any one year, though some options such as getting NZE/ZE truck visits would be cheaper and options such as installing a fueling station may be more expensive. Through time, the mitigation fee is expected to be a more expensive option if warehouse operators don't take additional actions as early investments within the rule result in later cost savings, and lower emissions. The mitigation fee is proposed to be consistent across all warehouses similar to how the stringency of the rule is consistent across all warehouses. This approach will necessarily benefit disadvantaged communities as about 85% of warehouses are in communities that are in at least the worst 70th percentile as determined with the CalEnviroScreen tool (see Figure 4 of the Final Staff Report for a map). Because of the high overlap between the vast majority of warehouses and communities with pollution burdens, the most practical approach to reduce these impacts is to ensure that all warehouse operators must take actions to benefit their local communities.

Response to Comment 4-9

The WAIRE Mitigation Program will fund NZE and ZE trucks and ZE charging and fueling infrastructure in the communities around the warehouses that paid the fee as described at the end of Chapter 2 of the Final Staff Report. Specific language detailing requirements for spending mitigation funds will be included in the Board Resolution when it considers PR 2305 and PR 316. Any future spending of mitigation funds from the WAIRE Mitigation Program will also include additional public process and a Board vote should PR 2305 and PR 316 be approved.

Response to Comment 4-10

PR 2305 is designed to provide flexibility given the wide variety of business models employed by warehouses subject to the rule. Near zero options for on-road trucks are commercially available today, including for Class 8 trucks, whereas zero emission truck options are not yet widely commercially available. Additionally, NZE trucks can be significantly more cost-effective, both for the warehouse operator in terms of compliance (see Table 22 of the Final Staff Report) and in terms of cost per ton of emissions reduced (see Table 27 of the Final Staff Report). Further, PR 2305 is not designed to address all concerns associated with warehousing (e.g., traffic, aesthetics, economic and worker considerations, climate change impacts, etc.) as its focus is on reducing emissions that impact federal and state air quality standards and air pollution exposures in local communities. Nevertheless, the options for NZE and ZE technologies in PR 2305 are expected to have a positive impact on reducing greenhouse gas emissions compared to conventional diesel technologies. For example, as stated in the most recent Proposed Final Integrated Energy Policy Report from the California Energy Commission, renewable natural gas made up about 77% of the pipeline gas supply for vehicles in 2019.⁴¹ According to CARB, the carbon intensity of renewable natural gas fuels is considerably lower than diesel fuels, with many sources showing negative carbon intensity values.⁴² Finally, NZE technologies also completely eliminate the emissions of Diesel PM, the toxic air contaminant with the highest impact on environmental justice communities as shown in South Coast AQMD's MATES study.⁴³

⁴¹ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236905>, pg. 134. Accessed 2-28-21

⁴² <https://ww3.arb.ca.gov/fuels/lcfs/dashboard/dashboard.htm>, Accessed 3-1-21

⁴³ <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv>

Response to Comment 4-11

ZE trucks are being commercialized rapidly today, and this is expected to continue over the next several years. However, charging/fueling infrastructure for these trucks has not been fully developed, some truck types will have longer wait times for zero emission technology to be commercialized (e.g., Class 8 trucks), and NZE technologies are significantly more cost effective than their ZE counterparts today. PR 2305 however does provide more options for ZE technologies, and these compliance options are anticipated to grow in popularity through time as these technologies enter the commercial market at greater scale and begin to reduce in price. The ZE technology options in PR 2305 are also designed to allow warehouses to take advantage of these options in ways that match their operations, by allowing WAIRE Points to be earned for charging infrastructure and ZE trucks and yard trucks. However, some warehouse operators have already invested in NZE technology that reduces NOx at least 90% compared to conventional diesel trucks and completely eliminates toxic Diesel PM, and may have needs that will not allow ZE trucks to work in their operations until the technology further matures. Nevertheless, the acquisition of ZE trucks and usage of Class 8 ZE trucks earns more points than the equivalent NZE acquisition or usage.

Response to Comment 4-12

The purpose of PR 2305 is to reduce regional and local NOx and PM and facilitate other related rules and regulations, reductions for greenhouse gases would be a collateral benefit. The facilitative purpose of PR 2305 will help with implementation of measures such as the installation of much needed charging and fueling infrastructure and promote demand for ZE trucks which are two components needed by other regulations from CARB and the Governor's Executive Order N-79-20 which direct state agencies toward ZE transportation goals. The targets set by the state have focused on dates far in the future, such as 2035 and 2045. However, air quality needs are immediate (e.g., attainment dates are as close as 2023, public health is impacted today from poor air quality), and near-zero technology options have the ability to provide cost-effective solutions today.

Response to Comment 4-13

The approval of CEQA documents is within the purview of local lead agencies like cities and counties. South Coast AQMD does not have land use authority and cannot dictate how those lead agencies make land use decisions or CEQA decisions. However, PR 2305 does provide a level playing field for all new and existing warehouses subject to the rule, and is expected to meaningfully reduce emissions from this sector. One outcome that may result if PR 2305 is passed is that lead agencies may be able to use the framework that the rule establishes to require new warehouses to over comply with PR 2305. This dynamic has worked in some instances with the application of LEED for new construction, with some lead agencies⁴⁴ or the legislature⁴⁵ requiring higher levels of compliance with that program for land use projects, and a similar dynamic could occur with the WAIRE Program if PR 2305 is approved.

Response to Comment 4-14

⁴⁴ Examples: https://planning.lacity.org/code_studies/GreenLa/Brochure.pdf, <https://www.cityoforange.org/DocumentCenter/View/531/Local-CEQA-Guidelines-PDF>, <http://file.lacounty.gov/SDSInter/bos/supdocs/97129.pdf>

⁴⁵ Examples: AB 734 (2018), AB 987 (2018), SB 742 (2013)

At this time, PR 2305 is expected to go before the South Coast AQMD Governing Board's for its consideration on May 7, 2021.

Response to Comment 4-15

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter – 5_CCAir– Draft Rule -12/6/19

Response to Comment 5-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 5-2

Staff understands that information regarding stringency, the annual variable, and WAIRE Points were still under development in the version of the draft Proposed Rule 2305 (PR 2305) available when the comment was made. The current draft of PR 2305 includes the details for how warehouse owners and operators will determine their final WPCO each year. As written in PR 2305, $WPCO = \text{Weighted Annual Truck Trips (WATTs)} \times \text{Stringency} \times (\text{Annual Variable})$, where WATTs is calculated as specified in PR 2305 subparagraph (d)(1)(B) or (d)(1)(C), as applicable, the recommended stringency is 0.0025 WAIRE Points per WATT, and the annual variable corresponds to a three-year stringency phase-in specified in PR 2305, Table 2.

Response to Comment 5-3

The current version of PR 2305 provides updated initial requirement dates (see “Table 1 – Initial Requirement Date”) as shown below:

Phase	Warehouse Size (square feet)	Initial Reporting Date	Initial Compliance Period
1	$\geq 250,000$	January 31, 2023	January 1, 2022 to December 31, 2022
2	$\geq 150,000$ -<250,000	January 31, 2024	January 1, 2023 to December 31, 2023
3	$\geq 100,000$ -<150,000	January 31, 2025	January 1, 2024 to December 31, 2024

Staff considered the universe of approximately 3,320 warehouse facilities with greater than or equal to 100,000 square feet of indoor floor space when it was decided to have a three-year phase-in of facilities. Staff determined that a The purposeful phase-in with approximately 1,000 facilities entering each year for three years would help manage the workload associated with was determined as PR 2305 address a previously unregulated industry, with a proposed new online reporting system, along with a proposed new compliance team conducting facility audits. Additionally, given that the current inventory of permitted facilities regulated by South Coast AQMD is approximately 28,000 facilities, and a slow phase-in is required to insure a smooth rollout of a nearly 10% increase in facilities with the existing staff. The order of the phase-in from larger to smaller facilities is based on focusing on facilities expected to have the highest truck traffic on average. Staff is aware of the urgency in meeting air quality goals; the relatively short phase-in schedule proposed is intended to ensure PR 2305’s success.

Response to Comment 5-4

PR 2305 has been revised since the date this comment letter was submitted. PR 2305 Section (f)(1) is now Section (d)(5), and specifies a mitigation fee of \$1,000 per WAIRE Point.

Response to Comment 5-5

The current version of PR 2305 provided at the time this comment letter was written has since been revised. PR 2305 Section (f)(2) and its language has been removed from PR 2305 as the mitigation fee is not intended as a penalty. The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as implementing the other WAIRE Menu options in any one year for a warehouse operator. Through time, the mitigation fee is expected to be a far more expensive option if warehouse operators don't take additional actions. This is because as early investments within the rule result in later cost savings through points attributable to usage, and lower emissions. The mitigation fee is proposed to be consistent across all warehouses similar to how the stringency of the rule is consistent across all warehouses.

Response to Comment 5-6

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. The additional detail requested has been provided in later drafts of the rule, as well as the Final Staff Report.

Response to Comment Letter – 6_SoCalGas– Draft Rule -12/6/19

Response to Comment 6-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 6-2

Staff intends to pursue State Implementation Plan (SIP) creditable emission reductions for PR 2305 for some of the actions taken from the WAIRE Menu, but PR 2305 is also a facilitative measure designed to enhance other rules and regulations which may also claim SIP credit. For example, CARB has its Advanced Clean Trucks (ACT) regulation which is largely a manufacturers' sales mandate, and the WAIRE Program can facilitate implementation of the ACT rule by warehouse operators choosing to purchase more ZE trucks earlier to earn WAIRE Points and by allowing facilities to earn points through truck usage. This could serve to additionally create more demand for ZE trucks. The WAIRE Program also includes the installation of ZE charging or fueling infrastructure which would be needed to support newly purchased ZE trucks. WAIRE Point values have a direct connection to SIP creditable emission reductions via NO_x and Diesel PM emission reductions, which are how PR 2305 will assist in meeting state and federal ambient air quality standards. Additional information regarding South Coast AQMD's approach to obtaining SIP credit for PR 2305 can be found in Appendix D of PR 2305's Final Staff Report

Response to Comment 6-3

Early action weighting is not included in the proposed regulation, however PR 2305 does have early action provisions. These include a provision that allows that allows extra WAIRE Points earned in one year to be banked for up to three future years, and another that allows both warehouse operators and owners to earn WAIRE Points ahead of their warehouse size phase-in schedule. The banking clock on these pre-phase-in WAIRE Points does not begin until the warehouse operator's first compliance period, providing an additional early action benefit. Finally, the WAIRE Menu includes options that go above and beyond current regulations in order to earn WAIRE Points. Warehouse operators may also decide to take early action ahead of the implementation schedule of U.S. EPA or CARB rules and regulation in order to earn WAIRE Points.

Response to Comment 6-4

The WAIRE Menu has nearly three dozen options that could earn WAIRE Points. However, due to comments from this stakeholder and others, PR 2305 now includes the option for warehouse owners and operators to submit a Custom WAIRE Plan application for proposed projects not on the WAIRE Menu but that achieve quantifiable, verifiable, and real NO_x and DPM emission reductions. These Custom WAIRE Plans must meet all the requirements as outlined in PR 2305 Section (d)(4). The Custom WAIRE Plan provides an opportunity to propose specific projects that are not included in the WAIRE Menu.

Response to Comment 6-5

The WAIRE Menu includes the installation of a hydrogen fueling station and the use of a hydrogen fueling station as options to earn WAIRE Points. Hydrogen fuel production equipment

was not analyzed as much of the emission reductions would result from the dispensed hydrogen replacing diesel fueled operation. Estimating and any emission reductions from such a scenario is difficult was difficult to set default values for calculation as it is dependent on many equipment design variables. Though hydrogen generation equipment is not included in the WAIRE Menu, a warehouse operator can propose it as a Custom WAIRE Plan application if it meets all the requirements for a Custom WAIRE Plan listed in PR 2305 (see PR 2305, Section (d)(4)).

Response to Comment 6-6

The commenter correctly points out that ZE charging/fueling infrastructure is included in the WAIRE Menu, but not NZE fueling infrastructure. A recent report from the California Energy Commission states that up to 157,000 chargers are needed for medium duty and heavy duty vehicles by 2030 in order to meet state goals, yet very few have been built to date.⁴⁶ PR 2305 provides a mechanism to install this needed infrastructure at warehouses – a key destination for medium and heavy duty trucks. While NZE trucks are allowed in PR 2305 (and are an attractive compliance option), fueling infrastructure has not been included in part due to a desire to work towards state ZE goals, and also because previous statements from the natural gas industry have stated that government support is not needed for the fueling infrastructure for widespread deployment of natural gas fueled NZE trucks other than policy and funding support for the trucks themselves.⁴⁷ These previous comments have also stated that the natural gas industry is ready to quickly scale up fueling infrastructure to meet the demands of the trucking industry in southern California, and has a track record of previous successful rapid station developments by constructing 70 stations within one year.

There are currently about 66 CNG and LNG stations in the South Coast AQMD that can serve heavy duty trucks. The ports of Los Angeles and Long Beach estimated that up to 14 new stations could be needed to support up to 18,000 Class 8 NZE trucks serving the ports, however their analysis did not consider the use of any of the existing stations throughout the region.⁴⁸ At a stringency of 0.0025 WAIRE Points per WATT, the level of deployment of NZE Class 8 trucks in PR 2305 is no more than about 16,000 trucks over a ten year period in the extreme unlikelihood that all warehouse operators only chose NZE Class 8 trucks as a compliance option. Therefore, no more than 14 new stations are expected to be needed to support NZE trucks under PR 2305, and potentially could be much lower if the existing natural gas “station infrastructure is overbuilt for the current natural gas truck market in California”.⁴⁹ As a result of these factors – the high need for zero emissions charging/fueling infrastructure, the expressed willingness of the natural gas industry to build out fueling stations on its own, and the limited amount of natural gas fueling infrastructure needed to support any NZE trucks that might be introduced due to PR 2305 – natural gas fueling options are not included as a compliance option within PR 2305. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options within PR 2305, and the Governing Board will consider these alternatives as part of its overall consideration of PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through

a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 6-7

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter – 7_Luskin Center– Draft Rule - 12-6-2019

Response to Comment 7-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 7-2

The term “Sensitive Receptor” was not used in the draft rule language. However, sensitive sites are listed out in the WAIRE Menu (Table 3 of PR 2305) for possible locations to install minimum efficiency reporting value (MERV) 16 or greater filters filter systems or replace MERV 16 or greater filters. Warehouse facilities can earn WAIRE Points by implementing community benefits, (e.g., filter system installations) to satisfy the warehouse operator’s WPCO. Installation of MERV 16 or greater filter systems or replacement of MERV 16 or greater filters at sensitive sites with high risk level such as residences, schools, daycares, hospitals and community centers are intended to provide a local health benefit to communities surround a warehouse by reducing community exposure and emission impacts.

Response to Comment 7-3

As stated in previous response to comments, the term sensitive receptor was not used in PR 2305. The concept of sensitive receptors and/or sensitive sites is only referred in the current version of PR 2305 in the WAIRE menu (see PR 2305, Table 3), for the installation of MERV 16 or great filter systems or MERV 16 or greater filter replacement and not defined under (c) Definitions. Similarly, “Residential Receptors” are not addressed, the localized benefit addresses the benefit of reduced DPM emissions in the communities surrounding warehouses that suffer health impacts from the DPM emissions.

Response to Comment 7-4

The information such as the calculations of Cost, Regional NOx reductions, and Local Benefits are available on the WAIRE Technical Report, available in Appendix B of the Final Staff Report.

Response to Comment 7-5

PR 2305 does not refer to sensitive receptors and/or sensitive sites and there is no requirement for warehouse operators or owners to identify sensitive receptors.

Response to Comment 7-6

PR 2305 allows limited transfer of excess WAIRE Points to a different site under a single operator’s control. Due to the concern raised by this commenter and others, the transferred WAIRE Points are discounted to account for any localized emission reductions of Diesel PM that wouldn’t be experienced for the community near the warehouse where the Points were transferred. Part of the reason for allowing this type of limited transfer is to, provided the warehouse operator of multiple warehouses the t be able to undertake larger scale WAIRE Menu projects such as the installation of charging or fueling infrastructure. These types of projects which may need to be initiated one warehouse at a time rather than all the warehouses at once due to cost investment and project management. The intent of the limited transfer was to enable large scale capital investment projects to be undertaken and not discouraged.

Response to Comment 7-7

Staff will be reporting on the implementation of the WAIRE Program to the South Coast AQMD Mobile Source Committee on an annual basis. In addition, staff anticipates providing a publicly accessible web portal (similar to other South Coast AQMD web resources) with information about WAIRE Program compliance if PR 2305 passes. Prior to developing that web portal, staff will initiate a public process to get feedback on the development of the website.

Response to Comment 7-8

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter #8 CCAEJ January 24, 2020 –Mobile Source Committee

Response to Comment 8-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 8-2

PR 2305 is designed to provide flexibility given the wide variety of business models employed by warehouses subject to the rule. Near zero options for on-road trucks are commercially available today, including for Class 8 trucks, whereas zero emission truck options are not yet widely commercially available. Additionally, NZE trucks can be significantly more cost-effective, both for the warehouse operator in terms of compliance (see Table 22 of the Final Staff Report) and in terms of cost per ton of emissions reduced (see Table 27 of the Final Staff Report). Further, PR 2305 is not designed to address all concerns associated with warehousing (e.g., traffic, aesthetics, economic and worker considerations, climate change impacts, etc.) as its focus is on reducing emissions that impact federal and state air quality standards and air pollution exposures in local communities. The options for NZE and ZE technologies in PR 2305 are expected to have a positive impact on reducing greenhouse gas emissions compared to conventional diesel technologies. For example, as stated in the most recent Proposed Final Integrated Energy Policy Report from the California Energy Commission, renewable natural gas made up about 77% of the pipeline gas supply for vehicles in 2019.⁵⁰ According to CARB, the carbon intensity of renewable natural gas fuels is considerably lower than diesel fuels, with many sources showing negative carbon intensity values.⁵¹ Finally, NZE technologies also completely eliminate the emissions of Diesel PM, the toxic air contaminant with the highest impact on environmental justice communities as shown in South Coast AQMD's MATES study.⁵²

As documented in the Final Staff Report and its Appendix B - WAIRE Menu Technical Report, the NOx and Diesel PM emission reductions and incremental costs relative to conventional diesel technologies are the factors that determine each WAIRE Menu action's Point value. Using a consistent method across all WAIRE Menu actions results in an ability to ensure approximately equal levels of compliance activity, regardless of the action chosen. Following this methodology, Class 4-7 ZE trucks and NZE trucks earn the same amount of WAIRE Points in the WAIRE Menu due to similar levels of emission reductions and costs between the two technologies. Class 8 truck WAIRE Point totals however are different between ZE and NZE technologies, due to the greater difference in cost and emission reductions for these trucks, with ZE trucks earning more Points than NZE.

Response to Comment 8-3

See Response to Comments 8-2 above.

⁵² <http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv>

Response to Comment 8-4

ZE trucks are being commercialized rapidly today, and this is expected to continue over the next several years. However, charging/fueling infrastructure for these trucks has not been fully developed, some truck types will have longer wait times for zero emission technology to be commercialized (e.g., Class 8 trucks), and NZE technologies are significantly more cost effective than their ZE counterparts today. PR 2305 however does provide more options for ZE technologies, and these compliance options are anticipated to grow in popularity through time as these technologies enter the commercial market at greater scale and begin to reduce in price. The ZE technology options in PR 2305 are also designed to allow warehouses to take advantage of these options in ways that match their operations, by allowing WAIRE Points to be earned for charging infrastructure and ZE trucks and yard trucks. However, some warehouse operators have already invested in NZE technology that reduces NOx at least 90% compared to conventional diesel trucks and completely eliminates toxic Diesel PM, and may have needs that will not allow ZE trucks to work in their operations until the technology further matures.

Response to Comment 8-5

The purpose of PR 2305 is to reduce regional and local NOx and PM and facilitate other related rules and regulations, reductions for greenhouse gases would be a collateral benefit. The facilitative purpose of PR 2305 will help with implementation of measures such as the installation of much needed charging and fueling infrastructure and promote demand for ZE trucks which are two components needed by other regulations from CARB and the Governor's Executive Order N-79-20 which direct state agencies toward ZE transportation goals. The targets set by the state have focused on dates far in the future, such as 2035 and 2045. However, air quality needs are immediate – our region is facing deadlines in 2023 and 2031 to attain federal air quality standards and (e.g., attainment dates are as close as 2023, public health is impacted today from poor air quality.), and near-zero technology options have the ability to provide cost-effective solutions today.

Response to Comment 8-6

Impacts of air pollution on communities surrounding warehouses are considered in the structure of the WAIRE Points themselves. WAIRE Points for each WAIRE Menu item were determined by calculating the NOx emission reductions (which affects regional air pollution) as well as Diesel PM emission reductions (which affects regional and local air pollution), and the cost. Further, all warehouse operators must take actions themselves that reduce emissions or facilitate emission and exposure reductions in the communities near their warehouses. This approach will necessarily benefit disadvantaged communities as about 85% of warehouses are in communities that are in at least the worst 70th percentile as determined with the CalEnviroScreen tool (see Figure 4 of the Final Staff Report for a map). Because of the high overlap between the vast majority of warehouses and communities with pollution burdens, the most practical approach to reduce these impacts is to ensure that all warehouse operators must take actions to benefit their local communities.

Finally, in order to ensure that any limited transferring of WAIRE Points that may occur under the rule does not disproportionately effect local communities, any WAIRE Points transferred from a different location are discounted by the number of WAIRE Points associated with local benefits from Diesel PM reductions.

Response to Comment 8-7

Sensitive receptors are not referenced in the draft rule language. However, in the WAIRE Menu under the option for installation of MERV 16 or greater filter systems and MERV 16 or greater filter replacement potential installation examples are provided at sensitive sites such as residences, schools, daycares, hospitals, or community centers. The term sensitive receptor was not used in the determination of the WPCO as that was calculated using the WATT, rule stringency, and an annual variable. The recommended stringency of 0.0025 WAIRE Points per WATT with a three-year phase-in was analyzed in various scenarios to analyze the potential impacts on warehouse operations and air quality (see Final Staff Report Chapter 3).

Response to Comment 8-8

Onsite resting areas for workers or truck drivers were not included in the WAIRE Menu, as default values for costs, NOx reductions, or Diesel PM reductions can vary from warehouse to warehouse. However, warehouse operators could propose a project of a designated onsite rest area for workers and truck drivers as a Custom WAIRE Plan application which would be evaluated based on the requirements listed in PR 2305. If the Custom WAIRE Plan is approved, this approach could earn the warehouse WAIRE Points toward the WPCO.

Response to Comment 8-9

The rule is currently anticipated to go before the South Coast AQMD Governing Board for consideration on May 7, 2021. Additional time has been needed to develop the rule concept and supporting analysis, and to reach out to stakeholders.

Response to Comment 8-10

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter #9 Clean Energy Fuels – December 10, 2019

Response to Comment 9-1

Thank you for your interest in the warehouse ISR development process, staff appreciates the time and effort taken to provide your feedback on the WAIRE Points system.

Response to Comment 9-2

By design the WAIRE Program seeks emission reductions and facilitate and enhances other related rules and regulations. While the WAIRE Program will result in emission reductions it will not on its own result in the attainment of the federal ozone standard for 2023, even if all warehouse emissions went to zero. PR 2305 is projected to provide about a 10-15% emission reduction, in the South Coast AQMD. However, PR 2305 is also part of a larger comprehensive strategy described in the 2016 Air Quality Management Plan that is designed to meet federal and state air quality standards. Thus, given the unique nature of the rule and South Coast AQMD's indirect source authority, it is important to include measures that do not necessarily reduce emissions on their own, but that facilitate emission reductions, including by laying the ground work for future emission reduction technologies such as zero emissions trucks.

Further, the WAIRE Menu has been designed to split WAIRE Points between acquiring and using vehicles and equipment. This is to allow warehouse operators to make progress every year as part of an annual program, and to allow incentive funding programs work within a regulatory setting. Incentive programs that offset the purchase price of a vehicle generally cannot be used if the purchase is required to comply with a regulation. However, because PR 2305 encourages the use of those purchased vehicles, as well as their use at specific warehouses, incentivized vehicles may still earn WAIRE Points. This mechanism has the effect of lowering the potential compliance cost of the rule, with the ability to further decrease compliance costs through the identification of additional sources of incentive funding.

Ultimately, all emission reductions achieved or facilitated by PR 2305 should be SIP creditable (see discussion in Appendix D of the Final Staff Report).

Response to Comment 9-3

Early action multipliers are not included in the proposed regulation H, however PR 2305 does have early action provisions including one that allows that allows extra WAIRE Points earned in one year to be banked for up to three future years, and another that allows both warehouse operators and owners to earn WAIRE Points ahead of their warehouse size phase-in schedule. The banking clock on these pre-phase-in WAIRE Points does not begin until the warehouse operator's first compliance period, providing an additional early action benefit.

Finally, the WAIRE Menu includes options that go above and beyond current regulations in order to earn WAIRE Points. Warehouse operators may also decide to take early action ahead of the implementation schedule of U.S. EPA or CARB rules and regulation in order to earn WAIRE Points.

Response to Comment 9-4

NZE and ZE trucks are treated equally in PR 2305. The development of the number of WAIRE Points for implementing each technology is described in detail in Appendix B to the Final Staff

Report. In summary, WAIRE Points in the WAIRE Menu are assigned based on each technology's costs and NOx and DPM emission reductions, relative to conventional diesel technologies. Although reducing greenhouse gases is an important goal, it is not one of the project objectives of PR 2305. The options for both NZE and ZE technologies in PR 2305 are expected to have a positive impact on reducing greenhouse gas emissions compared to conventional diesel technologies. For example, as stated in the most recent Proposed Final Integrated Energy Policy Report from the California Energy Commission, renewable natural gas made up about 77% of the pipeline gas supply for vehicles in 2019.⁵³ According to CARB, the average carbon intensity of renewable natural gas fuels is considerably lower than diesel fuels, with many sources showing negative carbon intensity values.⁵⁴ The average carbon intensity of electricity production is currently lower than for renewable natural gas. Powerplant that provide electricity (including for ZE trucks) are becoming a diminishing source of emissions in the air basin, emitting less than 2 tpd of NOx in South Coast AQMD in 2019 based on an analysis of continuous emissions monitoring systems data. These emissions are anticipated to continue to decline as more renewable sources of power are introduced due to state policies.

Response to Comment 9-5

Costs were included in the determination of WAIRE Points for every WAIRE Menu action in order to recognize the investments that warehouse operators (and owners who opt in) make towards clean air technologies. PR 2305 requires annual compliance in order to ensure ongoing air quality improvements, and it is not possible to provide credit for emission reductions far into the future with this structure. In addition, many logistics industry stakeholders have commented on the short-term nature of business relationships, with warehouse frequently leases common for about three-year terms, and trucking contracts common for one-year terms (or less). In order to ensure the flexibility needed in this environment, investments are allowed to earn WAIRE Points on their own, and in the year that the investment is made. The WAIRE Menu has been designed to split WAIRE Points between acquiring and using vehicles and equipment. This provision is to allow warehouse operators to make progress every year as part of an annual program, and to allow incentive funding programs work within a regulatory setting. Incentive programs that offset the purchase price of a vehicle generally cannot be used if the purchase is required to comply with a regulation. However, because PR 2305 encourages the use of those purchased vehicles, as well as their use at specific warehouses, incentivized vehicles may still earn WAIRE Points. This mechanism has the effect of lowering the potential compliance cost of the rule, with the ability to further decrease compliance costs through the identification of additional sources of incentive funding.

Response to Comment 9-6

The WAIRE Menu does not include NZE options for infrastructure or yard trucks. While NZE trucks are allowed in PR 2305 (and are an attractive compliance option), fueling infrastructure has not been included in part due to a desire to work towards state goals, and also because previous statements from the natural gas industry have stated that government support is not needed for the fueling infrastructure for widespread deployment of natural gas fueled NZE trucks other than policy and funding support for the trucks themselves.⁵⁵ These previous comments have also stated that the natural gas industry is ready to quickly scale up fueling infrastructure to meet

⁵³ <https://efiling.energy.ca.gov/getdocument.aspx?tn=236905>, pg. 134. Accessed 2-28-21

⁵⁴ <https://ww3.arb.ca.gov/fuels/lcfs/dashboard/dashboard.htm>, Accessed 3-1-21

⁵⁵ <https://cngvc.org/wp/wp-content/uploads/2017/04/ACT-Now-Plan-Final.pdf>, pg. 14, Accessed 2-28-21
<https://cleanairactionplan.org/documents/2018-draft-dravage-feasibility-assessment-public-comments.pdf>, letters at pg. 14 and 47 Accessed 2-28-21

the demands of the trucking industry in southern California, and has a track record of previous successful rapid station developments by constructing 70 stations within one year.

There are currently about 66 CNG and LNG stations in the South Coast AQMD that can serve heavy duty trucks. The ports of Los Angeles and Long Beach estimated that up to 14 new stations could be needed to support up to 18,000 Class 8 NZE trucks serving the ports, however their analysis did not consider the use of any of the existing stations throughout the region.⁵⁶ At a stringency of 0.0025 WAIRE Points per WATT, the level of deployment of NZE Class 8 trucks in PR 2305 is no more than about 16,000 trucks over a ten year period in the extreme unlikelyhood that all warehouse operators only chose NZE Class 8 trucks as a compliance option. Therefore, no more than 14 new stations are expected to be needed to support NZE trucks under PR 2305, and potentially could be much lower if the existing natural gas “station infrastructure is overbuilt for the current natural gas truck market in California”.⁵⁷ As a result of these factors – the high need for zero emissions charging/fueling infrastructure, the expressed willingness of the natural gas industry to build out fueling stations on its own, and the limited amount of natural gas fueling infrastructure needed to support any NZE trucks that might be introduced due to PR 2305 – natural gas fueling options are not included as a compliance option within PR 2305.

There are also key policy distinctions for why ZE yard trucks are the only option considered. First, in the on-road sector ZE trucks are not at the same stage of commercial development as NZE yard trucks, which have been operating in commercial service for several years, especially for Class 8 trucks. However, ZE yard trucks are commercially available today and have been operating at warehouses since 2015. Additionally, because ZE yard trucks are located at an individual facility, they are well-suited to serve as an early beachhead for the longer term development of ZE vehicle solutions.⁵⁸ By focusing PR 2305 on ZE yard trucks, warehouse operators are introduced to ZE technology to see how it works in their operations. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 9-7

See Response to Comments 9-2 and 9-5.

Response to Comment 9-8

One of the main goals of PR 2305 is regional NOx reductions, and the installation of EV chargers does facilitate indirect emission reductions by promoting the use of an EV rather than a traditional gasoline or diesel fueled vehicle. Staff agrees that the emissions from employee commuting is less than that of a heavy duty truck emissions, but is still NOx and PM emissions that can be reduced and are present at warehouses.

Response to Comment 9-9

There are many different business relationships between warehouse operators and trucking companies. 3rd parties may be able to provide a service in some instances that can earn WAIRE

⁵⁶ <https://cleanairactionplan.org/documents/final-dravage-truck-feasibility-assessment.pdf/>, Accessed 2-28-21

⁵⁷ <https://cleanairactionplan.org/documents/2018-draft-dravage-feasibility-assessment-public-comments.pdf>, pg. 17 Accessed 2-28-21

⁵⁸ https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

Points for an operator. Depending on the nature of the relationship, WAIRE Points could potentially be earned from the acquisition of trucks by a third party (if it is dedicated to a warehouse operator) from the WAIRE Menu, or through some other arrangement that would be detailed in a Custom WAIRE Plan.

Response to Comment 9-10

Both industry and utility stakeholders provided feedback that ZE charging infrastructure projects often can take more than one year to complete. In order to account for these delays and not penalize facilities that are making meaningful progress towards a goal, the milestone steps of equipment purchase, beginning construction, and construction finalization were incorporated into the WAIRE Program. Most WAIRE Points are earned upon completion of the project. As stated in previous comment responses, PR 2305 is a facilitative measure and though the installation of infrastructure does not directly result in emission reductions, it does facilitate reductions from other related rules and regulations and promote usage of ZE trucks and equipment. See Response to Comments 9-5.

Response to Comment 9-11

All comments received are taken into full consideration and appreciated as they help guide the development of the proposed rule.

Response to Comment Letter #10 - WPGA– Other General Comment -2/12/20

Response to Comment 10-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 10-2

Staff agrees that NOx reductions from mobile sources have a significant impact within the South Coast Air Basin (SCAB), especially to disadvantaged communities surrounding warehouse uses, and the warehouse ISR would help address these impacts.

Response to Comment 10-3

The primary purpose of PR 2305 is regional and local NOx and PM reductions to assist in attainment of the federal ozone standard and reduce disproportionate impacts on the communities surrounding warehouses. Greenhouse gas reductions would result as a collateral benefit reduced diesel use and the increased usage of renewable fuels. The current WAIRE Menu only includes NZE technology for truck acquisition and use. However, NZE yard trucks using renewable fuels can be submitted as a Custom WAIRE Plan submission, and can earn points upon approval. Additionally, NZE technology including propane will be part of the alternatives section of the CEQA analysis, which will be available for South Coast AQMD Board members to review and consider.

Response to Comment Letter #11 - Lion Electric April 9,2020

Response to Comment 11-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 11-2

Staff has researched various sources including the CARB's analysis on ZE costs as they developed their Advanced Clean Truck (ACT) and Low NOx Omnibus regulations. Additionally, staff is aware that costs are continually adjusting in response to decreasing battery costs and availability of technology. However, staff is aware that several truck manufacturers are still in their demonstration phases and have not reached Technology Readiness Level 9 (TRL-9) such that initial price quotes may be higher. The ZE Class 8 truck costs used in the analysis on the WAIRE Menu Technical Report are attributed to the costs in the CARB analysis, and are viewed as being representative and consistent with the ACT regulation. As stated in your comments, there are options on battery size and range which would impact the costs, but these are specific to each fleet or warehouse operator choosing to purchase ZE trucks to satisfy their WPCO. Many business models use a leasing approach for truck acquisition which would further lower costs and is allowed in the WAIRE Program. Staff notes your comment regarding incremental price, and is continuing to monitor changes in the pricing.

Response to Comment 11-3

The WAIRE Points for the ZE Class 8 trucks were calculated using the costs stated in the CARB analysis for the ACT regulation. Staff understands that there are options in battery size and leasing options which may make the acquisition costs less or more depending on the preference and needs of the warehouse operator. ZE trucks are provided additional WAIRE Points due to their higher costs relative to NZE trucks, and this may be a motivating factor for some warehouse operators.

Response to Comment 11-4

The addition of new ZE truck offerings is welcome. A useful list of ZE trucks (including from the commenter), along with their expected commercial availability is maintained at the website below:

<https://globaldrivetozero.org/tools/zero-emission-technology-inventory/>

Response to Comment 11-5

With regard to the "midlife costs", the source document was CARB's ACT Total Cost of Ownership (TCO) Discussion which presents the "midlife costs" to be the potential to replace a battery should it fail. The 12-year truck life an assumption used in several models, and many manufacturers have warranties that range from 8-12 years with options of extending the warranty. Because different truck manufacturers, and truck operator use cases, will result in different lengths of battery life, the assumption from CARB's ACT analysis was used as a default for purposes of developing the number of WAIRE Points for ZE trucks.

Response to Comment 11-6

The proposed approach of increasing the WAIRE Points for ZE and NZE truck visits is included to encourage operators to choose this option as it is the largest source of emissions associated with warehouses. The commenter's proposed difference between NZE and ZE trucks has not

been included however as the distinctions between those two technologies has already been considered in relation to their relative cost and emission reductions of NOx and DPM.

Response to Comment 11-7

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter #12 – Moreno Valley – Draft Technical Document -4/30/2020

Response to Comment 12-1

The WAIRE Menu Technical Report includes many complex analyses in order to simplify the analysis that warehouse operators will need to do when complying with PR 2305 should it be approved by the South Coast AQMD Governing Board. After determining their annual truck trips, warehouse operators will only need to reference the WAIRE Menu (Table 3 of PR 2305) to provide the number of WAIRE Points each action would earn in order to meet their Warehouse Points Compliance Obligation (WPCO).

Response to Comment 12-2

PR 2305 defines the mitigation fee to be \$1000 per WAIRE Point, and is meant to be within a similar range of cost as the other WAIRE Menu options and is not meant as a way to avoid PR 2305's objective to reduce emissions of NO_x or PM. At the current cost of the mitigation fee there are cheaper options for the warehouse operator to meet their WPCO such as NZE or ZE truck visits, and more expensive options such as the installation of a hydrogen fueling station that could be beneficial to the warehouse operator's business model. Each warehouse operator will decide the correct approach for their operations in any year, however the mitigation fee is not expected to be the most cost-effective approach in most cases as it does not allow a warehouse operator to make early investments that can earn WAIRE Points at a cheaper level in future years through usage of the investments.

Response to Comment 12-3

Elements in the WAIRE Program such as the stringency and phase-in schedule had not been defined at the time City of Moreno Valley drafted this letter. The commenter is directed to the current draft of PR 2305 and the Final Staff Report for the details and analysis requested. PR 2305 has been revised since the date this comment letter was submitted, the recommended stringency is 0.0025 WAIRE Points per WATT with a phase-in of 3 years. The current version of PR 2305 states the recommended stringency to equal 0.0025 WAIRE Points per WATT. The annual variable listed in the WPCO equation corresponds to the three-year phase-in of the stringency as listed in PR 2305, Table 2.

Response to Comment 12-4

The latest draft of the WAIRE Menu Technical Report is included in the Final Staff Report for review, and will not be finalized unless the Board approves the proposed rule.

Response to Comment 12-5

Staff has included commenter on the notice list for updates on the rulemaking process for PR 2305, including updates to PR 2305 and availability of related documents such as the Socioeconomic Impact Assessment.

Response to Comment 12-6

Thank you for bringing this to South Coast AQMD Staff attention. The link has been fixed.

Response to Comment 12-7

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment Letter #13 – CCAEJ - May 1, 2020

Response to Comment 13-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. Comments made throughout this group of stakeholders have shaped the rule in many meaningful ways, including pivoting away from a credit-trading program, more explicit focus on individual actions of every warehouse at their facility and in their communities, and consideration of diesel PM as an integral part of the rule. However, many other stakeholders also have an interest in the development of this rule and their concerns are also considered, as well as the limitation of South Coast AQMD's unique authority in relation to mobile sources. Responses to specific comments in this letter are included below.

Response to Comment 13-2

The commenter's continued interest in ZE-only solutions is recognized and understood. While ZE technology solutions are ultimately needed, in the next several years NZE technologies are expected to be considerably more cost-effective in reducing NO_x, while also eliminating Diesel PM. The calculation of WAIRE Points for each WAIRE Menu item is based on the cost and emission reductions of NO_x and DPM relative to conventional diesel technologies. Hence ZE technologies result in higher WAIRE Points for acquisition (due to higher cost), but nearly identical WAIRE Points for visits (due to nearly equal emission reductions). For any warehouse operators who choose NZE options, their investments are not anticipated to be stranded assets as the transition to full ZE technologies is not anticipated by CARB in their most optimistic scenarios until 2045. This timeline allows a full useful life (between about 13-18 years) for NZE trucks for about the next decade.⁵⁹ Given the higher cost of ZE technologies, NZE technologies are included as an option to provide near-term cost-effective benefits until ZE technologies are more widely available commercially, and at cost-competitive levels.

Response to Comment 13-3

The commenter states that ZE truck emission reductions are underestimated, but does not cite any evidence in support of this statement. The analysis included in the WAIRE Menu Technical Report describes the standard emission factors from CARB's EMFAC model to calculate emission reductions from both ZE and NZE technologies. The commenter further states that the assessment that DPM emission reductions are the same between ZE and NZE technologies is incorrect, however no evidence is cited. NZE trucks are defined as those meeting CARB's lowest optional NO_x standard (currently 0.02 g/hp-hr). There are currently no diesel fueled trucks that meet this standard, and alternative fueled engines (like natural gas) are the only fuel available. By definition, Diesel Particulate Matter (DPM) is the particulate matter emitted from diesel fueled internal combustion engines.⁶⁰ Since trucks that meet the definition of NZE are not diesel-fueled, they do not emit DPM.

Response to Comment 13-4

Staff used several sources from the California Air Resources Board, the North American Council for Freight Efficiency, and the Feasibility Assessment for Drayage Trucks conducted by the Port of Los Angeles and Port of Long Beach to determine the total cost of ownership for trucks. These considered the 12-year useful life of trucks, fuel costs, fuel economy, lifetime maintenance costs, midlife costs, registration fees, and residual value of the trucks to calculate the WAIRE Points

⁵⁹ <https://ww2.arb.ca.gov/resources/documents/2020-mobile-source-strategy>

⁶⁰ <https://ww2.arb.ca.gov/sites/default/files/classic/toxics/dieseltac/finexsum.pdf>

attributed to the cost of the truck visits. However, it is worthwhile to report that since many ZE trucks are not yet commercially available the actual price of a Class 8 ZE truck cannot be accurately predicted.

The commenter cites a study⁶¹ by the Union of Concerned Scientists (UCS) that states that ‘***With California’s policies and incentives***, however, the total cost of ownership is lower than diesel today for 19 of 20 vehicle scenarios examined in the three studies’. The analysis included in the WAIRE Menu Technical Report does not take into account how any incentives programs could reduce costs. As an example, in the case of ZE Class 8 trucks this could include \$120,000 from the HVIP Program.⁶² The HVIP Program currently includes \$25 million in funding for all vehicle categories it covers throughout the state.⁶³ Even assuming that all funding were dedicated to South Coast AQMD Class 8 trucks going to warehouses, that would incentivize only 250 trucks. The number is expected to be considerably less because funding is for the entire state, and for many use cases unrelated to warehousing (e.g., transit buses). For comparison, in the Final Staff Report a scenario analysis focused on a Class 8 ZE truck-only compliance approach (Scenario 5). This analysis found that in Year 2 (the first year that Class 8 trucks are expected to be available), approximately 6,000 visits per day would be needed across the entire universe of PR 2305 warehouses to meet the collective compliance obligation. With the proposed phase-in of the rule, by Year 5 the number of visits per year would increase to about 14,000 visits per day. The level of incentive funding available is clearly not available to cover this number of trucks. Because of that, as shown in the UCS study, non-incentivized ZE trucks today are significantly more expensive to purchase, and also more expensive over time compared to their diesel counterparts (see Figures 8 and 9 from that study). While this dynamic is anticipated to change in the future due to declining battery costs, in the near term ZE technologies are not the most cost-effective option to reduce emissions. However, because warehouse operators do not need to report their costs as part of compliance with PR 2305, as those costs decline the technology is expected to become more popular due to the higher WAIRE Point totals relative to NZE counterparts.

Response to Comment 13-5

The commenter’s claim that NZE trucks are powered by natural gas are correct. The commenter also states that there are burdens of natural gas infrastructure on communities, however the claim is vague, and it is uncertain what level of impact there is. Every natural gas fueled truck brought into service due to PR 2305 will provide a 90% reduction in NOx and an elimination of Diesel PM in the communities around warehouses.

Response to Comment 13-6

⁶¹ <https://www.ucsusa.org/sites/default/files/2019-12/ReadyforWorkFullReport.pdf>

⁶² <https://californiahvip.org/vehicle-category/heavy-duty/>

⁶³ As a point of comparison, since 2017, about \$105 million of funding has been provided for all on-road vehicles in South Coast AQMD, about \$35 million per year.

<http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/combine-hd-trucks-carb-biz-aqmp-presentations-1-26-21.pdf#page=69>

The commenter states that natural gas technologies have negative climate and health impacts and cites to a study from the European Federation⁶⁴ as support. The natural gas engines and fuels studied in that report are not equal to natural gas engines or fuels that are certified as NZE by CARB. A study conducted by UC Riverside⁶⁵ and the certification executive order by CARB⁶⁶ both verify that natural gas NZE trucks have at least 90% lower NOx emissions than diesel counterparts. Further, after factoring in the respective amounts of renewable fuels used in the state, the carbon intensity of natural gas used in transportation is about 52 g CO₂e/MJ, whereas diesel fuel is about 90 g CO₂e/MJ, representing a reduction of about 45% for natural gas trucks.⁶⁷ Therefore, greenhouse gas emissions and NOx emissions are significantly lower for NZE trucks than their diesel counterparts that they would replace if they were used as a compliance option for PR 2305.

Finally, the proposed stringency and phase-in schedule of the rule has been established since the comment letter was written. This proposed stringency is 0.0025 WAIRE Points per WATT, which would result in approximately a 10-15% reduction in NOx emissions, and approximately equal reductions in Diesel PM. While the reduction of greenhouse gas emissions is an important goal, it is not one of the objectives of this proposed rule. The objective of this rule is the reduction of these criteria pollutant emissions in order to assist in meeting federal and state air quality standards, to facilitate emission reductions in other programs, and to provide public health benefits to communities around warehouses. The proposed rule will meet all of these objectives.

Response to Comment 13-7

Staff understands that key information regarding stringency, the annual variable, and points were still under development in the version of the draft PR 2305 when these comments were provided. The current draft of PR 2305 states the recommended stringency to equal 0.0025 WAIRE Points per WATT. The annual variable listed in the WPCO equation corresponds to the three-year phase-in of the stringency as listed in PR 2305, Table 2.

Impacts of air pollution on communities surrounding warehouses are considered in the structure of the WAIRE Points themselves. WAIRE Points for each WAIRE Menu item were determined by calculating the NOx emission reductions (which affects regional air pollution) as well as Diesel PM emission reductions (which affects regional and local air pollution), and the cost. Further, all warehouse operators must take actions themselves that reduce emissions or facilitate emission and exposure reductions in the communities near their warehouses. This approach will necessarily benefit disadvantaged communities as about 85% of warehouses are in communities that are in at least the worst 70th percentile as determined with the CalEnviroScreen tool (see Figure 4 of the Final Staff Report for a map). Because of the high overlap between the vast majority of warehouses and communities with pollution burdens, the most practical approach to reduce these impacts is to ensure that all warehouse operators must take actions to benefit their local communities.

⁶⁴

https://www.transportenvironment.org/sites/te/files/publications/2019_09_do_gas_trucks_reduce_emissions_paper_EN.pdf

⁶⁵ https://ucrtoday.ucr.edu/wp-content/uploads/2018/08/CWI-LowNOx-12L-NG_v03.pdf

⁶⁶ https://ww2.arb.ca.gov/sites/default/files/classic/msprog/onroad/cert/mdehdehdv/2020/cummins_hhdd-ub_a0210711_11d9_0d02_ng.pdf

⁶⁷ <https://ww3.arb.ca.gov/fuels/lcfs/dashboard/dashboard.htm>

Finally, in order to ensure that any limited transferring of WAIRE Points that may occur under the rule does not disproportionately affect local communities, any WAIRE Points transferred from a different location are discounted by the number of WAIRE Points associated with local benefits from Diesel PM reductions.

Response to Comment 13-8

The recommended stringency of 0.0025 WAIRE Points per WATT was analyzed using 18 scenarios that assumed all 2,902 of the warehouses that needed to earn WAIRE Points chose one WAIRE Menu option or a specific combination WAIRE Menu options scenario. Based on the analysis, the range of potential NOx reductions from PR 2305 is ~2.5 - 4 tons per day above the NOx reductions the current CARB regulations would provide. The PR 2305 reductions would also result in immediate reductions toward the 2023 and 2031 attainment goals, and provide emission reduction and public health benefits to communities around warehouses.

Response to Comment 13-9

The term “Sensitive Receptor” was not used in the draft rule language. However, sensitive sites are listed out in the WAIRE Menu (Table 3 of PR 2305) for possible locations to install minimum efficiency reporting value (MERV) 16 or greater filters filter systems or replace MERV 16 or greater filters. Warehouse facilities can earn WAIRE Points by implementing community benefits, (e.g., filter system installations) to satisfy the warehouse operator’s WPCO. Installation of MERV 16 or greater filter systems or replacement of MERV 16 or greater filters at sensitive sites with high risk levels such as residences, schools, daycares, hospitals and community centers are intended to provide a local health benefit to communities surround a warehouse by reducing community exposure and emission impacts.

Response to Comment 13-10

Onsite resting areas for workers or truck drivers were not included in the WAIRE Menu, as default values for costs, NOx reductions, or Diesel PM reductions can vary from warehouse to warehouse. However, warehouse operators could propose a project of a designated onsite rest area for workers and truck drivers as a Custom WAIRE Plan application which would be evaluated based on the requirements listed in PR 2305. If the Custom WAIRE Plan is approved, this approach could earn the warehouse WAIRE Points toward the WPCO.

Response to Comment 13-11

The mitigation fee is not designed as a “pay to pollute” alternative. The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as implementing the other WAIRE Menu options in any one year for a warehouse operator. Through time, the mitigation fee is expected to be a more expensive option if warehouse operators don’t take additional actions as early investments within the rule result in later cost savings, and lower emissions. The mitigation fee is proposed to be consistent across all warehouses similar to how the stringency of the rule is consistent across all warehouses. The proposed stringency could result in mitigation fees up to about \$195,000 per year for a ‘typical’ 250,000 square foot warehouse with average levels of truck traffic, and whose operator takes no additional actions, such as encouraging or tracking any NZE or ZE trucks visiting their site.

Response to Comment 13-12

With the WAIRE Program being such a new concept, it is difficult to estimate how many warehouse operators will choose to pay the mitigation fee and how much those mitigation fee

funds will total. The proposed rule language includes equal requirements regardless of warehouse location. This was done in part because about 85% of warehouses are in communities that are in at least the worst 70th percentile as determined with the CalEnviroScreen tool (see Figure 4 of the Final Staff Report for a map). Because of the high overlap between the vast majority of warehouses and communities with pollution burdens, the most practical approach to reduce these impacts is to ensure that all warehouse operators must take actions to benefit their local communities. This rationale for equal application of the rule across all warehouses, also supports the regional need for emissions reductions to meet state and federal air quality standards.

The WAIRE Mitigation Program that would be established if PR 2305 is approved will focus on funding NZE and ZE trucks and ZE charging and fueling infrastructure in the communities around the warehouses that paid the fee. A short description of the proposed program is included in the Final Staff Report at the end of Chapter 2. Additionally, more specific requirements will be included for the Board's consideration in the resolution that would be adopted if they approve PR 2305.

Response to Comment 13-13

PR 2305 does not include onsite generation, distributed energy resources or battery energy storage in the WAIRE Menu. However, the commenter is correct that these options could support the grid and warehouse operators could submit a Custom WAIRE Plan application that includes these options, and if approved the warehouse operator may earn WAIRE Points for those Custom WAIRE Plans.

Response to Comment 13-14

As suggested by the commenter, the socioeconomic analysis will include an analysis of monetized health benefits of the rule as well as potential job gains and losses due to the proposed rule.

Response to Comment 13-15

The impact of air pollution on communities near warehouses is an important consideration, along with the added burden of COVID-19. The proposed rule is anticipated to go before the South Coast AQMD Board for its consideration on May 7, 2021.

Response to Comment Letter #14 - IBEW & NECA

Response to 14-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to 14-2

The WAIRE Menu does include ZE charging and fueling infrastructure and solar panel systems. WAIRE Points may be earned for solar panel system installation and usage, the WAIRE Points calculation considered the costs of the solar panel system, and the emission reductions that can be gained by offsetting the electricity demand that would otherwise have been generated by a local natural gas fired power plant. The options on the WAIRE Menu will result in NOx and PM emission reductions, facilitate the implementation of other related rules and regulations, and promote the integration of cleaner technologies by warehouse operators. Additional onsite distributed energy resources such as onsite stationary battery systems can also be included in a Custom WAIRE Plan.

Response to 14-3

Although the proposed project labor standards suggested by the commenter are not included within the proposed rule, labor standards are being developed for the Board's consideration as part of the proposed WAIRE Mitigation Program. These could include using a skilled and trained workforce as defined in Public Contract Code section 2601 to perform such work. In addition, any recipients of WAIRE Mitigation Program incentives or funding for the installation of electric vehicle infrastructure could be required to comply with the Public Utilities Code section 740.20, subdivision (2) requirement that at least 25 percent of the total electricians working on an electric vehicle infrastructure project, at any given time, hold Electric Vehicle Infrastructure Training Program certification.

Response to 14-4

The optional mitigation fee of \$1000 per WAIRE Point is an optional compliance option to meet the WPCO, in addition to choosing options off the WAIRE Menu or submitting a Custom WAIRE Plan application. The optional mitigation fee is set to be consistent with the level of implementation of other options with the WAIRE Menu. The proposed stringency could result in mitigation fees up to about \$195,000 per year for a 'typical' 250,000 square foot warehouse with average levels of truck traffic, and whose operator takes no additional actions, such as encouraging or tracking any NZE or ZE trucks visiting their site. Those actions could significantly reduce or eliminate any mitigation fees paid. All options of compliance with PR 2305 will potential have both positive and negative jobs impacts. The analysis of these impacts will be included in the Socioeconomic Impact Assessment.

Response to 14-5

PR 2305 is designed to work with other state and local regulations and policies, including the ports' proposed Clean Truck Rate. Trucks that go to the port commonly end up at a PR 2305 warehouse, and trucks that comply in one program will be able to comply in the other. Further, potential incentive funding provided by mitigation programs from both PR 2305 and the Clean Truck Rate program are expected to go towards the same pool of trucks.

Response to Comment Letter #15 Lineage Logistics – Draft Technical Document

Response to Comment 15-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. The comments and dialogue throughout the rulemaking process have resulted in improvements to the proposed rule.

Response to Comment 15-2

Potential economic impacts of PR 2305 and PR 316 will be analyzed and available for public review in the socioeconomic report. A supporting study conducted by IEC and commissioned by South Coast AQMD found that the warehousing industry in the region is robust (similar to the LAEDC study cited by the commenter). The IEC study found that the proposed rule would not result in any relocation of warehousing outside of South Coast AQMD. Further, the significant growth in warehousing is not projected to decline and potential impacts to industry take this growth into account.

Response to Comment 15-3

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 15-4

The commenter points out the importance of the underlying calculation in the Technical WAIRE Menu Report. This report was provided to stakeholders early in the process to solicit feedback due to its importance in establishing the WAIRE Points system.

Response to Comment 15-5

PR 2305 does not prohibit the use of incentive funds. Individual incentive funding programs themselves each have their own prohibitions, including how those funds can or cannot be used to comply with regulations. Warehouse operators are encouraged to use incentive funds to lower the purchase costs if allowed by the incentive program. Warehouse operators (and owners who opt in) should consult with the incentive programs they are seeking funding from to ensure funds can be used with PR 2305, should it be approved by the Board.

Response to Comment 15-6

The commenter correctly characterizes how WAIRE Points may be earned for specific milestones for the installation of ZE charging infrastructure. Other infrastructure projects in the WAIRE Menu do not include these milestones due to their expected quicker delivery times, including for solar and hydrogen fueling. For more complex projects that might be carried out that are not included in the WAIRE Menu, a Custom WAIRE Plan application would need to be submitted and approved before Points could be earned. This Custom Plan could include specific milestones similar to those described for ZE charging infrastructure, if appropriate for the project that is proposed.

Response to Comment 15-7

The rates shown include full demand charges and time of use schedules to the extent they are available. SCE has not yet established the demand charges it may apply in the future for TOU-EV-9, and an estimate would therefore be speculative. Different utilities had different tariff schedules and different rates, however an approximate average scenario and cost was used to calculate the WAIRE Points attributed to the WAIRE Menu options. Due to the variation in demand charges overlaid on time of use costs, there can be a wide range in potential monthly costs. However, the warehouse operator may have some flexibility as they can potentially time their charging to lower their costs. Finally, potential Low Carbon Fuel Standard revenue was not included in any estimates. These revenues can be substantial, (above \$0.10/kWh), reducing costs potentially more than half.

Response to Comment 15-8

In part due to comments received from this stakeholder, PR 2305 was modified to include the option for warehouse owners and operators to propose a Custom WAIRE Plan to comply with PR 2305 (see PR 2305, Section (d)(4)). A Custom WAIRE Plan contains actions not included in the existing WAIRE Menu, which warehouse owners and operators can propose to meet their WPCO. In order to achieve WAIRE Points, warehouse owners and operators must show how a proposed Custom WAIRE Plan will achieve quantifiable, verifiable, and real NOx and DPM emission reductions, and meet all the requirements as outlined in PR 2305 Section (d)(4). Thus, a Custom WAIRE Plan provides opportunities to pursue flexible solutions to comply with PR 2305, and accommodate new developments in technology. WAIRE Points may only be earned from approved Custom WAIRE Plans.

Response to Comment 15-9

Staff understands the importance of backup generation systems in warehouse operations, particularly those for cold storage warehouses that must use electricity to maintain certain temperatures. There are no back up generation systems listed in the WAIRE Menu, however if there are existing non-alternative fueled back up generation systems that could reduce emissions relative to diesel fueled engines, then a Custom WAIRE Plan application could be submitted and implemented to earn WAIRE Points if approved.

Response to Comment 15-10

Cold storage warehouse facilities are significant users of electricity and can reduce air pollutant emissions from fossil fueled power plants via reduced power consumption and energy generation choice. The proposed methods to reduce onsite electricity consumption is best addressed as a Custom WAIRE Plan, which would need to be approved prior to being able to earn any WAIRE Points. The Custom WAIRE Plan approach was included in part due to suggestions like those made in this comment to allow flexibility for warehouse operators to take actions unique to their facility.

Response to Comment 15-11

PR 2305 has been revised since the date of this comment letter; the most recent version of PR 2305 no longer includes battery storage as a WAIRE Menu action. However, onsite energy storage systems, including the type proposed by the commenter can be included in a Custom WAIRE Plan application. A Custom WAIRE Plan contains actions not included in the existing

WAIRE menu, which warehouse owners and operators can propose to meet their WPCO. Thermal flywheeling could be included in a Custom WAIRE Plan, provided it meets all PR 2305's requirements as outlined in Section (d)(4) of PR 2305's rule language.

Response to Comment 15-12

PR 2305 includes the option for warehouse owners and operators to propose a Custom WAIRE Plan to comply with PR 2305 (see PR 2305, Section (d)(4)). A Custom WAIRE Plan actions and investments would include actions to reduce emissions that are not included in the existing WAIRE Menu, and that go above current regulatory requirements. Warehouse owners and operators can propose a Custom WAIRE Plan that is specific to their warehouse, and once the Custom WAIRE Plan is approved WAIRE Points could be earned to meet the warehouse operator's WPCO. In order to achieve WAIRE Points, warehouse owners and operators must show how a proposed Custom WAIRE Plan will achieve quantifiable, verifiable, and real NOx and DPM emission reductions, and meet all the requirements as outlined in PR 2305 Section (d)(4). Thus, a Custom WAIRE Plan provides opportunities to utilize new or newly affordable solutions to comply with PR 2305.

If PR 2305 is approved, South Coast AQMD staff anticipates bringing annual status reports to the Mobile Source Committee to discuss implementation of the WAIRE Program. If technologies have progressed substantially beyond the currently proposed WAIRE Menu items, staff will seek direction from the Board on future steps during these updates.

Response to Comment 15-13

The WAIRE Program was designed to be simple and allow for flexibility. The commenter's suggestion in this comment is reflected in the modification to the proposed rule that now allows for Custom WAIRE Plans to earn WAIRE Points upon approval. The methodology for calculating WAIRE Points in a Custom WAIRE Plan is outlined in the WAIRE Program Implementation Guidelines, as included with the Final Staff Report (see PR 2305, Section (d)(4) for all Custom WAIRE Plan requirements).

Response to Comment 15-14

The WAIRE Program was specifically designed not to be a crediting system, to ensure maximum actions in communities near warehouses. The original approach in PR 2305 included a crediting and trading scheme, however many stakeholders opposed this approach. They also noted that South Coast AQMD was winding down its RECLAIM cap-and-trade program due in part to concerns that local communities around facilities were not experiencing sufficient levels of emissions reduction. At that time the proposed crediting-trading rulemaking approaches being explored that were similar to the suggestion by the commenter were scrapped in favor of the current menu-based points system. Limited transferring of points is still allowed to provide some flexibility, however only in instances of overcompliance in any one compliance year.

Response to Comment 15-15

The commenter lists three potential mechanisms to allow additional trading of WAIRE Points within PR 2305. See Response to Comment 15-14. In addition, the commenter suggests that hypothetically additional emission reductions could be achieved with more flexibility in trading,

however no specific examples are provided. It is therefore unclear as to whether any additional emission reduction would occur. In addition, the added level of complexity proposed by this comment would pose significant administrative burden on South Coast AQMD and the regulated community, and would likely be confusing to the public. For all these reasons, the proposed suggestions have not been included in PR 2305.

Response to Comment 15-16

CARB's proposed TRU regulation has been modified since the comment letter was submitted.⁶⁸ The current CARB concept will focus on ZE TRU trucks (instead of trailers). A later regulation may focus on ZE trailer TRUs, however that rulemaking is not expected until at least 2023. One potential overlap between CARB's current proposal for ZE TRU trucks and PR 2305 relates to the phase-in schedule for fleets. In one case, if a warehouse operator owns a fleet of TRU trucks and submits a Custom WAIRE Plan to convert that fleet to ZE, the implementation schedule in the Custom Plan would need to show early and/or extra compliance beyond CARB's requirements. For example, CARB is currently proposing fleets to turn over 15% of their trucks to ZE TRUs per year starting at the end of 2023. If a Custom Plan included a transition of 20% per year, then the additional 5% could earn WAIRE Points. As a different example, if CARB does not require TRU charging infrastructure to be used, then any kWh of electricity dispensed from TRU plugs at a PR 2305 warehouse could earn WAIRE Points. The specifics of CARB's proposed rule will ultimately determine any potential overlap with PR 2305 if both rules pass. South Coast AQMD staff will continue to coordinate with CARB staff to ensure that there is a common understanding of each other's programs.

Response to Comment 15-27

PR 2305 has been revised since this comment letter date; the most recent version of PR 2305 uses a reporting metric for use of onsite ZE charging or fueling infrastructure of kilowatt-hours (kWh) of dispensed electricity, without referring CARB requirements in the Menu.

Response to Comment 15-28

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

⁶⁸ <https://ww2.arb.ca.gov/sites/default/files/2021-01/Informational%20Document%20on%20Changes%20to%20TRU%20Rulemaking.pdf>

Response to Comment Letter #16 – CTA – Draft Technical Report - 5/8/2020

Response to Comment 16-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 and PR 316 have been developed within South Coast AQMD's legal authority and care has been taken to ensure industry's concerns have been taken into account. Further, the changes in response to the COVID-19 pandemic have also resulted in significant public health impacts, including from air pollution from the increased movement of goods in our region.

Response to Comment 16-2

South Coast AQMD Staff understand that COVID-19 has had a significant impact on the economy, employment, and specifically the trucking industry. Since the receipt of this comment letter, the Ports of Long Beach and Los Angeles have recorded record volumes and have significantly exceeded their capacity to handle more goods movement, with up to 62 ships anchored awaiting entrance into the Ports.⁶⁹ At the same time, the industrial warehouse real estate market shows continued strength, even while other commercial real estate sectors have been affected by the pandemic.⁷⁰ While many sectors of the economy were significantly impacted early in the pandemic, some have rebounded dramatically, in particular in goods movement. For example, the DAT Load-to-Truck Ratio cited by the commenter showed a decline from 4.9 to 1.3 in the early part of the pandemic, but has since rebounded to a level of 10.9 in February 2021.⁷¹

Undoubtedly there are significant economic impacts of the pandemic. While unemployment spiked early at almost 15%, it quickly dropped and is now about 6%.⁷² However, the goods movement industry overall has shown significant demand in the South Coast AQMD region and the resulting activity is both expected to continue and to have resulted in increased emissions associated with warehouses.

Response to Comment 16-3

The commenter is correct that the Carl Moyer Guidelines use a 20x weighting factor for PM reductions. PR 2305 looks at Diesel PM, which is both a contributor to regional particulate matter emissions as well as a toxic air contaminant. Particulate matter emissions are an important consideration as the South Coast AQMD is in serious non-attainment for PM_{2.5}, and Diesel PM is also a toxic air contaminant that is the largest contributor of air toxics cancer risk in our region.

⁶⁹ <https://www.freightwaves.com/news/62-ships-at-anchor-in-san-pedro-bay-on-wednesday>

https://connect.allenmatkins.com/hubfs/Anderson%20Forecast/Winter%202021/AMCRES_Winter_2021.pdf?hsCtaTracking=9cbedffc-5a28-4951-a7e1-255393bef5e5%7Ccecf4503-3ced-43f9-9cd2-36f68c0ac76e

⁷¹ <https://www.dat.com/industry-trends/trendlines/van/demand-and-capacity>

⁷² <https://www.bls.gov/news.release/pdf/empisit.pdf>

Diesel PM affects communities around warehouses more than those living farther away, and stakeholder concerns were continually expressed during rulemaking working group meetings, and in AB 617 community meetings and Community Emission Reduction Plans (CERPs).

Response to Comment 16-4

In part due to this comment, PR 2305 now includes the option for warehouse owners and operators to propose a Custom WAIRE Plan to comply with PR 2305 (see PR 2305, Section (d)(4)). A Custom WAIRE Plan contains actions not included in the existing WAIRE Menu, which warehouse owners and operators can propose to meet their WPCO. The analysis of the Custom WAIRE Plan applications mirrors the analysis conducted on the WAIRE Menu actions and investments. In order to achieve WAIRE Points, warehouse owners and operators must show how a proposed Custom WAIRE Plan will achieve quantifiable, verifiable, and real NO_x and DPM emission reductions, and meet all the requirements as outlined in PR 2305 Section (d)(4). Thus, a Custom WAIRE Menu provides opportunities to pursue flexible solutions to comply with PR 2305 that can provide a streamlined method to evaluate new and emerging technologies.

Response to Comment 16-5

Due to existing statutory or regulatory prohibitions, most state incentive funding programs used to offset the higher purchase price of zero emission NZE/ZE vehicles and equipment cannot be used to aid in complying with state or federal law or South Coast AQMD rules or regulations.⁷³ In practice, this means that NZE/ZE trucks acquisitions with incentive funding by warehouse operators or owners cannot be used to comply with PR 2305, thus no WAIRE Points can be earned from these acquisitions. However, because PR 2305 requires use of those trucks at specific locations to reduce local emissions, and because PR 2305 does not apply to trucking companies, but rather to warehouse operators, the use of incentivized trucks is not prohibited by incentive programs with a program like PR 2305. Warehouse operators will therefore not be required to determine if a NZE or ZE truck that visits their warehouse is incentivized, and will not be required to determine if any usage is surplus.

Response to Comment 16-6

The statutory authority that PR 2305 relies upon is described in Chapter 1 of the Final Staff Report. South Coast AQMD currently uses a cost effectiveness threshold up to \$100,000 per ton in its Carl Moyer Funding Program. This same level was included as a parameter within the development of the WAIRE Menu, however it is not a requirement within PR 2305. The use of \$100,000 per ton within the development of the Points used in the WAIRE Menu is a mechanism to provide extra WAIRE Points for investments made by a warehouse operator, even though the investment on its own may not result in emission reductions. Also, with PR 2305, instead of investing \$100,000 in whichever WAIRE Menu action made sense to the warehouse operator, the money could be provided to South Coast AQMD as a mitigation fee. South Coast AQMD would then likely fund projects at \$100,000 per ton. By providing WAIRE Points at this level directly to the warehouse operator, they are given more flexibility as to how to make investments. Finally, as shown in Table 27 of the Final Staff Report, some options have cost effectiveness

⁷³ California Health and Safety Codes 44281(b), 44391.4(a), 44271(c), CCR Title 13, Ch. 8.2 Sec. 2353 (c)(4), Moyer Guidelines Ch. 2, CA Beneficiary Mitigation Plan

levels below \$100,000 per ton, while others are higher, highlighting that the \$100,000 per ton is not a requirement within PR 2305.

Response to Comment 16-7

The commenter cites a cost effectiveness of \$3,820 per ton of NO_x for the Truck and Bus Rule, however that rule allowed for trucks to be kept for about 13 years, equal to a full useful life, or where the value of the older truck is significantly reduced. The cost effectiveness of more recent mobile source regulations varies depending on the program, and depending on the timescale chosen. The table below summarizes recent key regulations from CARB and their cost effectiveness through about 2032 (dollars per ton of NO_x). Costs are substantially lower for many of these regulations when considering cost savings that are projected to occur in the 2030s and beyond, however the shorter timeline is compiled here to show a similar end year as for the analysis for PR 2305 (analysis conducted through 2031). The cost effectiveness for various scenarios with PR 2305 as shown in Table 27 of the Final Staff Report is similar to the wide range of values shown in the table below.

CARB Regulation	Approximate Cost Effectiveness (through 2032)
Airport Shuttle Bus	\$430,000/ton NO _x
Innovative Clean Transit	\$271,000/ton NO _x
At Berth (Ocean Going Vessels)	\$83,000/ton NO _x
Low NO _x Omnibus	\$39,000/ton NO _x
Advanced Clean Trucks	\$22,000/ton NO _x

Response to Comment 16-8

PR 2305 is not setting new emission standards as described by the commenter. The legal authority used for PR 2305 is listed in Chapter 1 of the Final Staff Report.

Response to Comment 16-9

South Coast AQMD does not intend to pursue a Section 209 waiver under the Clean Air Act for PR 2305.

Response to Comment 16-10

The effect of recent CARB rules has been included in the analysis in the Final Staff Report as shown in Tables 15 through 18. CARB's development of the META tool as a companion to its Draft Mobile Source Strategy allowed recent CARB rules like the Advanced Clean Truck rule to be subtracted from the EMFAC baseline so that the effects of PR 2305 could be isolated.

Response to Comment 16-11

Adjustments to truck emissions through time have been accounted for in the analysis. See Response to Comments 16-10. Warehouse operators will not need to account for changes in emissions through time, only their WAIRE Points Compliance Obligation.

Response to Comment 16-12

The full details of how calculations were conducted are included in the Final Staff Report as well as detailed companion calculation spreadsheets that were made available online.⁷⁴

Response to Comment 16-13

PR 2305's rule language provides a simple, clear methodology for calculating a warehouse operator's WAIRE Points Compliance Obligation, as well as a simple WAIRE Menu with Points for each action. Warehouse operators are not expected to use the EMFAC model or any other model when complying with PR 2305 using the WAIRE Menu. The purpose of the much more complicated WAIRE Menu Technical Report is to develop as much of the complicated analysis up front during rulemaking so as to provide a streamlined methodology for warehouse operators to comply with PR 2305. Further, if PR 2305 is adopted there will be ample outreach efforts in order to inform warehouse owners and operators of their obligations and the steps that can be made to meet them. Additional guidance on PR 2305 will be provided online and in the WAIRE Program Implementation Guidelines.

Response to Comment 16-14

Deterioration rates are included within the EMFAC model and within the META tool that were used to develop emissions and emission reductions estimates in the Final Staff Report. These modeling tools are the standard used throughout the state to evaluate truck emissions.

Response to Comment 16-15

The purpose of PR 2305 is to facilitate regional NO_x and local DPM emission reductions associated with warehouses and the mobile sources attracted to applicable warehouses in order to assist in meeting state and federal air quality standards for ozone and fine particulate matter. Accelerated fleet turnover and replacing retired vehicles with electric vehicles are possible means to achieve PR 2305 goals. The incremental cost is used as a component in the calculation of the WAIRE Points value of the WAIRE Menu actions and investments, as it represents the additional cost effort that warehouse operators would have to take in order to comply with PR 2305. As part of the analysis of the proposed stringency within PR 2305, the number of new truck sales due to PR 2305 was evaluated relative to baseline new truck sales without PR 2305. This analysis found that in only extreme examples where all warehouse operators chose exactly the same method of compliance (e.g., 4,000 operators all chose to purchase a Class 8 NZE truck) would sales in any one year from PR 2305 exceed baseline levels. With so many operators and so many options for compliance, this extreme outcome is unlikely. Even in this unlikely case, the number of new truck sales varies widely year to year. In the graph below, national new heavy truck sales vary by about 50,000 to 100,000 units every year, out of a baseline of about 400,000 to 500,000 units.⁷⁵ In the most extreme case, up to about 7,600 new trucks beyond normal sales could occur in one year due to PR 2305. This is within the range of variability in any given year. Therefore PR 2305 is not expected to result in early retirement of trucks as normal levels of new truck sales can accommodate the compliance requirements of PR 2305. Even if a warehouse operator did

⁷⁴ <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305-draft-scenario-calculations.xlsm>, <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305-draft-baseline-emission-inventory.xlsx>, <http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305-draft-truck-emission-rate-calculations.xlsx>

⁷⁵ <https://fred.stlouisfed.org/series/HTRUCKSSAAR#0>

purchase a truck earlier than expected, PR 2305 does not have any requirement to scrap a truck, and the vehicle could be sold on the used market, thus retaining the value for the truck owner.

Response to Comment 16-16

The commenter notes that there is wide variability in trucking operations, and homogeneous treatment across the sector results in inconsistencies at the individual level. The use of averages is therefore the most appropriate method to estimate emission reductions precisely because of this variability and the large number of warehouses and truck trips potentially affected by PR 2305. The alternative to using averages in many detailed calculations in the rulemaking analysis is to have all of the warehouse operators calculate their own site specific emissions and submit that to South Coast AQMD for review every year. This approach would be administratively burdensome for warehouse operators and South Coast AQMD, and would not be a good use of resources. Therefore, in order to facilitate a more streamlined approach on the back end for rule compliance, averages that are most applicable to large populations (which applies for the ~4,000 operators subject to PR 2305) are used in calculations at the front end of rulemaking.

Response to Comment 16-17

For off-site investments, the most appropriate action for a warehouse operator is to pursue a Custom WAIRE Plan, which had not been proposed at the time that this letter was written. The warehouse operator can submit a Custom WAIRE Plan application that details specifics on the project, emission reductions, and costs in accordance to the requirements listed in PR 2305 for Custom WAIRE Plan submissions. Off-site actions and investments were not included or evaluated for the WAIRE Menu as it was not possible to calculate default values that any warehouse operator could use to earn WAIRE Points for projects that may be specific to particular warehouses offsite or partnering with other warehouse operators.

Response to Comment 16-18

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #17 - PERC

Response to 17-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to 17-2

The WAIRE Menu includes both NZE and ZE on-road truck acquisition and use, but the WAIRE Menu only includes ZE yard trucks. There are key policy reasons supporting why ZE yard trucks are the only option considered. First, in the on-road sector ZE trucks are not at the same stage of commercial development as NZE trucks, which have been operating in commercial service for several years, especially for Class 8 trucks. However, ZE yard trucks are commercially available today and have been operating at warehouses since 2015. Additionally, because ZE yard trucks are located at an individual facility, they are well-suited to serve as an early beachhead for the longer term development of ZE vehicle solutions.⁷⁶ By focusing PR 2305 on ZE yard trucks, warehouse operators are introduced to ZE technology to see how it works in their operations. Further, because yard trucks primarily stay at the warehouse facility, their emissions can have a disproportionate impact on communities surrounding warehouses compared to on-road trucks with emission miles away from a facility. Many yard trucks idle as part of their operation at warehouse facilities, and the switch to ZE yard trucks would benefit public health of the communities surrounding the warehouse by not being burdened idling emissions. Although NZE engines have lower emissions than their conventional diesel counterparts, they do still have tailpipe emissions. Finally, although the commenter states that NZE yard trucks exist, there is no acknowledgement that yard trucks come in both on-road and off-road varieties. While propane or natural gas on-road yard trucks can meet CARB's standards for NZE, CARB currently does not have a certification standard for NZE off-road purposes. It is not clear how a default NZE definition would apply in the off-road setting. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options (including for yard trucks) within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to 17-3

It is encouraging to see that renewable propane development is being pursued and is emerging as a new fuel source. The reduction of greenhouse gas emissions is an important goal, however it is not one of the objectives of this proposed rule. The objective of this rule is the reduction of these criteria pollutant emissions in order to assist in meeting federal and state air quality standards, to facilitate emission reductions in other programs, and to provide public health benefits to communities around warehouses. While renewable propane may have climate benefits, traditional propane has a carbon intensity almost identical to diesel, and it is not clear how widely available renewable propane is for wide use.⁷⁷

Response to 17-4

Staff appreciates PERC's work in replicating the rule language and analysis on ZE yard trucks to present how NZE yard trucks could be included in both the PR 2305 rule language and the

⁷⁶ https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

⁷⁷ <https://ww3.arb.ca.gov/fuels/lcfs/dashboard/dashboard.htm>

WAIRE Menu. However, given the reasons stated in the previous response to comment regarding the commercial availability of ZE, the operation of ZE yard truck at warehouses for several years, and emission impacts from combustion operations and idling to local communities surrounding warehouses, staff is proposing to maintain the inclusion of only ZE yard trucks in the PR 2305 rule language and WAIRE Menu. And as stated in previous response to comments, NZE technology has been analyzed as an alternative in the CEQA analysis and will be available for consideration by South Coast AQMD Governing Board members. Staff will maintain the comment letter with the provided language and calculations for reference should further analysis be required. Additionally, a supplemental discussion on a NZE alternative will be included as an appendix to the Final Staff Report. Additional responses regarding the submitted materials are included below.

Response to 17-5

The information on the 300 NZE yard trucks ordered is helpful, but additional information about how many of those 300 NZE yard trucks have been certified and delivered, and if the facility installed CNG or propane fueling infrastructure at each of the locations the NZE yard trucks operate as part of the demonstration project. As stated previously, one of the reasons that only ZE yard trucks are present in the WAIRE Menu is that they are an established technology, with some warehouses operating them since 2015. While it is interesting to note that the Port's feasibility study stated that the NZE yard truck feasibility was equivalent to ZE yard trucks, and UCR documented the 90% or greater emission reduction, the remaining emissions would still impact the local community since the yard trucks stay onsite and may at times idle. The PERC provided proposed addition to the WAIRE Menu Technical Document does accurately replicate the analysis performed on ZE yard trucks including the 90% emission reduction of a conventional diesel yard truck for NOx and complete reduction of PM, and the cost analysis. However, the 2018 Feasibility Assessment for Cargo-Handling Equipment referenced analyzes a near-zero LNG internal combustion engine, and not the propane model that is proposed. Though propane may be similar to natural gas such as LNG or CNG, the proposed analysis would be better served if actual emission reductions and costs for propane fuel were used.

Response to 17-10

Staff appreciates the effort PERC has exerted in replicating the analysis and calculation of the ZE yard trucks to provide a similar analysis for NZE yard trucks. However, it should be pointed out that there is a potential difference in that the 2018 Feasibility Assessment for Cargo-Handling Equipment referenced analyzes a near-zero LNG internal combustion engine and CNG or Propane models. Additionally, the propane quick tank replacement system may have additional costs not captured in the LNG yard truck analysis.

Response to 17-11

In reviewing the proposed WAIRE Menu addition of NZE yard trucks, staff observed that the general calculation methodology for the ZE yard truck was duplicated. Staff believes that there may be differences in emission reductions and costs between the LNG values used from the 2018 Feasibility Assessment for Cargo-Handling Equipment versus the costs for CNG or propane. It is not known whether the incremental costs for an LNG yard truck would differ from a CNG or propane yard truck. There were also some minor corrections on the acquisition of NZE yard trucks, as the stated incremental cost of acquisition of \$50,000 when binned results in two WAIRE Points not 3, and there was rounding for the regional NOx benefit binning that resulted rounding 14.2 to 15 which impacted the three times multiplier which resulted in two more

WAIRE Points than should have been attributed to NZE yard truck usage being 288 rather than the staff calculated 286 WAIRE Points.

Response to 17-12

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #18 - CCAEJ -10/8/20

Response to Comment 18-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 18-2

Staff agrees with your assessment that air pollution emitted from indirect warehouses sources (i.e., diesel trucks serving warehouses) contribute to air pollution, and thus negative health impacts, in communities located near warehouses. South Coast AQMD has developed PR 2305 to reduce regional and local emissions of nitrogen oxides (NOx) and particulate matter (PM) associated with warehouses assist meet the federal ozone standards and reduce health risks in the community.

Response to Comment 18-3

The objective of this rule is the reduction of these criteria pollutant emissions in order to assist in meeting federal and state air quality standards, to facilitate emission reductions in other programs, and to provide public health benefits to communities around warehouses. South Coast AQMD acknowledges the commenter's support for ZE technology, and the strategy to phase-out NZE. The current WAIRE Menu reflects many options from which warehouse operators may choose, that utilized CARB's technical documents which reflect NZE having a 90% NOx emission reduction as compared to 100% reduction by ZE technology. Based on the greater emission reductions resulting from ZE trucks, the WAIRE menu reflects more WAIRE Points attributed to ZE trucks and are awarding points for ZE charging and Hydrogen fueling infrastructure investments. Currently, the commercially available options for Class 8 Heavy-Duty trucks remain to be conventional diesel and NZE trucks, with the NZE trucks having an incrementally higher purchase price with an established natural gas fueling infrastructure. Staff acknowledges ZE trucks as emerging from demonstration projects, but with future release dates for commercial availability, and with a still developing infrastructure foundation. As the prevalence of ZE trucks and ZE charging infrastructure develops, staff sees the incremental costs of ZE decreasing lower than NZE and at a time may be even with the cost of conventional diesel technology when ZE technology does become widespread. Based on the current commercial availability, the existing NZE infrastructure, and unknown timeline for ZE trucks and infrastructure staff is recommending keeping NZE on-road trucks on the menu. However, NZE fueling stations are not offered on the WAIRE Menu. The Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 18-4

The WAIRE Menu reflects more WARIE Points attributed to ZE trucks than to NZE trucks and are offering WAIRE Points for ZE charging and Hydrogen fueling infrastructure investments. As mentioned in Response to Comment 18-3, as the prevalence of ZE trucks and ZE charging infrastructure develops, staff sees the incremental costs of ZE decreasing lower than NZE technology, and may even with the cost of conventional diesel technology when the technology become widespread. Based on the current commercial availability, the existing NZE infrastructure, and unknown timeline for ZE truck and infrastructure availability, Staff is

recommending maintaining NZE trucks on the WAIRE Menu, which could be modified in future revisions of PR 2305.

Response to Comment 18-5

The recommended stringency was set after considering many factors including the impacts on emission reductions and public health benefits, modeled availability of trucks to turnover, costs, and the potential for warehouse relocation. The current draft of PR 2305 includes a recommended stringency of 0.0025 WAIRE Points per WATT with a three-year stringency phase-in. This stringency is anticipated to provide about \$3.5 billion in monetized public health benefits over ten years, with 42-49 premature deaths avoided each year, along with additional health benefits (e.g., reduced asthma attacks, etc.).

Response to Comment 18-6

PR 2305 sets the mitigation fee at \$1,000 per WAIRE Point (see PR 2305 section (d)(5)), which is designed to be within the range of the cost of most WAIRE Menu options. The mitigation fee is not meant as a way to avoid PR 2305's purpose of regional and local emission reductions of NO_x and PM. The mitigation fees are meant to be pooled together and subsidize incentives for NZE and ZE trucks or ZE infrastructure to benefit the community surrounding the warehouse that paid the mitigation fee, and staying in the county where the warehouse is located. A short description of the proposed program is included in the Final Staff Report at the end of Chapter 2. Additionally, more specific requirements will be included for the Board's consideration in the resolution that would be adopted if they approve PR 2305.

Response to Comment 18-7

PR 2305 and PR 316 are anticipated to go before the Governing Board for its consideration on May 7, 2021.

Response to Comment 18-9

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #19 - Disneyland Resort – 11/4/2020

Response to Comment 19-1

The applicability of PR 2305 to warehouses greater than or equal to 100,000 square feet of indoor floor space in a single building that may be used for warehousing activities is an applicability that has been revised several times to promote clarity, and adequately capture the population of warehouses that have sufficient warehousing activity that impact the air quality of both the region and the neighboring community of the warehouse. The suggestion of removing “may be” from the applicability cannot be considered because the space used at a warehouse is dynamic and can be modified at any time to accommodate higher product levels, and space can be seasonal to account for the influx of goods movement and storage during the holiday season. Increases in use due to changes in activity or due to seasonal fluctuations results in added truck trip activity which results in added regional and local NOx and PM emissions. Additional clarification has been added however to the definition for ‘warehousing activity’ to ensure that PR 2305 is focused on those kinds of operations.

Response to Comment 19-2

The proposed revision regarding the exemption provision to include a clause regarding “physical limitation” and “self-imposed administrative control” could lead to circumvention of PR 2305 as added physical limitations or self-imposed administrative control can easily be removed at any time by the warehouse operator to adjust to the demands of additional or seasonal changes. Some physical limitations are inherently included in the rule language already in that it already assumes that any permanent physical limitation in a building that prevent warehousing activities in spaces greater than 50,000 sq. ft. The suggestion to include additional language for “physical limitations” and “self-imposed administrative control” cannot be considered as the warehousing industry is dynamic and could adjust the warehouse square footage to accommodate increased demand or seasonal changes for goods storage or movement needs.

Response to Comment 19-3

Template forms will be included as part of the online portal used for reporting that will be developed if PR 2305 is approved by the Board.

Response to Comment Letter #20 - CCAEJ - December 3, 2020

Response to Comment 20-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 20-2

PR 2305 has continually considered the impacts of warehouse operations on local communities, including the AB617 communities. Staff has been engaged with the AB617 Community Steering Committees, and has continued to update them on the progress of the warehouse ISR. In addition, a community workshop was held to better explain an overview of the rule and how it would be a benefit to the local community. Staff prioritized efforts to solicit feedback and comment from the community, as a way to inform revisions to the draft rule and staff's approach to the development of PR 2305. The Final Staff Report in Chapter 1 also notes that several AB 617 CERP's have included reference to PR 2305.

Response to Comment 20-3

The commenter's reference to Agenda Item 5 related to the undersubscription of the VW Mitigation Trust which is in the first year for the program. Part of the reason for the unused incentive funds was that the program was undersubscribed partially due to the incentive funding amounts being set lower, and thus not being competitive with the previously mentioned established incentive programs. The commenter's point that sufficient demand is needed to fully utilize incentive funding is correct. This can occur through mechanisms like higher incentive levels, complementary strategies across different incentive programs, and through other market drivers, such as regulations.

Response to Comment 20-4

Staff agrees that slow progress to meeting federal air quality standards underscores the need for addressing the immediate needs to reduce emissions in the near term to assist in attainment of the 2023 and 2031 federal ozone standards. PR 2305 stems from the 2016 AQMP as a strategy to reduce regional NOx as a way to meet attainment with the federal and state ambient air quality standards. PR 2305 is being developed to reduce mobile source emissions attracted to warehouses toward the immediate federal ozone attainment goals and to facilitate the implementation of other related rules and regulations.

Response to Comment 20-5

COVID-19 has had a dramatic impact on the health of local communities, while at the same time increasing activity in the logistics industry. The consistently low vacancy rates and higher lease rates mentioned by the commenter were analyzed in the development of PR 2305, to help address the disproportionate burden of air pollution in the communities neighboring warehouses and reduce emissions. PR 2305 is fully defined with the recommended stringency and stringency phase-in determined, while analyzing the emission and cost impacts of the stringency on the range of options offered on the WAIRE Menu.

Response to Comment 20-6

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter – 21_SoCalGas

Response to Comment 21-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 21-2

Staff intends to pursue State Implementation Plan (SIP) creditable emission reductions for PR 2305, but the main purpose of the PR 2305 is to reduce regional and local NO_x and PM emission reductions toward our immediate need to meet the 2023 and 2031 federal ozone attainment standards, and to reduce emissions and exposures for local communities. Additional information regarding the proposed approach to obtaining SIP credit for PR 2305 can be found in Appendix D of PR 2305's Final Staff Report. Due to the nature of the proposed rule and the accounting rules from EPA, SIP credit for all of the emission reductions cannot be claimed at time of rule adoption. However, the emission reductions evaluated in the Final Staff Report are expected to be SIP creditable, for example through future updates to CARB's EMFAC tool. The best estimate is that about 2.5 – 4 tpd of NO_x reduction can be achieved by the rule, however continued tracking will be a necessary component to evaluate rule progress if it is approved by the Board.

Staff agrees with the importance of achieving emission reductions as soon as possible to help with our immediate ozone attainment goals for 2023 and 2031. Early action in complying with PR 2305 is beneficial to warehouse owners and operators because complying with PR 2305 will help them complying with other upcoming state regulations such as CARB's Transport Refrigeration Unit (TRU) or the Low NO_x Omnibus regulations. Warehouse operator could purchase new equipment in advance of the CARB regulations in order to earn WAIRE Point for compliance efforts years in advance of the actual implementation dates. In addition, PR 2305 has an early action provision that allows WAIRE Point banking ahead of the WAIRE Program implementation phase in. As an example, a warehouse operator who operates a 150,000 square foot warehouse has an initial compliance period does not start until 2023, but could start earning WAIRE Points as early as January 1, 2022 and the three year banking period would not start until the warehouse officially phases in in 2024. Finally, PR 2305 is designed to be flexible to meet the varied needs of industry, and how those needs can change year to year for any individual facility. Options like solar panels and infrastructure are important components because they can help facilitate emission reductions, and are onsite actions that warehouse operators can potentially take.

Response to Comment 21-3

Staff analyzed the installation of Hydrogen fueling infrastructure separately from electric charging stations due to the inherent differences in the construction and operation of these technologies. However, the analysis of ZE truck acquisitions and usage were calculated together for both electric and hydrogen fuel cell trucks. The lower cost for electric trucks was included in the WAIRE Menu Technical Report with the assumption that warehouse operators will choose the lower cost option. However, if hydrogen trucks make sense for warehouse operators (e.g., by becoming cheaper than electric counterparts), they will receive the same number of WAIRE Points due to the same level of emission reductions. Because emission reductions are one of the

primary goals of PR 2305, no extra WAIRE Points were provided for hydrogen trucks that have the same emissions benefit as electric trucks.

Response to Comment 21-4

WAIRE Points are earned for every truck trip to a facility and annual mileage per truck is not considered. The mileage per trip assumed for trucks is within the range of commercial and pre-commercial ZE trucks (~40 miles per trip for tractors, ~14 miles per trip for straight trucks) and is therefore appropriate for use. While electric trucks do not currently have the range to travel many hundreds of miles, the emissions analysis and WAIRE Points do not assume this is the case, and emission reductions are not overestimated.

Response to Comment 21-5

VMT calculations are impractical for warehouse operators to make in the context of PR 2305 for many reasons. First, trucking companies have expressed concern that they do not want to share where they go with warehouse operators as it can affect business competition. Second, determining how much of a truck load is dedicated to one warehouse's VMT is not clear when a single load could contain goods from or going to multiple destinations. Finally, the administrative burden of tracking this VMT is impractical for a warehouse operator, and for South Coast AQMD to manage for 4,000 warehouse operators subject to PR 2305.

Response to Comment 21-6

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #22 - Tesla - December 16, 2020

Tesla submitted an email with a Word Version of the PR2305 with tracked changes and comments, a subsequent call and conversation was held with Tesla on 01/27/2021.

Response to Comment 22-1

Staff is aware of the different business models of warehouse owners with a number of warehouse operators also owning and operating a fleet. The WAIRE Menu includes actions and investments for NZE or ZE truck visits of Class 2b-7 or Class 8 whether or not the warehouse operator owns the fleet. Based on the analysis of staff, many warehouse operators do not own their own fleet, but can contract with fleets with NZE or ZE trucks. Additionally, if the warehouse operator installed ZE charging infrastructure, the warehouse operator would earn WAIRE Points for the installation and also the usage of the ZE charging infrastructure based on the annual metrics as listed on the WAIRE Menu. At the present time, there are no adopted CARB Regulations that require operating a ZE fleet or installation of ZE charging infrastructure. One of the purposes of PR 2305 is to facilitate other local or regional reductions. Having the ZE truck acquisition and use along with ZE infrastructure installation and use, motivates early action on those other regulations for early adoption of ZE technology. When other regulations require and implement deadlines to electrify their fleets or use ZE chargers, then WAIRE Points would no longer be earned for those actions that no longer go above and beyond U.S. EPA, CARB, or South Coast AQMD rules and regulations.

Response to Comment 22-2

Staff agrees that some charging station stalls will include two plugs, but WAIRE Points will only be earned for the use of one plug, and the installation of an optional plug is not necessary and will not earn additional WAIRE Points. A two plug charging station stall, may increase utilization which would result in more WAIRE Points earned for the increased usage. The definition provided for Electric Charger, is specifically worded for the WAIRE Program menu-based point system concept.

Response to Comment 22-3

Staff agrees with the comment on the defined levels for the range and level of chargers, and has revised the rule to reflect the different ranges of chargers. The charger level references were removed in favor of listing ranges of charger kW ratings, and the 240-volts electric charge rate was included in the Electric Charger definition.

Response to Comment 22-4

The analysis of truck trips assumes a certain number of miles per trip depending on the class of the trucks and if the warehouse is a cold storage facility or not, and also factors in a discounting for overlapping trips. Providing for these factors, a truck trip was assumed to be 39.9 miles. We recognize that some actual trips will be longer, as in the long haul example provided in the comment of 600 miles, and some actual trips will be shorter, but the trip length is assumed to be an average.

Response to Comment 22-5

WAIRE stands for Warehouse Actions and Investments to Reduce Emissions, and is spelled out on the main heading of PR 2305, but not on the header section d. The header for section (d) has been revised to avoid confusion.

Response to Comment 22-6

For the WATTs calculation, the Class 2b-7 straight trucks and the Class 8 tractors engaged in commercial operations are to be counted to determine the WATTs. Truck trips for such activities as correspondence mail deliver or vendor service trucks will not be counted as part of the truck trips to determine the WATTs.

Response to Comment 22-7

The 2.5 coefficient for the Class 8 truck trips represents the approximately 2.5 times more emissions or activity of Class 8 tractors than the smaller Class 2b-7 straight trucks.

Response to Comment 22-8

Truck trip count data should be representative and verifiable, and utilize a method of counting that can meet that standard. The subsection of the rule highlighted in the comment, is in the event of force majeure when due to an event such as a fire that destroys the truck trip count data. This alternative calculation can only be used in the extreme case where data is lost and a warehouse operator must use the Weighted Truck Trip Rate (WTTR). There is no reliable correlation between the size of a warehouse and the number of truck trips, and that poor relationship can be seen in the high number of truck trips for small cold storage or cross dock warehouses. Therefore the use of the WTTR is only in the extreme case of truck trip data loss due to force majeure. Nevertheless, the WAIRE Program Implementation Guidelines provide for a variety of methods that can be utilized by a warehouse operator to provide truck trip count data. The purpose of the alternatives methods is to provide warehouse operators with the flexibility to choose a methodology that is best adaptable to their operations and thereby reduce any burden from reporting.

Response to Comment 22-9

There is an immediate need and legal obligation in the South Coast AQMD jurisdiction to meet the federal ozone standards in 2023 and 2031. To do so NOx and PM emissions must be reduced as quickly as feasible, so it is necessary to have time limits on the Custom WAIRE Plans. Without the deadlines, project development could take years and never meet the potential emission reductions outlined in the Custom WAIRE Plan applications. Additionally, there are deadlines in the Custom WAIRE Plan application process to provide adequate time for the warehouse operator to implement the Custom WAIRE Plan once approved in order to earn WAIRE Points, and there are also time lines for which approved plans will be available for public review.

Response to Comment 22-10

Most of the requirements of the PR 2305 are the responsibility of the warehouse operator. The warehouse owner is mainly required to provide limited reporting. However, there are cases where the warehouse owner is also the warehouse operator or if the warehouse operator wishes to comply with PR 2305 on behalf of the warehouse operator and then transfer those WAIRE Points. The requirement to earn WAIRE Points or pay the optional mitigation fee to meet the WPCO is the responsibility of the warehouse operator and not the warehouse owner. Therefore, the warehouse owner would never be responsible for paying the mitigation fee.

Response to Comment 22-11

The mitigation fee funds would be pooled to subsidize incentive programs toward NZE or ZE trucks or ZE charging infrastructure back to the communities surrounding the warehouse that paid the mitigation fee. More details on the mitigation fee program will be developed, and brought to the South Coast AQMD Governing Board, as it is not currently known how many warehouse operators will actually choose to pay the optional mitigation fee in lieu of the lower cost WAIRE Menu options such as NZE or ZE truck visits.

Response to Comment 22-12

Staff acknowledges that there are warehouse operators that have operational control over other applicable warehouses. The provision to allow the limited transfer of excess WAIRE Points, does include conditions such as discounting the local benefit component of the WAIRE Points as that local benefit should stay near the community where the local benefit was generated. This limited transfer provision of excess points to other warehouses under the same operational control allows warehouse operators to implement larger scale projects one warehouse at a time, rather than be limited to smaller projects at each warehouse due to the high capital expenses of large projects.

Response to Comment 22-13

The comment bubble on page 8 of PR 2305, just has highlighted text, but no entry in the comment bubble and appears to relate to the charging infrastructure component of the Initial Site Information Report. No response will be provided as it appears to just be a highlighted section.

Response to Comment 22-14

The annual variable is related to the phase in of the recommended stringency, which was not available on the draft version of PR 2305 the comment bubbles address. In the latest draft of PR 2305, the recommended stringency is 0.0025 WAIRE Points per WATT with a phase-in of 3 years. In order to phase-in the stringency over three-years, the annual variable is set to successive thirds, with the First Year Annual Variable being 1/3, the Second Year Annual Variable being 2/3, and the Third Year Annual Variable reaching full stringency of 1 for that year and each year thereafter.

Response to Comment 22-15

As stated in the previous response to comments, the charging levels were revised to clarify charging ranges for chargers above 19.2 kW and up to 350 kW. Staff acknowledges the potential for charging levels higher than 350 kW. In the event a warehouse operator would like to install or use higher charging level chargers, they may earn WAIRE Points by submitting a Custom WAIRE Plan application. In that application they can analyze the new technology and higher charging levels to calculate the WAIRE Points that may be earned. Once the Custom WAIRE Plan is approved, the warehouse operator may start earning WAIRE Points.

Response to Comment 22-16

The TRU Plug EVSE purchase is the purchase of the wall or pedestal plug unit that trailer TRUs may plug into at cold storage warehouse or other facilities that get regular deliveries of time sensitive goods in TRU equipped trucks or trailers.

Response to Comment 22-17

The methodology on calculating the WAIRE Points for the WAIRE Menu actions and investments considers cost effort. At this time the cost of hydrogen fuel and hydrogen fueling equipment is expensive but is expected to decrease in time. The high costs of hydrogen fueling stations is reflected in the higher amount of WAIRE Points attributed to the hydrogen fueling

stations. Though the cost may be higher, some warehouses may decide on fuel cell technology because it may be more beneficial to their business model.

Response to Comment Letter –23_CCAEJ – 2/5/2021

Response to Comment 23-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 23-2

The recommended stringency is 0.0025 WAIRE Points per WATT, which will be phased-in over three-years will results in annual variables of 0.33, 0.67, and 1, when full stringency is reached. The recommended stringency of 0.0025 WAIRE Points per WATT was analyzed in various scenarios to analyze the complex structure of warehouse operations in the development of PR 2305, to reduce regional and local emissions of NO_x and particulate matter, and to help address the disproportionate burden of air pollution in the communities neighboring warehouses. Staff devised calculations of the WPCO and the WAIRE Menu that are designed to be equitable and promote the implementation of cleaner technologies to help address state and federal attainment standards and the disproportionate impacts of air pollution faced by disadvantaged communities.

Response to Comment 23-3

Staff understands the importance of prioritizing zero emission technology. Currently, the WAIRE Menu includes both NZE and ZE on-road trucks because on-road ZE trucks are not commercially available in all sizes and some of the ZE trucks are in the demonstration phase and not yet ready for commercial availability. By allowing NZE technology in part of the WAIRE Menu, NZE can provide at least a 90% reduction in NO_x emissions when compared to conventional diesel fueled trucks. The reduction of diesel fueled trucks can produce emission reductions in the near term which can increase the public health benefit to the communities surrounding the warehouse, as on-road ZE trucks and ZE charging and fueling infrastructure are developed and become widespread and commercially available.

Response to Comment 23-4

The mitigation fee is an option warehouse operators can use, including to make up shortages in the warehouse operator's WPCO and provide options for warehouse operators that best address their individual business needs in complying believe paying such a fee is a more optimal way to comply with their WPCO than the other compliance options in the rule. The mitigation fee of \$1,000 per WAIRE Point was analyzed to be within a similar range of cost as the other WAIRE Menu options and is not meant as a way to allow for a "pay-to-pollute" compliance option. There are less expensive options for the warehouse operators to meet their WPCO, so the current cost of the optional mitigation fee may not be the most cost-effective option for warehouse operators. With the WAIRE Program being a new regulatory concept, staff is not sure how many warehouse operators would actually opt to pay the mitigation fee in lieu of choosing an item off the WAIRE Menu. Each warehouse owner and operator will make decisions on which WAIRE menu items to pursue, based on their specific situation and circumstances. The mitigation fee funds would be tracked to ensure the funds are used to incentivize NZE and ZE trucks and ZE charging and fueling infrastructure in the communities surrounding the warehouses that paid the mitigation fees.

Response to Comment 23-5

Staff understands the needs for public engagement. Staff will be reporting on the effectiveness of the WAIRE Program to the South Coast AQMD Mobile Source Committee on an annual basis. This annual reporting will ensure that all aspects of the WAIRE Program are evaluated and a version of the annual update report will be released for public review. Custom WAIRE Plan applications would also be released for public review prior to their approval.

Response to Comment 23-6

Thank you for your comments and support of PR 2305. We look forward to working with you in the future.

Response to Comment Letter – 24_Coalition NZE – 2/16/2021

Response to Comment 24-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 24-2

The purpose of PR 2305 is to reduce regional NO_x and PM, facilitate other related rules and regulations, and reduce emissions and exposures for local communities around warehouses. The WAIRE Menu only includes ZE terminal tractors (aka yard hostlers, yard tractors, etc.) as a compliance pathway under PR 2305 as ZE yard trucks are commercially available and they are an established technology that have operated in some warehouses for several years. It was necessary to include on-road NZE trucks as part of the WAIRE menu options because there is currently a lack of commercially available on-road ZE trucks and uncertainty on when on-road ZE trucks or ZE fueling infrastructure will be widely commercially available. Using NZE trucks at warehouse facilities would provide at least a 90% reduction in NO_x emissions as compared to conventional diesel fueled trucks and the use of NZE trucks would provide immediate emission reductions for the communities surrounding warehouses. While use of NZE and ZE yard trucks both lead to emission reductions, yard trucks primarily stay on the warehouse premises and they are a constant source of mobile emissions that could impact the community surrounding the warehouses. The switch to ZE yard trucks at these warehouse facilities would lead to greater and more near-term emission reductions and will provide a greater benefit to the public health of the communities. Nonetheless, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 24-3

Many yard trucks stay on site and idle as part of their operations at warehouse facilities. ZE yard trucks will benefit the communities surrounding the warehouse as they do not idle, and therefore will not result in emissions that will negatively impact the neighboring communities. Conventional on road NZE trucks are included in the WAIRE Menu because on-road ZE are not well established and in comparison, have much shorter dwell time at warehouse facilities. NZE technology is being analyzed as an alternative in the CEQA analysis. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 24-4 and Appendix

South Coast AQMD acknowledges the support in reducing emissions from both mobile and stationary sources with the use of clean fuel and low emission technologies. The citations made by the commenter on the importance of near-zero emission options in this comment and the appendix to the letter are recognized and a key part of South Coast AQMD's strategies to achieve clean air. The WAIRE Menu includes both NZE and ZE on-road truck acquisition and use, but in one instance the WAIRE Menu only includes a ZE option for yard trucks. There are key policy distinctions for why ZE yard trucks are the only option considered. First, in the on-road sector ZE trucks are not at the same stage of commercial development as NZE trucks, which have been

operating in commercial service for several years, especially for Class 8 trucks. However, ZE yard trucks are commercially available today and have been operating at warehouses since 2015. Additionally, because ZE yard trucks are located at an individual facility, they are well-suited to serve as an early beachhead for the longer term development of ZE vehicle solutions.⁷⁸ By focusing PR 2305 on ZE yard trucks, warehouse operators are introduced to ZE technology to see how it works in their operations.

Further, because yard trucks primarily stay at the warehouse facility, their emissions can have a disproportionate impact on communities surrounding warehouses compared to on-road trucks with emission miles away from a facility. Many yard trucks idle as part of their operation at warehouse facilities, and the switch to ZE yard trucks would benefit public health of the communities surrounding the warehouse by not being burdened idling emissions. Although NZE engines have lower emissions than their conventional diesel counterparts, they do still have tailpipe emissions. Finally, although the commenter states that NZE yard trucks exist, there is no acknowledgement that yard trucks come in both on-road and off-road varieties. While propane or natural gas on-road yard trucks can meet CARB's standards for NZE, CARB currently does not have a certification standard for NZE off-road purposes. It is not clear how a default NZE definition would apply in the off-road setting. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options (including for yard trucks) within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 24-5

Staff thanks you for your comment and continued support of the South Coast AQMD's Technology Advancement / Clean Fuels Program goals to provide incentives to promote the commercialization of clean technologies. As stated in previous response to comments, only ZE yard truck purchase and usage is included in the WAIRE Menu due to the commercial availability of NZE yard trucks and emission impacts to communities located near warehouses. However, NZE technology is being analyzed as an alternative in the CEQA analysis and the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 24-6

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 24-Appendix

Refer to Response to Comment 24-4.

⁷⁸ https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

Response to Comment Letter –25_ Energy Distribution Partners – 2/8/2021

Response to Comment 25-1

Thank you for your participation in the rule development process and your comments in support of a warehouse ISR.

Response to Comment 25-2

The purpose of PR 2305 is to reduce regional NO_x and PM, facilitate other related rules and regulations, and reduce emissions and exposures for local communities around warehouses. The WAIRE Menu only includes ZE terminal tractors (aka yard hostlers, yard tractors, etc.) as a compliance pathway under PR 2305 as ZE yard trucks are commercially available and they are an established technology that have operated in some warehouses for several years. It was necessary to include on-road NZE trucks as part of the WAIRE menu options because there is a lack of commercial availability for on-road ZE trucks and uncertainty on when on-road ZE trucks or ZE fueling infrastructure will be widely commercially available. Using NZE trucks at warehouse facilities would provide at least a 90% reduction in NO_x emissions as compared to conventional diesel fueled trucks; the use of NZE trucks would provide immediate emission reductions for the communities surrounding warehouses. While use of NZE and ZE yard trucks both lead to emission reductions, yard trucks primarily stay on the warehouse premises and they are a constant source of mobile emissions that could impact the community surrounding the warehouses. The switch to ZE yard trucks at these warehouse facilities would lead to greater and earlier emission reductions and benefit the public health of the communities. Nonetheless, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 25-3

Many yard trucks stay on site and idle as part of their operations at warehouse facilities. ZE yard trucks will benefit the communities surrounding the warehouse as they do not idle, and therefore will not produce emissions that could negatively impact the neighboring communities. Conventional on road NZE trucks are included in the WAIRE Menu because on-road ZE trucks are not well established and in comparison, also have a much shorter dwell time at warehouse facilities. However, NZE technology are analyzed as an alternative in the CEQA analysis and the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 25-6

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 26 - Public Workshop and Community Meeting 2/16 & 2/17/2021

Public Workshop 02/16/2021 Live Public Comments

⁷⁹ https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

1. Can you please explain how credit is given for use of a ZE truck under a state mandate but not the purchase since the tonnage taken for such a rule is based on use? How do you avoid double counting?
 - a. Answer: Currently there is no state mandate that would require the trucks visiting warehouses to be ZE. ARB is currently working on the Advanced Clean Fleet rule, which could have requirements for ZE trucks. Some of the concepts in the Advanced Clean Fleet rule could potentially overlap with the concepts of the ISR rule but it is not entirely clear at this date. Staff is coordinating with ARB to make sure we understand how a potential overlap could work. Currently there is no overlap we are anticipating with CARB's Advanced Clean Fleet rule and the South Coast AQMD ISR that concerns trucks.
2. Does this rule apply to warehouses without fleet trucks?
 - a. Yes, this rule would apply to any warehouses that are over 100,000 sf.
3. Do docks without doors count towards the square footage?
 - a. The rule and definition refer to the indoor square footage space inside the warehouse building and not the entire property.
4. How do you know how many WAIRE points you will need in a year?
 - a. The WAIRE points are based on your WPCO which is based on a facility's truck trips multiplied by the stringency factor multiplied by the annual variable. Truck trips are based on the amount of Class 2-7 trucks that enter and exit your facility during the 12 months period plus 2.5 times the number of Class 8 trucks that enter and exit your facility. Truck trips determine your WATTs, which will be multiplied by the stringency factor and the annual variable to determine your WPCO, i.e. the amount of WAIRE Points you need for the compliance period.
5. When do you envision the rule applying to warehouses under 100,000 sf?
 - a. Staff is not currently contemplating expanding rule coverage to warehouses under 100,000 sf. Instead, the focus is on the approximately 3,000 warehouses covered by PR 2305 that are 100,000 sf or greater. Warehouses under 100,000 sf could be potentially included in PR 2305 in a future action, but that would only occur after a public process and formal rulemaking.
6. Can you please explain how points are banked in PR 2305?
7. There are very limited amounts of banking or trading of WAIRE points. There is no trading or selling of WAIRE points, however, there are three very limited cases allowing WAIRE points transfer. The first type of transfer is if a warehouse operator has operational control over another applicable warehouse in our basin, they can transfer the points to the other location minus the local benefit discount. The second type of transfer is the banking of points which is transferring the points forward in time. The points can only be transferred up to 3 years and they only have a 3 years life. If some of the banked points were done for early compliance, and now new regulations apply, such that the WAIRE compliance action is no longer above and beyond the new regulation (ie: CARB or South Coast AQMD rule) the WAIRE Points can no longer be applied for that action. If you are taking credit for earlier compliance action, that piece of equipment must be on site and in operation. Any WAIRE points earned prior to the phase in cannot be transferred off-site. Finally, a warehouse landowner does have the ability to earn points for the warehouse operators and transfer them to the operator.

8. Will custom plan approvals be appealable to the Hearing Board? Is there any public review process for these custom plans?
 - a. All custom WAIRE Plans will fall under South Coast AQMD Rule 216 and Rule 221 and will be appealable to the Hearing Board.
9. Has South Coast AQMD performed any surveys on warehouses to find out how warehouses will use payment of mitigation fees rather than to using ZE trucks.
 - a. South Coast AQMD has not conducted this type of survey. Discussions with various warehouses show facilities will try to find the most cost-effective methods for compliance. In the analysis in the Draft Staff Report, the mitigation fees very often will be more expensive than other options. While it is available for facilities to use, it is anticipated facilities will choose other more cost-effective actions on the WAIRE menu in lieu of the mitigation fees.
10. If warehouse more than 100,000 sf changes use, will the warehouse no longer be required to earn WAIRE Points?
 - a. For the portion of the compliance period of which the facility is used as a warehouse, they will be required to earn WAIRE points, in other words, it will be prorated.
11. What is the proposed marketing approach of PR 2305 and are businesses aware of these changes?
 - a. South Coast AQMD has sent out mailers to every facility that could be potentially affected by PR 2305. These addresses are in Appendix C of the staff report. We have also performed outreach to various trade associations, chambers of commerce, and held publicly noticed public workshops and community meetings. If PR 2305 is adopted, we anticipate a robust outreach process of training and continued outreach with facilities to go through all the details of the rule and compliance requirements.
12. Will near zero emission trucks be allowed to mitigate fees until 2050, state mandate to go all electric?
 - a. At the time of the workshop there was no proposed sunset on PR 2305 or for any of the options within the rule,. The Governor's executive order directed state agencies to look at that transition to all electric by 2035. But there are no actual mandates, no actual regulations in place or developed yet. As the state requirements come along, PR 2305 will be evaluated at that time. Currently, the rule contains a sunset provision effective when CARB and EPA have determined the South Coast Air Basin has attained the 70 ppb ozone standard.

13. What cost estimates or modeling have been made for an average warehouse of 100,000 sf to comply with PR 2305?
 - a. We have a lot of details in our preliminary draft staff report and subsequent drafts that explain the analysis and cost estimates. Please refer to the preliminary draft staff reports for a high-level summary of those analysis. Additional details are available in the socioeconomic analysis. A user calculator is also available at www.aqmd.gov/fbmsm for warehouse operators to evaluate different compliance options for their warehouse.
14. Would a warehouse owner, land owner, and contracted operator both need to meet WAIRE points requirements for the same location?
 - a. Requirements for a warehouse owner/landowner are typically different than for an operator,. Most of the compliance requirements of the rule fall on the operator. There are limited reporting requirements for owners. Warehouse owners can comply and earn WAIRE points on behalf of the operators if they chose to but is not required by the rule..
15. Is there a reason why an electric charging station counts towards the WAIRE Points menu but not a natural gas fueling station?
 - a. There is currently a lot of policy direction from the state and interest from many community members in zero emissions technology. Stakeholders have expressed a desire to accelerate zero emission operations. To meet that goal there is a need to build charging and fueling infrastructure for zero emission operations and PR 2305 is a potential mechanism to assist in that effort. Meanwhile, natural gas fueling infrastructure is more available and natural gas fueling providers have said that they can deploy their infrastructure without additional incentives.
16. What if a facility resides in a shared location? What if 2 companies reside in a single building? Will the facility be subjected to a single facility's square footage or the entire square footage?
17. The rule applies to any warehouse over 100,000 s., If there are more than one tenant at the building, if any of the tenants conduct warehousing activities in spaces of more than 50,000 sf, they will be subjected to the points requirement of the rule. If not, the facility will be just subjected to the reporting part of the requirements. Trucks at airports may travel to many warehouses before departure, how will those truck trips be calculated?
 - a. Each individual warehouse will count truck trips on their own, independent of the business next to them.
18. Tonight's meeting is a public workshop and tomorrow night's meeting is a community meeting, will the content be different?
 - a. The slides are posted on South Coast AQMD's website and there is a slight difference in contents of the meeting. The public workshop is a more detailed walked through of the rules; the community meeting is a high-level summary of the rule with a community focus.
19. What is the policy or reasoning for excluding near zero emission yard trucks from earning points on the WAIRE Menu?
 - a. In general, stakeholders have expressed strong interest in zero emission operations and this interest is also reflected in state policy promoting ZE technology. While both ZE and NZE yard trucks are commercially available, ZE yard trucks are far more expensive, and have not been adopted as broadly as NZE yard trucks. PR 2305 can facilitate a facility to choose ZE technology even though it is more expensive. Since

the public workshop, staff received multiple comments regarding the benefits that NZE yard trucks provide and the need to reflect those benefits in PR 2305. Staff are therefore recommending that renewable natural gas yard trucks may be used in a Custom Waire Plan.

20. Can you earn WAIRE points for zero emission forklifts currently operating at the warehouse?
 - a. Currently the rule does not allow points for the zero emission forklifts. There is already a widely adopted number of zero emission forklifts being used in the industry so they do not need to be incentivized and it is not clear that any surplus emission reductions would occur by allowing forklifts into PR 2305.
21. Is there consideration of a greater than 12 months period if electrical infrastructure is needed to be installed by electrical companies in order to earn points?
 - a. Yes, in the WAIRE Menu, for charging infrastructure there are multiple milestones that can earn points because we recognized for some of the installation of the charging infrastructure can take more than 1 single year. There are 3 built in milestones included in the WAIRE Menu. The 3 milestones are as follows: purchase of the electric supply equipment, begin construction of project, with most of the points earned for final permit signoff and energization of the infrastructure.
22. Can a warehouse operator earn WAIRE points for actions already taken?
 - a. The WAIRE menu is set up to earn points from either purchase of ZE trucks or through usage of that equipment. If chargers were already installed prior to rule adoption, they will not be able to earn points for their purchase, but they are able to earn WAIRE points through the usage of the chargers.
23. Is it possible for a WAIRE operator to meet the WPCO exclusively through non truck related measures? If not, how does South Coast AQMD envision operators that do not own or operate their trucks in achieving compliance?
 - a. Yes, it is possible, there are ways to earn points without owning the trucks. We recognize a lot of operators do not own their own fleet, but there are options available that do not require operators to do anything with their own fleet. For example, points are available for installing charging infrastructure, for installing solar energy, for installing air filtration systems, for acquiring and using ZE/NZE off-road yard trucks, as well as by paying a mitigation fee. However, there are business relationships that can be explored by the operators to try to identify ways for clean trucks to visit the facilities even though the warehouse operator does not own the fleet.
24. Can a warehouse operator avoid most reporting requirements by having only zero emission equipment and only allow zero emission trucks to visit the warehouse?
 - a. Currently, PR 2305 does not have any exemptions for reporting requirements if a facility is zero emissions. All facilities will still be required to comply with the same reporting requirements as required by other warehouses. They would easily meet their WPCO well before all trucks visiting the warehouse would need to have zero emissions operations.
25. Would nature based NOx solutions be able to be used to earn points? For example, trees, vegetations, etc. planted at a facility?
 - a. It is true that some vegetation can absorb small amounts of NOx, however, the net benefit regarding reduction of regional pollution from those activities – the main

objective of PR 2305 – is unclear. Currently, there is nothing on the WAIRE menu that will utilize vegetation as a way to reduce NOx emission.

26. Where are the slides posted on the South Coast AQMD websites?

- a. The slides are available at <http://www.aqmd.gov/fbmsm>.

27. Can you repeat slowly what are the cost per year to the warehouse?

- a. We gave an example of a 250,000-sf warehouse that is about the mid-size range for the sizes covered by PR 2305. Assuming the warehouse has an average number of truck trips going to their facility, the range of cost could be \$12,500 per year to \$195,000 per year to earn the points they need to comply with the rule. Please refer to the draft staff report and socioeconomic analysis for more details regarding costs.

28. Are there reporting fees per warehouse address?

- a. There are administrative fees that are required for every report submitted under PR 2305 that are described in PR 316.

29. Please briefly explain the legal authority for the ISR rule?

- a. An explanation of legal authority to regulate indirect sources is in the staff report. Also see Master Response to Comment 7.

30. Please discuss the equipment subsidy via the incentive fund work for someone wishing to purchase new equipment.

- a. Incentive programs have their own limitations on how they can be used within regulatory settings. There is nothing that South Coast AQMD is aware of within indirect source authority that regulates how incentive funds can be used. Incentives for the mitigation funds that would come out of PR 2305 have not been explicitly defined; the purchasing of the equipment via the incentive funds will not be able to earn points for programs such as Carl Moyer that provide that the incentives cannot be used to comply with another regulation,, but the usage of the equipment will allow a facility to earn points.

31. When is the vote on PR 2305 schedule? If passed, when is the rule expected to be implemented?

- a. Staff was expected to be bringing the rule to the board for a vote on April 3rd, 2021 [subsequently updated to May 7, 2021]. If passed, the first major(WPCO) compliance date was expected to be summer of 2022 [subsequently updated to early 2023]. But there will be reporting requirements prior to summer 2022, starting with the first report in September 2021.

32. Please explain again how NOx reduction is calculated?

- a. The NOx reduction of each of the WAIRE Menu items was calculated relative to conventional diesel for trucks and yard trucks. Staff used standard emission factors from CARB to calculate the difference based on different amount of activity. There is more detailed analysis on emission reductions based on PR 2305 that is available on <http://www.aqmd.gov/fbmsm>. The PR 2305 emission reductions and analysis presented are calculated so that they are above CARB's Advanced Clean Truck Rule, Low NOx Omnibus Rule, and Heavy Duty Inspection Maintenance Rule.

33. If costs prove to be higher, will PR 2305 be evaluated over time?

- a. Staff will be providing regular updates regarding PR 2305 to the South Coast AQMD Mobile Source Committee after rule adoption. The report will likely include an annual look back and provide information on facilities compliance rates and methods of compliance and what implications or effects it has on the facilities, including costs.
- 34. Do owners of multiple warehouses provide a separate report on each address of the warehouse?
 - a. Yes.
- 35. If a connective/ contiguous warehouse building has 2 or more addresses, how do you report?
 - a. Currently, PR 2305 requires each building to have its own reporting requirements for owners. Operators are required to provide their own report for their operations, so multiple operators in a single building may provide reports.
- 36. Adoption in April would require initial notifications 2 months later in June of 2021.
 - a. There are some initial reporting requirements for original warehouse owners required by June if PR 2305 is required. [subsequently updated to September 1, 2021 for the first warehouse operations notification report, and July 1, 2023 for the first Initial Site Information report].
- 37. To clarify in terms of compliance, the annual WAIRE [points? Report?] for warehouse greater than 250,000 sf will be due August 2, 2022. But utilizing real world truck data beginning July 2, 2021.
 - a. Yes, that is correct. [subsequently updated to 30 days after January 1, 2023, using truck data from calendar year 2022].
- 38. If a truck leaves a yard at start of day and returns at end of day is that considered one trip or two? Is it a trip every time it goes through the gate or every round trip?
 - a. PR 2305 WAIRE menu counts a truck trip as every time a truck leaves a facility and every time it enters a facility. Truck trips used in the WATT is counted as one-way trips (entering and exiting the facility gates). So the example given counts as two trips. The PR 2305 online portal for reporting will make it clear on how to count the truck activity.
- 39. How are the fees be collected? Would the fees be collected as property taxes so a lien could be placed on a property?
 - a. The fees associated with this rule are not taxes, and will not be collected as property taxes. Fees are instead collected as part of a regulatory program, Some of the fees will be invoiced and paid by facilities due to South Coast AQMD at the time of reporting. Some of the reports in PR 316 will have fees associated with them and those fees are paid when the reports are turned in. For a custom WAIRE plan, there will be some specific fees for the time that the material is reviewed and there will be invoicing associated with that. Mitigation fees are something that will be turned in based on a facility's WAIRE points obligation and that will be something that the facility will be paying on their own at the time the demonstration of compliance with the WPCO is due. There will be reporting so that it will be clear what fees are due through the PR 2305 online portal.
- 40. What if a company does not comply with a payment of fees? What is the process to collect?

- a. This would be typical for other regulatory program at South Coast AQMD, a potential Notice of Violation could be issued to the facility and that Notice goes through the South Coast AQMD compliance process, including efforts to settle out of court.
- 41. Will the district provide a template for truck trip record keeping for warehouses to use?
 - a. There will be an online portal that facility will be required to enter the truck trip information on their facilities. Warehouses will probably not have a specific form for their daily truck trip counts as there are many ways for a facility or operator to track truck trips. There will not be any specific form imposed for record keeping, but we would like to make sure the facility has continuous and verifiable records that are reported back to the South Coast AQMD online portal.
- 42. Will this rule go to a public vote?
 - a. This rule will go to a vote with the Governing Board of South Coast AQMD and it is anticipated for April 2, 2021. [subsequently updated to May 7, 2021]
- 43. Will the slides be posted on the web after the presentation today?
 - a. The slides are available at <http://www.aqmd.gov/fbmsm>.
- 44. Thank you for the presentation. The warehouse industry and goods movement are responsible for significant source of pollution and disproportionally impacted communities. There is a need for a stronger stringency (at least 3 times the current proposed stringency) and prioritizing zero emission technology.
 - a. Thank you for your comments.
- 45. The warehouse sector contributes to LA's ozone pollution and cause immense public health burdens. The indirect source rule should focus on zero emission trucks and infrastructure. The rule is needed urgently, and urge the district to pass it quickly.
 - a. Thank you for your comments.
- 46. The Covid-19 pandemic has exacerbated the existing health risks faced by frontline communities, and the warehouse industry has reported record-breaking profits. AQMD must pass a strong rule that prioritizes public health and good jobs. We support a strong ISR Rule that puts the health of frontline communities and good green jobs first.
 - a. Thank you for your comments.
- 47. I know firsthand how bad the problem with the trucks causing increased NOx emissions and ozone, I have severe asthma and I've been hospitalized. Is it possible to taper down the proportion of points that can be achieved through just paying fees as opposed to actual use of zero-emission trucks and buying zero-emission trucks?
 - a. The implementation of PR 2305, if approved, will be reported to the Mobile Source Committee annually. Staff may make recommendations for amendments as part of those annual updates.
- 48. Limit the opportunities for paper compliance and get emission reductions in those communities. Support a stronger stringency factor, and don't want a pay-to-pollute type option for warehouses.
 - a. Thank you for your comments.
- 49. Is "table 2 annual variable" for calculation of WPCO?

- a. Table 2 is referring to Table 2 in the rule.

COMMUNITY MEETING 2/17/2021 - FORMS SUBMISSION

ID 7

What is your experience with warehouses?

Review warehouse designs and involved with warehouse construction. Provide feedback to owners during construction.

RESPONSE: The proposed approach is not included in PR 2305. South Coast AQMD staff reviews CEQA documents prepared for new warehouses and provides comments through that existing process.

What do you most want the South Coast AQMD Board to consider with the proposed Warehouse Indirect Source Rule?

Emission reductions, near zero technologies, enforcement

RESPONSE: Thank you for your comments.

ID 8

What is your experience with warehouses?

Since I live in Carson there are tons of trucks transporting back and forth to these warehouses. The tons of trucks are the main things in the streets causing traffic which is also causing the major air pollution by my house and community. It does not help that the warehouses are literally right by the neighborhoods. Its only been brought to my attention right now that these trucks and warehouses are doing more bad to me and my community than good.

RESPONSE: Thank you for your comments.

What do you most want the South Coast AQMD Board to consider with the proposed Warehouse Indirect Source Rule?

Consider the communities by these warehouses. Its one thing that these trucks slow down the daily life of someone in the nearby communities commute.

RESPONSE: Thank you for your comments.

ID 9

What is your experience with warehouses?

Multiple warehouses are located in or around my community of West Long Beach, which experiences high levels of pollution as a result of such warehouses, the nearby Ports of Long Beach and Los Angeles, a rail yard, refineries, and the 710 and 405 freeways. Warehouses, in my experience, are often accompanied by diesel trucks that emit toxic particles into the lungs of those who live and work near them. Residents of West Long Beach and similar communities deserve better.

RESPONSE: Thank you for your comments.

What do you most want the South Coast AQMD Board to consider with the proposed Warehouse Indirect Source Rule?

I want the rule to focus not only on the monitoring and lowering of emissions from trucks but also on said trucks moving in the direction of zero-emissions. I want to see this rule implemented as soon as possible. It is imperative that this rule is vigorously executed and warehouses are no longer allowed to pollute communities like my own that are frequently the target of toxic industries that find ways to evade emission standards.

RESPONSE: Thank you for your comments.

ID 10

What is your experience with warehouses?

General Motors (GM) owns and operates one warehouse in Rancho Cucamonga for smaller aftermarket auto parts and operates one warehouse in Fontana for bulk aftermarket auto parts. Both warehouses are roughly 400,000ft². These warehouses supply GM auto parts to much of the Pacific Coast region and are part of GM's Customer Care and Aftersales warehousing network. Globally, GM offers hundreds of thousands of parts, with about 8% of its annual volume flowing through California.

RESPONSE: Thank you for your comments.

What do you most want the South Coast AQMD Board to consider with the proposed Warehouse Indirect Source Rule?

General Motors' vision is a world with Zero Crashes, Zero Emissions, and Zero Congestion. Our company's recent announcements show we are committed to our vision's emissions strategy by aspiring to only sell electric vehicles in our light-duty portfolio by 2035. Additionally, GM plans to achieve carbon neutrality by 2040. GM is also expanding its Zero Emissions vehicle strategy into the goods movement market through the addition of BrightDrop commercial electric vehicles and pallets and through collaborative agreements with Nikola and Navistar to produce fuel cell powered semi-trucks. Clearly, GM cannot fulfill its vision of Zero Emissions without sound energy and environmental policies that encourage and enable the shift to electric vehicles. Accelerating the transition to a Zero Emission future will require a comprehensive suite of well-designed policies and incentives, including vehicle incentives, utility engagement and infrastructure support, and complementary policies, to reduce costs and overcome hurdles. Like many of the warehouses in operation in the South Coast District, GM does not own the fleets that service our warehouses and must work with our suppliers and partners to encourage this transition. The Warehouse ISR directs a gradual transition through a phased-in approach that allows warehouses both time to phase in the use of zero emission trucks and offers flexibility in achieving WAIRE points obligations through other projects such as installing zero emission charging or fueling infrastructure, installing onsite solar panels, or through the use of an approved custom approach. As this is a first-of-its-kind regulation striving to encourage rapid uptake of vehicles that are in the early stages of pre-commercial or early commercial deployment, GM also believes the proposed stringency factor is appropriate to encourage this transition while providing needed flexibilities. Implementing this regulation now – in conjunction with complementary policies such as incentives and infrastructure support – will likely speed up the transition to cleaner air quality directly in the communities where warehouses are abundant providing a better quality of life for our employees and neighbors. As such, GM supports South Coast Air Quality Management District's innovative approach to begin the

transition to zero emission trucks in the region through the implementation of Proposed Rules 2305 and 316.

RESPONSE: Thank you for your comments.

47	Thank you AQMD.	

PR 2305 Public Workshop 2/16/2021									
Question Details									
#	Question	Answer(s)							
1	Will the slides be available for download?	Slides are available at www.aqmd.gov/fbmsm							
2	Thank you.	Our pleasure.							
3	Can you speak slower and more clearly please	Will do							
4	Please speak slower please .	Will do							
5	Appreciate slowing down a bit. Thanks	Will do							
6	Will this be recorded and recording available for access later on?	Yes. The meeting is being recorded and will be posted online in the coming days.	www.aqmd.gov/fbmsm						
	Comment for next zoom meeting: it is very hard to read slides, when 2 slides are displayed at the same time.	challenge with presenting two languages at the same time. We will continue to identify other possibilities for future meetings.	change your view options to 300% and focus on just either english or spanish.	150% works as well					
7	purchase since the tonnage taken for such a rule is based on use? How do you avoid double counting?	You can follow along with slides that only show one language, available at www.aqmd.gov/fbmsm							
8	Do docks without doors count toward the square footage?	live answered							
9	How do you know how many WAIRE points you will need per year?	live answered							
10	Does this rule apply with warehouse without fleet trucks?	live answered	Thank you, Vera.	Sorry, wrong place!					
11	When do you envision going to warehouses below 100,000 square feet?	live answered							
12	thank you	live answered							
13	How long are banked WARE points usable? Are the banked points discounted over time?	live answered							
14	Can one use nature based NOx reduction solutions to achieve WAIRE points under custom plan	Can you clarify what you mean by "nature based"?							
15	Will custom plan approvals be appealable to the Hearing Board? Is there any public review process for these custom plans?	Custom plan approvals (or denials) may be appealed under South Coast AQMD Rule 216, as provided in Rule 221.	Thank you, Vera.	Err... Veera. (Sorry, auto correct)	No problem!		Custom plans will also be released for public review at least 30 days prior to approval by the Executive Officer.	That is great, Ian. Hopefully, there will be a subscription list or place where people can track these.	Well done.
16	Has SCAQMD done any surveys of warehouses to find out how heavily warehouses will rely on payment of mitigation fees rather than changing to ZE trucks?	live answered							
17	If a warehouse greater than 100,000 square feet changes use would the warehouse no longer be to required to earn WAIRE points?	live answered							
18	1) What is the proposed marketing approach to let business owners about this change?	live answered							
19	2) Will NZE trucks be allowed to mitigate fees until 2050 (state mandate to go all electric)?	live answered							
20	Can you earn waire points for zero emission forklifts operating within the warehouse	live answered							
21	What cost estimates or modeling have been made for an "average" 100,000sf warehouse to comply with this rule?	live answered							
22	Would a warehouse/land owner AND a contracted operator BOTH need to meet WAIRE point requirements for the same location?	live answered							
23	3) Is there a reason why an electric charging station counts towards the WAIRE points menu but not Natural Gas Station using 100% renewable natural gas?	Thank you.	live answered						
24	What if a facility resides in a shared location(2 separate companies in a single building)? Would we be subject to our facilities square footage, or the entire locations square footage?	live answered							
25	At an airport, a truck may visit several warehouses before departure. How would that truck trip be	live answered							
26	Tonight's meeting is called a public workshop, tomorrow's a community meeting - will they differ in terms of content provided by AQMD?	live answered							
27	What is the policy reasoning for excluding NZE yard trucks from earning points under the proposal?	live answered							
28	To verify, when a truck leaves a warehouse on a route and returns to the same warehouse later, does it count 1 time(per route) or 2 times(1 for exit gate and 1 for entering gate)?	live answered	Apologize, I must of missed this. Does it count as 1 or 2?	Must have missed this as well. Can this be touched on again?					
29	Is there consideration of greater than 12 month compliance period if electrical infrastructure upgrades are needed to be installed by a utility provider in order for an operator earn WAIRE points (i.e., utility upgrades or new service for chargers or solar, etc)	live answered							
30	Can warehouses earn WAIRE points for actions already taken? (i.e., building has solar or already installed EV chargers)	live answered							
31	Is it possible for a warehouse operator to meet the WPCO exclusively through non-truck related measures? If not, how does AQMD envision operators that do not own or operate the trucks that visit their facility achieving compliance?	live answered							
32	Can a warehouse operator avoid most reporting requirements by having only zero emission equipment and allow only zero emission trucks to visit the warehouse?	live answered							
33	Trees, plants or micro-forests projects at the warehouse that might uptake and reduce NOx	live answered							
34	Where are these slides posted on the SCAQMD website?	Slides are available at www.aqmd.gov/fbmsm							
35		staff report starts at page 17:							
36	Would you please briefly explain the legal authority for the ISR rule?	http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/preliminary-draft-							
37	Are the reporting fees per warehouse address?	live answered							
38	Can you repeat SLOWLY what are the costs per year to the average warehouse?	live answered							
39	How does the equipment subsidy via the incentive fund work for someone wishing to purchase new equipment?	live answered							
40	when is the vote on this scheduled? If passed, what is the expected date for this to be	live answered							
41	Can you explain again slowly how you calculated the NOx reductions?	live answered							
42	That honestly does not seem overly expensive at all. Seems quite reasonable for industry. What is costs prove to be higher will we be evaluating over time?	live answered							
43	Does an owner of multiple warehouses report individually for each warehouse	live answered							
44	If a contiguous or connected warehouse building(s) has two or more addresses - how do you report?	live answered							
45	Adoption in April would require initial notifications two months later - June of this year?	live answered							
46	warehouse would be due Aug 2, 2022, but would utilize real-world truck trip data beginning July 1, 2021.	live answered							
47	If a truck leaves a yard at start of day and returns at end of day, is that considered one trip or two? Is it a trip every time it goes through the gate or every round trip?	live answered							
48	how will the fee be collected? will the business owner be sent an invoice? will these fees be collected as property taxes with liens placed on the property?	live answered							
49	(clarification) what if a company does not comply with payments of fees. What is the process to	live answered							
50	Thank you.	live answered							
51	Will the District provide a template for truck trip recordkeeping for warehouses to use?	live answered							
52	Does this rule go to a public vote?	live answered							
53	Will these slides be posted on the web after your presentation is finished today?	live answered							
54	On page 20 of presentation; it mentions "table 2 annual variable" for calculation of WPCO. Which page has table 2?	live answered							
55	Thank you for the presentation.								
56	Thanks Ian and Victor								

Response to Comment Letter #27 – Rail Cents -01/20/2021 and 02/19/2021

Response to Comment 27-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. The concept of introducing direct pick-up and drop-off of large lot shipments in urban areas would require participation by the large railroads and use of Tier 4 locomotives or cleaner to achieve emissions benefits.⁸⁰ PR 2305 is applicable to warehouse operators, many of which do not have access to rail lines in order to invest in rail sidings. Based on the lack of availability for warehouse operators to access rail lines and the commercial availability of NZE or ZE locomotives, this concept will not be added to the WAIRE Menu. Warehouse operators that have projects that are site- or business model-specific which were not analyzed for the WAIRE Menu, can propose the concept in a Custom WAIRE Plan application, and if approved the warehouse operator may earn WAIRE Points.

Response to Comment 27-2

Thank you for acknowledging South Coast AQMD's leading efforts in incentivizing cleaner locomotives and funding the demonstration of the ZE battery locomotive.

Response to Comment 27-3

As stated in Response to Comments 27-1, railroading concepts will not be included in the WAIRE Menu as most warehouse operators do not have access to rail lines and the NZE and ZE locomotive technology is not commercially available. As with other site or business model specific concepts, warehouse operators can propose the concept as a Custom WAIRE Plan application.

Response to Comment 27-4

Staff appreciates the time and information provided regarding locomotive technology and railroad insight.

Response to Comment 27-5

Thank you for providing the reasons and benefits of using cleaner locomotives over trucks.

Response to Comment 27-6

Staff appreciates the effort made to explain where the rail side track concept may fit in the WAIRE Menu, but as stated in previous response to comments the concept will not be included in the WAIRE Menu. This concept could be proposed by warehouse operators as a Custom WAIRE Plan application.

Response to Comment 27-7

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

⁸⁰ <https://ww2.arb.ca.gov/resources/fact-sheets/draft-truck-vs-train-emissions-analysis>

Response to Comment Letter #28 – Earthjustice - 02/19/2021

Response to Comment 28-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 28-2

It is recognized that the COVID-19 pandemic has added to the health impacts faced by communities already burdened by poor air quality. The logistics and warehouse industry have increased their activity while hitting record cargo volumes in the ports. This has in turn increased the public health burden on those same communities.

Response to Comment 28-3

PR 2305 is anticipated to get significant reductions at the recommended stringency of 0.0025 WAIRE Points per WATT phased-in over three-years. Based on the analysis of 18 WAIRE Menu scenarios, PR 2305 could achieve NOx reductions in the range of 2.5 – 4 tons per day beyond CARB Rules, which is 10-15% reductions from baseline of both NOx and PM. While CARB's strategies are targeting dates in 2035 and 2045, PR 2305 would get immediate reductions as soon as 2023. Further analysis on other stringencies within the range of the CEQA analysis and relocation was conducted, however a screening analysis of the commenter's proposed tripling of the recommended stringency indicates that it could require NZE/ZE truck sales to significantly surpass the limited number of new NZE and ZE truck sales projected by CARB modeling, and could lead to some warehouses relocating to other areas outside South Coast AQMD. As currently proposed, the WAIRE Menu contains ZE yard trucks, ZE charging/fueling infrastructure, and ZE on-road trucks as potential compliance options. The methodology to determine WAIRE Points for each WAIRE Menu item (ZE or NZE) is included in the WAIRE Menu Technical Report included as Appendix B to the Final Staff Report.

Response to Comment 28-4

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #29 – RRC - 02/17/2021

Response to Comment 29-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 29-2

PR 2305 is intended to reduce emissions to meet federal and state air quality standards for ozone and fine PM, facilitate emission reductions from other regulations and policies, and reduce emissions and exposures for local communities surrounding warehouses. The WAIRE Menu provides nearly three dozen NZE and ZE technologies that will reduce emissions or reduce exposure to benefit both the community and the logistics industry workers.

Response to Comment 29-3

The commenter's support for PR 2305 is appreciated.

Response to Comment 29-4

PR 2305 as proposed is expected to result in about 2.5 – 4 tons per day of needed NO_x emission reductions, that would result in a 10-15% reduction of the baseline emissions which will assist in meeting the federal and state air quality standards. PR 2305 is designed to address local and regional air pollution, but climate benefits are expected as well with a transition to lower carbon intensity fuels like electricity.

Response to Comment 29-5

Staff is recommending a stringency a 0.0025 WAIRE Points per WATT, which was a result of a thorough analysis of 18 WAIRE Menu scenarios. These scenarios looked at the emissions and the available technology production, a relocation study, and a socioeconomic analysis. The recommend stringency of 0.0025 WAIRE Points per WATT results in significant emission reductions and facilitates emission reductions from other related rules and regulations. A screening analysis of the commenter's proposed tripling of the recommended stringency indicates that it could require NZE/ZE truck sales to significantly surpass the limited number of new NZE and ZE truck sales projected by CARB modeling, and could lead to some warehouses relocating to other areas outside South Coast AQMD. The mitigation fee of \$1,000 per WAIRE Point is not intended to be a "pay-to-pollute" scheme as the funds from the optional mitigation fee would be pooled to subsidize incentives for NZE and ZE trucks and ZE charging infrastructure back in the communities surrounding the warehouse that paid the mitigation fee. Based on the analysis conducted during rulemaking, the \$1,000 per WAIRE Point value is similar to other WAIRE Menu actions and investments in any one year, but would be a higher cost option over time as it would not allow warehouse operators to make early investments that could lead to cheaper compliance options later.

Response to Comment 29-6

As currently proposed, the WAIRE Menu contains ZE yard trucks, ZE charging/fueling infrastructure, and ZE on-road trucks as potential compliance options. NZE on-road trucks options are also present in the WAIRE Menu as many warehouse operators may find this technology choice better fits their operations. These NZE on-road trucks provide a 90% or better

NOx emission reduction compared to diesel engines, and will assist with meeting the federal ozone attainment goals and provide public health benefit to the local communities surrounding the warehouses. Job impacts from PR 2305 will be included in the socioeconomic analysis.

Response to Comment 29-7

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment Letter #30 – Origin Engines - 02/18/2021

Response to Comment 30-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 30-2

The WAIRE Menu includes both NZE and ZE on-road truck acquisition and use, but the WAIRE Menu only includes ZE yard trucks. There are key policy reasons supporting why ZE yard trucks are the only option considered. First, in the on-road sector ZE trucks are not at the same stage of commercial development as NZE trucks, which have been operating in commercial service for several years, especially for Class 8 trucks. However, ZE yard trucks are commercially available today and have been operating at warehouses since 2015. Additionally, because ZE yard trucks are located at an individual facility, they are well-suited to serve as an early beachhead for the longer term development of ZE vehicle solutions.⁸¹ By focusing PR 2305 on ZE yard trucks, warehouse operators are introduced to ZE technology to see how it works in their operations.

Further, because yard trucks primarily stay at the warehouse facility, their emissions can have a disproportionate impact on communities surrounding warehouses compared to on-road trucks with emissions miles away from a facility while traveling between destinations. Many yard trucks idle as part of their operation at warehouse facilities, and the switch to ZE yard trucks would benefit public health of the communities surrounding the warehouse by not being burdened by idling emissions. Although NZE engines have lower emissions than their conventional diesel counterparts, they do still have tailpipe emissions. Finally, although the commenter states that NZE yard trucks exist, there is no acknowledgement that yard trucks come in both on-road and off-road varieties. While propane or natural gas on-road yard trucks can meet CARB's standards for NZE, CARB currently does not have a certification standard for NZE off-road purposes. It is not clear how a default NZE definition would apply in the off-road setting. Nonetheless, a CEQA alternative has been included that evaluates additional NZE compliance options (including for yard trucks) within PR 2305. Further, the Final Staff Report and the accompanying WAIRE Implementation Guidelines now explicitly allow NZE yard trucks to earn WAIRE Points through a Custom WAIRE Plan, and example calculations that warehouse operators could use are included.

Response to Comment 30-2

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. Staff has noted that Origin Engines is a developer of NZE engines for use in off-road applications.

Response to Comment Letter 31 – Long Beach Area Chamber of Commerce - 02/22/2021

Response to Comment 31-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for a discussion on the warehousing industry during the COVID-19 pandemic.

Response to Comment 31-2

PR 2305 is a part of the targeted strategy to reduce regional and local NO_x and PM emissions toward meeting the federal ozone standards for 2023 and 2031, meeting federal PM 2.5 standards, meeting state standards for ozone and PM 2.5, and for improving public health. The most recent version of the PR 2305 rule language released April 7, 2021 addresses the commenter's concerns regarding rule implementation dates. The first compliance date requiring the submission of the Warehouse Operations Notification is September 1, 2021, an informational report to be submitted by the warehouse owner requiring basic warehouse information including the square footage information on the warehouse, the tenant(s), lease duration, and contact information. The first compliance period for the largest warehouse operators to earn WAIRE Points begins on January 1, 2022. Warehouses will be phased into PR 2305 based on size over three years and once in, there is a three-year phase-in of the rule stringency.

Response to Comment 31-3

The potential costs stated by the commenter are inaccurate and as potential cost ranges are significantly lower. The commenter did not mention that the growth of the warehousing industry has continued during the COVID-19 pandemic. See Master Responses 1, 5, and Socioeconomic Impact Assessment (SIA) for a discussion on the potential costs of PR 2305 and economic impacts.

Response to Comment 31-4

See Master Response 2a through 2c for a discussion on feasibility.

Response to Comment 31-5

See Master Response 2d for a discussion of available technology on the WAIRE Menu.

Response to Comment 31-6

See Master Response 4 and 5 for discussions on the warehousing industry and economic impacts.

Response to Comment 31-7

See Master Response 4 and 5 addressing economic uncertainty related to goods movement during the COVID-19 pandemic.

Response to Comment 31-8

See Master Response 6 and the Socioeconomic Impact Assessment for a discussion on the jobs impacts of PR 2305.

Response to Comment 31-9

See Master Response 7 and Response to Comment Letters 39, 40, and 44 for discussion of South Coast AQMD legal authority.

Response to Comment 31-10

Thank you for your interest in the warehouse ISR and your comments. This letter and responses will be provided to the South Coast AQMD Governing Board.

Response to Comment Letter 32 – Clean Energy - 02/25/2021

Response to Comment 32-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. The estimated emission reductions from the proposed rule are included in the Final Staff Report in Tables 15 and 16. These anticipated emissions reductions will help the region get closer to reaching attainment of federal and state air quality standards. Additional detailed responses are included below.

Response to Comment 32-2

The WAIRE Menu offers nearly three dozen actions and investments that warehouse operators and owners may choose to satisfy the warehouse operator's WPCO. Some WAIRE Menu items involve acquiring equipment which does not directly result in emission reductions but it does support other WAIRE Menu items and will enhance the effectiveness of other regulations and policies that will help result in the reduction of emissions necessary to attain federal and state air quality standards. This includes options such as installing zero emission fueling and charging infrastructure, installing TRU plugs, and installing solar panels. WAIRE Points are calculated with three components: the incremental cost relative to conventional technologies, the estimated NOx emissions reduction, and the estimated diesel particulate matter emission reduction. The cost is a critical component to ensure that the level of effort for warehouse operators is taken into account when assigning WAIRE Points to an action. Further, because some WAIRE Menu items on their own will not result in emission reductions (e.g., ZE charging/fueling infrastructure) but instead facilitate emission reductions from other actions, including the cost allows a common metric that can be used to compare all WAIRE Menu items. Although other schemes could have been used to determine the WAIRE Point value for each action, the proposed approach is considered the most appropriate balance of all of the needs of the proposed rule. The approach of including the cost is uniformly applied to all WAIRE Menu options and does not disincentivize the market of cost-effective emission reductions. In fact, some NZE truck options that the commenter advocates are found to be more cost effective options with the current approach than ZE options. Costs for third party visits from Class 8 NZE trucks are anticipated to be \$0.12/sf/yr while third party visits from Class 8 ZE trucks are anticipated to be \$0.14/sf/yr (see Table 20 in the Final Staff Report).

Response to Comment 32-3

While emission reductions are a critical consideration when determining the WAIRE Point value for each action, they are not the only consideration. The level of effort needed to implement the action, the ability of the action to facilitate emission reductions from other regulations and policies, and the ability of incentive funding to be used with PR 2305 are also important considerations. The structure of the proposed WAIRE Points system allows all of these additional considerations to be included, while also furthering the primary objective of reducing regional and local emissions. As shown in the WAIRE Menu Technical Report (Appendix B of the Final Staff Report), ZE and NZE technologies are treated equally using the proposed approach. Although other schemes could have been used to determine the WAIRE Point value for each action, the proposed approach is considered the most appropriate balance

of all of the needs of the proposed rule. See Response to Comment 32-2 for additional discussion.

Response to Comment 32-4

ZE yard trucks are commercially available and have been in commercial service for several years at local warehouses who have expressed no issues with their usage. ZE yard trucks have no tailpipe emissions which provide both 100% NO_x and DPM emission reductions which improves the public health in the communities surrounding warehouses as ZE yard trucks do not cause emissions from idling.

The WAIRE Implementation Guidelines have been updated since this comment letter was submitted. In the recent version released on April 7, 2021, NZE yard trucks using renewable fuels can earn WAIRE Points in a Custom WAIRE Plan. Using the calculation methods for ZE yard trucks and NZE on-road trucks, the evaluation process for NZE yard trucks will follow a streamlined approach.

Response to Comment 32-5

While NZE trucks are allowed in PR 2305 (and are an attractive compliance option), NZE fueling infrastructure has not been included. This is in part due to a desire to work towards state ZE goals, and also because previous statements from the natural gas industry, and implied statements from this comment letter, have identified that government support is not needed for the fueling infrastructure for widespread deployment of natural gas fueled NZE trucks other than policy and funding support for the trucks themselves.⁸² These previous comments have also stated that the natural gas industry is ready to quickly scale up fueling infrastructure to meet the demands of the trucking industry in southern California, and has a track record of previous successful rapid station developments by constructing 70 stations within one year.

Response to Comment 32-6

While emission reductions are a critical consideration when determining the WAIRE Point value for each action, they are not the only consideration. The level of effort needed to implement the action, the ability of the action to facilitate emission reductions from other regulations and policies, and the ability of incentive funding to be used with PR 2305 are also important considerations. The structure of the proposed WAIRE Points system allows all of these additional considerations to be included, while also furthering the primary objective of reducing regional and local emissions. As shown in the WAIRE Menu Technical Report (Appendix B of the Final Staff Report), all technologies are treated equally using the proposed approach. Although other approaches could have been used to determine the WAIRE Point value for each action, the proposed approach is considered the most appropriate balance of all of the needs of the proposed rule. See Response to Comment 32-2 for additional discussion.

Response to Comment 32-7

⁸² <https://cngvc.org/wp/wp-content/uploads/2017/04/ACT-Now-Plan-Final.pdf>, pg. 14, <https://cleanairactionplan.org/documents/2018-draft-drillage-feasibility-assessment-public-comments.pdf>, letters at pg. 14 and 47

PR 2305 is not contrary to the 2016 AQMP. PR 2305 includes both NZE and ZE options that warehouse operators can choose to earn WAIRE Points. In some instances, NZE options are more cost-effective than ZE options (e.g., third party Class 8 truck visits), whereas other instances are the opposite (e.g., third party Class 6 truck visits). There are many considerations incorporated into the proposed rule, and the proposed approach strikes the most appropriate balance to achieve cost-effective emission reductions, while facilitating other regulations and policies throughout the state, and providing flexibility for warehouse operators to tailor the options to their specific operation.⁸³

⁸³ Note that the cited resolution language by the commenter applies to incentive programs, not regulations.

Response to Comment Letter 33 – Carson Dominguez Employers Association - 03/01/2021

Response to Comment 33-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Response 4 for responses on the warehousing industry during the COVID-19 pandemic.

Thank you for your interest in the warehouse ISR and providing your comments.

Response to Comment Letter –34-Weber – 3/1/2021

Response to Comment 34-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. See Master Responses 5 and 6 for responses on concerns on the warehousing industry and the economy, and the potential for relocation of warehousing.

Response to Comment 34-2

See Master Response to Comments 1, 5, 6, and 9 for discussion of economic and job impacts of PR 2305, as well as the emissions from the state's goods movement industry.

Response to Comment 34-3

PR 2305 offers flexibility by providing 32 WAIRE Menu options, a Custom WAIRE Plan option, and an optional mitigation fee that warehouse operators may choose from to comply with PR 2305. No warehouse operator is required to pay a mitigation fee. See Master Responses 1 and 8 for responses to the costs of PR 2305 and concerns on being a duplicative effort.

Response to Comment 34-4

See Master Response to Comments 8 for a discussion of recent and upcoming CARB regulations, and how PR 2305 is not duplicative with their efforts. See Master Response to Comments 1 and 5 for discussion of costs and economic impacts. See Master Response to Comments 3 for a discussion of air quality benefits.

Response to Comment 34-5

See Master Response to Comments 8 for a discussion of recent and upcoming CARB regulations, and how PR 2305 is not duplicative with their efforts. See Master Response to Comments 1 and 5 for discussion of costs and economic impacts. See Master Response to Comments 3 for a discussion of air quality benefits including what was presented at the referenced meeting.

Response to Comment 34-6

Thank you for your interest in the warehouse ISR and providing your comments. See Master Response to Comments 8 for a discussion of recent and upcoming CARB regulations, and how PR 2305 is not duplicative with their efforts. See Master Response to Comments 7 for a discussion of South Coast AQMD legal authority. Staff developed PR 2305 and PR 316 through a thorough public process. Following the Board's approval of the 2016 AQMP, staff initiated a year-long process to identify potential voluntary measures to address emissions from warehouses that included five working group meetings. As no viable voluntary measures were identified during that process, the Board directed staff to initiate rulemaking in May 2018. Staff subsequently has conducted 12 working group meetings, two community meetings, seven updates to the Mobile Source Committee and two updates to the full South Coast AQMD Governing Board. Staff has also conducted dozens of warehouse site visits, presented updates of the proposed rule to numerous outside organizations such as Councils of Governments and trade

associations, and had hundreds of meetings with individual businesses, governments, and community members during development of the proposed rules.

Response to Comment Letter 35 – United - March 2, 2021

Response to Comment 35-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 35-2

See Master Response to Comments 7 for discussion of legal authority. The comment contends that PR 2305 is preempted by the Airline Deregulation Act (“ADA”). Courts apply the same preemption analysis under the ADA that they apply under the Federal Aviation Administration Authorization Act (“FAAAA”). *Ward v. United Airlines, Inc.*, 986 F.3d 1234, 1243 n.2 (9th Cir. 2021). The District has responded to other comments contending that PR 2305 is preempted by the FAAAA, and those responses apply fully here. *See* Responses to Comments 44-4, 106-1, 106-2.

Response to Comment 35-3

The comment incorrectly represents what was agreed to in the airport MOU’s.⁸⁴ The MOU’s do not contain any provision which restricts South Coast AQMD from applying PR 2305 to warehouses, even if they are in some way related to airports.⁸⁵ To the contrary, during the development of the MOU’s staff clarified repeatedly that warehouses associated with airports would not be included in the MOU’s and would instead be addressed in PR 2305. For example, the minutes to the November 15, 2019 Mobile Source Committee record the following discussion:

“Mayor Pro Tem McCallon inquired whether airport tenants engaged in cargo operations at Ontario airport are aware of the proposed Indirect Source Rule (ISR) for warehouses which would affect cargo trucks operating at the airport. Dr. Philip Fine, Deputy Executive Officer/Planning, Rule Development, and Area Sources, confirmed that they are aware of the ISR and have requested to be under the ISR instead of the airport MOU.”⁸⁶

Further, the comment states that the CEQA analysis does not analyze the potential impacts of PR 2305 on the existing airport MOU’s and Air Quality Improvement Plans (AQIP’s) [also called Air Quality Improvement Measures (AQIM’s) in the MOU’s]. As stated above, PR 2305 is not in conflict with the MOU’s, and in fact was anticipated during the development of the MOU’s. Therefore, there is no impact to the MOU’s or the AQIP’s/AQIM’s included

⁸⁴ All airport MOU’s are available here: <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/facility-based-mobile-source-measures/commercial-airports-mous>

⁸⁵ Rather, the MOU’s explicitly state the opposite: “Nothing in this MOU is intended or shall be interpreted to apply to: (1) any source that is not specifically identified in the MOU Measures, or (2) the operation of any source that is not specifically identified in the MOU Measures.” Warehouses are not included in the MOUs., For example, see section (I)(C)(3)(a) here: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/facility-based-mobile-source-measures/mou-la-department-of-airports.pdf>

⁸⁶ <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2019/2019-dec6-021.pdf>

within them, and the analysis included within the Final Environmental Assessment accurately analyzes and discloses the potential environmental impacts of the proposed project.

Response to Comment 35-4

See Master Response to Comments 2a through 2d. In addition, the compliance options that are available that are not related to on-road trucks include actions that either reduce NO_x (e.g., through the use of solar panels which reduce the reliance on power plants which emit NO_x), facilitate emission reductions from other measures (e.g., through ZE charging/fueling infrastructure that powers cars and trucks), or it reduces exposures to air pollution from trucks visiting their facility (e.g., through installation of filters in nearby schools, daycares, etc.).

Response to Comment 35-5

The definition of warehouse is appropriately designed and captures the range of facilities that PR 2305 is intended to cover. Staff is unaware of any buildings that are “connected to, or part of, other transportation centers (such as a port, commercial airport or rail yard)” that would be subject to PR 2305 that are not warehouses. For example, it is staff’s understanding that cargo facilities adjacent to airports clearly store “cargo, goods, or products on a short- or long-term basis for later distribution to businesses and/or retail customers.” [see PR 2305 (c)(27)] These facilities can be clearly distinguished from airport terminals. To the extent that an airport terminal stores any cargo, staff is unaware of any terminals in the South Coast AQMD that include more than 100,000 square feet for warehousing activities (the threshold in PR 2305 (d)(1) for earning WAIRE Points).

The commenter also refers to the terms “distribution” and “retail customer”. “Distribution” in the context of PR 2305 (d)(27) follows the common definition, for example for ‘distribute’ in the Merriam-Webster dictionary: “to give out or deliver especially to members of a group”.⁸⁷ “Retail customers” in the context of (c)(27) similarly follows common definitions found in Merriam-Webster for “retail”: “the sale of commodities or goods in small quantities to ultimate consumers” and “customer”: “one that purchases a commodity or service”.⁸⁸ Retail customers are distinguished from business in PR 2305 (c)(27) because some warehouses are used for distributing goods directly to retail customers (e.g., through e-commerce that delivers goods directly from a warehouse to an individual’s home), while others are used for distributing goods to stores, other warehouses, or an intermodal facility like a railyard (which are businesses). Indeed, some individual warehouses could be used for distribution to any of the businesses or retail customers listed above.

Finally, to the extent that a building stores cargo that does not utilize trucks for distribution of that cargo, then the WAIRE Points Compliance Obligation for the facility would be zero using the formula under PR 2305 (d)(1), and no WAIRE Points would need to be earned. The hypothetical example provided by the commenter may indeed have a short distance of travel

⁸⁷ <https://www.merriam-webster.com/dictionary/distribute>

⁸⁸ <https://www.merriam-webster.com/dictionary/retail>, <https://www.merriam-webster.com/dictionary/customer>

from a warehouse to a plane or train for one leg of the journey (e.g., inbound), but the other leg (e.g., outbound) may be to a more distant location using a truck.

Response to Comment 35-6

See Response to Comment 35-5 for a discussion of the definition of retail customer. The example cited in this comment appears to refer to distribution to a business rather than a retail customer (delivery from a warehouse near an airport to another warehouse near another airport, regardless of who ultimately picks up or drops off the goods at each warehouse). If the proposed service of the commenter ('United Cargo') allows shipment of goods dropped off at an airline terminal and picked up at another airline terminal, then the size threshold of PR 2305 would need to be evaluated to determine whether the facility has more than 100,000 square feet used for warehousing activity when determining if the operator needs to earn WAIRE Points [see PR 2305 (d)(1)]. Staff is unaware of any airline terminal that meets this criteria, or of any operator within a terminal that operates more than 50,000 square feet within the terminal for warehousing activities.

The definition in (c)(27) is purposefully written so as not to place the commenter's proposed limits on the applicability of the definition or PR 2305.

Response to Comment 35-7

The commenter's statement that LAX could be a warehouse facility under PR 2305 is correct, and the proposed definition for warehouse facility is meant to reflect this situation. LAX is either a 'warehouse facility owner' or 'warehouse land owner' under PR 2305 (the exact ownership relationship is not clear at this time, but would be reported if PR 2305 is approved). However, the comment regarding the obligations for reporting on a warehouse facility under PR 2305 (d)(7) is not the intent. PR 2305 (d)(7) is proposed to be clarified to state:

Warehouse operators shall submit an Initial Site Information Report in the manner specified in paragraph (e)(2) no later than July 1 of the year that they must submit their first annual WAIRE Report for their operations at that warehouse facility,

This is the only instance within PR 2305 staff identified where a clarification based on the definition for 'warehouse facility' is necessary. The requirements throughout the rest of PR 2305 are clear with regards to warehouse owner compared to warehouse operator obligations. Further, the suggestion to incentive owners to earn WAIRE Points in multi-tenant situations is not included because warehouse owners who are not operators do not have day-to-day control of activity at a warehouse. There may be situations where warehouse operators and owners will need to cooperate to earn WAIRE Points (e.g., for upgrades to a building like some charging/fueling infrastructure or installation of solar panels that aren't already allowed in the tenant agreement), however not all WAIRE Menu options require the agreement of the warehouse owner. If a tenant is unable to come to an agreement with the warehouse owner, they will need to earn WAIRE Points in another way. However, it is anticipated that warehouse owners will be incentivized by the existence of the rule (if approved) to cooperate with warehouse operators in order to keep their warehouses competitive in the marketplace.

Response to Comment 35-8

PR 2305 uses truck trips as a metric for calculating the WPCO as VMT is a difficult metric to capture. Many trucking companies expressed concern about providing VMT as it relates to their proprietary business model, specific routes, and may disclose the warehouses and clients that their truck fleets visit. Further, if a truck visits multiple warehouses on the same route, it is unclear how much VMT to assign to each warehouse. Therefore, VMT is not included in PR 2305 except to the extent that it can be applied to Custom WAIRE Plans as described in PR 2305 (d)(4)(v).

The comment also expresses concern that an operator would be required to count truck trips to a facility, however PR 2305 (d)(1)(B) does not require this, nor does any other part of PR 2305. Operators are required to count truck trips to their warehouse, not a warehouse facility. To the extent there are multiple operators in a warehouse, they only are required to count truck trips to their operation.

Additionally, the comment states that a truck that visits the commenter's warehouse and another warehouse at LAX should not count as more than one trip. As discussed during follow up conversations with LAX staff and various airlines, this is impractical to track as it would require operators to know the origin and destination of every truck that visits their warehouse, as well as whether it left LAX at any point and subsequently returned. Further, LAX is a large property, and it is possible that a truck could travel about two miles in between warehouses just at LAX, without accounting for how far they travel once they leave the airport. The shorter truck trip distances between warehouse located close to one another have been included with other longer trip distances that trucks take by using the average truck trip length from SCAG's Regional Transportation Plan model. These averages allow for a reasonable estimate of potential emissions impacts from PR 2305, including in the development of the WAIRE Points system. The commenter has not provided evidence that the overall average trip length associated with warehouses located at an airport are substantially different than the average trip length used throughout the rest of the analysis in the Final Staff Report and its appendices, despite some of those truck trip lengths potentially being shorter.

Response to Comment 35-9

The comment states that an operator's WAIRE Points Compliance Obligation should be determined at the facility level if there are multiple warehouses at a facility. Each warehouse operator is required to determine their own WAIRE Points Compliance Obligation. Warehouse facility or land owners are not responsible for the day-to-day operations of their tenants. Staff is unaware of any viable means of determining the exact number of truck trips to every warehouse at a facility like LAX, whether those trucks are travelling between warehouses at LAX, and the extent to which those trucks are transporting goods from one warehouse at LAX for delivery at another warehouse at LAX. This last point is important because it is not clear if the trips between warehouses located as close as next door to each other at LAX that share a

truck trip are actually experiencing any overall reduced VMT. While the trip between the warehouses is short, the trip to the first warehouse may have been long. If goods are being transported from the first warehouse at LAX to the second warehouse at LAX, then the longer trip would have occurred to the second warehouse regardless of whether the truck visited the first warehouse or not.

Response to Comment 35-10

There are multiple methods for counting trucks allowed by PR 2305 and the WAIRE Implementation Guidelines. Updated language in the rule since the comment was submitted has added additional flexibility for warehouse operators to document the number of truck trips to their warehouses. For example, operators now must only use methods that provide a verifiable and representative record of truck trips. This allows for once per month trip counts, as well as systems like existing warehouse security protocols like security logs and/or security cameras to be used to count truck trips. See the WAIRE Implementation Guidelines section on Truck Trip Counts for Determining WPCO for additional details.

Response to Comment 35-11

The commenter's suggestion is already allowed under PR 2305 (d)(6)(C). A warehouse facility or land owner can opt in and earn WAIRE Points for any project completed using the WAIRE Menu or under an approved Custom WAIRE Plan at the warehouse facility and then transfer those WAIRE Points to any warehouse operator at that warehouse facility.

Response to Comment 35-12

The commenter's support for including an option for an in lieu mitigation fee in PR 2305 is appreciated. The mitigation fee has been set at a level that is designed to achieve approximately the same level of implementation as what a warehouse operator could do on their own using the WAIRE Menu in any particular year. However, the commenter's suggestion to add a feasibility test into determining what level the mitigation fee should be is not practical. For example, this feasibility test would likely require that South Coast AQMD staff to determine when a warehouse operator can arrange for third party visits from NZE and ZE trucks, and when that is infeasible. While this practice may be different than a warehouse operator's current practices, other warehouse operators have business models that allow this and can work within their operations. In addition, it is not clear under which conditions a warehouse operator not approving their tenant's proposed WAIRE Points project should be considered as a matter of infeasibility. While a tenant does not own a building, they do have the ability to negotiate with their landlord to find terms that work for both parties. By including a feasibility test, it may require South Coast AQMD staff to understand the details of those negotiations, which is not practical for thousands of operators, or desirable by industry.

Response to Comment 35-13

Thank you for your interest in the warehouse ISR and your comments.

Response to Comment Letter 36 - PriceTransfer – 3/2/2021

Response to Comment 36-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention. PR 2305 is a menu-based point system that offers nearly three dozen flexible options for warehouse operators to choose from to comply and has no requirement that warehouse operators or owners pay a mitigation fee. See also Master Response to Comments 1, 3, 8, and 10 for responses to concerns on the costs of PR 2305, concerns about air quality improvements achieved, concerns on duplicative efforts, and concerns about the mitigation fee.

Response to Comment 36-2

See Master Response to Comments 4 for a discussion of PR 2305 in relation to the COVID-19 pandemic.

Response to Comment 36-3

See Master Response to Comments 5 and 6 for discussion of concerns about the economy and concerns about job impacts. Warehouses are not anticipated to relocate out of the region due to PR 2305, as documented in a study commissioned by South Coast AQMD. Therefore, there is not expected to be any lost tax revenue from PR 2305. In addition, as documented in the Socioeconomic Impact Assessment, tax revenues could potentially increase due to the additional sales of NZE or ZE trucks, ZE charging and fueling infrastructure, etc. that are anticipated through warehouse operators complying with PR 2305.

Response to Comment 36-4

See Master Response to Comments 9 for the response to the comment that California has the cleanest supply chain.

Response to Comment 36-5

Response to Comment Letter 38 - American Lung Association – 2/26/2021

Response to Comment 38-1

Thank you for your interest in the warehouse ISR development process, and for bringing your comments to our attention.

Response to Comment 38-2

Thank you for bringing attention to the 2020 State of the Air Report. Staff is aware of the recently released 2021 State of the Air Report which unfortunately came to the same conclusion as the 2020 report as well as many before it that the South Coast AQMD region has the worst ozone in the nation, and is among the worst in the nation regarding fine particulate matter.⁸⁹ The comment is correct that trucks are a large part of the pollution, being the largest source of NO_x in the air basin according to the 2016 AQMP. Disparities in air pollution exposure are also prevalent as identified in the 2016 AQMP, the various AB 617 Community Emission Reduction Plans, and as shown in Figure 4 of the Final Staff Report.⁹⁰ PR 2305 is designed to reduce emissions, and public health impacts associated with warehouses, as documented in the Final Staff Report and Socioeconomic Impact Assessment.

Response to Comment 38-3

The comment highlights a report which shows the potential public health benefits that could be achieved by transitioning to ZE transportation by 2050.⁹¹ The results in this report show the transition would result insubstantial reductions in NO_x and ozone, as well as \$14.1 billion in monetized health benefits in 2050. This analysis supports the conclusions of the 2016 AQMP socioeconomic analysis that found \$173 billion in monetized public health benefits from meeting federal air quality standards by 2031,⁹² as well as the monetized public health benefits of PR 2305 of about \$1 billion to \$3 billion from most compliance scenarios for PR 2305 documented in the Socioeconomic Impact Assessment.

PR 2305 includes many options designed to encourage increased adoption of ZE trucks, including allowing warehouse operators to earn WAIRE Points from acquiring ZE trucks and yard trucks, as well as using them, or getting third party fleets to use them at their facility. In addition, WAIRE Points can be earned for ZE charging and fueling infrastructure, a critical facilitating measure necessary for the use of ZE trucks and yard trucks.

Response to Comment 38-4

Thank you for your comments and your interest in the rule development for PRs 2305 and 316.

Response to Comment Letter 39 – CalTax – March 2, 2021

Response to Comment 39-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention. District counsel has carefully evaluated PR 2305 and PR 316 for compliance with Proposition 26 and other constitutional provisions and has concluded that they are fully constitutional. District counsel has further concluded that the proposed rules do not impose a tax requiring a vote of the people under Article XIII C of the California Constitution and applicable case law. As the letter acknowledges, not all charges are taxes, and non-tax charges need not be adopted by a vote of the people.

The in-lieu fee provided for in PR 2305 is not a tax primarily because it is not compulsory and provides a benefit to those that pay the fee in the form of compliance flexibility. The definition of tax in Proposition 26 includes only charges “imposed” by public agencies. Cal. Const. art. XIII C, § 1(e). The in-lieu fee is not imposed by PR 2305: the rule does not require any warehouse owners or operators (i.e., covered entities) to pay that fee. The only circumstance in which a warehouse operator will pay the fee is if it *elects* to do so rather than using another source of Warehouse Actions and Investments to Reduce Emissions (“WAIRE”) points. The obligatory portion of the proposed rule is the WAIRE Points Compliance Obligation (“WPCO”), and the in-lieu fee is only one route to satisfying an entity’s WPCO. In *616 Croft Ave., LLC v. City of West Hollywood*, 3 Cal. App. 5th 621 (2016), the court confronted affordable housing fees that a developer could pay in lieu of complying with a requirement to set aside units as affordable housing. The court found “the fees are not compulsory because developers could choose the set-aside option” and therefore were not special taxes. *Id.* at 630-31; *see also id.* (holding that the in-lieu fee was paid “voluntarily as an *alternative* to setting aside a number of units”).

The fee thus also provides payors with the privilege of avoiding the need to implement other measures to comply with PR 2305. California courts have repeatedly recognized that there is no right to pollute; that a regulated entity is allowed to continue polluting is thus a “privilege” and a “substantial benefit.” *Cal. Chamber of Commerce v. State Air Res. Bd.*, 10 Cal. App. 5th 604, 645 (2017) (“*CalChamber*”) (citing cases). Proposition 26’s definition of tax includes an express exemption for charges paid in exchange for a “privilege granted directly to the payor that is not provided to those not charged.” Cal. Const. art. XIII C, § 1(e)(1). Here, payment of the in-lieu fee provides the payor with WAIRE points equivalent to the payment, which can be used in satisfying the WPCO. Those points and their compliance benefits are not afforded to anyone other than the payor. Moreover, as required by the Proposition 26 exemption, the amount of the fee is based on an estimate of the cost of obtaining emission reductions comparable to those achieved by the WAIRE menu items. *See* Draft Staff Rep. at 33, 213; *see also Cal. Bldg. Indus. Ass’n v. San Joaquin Valley Unified Air Pollution Control Dist.*, 178 Cal. App. 4th 120, 128, 131-35 (2009) (upholding ISR fee based on the cost of offsetting the payors’ emissions).

The fee will benefit payors in an additional way. The District will expend the fees, at least in part, to subsidize acquisition of low- and zero-emission trucks. Covered entities will further benefit from those expenditures to the extent those trucks make trips to warehouses regulated under PR 2305 because covered entities obtain credit for such visits through the WAIRE menu. This benefit is reflected in Scenario 7a analyzed in the Final Staff Report, which concludes that it would substantially reduce the cost of compliance with the rule. Draft Staff Rep. at 61, 66-67.

The fee draws strong support from the *CalChamber* case, on which the comment letter repeatedly relies. *CalChamber* upheld the auction of greenhouse gas emission allowances under the State’s cap-and-trade program against a claim that it imposed an unconstitutional tax. As the letter acknowledges, *CalChamber* held that “generally speaking, a tax has two hallmarks: (1) it is compulsory, and (2) it does not grant any special benefit to the payor.” 10 Cal. App. 5th at 640. First, the court concluded that participating in the auction was not compulsory because the cap-and-trade rule did not mandate that regulated entities bid at auction, and they had other options for reducing or meeting their compliance obligations. Second, it found that bidders obtained a valuable benefit in exchange for their bids: emission allowances that could be used for compliance with the cap-and-trade regulation. *Id.* at 646-49.

As noted above, PR 2305’s in-lieu fee shares both features of the auction charge. The proposed rule does not require any covered entities to pay the fee; they may instead obtain WAIRE points through a variety of methods. In addition, those that elect to pay the fee obtain WAIRE points in exchange—a valuable benefit that they would otherwise need to obtain by investing in other projects.

Moreover, in *California Building Industry Association v. City of San Jose*, 61 Cal. 4th 435 (2015), the California Supreme Court recognized that the availability of a constitutional option for complying with regulation means that a fee offered in lieu of compliance cannot be invalidated as unconstitutional. *Id.* at 468-69 (citing *Koontz v. St. Johns River Water Mgmt. Dist.*, 133 S. Ct. 2586, 2599 (2013)). Here, PR 2305 offers covered entities the option to pay the in-lieu fee rather than implementing items from the WAIRE menu. The WAIRE menu items plainly do not impose an unconstitutional tax,⁹³ and thus the availability of that compliance option dictates that the in-lieu fee option cannot be invalidated as an unconstitutional tax. Indeed, because Article XIII C poses no obstacle to imposing the rule’s regulatory obligation—the WPCO—if the position taken by the commenter were accepted by a court, the in lieu fee would be invalidated but the compliance obligation would remain. It would thus have the paradoxical effect of *reducing* flexibility for covered entities and thereby potentially *increasing* the costs of compliance for at least some covered entities.

Although the letter offers no analysis to support its contention that the administrative fee imposed by PR 316 is tax, it likewise is not a tax. It is a fee imposed to cover the costs to the District of administering a program to regulate the payors alone. Courts have routinely upheld such fees, including fees specifically to offset the costs of regulating air pollution. *See, e.g., San Diego Gas & Elec. Co. v. San Diego Cty. Air Pollution Control Dist.*, 203 Cal. App. 3d 1132, 1145-49 (1988). Here too, Proposition 26 provides an applicable exemption from the definition of tax. Article XIII C, Section 1(e)(3) exempts “a charge imposed for the reasonable regulatory costs to a local government for issuing licenses and permits, performing investigations, inspections, and audits, enforcing agricultural marketing orders, and the administrative enforcement and adjudication thereof.”

PR 316 allows the District to recoup the “reasonable regulatory costs” of implementing PR 2305—and those costs alone—from the entities subject to the program. First, it allows recovery of the District’s estimated costs in processing reports and notices submitted by covered entities under PR 2305 and carrying out compliance activities including audits, inspections, and

⁹³ The letter is vague about whether the commenter contends that aspects of the rule other than the in-lieu fee impose a tax. However, the WAIRE menu items do not involve payments to the District and cannot be taxes for that reason, among others. *See Schmeer v. Cty. of Los Angeles*, 213 Cal. App. 4th 1310 (2013).

enforcement for covered entities. The fee “is equal to the level of effort required by South Coast AQMD staff to conduct compliance activities related to the reports for which the fees are being paid.” Draft Staff Rep. at 38. This is consistent with the cases upholding fees imposed to recoup the direct costs of regulating payors. The fee does not fund unrelated District activities and is not imposed on any party that does not cause the District to incur the costs. *See S. Cal. Edison Co. v. Pub. Util. Comm’n*, 227 Cal. App. 4th 172, 199 (2014) (upholding fee against Proposition 26 challenge and holding that it “does not embrace fees charged in connection with regulatory activities which do not exceed the reasonable cost of providing services necessary to the activity for which the fee is charged and are not levied for unrelated revenue purposes”). It thus satisfies Proposition 26’s requirement that the “costs [that] are allocated to a payor bear a fair or reasonable relationship to the payor’s burdens on . . . the governmental activity.” Cal. Const. art. XIII C, § 1(e) (trailing paragraph); *see also Griffith v. City of Santa Cruz*, 207 Cal. App. 4th 982, 996-97 (2012).

Second, PR 316 provides for a fee to be paid by covered entities that elect to pay the in-lieu fee or apply for approval of a custom WAIRE plan. Like the fees for processing submissions by covered entities, these fees do no more than recoup the administrative costs that the District incurs in implementing those portions of PR 2305. Furthermore, like the in-lieu fees themselves, these fees are only paid if a covered entity *elects* to use one of these alternatives to implementation of WAIRE menu items to satisfy their WPCO. As a result, these fees are not taxes for the reasons discussed above for the in-lieu fee. Moreover, the amount of the fees is calibrated to the District staff effort required to implement these tasks. *See* Draft Staff Rep. at 37.

Response to Comment 39-2

This comment largely does not address the proposed rules, but rather provides the commenter’s view of the history of Propositions 13 and 26. District counsel acknowledges that, as noted in the final paragraph of this comment, in the event of a challenge to the proposed rules, the District would bear the burden of proving that the fees provided for in the proposed rules are not taxes. Cal. Const. art. XIII C, § 1 (trailing paragraph).

Response to Comment 39-3

The comment contends the proposed rules would impose a tax. As explained above in Response to Comment 39-1, District counsel has concluded that the proposed rules do not impose taxes for purposes of Proposition 26.

The comment’s reference to *Morning Star Co. v. Board of Equalization*, 201 Cal. App. 4th 737 (2011), is inapposite. The charge imposed in *Morning Star* was intentionally imposed as a tax to fund general operations of the Department of Toxic Substances Control. *Id.* at 755. The tax in *Morning Star* is plainly distinguishable from the fees in PR 2305 and PR 316. The PR 2305 in-lieu fee will not be used to fund general District operations, as explained above, but rather to fund projects that reduce emissions or facilitate emission reductions to offset the same emissions caused by the payors’ businesses. Likewise, the fees charged under PR 316 will recoup only the costs incurred by the District in implementing regulatory activities directly related to PR 2305. Unlike the tax in *Morning Star*, the District here is not funding its general operations at the payors’ expense. On the contrary, the charges in PR 2305 and PR 316 are tailored to the cost of offsetting pollution associated with the payors’ businesses and the cost of implementing regulation necessitated directly by the payors’ activities.

Response to Comment 39-4

The comment also asserts that the proposed rules impose taxes because they do not provide a sunset date and that a true regulatory requirement would supposedly include such a date. The comment points to no supporting case law or other legal authority for this novel contention, and the District is aware of none. The District is under no legal obligation to adopt sunset dates for its regulations, and there is similarly no such obligation for fees offered in lieu of compliance obligations. Moreover, because the in-lieu fee is offered solely as an alternative mechanism for satisfying an operator's WPCO, the fee option will only remain available as long as covered entities have WPCOs. The duration of the fee is thus perfectly calibrated to the duration of the underlying regulatory obligation. If the District is successful in reducing emissions in the Basin sufficiently to attain the state and federal ambient air quality standards, the rule can be brought back to the District Board for reconsideration. Since this response was initially written, the proposed rule has been modified to include a sunset provision effective when CARB and EPA determine that the South Coast Air Basin has attained the 70 ppb ozone standard.

Response to Comment 39-5

The comment emphasizes the *CalChamber* case, discussed above, in which the Court of Appeal rejected a challenge to somewhat similar regulatory charge. The comment misconstrues the case. It argues the case established a new basis for concluding that a charge is a tax, when it instead found a new basis for concluding that a charge is *not* a tax. The commenter thus attempts to use a shield as a sword. The court held that the auction payments in *CalChamber* were not a tax in large measure because they were voluntary and were paid in exchange for benefits enjoyed solely by the bidders. The court thus upheld them despite the fact that they did not qualify as non-tax charges under the prior case law identifying several categories of non-tax fees. *See* 10 Cal. App. 5th at 639-40, 650. The court never suggested that all charges that are compulsory and do not provide a direct benefit to the payor are taxes. As discussed above, far from suggesting that the PR 2305 in-lieu fee is a tax, *CalChamber* strongly supports the conclusion that it is not. *See* Response to Comment 39-1.

Similarly, nothing in *CalChamber* holds or even implies that charges that are not "evenly distributed" across the population are taxes, as the commenter contends. The comment provides no citation to support that theory. On the contrary, the auction charge in *CalChamber* plainly was not evenly distributed: it was paid only by the narrow group of bidders in the cap-and-trade auction and the amount of payments would differ based on bidders' demand for allowances.⁹⁴

The comment also suggests that a charge can avoid being considered a tax only if its expenditure benefits only the payors. Here too, the comment cites no authority for this assertion. Neither *CalChamber* nor any other case of which District counsel is aware supports that conclusion. In fact, the trailing paragraph of Article XIII C, Section 1(e) makes clear that a fee may be based on "the payor's burdens on, *or* benefits received from, the governmental activity." Cal. Const. art. XIII C, § 1(e) (emphasis added); *see also S. Cal. Edison Co.*, 227 Cal. App. 4th at 199. In any event, as discussed previously, the in-lieu fee does provide benefits to payors in the form of regulatory flexibility. *See supra* Response to Comment 39-1.

⁹⁴ In fact, because participation in the auction was not compulsory, the auction price was not even paid by all entities with a compliance obligation under the cap-and-trade program.

Response to Comment 39-6

The comment again contends that charges must be “evenly distributed” and not apply “to a limited segment of the population.” There is no legal support for that proposition and indeed the comment cites none. *See* Response to Comment 39-5.

Response to Comment 39-7

The District agrees that whether a charge is compulsory and the extent to which it is paid in exchange for a benefit to the payor can be relevant to determining whether the charge qualifies as a tax. As noted previously, the PR 2305 in-lieu fee is not compulsory and provides the benefit of compliance flexibility to payors. Although sufficient, those features are not necessary to prevent a charge from being considered a tax. The administrative fee established by PR 316 is compulsory for covered entities, but as explained above, it is not a tax because it is a fee properly imposed to recoup only the direct costs of processing the payors’ submissions. *See* Response to Comment 39-1.

Response to Comment Letter 40 – NAIOP – March 2, 2021

Response to Comment 40-1

Thank you for your interest in the warehouse ISR development process and for bringing your comments to our attention.

Response to Comment 40-2

The assertion in the comment that South Coast AQMD does not have indirect source authority for existing sources is incorrect. See Master Response 7 and Response to Comments for Letter #44 (Holland and Knight on behalf of California Trucking Association).

Response to Comment 40-3

The assertion in the comment that the mitigation fee option in PR 2305 is an illegal tax is incorrect. See Master Response 7 and Response to Comments for Letter # 39 (CalTax).

Response to Comment 40-4

The assertion in the comment that the rule has numerous infeasible, as well as arbitrary and capricious provisions is incorrect. This comment is vague, and it is not clear what provisions it is referring to, so cannot be responded to in detail here. Additional detailed responses are included below.

The assertion in the comment that the potential for emission reductions and ozone reductions is unknown and that the rule cannot achieve any reductions is incorrect. As documented in the Final Staff Report, and in detailed calculations available at www.aqmd.gov/fbmsm, 19 separate scenarios were evaluated to estimate the potential emission reductions of PR 2305. The estimates vary due to the flexibility allowed under the rule, however they provide a bounding analysis to show the potential emission reductions that would occur. For the 13 cheapest scenarios on a \$/sf/yr basis (with the highest cost scenario being \$0.23/sf/yr), NOx emission reductions average 1.8 tons per day (see Tables 15 and 20 in the Final Staff Report), and they generally achieve reductions in the range of 1.5 to 3 tons per day. As stated in the Final Staff Report (Chapter 1, Air Quality Management Plan section), the 2016 AQMP determined that new measures are needed to reduce NOx by 108 tons per day and 88 tons per day to meet the 80 parts per billion (ppb) and 75 ppb federal ozone standards, respectively. PR 2305 would assist in meeting these federal ozone standards as part of the larger, comprehensive strategy included in the 2016 AQMP.

The concern about SIP credit does not consider the full range of options normally available to fold emission reductions into the SIP inventory. These options are discussed in Appendix D of the Final Staff Report. As an example, the indirect source rule adopted by San Joaquin Valley Air District was approved into the SIP by EPA, but the approval did not include any ‘SIP credit’ for emission reductions.⁹⁵ However, the emission reductions achieved by their rule are included as part of normal updates to the mobile source emissions inventory in regular updates by CARB.

⁹⁵ When EPA approved the SJVAPCD Rule 9510 into the SIP, it specifically did not allow the rule to be used for prospective SIP credit (76 FR 26609). Notwithstanding this approach, the most recent Annual Report for Rule 9510 shows that since its inception the rule has resulted in 15,617 tons of NOx and PM10 that have been avoided, with another 12,147 tons of NOx and PM10 that has been reduced through use of its mitigation fee program (<https://www.valleyair.org/ISR/Documents/2020-ISR-Final-Annual-Report.pdf>)

This proven example is expected to be the primary process by which SIP creditable emissions reductions would be accounted for with PR 2305 as well. Other prospective SIP creditable emission reductions methods may be possible too with the WAIRE Mitigation Program once funds are received and the program has been established.

Response to Comment 40-5

The assertion that “warehouses have no control over the marketplace for heavy duty trucks” is incorrect. About 40% of warehouse operators are estimated to own their own truck fleets, and additional warehouse operators arrange for at least some of the trucking services to move the goods stored in their warehouse. See Master Response 2c for a discussion of warehouses that don’t own truck fleets.

Response to Comment 40-6

The assertion that “No one knows when low emission trucks will be commercially available in sufficient supply to even be able to achieve any WAIRE Points” is incorrect. NZE Class 8 trucks have been in commercial service for several years, and South Coast AQMD has incentivized at least 1,200 NZE trucks which are already in commercial service. Recent discussions with representatives from Cummins, the manufacturer of NZE engines, and Peterbilt (a truck manufacturer) confirmed that there are no limitations to how many NZE trucks could be ordered or manufactured today relative to conventional diesel trucks. They only need to be ordered and purchased. See Master Response 2d for additional discussion about truck availability. Also see Appendix B of the Final Staff Report which contains information on the commercial availability of technology in the WAIRE Menu.

Response to Comment 40-7

See Master Response 8 for a discussion of other regulations being pursued by CARB. EPA is also pursuing their Cleaner Trucks Initiative, but that is not expected to take effect any earlier than 2027, and this would not result in significant turnover of trucks until the 2030s, well after air quality attainment deadlines for South Coast AQMD.⁹⁶

Response to Comment 40-8

The public may provide comments at the South Coast AQMD’s Governing Board’s Public Hearing on PR 2305 on May 7, 2021, but written comments are requested by May 4, 2021 at 5PM if the commenter wishes for them to be included in the Board materials.

⁹⁶ <https://www.govinfo.gov/content/pkg/FR-2020-01-21/pdf/2020-00542.pdf>

Response to Comment 40-9

See Master Response 4 for a discussion of warehouses as an essential industry, including during the COVID-19 pandemic.

Response to Comment 40-10

See Master Response 6 for a discussion of how PR 2305 would affect jobs.

Response to Comment 40-11

The suggestion that PR 2305 and PR 316 imposes a tax is incorrect. See Response to Comment Letter 39 for a discussion of taxes. The potential economic impacts of PR 2305 and PR 316 have been analyzed in the Socioeconomic Impact Assessment. This analysis found that the monetized public health benefits of most compliance scenarios outweighed the potential costs by a ratio of about 3:1, including in 11 of the 13 scenarios with the lowest costs ($\leq \$0.23/\text{sf}$). Further, the increase in operating costs for these cheapest compliance scenarios would be less half of the approximately $\$0.50/\text{sf}/\text{yr}$ increase in rental prices that warehouse operators have had to absorb continually over the past decade (see Figure 12 in the Final Staff Report). PR 2305 could potentially increase the cost of goods by about 0.05%, which is much less than the typical increases of about 2% from inflation as shown in the Consumer Price Index.⁹⁷

Response to Comment 40-12

South Coast AQMD Staff understand that warehouses have provided many community benefits. Those benefits are expected to continue if PR 2305 is approved, as warehousing is expected to continue as a thriving industry in the region. The warehouse relocation study commissioned by South Coast AQMD determined that no warehouses would relocate unless costs increased more than $\$1.50/\text{sf}/\text{yr}$ here compared to any surrounding market area. PR 2305 and PR 316 are expected to add up to $\$0.83/\text{sf}/\text{yr}$ in costs in the worst case, but probably closer to $\$0.23/\text{sf}/\text{yr}$ or less as most compliance scenarios were found to cost no more than this amount. Even with these costs, the potential monetized public health benefits outweigh the potential costs of the rule for most compliance scenarios modeled by about 3:1. Warehouse operators have faced rental price increases of about $\$0.50/\text{sf}/\text{yr}$ continuously for the past decade and the warehousing market responded by growing even faster while maintaining very low vacancy rates (see Chapter 3 of the Final Staff Report and Socioeconomic Impact Assessment). Therefore the community benefits identified in the comment are expected to continue if PR 2305 is approved.

Response to Comment 40-13

The comment that South Coast AQMD does not have the legal authority to adopt PR 2305 is incorrect. See Master Response 7 and Response to Comments 44-2. The South Coast AQMD is indeed governed by Health and Safety Code 40400, but not exclusively. The comment ignores the many other statutes that grant authority to South Coast AQMD. The statement that the Final Staff Report omits any citation of section 40440 is incorrect. In the Draft Findings under California Health and Safety Code Section 40727 in Chapter 3, section 40440 is listed along with many other authorizing statutes under the section labelled 'Authority'. Nothing in

⁹⁷ <https://www.dir.ca.gov/OPRL/CPI/EntireCCPI.PDF>

Section 40440(b)(3) indicates that it is intended to impose a limitation on the South Coast AQMD's indirect source authority.

Response to Comment 40-14

The comment that the rule is a regulation of mobile sources, rather than a true "indirect source" rule is incorrect. The federal Clean Air Act does not limit the South Coast AQMD's authority to adopt indirect source rules. See Master Response 7 and Response to Comments 44-2.

Response to Comment 40-15

The comment that several respects of Rule 2305 is arbitrary, capricious, entirely lacking in evidentiary support, or unlawfully or procedurally unfair is incorrect. The reasoning supporting PR 2305 is contained within the Final Staff Report, as well as the Socioeconomic Impact Assessment, and the Environmental Assessment. The development of PRs 2305 and 316 included significant public outreach and has followed all required procedures to ensure that the public has had a fair process to understand and comment on the proposed rules.

Response to Comment 40-16

The purpose of PR 2305 and PR 316 is to reduce local and regional emissions of NO_x and PM associated with warehouse operations in order to assist in meeting attainment of state and federal air quality standards. See Master Response 2d for information on the commercial availability of NZE/ZE technology. Also see Appendix B of the PR 2305 Final Staff Report, which contains information on the commercial availability of technology on the WAIRE Menu. All warehouse owners and operators are expected to be able to use any of the WAIRE Menu items to meet rule compliance, with one limited exception. As shown in the analysis of a scenario only focused on solar panel acquisition and usage, all warehouse operators will be unlikely to be able to fully satisfy their WPCO just by using solar panels they install and use, assuming that they can only use solar panels equal to about 50% of their warehouse's square footage. They would need to then use any of the other WAIRE Menu options to cover any shortfall.

Further, while the scenario modeling conservatively assumed that warehouse operators would not use earn any WAIRE Points for Class 8 truck acquisitions in the first compliance year, this technology is expected to be commercially available before the end of 2021 by some major truck manufacturers, with additional models becoming commercially available during the first compliance period in 2022.⁹⁸ To the extent that warehouse operators want to pursue options from the WAIRE Menu related to on-road truck acquisitions or visits, there are no limits, other than what they choose to do and/or can negotiate with the goods owners and trucking companies that they work with. For the non-truck acquisition/ visit options, these measures are either facilitating actions that are necessary components for ZE trucks (e.g., charging/fueling infrastructure) which will assist in encouraging the adoption of ZE trucks in order to reduce NO_x, or they will directly reduce NO_x on their own (e.g., on-site NZE or ZE yard truck acquisition or usage, installation and usage of solar panels that reduce the reliance on fossil-fueled power plants that emit NO_x in South Coast AQMD), or they will provide a community

⁹⁸ See <https://globaldrivetozero.org/tools/zero-emission-technology-inventory/> for a summary of truck manufacturer announcements.
